**Abstract:** Factors affecting the NMR titration procedures for the determination of  $pK_a$  values in strongly basic and strongly acidic aqueous solutions ( $2 \geq \text{pH} \geq 0$  and  $14 \geq \text{pH} \geq 12$ ) are analyzed. Guidelines for experimental procedure and publication protocols are formulated. These include: calculation of the equilibrium  $\text{H}^+$  concentration in a sample; avoidance of measurement with glass electrode in highly acidic (basic) solutions; exclusion of  $\text{D}_2\text{O}$  as a solvent; use of an individual sample isolated from air for each pH value; use of external reference and lock compounds; use of a medium of constant ionic strength with clear indication of the supporting electrolyte and of the way the contribution of any ligand to the ionic strength of the medium is accounted for; use of the NMR technique in a way that eliminates sample heating to facilitate better sample temperature control (e.g.,  $^1\text{H}$ -coupled NMR for nuclei other than protons, GD-mode, CPD-mode, etc.); use of  $\text{Me}_4\text{NCl}/\text{Me}_4\text{NOH}$  or  $\text{KCl}/\text{KOH}$  as a supporting electrolyte in basic solution rather than sodium salts in order to eliminate errors arising from  $\text{NaOH}$  association; verification of the independence of the NMR chemical shift from background electrolyte composition and concentration; use of extrapolation procedures.

**Keywords:** NMR titration; dissociation constants; acidity constants; chemical shift dependence on medium; high and low  $pK_a$  measurement; IUPAC Analytical Chemistry Division.

## Introduction

Numerical data for acid–base equilibria ( $\lg K_a$  values) have contributed significantly to the theoretical foundation of modern organic and inorganic chemistry [1,2]. In particular, the ligand acid dissociation constants ( $pK_a$ ) correlate strongly with complex stability for many classes of ligands [3]. The related linear Gibbs energy relationships may be used for prediction of metal complex stability constants  $K_{ML}$  in cases where their direct experimental measurement is difficult or impossible [2,4,5].

Many important acid–base equilibria take place in highly basic or highly acidic aqueous solutions. For strongly acidic aquametal ions (e.g.,  $\text{Tl}^{\text{III}}$ ,  $\text{Bi}^{\text{III}}$ ,  $\text{Tl}^{\text{IV}}$ ,  $\text{Th}^{\text{IV}}$ ,  $\text{Be}^{\text{II}}$ ,  $\text{Pd}^{\text{II}}$ ), the measurement of stability constants frequently requires solutions of low pH ( $\text{pH} \geq 2$ ) [6], while complex formation frequently involves ligands with very small  $pK_a$  values. By contrast, many technologies and complexation reactions require  $\text{pH} \geq 12$  [7] and ligands that are strongly basic (e.g., phosphonates, anionic forms of sugars, hydroxybenzoates, polyamines). In both cases, the application of glass electrode-based potentiometry does not give reliable results [8].

In recent years, a variety of new techniques have been developed as alternatives to the classical potentiometric titration procedure. Among these is nuclear magnetic resonance (NMR), which has a unique application for microscopic acid dissociation constant measurements [9] as well as for work in highly basic and highly acidic media [1,6–8]. Although early reports on the use of the NMR technique were not promising [1], later work revealed good concurrence with potentiometric results for compounds with  $pK_a$  values in the range  $11 \geq pK_a \geq 3$  [10–11]. Recently, fully automated pH-NMR titration equipment for protonation studies has been reported [10a,10c,12–14]. However, the  $pK_a$  values estimated from NMR measurements in strongly basic (acidic) solutions often differ significantly from those obtained by potentiometry. The higher reliability of equilibrium data based on NMR measurements in the ranges  $2 \geq \text{pH}$  and  $\text{pH} \geq 12$  is widely recognized [7,8b,8c,8d,12,13].

At the same time, diverse experimental conditions have been used for protonation and stability constant measurements by NMR. This affects the reliability and the comparison of the resulting equilibrium constants. Further, many authors have not used a standard approach to the chemical shift reference application, preparation of samples, pD/pH corrections, ionic strength control, etc. [11,14–17]. This in turn has resulted in a considerable disparity among the calculated constants. The present report is therefore focused on general recommendations for the application of NMR spectroscopy to the determination of protonation (dissociation) constants in aqueous solution, with an emphasis on titration procedures in highly acidic or highly basic media ( $2 \geq \text{pH} \geq 0$  and  $14 \geq \text{pH} \geq 12$ ). At the same time, it provides some guidelines for the critical treatment of the NMR-based  $pK_a$  values published earlier.

## Factors affecting the accuracy of NMR titrations

Acid dissociation constants can be expressed in terms of activity (thermodynamic constants) or concentrations (concentration, conditional constants). In the former case, the activity constant  $K_a = a_{\text{H}^+}a_{\text{L}}/a_{\text{HL}}a^{\circ}$ , or a mixed activity-concentration constant  $K_a = a_{\text{H}^+}[L]/[HL]c^{\circ}$  are considered, where  $c^{\circ} = 1 \text{ mol dm}^{-3}$  is the standard amount concentration;  $a^{\circ}$  is the corresponding activity;  $a_{\text{H}^+}$ ,  $a_{\text{L}}$ ,  $a_{\text{HL}}$  represent activities; and  $[H]$ ,  $[L]$ ,  $[HL]$  amount concentrations of  $\text{H}^+$ ,  $\text{L}^-$ , and  $\text{HL}$  species, respectively. IUPAC recommends for solution equilibrium studies the determination of concentration-based constants  $K_a = [H][L]/[HL]c^{\circ}$  [18, 19]. In the present paper, the term  $\text{p}K_a$  always indicates the concentration constant valid for a particular ionic strength  $I$  and temperature, while  $\text{pH}$  corresponds to the concentration  $\text{p}[H]$  scale ( $\text{p}[H^+]$ ); i.e., we define  $\text{p}[H] = -\lg \{[H^+]/c^{\circ}\}$  unless otherwise is stated. In a similar way,  $\text{p}[D]$  should correspond to  $-\lg \{[D^+]/c^{\circ}\}$ . This requires either calibration of a  $\text{pH}$  meter by solutions with known  $[D^+]$  at a particular  $I$ , or the direct calculation of  $[D^+]$  in strongly basic (acidic) solutions when the concentration of  $\text{L}$  can be neglected. However, this ideal condition is seldom if ever fulfilled, and the common practice is based on the “ $\text{pH}$  meter readings” in  $\text{D}_2\text{O}$  solutions after the  $\text{pH}$  meter was calibrated in  $\text{H}_2\text{O}$  buffer solution [8a] (see eqs. 5–7 and further discussion). Obviously, this approach gives some value of  $\text{pD}$  as unclear function of activity  $a_{\text{D}}$  and cannot be recommended for work in concentrated ( $>0.1 \text{ mol dm}^{-3}$ ) solutions of bases (acids).

For the dissociation equilibrium of the protonated ligand  $\text{HL}$  (charge numbers are neglected):

the acidity constant  $K_a$  is defined at a particular ionic strength  $I$  as  $K_a = [L][H]/[HL]c^{\circ}$ . Then  $\text{p}K_a = -\lg K_a = \text{p}[H] + \lg ([HL]/[L])$  and at half-neutralization  $\text{p}[H]$  becomes a reasonable estimate of  $\text{p}K_a$  as  $[HL] = [L]$  and  $\lg ([HL]/[L]) = 0$ .

However, many research groups use the NMR technique for  $\text{D}_2\text{O}$  solutions and therefore operate with measurements of  $\text{pD}$  in terms of activity as indicated earlier. The corresponding mixed activity-concentration constant is denoted here as  $K_a(\text{D}_2\text{O}) = a_{\text{D}}[L]/[DL]c^{\circ}$ . Then the  $K_a(\text{D}_2\text{O})$  values are recalculated by means of some empirical and very arbitrary equations (see further discussion) into some equilibrium activity-concentration constant

$K_a(\text{H}_2\text{O})$ , which is supposed to indicate  $K_a = a_{\text{H}^+}[L]/[HL]c^{\circ}$  for  $\text{H}_2\text{O}$  solutions, although there is no rigorous background for that supposition.

From the  $\text{p}[H]$  dependence of the chemical shift, the  $\text{p}K_a$  can be determined, using  $^1\text{H}$ ,  $^{13}\text{C}$ ,  $^{14}\text{N}$ ,  $^{15}\text{N}$ ,  $^{31}\text{P}$ ,  $^{19}\text{F}$ , or any other NMR-active nucleus in a ligand [9a]. Since proton dissociation from  $\text{HL}$  changes the electron density, species  $\text{HL}$  and  $\text{L}$  reveal different chemical shifts, denoted as  $\delta_{\text{HL}}$  and  $\delta_{\text{L}}$ . Most acids in aqueous solutions are characterized by rapid proton-transfer reactions on the NMR time-scale. Thus, the observed chemical shift of any one nucleus represents the single concentration-weighted average  $\delta_{\text{obs}}$  of the chemical shifts for the nucleus of each chemical species in the equilibrium:

$$\delta_{\text{obs}} = x_{\text{HL}}\delta_{\text{HL}} + x_{\text{L}}\delta_{\text{L}} \quad (2)$$

where  $x_{\text{HL}}$  and  $x_{\text{L}}$  denote the mole fractions of equilibrium species  $\text{HL}$  and  $\text{L}$ . The dynamically averaged chemical shift  $\delta_{\text{obs}}$  provides a good measure for the degree of ionization (proton dissociation):

$$x_{\text{L}} = (\delta_{\text{obs}} - \delta_{\text{HL}}) / (\delta_{\text{L}} - \delta_{\text{HL}}) \quad (3)$$

The mole fractions can be expressed in terms of  $\text{p}[H]$  and  $\text{p}K_a$  [1, 13]:

$$\text{p}K_a = \text{p}[H] + \lg [(\delta_{\text{L}} - \delta_{\text{obs}}) / (\delta_{\text{obs}} - \delta_{\text{HL}})] \quad (4)$$

It is easy to demonstrate from eq. 4 that: (a) for an acid  $\text{HL}$ , a plot of  $\delta_{\text{obs}}$  vs.  $\text{p}[H]$  has the shape of a titration curve lying between the asymptotes  $\delta_{\text{L}}$  and  $\delta_{\text{HL}}$ , with a point of inflection at  $\text{p}[H] = \text{p}K_a$ ,  $\delta_{\text{obs}} = (\delta_{\text{L}} + \delta_{\text{HL}})/2$ ; (b) the titration curve is symmetrical about the inflection point (Fig. 1), which gives a possible simple method of estimating  $\text{p}K_a$ ,  $\delta_{\text{L}}$ , and  $\delta_{\text{HL}}$ .

The normal procedure for a NMR titration is based on the dependence of the chemical shift  $\delta_{\text{obs}}$  on  $\text{p}[H]$ , with subsequent treatment of experimental data via routine software. Therefore, three constants are to be found from the  $\delta_{\text{obs}}$  vs.  $\text{p}[H]$  data by computer analysis of this nonlinear equation, and preliminary values can often be found directly from the plot. A significant advantage of the NMR technique is associated with the possibility of titrating a mixture of ligands, including impurities, if the total concentration of the ligands (and therefore of impurities

**FIGURE 1:** Simulated NMR titration curve for the hypothetical  $0.001 \text{ mol dm}^{-3}$  acid  $\text{HL}$  with  $\text{p}K_a = 13.5$  at  $I = 0.1 \text{ mol dm}^{-3}$  (solid line), plotted by SPECIES [35]. Squares refer to hypothetical experimental NMR-titration points at  $I = 0.1 \text{ mol dm}^{-3}$ . Their range is limited by the ionic strength  $I$  (high pH limit) and by the requirement  $[\text{OH}^-] \gg [\text{HL}]$  (low pH limit). Dashed line and triangles refer to a simulated NMR titration of the same acid at  $I = 1.0 \text{ mol dm}^{-3}$ , which provides the value  $\delta_{\text{L}}^*$  directly or via extrapolation.

associated with the ligands) is much less than the base (acid) concentration.

It is important to stress that for classical potentiometry with a glass electrode the inflection point can be observed only if  $pK_a$  is close to  $(pK_w)^{1/2}$  [1]. For a NMR titration, the situation is completely different. As far as only mole fractions, instead of the total acid concentration, are involved in the data evaluation, NMR facilitates  $pK_a$  measurement outside the range of potentiometry if high or low  $p[H]$  are determined by means other than glass electrode readings [13]. Thus, the main sources of errors in NMR-based  $pK_a$  determinations are the accuracy and precision of  $\delta_{\text{obs}}$  and  $p[H]$  values.

## Chemical shifts

General conventions for chemical shifts are comprehensively considered in recent IUPAC recommendations [20]. In the present paper, we will focus only on specific problems associated with NMR-based  $pK_a$  determinations, bearing in mind that many research groups involved in solution chemistry equilibria still do not have modern NMR equipment and have to work with routine spectrometers. It is essential that the chemical shift measurement being made for each datum point is reliable. Another important requirement is to obtain from the set of chemical shifts such a  $pK_a$  value that can pass comparison with other equilibrium constants.

As described in ref. [20], there are three types of referencing method that could reasonably be applied in titrations: *internal referencing*, *substitution method*, and *external referencing*. These methods all have various advantages and disadvantages in relevance to NMR titration.

*Internal referencing* may lead to intermolecular interactions between ligand, solvent, and reference compound. Further, in many spectrometers the sample must normally include a deuterium-containing molecule for magnetic field stabilization ("lock"). For many purposes, all these interactions can be safely ignored, but for NMR-based titrations at high and low  $p[H]$  a considerable caution is needed. The use of  $D_2O$  (as the "lock") instead of  $H_2O$  as a solvent, and the addition of uncontrolled "small" amounts of a reference compound like sodium 3-(trimethylsilyl)propane-1-sulfonate (DSS), dimethyl sulfoxide (DMSO), *tert*-butylalcohol or 1,4-dioxane inside a sample (internally), became common practice for  $^1H$  and  $^{13}C$  NMR [12,15,16]. In some cases ( $^{13}C$  NMR), the added reference compound is itself deuterated (e.g.,  $(^2H_6)DMSO$  or DSS, deuterated at the  $CH_2$  positions), thus providing the lock signal as well. Modern NMR techniques give the possibility to work with very low concentrations of DSS. Therefore, it gives a negligible contribution to ionic strength and to solution properties. It is demonstrated to be effective at  $p[H]$  0–1 [12]. At the same time, little is known about the properties of internal references at elevated  $p[H]$ . Nevertheless, any internal substance can potentially participate in association processes either with the cation under complex formation study or with the background electrolyte and is therefore generally undesirable from the point of view of equilibrium studies.

For  $^1H$  NMR titrations, the use of  $D_2O$  as a solvent instead of  $H_2O$  is a common procedure. This is usually done to eliminate masking of a substrate peak by the  $H_2O$  resonance [15–17]. The use of  $D_2O$  internally raises the problems of how to effect  $pD$  measurement with a standard glass electrode, as well as the relationship between  $pK_a(H_2O)$  and  $pK_a(D_2O)$ . The proposed simple empirical eq. 5 derived for ionic strength  $I = 0.001$ – $0.01 \text{ mol dm}^{-3}$  and  $25^\circ C$  [21] to obtain values on the conventional  $pD$  scale from glass electrode readings is widely accepted, although it is frequently used far outside of the originally intended ionic strength

and temperature limits:

$$pD = \text{pH-meter reading}^* + 0.40 \quad (5)$$

Some authors, however, use eqs. 6 or 7 [22,23]:

$$pD = \text{pH-meter reading} + 0.44 \quad (22^\circ C, I = 0.01 \text{ mol dm}^{-3}) \quad (6)$$

$$pD = \text{pH-meter reading} + 0.50 \quad (22^\circ C, I = 0.1 \text{ mol dm}^{-3}) \quad (7)$$

Although the difference between  $pD$  values calculated by different equations is not large, it is a substantial contribution to systematic error, even for low ionic strength and room temperature, but particularly for high ionic strengths and high temperatures.

There is an even greater diversity of relationships between  $pK_a(H_2O)$  and  $pK_a(D_2O)$ . Both quantities are ionic strength-dependent. The proposed empirical equations yield significantly different results and seem very arbitrary: relationships depend on the nature and number of compounds studied [24–26]. It is observed that the activity coefficient products undergo significant changes when one goes from light to heavy water [27]. It is obvious that at present a correct extrapolation of  $pK_a(D_2O)$  to an aqueous phase  $pK_a(H_2O)$  is not possible, and that the systematic errors for calculated values are outside the accepted uncertainty for  $pK_a(H_2O)$  values derived directly from NMR measurements with external  $D_2O$ . Besides,  $pK_a(D_2O)$  values can hardly pass comparison with other equilibrium constants measured in  $H_2O$ , and their use for complex formation equilibria in  $H_2O$  is very doubtful. Assuming the above difficulties, the use of internal  $D_2O$  is not recommended.

For  $^{31}P$  NMR, the use of internal referencing at high and low  $p[H]$  is difficult, and external reference application is widely used and recommended [7c,7d,8b,8c,11a,11b,16,17a,17b].

*Substitution method* uses measurement of sample and reference spectra in two separate experiments. It became feasible due to implementation of stable, internally locked spectrometers. In this procedure, the sample and reference materials are not mixed. This benefits the equilibrium study. If locking is not used, the magnet should not be reshimmied between running the sample and reference solution, since this changes the applied magnetic field [20]. This can become a disadvantage for time-consuming  $^{13}C$  NMR-based equilibrium experiments because the ligand concentrations have to be small.

*External referencing* involves sample and reference contained separately in coaxial cylindrical tubes. A single spectrum is recorded, which includes signals from both the sample and the reference. It is also an ideal situation for equilibrium study as far as both reference and "lock" substances are separated from the ligand solution. The external reference procedure generally requires corrections arising from differences in bulk magnetic susceptibility between sample and reference [20]. This is important for precise chemical shift measurements, but for the relative change of  $\delta_{\text{obs}}$  between  $\delta_L$  and  $\delta_{HL}$  for a series of nearly identical aqueous solutions in a narrow  $pH$  range (either  $p[H]$  0–2 or 12–14) with constant ionic strength and a constant sample volume it is insignificant. Numerous measurements of  $^{13}P$  NMR-based  $pK_a$  values revealed no influence from this factor [7c,7d,8b,8c,11a,11b,16,17a,11b]. Alternatively, magic-angle spinning could be used. Therefore, such a technique seems to be the preferable choice.

\*  $pH$ -meter reading for solutions in  $D_2O$  when the  $pH$  electrodes are calibrated with standard aqueous buffers.

### p[H] Values and titration procedure

An important source of error in NMR-based  $pK_a$  determinations is the accuracy and precision of the p[H] values. Determining extreme values of p[H] requires special attention, since glass electrodes cannot be used reliably [8a,8c,12,13]. Therefore, the traditional single-sample NMR titration is recommended [8c,13,27,29,30]. A set of individual samples with constant monoprotic acid HL (or ligand L) concentration (e.g.,  $0.01 \text{ mol dm}^{-3}$ ), constant ionic strength (e.g.,  $1 \text{ mol dm}^{-3}$ ) and varying p[H] value are prepared one-by-one ("constant volume titration") in such a way that a strong acid or a strong base added for desired p[H] adjustment is taken in a significant excess over HL or L (e.g.,  $0.1\text{--}1.0 \text{ mol dm}^{-3}$ ). This permits the equilibrium p[H] value to be calculated reliably as it is equated to the total amount of a strong acid (strong base) added to the sample [27]. Since each sample is prepared individually from stock solutions, the ionic strength can be very precisely controlled [12]. The use of "lock" and reference substances externally excludes their undesirable influence on the equilibrium system. Alternatively, in an approach developed by Hägele [13], the glass electrode can be completely avoided by adding an indicator molecule to the sample for in situ p[H] monitoring. However, this method is primarily based on the procedure stated above.

The proposed method is equally valid for both strongly acidic ( $\text{pH} < 2$ ) and strongly basic ( $\text{pH} > 12$ ) solutions, although some peculiarities do exist in the latter. For the acidic medium, p[H] is directly derived from the total strong acid concentration. In the case of highly basic solutions, the initially calculated p[OH<sup>-</sup>] values have to be converted to the p[H] scale, using appropriate  $pK_w$  values to allow calculation of the corresponding  $pK_a$  values. Some important issues that restrict the application of the above method and influence the data quality should also be considered.

### Titration procedure and titration curve treatment

A full-scale NMR titration for a single proton equilibrium 1 will provide values of  $\delta_{\text{HL}}$ ,  $\delta_L$ , and some intermediate chemical shift values applicable to a particular pH at a constant  $I$ . Ideally, a titration spans over 4 pH units with the half-neutralization point in the middle of this pH range. For extremely high or low  $pK_a$ , this condition is not achievable: for  $pK_a = 13.5$ , the value for  $\delta_L$  has to be measured at pH 15.5, while for  $pK_a = 0.5$  a direct observation of  $\delta_{\text{HL}}$  requires pH = -1.5.

If the ionic strength is  $1.0 \text{ mol dm}^{-3}$  (NaCl/NaOH), then the highest pH attainable at  $25^\circ\text{C}$  ( $\text{pH}_{\text{max}}$ ) is less than 13.72 ( $pK_w$  for  $1 \text{ mol dm}^{-3}$  NaOH<sup>\*</sup>), while for  $I = 0.1 \text{ mol dm}^{-3}$  NaCl/NaOH  $\text{pH}_{\text{max}} < 12.78$  (limitation due to  $pK_w$  and  $I$ ). Thus for  $pK_a = 13.5$  at  $I = 1.0 \text{ mol dm}^{-3}$  (NaCl/NaOH) only about 80 % of the titration curve is accessible, providing a value for  $\delta_{\text{HL}}$  and a half-neutralization point, but not for  $\delta_L$ . In the case of  $I = 0.1 \text{ mol dm}^{-3}$  (NaCl/NaOH<sup>\*</sup>), about 30 % of the full curve can be obtained experimentally, but excluding the half-neutralization point and  $\delta_L$ , Fig. 1 (square points). Although comprehensive software (SigmaPlot, WinEQNMR) permits calculation of  $pK_a$  and  $\delta_L$  values for very weak acids on the basis of data at different pH values below that for the half-neutralization point, the corresponding constants have a large error. But in some cases,

the programs fail to produce results and experimental measurement of high  $pK_a$  at low ionic strength becomes impossible. This can be illustrated by the last dissociation step of nitrilotris(methylenephosphonic acid) (NTPH,  $\text{H}_6\text{ntph}$ ) and ethylenediaminetetra(methylenephosphonic acid) (EDTPH,  $\text{H}_8\text{edtpH}$ )<sup>\*\*</sup>, Table 1.

On the other hand, if the initial  $\delta_{\text{HL}}$  experimental value and the subsequent 30–40 % of a complete titration curve are supported by at least one final high pH titration point to provide  $\delta_L$ , then the precision of the  $pK_a$  calculation becomes sufficiently high and the measurement becomes feasible.

For those nuclei with chemical shift poorly dependent on the ionic strength and nature of the supporting electrolyte (the case of  $^{31}\text{P}$  and  $^{13}\text{C}$ ),  $\delta_L$  can be obtained by titration of the same system at a higher or even uncontrolled ionic strength until the "plateau" is reached (triangle points, Fig. 1). The resultant  $\delta_L^*$  is very close to  $\delta_L$ , e.g.,  $\delta_L (I = 0.1 \text{ mol dm}^{-3}) \sim \delta_L^* (I = 1.0 \text{ mol dm}^{-3})$ . Then the following two-step procedure is recommended. The first step involves the titration of a ligand at a sufficiently high ionic strength, e.g.,  $1.0 \text{ mol dm}^{-3}$  NaCl (triangles in Fig. 1) or  $1.5 \text{ mol dm}^{-3}$  NaCl, etc., rather than in  $0.1 \text{ mol dm}^{-3}$  NaCl. This gives two advantages. The first is that the  $\text{pH}_{\text{max}}$  is shifted from 12.78 to ca. 14. The second derives from the fact that sodium ion forms weak complexes with L (e.g., phosphonic acids). Therefore, the whole titration curve is shifted to a lower pH range as the total sodium concentration is increased. Both of these factors facilitated the direct observation of a "plateau" corresponding to  $\delta_L^*$  ( $I = 1 \text{ mol dm}^{-3}$ ).

Due to the fact that  $\delta_L (0.1 \text{ mol dm}^{-3} \text{ NaCl})$  is practically equal to  $\delta_L^* (1 \text{ mol dm}^{-3} \text{ NaCl})$ , then the  $\delta_L^*$ -value could be used instead of  $\delta_L$  along with experimental points obtained for  $I = 0.1 \text{ mol dm}^{-3}$  (square points, Fig. 1). Therefore, within the second step,  $\delta_L^*$  is assigned to a conventional pH = 16 or pH = 17, where the titration curve definitely has a plateau. A titration is repeated for  $0.1 \text{ mol dm}^{-3}$  NaCl solutions, a  $\delta_L^*$  point is added to the experimental data set, and a  $pK_a^*$  value is calculated. The subsequent treatment of the united data reveals a significant increase in the accuracy of  $pK_a$ . This can be seen from Table 1, where both constants  $pK_a$  (calculated without  $\delta_L^*$ ) and  $pK_a^*$  (calculated with a  $\delta_L^*$  point) are represented. If  $\delta_L$  is significantly dependent on ionic strength, then the extrapolation procedure proposed by Popov, Lajunen, and Rönkkömäki [28,29] could be applied.

### Ligand concentration

Calculation of p[H] from the acid stoichiometry requires a low ligand concentration: for a monoprotic acid  $C_{\text{HL}} < 0.01 I$ . Recent developments of the NMR technique make it possible to now work with very dilute solutions. In case of the organophosphonates, concentrations  $C_L \sim 0.001 \text{ mol dm}^{-3}$  are quite suitable for  $^{31}\text{P}$  NMR titrations [28,29].

By contrast, for  $^{13}\text{C}$  NMR titrations, the ligand concentration has to be rather high (about  $0.1 \text{ mol dm}^{-3}$ ) in order to perform the titration in a reasonable time. Therefore, the equilibrium [OH<sup>-</sup>] cannot be equal to the total [OH<sup>-</sup>] added to the system. For this case (e.g.,  $0.1 \text{ mol dm}^{-3}$  HL), another two-step procedure reported for sucrose dissociation constant measurements [31] is recommended. In the first step, the equilibrium [OH<sup>-</sup>] is taken as equal to the total [OH<sup>-</sup>] added, and the full titration curve is plotted, mathematically treated, and the  $pK_a$ ,  $\delta_L$ , and  $\delta_{\text{HL}}$  values are calculated. The difference between  $\delta_L$  and  $\delta_{\text{HL}}$  chemical shifts defines the linear scale of OH<sup>-</sup> consumption by the ligand:  $0 \text{ mol dm}^{-3}$

\* Reliable values for  $pK_w$  are measured only for some common supporting electrolytes, e.g., NaCl, NaClO<sub>4</sub>, KN O<sub>3</sub>, etc. For  $1 \text{ mol dm}^{-3}$  NaOH, the  $pK_w$  value found for  $1 \text{ mol dm}^{-3}$  NaCl is valid as far as the difference in corresponding activity coefficients is negligible. The same situation is observed for the  $0.1 \text{ mol dm}^{-3}$  NaCl/NaOH system. However, it is not the case for a complete substitution of  $1 \text{ mol dm}^{-3}$  NO<sub>3</sub><sup>-</sup> for OH<sup>-</sup> or of  $1 \text{ mol dm}^{-3}$  K<sup>+</sup> (Na<sup>+</sup>) for H<sup>+</sup> (acidic solutions).

\*\* The PINs (preferred IUPAC names) for NTPH and EDTPH are: [nitrilotris(methylene)]tris(phosphonic acid) and ethane-1, 2-diyldinitrilotetakis(methylene)tetrakis(phosphonic acid).

**TABLE 2: Dissociation Constant of 0.1 mol dm<sup>-3</sup> Sucrose (HL) from <sup>13</sup>C NMR Titration at 60°C in 1 mol dm<sup>-3</sup> NaCl/NaOH [31].**

Procedure	$\delta_L/\text{ppm}$	$\delta_{\text{HL}}/\text{ppm}$	$pK_a$	$R$
One-step data treatment	103.00	101.98	$12.40 \pm 0.05$	0.999
Two-step data treatment	102.96	101.98	$12.30 \pm 0.05$	0.999

( $\delta_{\text{HL}}$ ) and 0.1 mol dm<sup>-3</sup> ( $\delta_L$ ) for a 0.1 mol dm<sup>-3</sup> solution of L. Within the second step, all the experimental values  $\delta_{\text{obs}}$  are treated again with redefined values of  $p[\text{OH}^-]$ , and an improved value of  $pK_a$  is calculated. As indicated in Table 2, the correction due to the second step reveals a systematic error of 0.1 in  $pK_a$ .

### Background electrolyte and ionic strength

To date, the background electrolyte effect on chemical shifts has been inadequately studied. Equilibrium concentration products are ionic strength-dependent, yet numerous NMR titration experiments have been performed without ionic strength control [14c,16c], and have produced  $pK_a$  values in reasonable agreement with potentiometric results. In part, this arises from the fact that the chemical shifts depend on concentrations, rather than the activities of various species in solution [32]. The best agreement has been demonstrated for systems studied by <sup>13</sup>C and <sup>31</sup>P NMR [28,29,33]. For the <sup>13</sup>C and <sup>31</sup>P NMR resonances in alkylcarboxylic and alkylphosphonic acids, the chemical shifts correlate linearly with the background electrolyte concentration. However, this effect is normally negligible in comparison with that associated with a ligand dissociation or complex formation. This fact offers a unique possibility to use <sup>13</sup>C and <sup>31</sup>P NMR chemical shifts,  $\delta_L$ , of a ligand, measured at high pH and high ionic strength, for calculations of  $pK_a$  at low ionic strength [28,29]. General observation reveals that the chemical shift depends on both the nature of the nucleus and its position in the ligand. The <sup>31</sup>P nuclei in phosphonic ( $-\text{PO}_3\text{H}_2$ ,  $-\text{PO}_3\text{H}^-$ ,  $-\text{PO}_3^{2-}$ ) as well as <sup>13</sup>C nuclei in carboxylate or methylenic groups ( $-\text{CO}_2^-$ ,  $-\text{CH}_2^-$ ,  $-\text{CH}_3$ ) are relatively isolated

from solution by oxygen or hydrogen atoms. Thus, their chemical shifts are mostly sensitive to the substrate intramolecular processes (deprotonation/protonation, complex formation), while the solvent changes give the least contribution. On the other hand, the nuclei that contact the solvent directly, e.g., <sup>133</sup>Cs<sup>+</sup>, <sup>35</sup>Cl<sup>-</sup>, are more affected by medium effects. Therefore, a NMR titration under variable ionic strength is not desirable, unless the independence of chemical shift  $\delta$  on ionic strength  $I$  is demonstrated.

Among the supporting electrolytes for  $14 \geq \text{pH} \geq 12$ , the use of 1.0 mol dm<sup>-3</sup> Me<sub>4</sub>NCl/Me<sub>4</sub>NOH is recommended as there is no reported evidence for Me<sub>4</sub>NOH self-association. In the case of KOH and NaOH, corrections for base self-association could be needed. The uncertainty is associated with imprecise knowledge of the MOH stability constants. Table 3 represents the estimation of errors if the MOH stability constants recommended by Baes and Mesmer [34] are used. Table 3 also demonstrates that for NaOH solutions the pH scale has to be corrected, while for KOH no correction is needed. However, it should be mentioned that Martell [35] gives significantly higher stability constants for MOH ion pairing. Thus, the corresponding corrections could be larger.

Another important issue for NMR titration is the need for a clear indication as to whether the contribution of the ligand to the total ionic strength is considered or not. For monobasic acids, this contribution could be negligible, but it is not the case for polyprotic substrates such as EDTPH. In basic 0.01 mol dm<sup>-3</sup> solutions of EDTPH, the ligand contribution to the total ionic strength constitutes 0.25 mol dm<sup>-3</sup> for Hedtp<sup>-7</sup> and 0.33 for edtp<sup>-8</sup>.

Special care should be taken over supporting electrolyte purity. Indeed, in 1 mol dm<sup>-3</sup> Me<sub>4</sub>NCl/Me<sub>4</sub>NOH medium, the concentration of Ca<sup>2+</sup> impurities in the supporting electrolyte can be comparable with the ligand content in the system [8c].

Another important peculiarity of the titration procedure at high and low pH arises from a complete substitution of either cation or anion. Indeed, within the constant background electrolyte concentration, e.g., 1 mol dm<sup>-3</sup> at 25°C, the ionic strength can change significantly. For example, the complete substitution of 1 mol dm<sup>-3</sup> KNO<sub>3</sub> for 1 mol dm<sup>-3</sup> KOH induces the change of

**TABLE 3: Calculated  $-\lg \{[\text{H}^+]/\text{mol dm}^{-3}\}$  for MOH Solutions in 0.1 and 1.0 mol dm<sup>-3</sup> MCl/MOH.<sup>a</sup>**

MOH	Total $[\text{OH}^-]$ , mol dm <sup>-3</sup>	Free <sup>a</sup> $[\text{OH}^-]$ , mol dm <sup>-3</sup>	pH Calculated without correction		$\Delta\text{pH}$
			for MOH Association	pH Corrected for MOH Association <sup>a</sup>	
NaOH	0.1000	0.0947	12.75	12.73	0.02
	1.00	0.69	13.75	13.54	0.21
KOH	0.1000	0.0998	13.15	13.15	0.00
	1.00	0.91	14.15	14.11	0.04

<sup>a</sup> Free  $[\text{OH}^-]$  is calculated with the SPECIES software [36] using MOH stability constants  $\lg K_1$  from [34] (for ionic strength 1.0 mol dm<sup>-3</sup>  $\lg K_1 = -0.5$  for NaOH and  $-0.8$  for KOH),  $[\text{H}^+]$  is calculated from  $[\text{OH}^-]$  using  $pK_w = 13.75$  for 1 mol dm<sup>-3</sup> NaCl and 14.16 for 1 mol dm<sup>-3</sup> KCl [37].

mean activity coefficient from 0.444 to 0.733. In the same way, a substitution of 1 mol dm<sup>-3</sup> KNO<sub>3</sub> for 1 mol dm<sup>-3</sup> HNO<sub>3</sub> results in a change of activity coefficient from 0.444 to 0.730. At the same time for 1 mol dm<sup>-3</sup> NaCl/NaOH system, the corresponding change is negligible (0.657 and 0.674)<sup>\*</sup>. Therefore, a proper choice of supporting electrolyte, or clear indication of corresponding corrections, is needed.

### Temperature

Dissociation constants, as well as  $pK_w$ , are temperature-dependent [35]. A temperature variation of 20–30°C can result in a change of 0.2–0.3 in  $pK_a$  (or more). Especially critical are the high  $pK_a$  – values. For example, for Hntph<sup>-5</sup> dissociation  $\Delta H = -38.8$  kJ mol<sup>-1</sup> for  $I = 0.1$  mol dm<sup>-3</sup> and 25°C ([36], Mini Database). Therefore,  $pK_a = 13.30$  at 25°C and 12.98 at 40°C. The difference in 0.1  $pK_a$  unit per 5°C is significant for dissociation constant. The temperature dependence of  $pK_w$  additionally affects all the measurements in basic solutions. For example, in 0.51 mol dm<sup>-3</sup> NaCl solutions,  $pK_w$  changes from 13.71 (25°C) to 12.96 (50°C). In this respect, the noise associated with <sup>1</sup>H-decoupling widely used in early NMR measurements might have led to some errors in  $pK_a$  values due to significant energy dissipation and therefore to a sample heating. Although modern multipulse decoupling methods (GD-mode, CPD-mode) dissipate less energy, some caution is needed to control the process. In some cases, <sup>1</sup>H-coupled spectra are the better choice.

## Guidelines

Recommendations for NMR titrations in solutions of high and low pH ( $2 \geq \text{pH} \geq 0$  and  $14 \geq \text{pH} \geq 12$ ) are intended to be a supplement to the IUPAC guidelines for the determination of stability constants [19] and to a standard format for the publication of stability constant measurements [38] considering the peculiarities of NMR spectroscopy mentioned above. Some of these requirements are also valid for the range  $12 \geq \text{pH} \geq 2$ .

1. Within the NMR titration procedure at high and low pH solutions ( $2 \geq \text{pH} \geq 0$  and  $14 \geq \text{pH} \geq 12$ ), the equilibrium H<sup>+</sup> concentration should be calculated from solution stoichiometry, not measured with a glass electrode. For this reason, the ligand concentration has to be  $\leq 0.001$  mol dm<sup>-3</sup>. For higher ligand concentrations, the titration is possible, but corrections for strong base (strong acid) consumption by a ligand are necessary.
2. Arrangement of a titration procedure. Sets of samples should be prepared in such a way that the concentration of the ligand and the total ionic strength remain constant, while the supporting electrolyte composition is varied from sample to sample to provide different concentrations of OH<sup>-</sup> or H<sup>+</sup>. For highly basic solutions, the total concentration of added base should be much greater than the ligand concentration ( $[\text{OH}^-] \gg [\text{L}]$ ). For highly acidic media, the same requirement applies to  $[\text{H}^+]$  ( $[\text{H}^+] \gg [\text{L}]$ ). Thus, the total concentration of added base (acid) can be treated as the equilibrium concentration (i.e., the OH<sup>-</sup> or H<sup>+</sup> consumption by the substrate can be neglected). This circumvents the problems associated with pH measurements with

the glass electrode. An additional advantage of such an approach is that the protonation constants are derived in terms of concentration, not activity.

3. A medium of constant ionic strength should be used, with clear indication of the supporting electrolyte and of the way the contribution of the deprotonated ligand and of the change in a background electrolyte composition (e.g., change of  $[\text{Cl}^-]$  for  $[\text{OH}^-]$  or  $[\text{Cl}^-]$  for  $[\text{H}^+]$ ) to medium ionic strength is taken into account.
4. The supporting electrolytes Me<sub>4</sub>NCl/Me<sub>4</sub>NOH or KCl/KOH should be used in basic solution rather than NaCl/NaOH or LiCl/LiOH in order to eliminate errors arising from NaOH and LiOH association. A clear indication of the  $pK_w$  used is necessary.
5. External reference and “lock” compounds should be used to eliminate any possible interactions with the ligand and additional changes of the medium.
6. Water should be used as a solvent rather than D<sub>2</sub>O or H<sub>2</sub>O/D<sub>2</sub>O mixtures. This eliminates the need for pD/pH corrections and makes the  $pK_a$  values obtained comparable and compatible with values derived from potentiometric measurements performed in H<sub>2</sub>O.
7. An NMR procedure should be selected, and described clearly, that will minimize possible sample heating (e.g., <sup>1</sup>H-coupled NMR, GD-technique, etc.) and provide confidence in temperature control.
8. The calculation of  $pK_a$  requires the chemical shift value for the free ligand L ( $\delta_L$ ) and for the protonated species HL ( $\delta_{HL}$ ) along with a number of intermediate experimental values. This is seldom possible for high (low) pH range. In those cases where the  $\delta_{HL}$  or  $\delta_L$  value is not available due to ionic strength (and pH) limitations, it should be derived either directly from higher ionic strength measurements (for ionic strength-independent resonance) or by an extrapolation of high ionic strength values to the lower  $I$  used in the experiment (for ionic strength-dependent resonance).

## Acknowledgments

The authors are grateful to the IUPAC Analytical Chemistry Division for support within the Grant 2001-038-2-500 as well as to the Finnish Academy of Science, which supported preparation of the present paper in part. We are also thankful to K. J. Powell, P. M. May, E. D. Becker, and R. K. Harris for valuable comments and suggestions.

†Corresponding author

**Abstract:** In this report, the status quo and recent progress in electrokinetics are reviewed. Practical rules are recommended for performing electrokinetic measurements and interpreting their results in terms of well-defined quantities, the most familiar being the  $\zeta$ -potential or electrokinetic potential. This potential is a property of charged interfaces, and it should be independent of the technique used for its determination. However, often the  $\zeta$ -potential is not the only property electrokinetically characterizing the electrical state of the interfacial region; the excess conductivity of the stagnant layer is an additional parameter. The requirement to obtain the  $\zeta$ -potential is that electrokinetic theories be correctly used and applied within their range of validity. Basic theories and their application ranges are discussed. A thorough description of the main electrokinetic methods is given; special attention is paid to their ranges of applicability as well as to the validity of the underlying theoretical models. Electrokinetic consistency tests are proposed in order to assess the validity of the  $\zeta$ -potentials obtained. The recommendations given in the report apply mainly to smooth and homogeneous solid particles and plugs in aqueous systems; some attention is paid to nonaqueous media and less ideal surfaces.

## 1. Introduction

### 1.1 Electrokinetic phenomena

*Electrokinetic phenomena* (EKP) can be loosely defined as all those phenomena involving tangential fluid motion adjacent to a charged surface. They are manifestations of the electrical properties of interfaces under steady-state and isothermal conditions. In practice, they are often the only source of information available on those properties. For this reason, their study constitutes one of the classical branches of colloid science, *electrokinetics*, which has been developed in close connection with the theories

of the electrical double layer (EDL) and of electrostatic surface forces [1–4].

From the point of view of nonequilibrium thermodynamics, EKP are typically cross-phenomena, because thermodynamic forces of a certain kind create fluxes of another type. For instance, in *electro-osmosis* and *electrophoresis*, an electric force leads to a mechanical motion, and in *streaming current (potential)*, an applied mechanical force produces an electric current (potential). First-order phenomena may also provide valuable information about the electrical state of the interface: for instance, an external electric field causes the appearance of a *surface current*, which

flows along the interfacial region and is controlled by the *surface conductivity* of the latter. If the applied field is alternating, the *electric permittivity* of the system as a function of frequency will display one or more relaxations. The characteristic frequency and amplitude of these relaxations may yield additional information about the electrical state of the interface. We consider these first-order phenomena as *closely related* to EKP.

## 1.2 Definitions

Here follows a brief description of the main and related EKP [1–9].

- *Electrophoresis* is the movement of charged colloidal particles or polyelectrolytes, immersed in a liquid, under the influence of an external electric field. The *electrophoretic velocity*,  $v_e$  ( $\text{m s}^{-1}$ ), is the velocity during electrophoresis. The *electrophoretic mobility*,  $u_e$  ( $\text{m}^2 \text{V}^{-1} \text{s}^{-1}$ ), is the magnitude of the velocity divided by the magnitude of the electric field strength. The mobility is counted positive if the particles move toward lower potential (negative electrode) and negative in the opposite case.
- *Electro-osmosis* is the motion of a liquid through an immobilized set of particles, a porous plug, a capillary, or a membrane, in response to an applied electric field. It is the result of the force exerted by the field on the counter-charge in the liquid inside the charged capillaries, pores, etc. The moving ions drag the liquid in which they are embedded along. The *electro-osmotic velocity*,  $v_{eo}$  ( $\text{m s}^{-1}$ ), is the uniform velocity of the liquid far from the charged interface. Usually, the measured quantity is the volume flow rate of liquid ( $\text{m}^3 \text{s}^{-1}$ ) through the capillary, plug, or membrane, divided by the electric field strength,  $Q_{to\ eo}$  ( $\text{m}^4 \text{V}^{-1} \text{s}^{-1}$ ), or divided by the electric current,  $Q_{to\ eo}$  ( $\text{m}^3 \text{C}^{-1}$ ). A related concept is the *electro-osmotic counter-pressure*,  $\Delta p_{eo}$  (Pa), the pressure difference that must be applied across the system to stop the electro-osmotic volume flow. The value  $\Delta p_{eo}$  is considered to be positive if the high pressure is on the higher electric potential side.
- *Streaming potential (difference)*,  $U_{str}$  (V), is the potential difference at zero electric current, caused by the flow of liquid under a pressure gradient through a capillary, plug, diaphragm, or membrane. The difference is measured across the plug or between the ends of the capillary. Streaming potentials are created by charge accumulation caused by the flow of counter-charges inside capillaries or pores.
- *Streaming current*,  $I_{str}$  (A), is the current through the plug when the two electrodes are relaxed and short-circuited. The *streaming current density*,  $j_{str}$  ( $\text{A m}^{-2}$ ), is the streaming current per area.
- *Dielectric dispersion* is the change of the electric permittivity of a suspension of colloidal particles with the frequency of an applied alternating current (ac) field. For low and middle frequencies, this change is connected with the polarization of the ionic atmosphere. Often, only the low-frequency dielectric dispersion (LFDD) is investigated.
- *Sedimentation potential*,  $U_{sed}$  (V), is the potential difference sensed by two identical electrodes placed some vertical distance  $L$  apart in a suspension in which particles are sedimenting under the effect of gravity. The electric field generated,  $U_{sed}/L$ , is known as the *sedimentation field*,  $E_{sed}$  ( $\text{V m}^{-1}$ ). When the sedimentation is produced by a centrifugal field, the phenomenon is called *centrifugation potential*.
- *Colloid vibration potential*,  $U_{CV}$  (V), measures the ac potential difference generated between two identical

relaxed electrodes, placed in the dispersion, if the latter is subjected to an (ultra)sonic field. When a sound wave travels through a colloidal suspension of particles whose density differs from that of the surrounding medium, inertial forces induced by the vibration of the suspension give rise to a motion of the charged particles relative to the liquid, causing an alternating electromotive force. The manifestations of this electromotive force may be measured, depending on the relation between the impedance of the suspension and that of the measuring instrument, either as  $U_{CV}$  or as *colloid vibration current*,  $I_{CV}$  (A).

- *Electrokinetic sonic amplitude* (ESA) method provides the *amplitude*,  $A_{ESA}$  (Pa), of the (ultra)sonic field created by an ac electric field in a dispersion; it is the counterpart of the colloid vibration potential method.
- *Surface conduction* is the excess electrical conduction tangential to a charged surface. It will be represented by the *surface conductivity*,  $K^\sigma$  (S), and its magnitude with respect to the bulk conductivity is frequently accounted for by the *Dukhin number*,  $Du$  (see eq. 12 below).

## 1.3 Model of charges and potentials in the vicinity of a surface

### 1.3.1 Charges

The electrical state of a charged surface is determined by the spatial distribution of ions around it. Such a distribution of charges has traditionally been called EDL, although it is often more complex than just two layers, and some authors have proposed the term “electrical interfacial layer”. We propose here to keep the traditional terminology, which is used widely in the field. The simplest picture of the EDL is a physical model in which one layer of the EDL is envisaged as a fixed charge, the surface or titratable charge, firmly bound to the particle or solid surface, while the other layer is distributed more or less diffusely within the solution in contact with the surface. This layer contains an excess of counterions (ions opposite in sign to the fixed charge), and has a deficit of co-ions (ions of the same sign as the fixed charge).

For most purposes, a more elaborate model is necessary [3, 10]: the uncharged region between the surface and the locus of hydrated counterions is called the *Stern layer*, whereas ions beyond it form the *diffuse layer* or *Gouy layer* (also, Gouy–Chapman layer). In some cases, the separation of the EDL into a charge-free Stern layer and a diffuse layer is not sufficient to interpret experiments. The Stern layer is then subdivided into an *inner Helmholtz layer* (IHL), bounded by the surface and the *inner Helmholtz plane* (IHP) and an *outer Helmholtz layer* (OHL), located between the IHP and the *outer Helmholtz plane* (OHP). This situation is shown in Fig. 1 for a simple case. The necessity of this subdivision may occur when some ion types (possessing a chemical affinity for the surface in addition to purely Coulombic interactions), are specifically adsorbed on the surface, whereas other ion types interact with the surface charge only through electrostatic forces. The IHP is the locus of the former ions, and the OHP determines the beginning of the diffuse layer, which is the generic part of the EDL (i.e., the part governed by purely electrostatic forces). The fixed surface-charge density is denoted  $\sigma^0$ , the charge density at the IHP  $\sigma^i$ , and that in the diffuse layer  $\sigma^d$ . As the system is electroneutral.

$$\sigma^0 + \sigma^i + \sigma^d = 0 \quad (1)$$

### 1.3.2 Potentials

As isolated particles cannot be linked directly to an external circuit, it is not possible to change their *surface potential* at will

**FIGURE 1:** Schematic representation of the charges and potentials at a positively charged interface. The region between the surface (electric potential  $\psi^0$ ; charge density  $\sigma^0$ ) and the IHP (distance  $\beta$  from the surface) is free of charge. The IHP (electric potential  $\psi^i$ ; charge density  $\sigma^i$ ) is the locus of specifically adsorbed ions. The diffuse layer starts at  $x = d$  (OHP), with potential  $\psi^d$  and charge density  $\sigma^d$ . The *slip plane* or *shear plane* is located at  $x = d^{ek}$ . The potential at the slip plane is the *electrokinetic* or *zeta-potential*,  $\zeta$ ; the *electrokinetic charge density* is  $\sigma^{ek}$ .

by applying an external field. Contrary to mercury and other electrodes, the surface potential,  $\psi^0$ , of a solid is therefore not capable of operational definition, meaning that it cannot be unambiguously measured without making model assumptions. As a consequence, for disperse systems it is the surface charge that is the primary parameter, rather than the surface potential. The potential at the OHP, at distance  $d$  from the surface, is called the *diffuse-layer potential*,  $\psi^d$  (sometimes also known as *Stern potential*): it is the potential at the beginning of the diffuse part of the double layer. The potential at the IHP, located at distance  $\beta$  ( $0 \leq \beta \leq d$ ) from the surface, the *IHP potential*, is given the symbol  $\psi^i$ . All potentials are defined with respect to the potential in bulk solution.

Concerning the ions in the EDL, some further comments can be of interest. Usually, a distinction is made between *indifferent* and *specifically adsorbing* ions. Indifferent ions adsorb through Coulomb forces only; hence, they are repelled by surfaces of like sign, attracted by surfaces of opposite sign, and do not preferentially adsorb on an uncharged surface. Specifically adsorbing ions possess a chemical or specific affinity for the surface in addition to the Coulomb interaction, where chemical or specific is a collective adjective, embracing all interactions other than those purely Coulombic. It was recommended in [10], and is now commonly in use to restrict the notion of *surface ions* to those that are constituents of the solid, and hence are present on the surface, and to proton and hydroxyl ions. The former are covalently adsorbed. The latter are included because they are always present in aqueous solutions, their adsorption can be measured (e.g., by potentiometric titration) and they have, for many surfaces, a particularly high affinity. The term *specifically adsorbed* then applies to the sorption of all other ions having a specific affinity to the surface in addition to the generic Coulombic contribution. Specifically adsorbed charges are located within the Stern layer.

#### 1.4 Plane of shear, electrokinetic potential, and electrokinetic charge density

Tangential liquid flow along a charged solid surface can be caused by an external electric field (*electrophoresis*, *electro-osmosis*) or by an applied mechanical force (*streaming potential*,

*current*). Experience and recent molecular dynamic simulations [11] have shown that in such tangential motion usually a very thin layer of fluid adheres to the surface: it is called the *hydrodynamically stagnant layer*, which extends from the surface to some specified distance,  $d^{ek}$ , where a so-called hydrodynamic slip plane is assumed to exist. For distances to the wall,  $x < d^{ek}$ , one has the *stagnant layer* in which no hydrodynamic flows can develop. Thus, we can speak of a distance-dependent viscosity with roughly a step-function dependence [12]. The space charge for  $x > d^{ek}$  is hydrodynamically mobile and electro-kinetically active, and a particle (if spherical) behaves hydrodynamically as if it had a radius  $a + d^{ek}$ . The space charge for  $x < d^{ek}$  is hydrodynamically immobile, but can still be electrically conducting. The potential at the plane where slip with respect to bulk solution is postulated to occur is identified as the *electrokinetic* or *zeta-potential*,  $\zeta$ . The diffuse charge at the solution side of the slip plane equals the negative of the *electrokinetic (particle) charge*,  $\sigma^{ek}$ .

General experience indicates that the plane of shear is located very close to the OHP. Both planes are abstractions of reality. The OHP is interpreted as a sharp boundary between the diffuse and the non diffuse parts of the EDL, but it is very difficult to locate it exactly. Likewise, the slip plane is interpreted as a sharp boundary between the hydrodynamically mobile and immobile fluid. In reality, none of these transitions is sharp. However, liquid motion may be hindered in the region where ions experience strong interactions with the surface. Therefore, it is feasible that the immobilization of the fluid extends further out of the surface than the beginning of the diffuse part of the EDL. This means that, in practice, the  $\zeta$ -potential is equal to or lower in magnitude than the diffuse-layer potential,  $\psi^d$ . In the latter case, the difference between  $\psi^d$  and  $\zeta$  is a function of the ionic strength: at low ionic strength, the decay of the potential as a function of distance is small and  $\zeta = \psi^d$ ; at high ionic strength, the decay is steeper and  $|\zeta| \leq |\psi^d|$ . A similar reasoning applies to the electrokinetic charge, as compared to the diffuse charge.

#### 1.5 Basic problem: Evaluation of $\zeta$ -potentials

The notion of slip plane is generally accepted in spite of the fact that there is no unambiguous way of locating it. It is also accepted that  $\zeta$  is fully defined by the nature of the surface, its charge (often determined by pH), the electrolyte concentration in the solution, and the nature of the electrolyte and of the solvent. It can be said that for any interface with all these parameters fixed,  $\zeta$  is a well-defined property.

Experience demonstrates that different researchers often find different  $\zeta$ -potentials for supposedly identical interfaces. Sometimes, the surfaces are not in fact identical: the high specific surface area and surface reactivity of colloidal systems make  $\zeta$  very sensitive to even minor amounts of impurities in solution. This can partly explain variations in electrokinetic determinations from one laboratory to another. Alternatively, since  $\zeta$  is not a directly measurable property, it may be that an inappropriate model has been used to convert the electrokinetic signal into a  $\zeta$ -potential. The level of sophistication required (for the model) depends on the situation and on the particular phenomena investigated. The choice of measuring technique and of the theory used depends to a large extent on the purpose of the electrokinetic investigation.

There are instances in which the use of simple models can be justified, even if they do not yield the correct  $\zeta$ -potential. For example, if electrokinetic measurements are used as a sort of quality-control tool, one is interested in rapidly (online) detecting modifications in the electrical state of the interface rather than

in obtaining accurate  $\zeta$ -potentials. On the other hand, when the purpose is to compare the calculated values of  $\zeta$  of a system under given conditions using different electrokinetic techniques, it may be essential to find a true  $\zeta$ -potential. The same applies to those cases in which  $\zeta$  will be used to perform calculations of other physical quantities, such as the Gibbs interaction energy between particles. Furthermore, there may be situations in which the use of simple theories may be misleading even for simple quality control. For example, there are ranges of  $\zeta$ -potential and double-layer thickness for which the electrophoretic mobility does not depend linearly on  $\zeta$ , as assumed in the simple models. Two samples might have the same true  $\zeta$ -potential and quite different mobilities because of their different sizes. The simple theory would lead us to believe that their electrical surface characteristics are different when they are not.

An important complicating factor in the reliable estimation of  $\zeta$  is the possibility that charges behind the plane of shear may contribute to the excess conductivity of the double layer (*stagnant-layer* or *inner-layer* conductivity.) If it is assumed that charges located between the surface and the plane of shear are electrokinetically inactive, then the  $\zeta$ -potential will be the only interfacial quantity explaining the observed electrokinetic signal.

Otherwise, a correct quantitative explanation of EKP will require the additional estimation of the stagnant-layer conductivity (SLC). This requires more elaborate treatments [2, 3, 13–17] than standard or classical theories, in which only conduction at the solution side of the plane of shear is considered.

It should be noted that there are a number of situations where electrokinetic measurements, without further interpretation, provide extremely useful and unequivocal information, of great value for technological purposes. The most important of these situations are

- Identification of the isoelectric point (or point of zero  $z$ -potential) in titrations with a potential determining ion (e.g., pH titration).
- Identification of the isoelectric point in titrations with other ionic reagents such as surfactants or polyelectrolytes.
- Identification of a plateau in the adsorption of an ionic species indicating optimum dosage for a dispersing agent.

In these cases, the complications and digressions, which are discussed below, are essentially irrelevant. The electrokinetic property (or the estimated  $\zeta$ -potential) is then zero or constant and that fact alone is of value.

### 1.6 Purpose of the document

The present document is intended to deal mainly with the following issues, related to the role of the different EKP as tools for surface chemistry research. Specifically, its aims are:

- Describe and codify the main and related EKP and the quantities involved in their definitions.
- Give a general overview of the main experimental techniques that are available for electrokinetic characterization.
- Discuss the models for the conversion of the experimental signal into  $\zeta$ -potential and, where appropriate, other double-layer characteristics.
- Identify the validity range of such models, and the way in which they should be applied to any particular experimental situation.

The report first discusses the most widely used EKP and techniques, such as electrophoresis, streaming-potential, streaming

current, or electro-osmosis. Attention is also paid to the rapidly growing techniques based on dielectric dispersion and electro-acoustics.

## 2. Elementary theory of electrokinetic phenomena

All electrokinetic effects originate from two generic phenomena, namely, the *electro-osmotic flow* and the *convective electric surface current* within the EDL. For nonconducting solids, Smoluchowski [18] derived equations for these generic phenomena, which allowed an extension of the theory to all other specific EKP. Smoluchowski's theory is valid for any shape of a particle or pores inside a solid, provided the (local) curvature radius  $a$  largely exceeds the Debye length  $\kappa^{-1}$ :

$$\kappa a \gg 1 \quad (2)$$

where  $\kappa$  is defined as

$$\kappa = \left\{ \frac{\sum_{i=1}^N e^2 z_i^2 n_i}{\epsilon_{rs} \epsilon_0 k T} \right\}^{1/2} \quad (3)$$

with  $e$  the elementary charge,  $z_i$ ,  $n_i$  the charge number and number concentration of ion  $i$  (the solution contains  $N$  ionic species),  $\epsilon_{rs}$  the relative permittivity of the electrolyte solution,  $\epsilon_0$  the electric permittivity of vacuum,  $k$  the Boltzmann constant, and  $T$  the thermodynamic temperature. Note that under condition (2), a curved surface can be considered as flat for any small section of the double layer. This condition is traditionally called the "thin double-layer approximation", but we do not recommend this language, and we rather refer to this as the "large  $\kappa a$  limit". Many aqueous dispersions satisfy this condition, but not those for very small particles in low ionic strength media.

*Electro-osmotic flow* is the liquid flow along any section of the double layer under the action of the tangential component  $E_t$  of an external field  $\mathbf{E}$ . In Smoluchowski's theory, this field is considered to be independent of the presence of the double layer, i.e., the distortion of the latter is ignored\*. Also, because the EDL is assumed to be very thin compared to the particle radius, the hydrodynamic and electric field lines are parallel for large  $\kappa a$ . Under these conditions, it can be shown [3] that at a large distance from the surface the liquid velocity (electro-osmotic velocity),  $v_{eo}$ , is given by

$$v_{eo} = - \frac{\epsilon_{rs} \epsilon_0 \zeta}{\eta} \mathbf{E} \quad (4)$$

where  $\eta$  is the dynamic viscosity of the liquid. This is the *Smoluchowski equation for the electro-osmotic slip velocity*. From this, the electro-osmotic flow rate of liquid per current,  $Q_{eo,I}$  ( $\text{m}^3 \text{s}^{-1} \text{A}^{-1}$ ), can be derived

$$Q_{eo,I} = \frac{Q_{eo}}{I} = - \frac{\epsilon_{rs} \epsilon_0 \zeta}{\eta K_L} \quad (5)$$

$K_L$  being the bulk liquid conductivity ( $\text{S m}^{-1}$ ) and  $I$  the electric current (A).

It is impossible to quantify the distribution of the electric field and the velocity in pores with unknown or complex geometry.

\* The approximation that the structure of the double layer is not affected by the applied field is one of the most restrictive assumptions of the elementary theory of EKP.

However, this fundamental difficulty is avoided for  $\kappa a \gg 1$ , when eqs. 4 and 5 are valid [3].

*Electrophoresis* is the counterpart of *electro-osmosis*. In the latter, the liquid moves with respect to a solid body when an electric field is applied, whereas during electrophoresis the liquid as a whole is at rest, while the particle moves with respect to the liquid under the influence of the electric field. In both phenomena, such influence on the double layer controls the relative motions of the liquid and the solid body. Hence, the results obtained in considering electro-osmosis can be readily applied for obtaining the corresponding formula for electrophoresis. The expression for the electrophoretic velocity, that is, the velocity of the particle with respect to a medium at rest, becomes, after changing the sign in eq. 4

$$v_e = \frac{\epsilon_{rs}\epsilon_0\zeta}{\eta} E \quad (6)$$

and the electrophoretic mobility,  $u_e$

$$u_e = \frac{\epsilon_{rs}\epsilon_0\zeta}{\eta} \quad (7)$$

This equation is known as the *Helmholtz–Smoluchowski* (HS) equation for electrophoresis.

Let us consider a capillary with circular cross-section of radius  $a$  and length  $L$  with charged walls. A pressure difference between the two ends of the capillary,  $\Delta p$ , is produced externally to drive the liquid through the capillary. Since the fluid near the interface carries an excess of charge equal to  $\sigma^{ek}$ , its motion will produce an electric current known as *streaming current*,  $I_{str}$ :

$$I_{str} = -\frac{\epsilon_{rs}\epsilon_0 a^2}{\eta} \frac{\Delta p}{L} \zeta \quad (8)$$

The observation of this current is only possible if the extremes of the capillary are connected through a low-resistance external circuit (short-circuit conditions). If this resistance is high (open circuit), transport of ions by this current leads to the accumulation of charges of opposite signs between the two ends of the capillary and, consequently, to the appearance of a potential difference across the length of the capillary, the *streaming-potential*,  $U_{str}$ . This gives rise to a *conduction current*,  $I_c$ :

$$I_c = K_L a^2 \frac{U_{str}}{L} \quad (9)$$

The value of the *streaming-potential* is obtained by the condition of equality of the conduction and streaming currents (the net current vanishes)

$$\frac{U_{str}}{\Delta p} = \frac{\epsilon_{rs}\epsilon_0\zeta}{\eta K_L} \quad (10)$$

For large  $\kappa a$ , eq. 10 is also valid for porous bodies.

As described, the theory is incomplete in mainly three aspects: (i) it does not include the treatment of strongly curved surfaces (i.e., surfaces for which the condition  $\kappa a \gg 1$  does not apply); (ii) it neglects the effect of *surface conduction* both in the diffuse and the inner part of the EDL; and (iii) it neglects EDL polarization. Concerning the first point, the theoretical analysis described above is based on the assumption that the interface is flat or that its radius of curvature at any point is much larger than the

double-layer thickness. When this condition is not fulfilled, the Smoluchowski theory ceases to be valid, no matter the existence or not of surface conduction of any kind. However, theoretical treatments have been devised to deal with these surface curvature effects. Roughly, in order to check if such corrections are needed, one should simply calculate the product  $\kappa a$ , where  $a$  is a characteristic radius of curvature (e.g., particle radius, pore or capillary radius). When describing the methods below, we will give details about analytical or numerical procedures that can be used to account for this effect.

With respect to surface conductivity, a detailed account is given in Section 3 and mention will be made to it where necessary in the description of the methods. Here, it may suffice to say that it may be important when the  $\zeta$ -potential is moderately large (>50 mV, say).

Finally, the *polarization* of the double layer implies accumulation of excess charge on one side of the colloidal particle and depletion on the other. The resulting induced dipole is the source of an electric field distribution that is superimposed on the applied field and affects the relative solid/liquid motion. The extent of polarization depends on surface conductivity, and its role in electrokinetics will be discussed together with the methodologies.

### 3. Surface conductivity and electrokinetic phenomena

*Surface conduction* is the name given to the excess electric conduction that takes place in dispersed systems owing to the presence of the electric double layers. Excess charges in them may move under the influence of electric fields applied tangentially to the surface. The phenomenon is quantified in terms of the *surface conductivity*,  $K^\sigma$ , which is the surface equivalent to the bulk conductivity,  $K_L$ .  $K^\sigma$  is a surface excess quantity just as the surface concentration  $\Gamma_i$  of a certain species  $i$ . Whatever the charge distribution,  $K^\sigma$  can always be defined through the two-dimensional analog of Ohm's law

$$j^\sigma = K^\sigma E \quad (11)$$

where  $j^\sigma$  is the (excess) *surface current density* ( $A\ m^{-1}$ ).

A measure of the relative importance of surface conductivity is given by the dimensionless Dukhin number,  $Du$ , relating surface ( $K^\sigma$ ) and bulk ( $K_L$ ) conductivities

$$Du = \frac{K^\sigma}{K_L a} \quad (12)$$

where  $a$  is the local curvature radius of the surface. For a colloidal system, the total conductivity,  $K$ , can be expressed as the sum of a solution contribution and a surface contribution. For instance, for a cylindrical capillary, the following expression results:

$$K = (K_L + 2K^\sigma/a) = K_L(1 + 2Du) \quad (13)$$

The factor 2 in eq. 13 applies for cylindrical geometry. For other geometries, its value may be different.

As mentioned, HS theory does not consider surface conduction, and only the solution conductivity,  $K_L$ , is taken into account to derive the tangential electric field within the double layer. Thus, in addition to eq. 2, the applicability of the HS theory requires

$$Du \ll 1 \quad (14)$$

The surface conductivity can have contributions owing to the diffuse-layer charge outside the plane of shear,  $K^{\sigma d}$ , and to the stagnant layer  $K^{\sigma i}$ :

$$K^{\sigma} = K^{\sigma d} + K^{\sigma i} \quad (15)$$

Accordingly,  $Du$  can be written as

$$Du = \frac{K^{\sigma d}}{K_{\perp} a} + \frac{K^{\sigma i}}{K_{\perp} a} = Du^d + Du^i \quad (16)$$

The  $K^{\sigma d}$  contribution is called the *Bikerman surface conductivity* after Bikerman, who found a simple equation for  $K^{\sigma d}$  (Eq. 17). The SLC may include a contribution due to the specifically adsorbed charge and another one due to the part of the diffuse-layer charge that may reside behind the plane of shear. The charge on the solid surface is generally assumed to be immobile; it does not contribute to  $K^{\sigma}$ .

The conductivity in the diffuse double layer outside the plane of shear,  $K^{\sigma d}$ , consists of two parts: a migration contribution, caused by the movement of charges with respect to the liquid; and a convective contribution, due to the electro-osmotic liquid flow beyond the shear plane, which gives rise to an additional mobility of the charges and hence leads to an extra contribution to  $K^{\sigma d}$ . For the calculation of  $K^{\sigma d}$ , the Bikerman equation (eq. 17, see below) can be used. This equation expresses  $K^{\sigma d}$  as a function of the electrolyte and double-layer parameters. For a symmetrical  $z$ - $z$  electrolyte, a convenient expression is

$$K^{\sigma d} = \frac{2e^2 N_A z^2 c}{kT \kappa} \left[ D_+ (e^{-ze\zeta/2kT} - 1) \left( 1 + \frac{3m_+}{z^2} \right) + D_- (e^{ze\zeta/2kT} - 1) \left( 1 + \frac{3m_-}{z^2} \right) \right] \quad (17)$$

where  $c$  is the electrolyte amount concentration ( $\text{mol m}^{-3}$ ),  $N_A$  is the Avogadro constant ( $\text{mol}^{-1}$ ), and  $m_+$  ( $m_-$ ) is the dimensionless mobility of the cations (anions)

$$m_{\pm} = \frac{2}{3} \left( \frac{kT}{e} \right)^2 \frac{\epsilon_{rs} \epsilon_0}{\eta D_{\pm}} \quad (18)$$

where  $D_{\pm}$  ( $\text{m}^2 \text{s}^{-1}$ ) are the ionic diffusion coefficients. The parameters  $m_{\pm}$  indicate the relative contribution of electro-osmosis to the surface conductivity.

The extent to which  $K^{\sigma}$  influences the electrokinetic behavior of the systems depends on the value of  $Du$ . For the Bikerman part of the conductivity,  $Du^d$  can be written explicitly. For a symmetrical  $z$ - $z$  electrolyte and identical cation and anion diffusion coefficients so that  $m_+ = m_- = m$ :

$$Du^d = \frac{K^{\sigma d}}{K_{\perp} a} = \frac{2}{\kappa a} \left( 1 + \frac{3m}{z^2} \right) \left[ \cosh \left( \frac{ze\zeta}{2kT} \right) - 1 \right] \quad (19)$$

From this equation, it follows that  $Du^d$  is small if  $\kappa a \gg 1$ , and  $\zeta$  is small. Substitution of this expression for  $Du^d$  in eq. 16 yields

$$Du = \frac{2}{\kappa a} \left( 1 + \frac{3m}{z^2} \right) \left[ \cosh \left( \frac{ze\zeta}{2kT} \right) - 1 \right] \left( 1 + \frac{K^{\sigma i}}{K^{\sigma d}} \right) \quad (20)$$

This equation shows that, in general,  $Du$  is dependent on the  $\zeta$ -potential, the ion mobility in bulk solution, and  $K^{\sigma i}/K^{\sigma d}$ . Now, the condition  $Du \ll 1$  required for application of the HS theory is achieved for  $\kappa a \gg 1$ , rather low values of  $\zeta$ , and  $K^{\sigma i}/K^{\sigma d} < 1$ .

## 4. Methods

### 4.1 Electrophoresis

#### 4.1.1 Operational definitions; recommended symbols and terminology; relationship between the measured quantity and $\zeta$ -potential

*Electrophoresis* is the translation of a colloidal particle or polyelectrolyte, immersed in a liquid, under the action of an externally applied field,  $E$ , constant in time and position-independent. For uniform and not very strong electric fields, a linear relationship exists between the steady-state *electrophoretic velocity*,  $v_e$  (attained by the particle roughly a few milliseconds after application of the field) and the applied field

$$v_e = u_e E \quad (21)$$

where  $u_e$  is the quantity of interest, the *electrophoretic mobility*.

#### 4.1.2 How and under which conditions the electrophoretic mobility can be converted into $\zeta$ -potential

As discussed above, it is not always possible to rigorously obtain the  $\zeta$ -potential from measurements of electrophoretic mobility only. We give here some guidelines to check whether the system under study can be described with the standard electrokinetic models:

- a. Calculate  $\kappa a$  for the suspension.
- b. If  $\kappa a \gg 1$  ( $\kappa a > 20$ , say), we are in the large  $\kappa a$  regime, and simple analytical models are available.
  - b.1 Obtain the mobility  $u_e$  for a range of indifferent electrolyte concentrations. If  $u_e$  decreases with increasing electrolyte concentration, use the HS formula, eq. 7, to obtain  $\zeta$ .
    - b.1.1 If the  $\zeta$  value obtained is low ( $\zeta \leq 50$  mV, say), concentration polarization is negligible, and one can trust the value of  $\zeta$ .
    - b.1.2 If  $\zeta$  is rather high ( $\zeta > 50$  mV, say), then HS theory is not applicable. One has to use more elaborate models. The possibilities are: (i) the numerical calculations of O'Brien and White [22]; (ii) the equation derived by Dukhin and Semnikhin [5] for symmetrical  $z$ - $z$  electrolytes

$$\frac{3}{2} \frac{\eta e}{\epsilon_{rs} \epsilon_0 kT} u_e = \frac{3y^{\text{ek}}}{2} - 6 \times \left( \frac{y^{\text{ek}} (1 + 3m/z^2) \sinh^2(zy^{\text{ek}}/4) + [2z^{-1} \sinh(zy^{\text{ek}}/2) - 3my^{\text{ek}}] \ln \cosh(zy^{\text{ek}}/4)}{\kappa a + 8(1 + 3m/z^2) \sinh^2(zy^{\text{ek}}/4) - (24m/z^2) \ln \cosh(zy^{\text{ek}}/4)} \right) \quad (22)$$

where  $m$  was defined in eq. 18 and

$$y^{\text{ek}} = \frac{e\zeta}{kT} \quad (23)$$

is the dimensionless  $\zeta$ -potential. For aqueous solutions,  $m$  is about 0.15. O'Brien [4] found

that eq. 22 can be simplified by neglecting terms of order  $(\kappa a)^{-1}$  as follows:

$$\begin{aligned} & \frac{3}{2} \frac{\eta e}{\epsilon_{rs} \epsilon_0 k T} u_e \\ &= \frac{3}{2} y^{ek} - \frac{6 \left[ \frac{y^{ek}}{2} - \frac{\ln 2}{z} \{1 - \exp(-zy^{ek})\} \right]}{2 + \frac{\kappa a}{1 + 3m/z^2} \exp\left(-\frac{zy^{ek}}{2}\right)} \end{aligned} \quad (24)$$

Note that both the numerical calculations and eqs. 22 and 24 automatically account for diffuse-layer conductivity.

- b.2 If a maximum in  $u_e$  (or in the apparent  $\zeta$ -potential deduced from the HS formula) vs. electrolyte concentration is found, the effect of stagnant-layer conduction is likely significant. For low  $\zeta$ -potentials, when concentration polarization is negligible, the following expression can be used [23]:

$$u_e = \frac{\epsilon_{rs} \epsilon_0}{\eta} \zeta \left[ 1 + \frac{Du}{1 + Du} \left( \frac{kT}{e|\zeta|} \frac{2 \ln 2}{z} - 1 \right) \right] \quad (25)$$

with  $Du$  including both the stagnant- and diffuse-layer conductivities. This requires additional information about the value of  $K^{\sigma}$  (see Section 3).

- c. If  $\kappa a$  is low, the O'Brien and White [22] numerical calculations remain valid, but there are also several analytical approximations. For  $\kappa a < 1$ , the *Hückel–Onsager* (HO) equation applies [4]:

$$u_e = \frac{2}{3} \frac{\epsilon_{rs} \epsilon_0}{\eta} \zeta \quad (26)$$

- d. For the transition range between low and high  $\kappa a$ , Henry's formula can be applied if  $\zeta$  is presumed to be low ( $< 50$  mV; in such conditions, surface conductivity and concentration polarization are negligible). For a nonconducting sphere, Henry derived the following expression:

$$u_e = \frac{2}{3} \frac{\epsilon_{rs} \epsilon_0}{\eta} \zeta f_1(\kappa a) \quad (27)$$

where the function  $f_1$  varies smoothly from 1.0, for low values of  $\kappa a$ , to 1.5 as  $\kappa a$  approaches infinity. Henry [24] gave two series expansions for the function  $f_1$  one for small  $\kappa a$  and one for large  $\kappa a$ . Ohshima [25] has provided an approximate analytical expression which duplicates the Henry expansion almost exactly. Ohshima's relation is

$$f_1(\kappa a) = 1 + \frac{1}{2} \left[ 1 + \left( \frac{2.5}{\kappa a [1 + 2 \exp(-\kappa a)]} \right) \right]^3 \quad (28)$$

Equation 27 can be used in the calculation of the electrophoretic mobility of particles with nonzero bulk

conductivity,  $K_p$ . With that aim, it can be modified to read [2]

$$u_e = \frac{2}{3} \frac{\epsilon_{rs} \epsilon_0}{\eta} \zeta \times F_1(\kappa a, K_p) \quad (29)$$

$$F_1(\kappa a, K_p) = 1 + \frac{2 - 2K_{rel}}{1 + K_{rel}} [f_1(\kappa a) - 1] \quad (30)$$

with

$$K_{rel} = \frac{K_p}{K_L} \quad (31)$$

- e. If SLC is likely for a system with low  $\kappa a$ , then as discussed before,  $\zeta$  ceases to be the only parameter needed for a full characterization of the EDL, and additional information on  $K^{\sigma}$  is required (see Section 3). Numerical calculations like those of Zukoski and Saville [9] or Mangelsdorf and White [10–12] can be used.

Figure 2a allows a comparison to be established between the predictions of the different models mentioned, for the case of spheres. For the  $\kappa a$  chosen, the curvature is enough for the HS theory to be in error, the more so the higher  $|\zeta|$ . According to Henry's treatment, the electrophoretic mobility is lower than predicted by the simpler HS equation. Note also that Henry's theory fails for low-to-moderate  $\zeta$ -potentials; this is a consequence of its neglecting concentration polarization. The full O'Brien and White theory demonstrates that as  $\zeta$  increases, the mobility is lower than predicted by either Henry's or HS calculations. The existence of surface conduction can account for this. In addition, for sufficiently high  $\zeta$ -potential, the effect of concentration polarization is a further reduction of the mobility, which goes through a maximum and eventually decreases with the increase of  $\zeta$ -potential.

The effect of  $\kappa a$  on the  $u_e(\zeta)$  relationship is depicted in Fig. 2b. Note that the maximum is more pronounced with the larger  $\kappa a$ , and that the electrophoretic mobility increases (in the range of  $\kappa a$  shown) with the former. Finally, Fig. 2c demonstrates the drastic change that can occur in the mobility- $\zeta$ -potential trends if SLC is present. This quantity always tends to decrease  $u_e$ , as the total surface conductivity is increased, as compared to the case of diffuse-layer conductivity alone.

#### 4.1.3 Experimental techniques available: Samples

- i. Earlier techniques, at present seldom used in colloid science:
  - *Moving boundary* [26]. In this method, a boundary is mechanically produced between the suspension and its equilibrium serum. When the electric field is applied, the migration of the solid particles provokes a displacement of the solid/liquid separation whose velocity is in fact proportional to  $v_e$ . The traditional moving-boundary method contributed to a great extent to the knowledge of proteins and polyelectrolytes as well as of colloids. It inspired gel electrophoresis, presently essential in such important fields as genetic analysis.
  - *Mass transport* electrophoresis [27]. The mass transport method is based on the fact the application of a

**FIGURE 2:** (a) Electrophoretic mobility  $u_e$  plotted as a function of the  $\zeta$ -potential according to different theoretical treatments, all neglecting SLC: HS, O'Brien-White (full theory), Henry (no surface conductance), for  $\kappa a = 15$ . (b) Role of  $\kappa a$  on the mobility- $\zeta$  relationship (O'Brien-White theory). (c) Effect of SLC on the electrophoretic mobility- $\zeta$ -potential relationship for the same suspensions as in part (a). The ratios between the diffusion coefficients of counterions in the stagnant layer and in the bulk electrolyte are indicated (the upper curve corresponds to zero SLC).

known potential difference to the suspension causes the particles to migrate from a reservoir to a detachable collection chamber. The electrophoretic mobility is deduced from data on the amount of particles moved after a certain time, which can be determined by simply weighing the collection chamber or otherwise analyzing its contents.

ii. Microscopic (visual) microelectrophoresis

Probably the most widespread method until the 1980s, microscopic (visual) microelectrophoresis is based on the direct observation, with a suitable magnifying optics, of individual particles in their electrophoretic motion. In fact, it is not the particle that is seen, but a bright dot on a dark background, due to the Tyndall effect, that is the strong lateral light scattering of colloidal particles.

*Size range of samples*

The ultramicroscope is necessary for particles smaller than  $0.1 \mu\text{m}$ . Particles about  $0.5 \mu\text{m}$  can be directly observed using a travelling microscope illuminated with a strong (cold) light source.

*Advantages and prerequisites of the technique*

- The particles are directly observed in their medium.
- The suspensions to be studied should be stable and dilute; if they are not, individual particles cannot be identified under the microscope. However, in dilute systems; the aggregation times are very long, even in the worst conditions, so that velocities can likely be measured.

*Problems involved in the technique and proposed actions to solve them*

- Its main limitations are the bias and subjectivity of the observer, who can easily select only a narrow range of velocities, which might be little representative of the true average value of the suspension. Furthermore, measurements usually take a fairly long time, and this can bring about additional problems such as Joule heating, pH changes, and so on. Hence, some manufacturers of commercial apparatus have modified their designs to include automatic tracking by digital image processing.
- Recall that electrophoresis is the movement of the particles with respect to the fluid, which is assumed to be at rest. However, the observed velocity is in fact relative to the instrument, and this is a source of error, as an electro-osmotic flow of liquid is also induced by the external field if the cell walls are charged, which is often the case. If the cell is open, the velocity over its section would be constant and equal to its value at the outer double-layer boundary. However, in almost all experimental set-ups, the measuring cell is closed, and the electro-osmotic counter-pressure provokes a liquid flow of Poiseuille type. The resulting velocity profile for the case of a cylindrical channel is given by [4]

$$v_L = v_{eo} \left( 2 \frac{r^2}{a^2} - 1 \right) \quad (32)$$

where  $v_{eo}$  is the electro-osmotic liquid velocity in the channel,  $a$  is the capillary radius, and  $r$  is the radial distance from the cylinder axis. From eq. 32, it is clear that  $v_L = 0$  if  $r = a/\sqrt{2}$ , so that the true electrophoretic velocity will be displayed only by particles moving in

a cylindrical shell placed at  $0.292 a$  from the channel wall. It is easy to estimate the uncertainties associated with errors in the measuring position: if  $a \sim 2$  mm and the microscope has a focus depth of  $\sim 50$   $\mu\text{m}$ , then an error of 2% in the velocity will be always present. A more accurate, although time-consuming method, consists in measuring the whole parabolic velocity profile to check for absence of systematic errors. These arguments also apply to electrophoresis cells with rectangular or square cross-sections.

Some authors (see, e.g., [28]) have suggested that a procedure to avoid this problem would be to cover the cell walls, whatever their geometry, with a layer of uncharged chemical species, for instance, polyacrylamide. However, it is possible that after some usage, the layer gets detached from the walls, and this would mask the electrophoretic velocity measured at an arbitrary depth, with an electro-osmotic contribution, the absence of which can only be ascertained by measuring  $u_e$  of standard, stable particles, which in turn remains an open problem in electrokinetics.

A more recent suggestion [29] is to perform the electrophoresis measurements in an alternating field with frequency much larger than the reciprocal of the characteristic time  $\tau$  for steady electro-osmosis ( $\tau \sim 1$  s), but smaller than that of steady electrophoresis ( $\tau \sim 10^{-4}$  s). Under such conditions, no electro-osmotic flow can develop and hence the velocity of the particle is independent of the position in the cell.

Another way of overcoming the electro-osmosis problem is to place both electrodes providing the external field inside the cell, completely surrounded by the suspension; since no net external field acts on the charged layer close to the cell walls, the associated electro-osmotic flow will not exist [30].

### iii. Electrophoretic light scattering (ELS)

These are automated methods based on the analysis of the (laser) light scattered by moving particles [31–34]. They have different principles of operation [35]. The most frequently used method, known as laser Doppler velocimetry, is based on the analysis of the intensity autocorrelation function of the scattered light. The method of phase analysis light scattering (PALS) [36–38] has the advantage of being suited for particles moving very slowly, for instance, close to their isoelectric point. The method is capable of detecting electrophoretic mobilities as low as  $10^{-12}$   $\text{m}^2 \text{V}^{-1} \text{s}^{-1}$ , that is,  $10^{-4}$   $\mu\text{m} \text{s}^{-1}/\text{V cm}^{-1}$  in practical mobility units (note that mobilities typically measurable with standard techniques must be above  $\sim 10^{-9}$   $\text{m}^2 \text{V}^{-1} \text{s}^{-1}$ ). These techniques are rapid, and measurements can be made in a few seconds. The results obtained are very reproducible, with typical standard deviations less than 2%. A small amount of sample is required for analysis, often a few millilitres of a suitable dispersion. However, dilution of the sample may be required, and therefore the sample preparation technique becomes very important.

#### *Samples that can be studied*

##### a. Sample composition

Measurements can be made of any colloidal dispersion where the continuous phase is a transparent liquid and the dispersed phase has a refractive index which differs from that of the continuous phase.

##### b. Size range of samples

The lower size limit is dependent upon the sample concentration, the refractive index difference between disperse and continuous phase, and the quality of the optics and performance of the instrument. Particle sizes down to 5 nm can be measured under optimum conditions.

The upper size limit is dependent upon the rate of sedimentation of particles (which is related to particle size and density). ELS methods are inherently directional in their measurement plane. Hence, for a horizontal field, samples can be measured while they are sedimenting. Measurement is possible so long as there are particles present in the detection volume. Typically, measurements are possible for particles with diameters below 30  $\mu\text{m}$ .

##### c. Sample conductivity

The conductivity of samples that can be measured ranges from that of particles dispersed in deionized water up to media containing greater than physiological saline. In high salt concentration, the Joule heating of the sample will affect the particle mobility, and thermostating of the cell is not at all easy. Reduction of the applied voltage decreases this effect, but will also reduce the resolution obtainable from the measurement.

The presence of some ions in the medium is recommended (e.g.,  $10^{-4}$  mol/L NaCl) as this will stabilize the field in the cell and will improve the repeatability of measurements. Furthermore, some salt is always needed anyway because otherwise the double layer becomes ill-defined.

##### d. Sample viscosity

There is no particular limit as to the viscosity range of samples that can be measured. But it must be emphasized that increasing the viscosity of the medium will reduce the mobility of the particles and may require longer observation times, with the subsequent increased risk of Joule heating.

##### e. Permittivity

Measurements in a large variety of solvents are possible, depending on the instrument configuration.

##### f. Fluorescence

Sample fluorescence results in a reduction in the signal-to-noise ratio of the measurement. In severe cases, this may completely inhibit measurements.

#### *Sample preparation*

Many samples will be too concentrated for direct measurement and will require dilution. How this dilution is carried out is critical. The aim of sample preparation is to preserve the existing state of the particle surface during the process of dilution. One way to ensure this is by filtering or gently centrifuging some clear liquid from the original sample and using this to dilute the original concentrated sample. In this way, the equilibrium between surface and liquid is perfectly maintained. If extraction of a supernatant is not possible, then just letting a sample naturally sediment and using the fine particles left in the supernatant is a good alternative method. The possibility also exists of dialyzing the concentrate against a solution of the desired ionic composition. Another method is to imitate the original medium as closely as possible. This should be done with regard to pH, concentration of each ionic species in the medium, and concentration of any other additive that might be present.

However, attention must be paid to the possible modification of the surface composition upon dilution, particularly when polymers or polyelectrolytes are in solution [39]. Also, if the particles

are positively charged, care must be taken to avoid long storage in glass containers, as dissolution of glass can lead to adsorption of negatively charged species on the particles. For emulsion systems, dilution is always problematic, because changing the phase volume ratio may alter the surface properties due to differential solubility effects.

#### *Ranges of electrolyte and particle concentration that can be investigated*

Microelectrophoresis is a technique where samples must be dilute enough for particles not to interfere with each other. For any system under investigation, it is recommended that an experiment should be done to check the effect of concentration on the mobility. The concentration range which can be studied will depend upon the suitability of the sample (e.g., size, refractive index) and the optics of the instrument. By way of example, a 200-nm polystyrene latex standard (particle refractive index 1.59, particle absorbance 0.001) dispersed in water (refractive index 1.33) can be measured at a solids concentration ranging from  $2 \cdot 10^{-3}$  to  $1 \cdot 10^{-6}$  g/cm<sup>3</sup>.

#### *Standard samples for checking correct instrument operation*

Microelectrophoresis ELS instruments are constructed from basic physical principles and as such need not be calibrated. The correctness of their operation can only be verified by measuring a sample of which the  $\zeta$ -potential is known. A pioneering study in this direction was performed in 1970 by a group of Japanese surface and colloid chemists, forming a committee under the Division of Surface Chemistry in the Japan Oil Chemists Society [6, 39]. This group measured and compared  $\zeta$ -potentials of samples of titanium dioxide, silver iodide, silica, microcapsules, and some polymer latexes. The study involved different devices in nine laboratories, and concluded that the negatively charged PSSNa (polystyrene-sodium *p*-vinylbenzenesulfonate copolymer) particles prepared as described in [40] could be a very useful standard, providing reliable and reproducible mobility data. Currently, there is no negative  $\zeta$ -potential standard available from the U.S. National Institute of Standards and Technology (NIST).

A positively charged sample available from NIST is Standard Reference Material (SRM) 1980. It contains a 500 mg/L goethite ( $\alpha$ -FeOOH) suspension saturated with 100  $\mu$ mol/g phosphate in a  $5 \cdot 10^{-2}$  mol/L sodium perchlorate electrolyte solution at a pH of 2.5. When prepared according to the procedure supplied by NIST, the certified value and uncertainty for the positive electrophoretic mobility of SRM1980 is  $2.53 \pm 0.12 \mu\text{m s}^{-1}/\text{V cm}^{-1}$ . This will give a  $\zeta$ -potential of  $+32.0 \pm 1.5$  mV if the HS equation (eq. 7) is used.

## 4.2 Streaming current and streaming potential

### 4.2.1 Operational definitions; recommended symbols and terminology; conversion of the measured quantities into $\zeta$ -potential

The phenomena of streaming current and streaming potential occur in capillaries and plugs and are caused by the charge displacement in the EDL as a result of an applied pressure inducing the liquid phase to move tangentially to the solid. The *streaming current* can be detected directly by measuring the electric current between two positions, one upstream and the other downstream. This can be carried out via nonpolarizable electrodes, connected to an electrometer of sufficiently low internal resistance.

#### 4.2.1.1 Streaming current

The first quantity of interest is the *streaming current per pressure drop*,  $I_{\text{str}}/\Delta p$  (SI units: A Pa<sup>-1</sup>), where  $I_{\text{str}}$  is the measured current, and  $\Delta p$  the pressure drop. The relation between  $I_{\text{str}}/\Delta p$  and  $\zeta$ -potential has been found for a number of cases:

- a. If  $\kappa a \gg 1$  ( $a$  is the capillary radius), the HS formula can be used

$$\frac{I_{\text{str}}}{\Delta p} = -\frac{\epsilon_{\text{rs}} \epsilon_0 \zeta A_c}{\eta L} \quad (33)$$

where  $A_c$  is the capillary cross-section, and  $L$  its length. If instead of a single capillary, the experimental system is a porous plug or a membrane, eq. 33 remains approximately valid, provided that  $\kappa a \gg 1$  everywhere in the pore walls. In the case of porous plugs, attention has to be paid to the fact that a plug is not a system of straight parallel capillaries, but a random distribution of particles with a resulting porosity and tortuosity, for which an equivalent capillary length and cross-section is just a simplified model. In addition, the use of eq. 33 requires that the conduction current in the system is determined solely by the bulk conductivity of the supporting solution. It often happens that surface conductivity is important, and, besides that, the ions in the plug behave with a lower mobility than in solution.

$A_c/L$  can be estimated experimentally as follows [40, 41]. Measure the resistance,  $R_{\infty}$ , of the plug or capillary wetted by a highly concentrated (above  $10^{-2}$  mol/L, say) electrolyte solution, with conductivity  $K_{\infty}$ . Since for such a high ionic strength the double-layer contribution to the overall conductivity is negligible, we may write

$$\frac{A_c}{L} = \frac{1}{K_{\infty} R_{\infty}} \quad (34)$$

In addition, theoretical or semi-empirical models exist that relate the apparent values of  $A_c$  and  $L$  (external dimensions of the plug) to the volume fraction,  $\phi$ , of solids in the plug. For instance, according to [42]

$$\frac{A_c}{L} = \frac{A_c^{\text{ap}}}{L^{\text{ap}}} \exp(B\phi) \quad (35)$$

where  $B$  is an empirical constant that can be experimentally determined by measuring the electro-osmotic volume flow for different plug porosities. In eq. 35,  $L^{\text{ap}}$  and  $A_c^{\text{ap}}$  are the apparent (externally measured) length and cross-sectional area of the plug, respectively. An alternative expression was proposed in [43]:

$$\frac{A_c}{L} = \frac{A_c^{\text{ap}}}{L^{\text{ap}}} \phi_L^{-5/2} \quad (36)$$

where  $\phi_L$  is the volume fraction of liquid in the plug (or void volume fraction). Other estimates of  $A_c/L$  can be found in [44–46].

For the case of a close packing of spheres, theoretical treatments are available involving the calculation of streaming current using cell models. No simple expressions can be given in this case; see [3, 47–52] for details.

**FIGURE 3:** Streaming current divided by the applied pressure difference, eqs. 37 and 39, relative to the Smoluchowski formula, eq. 33, plotted as a function of the product  $\kappa a$  ( $a$ : capillary radius, or slit half-width) for slit- and cylindrical-shaped capillaries.

- b. If  $\kappa a$  is intermediate ( $\kappa a \approx 1-10$ , say), the HS equation is not valid. For low  $\zeta$ , curvature effects can be corrected by means of the Burgen and Nakache theory [4, 49]:

$$\frac{I_{\text{str}}}{\Delta p} = \frac{\varepsilon_{\text{rs}} \varepsilon_0 \zeta}{\eta} \frac{A_c}{L} [1 - G(\kappa a)] \quad (37)$$

where

$$G(\kappa a) = \frac{\tanh(\kappa a)}{\kappa a} \quad (38)$$

for slit-shaped capillaries ( $2a$  corresponds in this case to the separation of the parallel solid walls). In the case of cylindrical capillaries of radius  $a$ , the calculation was first carried out by Rice and Whitehead [50]. They found that the function  $G(\kappa a)$  in eq. 37 reads

$$G(\kappa a) = \frac{2I_1(\kappa a)}{\kappa a I_0(\kappa a)} \quad (39)$$

where  $I_0$  and  $I_1$  are the zeroth- and first-order modified Bessel functions of the first kind, respectively. Fig. 3 illustrates the importance of this curvature correction.

- c. If the  $\zeta$ -potential is not low and  $\kappa a$  is small, no simple expression for  $I_{\text{str}}$  can be given, and only numerical procedures are available [52].

#### 4.2.1.2 Streaming potential

The *streaming potential difference* (briefly, streaming potential)  $U_{\text{str}}$  can be measured between two electrodes, upstream and downstream in the liquid flow, connected via a high-input impedance voltmeter. The quantity of interest is, in this case, the ratio between the streaming potential and the pressure drop,  $U_{\text{str}}/\Delta p$  ( $\text{V Pa}^{-1}$ ). The conversion into  $\zeta$ -potentials can be realized in a number of cases.

- a. If  $\kappa a \gg 1$  and surface conduction can be neglected, the HS formula can be used:

$$\frac{U_{\text{str}}}{\Delta p} = \frac{\varepsilon_{\text{rs}} \varepsilon_0 \zeta}{\eta} \frac{1}{K_L} \quad (40)$$

- b. The most frequent case (except for high ionic strengths, or high  $K_L$ ) is that surface conductance,  $K^\sigma$ , is significant. Then the following equation should be used:

$$\frac{U_{\text{str}}}{\Delta p} = \frac{\varepsilon_{\text{rs}} \varepsilon_0 \zeta}{\eta} \frac{1}{K_L (1 + 2Du)} \quad (41)$$

where  $Du$  is given by eqs. 12 and 20.

An empirical way of taking into account the existence of surface conductivity is to measure the resistance  $R_\infty$  of the plug or capillary in a highly concentrated electrolyte solution of conductivity  $K_L^\infty$ . As for such a solution,  $Du$  is negligible, one can write

$$K_L^\infty R_\infty = \left( K_L + \frac{2K^\sigma}{a} \right) R_s \quad (42)$$

where  $R_s$  is the resistance of the plug in the solution under study, of conductivity  $K_L$ . Now, eq. 41 can be approximated by

$$\frac{U_{\text{str}}}{\Delta p} = \frac{\varepsilon_{\text{rs}} \varepsilon_0 \zeta}{\eta} \frac{R_s}{K_L^\infty R_\infty} \quad (43)$$

- c. If  $\kappa a$  is intermediate ( $\kappa a \sim 1 \dots 10$ ) and the  $\zeta$ -potential is low, Rice and Whitehead's corrections are needed [50]. For a cylindrical capillary, the result is

$$\frac{U_{\text{str}}}{\Delta p} = \frac{\varepsilon_{\text{rs}} \varepsilon_0 \zeta}{\eta} \frac{R_s}{K_L^\infty R_\infty} \frac{1 - \frac{2I_1(\kappa a)}{\kappa a I_0(\kappa a)}}{1 - \beta \left[ 1 - \frac{2I_1(\kappa a)}{\kappa a I_0(\kappa a)} - \frac{I_1^2(\kappa a)}{I_0^2(\kappa a)} \right]} \quad (44)$$

where

$$\beta = \frac{(\varepsilon_{\text{rs}} \varepsilon_0 \kappa \zeta)^2}{\eta} \frac{R_s}{K_L^\infty R_\infty} \quad (45)$$

Figure 4 illustrates some results that can be obtained by using eq. 44.

**FIGURE 4:** Streaming potential divided by the applied pressure difference, eq. 44, relative to its Smoluchowski value, eq. 40, as a function of the product  $\kappa a$  ( $a$ : capillary radius), for the  $\zeta$ -potentials indicated. Surface conductance is neglected.

- d. As in the case of streaming current, for high  $\zeta$ -potentials, only numerical methods are available (see, e.g., [53] for details).

In practice, instead of potential or current measurements for just one driving pressure, the streaming potential and streaming current are mostly measured at various pressure differences applied in both directions across the capillary system, and the slopes of the functions  $U_{\text{str}} = U_{\text{str}}(\Delta p)$  and  $I_{\text{str}} = I_{\text{str}}(\Delta p)$  are used to calculate the  $\zeta$ -potential. This makes it possible to detect electrode asymmetry effects and correct for them. It is also advisable to verify that the  $\Delta p$  dependencies are linear and pass through the origin.

#### 4.2.2 Samples that can be studied

Streaming potential/current measurements can be applied to study macroscopic interfaces of materials of different shape. Single capillaries made of flat sample surfaces (rectangular capillaries) and cylindrical capillaries can be used to produce micro-channels for streaming potential/current measurements. Further, parallel capillaries and irregular capillary systems such as fiber bundles, membranes, and particle plugs can also be studied. Recall, however, the precautions already mentioned in connection with the interpretation of results in the case of plugs of particles. Other effects, including temperature gradients, Donnan potentials, or membrane potential can contribute to the observed streaming potential or electro-osmotic flow. An additional condition is the constancy of the capillary geometry during the course of the experiment. Reversibility of the signal upon variations in the sign and magnitude of  $\Delta p$  is a criterion for such constancy.

Most of the materials studied so far by streaming potential/current measurements, including synthetic polymers and inorganic non-metals, are insulating. Either bulk materials or thin films on top of carriers can be characterized. In addition, in some cases, semiconductors [54] and even bulk metals [55] have been studied, proving the general feasibility of the experiment.

Note that streaming potential/current measurements on samples of different geometries (flat plates, particle plugs, fiber bundles, cylindrical capillaries,...) each require their own set-up.

#### 4.2.3 Sample preparation

The samples to be studied by streaming potential/current measurements have to be mechanically and chemically stable in the aqueous solutions used for the experiment. First, the geometry of the plug must be consolidated in the measuring cell. This can be checked by rinsing with the equilibrium liquid through repeatedly applying  $\Delta p$  in both directions until finding a constant signal. Another issue to consider is the necessity that the solid has reached chemical equilibrium with the permeating liquid; this may require making the plug from a suspension of the correct composition, followed by rinsing. Checking that the experimental signal does not change during the course of measurement may be a good practice. The presence or formation of air bubbles in the capillary system has to be avoided.

##### 4.2.3.1 Standard samples

No standard samples have been developed specifically so far for streaming potential/current measurements, although several materials have been frequently analyzed and may, therefore, serve as potential reference samples [56, 57].

##### 4.2.3.2 Range of electrolyte concentrations

From the operational standpoint, there is no lower limit to the ionic strength of the systems to be investigated by these methods, although in the case of narrow channels, very low ionic strengths

require effective electrical insulation of the set-up in order to prevent short-circuiting. However, such low ionic strength values can only be attained if the solid sample is extremely pure and insoluble. The upper value of electrolyte concentration depends on the sensitivity of the electrometer and on the applied pressure difference; usually, solutions above  $10^{-1}$  mol/L of 1-1 charge-type electrolyte are difficult to measure by the present techniques.

### 4.3 Electro-osmosis

#### 4.3.1 Operational definitions; recommended symbols and terminology; conversion of the measured quantities into $\zeta$ -potential

In electro-osmosis, a flow of liquid is produced when an electric field  $E$  is applied to a charged capillary or porous plug immersed in an electrolyte solution. If  $\kappa a \gg 1$  everywhere at the solid/liquid interface, far from that interface the liquid will attain a constant (i.e., independent of the position in the channel) velocity (the electro-osmotic velocity)  $v_{\text{eo}}$ , given by eq. 4. If such a velocity cannot be measured, the convenient physical quantity becomes the *electro-osmotic flow rate*,  $Q_{\text{eo}}$  ( $\text{m}^3 \text{s}^{-1}$ ), given by

$$Q_{\text{eo}} = \iint_{A_c} v_{\text{eo}} \cdot d\mathbf{S} \quad (46)$$

where  $d\mathbf{S}$  is the elementary surface vector at the location in the channel where the fluid velocity is  $v_{\text{eo}}$ . The counterparts of  $Q_{\text{eo}}$  are  $Q_{\text{eo},E}$  (flow rate divided by electric field) and  $Q_{\text{eo},I}$  (flow rate divided by current). These are the quantities that can be related to the  $\zeta$ -potential. As before, several cases can be distinguished:

- a. If  $\kappa a \gg 1$  and there is no surface conduction:

$$Q_{\text{eo},E} \equiv \frac{Q_{\text{eo}}}{E} = -\frac{\epsilon_{\text{rs}} \epsilon_0 \zeta}{\eta} A_c \quad (47)$$

$$Q_{\text{eo},I} \equiv \frac{Q_{\text{eo}}}{I} = -\frac{\epsilon_{\text{rs}} \epsilon_0 \zeta}{\eta} \frac{1}{K_L}$$

- b. With surface conduction, the expression for  $Q_{\text{eo},E}$  is as in eq. 47, and that for  $Q_{\text{eo},I}$  is

$$Q_{\text{eo},I} = -\frac{\epsilon_{\text{rs}} \epsilon_0 \zeta}{\eta} \frac{1}{K_L (1 + 2Du)} \quad (48)$$

In eq. 48, the empirical approach for the estimation of  $Du$  can be followed:

$$Q_{\text{eo},I} = -\frac{\epsilon_{\text{rs}} \epsilon_0 \zeta}{\eta} \frac{R_S}{K_L^\infty R_\infty} \quad (49)$$

- c. Low  $\zeta$ -potential, finite surface conduction, and arbitrary capillary radius [46]:

$$Q_{\text{eo},E} = -\frac{\epsilon_{\text{rs}} \epsilon_0 \zeta}{\eta} A_c [1 - G(\kappa a)]$$

$$Q_{\text{eo},I} = -\frac{\epsilon_{\text{rs}} \epsilon_0 \zeta}{\eta} \frac{[1 - G(\kappa a)]}{K_L (1 + 2Du)} \quad (50)$$

$$\equiv -\frac{\epsilon_{\text{rs}} \epsilon_0 \zeta}{\eta} \frac{R_S [1 - G(\kappa a)]}{K_L^\infty R_\infty}$$

where the function  $G(\kappa a)$  is given by eq. 38.

- d. When  $\zeta$  is high and the condition  $\kappa a \gg 1$  is not fulfilled, no simple expression can be given for  $Q_{eo}$ .

As in the case of streaming potential and current, the procedures described can be also applied to either plugs or membranes. If the electric field  $E$  is the independent variable (see eq. 47), then  $A_c$  must be estimated. In that situation, the recommendations suggested in Section 4.2.1 can be used, since eq. 47 can be written as

$$\frac{Q_{eo,E}}{\Delta V_{\text{ext}}} = -\frac{\epsilon_{rs}\epsilon_0\zeta}{\eta} \frac{A_c}{L} \quad (51)$$

where  $\Delta V_{\text{ext}}$  is the applied potential difference.

#### 4.3.2 Samples that can be studied

The same samples as with streaming current/potential, see Section 4.2.2.

#### 4.3.3 Sample preparation and standard samples

See Section 4.2.3 referring to streaming potential/current determination.

### 4.4 Experimental determination of surface conductivity

Surface conductivities are excess quantities and cannot be directly measured. There are, in principle, three methods to estimate them.

- i. In the case of plugs, measure the plug conductivity  $K_{\text{plug}}$  as a function of  $K_L$ . The latter can be changed by adjusting the electrolyte concentration. The plot of  $K_{\text{plug}}$  vs.  $K_L$  has a large linear range which can be extrapolated to  $K_L = 0$  where the intercept represents  $K^\sigma$ . This method requires a plug and seems relatively straightforward.
- ii. For capillaries, deduce  $K^\sigma$  from the radius dependence of the streaming potential, using eq. 41 and the definition of  $Du$  (eq. 12). This method is rather direct, but requires a range of capillaries with different radii, but identical surface properties [58, 59].
- iii. Utilize the observation that, when surface conductivity is not properly accounted for, different electrokinetic techniques may give different values for the  $\zeta$ -potential of the same material under the same solution conditions. Correct the theories by inclusion of the appropriate surface conductivity, and find in this way the value of  $K^\sigma$  that harmonizes the  $\zeta$ -potential. This method requires insight into the theoretical backgrounds [60, 61], and it works best if the two electrokinetic techniques have a rather different sensitivity for surface conduction (such as electrophoresis and LFDD).

In many cases, it is found that the surface conductivity obtained in one of these ways exceeds  $K^{\sigma d}$ , sometimes by orders of magnitude. This means that  $K^{\sigma i}$  is substantial. The procedure for obtaining  $K^{\sigma i}$  consists of subtracting  $K^{\sigma d}$  from  $K^\sigma$ . For  $K^{\sigma d}$ , Bikerman's equation (eq. 17) can be used. The method is not direct because this evaluation requires the  $\zeta$ -potential, which is one of the unknowns; hence, iteration is required.

### 4.5 Dielectric dispersion

#### 4.5.1 Operational definitions; recommended symbols and terminology; conversion of the measured quantities into $\zeta$ -potential

The phenomenon of dielectric dispersion in colloidal suspensions involves the study of the dependence on the frequency of the applied electric field of the electric permittivity and/or the electric

conductivity of disperse systems. When dealing with such heterogeneous systems as colloidal dispersions, these quantities are defined as the electric permittivity and conductivity of a sample of homogeneous material, that when placed between the electrodes of the measuring cell, would have the same resistance and capacitance as the suspension. The dielectric investigation of dispersed systems involves determinations of their *complex permittivity*,  $\epsilon^*(\omega)$  ( $\text{F m}^{-1}$ ) and *complex conductivity*  $K^*(\omega)$  ( $\text{S m}^{-1}$ ) as a function of the frequency  $\omega$  ( $\text{rad s}^{-1}$ ) of the applied ac field. These quantities are related to the volume, surface, and geometrical characteristics of the dispersed particles, the nature of the dispersion medium, and also to the concentration of particles, expressed either in terms of volume fraction,  $\phi$  (dimensionless) or number concentration  $N$  ( $\text{m}^{-3}$ ).

It is common to use the relative permittivity  $\epsilon_r^*(\omega)$  (dimensionless), instead of the permittivity

$$\epsilon^*(\omega) = \epsilon_r^*(\omega)\epsilon_0 \quad (52)$$

$\epsilon_0$  being the permittivity of vacuum.  $K^*(\omega)$  and  $\epsilon^*(\omega)$  are not independent quantities:

$$K^*(\omega) = K_{\text{DC}} - i\omega\epsilon^*(\omega) = K_{\text{DC}} - i\omega\epsilon_0\epsilon_r^*(\omega) \quad (53)$$

or, equivalently,

$$\begin{aligned} \text{Re}[K(\omega)] &= K_{\text{DC}} + \omega\epsilon_0 \text{Im}[\epsilon_r^*(\omega)] \\ \text{Im}[K^*(\omega)] &= -\omega\epsilon_0 \text{Re}[\epsilon_r^*(\omega)] \end{aligned} \quad (54)$$

where  $K_{\text{DC}}$  is the direct-current (zero frequency) conductivity of the system.

The complex conductivity  $K^*$  of the suspension can be expressed as

$$K^*(\omega) = K_L + \delta K^*(\omega) \quad (55)$$

where  $\delta K^*(\omega)$  is usually called *conductivity increment* of the suspension. Similarly, the complex dielectric constant of the suspension can be written in terms of a *relative permittivity increment* or, briefly, *dielectric increment*  $\delta\epsilon_r^*(\omega)$ :

$$\epsilon_r^*(\omega) = \epsilon_{rs} + \delta\epsilon_r^*(\omega) \quad (56)$$

As in homogeneous materials, the electric permittivity is the macroscopic manifestation of the electrical polarizability of the suspension components. Mostly, more than one relaxation frequency is observed, each associated with one of the various mechanisms contributing to the system's polarization. Hence, the investigation of the frequency dependence of the electric permittivity or conductivity allows us to obtain information about the characteristics of the disperse system that are responsible for the polarization of the particles.

The frequency range over which the dielectric dispersion of suspensions in electrolyte solutions is usually measured extends between 0.1 kHz and several hundred MHz. In order to define in this frame the *low-frequency* and *high-frequency* ranges, it is convenient to introduce an important concept dealing with a point in the frequency scale. This frequency corresponds to the *reciprocal of the Maxwell–Wagner–O'Konski relaxation time*  $\tau_{\text{MWO}}$

$$\omega_{\text{MWO}} \equiv \frac{1}{\tau_{\text{MWO}}} \equiv \frac{(1-\phi)K_p + (2+\phi)K_L}{\epsilon_0 \left[ (1-\phi)\epsilon_{\text{rp}} + (2+\phi)\epsilon_{\text{rs}} \right] \epsilon_{\text{rs}}} \quad (57)$$

and it is called the Maxwell–Wagner–O’Konski relaxation frequency. In eq. 57,  $\epsilon_{rp}$  is the relative permittivity of the dispersed particles. For low volume fractions and low permittivity of the particles ( $\epsilon_{rp} \ll \epsilon_{rs}$ ), this expression reduces to

$$\tau_{MWO} \approx \frac{\epsilon_{rs} \epsilon_0}{K_L} \approx \frac{1}{2D\kappa^2} \quad (58)$$

where  $D$  is the mean diffusion coefficient of ions in solution. The last term in eq. 58 suggests that  $\tau_{MWO}$  roughly corresponds in this case to the time needed for ions to diffuse a distance of the order of one Debye length. In fact, in such conditions  $\tau_{MWO}$  equals  $\tau_{ep}$ , the so-called *relaxation time of the electrolyte solution*. It is a measure of the time required for charges in the electrolyte solution to recover their equilibrium distribution after ceasing an external perturbation. Its role in the time domain is similar to the role of  $\kappa^{-1}$  in assessing the double-layer thickness.

The low-frequency range can be defined by the inequality

$$\omega < \omega_{MWO} \quad (59)$$

For these frequencies, the characteristic value of the *conduction current density* in the electrolyte solution significantly exceeds the *displacement current density*, and the spatial distribution of the local electric fields in the disperse system is mainly determined by the distribution of ionic currents. The frequency dependence shown by the permittivity of colloidal systems in this frequency range is known as low-frequency dielectric dispersion or LFDD.

In the high-frequency range, determined by the inequality

$$\omega > \omega_{MWO} \quad (60)$$

the characteristic value of the displacement current density exceeds that of conduction currents, and the space distribution of the local electric fields is determined by polarization of the molecular dipoles, rather than by the distribution of ions.

#### 4.6 Dielectric dispersion and $\zeta$ -potential: Models

a. Middle-frequency range: Maxwell–Wagner–O’Konski relaxation

There are various mechanisms for the polarization of a heterogeneous material, each of which is always associated with some property that differs between the solid, the liquid, and their interface. The most widely known mechanism of dielectric dispersion, the *Maxwell–Wagner dispersion*, occurs when the two contacting phases have different conductivities and electric permittivities. If the ratio  $\epsilon_{rp}/K_p$  is different from that of the dispersion medium, i.e., if

$$\frac{\epsilon_{rp}}{K_p} \neq \frac{\epsilon_{rs}}{K_L} \quad (61)$$

the conditions of continuity of the normal components of the current density and the electrostatic induction on both sides of the surface are inconsistent with each other. This results in the formation of free ionic charges near the surface. The finite time needed for the formation of such a free charge is in fact responsible for the Maxwell–Wagner dielectric dispersion.

In the Maxwell–Wagner model, no specific properties are assumed for the surface, which is simply considered as a geometrical boundary between homogeneous phases. The

Maxwell–Wagner model was generalized by O’Konski [61], who first took the surface conductivity  $K^\sigma$  explicitly into account. In his treatment, the conductivity of the particle is modified to include the contributions of both the solid material and the excess surface conductivity. This effective conductivity will be called  $K_{pef}$ :

$$K_{pef} = K_p + \frac{2K^\sigma}{a} \quad (62)$$

Both the conductivity and the dielectric constant can be considered as parts of a complex electric permittivity of any of the system’s components. Thus, for the dispersion medium

$$\epsilon_{rs}^* = \epsilon_{rs} - i \frac{K_L}{\omega \epsilon_0} \quad (63)$$

and for the particle

$$\epsilon_{rp}^* = \epsilon_{rp} - i \frac{K_{pef}}{\omega \epsilon_0} \quad (64)$$

In terms of these quantities, the Maxwell–Wagner–O’Konski theory gives the following expression for the complex dielectric constant of the suspension:

$$\epsilon_r^* = \epsilon_{rs}^* \frac{\epsilon_{rp}^* + 2\epsilon_{rs}^* + 2\phi(\epsilon_{rp}^* - \epsilon_{rs}^*)}{\epsilon_{rp}^* + 2\epsilon_{rs}^* - \phi(\epsilon_{rp}^* - \epsilon_{rs}^*)} \quad (65)$$

b. Low-frequency range: dilute suspensions of nonconducting spherical particles with  $\kappa a \gg 1$ , and negligible  $K^\sigma$

At moderate or high  $\zeta$ -potentials, mobile counterions are more abundant than coions in the EDL. Therefore, the contribution of the counterions and the coions to surface currents in the EDL differs from their contribution to currents in the bulk solution. Such difference gives rise to the existence of a field-induced perturbation of the electrolyte concentration,  $\delta c(r)$ , in the vicinity of the polarized particle. The ionic diffusion caused by  $\delta c(r)$  provokes a low-frequency dependence of the particle’s dipole coefficient,  $C_0^*$  (see below). This is the origin of the LFDD ( $\alpha$ -dispersion) displayed by colloidal suspensions. Recall that the dipole coefficient relates the dipole moment  $d^*$  to the applied field  $E$ . For the case of a spherical particle of radius  $a$ , the dipole coefficient is defined through the relation

$$d^* = 4\pi\epsilon_{rs}\epsilon_0 a^3 C_0^* E \quad (66)$$

The calculation of this quantity proves to be essential for evaluation of the dielectric dispersion of the suspension [63–65]. A model for the calculation of the low-frequency conductivity increment  $\delta K^*(\omega)$  and relative permittivity increment  $\delta \epsilon_r^*(\omega)$  from the dipole coefficient  $C_0^*$  when  $\kappa a \gg 1$  is described in Appendix I. There it is shown that, in the absence of SLC, the only parameter of the solid/liquid interface that is needed to account for LFDD is the  $\zeta$ -potential.

The overall behavior is illustrated in Fig. 5 for a dilute dispersion of spherical nonconducting particles ( $a = 100$  nm,  $\epsilon_{rp} = 2$ ) in a  $10^{-3}$  mol/L KCl solution ( $\epsilon_{rs} = 78.5$ ), and with negligible ionic conduction in the stagnant layer. In this figure, we plot the variation of the real and imaginary parts

**FIGURE 5:** Real and imaginary parts of the dielectric increment  $\delta\epsilon_r^*$  (divided by the volume fraction  $\phi$ ) for dilute suspensions of 100-nm particles in KCl solution, as a function of the frequency of the applied field for  $\kappa a=10$  and  $\zeta = 100$  mV. The arrows indicate the approximate location of the  $\alpha$ - (low frequency) and Maxwell-Wagner-O'Konski relaxations.

of  $\delta\epsilon_r^*$  with frequency. Note the very significant effect of the double-layer polarization on the low-frequency dielectric constant of a suspension. The variation with frequency is also noticeable, and both the  $\alpha$ - (around  $10^5$  s $^{-1}$ ) and Maxwell-Wagner ( $\sim 2 \cdot 10^7$  s $^{-1}$ ) relaxations are observed, the amplitude of the latter being much smaller than that of the former for the conditions chosen. No other electrokinetic technique can provide such a clear account of the double-layer relaxation processes. The effect of  $\zeta$ -potential on the frequency dependence of the dielectric constant is plotted in Fig. 6: the dielectric increment always increases with  $\zeta$ , as a consequence of the larger concentration of counterions in the EDL: all processes responsible for LFDD are amplified for this reason.

The procedure for obtaining  $\zeta$  from LFDD measurements is somewhat involved. It is advisable to determine experimentally the dielectric constant (or, equivalently, the conductivity) of the suspension over a wide frequency

**FIGURE 6:** Real part of the dielectric increment  $\delta\epsilon_r^*$  (per volume fraction) as a function of the frequency of the applied field for dilute suspensions of 100-nm particles in KCl solution. The  $\zeta$ -potentials are indicated, and in all cases,  $\kappa a = 10$ .

range, and use eqs. I.2 and I.3 (see Appendix I) to estimate the LFDD curve that best fits the data. A simpler routine is to measure only the low-frequency values, and deduce  $\zeta$  using the same equations, but substituting  $\omega = 0$ . However, the main experimental problems occur at low frequencies (see Section 4.5.3).

- c. Dilute suspensions of nonconducting spherical particles with arbitrary  $\kappa a$ , and negligible  $K^{\sigma i}$

In this situation, there are no analytical expressions relating LFDD measurements to  $\zeta$ . Instead, numerical calculations based on DeLacey and White's treatment [66] are recommended. As before, the computing routine should be constructed to perform the calculations a number of times with different  $\zeta$ -potentials as inputs, until agreement between theory and experiment is obtained over a wide frequency range (or, at least, at low frequencies).

- d. Dilute suspensions of nonconducting spherical particles with  $\kappa a \gg 1$  and SLC

The problem of generalizing the theory by taking into account surface conduction caused by ions situated in the hydrodynamically stagnant layer has been dealt with in [60, 61, 64]. In theoretical treatments, SLC is equated to conduction within the Stern layer.

According to these models, the dielectric dispersion is determined by both  $\zeta$  and  $K^{\sigma i}$ . This means that, as discussed before, additional information on  $K^{\sigma i}$  (see the methods described in Section 4.4) must accompany the dielectric dispersion measurements. Using dielectric dispersion data alone can only yield information about the total surface conductivity [66].

- e. Dilute suspensions of nonconducting spherical particles with arbitrary  $\kappa a$  and SLC.

Only numerical methods are available if this is the physical nature of the system under study. The reader is referred to [13–16, 61, 62, 67–69]. Figure 7 illustrates how important the effect of SLC on  $\text{Re}[\delta\epsilon_r^*(\omega)]$  can be for the same conditions as in Fig. 5. Roughly, the possibility of increased ionic mobilities in the stagnant layer brings about a systematically larger dielectric increment of the suspension: surface currents are larger for a conducting stagnant layer, and hence the electrolyte concentration gradients, ultimately responsible for the dielectric dispersion, will also be increased.

**FIGURE 7:** Real part of the dielectric increment (per volume fraction) of dilute suspensions as in Fig. 5. The curves correspond to increasing importance of SLC; the ratios between the diffusion coefficients of counterions in the stagnant layer and in the bulk electrolyte are indicated (the lower curve corresponds to zero SLC).

f. Nondilute suspensions of nonconducting spherical particles with large  $\kappa a$  and negligible  $K^{\text{oi}}$

Considering that many suspensions of technological interest are rather concentrated, the possibilities of LFDD in the characterization of moderately concentrated suspensions have also received attention. This requires establishing a theoretical basis relating the dielectric or conductivity increments of such systems to the concentration of particles [70–72]. Here, we focus on a simplified model [73] that allows the calculation of the volume-fraction dependence of both the low-frequency value of the real part of  $\delta\epsilon_r^*$ , and of the characteristic time  $\tau_\alpha$  of the  $\alpha$ -relaxation. The starting point is the assumption that  $L_D$ , the length scale over which ionic diffusion takes place around the particle, can be averaged in the following way between the values of a very dilute ( $L_D \approx a$ ) and a very concentrated ( $L_D \approx b - a$ ;  $b$  is half the average distance between the centers of neighboring particles) dispersion:

$$L_D = \left( \frac{1}{a^2} + \frac{1}{(b-a)^2} \right)^{-1/2} \quad (67)$$

or, in terms of the particle volume fraction

$$L_D = a \left( 1 + \frac{1}{(\phi^{-1/3} - 1)^2} \right)^{-1/2} \quad (68)$$

From these expressions, the simplified model allows us to obtain the dielectric increment at low frequency as follows. Let us call

$$\Delta\epsilon(0) \equiv \frac{\text{Re}[\delta\epsilon_r^*(0)]}{\phi} \quad (69)$$

the *specific* (i.e., per unit volume fraction) *dielectric increment* (for  $\omega \rightarrow 0$ ). In the case of dilute suspensions, this quantity is a constant (independent of  $\phi$ ), that we denote  $\Delta\epsilon_d(0)$ :

$$\Delta\epsilon(0) \equiv \frac{\text{Re}[\delta\epsilon_r^*(0)]}{\phi} \Big|_{\phi \rightarrow 0} \quad (70)$$

The model allows us to relate eq. 69 with eq. 70 through the volume-fraction dependence of  $L_D$ :

$$\Delta\epsilon(0) = \Delta\epsilon_d(0) \left( 1 + \frac{1}{(\phi^{-1/3} - 1)^2} \right)^{-3/2} \quad (71)$$

A similar relationship can be established between dilute and concentrated suspensions in the case of the relaxation frequency  $\omega_\alpha = 1/\tau_\alpha$ :

$$\omega_\alpha = \omega_{\alpha d} \left( 1 + \frac{1}{(\phi^{-1/3} - 1)^2} \right) \quad (72)$$

where  $\omega_{\alpha d}$  is the reciprocal of the relaxation time for a dilute suspension. Using this model, the dielectric increment and characteristic frequency of a concentrated suspension can be related to those corresponding to the dilute case which, in turn, can be related, as discussed above, to the  $\zeta$ -potential and other double-layer parameters. A general treatment of the problem, valid for arbitrary values of  $\kappa a$  and  $\zeta$  can be found in [74].

Summing up, we can say that the dielectric dispersion of suspensions is an interesting physical phenomenon, extremely sensitive to the characteristics of the particles, the solution, and their interface. It can provide invaluable information on the dynamics of the EDL and the processes through which it is altered by the application of an external field. Because of the experimental difficulties involved in its determination, it is unlikely that dielectric dispersion measurements alone can be useful as a tool to obtain the  $\zeta$ -potential of the dispersed particles.

#### 4.6.1 Experimental techniques available

One of the most usual techniques for measuring the dielectric permittivity and/or the conductivity of suspensions as a function of the frequency of the applied field, is based on the use of a conductivity cell connected to an impedance analyzer. This technique has been widely employed since it was first proposed by Fricke and Curtis [75]. In most modern setups, the distance between electrodes can be changed (see, e.g., [69, 76–79]). The need for variable electrode separation stems from the problem of electrode polarization at low frequencies, since at sufficiently low frequencies the electrode impedance dominates over that of the sample. The method makes use of the assumption that electrode polarization does not depend on their distance. A so-called *quadrupole method* has been recently introduced [80] in which the correction for electrode polarization is optimally carried out by proper calibration. Furthermore, the method based on the evaluation of the logarithmic derivative of the imaginary part of raw  $\epsilon^*(\omega)$  data also seems to be promising [81].

These are not, however, the only possible procedures. A four-electrode method has also been employed with success [60, 61, 68] in this case, since the sensing and current-supplying electrodes are different, polarization is not the main problem, but the electronics of the experimental set-up is rather complicated.

#### 4.6.2 Samples for LFDD measurements

There are no particular restrictions to the kind of colloidal particles that can be studied with the LFDD technique. The obvious precautions involve avoiding sedimentation of the particles during measurement, and control of the stability of the suspensions. LFDD quantities are most sensitive to particle size, particle concentration, and temperature. Hence, the constancy of the latter is essential. Another important concern deals with the effect of electrode polarization. Particularly at low frequencies, electrode polarization can be substantial and completely invalidate the data. This fact imposes severe limitations on the electrolyte concentrations that can be studied; it is very hard to obtain data for ionic strengths in excess of 1 to 5 mmol L<sup>-1</sup>.

### 4.7 Electroacoustics

#### 4.7.1 Operational definitions; recommended symbols and terminology; experimentally available quantities

##### Terminology

The term “electroacoustics” refers to two kinds of closely related phenomena:

- *Colloid vibration current* ( $I_{CV}$ ) and *colloid vibration potential* ( $U_{CV}$ ) are two phenomena in which a sound wave is passed through a colloidal dispersion and, as a result, electrical currents and fields arise in the suspension. When the wave travels through a dispersion of particles whose

density differs from that of the surrounding medium, inertial forces induced by the vibration of the suspension give rise to a motion of the charged particles relative to the liquid, causing an alternating electromotive force. The manifestations of this electromotive force may be measured in a way depending on the relation between the impedance of the suspension and the properties of the measuring instrument, either as  $I_{CV}$  (for small impedance of the meter) or as  $U_{CV}$  (for large one).

- The reciprocal effect of the above two phenomena is the electrokinetic sonic amplitude (ESA), in which an alternating electric field is applied to a suspension and a sound wave arises as a result of the motion of the particles caused by their ac electrophoresis.

Colloid vibration potential/current may be considered as the ac analog of sedimentation potential/current. Similarly, ESA may be considered as the ac analog of classical electrophoresis. The relationships between electroacoustics and classical EKP may be used for testing modern electroacoustic theories, which should at least provide the correct limiting transitions to the well-known and well-established results of the classical electrokinetic theory. A very important advantage of the electroacoustic techniques is the possibility they offer to be applied to concentrated dispersions.

#### 4.7.1.1 Experimentally available quantities

**4.7.1.1.1 Colloid vibration potential ( $U_{CV}$ )** If a standing sound wave is established in a suspension, a voltage difference can be measured between two different points in the standing wave. If measured at zero current flow, it is referred to as *colloid vibration potential*. The measured voltage is due to the motion of the particles: it alternates at the frequency of the sound wave and is proportional to another measured value,  $\Delta P$ , which is the pressure difference between the two points of the wave. The kinetic coefficient, equal to the ratio

$$\frac{U_{CV}}{\Delta P} = \frac{U_{CV}}{\Delta P}(\omega, \phi, \Delta \rho / \rho, K^{\sigma_i}, \zeta, \eta, a) \quad (73)$$

characterizes the suspension. In eq. 73,  $\Delta \rho$  is the difference in density between the particles and the suspending fluid, of density  $\rho$ .

**4.7.1.1.2 Colloid vibration current ( $I_{CV}$ )** If the measurements of the electric signal caused by the sound wave in the suspension, are carried out under zero  $U_{CV}$  conditions (short-circuited), an ac  $I_{CV}$  can be measured. Its value, measured between two different points in the standing wave, is also proportional to the pressure difference between those two points, and the kinetic coefficient  $I_{CV}/\Delta P$  characterizes the suspension and is closely related to  $U_{CV}/\Delta P$ :

$$\frac{I_{CV}}{\Delta P} = \frac{I_{CV}}{\Delta P}(\omega, \phi, \Delta \rho / \rho, K^{\sigma_i}, \zeta, \eta, a) = K^* \frac{U_{CV}}{\Delta P} \quad (74)$$

**4.7.1.1.3 Electrokinetic sonic amplitude (ESA)** This refers to the measurement of the sound wave amplitude, which is caused by the application of an alternating electric field to a suspension of particles of which the density is different from that of the suspending medium. The ESA signal (i.e., the amplitude  $A_{ESA}$  of the sound pressure wave generated by the applied electric field) is proportional to the field strength  $E$ , and the kinetic coefficient

$A_{ESA}/E$  can be expressed as a function of the characteristics of the suspension

$$\frac{A_{ESA}}{E} = \frac{A_{ESA}}{E}(\omega, \phi, \Delta \rho / \rho, K^{\sigma_i}, \zeta) \quad (75)$$

Measurement of  $I_{CV}$  or  $A_{ESA}$  rather than  $U_{CV}$  has the operational advantage that it enables measurement of the kinetic characteristics,  $I_{CV}/\Delta P$  and  $A_{ESA}/E$ , which are independent of the complex conductivity  $K^*$  of the suspension, and thus knowledge of  $K^*$  is not a prerequisite for the extraction of the  $\zeta$ -potential from the interpretation of the electroacoustic measurements. Note, however, that if SLC is significant, as with the other EKP, additional measurements will be needed, as both  $\zeta$  and  $K^{\sigma_i}$  are required to fully characterize the interface.

#### 4.7.2 Estimation of the $\zeta$ -potential from $U_{CV}$ , $I_{CV}$ or $A_{ESA}$

There are two recent methods for the theoretical interpretation of the data of electroacoustic measurements and extracting from them a value for the  $\zeta$ -potential. One is based on the symmetry relation proposed in [82, 83] to express both kinds of electroacoustic phenomena (colloid vibration potential/current and ESA) in terms of the same quantity, namely the *dynamic electrophoretic mobility*,  $u_d^*$ , which is the complex, frequency-dependent analog of the normal direct current (dc) electrophoretic mobility. The second method is based on the direct evaluation of  $I_{CV}$  without using the symmetry relations, and hence it is not necessarily based on the concept of dynamic electrophoretic mobility. Both methods for  $\zeta$ -potential determination from electroacoustic measurements are briefly described below.

Using the dynamic mobility method has some advantages: (i) the zero frequency limiting value of  $u_d^*$  is the normal electrophoretic mobility, and (ii) the frequency dependence of  $u_d^*$  can be used to estimate not only the  $\zeta$ -potential, but also (for particle radius  $> -40$  nm) the particle size distribution. Since the calculation of the  $\zeta$ -potential in the general case requires a knowledge of  $\kappa a$  it is helpful to have available the most appropriate estimate of the average particle size (most colloidal dispersions are polydisperse, and there are many possible "average" sizes which might be chosen). Although the calculation of the  $\zeta$ -potential from the experimental measurements would be a rather laborious procedure, the necessary software for effecting the conversion is provided as an integral part of the available measuring systems, for both dilute and moderately concentrated sols. The effects of SLC can also be eliminated in some cases, without access to alternative measuring devices, simply by undertaking a titration with an indifferent electrolyte.

In the case of methods based on the direct evaluation of  $I_{CV}$ , the use of different frequencies, if available, or of acoustic attenuation measurements, allows the determination of particle size distributions.

#### 4.8 Method based on the concept of dynamic electrophoretic mobility

The symmetry relations lead to the following expressions, relating the different electroacoustic phenomena to the dynamic electrophoretic mobility,  $u_d^*$  [82, 83]:

$$\frac{U_{CV}}{\Delta P} \propto \phi \frac{\Delta \rho}{\rho} \frac{u_d^*}{K^*} \quad (76)$$

$$\frac{I_{CV}}{\Delta p} \propto \phi \frac{\Delta \rho}{\rho} u_d^* \quad (77)$$

$$\frac{A_{ESA}}{E} \propto \phi \frac{\Delta \rho}{\rho} u_d^* \quad (78)$$

Although the kinetic coefficients on the right-hand side of these relations (both magnitude and phase) can readily be measured at any particle concentration, there is some difficulty (see below) in the conversion of  $u_d^*$  to a  $\zeta$ -potential, except for the simplest case of spherical particles in fairly dilute suspensions (up to a few vol %). In this respect, the situation is similar to that for the more conventional electrophoretic procedures. There are, though, some offsetting advantages. In particular, the ability to operate on concentrated systems obviates the problems of contamination which beset some other procedures. It also makes possible meaningful measurements on real systems without the need for extensive dilution, which can compromise the estimation of  $\zeta$ -potential, especially in emulsions systems.

#### 4.9 Dilute systems (up to ~4 vol %)

1. For a dilute suspension of spherical particles with  $\kappa a \gg 1$  and arbitrary  $\zeta$ -potential, the following equation can be used [84], which relates the dynamic mobility with the  $\zeta$ -potential and other particle properties:

$$u_d^* = \left( \frac{2\epsilon_{rs}\epsilon_0\zeta}{3\eta} \right) (1+f)G(\alpha) \quad (79)$$

The restriction concerning double-layer thickness requires in practice that  $\kappa a > \sim 20$  for reliable results, although the error is usually tolerable down to about  $\kappa a = 13$ .

The function  $f$  is a measure of the tangential electric field around the particle surface. It is a complex quantity, given by

$$f = \frac{1+i\omega' - [2Du + i\omega'(\epsilon_{rp}/\epsilon_{rs})]}{2(1+i\omega') + [2Du + i\omega'(\epsilon_{rp}/\epsilon_{rs})]} \quad (80)$$

where  $\omega' \equiv \omega\epsilon_{rs}\epsilon_0/K_L$  is the ratio of the measurement frequency,  $\omega$ , to the Maxwell–Wagner relaxation frequency of the electrolyte. If it can be assumed that the tangential current around the particle is carried essentially by ions outside the shear surface, then  $Du$  is given by the  $Du^d$  (eqs. 16–19); see also [85]\*.

The function  $G(\alpha)$  is also complex and given by

$$G(\alpha) = \frac{1+(1+i)\sqrt{\alpha/2}}{1+(1+i)\sqrt{\alpha/2} + i\frac{\alpha}{9}(3+2\Delta\rho/\rho)} \quad (81)$$

It is a direct measure of the inertia effect. The dimensionless parameter  $\alpha$  is defined as

$$\alpha = \frac{\omega a^2 \rho}{\eta} \quad (82)$$

\* If this assumption breaks down,  $Du$  must be estimated by reference to a suitable surface conductance model or, preferably, by direct measurement of the conductivity over the frequency range involved in the measurement (normally from about 1 to 40 MHz) [86]. Another procedure involved the analysis of the results of a salt titration (see previous subsection).

so  $G$  is strongly dependent on the particle size.  $G$  varies monotonically from a value of unity, with zero phase angle, when  $a$  is small (less than  $0.1 \mu\text{m}$  typically) to a minimum of zero and a phase lag of  $\pi/4$  when  $a$  is large (say,  $a > 10 \mu\text{m}$ ).

Equations 80–82 are, as mentioned above, applicable to systems of arbitrary  $\zeta$ -potential, even when conduction occurs in the stagnant layer, in which case  $Du$  in eq. 80 must be properly evaluated. They have been amply confirmed by measurements on model suspensions [86], and have proved to be of particular value in the estimation of high  $\zeta$ -potentials [87]. The maximum that appears in the plot of dc mobility against  $\zeta$ -potential ([22], see also Fig. 2) gives rise to an ambiguity in the assignment of the  $\zeta$ -potential, which does not occur when the full dynamic mobility spectrum is available.

2. For double layers with  $\kappa a < \sim 20$ , there are approximate analytical expressions [88, 89] for dilute suspensions of spheres, but they are valid only for low  $\zeta$ -potentials. They have been checked against the numerical solutions for general  $\kappa a$  and  $\zeta$  [90, 91], and those numerical calculations have been subjected to an experimental check in [92].
3. The effect of particle shape has been studied in [93,94], again in the limit of dilute systems with thin double layers. This analysis has been extended in [95] to derive formulae for cylindrical particles with zero permittivity and low  $\zeta$ -potentials, but for arbitrary  $\kappa a$ . The results are consistent with those of [93, 94].

#### 4.10 Concentrated systems

The problem of considering the effect on the electroacoustic signal of hydrodynamic or electrostatic interactions between particles in concentrated suspensions was first theoretically tackled [96] by using the cell model of Levine and Neale [97, 98] to provide a solution that was claimed to be valid for  $U_{CV}$  measurements on concentrated systems (see [87] for a discussion on the validity of such approach in the high-frequency range).

It is possible to deal with concentrated systems at high frequency without using cell models in the case of near neutrally buoyant systems (where the relative density compared to water is in the range 0.9–1.5) using a procedure developed by O'Brien [99, 100]. In that case, the interparticle interactions can be treated as pairwise additive and only nearest-neighbor interactions need to be taken into account. An alternative approach is to estimate the effects of particle concentration considering in detail the behavior of a pair of particles in all possible orientations [101, 102]. Empirical relations have been developed that appear to represent the interaction effects for more concentrated suspensions up to volume fractions of 30% at least. In [103], an example can be found where the dynamic mobility was analyzed assuming the system to be dilute. The resulting value of the  $\zeta$ -potential ( $\zeta_{app}$ ) was then corrected for concentration using the semi-empirical relation:

$$\zeta_{corr} = \zeta_{app} \exp\{2\phi[1+s(\phi)]\}, \quad \text{with } s(\phi) = \frac{1}{1+(0.1/\phi)^4} \quad (83)$$

Finally, O'Brien et al. [104] have recently developed an effective analytical solution to the concentration problem for the dynamic mobility.

#### 4.11 Method based on the direct evaluation of the $I_{CV}$

This approach [105] applies a “coupled phase model” [106–109] for describing the speed of the particle relative to the liquid. The

Kuwabara cell model [110] yields the required hydrodynamic parameters, such as the drag coefficient, whereas the Shilov–Zharkikh cell model [111] was used for the generalization of the Kuwabara cell model to the electrokinetic part of the problem.

The method allows the study of polydisperse systems without using any superposition assumption. It is important in concentrated systems, where superposition does not work because of the interactions between particles.

An independent exact expression for  $I_{CV}$  in the quasi-stationary case of low frequency, using Onsager's relationship and the HS equation, and neglecting the surface conductivity effect ( $Du \ll 1$ ), is [105]

$$I_{CV}|_{\omega \rightarrow 0} = \frac{\epsilon_{is} \epsilon_0 \zeta K_{DC} \phi (\rho_p - \rho_s) dp}{\eta K_L \rho_s dx} \quad (84)$$

where  $x$  is the coordinate in the direction of propagation of the pressure wave,  $\rho_s$  is the density of the suspension (not of the dispersion medium: this is essential for concentrated suspensions, see [112]). Equation 84 is the analog of the HS equation for stationary electrophoretic mobility. It has been claimed to be valid over the same wide range of real dispersions, with particles of any shape and size, and any concentration.

#### 4.11.1 Experimental procedures

In the basic experimental procedures, an ac voltage is applied to a transducer that produces a sound wave which travels down a delay line and passes into the suspension. This acoustic excitation causes a very small periodic displacement of the fluid. Although the particles tend to stay at rest because of their inertia, the ionic cloud surrounding them tends to move with the fluid to create a small oscillating dipole moment. The dipole moment from each particle adds up to create an electric field that can be sensed by the receiving transducer. The voltage difference that then appears between the electrodes (measured at zero current flow) is proportional to  $U_{CV}$ . The current, measured under short-circuit conditions, is a measure of  $I_{CV}$ . Alternatively, an ac electric field can be applied across the electrodes. A sound wave is thereby generated near the electrodes in the suspension, and this wave travels along the delay line to the transducer. The transducer output is then a measure of the ESA effect. For both techniques, measurements can be performed for just one frequency or for a set of frequencies ranging between 1 and 100 MHz, depending on the instrument.

Recently, the term *electroacoustic spectrometry* has been coined to refer to the measurement of the dynamic mobility as a function of frequency (see Fig. 8 for some examples of the kind of spectra that can be obtained). The plot of magnitude and phase of  $u_d^*$  over a range of (MHz) frequencies may yield information about the particle size as well as the  $\zeta$ -potential [86, 113], provided the particles are in a suitable size range (roughly  $0.05 \mu\text{m} < a < 5 \mu\text{m}$ ). For smaller particles, the signal provides a measure of the  $\zeta$ -potential, but an independent estimate of size is needed for quantitative results. That can be provided by, for instance, ultrasonic attenuation measurements with the same device.

#### 4.11.2 Samples for calibration

The original validation of the ESA technique was achieved by comparing the theoretical dynamic mobility spectrum, as given by eqs. 80–82, with the experimentally measured values. That comparison has been done for a number of silica, alumina, titania, and goethite samples, and some pharmaceutical emulsion samples

**FIGURE 8:** Modulus (a) and phase angle (b) of the dynamic mobility of spherical particles in a KCl solution with  $\kappa a = 20$  as a function of frequency for different  $\zeta$ -potentials; cf., eqs. 80–82. Parameters: particle radius 100 nm; dielectric constant of the particles (dispersion medium): 2 (78.54); density of the particles (dispersion medium):  $5 \cdot 10^3$  ( $1 \cdot 10^3$ )  $\text{kg m}^{-3}$ .

[86]. Presently, the calibration standard is a salt solution (potassium dodecatungstosilicate). This salt has a significant ESA signal that can be calculated from its known transport and equilibrium thermodynamic properties (namely, the transport numbers and partial molar volumes of the ions) [85]. Once calibrated, the instrument allows a direct measure of both the size and  $\zeta$ -potential of the particles. When applied to monodisperse suspensions of spherical particles, the instrument gives results that agree, for both size and  $\zeta$ -potential, with more conventional methods.

In  $I_{CV}$  measurements, calibration is often carried out using a colloid with known  $\zeta$ -potential, such as Ludox™ (commercially available colloidal silica), which is diluted to a mass concentration of  $0.1 \text{ g/cm}^3$  with  $10^{-2} \text{ mol L}^{-1}$  KCl.

## 5. Electrokinetics in nonaqueous systems

### 5.1 Difference with aqueous systems: Permittivity

The majority of the investigations of EKP are devoted to aqueous systems, for which the main charging mechanisms of solid/water interfaces have been established and the EDL properties are fairly well known. All general theories of EKP assume that

the equations relating them to the  $\zeta$ -potential are applicable to any liquid medium characterized by two bulk properties: *electric permittivity*  $\epsilon_{rs}\epsilon_0$  and *viscosity*  $\eta$ . The value of  $\epsilon_{rs}$  is an important parameter of the liquid phase, because it determines the dissociation of the electrolytes embedded in it. Most nonaqueous solvents are less polar than water, and hence  $\epsilon_{rs}$  is lower. All liquids can be classified roughly as nonpolar ( $\epsilon_{rs} \leq 5$ ), weakly polar ( $5 < \epsilon_{rs} \leq 12$ ), moderately polar ( $12 < \epsilon_{rs} \leq 40$ ), and polar ( $\epsilon_{rs} > 40$ ).

For  $\epsilon_{rs} > 40$ , dissociation of most dissolved electrolytes is complete, and all equations concerning EDL or EKP remain unmodified, except that a lower value for  $\epsilon_{rs}$  has to be used. For moderately polar solvents, the electrolyte dissociation is incomplete, which means that the concentration of charged species (i.e., the species that play a role in EDL or EKP) may be lower than the corresponding electrolyte concentration. Moreover, the charge number of the charge carriers can become lower. For instance, in solutions of  $\text{Ba}(\text{NO}_3)_2$ , we may find not (only)  $\text{Ba}^{2+}$  and  $\text{NO}_3^-$  ions, but (also)  $\text{Ba}(\text{NO}_3)^+$  complexes. The category of weakly polar solvents is a transition to the class of nonpolar liquids, for which the relative permittivity (at infinite frequency) equals the square of the index of refraction. Such liquids exhibit no self-dissociation, and the notion of electrolytes almost completely dissociated loses its meaning. However, even in such media, special types of molecules may dissociate to some extent and give rise to the formation of EDL and EKP. It is this group that we shall now emphasize.

Unlike in aqueous media, dissociation in these solvents occurs only for potential electrolytes that contain ions of widely different sizes. Once dissociation occurs, the tendency for re-dissociation is relatively small because the charge on the larger ion is distributed over a large area. However, the concentration of ions ( $c_+$ ,  $c_-$ ) is very small. An indication of the magnitude of  $c_+$  and  $c_-$  can be obtained from conductivity measurements.

Particles embedded in such a liquid can become charged when one type of ion can be preferentially adsorbed. Typically, the resulting surface charges,  $\sigma^0$ , are orders of magnitude lower than in aqueous systems. However, because of the very low EDL capacitance, the resulting surface potentials,  $\psi^0$ , are of the same order of magnitude as in aqueous systems.

The very slow decay of the potential with distance has two consequences. First, as the decay between surface and slip plane is negligible,  $\psi^0 \approx \zeta$ . This simplifies the analysis. Second, the slow decay implies that colloid particles “feel” each other’s presence at long range. So, even dilute sols may behave physically as “concentrated” and formation of small clusters of coagulated particles is typical.

Interestingly, electrophoresis can help in making a distinction between concentrated and dilute systems by studying the dependence of the electrophoretic mobility on the concentration of dispersed particles. If there is no dependence, the behavior is that of a dilute system. In this case, equations devised for dilute systems can be used. Otherwise, the behavior is effectively that of a concentrated system, and ESA or  $U_{CV}$  measurements are more appropriate [86].

## 5.2 Experimental requirements of electrokinetic techniques

The methods described are also applicable to electrokinetic measurements in nonaqueous systems, but some precautions need to be taken. Microelectrophoresis cells are often designed for aqueous and water-like media whose conductivity is high relative to that of the material from which the cell is made. A homogeneous electric field between the electrodes of such cells filled with well- or moderately conducting liquids is readily achieved. However, when the cell is filled with a low-conductivity liquid, the homogeneity of the electric field can be disturbed by the

more conducting cell walls and/or by the surface conduction due to adsorption of traces of water dissolved from the solvents of low polarity on the more hydrophilic cell walls. Special precautions (coating the walls with hydrophobic layers) are necessary to improve the field characteristics. The electric field in cells of regular geometrical shape is calculated from the measured current density and the conductivity of the nonaqueous liquid. Because of the low ionic strength of the latter, electrode polarization may occur and it can sometimes be observed as bubble formation. Hence, an additional pair of electrodes is often used for the measurements of the voltage gradient across the cell.

For the correct measurement of the *streaming potential* in nonaqueous systems, attention must be paid to ensure that the resistance of the capillary, plug, or diaphragm filled with liquid is at least 100 times less than the input impedance of the electrical measuring device. The usual practice is to use millivoltmeter-electrometers with input resistance higher than  $10^{14} \Omega$  and platinum gauze electrodes placed in contact with the ends of the capillary or plug for both resistance and streaming potential measurements. The resistance is usually measured with an ac bridge in the case of polar solvents (typical frequencies used are around a few kHz) and by dc methods in the case of nonpolar or weakly polar liquids. The use of data recording on the electrometer output is common practice to check the rate of attainment of equilibrium and possible polarization effects.

## 5.3 Conversion of electrokinetic data into $\zeta$ -potentials

The first step in interpreting the electrokinetic behavior of nonaqueous systems must be to check whether the system behaves as a dilute or as a concentrated system (see Section 5.2). In the dilute regime, all theories described for aqueous systems can be used, provided one can find the right values of the essential parameters  $\kappa a$ ,  $K_p$ , and  $K^\sigma$ .

The calculation of  $\kappa$  requires knowledge of the ionic strength of the solution; this, in turn, can be estimated from the measurement of the dialysate conductivity,  $K_L$ , and knowledge of the mobilities and valences of the ionic species.

The effective conductivity of the solid particle,  $K_{pef}$ , including its surface conductivity\* can be calculated from the experimental values of conductivities of the liquid  $K_L$ , and of a dilute suspension of particles,  $K$ , with volume fraction  $\phi$  using either Street’s equation

$$\frac{K_{pef}}{K^L} = 1 + \frac{2}{3} \frac{\frac{K}{K_L} - 1}{\phi} \quad (85)$$

or Dukhin’s equation

$$\frac{K_{pef}}{K^L} = 2 \frac{(1-\phi) - \frac{K}{K_L}(1+\phi/2)}{(1-\phi) \frac{K}{K_L} - (1+2\phi)} \quad (86)$$

which accounts for interfacial polarization.

\* The low conductivity of nonaqueous media with respect to aqueous solutions is the main reason why often the finite bulk conductivity of the dielectric solids cannot be neglected. In contrast, if one can assume that no water is adsorbed at the interface, any SLC effect can be neglected. Furthermore, the joint adsorption of the ionic species of both signs or (and) the adsorption of such polar species as water at the solid/liquid interface can produce an abnormally high surface conduction. This is not due to the excess of free charges in the EDL, commonly taken into account in the parameter  $K^\sigma$  of the generalized theories of EKP. Rather, it is conditioned by the presence of thin, highly conducting adsorption layers. Therefore, the ratio  $K_{pef}/K_L$  is an important parameter that has to be estimated for nonaqueous systems.

For the estimation of the  $\zeta$ -potential in the case of electrophoresis, considering that low  $\kappa a$  values are not rare, it is suggested to use Henry's theory, after substitution of  $K_{\text{pef}}$  estimated as described above, for the particle conductivity. In formulas, it is suggested to employ eqs. 29 and 30.

Concerning streaming potential/current or electro-osmotic flow measurements, all the above-mentioned features of non-aqueous systems must be taken into account to obtain correct values of  $\zeta$ -potential from this sort of data in either single capillaries, porous plugs, or diaphragms. In view of the low  $\kappa a$  values normally attained by nonaqueous systems, the Rice and Whitehead curvature corrections are recommended [50]; see eqs. 37–39, 44, and 50.

Finally, electroacoustic characterization of  $\zeta$ -potential in non-aqueous suspensions requires subtraction of the background arising from the equilibrium dispersion medium. This is imperative because the electroacoustic signal generated by particles in low- or nonpolar media is very weak. It is recommended to make measurements at several volume fractions in order to ensure that the signal comes, in fact, from the particles.

Note that there is one more issue that complicates the formulation of a rigorous electrokinetic theory in concentrated nonaqueous systems, namely, the conductivity of a dispersion of particles in such media becomes position-dependent, as the double layers of the particles may occupy most of the volume of the suspension. This is a significant theoretical obstacle in the elaboration of the theory. In the case of EKP based on the application of nonstationary fields (dielectric dispersion, electroacoustics), this problem can be overcome. This is possible because one of the peculiarities of low- and nonpolar liquids compared to aqueous systems is the very low value of the Maxwell–Wagner–O’Konski frequency, eqs. 57 and 58. This means that in the modern electroacoustic methods based on the application of electric or ultrasound fields in the MHz frequency region, all effects related to conductivity can be neglected, because that frequency range is well above the Maxwell–Wagner characteristic frequency of the liquid. This makes electroacoustic techniques most suitable for the electrokinetic characterization of suspensions in nonaqueous media.

## 6. Remarks on non-ideal surfaces

### 6.1 General comments

The general theory of EKP described so far strictly applies to *ideal*, *nonporous*, and *rigid* surfaces or particles. By *ideal*, we mean smooth (down to the scale of molecular diameters) and chemically homogeneous, and we use *rigid* to describe those particles and surfaces that do not deform under shear. We will briefly indicate interfaces that are nonporous and rigid as *hard interfaces*. For hard particles and surfaces, there is a sharp change of density in the transition between the particle or surface and the surrounding medium. Hard particles effectively lead to stacking of water (solvent, in general) molecules; that is, only for hard surfaces the notion of a stagnant layer close to the real surface is conceptually simple. Not many surfaces fulfill these conditions. For instance, polystyrenesulfonate latex colloid has, in fact, a heterogeneous interface: the hydrophilic sulfate end-groups of its polymer chains occupy some 10 % of the total surface of the particles, the remainder being hydrophobic styrene. Moreover, the sulfate groups will protrude somewhat into the solution. Generally speaking, many interfaces are far from molecularly smooth, as they may contain pores or can be somewhat deformable. Such interfaces can briefly be indicated as *soft interfaces*. For soft interfaces, such as, for instance, rigid particles with “soft” or

“hairy” polymer layers, gel-type penetrable particles and water–air or water–oil interfaces, the molecular densities vary gradually across the phase boundary. A main problem in such cases is the description of the hydrodynamics, and in some cases it is even questionable if a discrete slip plane can be defined operationally.

The difficulties encountered when interpreting experimental results obtained for non-ideal interfaces depend on the type and magnitude of the non-idealities and on the aim of the measurements. In practice, one can always measure some quantity (like  $u_e$ ), apply some equation (like HS) to compute what we can call an “effective”  $\zeta$ -potential, but the physical interpretation of such a  $\zeta$ -potential is ambiguous. We must keep in mind that the obtained value has only a relative meaning and should not be confused with an actual electrostatic potential close to the surface. Nevertheless, such an “effective  $\zeta$ ” can help us in practice, because it may give some feeling for the sign and magnitude of the part of the double-layer charge that controls the interaction between particles. When the purpose of the measurement is to obtain a realistic value of the  $\zeta$ -potential, there is no general recipe. It may be appropriate to use more than one electrokinetic method and to take into account the specific details of the non-ideality as well as possible in each model for the calculation of the  $\zeta$ -potential. If the  $\zeta$ -potentials resulting from both methods are similar, physical meaning can be assigned to this value.

Below, we will discuss different forms of non-ideality in somewhat more detail. We will mainly point out what the difficulties are, how these can be dealt with and where relevant literature can be found.

### 6.2 Hard surfaces

Some typical examples of non-ideal particles that still can be considered as hard are discussed below. Attention is paid to size and shape effects, surface roughness, and surface heterogeneity. For hard non-ideal surfaces, both the stagnant-layer concept and the  $\zeta$ -potential remain locally defined and experimental data provide some average electrokinetic quantity that will lead to an average  $\zeta$ -potential. The kind of averaging may depend on the electrokinetic method used, therefore, different methods may give different average  $\zeta$ -potentials.

#### 6.2.1 Size effects

For rigid particles that are spherical with a homogeneous charge density, but differ in size, a rigorous value of the  $\zeta$ -potential can be found if the electrokinetic quantity measured is independent of the particle radius,  $a$ . In general, this will be the case for  $\kappa a \gg 1$  (HS limit). In the case of electrophoresis, the mobility is also independent of  $a$  for  $\kappa a < 1$  (HO limit). For other cases, the particle size will come into play and most of the time an average radius has to be used to calculate an average  $\zeta$ -potential [3, 114]. The type of average radius used will, in principle, affect the average  $\zeta$ -potential. Furthermore, different EKP may require different averages. For instance, in [115] it was found that a simple number average is suitable for analysis of electrophoresis in polydisperse systems; a volume average, on the other hand, was found to be the best choice when discussing dielectric dispersion. In principle, the best solution would be found if the full size distribution is measured, but even in such a case the signal-processing procedure must be taken into account. For instance, in ELS methods, the scattering of light by particles of different sizes is determinant for the average  $u_e$  value found by the instrument. In this context, measuring the dynamic mobility spectrum may be useful in providing information on both the size and the  $\zeta$ -potential from the same signal.

### 6.2.2 Shape effects

For nonspherical particles (cylinders, discs, rods, etc.) of homogeneous  $\zeta$ -potential, the induced dipole moment is different for different orientations with respect to the applied field (i.e., it acquires a tensorial character). Only when the systems are sufficiently simple (cylinders, rods) is it sufficient to distinguish between a parallel and a normal orientation of the dipoles to the applied field [116]. In spite of these additional difficulties, some approximate approaches to either the electrophoresis [117–120] or the permittivity [121, 122] of suspensions of nonspherical particles are available.

A more complicated situation arises if the particles are polydisperse in shape and size. Except if  $\kappa a \gg 1$  (HS equation valid) or if  $\kappa a \ll 1$  (HO limit), the only (approximate) approach is to define an “equivalent spherical particle” (for instance, one having the same volume as the particle under study) and use theories developed for spheres. In that case, the “average”  $\zeta$ -potential that is obtained depends on the type(s) of polydispersity of the sample and the definition used for the “equivalent sphere”.

### 6.2.3 Surface roughness

Most theories described so far assume that the interface is smooth down to a molecular scale. However, even the surfaces prepared with the strictest precautions show some degree of roughness, which will be characterized by  $R$ , the typical dimension of the mountains or valleys present on the surface. However, surface roughness (with  $R$  as a measure of the roughness size) affects the position of the plane of shear except in conditions where  $\kappa R \gg 1$  (HS limit) or  $\kappa R \ll 1$  (roughness not seen). If it is assumed that the outer parts of the asperities determine the position of the slip plane, there will be diffusely bound or even free ions in the valleys. This will inevitably lead to large surface conductivities behind the apparent slip plane, and to an additional mechanism of stagnancy [6, 116, 123]. Due care must be taken to measure this conductivity and to take it into account in evaluating the  $\zeta$ -potentials. Experiments with surfaces of well-defined roughness are required to gain further insight in the complications.

We will not proceed with a more thorough description of these highly specialized—and mostly unsolved—topics. As a rule of thumb, we recommend that the reader deal with an interface of known, high roughness to use a simple approach based on the calculation of an effective  $\zeta$ -potential obtained under the assumption that the interface is smooth, but to refrain from using this effective  $\zeta$  for further calculations. This is particularly true if the estimation of interaction energies between the particles is sought, as it has been shown [124] that asperities have a considerable effect on both electrostatic and van der Waals forces between colloid particles.

### 6.2.4 Chemical surface heterogeneity

In general, chemical surface heterogeneity will also lead to surface charge heterogeneity. When the charges do not protrude into the solution, the position of the slip plane is unaffected. With charge heterogeneity, often two extreme cases are considered: (1) a *random* or *regular* heterogeneity that is assumed to lead to one (smeared-out) surface charge density and also one (averaged) electrokinetic potential and electrokinetic charge density at given solution conditions; and (2) a *patchwise* heterogeneity with large patches. The patches will lead to an inhomogeneous charge distribution. In this case, it is usually assumed that each patch has its own smeared-out charge density at given solution conditions. The characteristic size of the patches should be at

least of the order of the Debye length, otherwise the surface may be considered as regularly heterogeneous with one smeared-out charge density over the entire surface. Particles with random heterogeneity can be treated in the same way as particles with a homogeneous charge density, so it does not present additional problems.

The patchwise heterogeneity case applies, for instance, to surfaces with different crystal faces. The electrokinetic theory for this type of surface has been considered by several authors [118, 119, 125, 126]. Anderson et al. [127–129] have also performed experimental checks on the validity of some theoretical predictions. In the case of spherical particles, it has been demonstrated [130] that their motion depends on the first, second, and third moments of the  $\zeta$ -potential distribution along the surface of the particle. It is important to note that the second moment (dipole moment) brings about a rotational motion superimposed on the translational (when present) electrophoretic motion. Clay particles [126, 131], with anionic charges at the plate surfaces and pH-dependent charges at the edges, are typical examples of systems with patchwise heterogeneous surfaces.

A rather specific situation may appear in the case of sparse polyelectrolyte adsorption onto oppositely charged surfaces. This may lead to a mosaic-type charge distribution [132, 133]. Not only the very concepts of slip plane and hence  $\zeta$ -potential are doubtful here, but also electrokinetic data alone can lead us to erroneous conclusions. For instance, one can find a high  $|\mu_e|$  value for particles with attached polyelectrolytes and from this predict a high colloidal stability. This might not be found, since the patchwise nature of the charges might induce flocculation even in systems that have considerable average  $\zeta$ -potential. Such instability will be due to attraction between oppositely charged patches (corresponding to regions with and without adsorbed polyelectrolyte).

## 6.3 Soft particles

Some familiar examples in which the interface must be considered as soft are discussed below. The examples refer to two different groups. The first consists of hard particles with hairy, grafted, or adsorbed layers and of particles that are (partially) penetrable. The hydrodynamic permeability and the conductivity in the permeable layer make the interpretation of the data complicated. The second group are the water–oil or water–air interfaces. Droplets and bubbles comprise a specific class of “soft” particles, for which the definition of the slip plane is an academic question. When and how this issue can be solved depends on the surface active components present at the interface.

### 6.3.1 Charged particles with a soft uncharged layer

For a good understanding of charged hard particles covered by nonionic surfactants or uncharged polymers, the position of the slip plane and conduction behind the slip plane must be considered. It is very useful to also investigate the bare particles. Neutral adsorbed layers reduce the tangential fluid flow and the tangential electric current near a particle surface, but to a different extent [134]. Both reductions have to be considered for a correct interpretation of the electrokinetic results. By doing this, the comparison of the results between bare and covered particles may give information about the net particle potential and effective particle charge, the surface charge adjustment, and the adsorbed-layer thickness [135]. Let us mention that electroacoustic studies of the dynamic mobility spectrum of particles coated with adsorbed neutral polymer can give information on the thickness of the adsorbed layer and the shift of the slip plane due to the polymer [136].

### 6.3.2 Uncharged particles with a soft charged layer

The surface of many latex particles can be considered as being itself uncharged, but with charged groups at the end of oligomeric or polymeric “hairs” that protrude into the solution. The extension of the “hairs” from the surface into the liquid determines the position of the apparent slip plane. Due to the ion penetrability of the stagnant layer, the ionic strength will affect the distance between the surface and this (apparent) slip plane, and the electric conduction in the stagnant layer and this will lead to a more complex ionic strength dependence of the  $\zeta$ -potential than with rigid particles. Some studies account for these effects through the introduction of a “softness factor” [137, 138] as a fitting parameter. Stein [139] discusses the electrokinetics of polystyrene latex particles in more detail. Hidalgo-Álvarez et al. [140] discuss the anomalous electrokinetic behavior of polymer colloids in general.

### 6.3.3 Charged particles with a soft charged layer

Charged particles with adsorbed or grafted polyelectrolyte or ionic surfactant layers fall in this class. The complications arising with these systems are similar to those mentioned for the uncharged surfaces with charged layers. Adsorbed layers impede tangential fluid flow; therefore, in the presence of the bound layer the hydrodynamic particle radius increases and the apparent slip plane is moved outwards. This affects the tangential electric current. In most cases, the particle surface and the bound layers will have opposite charges, and, therefore, the electrostatic potential profile is rather complicated. The EKP will be dominated by conduction within the slip plane and the potential at the hydrodynamic boundary relatively far away from the surface [114, 141, 142]. To unravel the situation, a systematic investigation is required that considers the electrokinetic behavior of both uncovered and covered particles, the shift of the apparent slip plane and the conduction behind the slip plane. When qualitative information is required with respect to the net charge of the particle plus adsorbed layer, the sign of the  $\zeta$ -potential is important, as it will indicate whether the particle charge is overcompensated or not (within the plane of shear).

### 6.3.4 Ion-penetrable or partially penetrable particles

Some proteins, many biological cells, and other natural particles are penetrable for water and ions. The most important complications for the description of the electrokinetic behavior of such particles are associated with the conductivity, the dielectric constant, and the liquid transport inside the particles. An additional complication occurs when the particles are able to swell depending on the solution conditions.

When the particles are only partially penetrable, we may consider them as hard with a gel-like corona. This situation is very similar to hard particles coated with a polyelectrolyte layer. In the limit of a very small particle with a very thick corona, the penetrable particle limit results. The simplest models assume that the electrical potential inside the gel layer is the Donnan potential, whereas the hindered motion of liquid in it is represented by a friction parameter incorporated in the Navier–Stokes equation [143–146]. Ohshima’s theory of electrophoresis of soft spheres basically ranges from hard particles to penetrable particles. References to his work can be found in his review on EKP [140].

Systems with biological or medical relevance that have received some systematic attention are protein-coated latex particles [147],

electrophoresis of biological cells [148], liposomes [149], and bacteria [150].

### 6.3.5 Liquid droplets and gas bubbles in a liquid

The electrophoresis of uncontaminated liquid droplets and gas bubbles in a liquid show quite different behavior from that of rigid particles. The main reason is that flow may also occur within the droplets or bubbles because there is momentum transfer across the interface. The classical notion of a slip plane loses its meaning. Due to the flow inside the droplet or bubble, the tangential velocity of the liquid surrounding the droplet does not have to become zero at the surface of the particle. As a result, the electrophoretic mobility is higher than for a corresponding rigid body. However, to model this situation and to arrive at a conversion of the mobility to a  $\zeta$ -potential is not a trivial task. As there is no slip plane, even the HS model cannot be applied.

In general, however, droplets or bubbles are not stable without an adsorbed layer of a surface active component (surfactant, polymer, poly electrolyte, protein). Most layers will make the surface inextensible (rigid) if (nearly) completely covered. In this case, the surface behaves as rigid, and it is possible to use the treatments for rigid particles [3]. Even the presence of the double layer itself, through the primary electroviscous effect, makes momentum transfer to the liquid drop very slight [151].

For partially covered bubbles (as in flotation), the situation is more complex; surface inhomogeneities may occur under the influence of shear, and Marangoni effects become important. Problems arise with regard to the definition of the slip plane, its location, and the charge inhomogeneity [152].

## 7. Discussion and recommendations

From the analyses given above, it will be clear that the computation of the  $\zeta$ -potential from experimental data is not always a trivial task. For each method, the fundamental requirement for the conversion of experimental data is that models should be correctly used within their range of applicability. The bottom line is that the  $\zeta$ -potential does exist as a characteristic of a charged surface under fixed conditions. This is fortunate, because otherwise, how could two authors compare their results with the same material using two electrokinetic techniques, or even two different versions of the same technique?

This means that we must focus on the correct use of the existing theories, and in their improvement, if necessary. The sometimes-asked question: “Is the computed  $\zeta$ -potential independent of the technique used?” must be answered with *yes*, because  $\zeta$ -potentials are unique characteristics for the charge state of interfaces under given conditions. Whether by different techniques identical  $\zeta$ -potentials are indeed observed depends on the quality of both the technique and the interpretation. Measuring different electrokinetic properties for a given material in a given liquid medium, and checking the equality of  $\zeta$ -potentials using appropriate models, is what Lyklema calls an *electrokinetic consistency test* [3], and what Dukhin and Derjaguin called *integrated electro-surface investigation* [5].

Another related question that could be asked is “Is the  $\zeta$ -potential the only property characterizing the electrical equilibrium state of the interfacial region?” The answer is *most often it is not*. Most recent models and experimental results demonstrate that in the majority of cases the conductivity behind the slip

plane must also be taken into account. This implies that for a correct evaluation, the  $Du$  number should also be measured. Using  $Du$  only to characterize the interface has, in general, no practical interest either. One experimental electrokinetic technique suffices only if  $K^{\sigma i}/K^{\sigma d}$  is small because then  $Du(\zeta, K^{\sigma i}) \approx Du(\zeta)$ . The problem now is how does one know that  $K^{\sigma i}$  is in fact that small? We have some possibilities:

- If we have also access to the value of the potentiometrically measured surface charge,  $\sigma_0$ , the values of  $\sigma_{ek}$  (calculated from the value of the  $z$ -potential obtained by neglecting conductance behind the slip plane) and  $d$  can be compared. This comparison allows us to reach a first estimate of  $\sigma_i$ . From  $\sigma_i$   $K_{si}$  could be estimated assuming—as appears to be the case, at least for monovalent counterions—that the mobilities of ions in the inner layer are comparable to those in the bulk. When  $Du(z, K_{si}) \approx Du(z, 0) = Du(z)$ , the calculated value of  $z$  is correct, otherwise, it has to be recalculated taking the inner-layer conduction into account.
- In the case of capillaries or plugs, the total conductivity and the streaming potential can be measured. An initial value of  $K_{sd}$  can be obtained from  $z$  using Bikerman's equation, and  $K_{si}$  can be calculated. The improved value of  $z$  can now be obtained using a suitable model including inner-layer conduction, and again  $K_{\sigma d}$  and  $K_{si}$  can be obtained. If the difference between  $z$  computed without and with finite  $K_{si}$  is high, we should go back to the calculation of  $z$  and iterate till the difference between two steps is small.

If these approaches are not possible, there is no other way but employing different electrokinetic techniques on the same sample and performing the consistency test. In this respect, the best procedure would be using one technique in which neglecting  $K^{\sigma i}$  underestimates  $\zeta$  (electrophoresis, streaming potential, e.g.), and another in which  $\zeta$  is overestimated (dc conductivity, dielectric dispersion) [3].

For practical reasons—not every worker has available the numerical routines required for nonanalytical theories—another question emerges: “When can we use with confidence HS equations for the different types of electrokinetic data?”

Although most published data on  $\zeta$ -potentials are based on the various versions of the HS equation for EKP, let us stress that this approach is correct only if (eq. 2)  $\kappa a \gg 1$ , where  $a$  is a characteristic dimension of the system (curvature radius of the solid particle, capillary radius, equivalent pore radius of the plug,...), and furthermore, the surface conductance of any kind must be low, i.e.,  $Du(\zeta, K^{\sigma i}) \ll 1$ . Thus, in the absence of independent information about  $K^{\sigma i}$ , additional electrokinetic determinations can only be avoided for sufficiently large particles and high electrolyte concentrations.

Another caveat can be given, even if the previously mentioned conditions on dimensions and Dukhin number are met. For concentrated systems, the possibility of the overlap of the double layers of neighboring particles cannot be neglected if the concentration of the dispersed solids in a suspension or a plug is high. In such cases, the validity of the HS equation is also doubtful and cell models for either electrophoresis, streaming potential, or electroosmosis are required. Use of the latter two kinds of experiments or of electroacoustic or LFDD measurements is recommended. In all cases, a proper model accounting for interparticle interaction must be available.

## 8. Appendix I. Calculation of the low-frequency dielectric dispersion of suspensions

Neglecting SLC, the complex conductivity increment is related to the dipole coefficient as follows [62–64]:

$$\delta K^*(\omega) = \frac{3\phi}{a^3} K_L C_0^* = \delta K^* \Big|_{\omega \rightarrow 0} + 9\phi K_L \frac{(R^+ - R^-)H}{2AS} \frac{i\omega\tau_\alpha}{1 + \sqrt{S} \sqrt{i\omega\tau_\alpha + i\omega\tau_\alpha}} \quad (I.1)$$

Its low-frequency value is a real quantity:

$$\delta K^* \Big|_{\omega \rightarrow 0} = 3\phi K_L \left( \frac{2Du(\zeta) - 1}{2Du(\zeta) + 2} - \frac{3(R^+ - R^-)H}{2B} \right) \quad (I.2)$$

The dielectric increment of the suspension can be calculated from  $\delta K^* \Big|_{\omega \rightarrow 0}$  as follows:

$$\begin{aligned} \delta \epsilon_i^*(\omega) &= -\frac{1}{\omega \epsilon_0} \left( \delta K^* - \delta K^* \Big|_{\omega \rightarrow 0} \right) \\ &= \frac{9}{2} \phi \epsilon_{rs}' \frac{\tau_\alpha (R^+ - R^-)H}{\tau_{el} AS} \frac{1}{1 + \sqrt{S} \sqrt{i\omega\tau_\alpha + i\omega\tau_\alpha}} \end{aligned} \quad (I.3)$$

Here:

$$R^\pm = 4 \frac{\exp\left(\mp \frac{zy^{ek}}{2}\right) - 1}{\kappa a} + 6m^\pm \left[ \frac{\exp\left(\mp \frac{zy^{ek}}{2}\right) - 1}{\kappa a} \pm z \frac{zy^{ek}}{\kappa a} \right] \quad (I.4)$$

and

$$\tau_\alpha = \frac{a^2}{2D_{ef}} \frac{1}{S} \quad (I.5)$$

is the value of the relaxation time of the low-frequency dispersion. It is assumed that the dispersion medium is an aqueous solution of an electrolyte of  $z$ - $z$  charge type. The definitions of the other quantities appearing in eqs. I.1–5 and the  $\zeta$ -potential are as follows:

$$D_{ef} = \frac{2D^+ D^-}{D^+ + D^-} \quad (I.6)$$

$$A = 4Du(\zeta) + 4 \quad (I.7)$$

$$B = (R^+ + 2)(R^- + 2) - U^+ - U^- - (U^+ R^- + U^- R^+)/2 \quad (I.8)$$

$$S = \frac{B}{A} \quad (I.9)$$

$$H = \frac{(R^+ - R^-)(1 - z^2 \Delta^2) - U^+ + U^- + z\Delta(U^+ + U^-)}{A} \quad (I.10)$$

$$U^\pm = \frac{48m^\pm}{\kappa a} \ln \left[ \cosh \frac{zy_\zeta}{4} \right] \quad (\text{I.11})$$

$$\Delta = \frac{D^- - D^+}{z(D^- + D^+)} \quad (\text{I.12})$$

The factor  $1/S$  is of the order of unity, and comparison of eqs. 58 and I.5 leads to the important conclusion that

$$\frac{\tau_\alpha}{\tau_{\text{MWO}}} \approx (\kappa a)^2 \quad (\text{I.13})$$

This means that for the case of  $\kappa a \gg 1$ , the characteristic frequency for the  $\alpha$ -dispersion is  $(\kappa a)^2$  times lower than that of the Maxwell–Wagner dispersion.

## 11. List of symbols

Note: SI base (or derived) units are given in parentheses for all quantities, except dimensionless ones.

$a$ (m)	particle radius, local curvature radius, capillary radius	$L_D$ (m)	ionic diffusion length
$A_c$ (m <sup>2</sup> )	capillary cross-section	$m$	dimensionless ionic mobility of counterions
$A_c^{ap}$ (m <sup>2</sup> )	apparent (externally measured) capillary cross-section	$m+$ ( $m-$ )	dimensionless ionic mobility of cations (anions)
$A_{ESA}$ (Pa)	electrokinetic sonic amplitude	$n$ (m <sup>-3</sup> )	number concentration of particles
$b$ (m)	half distance between neighboring particles	$N_A$ (mol <sup>-1</sup> )	Avogadro constant
$c$ (mol m <sup>-3</sup> )	electrolyte concentration	$n_i$ (m <sup>-3</sup> )	number concentration of type $i$ ions
$c_+$ ( $c-$ ) (mol m <sup>-3</sup> )	concentration of cations (anions)	$Q_{eo}$ (m <sup>3</sup> s <sup>-1</sup> )	electro-osmotic flow rate
$C_0^*$	dipole coefficient of particles	$Q_{eo,E}$ (m <sup>4</sup> s <sup>-1</sup> V <sup>-1</sup> )	electro-osmotic flow rate per electric field
$d$ (m)	distance between the surface and the outer Helmholtz plane	$Q_{eo,I}$ (m <sup>3</sup> C <sup>-1</sup> )	electro-osmotic flow rate per current
$d^*$ (C m)	complex dipole moment	$r$ (m)	spherical or cylindrical radial coordinate
$d^{ek}$ (m)	distance between the surface and the slip plane	$R$ (m)	roughness of a surface
$D$ (m <sup>2</sup> s <sup>-1</sup> )	diffusion coefficient of counterions (or average diffusion coefficient of ions)	$R_s$ (Ω)	electrical resistance of a capillary or porous plug in an arbitrary solution
$D+$ ( $D-$ ) (m <sup>2</sup> s <sup>-1</sup> )	diffusion coefficient of cations (anions)	$R_\infty$ (Ω)	electrical resistance of a capillary or porous plug in a concentrated ionic solution
$Du$	Dukhin number	$T$ (K)	thermodynamic temperature
$Du^d$	Dukhin number associated with diffuse-layer conductivity	$U_d$ (m <sup>2</sup> s <sup>-1</sup> V <sup>-1</sup> )	dynamic electrophoretic mobility
$Du^i$	Dukhin number associated with stagnant-layer conductivity	$U_{CV}$ (V)	colloid vibration potential
$e$ (C)	elementary charge	$v_e$ (m <sup>2</sup> s <sup>-1</sup> V <sup>-1</sup> )	electrophoretic mobility
$E$ (V m <sup>-1</sup> )	applied electric field	$U_{sed}$ (V)	sedimentation potential
$E_{sed}$ (V m <sup>-1</sup> )	sedimentation field	$U_{str}$ (V)	streaming potential
$E_t$ (V m <sup>-1</sup> )	tangential component of external field	$v_e$ (m s <sup>-1</sup> )	electrophoretic velocity
$F$ (C mol <sup>-1</sup> )	Faraday constant	$v_{eo}$ (m s <sup>-1</sup> )	electro-osmotic velocity
$f_i(\kappa a), F_i(\kappa a, Kp)$	Henry's functions	$v_L$ (m s <sup>-1</sup> )	liquid velocity in electrophoresis cell
$I$ (A)	electric current intensity	$\gamma^{ek}$	dimensionless $\zeta$ -potential
$I_0 I_1$	zeroth- (first-) order modified Bessel functions of the first kind	$z$	common charge number of ions in a symmetrical electrolyte
$I_c$ (A)	conduction current	$z_i$	charge number of type $i$ ions
$I_{CV}$ (A)	colloid vibration current	$\alpha$	relaxation of double-layer polarization, degree of electrolyte dissociation, dimensionless parameter used in electroacoustics
$I_{str}$ (A)	streaming current	$\beta$ (m)	distance between the solid surface and the inner Helmholtz plane (see also eq. 45 for another use of this symbol)
$j^\sigma$ (A m <sup>-1</sup> )	surface current density	$\Gamma_i$ (m <sup>-2</sup> )	surface concentration of type $i$ ions
$j_{str}$ (A m <sup>-2</sup> )	streaming current density	$\delta_c$ (mol m <sup>-3</sup> )	field-induced perturbation of electrolyte amount concentration
$k$ (J K <sup>-1</sup> )	Boltzmann constant	$\delta K^*$ (S m <sup>-1</sup> )	conductivity increment of a suspension
$K$ (S m <sup>-1</sup> )	total conductivity of a colloidal system	$\delta_{er}$	relative dielectric increment of a suspension
$K_{DC}$ (S m <sup>-1</sup> )	direct current conductivity of a suspension	$\Delta_p$ (Pa)	applied pressure difference
$K_L$ (S m <sup>-1</sup> )	conductivity of dispersion medium	$\Delta_{peo}$ (Pa)	electro-osmotic counter-pressure
$K_L^\infty$ (S m <sup>-1</sup> )	conductivity of a highly concentrated ionic solution	$\Delta V_{ext}$ (V)	applied potential difference
$K_p$ (S m <sup>-1</sup> )	conductivity of particles	$\Delta_\epsilon(0)$	low-frequency dielectric increment per volume fraction
$K_{plug}$ (S m <sup>-1</sup> )	conductivity of a plug of particles	$\Delta_{ed}(0)$	value of $\Delta\epsilon(0)$ for suspensions with low volume fractions
$K_{p,ef}$ (S m <sup>-1</sup> )	effective conductivity of particles	$\Delta\rho$ (kg m <sup>-3</sup> )	density difference between particles and dispersion medium
$K_{rel}$	ratio between particle and liquid conductivities	$\epsilon^*$ (F m <sup>-1</sup> )	complex electric permittivity of a suspension
$K^*$ (S m <sup>-1</sup> )	complex conductivity of a suspension	$\epsilon_r^*$	complex relative permittivity of a suspension
$K^\sigma$ (S)	surface conductivity	$\epsilon_{rp}$	relative permittivity of the particle
$K^{\sigma d}$ (S)	diffuse-layer surface conductivity	$\epsilon_{rp}^*$	complex relative permittivity of a particle
$K^{\sigma i}$ (S)	stagnant-layer surface conductivity	$\epsilon_{rs}$	relative permittivity of the dispersion medium
$L$ (m)	capillary length, characteristic dimension		
$L^{ap}$ (m)	apparent (externally measured) capillary cross-section		

$\epsilon_{rs}^*$	complex relative permittivity of the dispersion medium	$\tau_{MWO}$ (s)	characteristic time of the Maxwell–Wagner–O’Konski relaxation
$\epsilon_0$ (F m <sup>-1</sup> )	electric permittivity of vacuum	$\tau_\alpha$ (s)	relaxation time of the low-frequency dispersion
$\zeta$ (V)	electrokinetic or $\zeta$ -potential	$\phi$	volume fraction of solids
$\zeta_{app}$ (V)	electrokinetic or $\zeta$ -potential not corrected for the effect of particle concentration	$\phi_L$	volume fraction of liquid in a plug
$\eta$ (Pa s)	dynamic viscosity	$\psi^d$ (V)	diffuse-layer potential
$\kappa$ (m <sup>-1</sup> )	reciprocal Debye length	$\psi^i$ (V)	inner Helmholtz plane potential
$\rho$ (kg m <sup>-3</sup> )	density of dispersion medium	$\psi^0$ (V)	surface potential
$\rho_p$ (kg m <sup>-3</sup> )	density of particles	$\omega$ (s <sup>-1</sup> )	angular frequency of an ac electric field
$\rho_s$ (kg m <sup>-3</sup> )	density of a suspension	$\omega_{MWO}$ (s <sup>-1</sup> )	Maxwell–Wagner–O’Konski characteristic frequency
$\sigma^d$ (C m <sup>-2</sup> )	diffuse charge density	$\omega_\alpha$ (s <sup>-1</sup> )	characteristic frequency of the $\alpha$ -relaxation
$\sigma^{ek}$ (C m <sup>-2</sup> )	electrokinetic charge density	$\omega_{ad}$ (s <sup>-1</sup> )	characteristic frequency of the $\alpha$ -relaxation for a dilute suspension
$\sigma^i$ (C m <sup>-2</sup> )	surface charge density at the inner Helmholtz plane		
$\sigma^0$ (C m <sup>-2</sup> )	titratable surface charge density

<sup>\*</sup>Corresponding author

**Abstract:** The definition of a “primary method of measurement” [1] has permitted a full consideration of the definition of primary standards for pH, determined by a primary method (cell without transference, Harned cell), of the definition of secondary standards by secondary methods, and of the question whether pH, as a conventional quantity, can be incorporated within the internationally accepted system of measurement, the International System of Units (SI, *Système International d’Unités*). This approach has enabled resolution of the previous compromise IUPAC 1985 Recommendations [2]. Furthermore, incorporation of the uncertainties for the primary method, and for all subsequent measurements, permits the uncertainties for all procedures to be linked to the primary standards by an unbroken chain of comparisons. Thus, a rational choice can be made by the analyst of the appropriate procedure to achieve the target uncertainty of sample pH. Accordingly, this document explains IUPAC recommended definitions, procedures, and terminology relating to pH measurements in dilute aqueous solutions in the temperature range 5–50°C. Details are given of the primary and secondary methods for measuring pH and the rationale for the assignment of pH values with appropriate uncertainties to selected primary and secondary substances.

## 1. Introduction and scope

### 1.1 pH, a single ion quantity

The concept of pH is unique among the commonly encountered physicochemical quantities listed in the IUPAC Green Book [3] in that, in terms of its definition [4],

$$\text{pH} = -\lg a_{\text{H}}$$

it involves a single ion quantity, the activity of the hydrogen ion, which is immeasurable by any thermodynamically valid method and requires a convention for its evaluation.

### 1.2 Cells without transference, Harned cells

As will be shown in Section 4, primary pH standard values can be determined from electrochemical data from the cell without transference using the hydrogen gas electrode, known as the Harned cell. These primary standards have *good* reproducibility and *low* uncertainty. Cells involving glass electrodes and liquid junctions have considerably *higher* uncertainties, as will be discussed later (Sections 5.1, 10.1). Using evaluated uncertainties, it is possible to rank reference materials as primary or secondary in terms of the methods used for assigning pH values to them. This ranking of primary (PS) or secondary (SS) standards is consistent with the metrological requirement that measurements are traceable with stated uncertainties to national, or international, standards by an unbroken chain of comparisons each with its own stated uncertainty. The accepted definition of traceability is given in Section 12.4. If the uncertainty of such measurements is calculated to include the hydrogen ion activity convention (Section 4.6), then the result can also be traceable to the internationally accepted SI system of units.

### 1.3 Primary pH standards

In Section 4 of this document, the procedure used to assign primary standard [pH(PS)] values to primary standards is described. The only method that meets the stringent criteria of a primary method of measurement for measuring pH is based on the Harned cell (Cell I). This method, extensively developed by R. G. Bates [5] and collaborators at NBS (later NIST), is now adopted in national metrological institutes (NMIs) worldwide, and the procedure is approved in this document with slight modifications (Section 3.2) to comply with the requirements of a primary method.

### 1.4 Secondary standards derived from measurements on the Harned cell (Cell I)

Values assigned by Harned cell measurements to substances that do not entirely fulfill the criteria for primary standard status are secondary standards (SS), with pH(SS) values, and are discussed in Section 8.1.

### 1.5 Secondary standards derived from primary standards by measuring differences in pH

Methods that can be used to obtain the difference in pH between buffer solutions are discussed in Sections 8.2–8.5 of these Recommendations. These methods involve cells that are practically more convenient than the Harned cell, but have greater uncertainties associated with the results. They enable the pH of other buffers to be compared with primary standard buffers that have been measured with a Harned cell. It is recommended that these are secondary methods, and buffers measured in this way are secondary standards (SS), with pH(SS) values.

### 1.6 Traceability

This hierarchical approach to primary and secondary measurements facilitates the availability of traceable buffers for laboratory calibrations. Recommended procedures for carrying out these calibrations to achieve specified uncertainties are given in Section 11.

### 1.7 Scope

The recommendations in this Report relate to analytical laboratory determinations of pH of dilute aqueous solutions ( $\leq 0.1$  mol  $\text{kg}^{-1}$ ). Systems including partially aqueous mixed solvents, biological measurements, heavy water solvent, natural waters, and high-temperature measurements are excluded from this Report.

### 1.8 Uncertainty estimates

The Annex (Section 13) includes typical uncertainty estimates for the use of the cells and measurements described.

## 2. Activity and the definition of pH

### 2.1 Hydrogen ion activity

pH was originally defined by Sørensen in 1909 [6] in terms of the concentration of hydrogen ions (in modern nomenclature) as  $\text{pH} = -\lg(c_{\text{H}}/c^\circ)$  where  $c_{\text{H}}$  is the hydrogen ion concentration in  $\text{mol dm}^{-3}$ , and  $c^\circ = 1 \text{ mol dm}^{-3}$  is the standard amount concentration. Subsequently [4], it has been accepted that it is more satisfactory to define pH in terms of the relative activity of hydrogen ions in solution

$$\text{pH} = -\lg a_{\text{H}} = -\lg(m_{\text{H}}\gamma_{\text{H}}/m^\circ) \quad (1)$$

where  $a_{\text{H}}$  is the relative (molality basis) activity and  $\gamma_{\text{H}}$  is the molal activity coefficient of the hydrogen ion  $\text{H}^+$  at the molality  $m_{\text{H}}$ , and  $m^\circ$  is the standard molality. The quantity pH is intended to be a measure of the activity of hydrogen ions in solution. However, since it is defined in terms of a quantity that cannot be measured by a thermodynamically valid method, eq. 1 can be only a *notional definition* of pH.

## 3. Traceability and primary methods of measurement

### 3.1 Relation to SI

Since pH, a single ion quantity, is not determinable in terms of a fundamental (or base) unit of any measurement system, there was some difficulty previously in providing a proper basis for the traceability of pH measurements. A satisfactory approach is now available in that pH determinations can be incorporated into the SI if they can be traced to measurements made using a method that fulfills the definition of a "Primary method of measurement" [1].

### 3.2 Primary method of measurement

The accepted definition of a primary method of measurement is given in Section 12.1. The essential feature of such a method is that it

must operate according to a well-defined measurement equation in which all of the variables can be determined experimentally in terms of SI units. Any limitation in the determination of the experimental variables, or in the theory, must be included within the estimated uncertainty of the method if traceability to the SI is to be established. If a convention is used without an estimate of its uncertainty, true traceability to the SI would not be established. In the following section, it is shown that the Harned cell fulfills the definition of a primary method for the measurement of the acidity function,  $p(a_H\gamma_{Cl})$ , and subsequently of the pH of buffer solutions.

## 4. Harned cell as a primary method for the absolute measurement of pH

### 4.1 Harned cell

The cell without transference defined by

known as the Harned cell [7], and containing standard buffer, S, and chloride ions, in the form of potassium or sodium chloride, which are added in order to use the silver–silver chloride electrode. The application of the Nernst equation to the spontaneous cell reaction:

yields the potential difference  $E_1$  of the cell [corrected to 1 atm (101.325 kPa), the partial pressure of hydrogen gas used in electrochemistry in preference to 100 kPa] as

$$E_1 = E^\circ - [(RT/F)\ln 10] \lg[(m_{\text{H}}\gamma_{\text{H}}/m^\circ)(m_{\text{Cl}}\gamma_{\text{Cl}}/m^\circ)] \quad (2)$$

which can be rearranged, since  $a_{\text{H}} = m_{\text{H}}\gamma_{\text{H}}/m^\circ$ , to give the acidity function

$$p(a_{\text{H}}\gamma_{\text{Cl}}) = -\lg(a_{\text{H}}\gamma_{\text{Cl}}) = (E_1 - E^\circ)/[(RT/F)\ln 10] + \lg(m_{\text{Cl}}/m^\circ) \quad (2')$$

where  $E^\circ$  is the standard potential difference of the cell, and hence of the silver–silver chloride electrode, and  $\gamma_{\text{Cl}}$  is the activity coefficient of the chloride ion.

*Note 1:* The sign of the standard electrode potential of an electrochemical reaction is that displayed on a high-impedance voltmeter when the lead attached to standard hydrogen electrode is connected to the minus pole of the voltmeter.

The steps in the use of the cell are summarized in Fig. 1 and described in the following paragraphs.

The standard potential difference of the silver–silver chloride electrode,  $E^\circ$ , is determined from a Harned cell in which only HCl is present at a fixed molality (e.g.,  $m = 0.01 \text{ mol kg}^{-1}$ ). The application of the Nernst equation to the HCl cell

gives

$$E_{\text{Ia}} = E^\circ - [(2RT/F)\ln 10] \lg[(m_{\text{HCl}}/m^\circ)(\gamma_{\pm\text{HCl}})] \quad (3)$$

where  $E_{\text{Ia}}$  has been corrected to 1 atmosphere partial pressure of hydrogen gas (101.325 kPa) and  $\gamma_{\pm\text{HCl}}$  is the mean ionic activity coefficient of HCl.

### 4.2 Activity coefficient of HCl

The values of the activity coefficient ( $\gamma_{\pm\text{HCl}}$ ) at molality  $0.01 \text{ mol kg}^{-1}$  and various temperatures are given by Bates and Robinson [8]. The standard potential difference depends in some not entirely

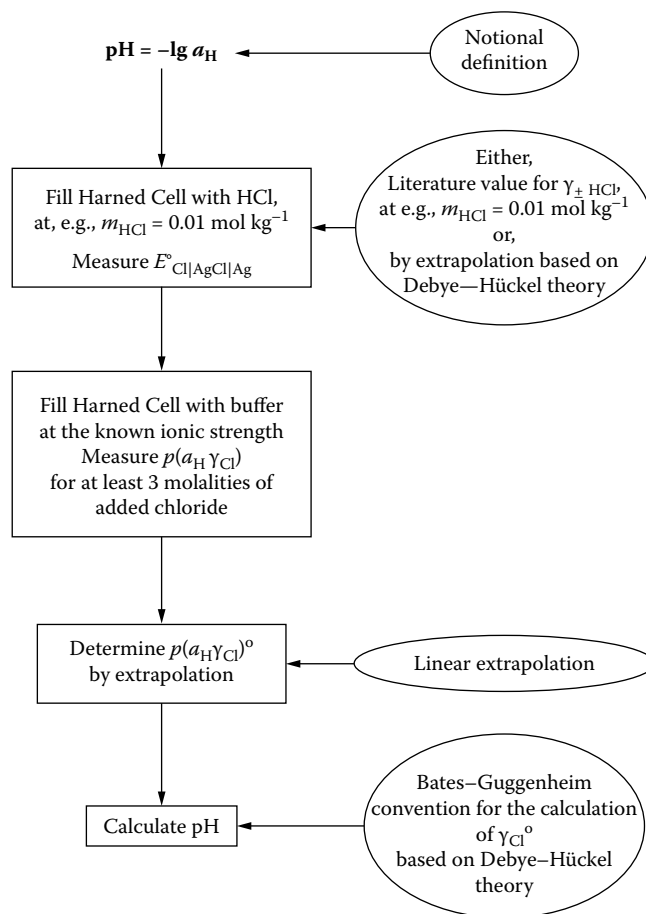

FIGURE 1 Operation of the Harned cell as a primary method for the measurement of absolute pH.

understood way on the method of preparation of the electrodes, but individual determinations of the activity coefficient of HCl at  $0.01 \text{ mol kg}^{-1}$  are more uniform than values of  $E^\circ$ . Hence, the practical determination of the potential difference of the cell with HCl at  $0.01 \text{ mol kg}^{-1}$  is recommended at 298.15 K at which the mean ionic activity coefficient is 0.904. Dickson [9] concluded that it is not necessary to repeat the measurement of  $E^\circ$  at other temperatures, but that it is satisfactory to correct published smoothed values by the observed difference in  $E^\circ$  at 298.15 K.

### 4.3 Acidity function

In NMIs, measurements of Cells I and Ia are often done simultaneously in a thermostat bath. Subtracting eq. 3 from eq. 2 gives

$$\Delta E = E_1 - E_{\text{Ia}} = -[(RT/F)\ln 10] \{ \lg[(m_{\text{H}}\gamma_{\text{H}}/m^\circ)(m_{\text{Cl}}\gamma_{\text{Cl}}/m^\circ)] - \lg[(m_{\text{HCl}}/m^\circ)^2\gamma_{\pm\text{HCl}}^2] \} \quad (4)$$

which is independent of the standard potential difference. Therefore, the subsequently calculated pH does not depend on the standard potential difference and hence does not depend on the assumption that the standard potential of the hydrogen electrode,  $E^\circ(\text{H}^+|\text{H}_2) = 0$  at all temperatures. Therefore, the Harned cell can give an exact comparison between hydrogen ion activities at two different temperatures (in contrast to statements found elsewhere, see, for example, ref. [5]).

The quantity  $p(a_{\text{H}}\gamma_{\text{Cl}}) = -\lg(a_{\text{H}}\gamma_{\text{Cl}})$ , on the left-hand side of eq. 2', is called the acidity function [5]. To obtain the quantity pH (according to eq. 1), from the acidity function, it is necessary to evaluate  $\lg \gamma_{\text{Cl}}$  by independent means. This is done in two steps:

(i) the value of  $\lg(a_{\text{H}}\gamma_{\text{Cl}})$  at zero chloride molality,  $\lg(a_{\text{H}}\gamma_{\text{Cl}})^{\circ}$ , is evaluated and (ii) a value for the activity of the chloride ion  $\gamma_{\text{Cl}}^{\circ}$ , at zero chloride molality (sometimes referred to as the limiting or “trace” activity coefficient [9]) is calculated using the Bates–Guggenheim convention [10]. These two steps are described in the following paragraphs.

#### 4.4 Extrapolation of acidity function to zero chloride molality

The value of  $\lg(a_{\text{H}}\gamma_{\text{Cl}})^{\circ}$  corresponding to zero chloride molality is determined by linear extrapolation of measurements using Harned cells with at least three added molalities of sodium or potassium chloride ( $I < 0.1 \text{ mol kg}^{-1}$ , see Sections 4.5 and 12.6)

$$-\lg(a_{\text{H}}\gamma_{\text{Cl}}) = -\lg(a_{\text{H}}\gamma_{\text{Cl}})^{\circ} + S m_{\text{Cl}} \quad (5)$$

where  $S$  is an empirical, temperature-dependent constant. The extrapolation is linear, which is expected from Brønsted’s observations [11] that specific ion interactions between oppositely charged ions are dominant in mixed strong electrolyte systems at constant molality or ionic strength. However, these acidity function measurements are made on mixtures of weak and strong electrolytes at constant buffer molality, but not constant total molality. It can be shown [12] that provided the change in ionic strength on addition of chloride is less than 20 %, the extrapolation will be linear without detectable curvature. If the latter, less-convenient method of preparation of constant total molality solutions is used, Bates [5] has reported that, for equimolar phosphate buffer, the two methods extrapolate to the same intercept. In an alternative procedure, often useful for partially aqueous mixed solvents where the above extrapolation appears to be curved, multiple application of the Bates–Guggenheim convention to each solution composition gives identical results within the estimated uncertainty of the two intercepts.

#### 4.5 Bates–Guggenheim convention

The activity coefficient of chloride (like the activity coefficient of the hydrogen ion) is an immeasurable quantity. However, in solutions of low ionic strength ( $I < 0.1 \text{ mol kg}^{-1}$ ), it is possible to calculate the activity coefficient of chloride ion using the Debye–Hückel theory. This is done by adopting the Bates–Guggenheim convention, which assumes the trace activity coefficient of the chloride ion  $\gamma_{\text{Cl}}^{\circ}$  is given by the expression [10]

$$\lg \gamma_{\text{Cl}}^{\circ} = -A I^{1/2} / (1 + Ba I^{1/2}) \quad (6)$$

where  $A$  is the Debye–Hückel temperature-dependent constant (limiting slope),  $a$  is the *mean* distance of closest approach of the ions (ion size parameter),  $Ba$  is set equal to  $1.5 (\text{mol kg}^{-1})^{-1/2}$  at all temperatures in the range 5–50 °C, and  $I$  is the ionic strength of the buffer (which, for its evaluation requires knowledge of appropriate acid dissociation constants). Values of  $A$  as a function of temperature can be found in Table A.9 and of  $B$ , which is effectively unaffected by revision of dielectric constant data, in Bates [5]. When the numerical value of  $Ba = 1.5$  (i.e., without units) is introduced into eq. 6 it should be written as

$$\lg \gamma_{\text{Cl}}^{\circ} = -A I^{1/2} / [1 + 1.5 (I/m^{\circ})^{1/2}] \quad (6')$$

The various stages in the assignment of primary standard pH values are combined in eq. 7, which is derived from eqs. 2', 5, 6',

$$\text{pH(PS)} = \lim_{m_{\text{Cl}} \rightarrow 0} \{ (E_1 - E^{\circ}) / [(RT/F) \ln 10] + \lg(m_{\text{Cl}}/m^{\circ}) - A I^{1/2} / [1 + 1.5 (I/m^{\circ})^{1/2}] \} \quad (7)$$

and the steps are summarized schematically in Fig. 1.

## 5. Sources of uncertainty in the use of the Harned cell

### 5.1 Potential primary method and uncertainty evaluation

The presentation of the procedure in Section 4 highlights the fact that assumptions based on electrolyte theories [7] are used at three points in the method:

- The Debye–Hückel theory is the basis of the extrapolation procedure to calculate the value for the standard potential of the silver–silver chloride electrode, even though it is a published value of  $\gamma_{\pm\text{HCl}}$  at, e.g.,  $m = 0.01 \text{ mol kg}^{-1}$ , that is recommended (Section 4.2) to facilitate  $E^{\circ}$  determination.
- Specific ion interaction theory is the basis for using a linear extrapolation to zero chloride (but the change in ionic strength produced by addition of chloride should be restricted to no more than 20 %).
- The Debye–Hückel theory is the basis for the Bates–Guggenheim convention used for the calculation of the trace activity coefficient,  $\gamma_{\text{Cl}}^{\circ}$ .

In the first two cases, the inadequacies of electrolyte theories are sources of uncertainty that limit the extent to which the measured pH is a true representation of  $\lg a_{\text{H}}$ . In the third case, the use of eq. 6 or 7 is a convention, since the value for  $Ba$  is not directly determinable experimentally. Previous recommendations have not included the uncertainty in  $Ba$  explicitly within the calculation of the uncertainty of the measurement.

Since eq. 2 is derived from the Nernst equation applied to the thermodynamically well-behaved platinum–hydrogen and silver–silver chloride electrodes, it is recommended that, when used to measure  $-\lg(a_{\text{H}}\gamma_{\text{Cl}})$  in aqueous solutions, the Harned cell *potentially* meets the agreed definition of a primary method for the measurement. The word “potentially” has been included to emphasize that the method can only achieve primary status if it is operated with the highest metrological qualities (see Sections 6.1–6.2). Additionally, if the Bates–Guggenheim convention is used for the calculation of  $\lg \gamma_{\text{Cl}}^{\circ}$ , the Harned cell *potentially* meets the agreed definition of a primary method for the measurement of pH, subject to this convention if a realistic estimate of its uncertainty is included. The uncertainty budget for the primary method of measurement by the Harned cell (Cell I) is given in the Annex, Section 13.

*Note 2:* The experimental uncertainty for a typical primary pH(PS) measurement is of the order of 0.004 (see Table 4).

### 5.2 Evaluation of uncertainty of the Bates–Guggenheim convention

In order for a measurement of pH made with a Harned cell to be traceable to the SI system, an estimate of the uncertainty of each step must be included in the result. Hence, it is recommended that an estimate of the uncertainty of 0.01 (95% confidence interval) in pH associated with the Bates–Guggenheim convention is used. The extent to which the Bates–Guggenheim convention represents the “true” (but immeasurable) activity coefficient of the chloride ion can be calculated by varying the coefficient  $Ba$  between 1.0 and 2.0  $(\text{mol kg}^{-1})^{1/2}$ . This corresponds to varying the ion-size parameter between 0.3 and 0.6 nm, yielding a range of  $\pm 0.012$  (at  $I = 0.1 \text{ mol kg}^{-1}$ ) and  $\pm 0.007$  (at  $I = 0.05 \text{ mol kg}^{-1}$ ) for  $\gamma_{\text{Cl}}^{\circ}$  calculated using equation [7]. Hence, an uncertainty of 0.01 should cover the full extent of variation. This must be included in the uncertainty of pH values that are to be regarded as traceable

to the SI. pH values stated without this contribution to their uncertainty cannot be considered to be traceable to the SI.

### 5.3 Hydrogen ion concentration

It is rarely required to calculate hydrogen ion concentration from measured pH. Should such a calculation be required, the only consistent, logical way of doing it is to assume  $\gamma_{\text{H}} = \gamma_{\text{Cl}}$  and set the latter to the appropriate Bates–Guggenheim conventional value. The uncertainties are then those derived from the Bates–Guggenheim convention.

### 5.4 Possible future approaches

Any model of electrolyte solutions that takes into account both electrostatic and specific interactions for individual solutions would be an improvement over use of the Bates–Guggenheim convention. It is hardly reasonable that a fixed value of the ion-size parameter should be appropriate for a diversity of selected buffer solutions. It is hoped that the Pitzer model of electrolytes [13], which uses a virial equation approach, will provide such an improvement, but data in the literature are insufficiently extensive to make these calculations at the present time. From limited work at 25 °C done on phosphate and carbonate buffers, it seems that changes to Bates–Guggenheim recommended values will be small [14]. It is possible that some anomalies attributed to liquid junction potentials (LJPs) may be resolved.

## 6. Primary buffer solutions and their required properties

### 6.1 Requisites for highest metrological quality

In the previous sections, it has been shown that the Harned cell provides a primary method for the determination of pH. In order for a particular buffer solution to be considered a primary buffer solution, it must be of the “highest metrological” quality [15] in accordance with the definition of a primary standard. It is recommended that it have the following attributes [5: p. 95;16,17]:

- High buffer value in the range 0.016–0.07 (mol OH<sup>-</sup>)/pH
- Small dilution value at half concentration (change in pH with change in buffer concentration) in the range 0.01–0.20
- Small dependence of pH on temperature less than  $\pm 0.01$  K<sup>-1</sup>
- Low residual LJP < 0.01 in pH (see Section 7)
- Ionic strength  $\leq 0.1$  mol kg<sup>-1</sup> to permit applicability of the Bates–Guggenheim convention
- NMI certificate for specific batch
- Reproducible purity of preparation (lot-to-lot differences of  $|\Delta\text{pH}(\text{PS})| < 0.003$ )
- Long-term stability of stored solid material

Values for the above and other important parameters for the selected primary buffer materials (see Section 6.2) are given in Table 1.

*Note 3:* The long-term stability of the solid compounds (>5 years) is a requirement not met by borax [16]. There are also doubts about the extent of polyborate formation in 0.05 mol kg<sup>-1</sup> borax solutions, and hence this solution is not accorded primary status.

### 6.2 Primary standard buffers

Since there can be significant variations in the purity of samples of a buffer of the same nominal chemical composition, it is essential that the primary buffer material used has been certified with values that have been measured with Cell I. The Harned cell has been used by many NMIs for accurate measurements of pH of

buffer solutions. Comparisons of such measurements have been carried out under EUROMET collaboration [18], which have demonstrated the high comparability of measurements (0.005 in pH) in different laboratories of samples from the same batch of buffer material. Typical values of the pH(PS) of the seven solutions from the six accepted primary standard reference buffers, which meet the conditions stated in Section 6.1, are listed in Table 2. These listed pH(PS) values have been derived from certificates issued by NBS/NIST over the past 35 years. Batch-to-batch variations in purity can result in changes in the pH value of samples of at most 0.003. The typical values in Table 2 should not be used in place of the certified value (from a Harned cell measurement) for a specific batch of buffer material.

The required attributes listed in Section 6.1 effectively limit the range of primary buffers available to between pH 3 and 10 (at 25 °C). Calcium hydroxide and potassium tetroxalate have been excluded because the contribution of hydroxide or hydrogen ions to the ionic strength is significant. Also excluded are the nitrogen bases of the type BH<sup>+</sup> [such as tris(hydroxymethyl)aminomethane and piperazine phosphate] and the zwitterionic buffers (e.g., HEPES and MOPS [19]). These do not comply because either the Bates–Guggenheim convention is not applicable, or the LJPs are high. This means the choice of primary standards is restricted to buffers derived from oxy-carbon, -phosphorus, -boron, and mono, di-, and tri-protic carboxylic acids. In the future, other buffer systems may fulfill the requirements listed in Section 6.1.

## 7. Consistency of primary buffer solutions

### 7.1 Consistency and the liquid junction potential

Primary methods of measurement are made with cells without transference as described in Sections 1–6. Less-complex, secondary methods use cells with transference, which contain liquid junctions. A single LJP is immeasurable, but differences in LJP can be estimated. LJPs vary with the composition of the solutions forming the junction and the geometry of the junction.

Equation 7 for Cell I applied successively to two primary standard buffers, PS<sub>1</sub>, PS<sub>2</sub>, gives

$$\Delta\text{pH}_I = \text{pH}_I(\text{PS}_2) - \text{pH}_I(\text{PS}_1) = \lim_{m_{\text{Cl}} \rightarrow 0} \{E_I(\text{PS}_2)/k - E_I(\text{PS}_1)/k\} - A\{I_{(2)}^{1/2}/[1 + 1.5(I_{(2)}/m^\circ)^{1/2}] - I_{(1)}^{1/2}/[1 + 1.5(I_{(1)}/m^\circ)^{1/2}]\} \quad (8)$$

where  $k = (RT/F)\ln 10$  and the last term is the ratio of trace chloride activity coefficients  $\lg[\gamma_{\text{Cl}(2)}^\circ/\gamma_{\text{Cl}(1)}^\circ]$ , conventionally evaluated via B–G eq. 6'.

*Note 4:* Since the convention may unevenly affect the  $\gamma_{\text{Cl}(2)}^\circ$  and  $\gamma_{\text{Cl}(1)}^\circ$  estimations,  $\Delta\text{pH}_I$  differs from the true value by the unknown contribution:  $\lg[\gamma_{\text{Cl}(2)}^\circ/\gamma_{\text{Cl}(1)}^\circ] - A\{I_{(1)}^{1/2}/[1 + 1.5(I_{(1)}/m^\circ)^{1/2}] - I_{(2)}^{1/2}/[1 + 1.5(I_{(2)}/m^\circ)^{1/2}]\}$ .

A second method of comparison is by measurement of Cell II in which there is a salt bridge with two free-diffusion liquid junctions

for which the spontaneous cell reaction is a dilution,

which gives the pH difference from Cell II as

$$\Delta\text{pH}_{\text{II}} = \text{pH}_{\text{II}}(\text{PS}_2) - \text{pH}_{\text{II}}(\text{PS}_1) = E_{\text{II}}/k - [(E_{j2} - E_{j1})/k] \quad (9)$$

where the subscript II is used to indicate that the pH difference between the same two buffer solutions is now obtained from Cell II.  $\Delta\text{pH}_{\text{II}}$  differs from  $\Delta\text{pH}_I$  (and both differ from the true value  $\Delta\text{pH}_I$ ) since it depends on unknown quantity, the residual LJP,

RLJP =  $(E_{j2} - E_{j1})$ , whose exact value could be determined if the true  $\Delta\text{pH}$  were known.

*Note 5:* The subject of liquid junction effects in ion-selective electrode potentiometry has been comprehensively reviewed [20]. Harper [21] and Bagg [22] have made computer calculations of LJPs for simple three-ion junctions (such as HCl + KCl), the only ones for which mobility and activity coefficient data are available. Breer, Ratkje, and Olsen [23] have thoroughly examined the possible errors arising from the commonly made approximations in calculating LJPs for three-ion junctions. They concluded that the assumption of linear concentration profiles has less-severe consequences (~0.1–1.0 mV) than the other two assumptions of the Henderson treatment, namely constant mobilities and neglect of activity coefficients, which can lead to errors in the order of 10 mV. Breer et al. concluded that their calculations supported an earlier statement [24] that in ion-selective electrode potentiometry, the theoretical Nernst slope, even for dilute sample solutions, could never be attained because of liquid junction effects.

*Note 6:* According to IUPAC recommendations on nomenclature and symbols [3], a single vertical bar ( | ) is used to represent a phase boundary, a dashed vertical bar ( | ) represents a liquid–liquid junction between two electrolyte solutions (across which a potential difference will occur), and a double dashed vertical bar ( || ) represents a similar liquid junction, in which the LJP is assumed to be effectively zero (~1 % of cell potential difference). Hence, terms such as that in square brackets on the right-hand side of eq. 9 are usually ignored, and the liquid junction is represented by ||. However, in the Annex, the symbol | is used because the error associated with the liquid junction is included in the analysis. For ease of comparison, numbers of related equations in the main text and in the Annex are indicated.

*Note 7:* The polarity of Cell II will be negative on the left, i.e., – | +, when  $\text{pH}(\text{PS}_2) > \text{pH}(\text{PS}_1)$ . The LJP  $E_j$  of a single liquid junction is defined as the difference in (Galvani) potential contributions to the total cell potential difference arising at the interface from the buffer solution less that from the KCl solution. For instance, in Cell II,  $E_{j1} = E(\text{S}_1) - E(\text{KCl})$  and  $E_{j2} = E(\text{S}_2) - E(\text{KCl})$ . It is negative when the buffer solution of interest is acidic and positive when it is alkaline, provided that  $E_j$  is principally caused by the hydrogen, or hydroxide, ion content of the solution of interest (and only to a smaller degree by its alkali ions or anions). The residual liquid junction potential (RLJP), the difference  $E_j(\text{right}) - E_j(\text{left})$ , depends on the relative magnitudes of the individual  $E_j$  values and has the opposite polarity to the potential difference  $E$  of the cell. Hence, in Cell II the RLJP,  $E_{j1}(\text{PS}_1) - E_{j2}(\text{PS}_2)$ , has a polarity + | – when  $\text{pH}(\text{S}_2) > \text{pH}(\text{S}_1)$ .

Notwithstanding the foregoing, comparison of  $\text{pH}_{\text{II}}$  values from the Cell II with two liquid junctions (eq. 9) with the assigned  $\text{pH}_1(\text{PS})$  values for the same two primary buffers measured with Cell I (eq. 8) makes an estimation of RLJPs possible [5]:

$$\begin{aligned} & [\text{pH}_1(\text{PS}_2) - \text{pH}_{\text{II}}(\text{PS}_2)] - [\text{pH}_1(\text{PS}_1) - \text{pH}_{\text{II}}(\text{PS}_1)] \\ & = (E_{j2} - E_{j1})/k = \text{RLJP} \end{aligned} \quad (10)$$

With the value of RLJP set equal to zero for equimolar phosphate buffer (taken as  $\text{PS}_1$ ) then  $[\text{pH}_1(\text{PS}_2) - \text{pH}_{\text{II}}(\text{PS}_2)]$  is plotted against  $\text{pH}(\text{PS})$ . Results for free-diffusion liquid junctions formed in a capillary tube with cylindrical symmetry at 25 °C are shown in Fig. 2 [25, and refs. cited therein].

*Note 8:* For 0.05 mol kg<sup>-1</sup> tetroxalate, the published values [26] for Cell II with free-diffusion junctions are wrong [27,28].

**FIGURE 2** Some values of residual LJPs in terms of pH with reference to the value for  $0.025 \text{ mol kg}^{-1} \text{Na}_2\text{HPO}_4 + 0.025 \text{ mol kg}^{-1} \text{KH}_2\text{PO}_4$  (0.025 phosphate buffer) taken as zero [25].

Values such as those shown in Fig. 2 give an indication of the extent of possible systematic uncertainties for primary standard buffers arising from three sources:

- Experimental uncertainties, including any variations in the chemical purity of primary buffer materials (or variations in the preparation of the solutions) if measurements of Cells I and II were not made in the same laboratory at the same occasion.
- Variation in RLJPs between primary buffers.
- Inconsistencies resulting from the application of the Bates–Guggenheim convention to chemically different buffer solutions of ionic strengths less than  $0.1 \text{ mol kg}^{-1}$ .

It may be concluded from examination of the results in Fig. 2, that a consistency no better than 0.01 can be ascribed to the primary pH standard solutions of Table 2 in the pH range 3–10. This value will be greater for less reproducibly formed liquid junctions than the free-diffusion type with cylindrical symmetry.

*Note 9:* Considering the conventional nature of eq. 10, and that the irreproducibility of formation of geometry-dependent devices exceeds possible bias between carefully formed junctions of known geometry, the RLJP contribution, which is included in the difference between measured potential differences of cells with transference, is treated as a statistical, and not a systematic error.

*Note 10:* Values of RLJP depend on the Bates–Guggenheim convention through the last term in eq. 8 and would be different if another convention were chosen. This interdependence of the single ion activity coefficient and the LJP may be emphasized by noting that it would be possible *arbitrarily* to reduce RLJP values to zero for each buffer by adjusting the ion-size parameter in eq. 6.

## 7.2 Computational approach to consistency

The consistency between conventionally assigned pH values can also be assessed by a computational approach. The pH values of standard buffer solutions have been calculated from literature values of acid dissociation constants by an iterative process. The arbitrary extension of the Bates–Guggenheim convention for chloride ion, to all ions, leads to the calculation of ionic activity coefficients of all ionic species, ionic strength, buffer capacity, and calculated pH values. The consistency of these values with primary pH values obtained using Cell I was 0.01 or lower between 10 and 40 °C [29,30].

## 8. Secondary standards and secondary methods of measurement

### 8.1 Secondary standards derived from Harned cell measurements

Substances that do not fulfill all the criteria for primary standards but to which pH values can be assigned using Cell I are considered to be secondary standards. Reasons for their exclusion as primary standards include, inter alia:

- Difficulties in achieving consistent, suitable chemical quality (e.g., acetic acid is a liquid).
- High LJP, or inappropriateness of the Bates–Guggenheim convention (e.g., other charge-type buffers).

Therefore, they do not comply with the stringent criterion for a primary measurement of being of the highest metrological quality. Nevertheless, their pH(SS) values can be determined. Their consistency with the primary standards should be checked with the method described in Section 7. The primary and secondary standard materials should be accompanied by certificates from NMIs in order for them to be described as certified reference materials (CRMs). Some illustrative pH(SS) values for secondary standard materials [5,17,25,31,32] are given in Table 3.

### 8.2 Secondary standards derived from primary standards

In most applications, the use of a high-accuracy primary standard for pH measurements is not justified, if a traceable secondary standard of sufficient accuracy is available. Several designs of cells are available for comparing the pH values of two buffer solutions. However, there is no primary method for measuring the *difference* in pH between two buffer solutions for reasons given in Section 8.6. Such measurements could involve either using a cell successively with two buffers, or a single measurement with a cell containing two buffer solutions separated by one or two liquid junctions.

### 8.3 Secondary standards derived from primary standards of the same nominal composition using cells without salt bridge

The most direct way of comparing pH(PS) and pH(SS) is by means of the single-junction Cell III [33].

The cell reaction for the spontaneous dilution reaction is the same as for Cell II, and the pH difference is given, see Note 6, by

$$\text{pH}(S_2) - \text{pH}(S_1) = E_{\text{III}}/k \quad (11) \text{ cf. (A-7)}$$

The buffer solutions containing identical Pt | H<sub>2</sub> electrodes with an identical hydrogen pressure are in direct contact via a vertical sintered glass disk of a suitable porosity (40 μm). The LJP formed between the two standards of nominally the same composition will be particularly small and is estimated to be in the μV range. It will, therefore, be less than 10 % of the potential difference measured if the pH(S) values of the standard solutions are in the range  $3 \leq \text{pH}(S) \leq 11$  and the difference in their pH(S) values is not larger than 0.02. Under these conditions, the LJP is not dominated by the hydrogen and hydroxyl ions but by the other ions (anions, alkali metal ions). The proper functioning of the cell can

TABLE 3 Values of pH(SS) of Some Secondary Standards from Harned Cell I Measurements

Secondary Standards	Temp./°C									
	0	5	10	15	20	25	30	37	40	50
0.05 mol kg <sup>-1</sup> potassium tetroxalate <sup>a</sup> [5,17]		1.67	1.67	1.67	1.68	1.68	1.68	1.69	1.69	1.71

<sup>a</sup> potassium trihydrogen dioxalate (KH<sub>2</sub>C<sub>4</sub>O<sub>6</sub>)

<sup>b</sup> sodium hydrogen 2,2'-oxydiacetate

<sup>c</sup> 2-amino-2-(hydroxymethyl)-1,3 propanediol or tris(hydroxymethyl)aminomethane

be checked by measuring the potential difference when both sides of the cell contain the same solution.

#### 8.4 Secondary standards derived from primary standards using cells with salt bridge

The cell that includes a hydrogen electrode [corrected to 1 atm (101.325 kPa) partial pressure of hydrogen] and a reference electrode, the filling solution of which is a saturated or high concentration of the almost equitransferent electrolyte, potassium chloride, hence minimizing the LJP, is, see Note 6:

Note 11: Other electrolytes, e.g., rubidium or cesium chloride, are more equitransferent [34].

Note 12: Cell IV is written in the direction: *reference* | *indicator*

- for conformity of treatment of all hydrogen ion-responsive electrodes and ion-selective electrodes with various choices of reference electrode, and partly,
- for the practical reason that pH meters usually have one low impedance socket for the reference electrode, assumed negative, and a high-impedance terminal with a different plug, usually for a glass electrode.

With this convention, whatever the form of hydrogen ion-responsive electrode used (e.g., glass or quinhydrone), or whatever the reference electrode, the potential of the hydrogen-ion responsive electrode always decreases (becomes more negative) with increasing pH (see Fig. 3).

This convention was used in the 1985 document [2] and is also consistent with the treatment of ion-selective electrodes [35]. In effect, it focuses attention on the indicator electrode, for which the potential is then given by the Nernst equation for the single-electrode potential, written as a reduction process, in accord with the Stockholm convention [36]:

$$\text{For Ox} + ne^- \rightarrow \text{Red}, \quad E = E^\circ - (k/n) \lg(a_{\text{red}}/a_{\text{ox}})$$

(where  $a$  is activity), or, for the hydrogen gas electrode at 1 atm partial pressure of hydrogen gas:

$$\text{H}^+ + e^- \rightarrow 1/2\text{H}_2 \quad E = E^\circ + k \lg a_{\text{H}^+} = E^\circ - k \text{pH}$$

The equation for Cell IV is, therefore:

$$\text{pH(S)} = -[E_{\text{IV}}(\text{S}) - E_{\text{IV}}^\circ]/k \quad (12)$$

FIGURE 3 Schematic plot of the variation of potential difference (----) for the cell  $\text{Ag}|\text{AgCl}|\text{KCl}|\text{H}^+(\text{buffer})|\text{H}_2|\text{Pt}^+$  with pH and illustrating the choice of sign convention. The effect of LJP is indicated (-----) with its variation of pH as given by the Henderson equation (see, e.g., ref. [5]). The approximate linearity (----) in the middle pH region should be noted. Both lines have been grossly exaggerated in their deviation from the Nernst line since otherwise they would be indistinguishable from each other and the Nernst line. For the calomel electrode  $\text{Hg}|\text{Hg}_2\text{Cl}_2|\text{KCl}$  and the thallium amalgam|thallium(I) chloride electrode  $\text{Hg}|\text{Tl}(\text{Hg})|\text{TlCl}|\text{KCl}$ , or any other constant potential reference electrode, the diagram is the same.

in which  $E_{IV}^{\circ}$  is the standard potential, which includes the term  $\lg a_{Cl}/m^{\circ}$ , and  $E_j$  is the LJP.

*Note 13:* Mercury–mercury(I) chloride (calomel) and thallium amalgam–thallium (I) chloride reference electrodes are alternative choices to the silver–silver chloride electrode in Cell IV.

The consecutive use of two such cells containing buffers  $S_1$  and  $S_2$  gives the pH difference of the solutions

$$\text{pH}(S_2) - \text{pH}(S_1) = -[E_{IV}(S_2) - E_{IV}(S_1)]/k \quad (13) \text{ cf. (A-8)}$$

*Note 14:* Experimentally, a three-limb electrode vessel allowing simultaneous measurement of two Cell IIs may be used [25] with the advantage that the stability with time of the electrodes and of the liquid junctions can be checked. The measurement of cells of type II, which has a salt bridge with two liquid junctions, has been discussed in Section 7.

Cells II and IV may also be used to measure the value of secondary buffer standards that are not compatible with the silver–silver chloride electrode used in Cell I. Since the LJPs in Cells II and IV are minimized by the use of an equitransferent salt, these cells are suitable for use with secondary buffers that have a different concentration and/or an ionic strength greater than the limit ( $I \leq 0.1 \text{ mol kg}^{-1}$ ) imposed by the Bates–Guggenheim convention. They may, however, also be used for comparing solutions of the same nominal composition.

### 8.5 Secondary standards from glass electrode cells

Measurements cannot be made with a hydrogen electrode in Cell IV, for example, if the buffer is reduced by hydrogen gas at the platinum (or palladium-coated platinum) electrode. Cell V involving a glass electrode and silver–silver chloride reference electrode may be used instead in consecutive measurements, with two buffers  $S_1, S_2$  (see Section 11 for details).

### 8.6 Secondary methods

The equations given for Cells II to V show that these cannot be considered primary (ratio) methods for measuring pH difference [1], (see also Section 12.1) because the cell reactions involve

transference, or the irreversible inter-diffusion of ions, and hence an LJP contribution to the measured potential difference. The value of this potential difference depends on the ionic constituents, their concentrations and the geometry of the liquid junction between the solutions. Hence, the measurement equations contain terms that, although small, are not quantifiable, and the methods are secondary not primary.

## 9. Consistency of secondary standard buffer solutions established with respect to primary standards

### 9.1 Summary of procedures for establishing secondary standards

The following procedures may be distinguished for establishing secondary standards (SS) with respect to primary standards:

- i. For SS of the same nominal composition as PS, use Cells III or II.
- ii. For SS of different composition, use Cells IV or II.
- iii. For SS not compatible with platinum hydrogen electrode, use Cell V (see Section 11.1).

Although any of Cells II to V could be used for certification of secondary standards with stated uncertainty, employing different procedures would lead to inconsistencies. It would be difficult to define specific terminology to distinguish each of these procedures or to define any rigorous hierarchy for them. Hence, the methods should include estimates of the typical uncertainty for each. The choice between methods should be made according to the uncertainty required for the application (see Section 10 and Table 4).

### 9.2 Secondary standard evaluation from primary standards of the same composition

It is strongly recommended that the preferred method for assigning secondary standards should be a procedure in which measurements are made with respect to the primary buffer of nominally the same chemical composition. All secondary standards should be accompanied by a certificate relating to that

TABLE 4 Summary of Recommended Target Uncertainties

	$U(\text{pH})$ (For coverage factor 2)	Comments
<b>PRIMARY STANDARDS</b>		
Uncertainty of PS measured (by an NMI) with Harned Cell I	0.004	
Repeatability of PS measured (by an NMI) with Harned Cell I	0.0015	
Reproducibility of measurements in comparisons with Harned Cell I	0.003	EUROMET comparisons
Typical variations between batches of PS buffers	0.003	
<b>SECONDARY STANDARDS</b>		
Value of SS compared with same PS material with Cell III	0.004	increase in uncertainty is negligible relative to PS used e.g., biological buffers
Value of SS measured in Harned Cell I	0.01	
Value of SS labeled against different PS with Cell II or IV	0.015	
Value of SS (not compatible with Pt   H <sub>2</sub> ) measured with Cell V	0.02	example based on phthalate
<b>ELECTRODE CALIBRATION</b>		
Multipoint (5-point) calibration	0.01–0.03	
Calibration (2-point) by bracketing	0.02–0.03	
Calibration (1-point), $\Delta\text{pH} = 3$ and assumed slope	0.3	

*Note:* None of the above includes the uncertainty associated with the Bates–Guggenheim convention so the results cannot be considered to be traceable to SI (see Section 5.2).

particular batch of reference material as significant batch-to-batch variations are likely to occur. Some secondary standards are disseminated in solution form. The uncertainty of the pH values of such solutions may be larger than those for material disseminated in solid form.

### 9.3 Secondary standard evaluation when there is no primary standard of the same composition

It may sometimes be necessary to set up a secondary standard when there is no primary standard of the same chemical composition available. It will, therefore, be necessary to use either Cells II, IV, or V, and a primary or secondary standard buffer of different chemical composition. Buffers measured in this way will have a different status from those measured with respect to primary standards because they are not directly traceable to a primary standard of the same chemical composition. This different status should be reflected in the, usually larger, uncertainty quoted for such a buffer. Since this situation will only occur for buffers when a primary standard is not available, no special nomenclature is recommended to distinguish the different routes to secondary standards. Secondary buffers of a composition different from those of primary standards can also be derived from measurements on Cell I, provided the buffer is compatible with Cell I. However, the uncertainty of such standards should reflect the limitations of the secondary standard (see Table 4).

## 10. Target uncertainties for the measurement of secondary buffer solutions

### 10.1 Uncertainties of secondary standards derived from primary standards

Cells II to IV (and occasionally Cell V) are used to measure secondary standards with respect to primary standards. In each case, the limitations associated with the measurement method will result in a greater uncertainty for the secondary standard than the primary standard from which it was derived.

Target uncertainties are listed in Table 4. However, these uncertainties do not take into account the uncertainty contribution arising from the adoption of the Bates–Guggenheim convention to achieve traceability to SI units.

### 10.2 Uncertainty evaluation [37]

Summaries of typical uncertainty calculations for Cells I–V are given in the Annex (Section 13).

## 11. Calibration of pH meter-electrode assemblies and target uncertainties for unknowns

### 11.1 Glass electrode cells

Practical pH measurements are carried out by means of Cell V reference electrode | KCl ( $c \geq 3.5 \text{ mol dm}^{-3}$ ) || solution[pH(S) or pH(X)] | glass electrode Cell V and pH(X) is obtained, see Note 6, from eq. 14

$$\text{pH(X)} = \text{pH(S)} - [E_V(\text{X}) - E_V(\text{S})] \quad (14)$$

This is a one-point calibration (see Section 11.3).

These cells often use glass electrodes in the form of single probes or combination electrodes (glass and reference electrodes fashioned into a single probe, a so-called “combination electrode”).

The potential difference of Cell V is made up of contributions arising from the potentials of the glass and reference electrodes and the liquid junction (see Section 7.1).

Various random and systematic effects must be noted when using these cells for pH measurements:

- i. Glass electrodes may exhibit a slope of the  $E$  vs. pH function smaller than the theoretical value [ $k = (RT/F)\ln 10$ ], often called a sub-Nernstian response or practical slope  $k'$ , which is experimentally determinable. A theoretical explanation for the sub-Nernstian response of pH glass electrodes in terms of the dissociation of functional groups at the glass surface has been given [38].
- ii. The response of the glass electrode may vary with time, history of use, and memory effects. It is recommended that the response time and the drift of the electrodes be taken into account [39].
- iii. The potential of the glass electrode is strongly temperature-dependent, as to a lesser extent are the other two terms. Calibrations and measurements should, therefore, be carried out under temperature-controlled conditions.
- iv. The LJP varies with the composition of the solutions forming the junction, e.g., with pH (see Fig. 2). Hence, it will change if one solution [pH(S) or pH(X)] in Cell V is replaced by another. It is also affected by the geometry of the liquid junction device. Hence, it may be different if a free-diffusion type junction, such as that used to measure the RLJP (see Section 7.1), is replaced by another type, such as a sleeve, ceramic diaphragm, fiber, or platinum junction [39,40].
- v. Liquid junction devices, particularly some commercial designs, may suffer from memory and clogging effects.
- vi. The LJP may be subject to hydrodynamic effects, e.g., stirring.

Since these effects introduce errors of unknown magnitude, the measurement of an unknown sample requires a suitable calibration procedure. Three procedures are in common use based on calibrations at one point (one-point calibration), two points (two-point calibration or bracketing), and a series of points (multipoint calibration).

### 11.2 Target uncertainties for unknowns

Uncertainties in pH(X) are obtained, as shown below, by several procedures involving different numbers of experiments. Numerical values of these uncertainties obtained from the different calibration procedures are, therefore, not directly comparable. It is, therefore, not possible at the present time to make a universal recommendation of the best procedure to adopt for all applications. Hence, the target uncertainty for the unknown is given, which the operator of a pH meter electrode assembly may reasonably seek to achieve. Values are given for each of the three techniques (see Table 4), but the uncertainties attainable experimentally are critically dependent on the factors listed in Section 11.1 above, on the quality of the electrodes, and on the experimental technique for changing solutions.

In order to obtain the overall uncertainty of the measurement, uncertainties of the respective pH(PS) or pH(SS) values must be taken into account (see Table 4). Target uncertainties given below, and in Table 4, refer to calibrations performed by the use of standard buffer solutions with an uncertainty  $U[\text{pH(PS)}]$  or  $U[\text{pH(SS)}]$  of 0.01. The overall uncertainty becomes higher if standards with higher uncertainties are used.

### 11.3 One-point calibration

A single-point calibration is insufficient to determine both slope and one-point parameters. The theoretical value for the slope can be assumed, but the practical slope may be up to 5% lower. Alternatively, a value for the practical slope can be assumed from the manufacturer's prior calibration. The one-point calibration, therefore, yields only an estimate of pH(X). Since both parameters may change with age of the electrodes, this is not a reliable procedure. Based on a measurement for which  $\Delta\text{pH} = |\text{pH}(X) - \text{pH}(S)| = 5$ , the expanded uncertainty would be  $U = 0.5$  in pH(X) for  $k' = 0.95k$ , but assumed theoretical, or  $U = 0.3$  in pH(X) for  $\Delta\text{pH} = |\text{pH}(X) - \text{pH}(S)| = 3$  (see Table 4). This approach could be satisfactory for certain applications. The uncertainty will decrease with decreasing difference  $\text{pH}(X) - \text{pH}(S)$  and be smaller if  $k'$  is known from prior calibration.

### 11.4 Two-point calibration {target uncertainty, $U[\text{pH}(X)] = 0.02\text{--}0.03$ at $25^\circ\text{C}$ }

In the majority of practical applications, glass electrode cells (Cell V) are calibrated by two-point calibration, or bracketing, procedure using two standard buffer solutions, with pH values  $\text{pH}(S_1)$  and  $\text{pH}(S_2)$ , bracketing the unknown pH(X). Bracketing is often taken to mean that the  $\text{pH}(S_1)$  and  $\text{pH}(S_2)$  buffers selected should be those that are immediately above and below pH(X). This may not be appropriate in all situations and choice of a wider range may be better.

If the respective potential differences measured are  $E_V(S_1)$ ,  $E_V(S_2)$ , and  $E_V(X)$ , the pH value of the unknown, pH(X), is obtained from eq. 15

$$\text{pH}(X) = \text{pH}(S_1) - [E_V(X) - E_V(S_1)]/k' \quad (15) \text{ cf. (A-10)}$$

where the practical slope factor ( $k'$ ) is given by

$$k' = [E_V(S_1) - E_V(S_2)]/[\text{pH}(S_2) - \text{pH}(S_1)] \quad (16)$$

An example is given in the Annex, Section 13.

### 11.5 Multipoint calibration {target uncertainty: $U[\text{pH}(X)] = 0.01\text{--}0.03$ at $25^\circ\text{C}$ }

Multipoint calibration is carried out using up to five standard buffers [39,40]. The use of more than five points does not yield any significant improvement in the statistical information obtainable.

The calibration function of Cell V is given by eq. 17

$$E_V(S) = E_V^\circ - k'\text{pH}(S) \quad (17) \text{ cf. (A-11)}$$

where  $E_V(S)$  is the measured potential difference when the solution of pH(S) in Cell V is a primary or secondary standard buffer. The intercept, or "standard potential",  $E_V^\circ$  and  $k'$ , the practical slope are determined by linear regression of eq. 17 [39–41].

pH(X) of an unknown solution is then obtained from the potential difference,  $E_V(X)$ , by

$$\text{pH}(X) = [E_V^\circ - E_V(X)]/k' \quad (18) \text{ cf. (A-12)}$$

Additional quantities obtainable from the regression procedure applied to eq. 17 are the uncertainties  $u(k')$  and  $u(E_V^\circ)$  [40]. Multipoint calibration is recommended when minimum uncertainty and maximum consistency are required over a wide range of pH(X) values. This applies, however, only to that range of pH values in which the calibration function is truly linear. In nonlinear regions of the calibration function, the two-point method has clear advantages provided that  $\text{pH}(S_1)$  and  $\text{pH}(S_2)$  are selected to be as close to pH(X) as possible.

Details of the uncertainty computations for the multipoint calibration have been given [40], and an example is given in

the Annex. The uncertainties are recommended as a means of checking the performance characteristics of pH meter-electrode assemblies [40]. By careful selection of electrodes for multipoint calibration, uncertainties of the unknown pH(X) can be kept as low as  $U[\text{pH}(X)] = 0.01$ .

In modern microprocessor pH meters, potential differences are often transformed automatically into pH values. Details of the calculations involved in such transformations, including the uncertainties, are available [41].

## 12. Glossary [2,15,44]

### 12.1 Primary method of measurement

A primary method of measurement is a method having the highest metrological qualities, whose operation can be completely described and understood, for which a complete uncertainty statement can be written down in terms of SI units.

A primary direct method measures the value of an unknown without reference to a standard of the same quantity.

A primary ratio method measures the value of a ratio of an unknown to a standard of the same quantity; its operation must be completely described by a measurement equation.

### 12.2 Primary standard

Standard that is designated or widely acknowledged as having the highest metrological qualities and whose value is accepted without reference to other standards of the same quantity.

### 12.3 Secondary standard

Standard whose value is assigned by comparison with a primary standard of the same quantity.

### 12.4 Traceability

Property of the result of a measurement or the value of a standard whereby it can be related to stated references, usually national or international standards, through an unbroken chain of comparisons all having stated uncertainties. The concept is often expressed by the adjective traceable. The unbroken chain of comparisons is called a traceability chain.

### 12.5 Primary pH standards

Aqueous solutions of selected reference buffer solutions to which pH(PS) values have been assigned over the temperature range  $0\text{--}50^\circ\text{C}$  from measurements on cells without transference, called Harned cells, by use of the Bates–Guggenheim convention.

### 12.6 Bates–Guggenheim convention

A convention based on a form of the Debye–Hückel equation that approximates the logarithm of the single ion activity coefficient of chloride and uses a fixed value of 1.5 for the product  $Ba$  in the denominator at all temperatures in the range  $0\text{--}50^\circ\text{C}$  (see eqs. 4, 5) and ionic strength of the buffer  $< 0.1 \text{ mol kg}^{-1}$ .

### 12.7 Secondary pH standards

Values that may be assigned to secondary standard pH(SS) solutions at each temperature:

- i. with reference to [pH(PS)] values of a primary standard of the same nominal composition by Cell III,
- ii with reference to [pH(PS)] values of a primary standard of different composition by Cells II, IV or V, or
- iii by use of Cell I.

*Note 15:* This is an exception to the usual definition, see Section 12.3.

### 12.8 pH glass electrode

Hydrogen-ion responsive electrode usually consisting of a bulb, or other suitable form, of special glass attached to a stem of high-resistance glass complete with internal reference electrode and internal filling solution system. Other geometrical forms may be appropriate for special applications, e.g., capillary electrode for measurement of blood pH.

### 12.9 Glass electrode error

Deviation of a glass electrode from the hydrogen-ion response function. An example often encountered is the error due to sodium ions at alkaline pH values, which by convention is regarded as positive.

### 12.10 Hydrogen gas electrode

A thin foil of platinum electrolytically coated with a finely divided deposit of platinum or (in the case of a reducible substance) palladium metal, which catalyzes the electrode reaction:  $H^+ + e \rightarrow \frac{1}{2}H_2$  in solutions saturated with hydrogen gas. It is customary to correct measured values to standard 1 atm (101.325 kPa) partial pressure of hydrogen gas.

### 12.11 Reference electrode

External electrode system that comprises an inner element, usually silver–silver chloride, mercury–mercury(I) chloride (calomel), or thallium amalgam–thallium(I) chloride, a chamber containing the appropriate filling solution (see 12.14), and a device for forming a liquid junction (e.g., capillary) ceramic plug, frit, or ground glass sleeve.

### 12.12 Liquid junction

Any junction between two electrolyte solutions of different composition. Across such a junction there arises a potential difference, called the liquid junction potential. In Cells II, IV, and V, the junction is between the pH standard or unknown solution and the filling solution, or the bridge solution (q.v.), of the reference electrode.

### 12.13 Residual liquid junction potential error

Error arising from breakdown in the assumption that the LJPs cancel in Cell II when solution X is substituted for solution S in Cell V.

### 12.14 Filling solution (of a reference electrode)

Solution containing the anion to which the reference electrode of Cells IV and V is reversible, e.g., chloride for silver–silver chloride electrode. In the absence of a bridge solution (q.v.), a high concentration of filling solution comprising almost equitransferent cations and anions is employed as a means of maintaining the LJP small and approximately constant on substitution of unknown solution for standard solution(s).

### 12.15 Bridge (or salt bridge) solution (of a double junction reference electrode)

Solution of high concentration of inert salt, preferably comprising cations and anions of equal mobility, optionally interposed between the reference electrode filling and both the unknown and standard solution, when the test solution and filling solution are chemically incompatible. This procedure introduces into the cell a second liquid junction formed, usually, in a similar way to the first.

### 12.16 Calibration

Set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument, or measuring system, or values represented by a

material measure or a reference material, and the corresponding values realized by standards.

### 12.17 Uncertainty (of a measurement)

Parameter, associated with the result of a measurement, which characterizes the dispersion of the values that could reasonably be attributed to the measurand.

### 12.18 Standard uncertainty, $u_x$

Uncertainty of the result of a measurement expressed as a standard deviation.

### 12.19 Combined standard uncertainty, $u_c(y)$

Standard uncertainty of the result of a measurement when that result is obtained from the values of a number of other quantities, equal to the positive square root of a sum of terms, the terms being the variances, or covariances of these other quantities, weighted according to how the measurement result varies with changes in these quantities.

### 12.20 Expanded uncertainty, $U$

Quantity defining an interval about the result of a measurement that may be expected to encompass a large fraction of the distribution of values that could reasonably be attributed to the measurand.

*Note 16:* The fraction may be viewed as the coverage probability or level of confidence of the interval.

*Note 17:* To associate a specific level of confidence with the interval defined by the expanded uncertainty requires explicit or implicit assumptions regarding the probability distribution characterized by the measurement result and its combined standard uncertainty. The level of confidence that may be attributed to this interval can be known only to the extent to which such assumptions may be justified.

*Note 18:* Expanded uncertainty is sometimes termed overall uncertainty.

### 12.21 Coverage factor

Numerical factor used as a multiplier of the combined standard uncertainty in order to obtain an expanded uncertainty

*Note 19:* A coverage factor is typically in the range 2 to 3. The value 2 is used throughout in the Annex.

## 13. Annex: measurement uncertainty

Examples are given of uncertainty budgets for pH measurements at the primary, secondary, and working level. The calculations are done in accordance with published procedures [15,37].

When a measurement ( $y$ ) results from the values of a number of other quantities,  $y = f(x_1, x_2, \dots, x_n)$ , the combined standard uncertainty of the measurement is obtained from the square root of the expression

$$u_c^2(y) = \sum_{i=1}^n \left( \frac{\partial f}{\partial x_i} \right)^2 \cdot u^2(x_i)$$

where  $\frac{\partial f}{\partial x_i}$  is called the sensitivity coefficient ( $c_i$ ). This equation holds for uncorrelated quantities. The  $\partial x_i$  equation for correlated quantities is more complex.

The uncertainty stated is the expanded uncertainty,  $U$ , obtained by multiplying the standard uncertainty,  $u_c(y)$ , by an appropriate

coverage factor. When the result has a large number of degrees of freedom, the use of a value of 2 leads to approximately 95% confidence that the true value lies in the range  $\pm U$ . The value of 2 will be used throughout this Annex.

The following sections give illustrative examples of the uncertainty calculations for Cells I–V.

After the assessment of uncertainties, there should be a reappraisal of experimental design factors and statistical treatment of the data, with due regard for economic factors before the adoption of more elaborate procedures.

### A.1 Uncertainty budget for the primary method of measurement using Cell I

Experimental details have been published [42–45].

#### A-1.1 Measurement equations

The primary method for the determination of pH(PS) values consists of the following steps (Section 4.1):

1. Determination of the standard potential of the Ag | AgCl electrode from the acid-filled cell (Cell Ia)

$$E^\circ = E_a + 2k \lg(m_{\text{HCl}}/m^\circ) + 2k \lg \gamma_{\text{HCl}} - (k/2) \lg(p^\circ/p_{\text{H}_2}) \quad (\text{A-2}) \text{ cf. (3)}$$

where  $E_{\text{Ia}} = E_a - (k/2) \lg(p^\circ/p_{\text{H}_2})$ ,  $k = (RT/F) \ln 10$ ,  $p_{\text{H}_2}$  is the partial pressure of hydrogen in Cell Ia, and  $p^\circ$  is the standard pressure.

2. Determination of the acidity function,  $p(a_{\text{H}}\gamma_{\text{Cl}})$ , in the buffer-filled cell (Cell I)

$$-\lg(a_{\text{H}}\gamma_{\text{Cl}}) = (E_b - E^\circ)/k + \lg(m_{\text{Cl}}/m^\circ) - (1/2) \lg(p^\circ/p_{\text{H}_2}), \quad (\text{A-3}) \text{ cf. (2)}$$

where  $E_{\text{I}} = E_b - (k/2) \lg(p^\circ/p_{\text{H}_2})$ ,  $p_{\text{H}_2}$  is the partial pressure of hydrogen in Cell I, and  $p^\circ$  the standard pressure.

3. Extrapolation of the acidity function to zero chloride concentration

$$-\lg(a_{\text{H}}\gamma_{\text{Cl}}) = -\lg(a_{\text{H}}\gamma_{\text{Cl}})^\circ + S m_{\text{Cl}} \quad (\text{A-4}) \text{ cf. (5)}$$

4. pH Determination

$$\text{pH(PS)} = -\lg(a_{\text{H}}\gamma_{\text{Cl}})^\circ + \lg \gamma_{\text{Cl}}^\circ \quad (\text{A-5})$$

where  $\lg \gamma_{\text{Cl}}^\circ$  is calculated from the Bates–Guggenheim convention (see eq. 6). Values of the Debye–Hückel limiting law slope for 0 to 50 °C are given in Table A.9 [46].

#### A-1.2 Uncertainty budget

Example: PS = 0.025 mol kg<sup>-1</sup> disodium hydrogen phosphate + 0.025 mol kg<sup>-1</sup> potassium dihydrogen phosphate.

TABLE A.1 Calculation of Standard Uncertainty of the Standard Potential of the Silver–Silver Chloride Electrode ( $E^\circ$ ) from Measurements in  $m_{\text{HCl}} = 0.01 \text{ mol kg}^{-1}$

Quantity	Estimate $x_i$	Standard Uncertainty $u(x_i)$	Sensitivity Coefficient $ c_i $	Uncertainty Contribution $u_i(y)$
$E/V$	0.464	$2 \cdot 10^{-5}$	1	$2 \cdot 10^{-5}$
$T/K$	298.15	$8 \cdot 10^{-3}$	$8.1 \cdot 10^{-4}$	$6.7 \cdot 10^{-6}$
$m_{\text{HCl}}/\text{mol kg}^{-1}$	0.01	$1 \cdot 10^{-5}$	5.14	$5.1 \cdot 10^{-5}$
$p_{\text{H}_2}/\text{kPa}$	101.000	0.003	$1.3 \cdot 10^{-7}$	$4.2 \cdot 10^{-7}$
$\Delta E(\text{Ag}/\text{AgCl})/V$	$3.5 \cdot 10^{-5}$	$3.5 \cdot 10^{-5}$	1	$3.5 \cdot 10^{-5}$
Bias potential				
$\gamma_{\pm}$	0.9042	$9.3 \cdot 10^{-4}$	0.0568	$5.2 \cdot 10^{-6}$

$$u_c(E^\circ) = 6.5 \times 10^{-5} \text{ V}$$

Note 20: The uncertainty of method used for the determination of hydrochloric acid concentration is critical. The uncertainty quoted here is for potentiometric silver chloride titration. The uncertainty for coulometry is about 10 times lower.

TABLE A.2 Calculation of the Standard Uncertainty of the Acidity Function  $\lg(a_{\text{H}}\gamma_{\text{Cl}})$  for  $m_{\text{Cl}} = 0.005 \text{ mol kg}^{-1}$

Quantity	Estimate $x_i$	Standard Uncertainty $u(x_i)$	Sensitivity Coefficient $ c_i $	Uncertainty Contribution $u_i(y)$
$E/V$	0.770	$2 \cdot 10^{-5}$	16.9	$3.4 \cdot 10^{-4}$
$E^\circ/V$	0.222	$6.5 \cdot 10^{-5}$	16.9	$1.1 \cdot 10^{-3}$
$T/K$	298.15	$8 \cdot 10^{-3}$	0.031	$2.5 \cdot 10^{-4}$
$m_{\text{Cl}}/\text{mol kg}^{-1}$	0.005	$2.2 \cdot 10^{-6}$	86.86	$1.9 \cdot 10^{-4}$
$p_{\text{H}_2}/\text{kPa}$	101.000	0.003	$2.2 \cdot 10^{-6}$	$7 \cdot 10^{-6}$
$\Delta E(\text{Ag}/\text{AgCl})/V$	$3.5 \cdot 10^{-5}$	$3.5 \cdot 10^{-5}$	16.9	$5.9 \cdot 10^{-4}$

$$u_c[\lg(a_{\text{H}}\gamma_{\text{Cl}})] = 0.0013$$

Note 21: If, as is usual practice in some NMIs [42–44], acid and buffer cells are measured at the same time, then the pressure measuring instrument uncertainty quoted above (0.003 kPa) cancels, but there remains the possibility of a much smaller bubbler depth variation between cells.

**TABLE A.3**  $S_1 = \text{Primary Buffer, pH(PS)} = 4.005, u(\text{pH}) = 0.003; S_2 = \text{Secondary Buffer, pH(SS)} = 6.86.$   
**Free-Diffusion Junctions with Cylindrical Symmetry Formed in Vertical Tubes Were Used [25]**

Quantity	Estimate $x_i$	Standard Uncertainty $u(x_i)$	Sensitivity Coefficient $ c_i $	Uncertainty Contribution $u_i(y)$
pH( $S_1$ )	4.005	0.003	1	0.003
$E_{II}/V$	0.2	$1 \cdot 10^{-5}$	16.9	$1.7 \cdot 10^{-4}$
$(E_{j_2} - E_{j_1})/V$	$3.5 \cdot 10^{-4}$	$3.5 \cdot 10^{-4}$	16.9	$6 \cdot 10^{-3}$
$T/K$	298.15	0.1	$1.2 \cdot 10^{-5}$	$1.2 \cdot 10^{-6}$

$u_c[\text{pH}(S_2)] = 0.007$

Note 22: The error in  $E_{II}$  is estimated as the scatter from 3 measurements. The RLJP contribution is estimated from Fig. 2 as 0.006 in pH; it is the principal contribution to the uncertainty.

The standard uncertainty due to the extrapolation to zero added chloride concentration (Section 4.4) depends in detail on the number of data points available and the concentration range. Consequently, it is not discussed in detail here. This calculation may increase the expanded uncertainty (of the acidity function at zero concentration) to  $U = 0.004$ .

As discussed in Section 5.2, the uncertainty due to the use of the Bates–Guggenheim convention includes two components:

- i. The uncertainty of the convention itself, and this is estimated to be approximately 0.01. This contribution to the uncertainty is required if the result is to be traceable to SI, but will not be included in the uncertainty of “conventional” pH values.
- ii The contribution to the uncertainty from the value of the ionic strength should be calculated for each individual case.

The typical uncertainty for Cell I is between  $U = 0.003$  and  $U = 0.004$ .

**A.2 Uncertainty budget for secondary pH buffer using Cell II**

where  $S_1$  and  $S_2$  are different buffers.

**A.2.1 Measurement equations**

- 1. Determination of pH( $S_2$ )  $\text{pH}_{II}(S_2)$

$-\text{pH}_{II}(S_1) = E_{II}/k - (E_{j_2} - E_{j_1})/k$       (A-6) cf. (9)

- 2. Theoretical slope,  $k = (RT/F)\ln 10$

**A.2.2 Uncertainty budget**

Therefore,  $U[\text{pH}(S_2)] = 0.014$ .

**A.3 Uncertainty budget for secondary pH buffer using Cell III**

**A.3.1 Measurement equations**

- 1.  $\text{pH}(S_2) - \text{pH}(S_1) = (E_{III} + E_j)/k$       (A-7) cf. (11)
- 2.  $k = (RT/F)\ln 10$

For experimental details, see refs. [16,33,38].

Therefore,  $U[\text{pH}(S_2)] = 0.004$ . The uncertainty is no more than that of the primary standard PS<sub>1</sub>.

**A.4 Uncertainty budget for secondary pH buffer using Cell IV**

**A.4.1 Measurement equations**

- 1. Determination of pH( $S_2$ )

$\text{pH}_{IV}(S_2) - \text{pH}_{IV}(S_1) = -[E_{IV}(S_2) - E_{IV}(S_1)]/k - (E_{j_2} - E_{j_1})/k$       (A-8) cf. (13)

- 2. Theoretical slope,  $k = (RT/F)\ln 10$

**TABLE A.4** pH ( $S_2$ ) Determination.  $S_1 = \text{Primary Standard (PS)}$  and  $S_2 = \text{Secondary Standard (SS)}$  are of the Same Nominal Composition. Example: 0.025 mol kg<sup>-1</sup> Disodium Hydrogen Phosphate + 0.025 mol kg<sup>-1</sup> Potassium Dihydrogen Phosphate, PS<sub>1</sub> = 6.865,  $u(\text{pH}) = 0.002$

Quantity	Estimate $x_i$	Standard Uncertainty $u(x_i)$	Sensitivity Coefficient $ c_i $	Uncertainty Contribution $u_i(y)$
pH(PS <sub>1</sub> )	6.865	$2 \cdot 10^{-3}$	1	$2 \cdot 10^{-3}$
$[E(S_2) - E(S_1)]/V$	$1 \cdot 10^{-4}$	$1 \cdot 10^{-6}$	16.9	$16.9 \cdot 10^{-6}$
$[E_{id}(S_2) - E_{id}(S_1)]/V$	$1 \cdot 10^{-6}$	$1 \cdot 10^{-6}$	16.9	$1.7 \cdot 10^{-5}$
$E_j/V$	$1 \cdot 10^{-5}$	$1 \cdot 10^{-5}$	16.9	$16.9 \cdot 10^{-5}$
$T/K$	298.15	$2 \cdot 10^{-3}$	$5 \cdot 10^{-6}$	$1 \cdot 10^{-8}$

$u_c[\text{pH}(S_2)] = 0.002$

Note 23:  $[E_{id}(S_2) - E_{id}(S_1)]$  is the difference in cell potential when both compartments are filled with solution made up from the same sample of buffer material. The estimate of  $E_j$  comes from the observations made of the result of perturbing the pH of samples by small additions of strong acid or alkali, and supported by Henderson equation considerations, that  $E_j$  contributes about 10 % to the total cell potential difference [33].

**TABLE A.5 Example from the Work of Paabo and Bates [5] Supplemented by Private Communication from Bates to Covington.  $S_1 = 0.05 \text{ mol kg}^{-1}$  Equimolal Phosphate;  $S_2 = 0.05 \text{ mol kg}^{-1}$  Potassium Hydrogen Phthalate.  $\text{KCl} = 3.5 \text{ mol dm}^{-3}$ .  $S_1 = \text{Primary Buffer PS}_1$ ,  $\text{pH} = 6.86$ ,  $u(\text{pH}) = 0.003$ ,  $S_2 = \text{Secondary Buffer SS}_2$ ,  $\text{pH} = 4.01$**

Quantity	Estimate $x_i$	Standard Uncertainty $u(x_i)$	Sensitivity Coefficient $ c_i $	Uncertainty Contribution $u_i(y)$
$\text{pH}(S_1)$	6.86	0.003	1	0.003
$\Delta E_{IV}/V$	0.2	$2.5 \cdot 10^{-4}$	16.9	$4 \cdot 10^{-3}$
$(E_{j2} - E_{j1})/V$	$3.5 \cdot 10^{-4}$	$3.5 \cdot 10^{-4}$	16.9	$6 \cdot 10^{-3}$
$T/K$	298.15	0.1	$1.78 \cdot 10^{-3}$	$1.78 \cdot 10^{-4}$

$$u_c[\text{pH}(S_2)] = 0.008$$

Note 24: The estimate of the error in  $\Delta E_{IV}$  comes from an investigation of several  $3.5 \text{ mol dm}^{-3}$  KCl calomel electrodes in phosphate solutions. The RLJP contribution for free-diffusion junctions is estimated from Fig. 2 as 0.006 in pH.

#### A.4.2 Uncertainty budget

Therefore,  $U[\text{pH}(S_2)] = 0.016$ .

#### A.5 Uncertainty budget for unknown pH(X) buffer determination using Cell V

Ag | AgCl | KCl ( $\geq 3.5 \text{ mol dm}^{-3}$ ) | Buffer pH(S) or pH(X) | glass electrode

Cell V

##### A.5.1 Measurement equations: 2-point calibration (bracketing)

- Determination of the practical slope ( $k'$ )

$$k' = [(E_V(S_2) - E_V(S_1))/[\text{pH}(S_2) - \text{pH}(S_1)]] \quad (\text{A-9}) \text{ cf. (16)}$$

- Measurement of unknown solution (X)

$$\begin{aligned} \text{(X) pH(X)} &= \text{pH}(S_1) \\ -[E_V(X) - E_V(S_1)]/k' - (E_{j2} - E_{j1})/k' & \quad (\text{A-10}) \text{ cf. (15)} \end{aligned}$$

##### A.5.2 Uncertainty budget

Example of two-point calibration (bracketing) with a pH combination electrode [47].

##### A.5.3 Measurement equations for multipoint calibration

$$E_V(S) = E_V^\circ - k' \text{pH}(S) \quad (\text{A-11}) \text{ cf. (17)}$$

$$\text{pH}(X) = [E_V^\circ - E_V(X)]/k' \quad (\text{A-12}) \text{ cf. (18)}$$

Uncertainty budget:

Example: Standard buffers  $\text{pH}(S_1) = 3.557$ ,  $\text{pH}(S_2) = 4.008$ ,  $\text{pH}(S_3) = 6.865$ ,  $\text{pH}(S_4) = 7.416$ ,  $\text{pH}(S_5) = 9.182$ ; pH(X) was a "ready-to-use" buffer solution with a nominal pH of 7.

A combination electrode with capillary liquid junction was used. For experimental details, see ref. [41]; and for details of the calculations, see ref. [45].

The uncertainty will be different arising from the RLJPs if an alternative selection of the five standard buffers was used. The uncertainty attained will be dependent on the design and quality of the commercial electrodes selected.

Therefore,  $U[\text{pH}(X)] = 0.01$ .

**TABLE A.6 Primary Buffers  $\text{PS}_1$ ,  $\text{pH} = 7.4$ ,  $u(\text{pH}) = 0.003$ ;  $\text{PS}_2$ ,  $\text{pH} = 4.01$ ,  $u(\text{pH}) = 0.003$ . Practical Slope ( $k'$ ) Determination**

Quantity	Estimate $x_i$	Standard Uncertainty $u(x_i)$	Sensitivity Coefficient $ c_i $	Uncertainty Contribution $u_i(y)$
$\Delta E/V$	0.2	$5 \cdot 10^{-4}$	$2.95 \cdot 10^{-1}$	$1.5 \cdot 10^{-4}$
$T/K$	298.15	0.1	$1.98 \cdot 10^{-4}$	$1.98 \cdot 10^{-5}$
$(E_{j2} - E_{j1})/V$	$6 \cdot 10^{-4}$	$6 \cdot 10^{-4}$	$2.95 \cdot 10^{-1}$	$1.8 \cdot 10^{-4}$
$\Delta \text{pH}$	3.39	$4.24 \cdot 10^{-3}$	$1.75 \cdot 10^{-2}$	$7.40 \cdot 10^{-5}$

$$u_c(k') = 2.3 \cdot 10^{-4}$$

**TABLE A.7 pH(X) Determination**

Quantity	Estimate $x_i$	Standard Uncertainty $u(x_i)$	Sensitivity Coefficient $ c_i $	Uncertainty Contribution $u_i(y)$
$\text{pH}(S_1)$	7.4	0.003	1	0.003
$\Delta E/V$	0.03	$1.40 \cdot 10^{-5}$	16.95	$2.37 \cdot 10^{-4}$
$(E_{j2} - E_{j1})/V$	$6.00 \cdot 10^{-4}$	$6.00 \cdot 10^{-4}$	16.95	$1.01 \cdot 10^{-2}$
$k'/V$	0.059	$2.3 \cdot 10^{-4}$	9.01	$2.1 \cdot 10^{-3}$

$$u_c[\text{pH}(X)] = 1.6 \cdot 10^{-2}$$

Note 25: The estimated error in  $\Delta E$  comes from replicates. The RLJP is estimated as 0.6 mV. Therefore,  $U[\text{pH}(X)] = 0.021$ .

TABLE A.8

Quantity	Estimate $x_i$	Standard Uncertainty $u(x_i)$	Sensitivity Coefficient $ c_i $	Uncertainty Contribution $u_i(y)$
$E^\circ/V$	-0.427	$5 \cdot 10^{-4}$	16.96	0.0085
$T/K$	298.15	0.058	$1.98 \cdot 10^{-4}$	$1.15 \cdot 10^{-5}$
$E(X)/V$	0.016	$2 \cdot 10^{-4}$	16.9	0.0034
$k'/V$	0.059	$0.076 \cdot 10^{-3}$	67.6	0.0051

$$u_c[\text{pH}(X)] = 0.005$$

Note 26: There is no explicit RLJP error assessment as it is assessed statistically by regression analysis.

**TABLE A.9 Values of the Relative Permittivity of Water [46] and the Debye–Hückel limiting Law Slope for Activity Coefficients as  $\lg \gamma$  in eq. 6. Values are for 100.000 kPa, but the Difference from 101.325 kPa (1 atm) is Negligible**

$t/^\circ\text{C}$	Relative Permittivity	$A/\text{mol}^{-1/2} \text{kg}^{1/2}$
0	87.90	0.4904
5	85.90	0.4941
10	83.96	0.4978
15	82.06	0.5017
20	80.20	0.5058
25	78.38	0.5100
30	76.60	0.5145
35	74.86	0.5192
40	73.17	0.5241
45	71.50	0.5292
50	69.88	0.5345

## 14. Summary of recommendations

- IUPAC recommended definitions, procedures, and terminology are described relating to pH measurements in dilute aqueous solutions in the temperature range 0–50 °C.
- The recent definition of *primary method of measurement* permits the definition of primary standards for pH, determined by a primary method (cell without transference, called the Harned cell) and of secondary standards for pH.
- pH is a conventional quantity and values are based on the Bates–Guggenheim convention. The assigned uncertainty of the Bates–Guggenheim convention is 0.01 in pH. By accepting this value, pH becomes traceable to the internationally accepted SI system of measurement.
- The required attributes (listed in Section 6.1) for primary standard materials effectively limit the number of primary substances to six, from which seven primary standards are defined in the pH range 3–10 (at 25 °C). Values of pH(PS) from 0–50 °C are given in Table 2.
- Methods that can be used to obtain the difference in pH between buffer solutions are discussed in Section 8. These methods include the use of cells with transference that are practically more convenient to use than the Harned cell, but have greater uncertainties associated with the results.
- Incorporation of the uncertainties for the primary method, and for all subsequent measurements, permits the uncertainties for all procedures to be linked to the primary standards by an unbroken chain of comparisons. Despite its conventional basis, the definition of pH, the establishment of pH standards, and the procedures for pH determination

are self-consistent within the confidence limits determined by the uncertainty budgets.

- Comparison of values from the cell with liquid junction with the assigned pH(PS) values of the same primary buffers measured with Cell I makes the estimation of values of the RLJPs possible (Section 7), and the consistency of the seven primary standards can be estimated.
- The Annex (Section 13) to this document includes typical uncertainty estimates for the five cells and measurements described, which are summarized in Table 4.
- The hierarchical approach to primary and secondary measurements facilitates the availability of recommended procedures for carrying out laboratory calibrations with traceable buffers grouped to achieve specified target uncertainties of unknowns (Section 11). The three calibration procedures in common use, one-point, two-point (bracketing), and multi-point, are described in terms of target uncertainties.

## GENERAL COMMENTS ON BUFFERS

The major factor in biological pH control in eukaryotic cells is the carbon dioxide-bicarbonate-carbonate buffer (Scheme I) system<sup>1-4</sup>. There are other biological buffers such as bulk protein and phosphate anions which can provide some buffering effect, metabolites such as lactic acid which can lower pH and tris(hydroxymethylaminomethyl) methane, (THAM®) has been used to treat acid base disorders<sup>5-7</sup>. pH control in prokaryotic cells is mediated by membrane transport of various ions including hydrogen, potassium and sodium<sup>8-10</sup>.

### Scheme I

See Jungas, R.L., Best literature values for the pK of carbonic and phosphoric acid under physiological conditions, *Anal. Biochem.* 349, 1-15, 2006

In the laboratory, the bicarbonate/carbonate buffer system can only be used in the far alkaline range (pH 9-11) and unless "fixed" by a suitable cation such as sodium, can be volatile. A variety of buffers, most notably the "Good" buffers which were developed by Norman Good and colleagues<sup>10a</sup>, have been developed over the years to provide pH control in *in vitro* experiments. While effective in controlling pH, the numerous non-buffer effects that buffer salts have on experimental systems are somewhat less appreciated. Some effects, such as observed with phosphate buffers, are based on biologically significant interactions with proteins and, as such, demonstrate specificity. Other effects, such as metal ion chelation, can be considered general. There are some effects where the stability of a reagent is dependent on both pH and buffer species. One example is provided by the stability of phenylmethylsulfonyl fluoride (PMSF)<sup>11</sup>. PMSF was less stable in Tris buffer than in either HEPES or phosphate buffer; PMSF is less stable in HEPES than in phosphate buffer. Activity was measured by the ability of PMSF to inhibit chymotrypsin; all activity was lost in Tris (10 mM; pH 7.5) after one hour at 25°C while activity was fully retained in phosphate (10 mM, pH 7.5). This is likely a reflection of the nucleophilic property of Tris<sup>12,13</sup> which appears to be enhanced in the presence of divalent cations such as zinc<sup>14</sup>. The loss of activity, presumably the result of the hydrolysis of the fluoride to hydroxyl function, is more marked at more alkaline pH. Tris can also function as phosphoacceptor in assays for alkaline phosphatase but was not as effective as 2-amino-2-methyl-1,3-propanediol<sup>15</sup>. The various nitrogen-based buffers such as Tris, HEPES, CAP, and BICINE influence colorimetric protein assays<sup>16-18</sup>.

Other specific examples are presented in Table 1.

TABLE 1: Effects of Buffers

Buffer	Observation
ACES	Competitive inhibitor of $\gamma$ -aminobutyric acid receptor binding <sup>1</sup> .
ADA	Competitive inhibitor of $\gamma$ -aminobutyric acid receptor binding <sup>1</sup> ; chelation of calcium ions <sup>2</sup> .
BES	Interacts with DNA yielding distortion of DNA electrophoretograms <sup>3</sup> .
BICINE	Chelation of calcium ions <sup>2</sup> ; protects liver alcohol dehydrogenase from inactivation by iodoacetic acid <sup>4</sup> .
Borate	Anomalous complex formation with nucleic acids <sup>5</sup> ; complex formation with carbohydrates <sup>6,7</sup> ; participant in the modification of arginine residues by 1,2-cyclohexanedione <sup>8</sup> .
Cacodylic Acid Carbonate	Reaction with sulfhydryl compounds <sup>9</sup> . Enhances rate of reaction of phenylglyoxal with arginine residues in proteins <sup>10</sup> ; modulation of peroxynitrite reactions with proteins <sup>11,12</sup> ; modulation of Cu <sup>2+</sup> oxidation reactions <sup>13-15</sup> .
Citrate	Chelation of calcium ions <sup>2</sup> .
HEPES	Free radical generation <sup>16,17</sup> and complexation of copper ions <sup>18</sup> ; reported adverse effects in tissue culture <sup>19,20</sup> .
MES	Complexes copper ions <sup>21</sup> .
MOPS	Adverse effect on smooth muscle contraction <sup>22</sup> ; Oxidation of metal ions <sup>22</sup> ; formation of nitric oxide donors on incubation with peroxynitrite <sup>24</sup> ; slow reaction with hydrogen peroxide <sup>25</sup> .
Phosphate	Catalysis of the racemization of 5-phenylhydantoins <sup>26,27</sup> .
PIPES	Binding to bile salt-stimulated lipase <sup>28</sup> ; variation in physiological response based on vendor source <sup>29</sup> ; inhibition of a K <sup>+</sup> -activated phosphatase <sup>30</sup> .
TES	Interaction with extracellular matrices <sup>31</sup> ; inhibition of the interaction of proteoglycans with type I collagen <sup>32</sup> .
Tricine	Chelating agent <sup>2</sup> ; tricine radicals have been reported in the presence of peroxide-forming enzymes <sup>33</sup> .
Tris	Nucleophile <sup>34,35</sup> and enzyme inhibitor <sup>36</sup> .

Alkaline carbonate buffers have been used as the medium for proteins for application to microplates for immunoassays such as ELISA assays (Rote, N.S., Taylor, N.L. Shigeoka, A.O., <i>et al.</i> , Enzyme-linked immunosorbent assay for group B streptococcal antibodies, <i>Infect. Immun.</i> 27, 118-123, 1980; Hubschle, O.J., Lorenz, R.J., and Matheka, H.D., Enzyme-linked immunosorbent assay for detection of bluetongue virus antibodies, <i>Am.J.Vet.Res.</i> 42, 61-65, 1981; Solling, H., and Dinesen, B., The development of a rapid ELISA for IgE utilizing commercially available reagents, <i>Clin.Chim.Acta</i> 130, 71-83, 1983; Mowat, W.P. and Dawson, S., Detection and identification of plant viruses by ELISA using crude sap extracts and unfractionated antisera, <i>J.Virol.Methods</i> 15, 233-247, 1987; Ferris, N.P., Powell, H., and Donaldson, A.I., Use of pre-coated immunoplates and freeze-dried reagents for the diagnosis of foot-and-mouth disease and swine vesicular disease by enzyme-linked immunosorbent assay [ELISA], <i>J.Virol.Methods</i> 19, 197-206, 1988; Cutler, S.J. and Wright, D.J., Comparison of immunofluorescence and enzyme linked immunosorbent assays for diagnosing Lyme disease, <i>J.Clin.Pathol.</i> 42, 869-871, 1989; Oshima, M. and Atassi, M.Z., Comparison of peptide-coating conditions in solid phase assays for detection of anti-peptide antibodies, <i>Immunol.Invest.</i> 18, 841-851, 1989; Martin, R.R., Relationships among luteoviruses based on nucleic acid hybridization and serological studies, <i>Intervirology</i> 31, 23-30, 1990; Houen, G. and Koch, C., A non-denaturing enzyme linked immunosorbent assay with protein preadsorbed onto aluminum hydroxide, <i>J.Immunol.Methods</i> 200, 99-105, 1997; Shrivastav, T.G., Basu, A., and Kariya, K.P., Substitution of carbonate buffer by water for IgG immobilization in enzyme linked immunosorbent assay, <i>J.Immunoassay Immunochem.</i> 24, 191-203, 2003). Bicarbonate buffers also have an effect on the reaction of phenylglyoxal with proteins (Cheung, S.T. and Fonda, M.L., Reaction of phenylglyoxal with arginine. The effect of buffers and pH, <i>Biochem.Biophys.Res.Comm.</i> 90, 940-947, 1979). Bicarbonate also enhances the binding of iron to transferrin (Matinaho, S., Karhumäki, P., and Parkkinen, J., Bicarbonate inhibits the growth of <i>Staphylococcus epidermidis</i> in platelet concentrates by lowering the level of non-transferrin-bound iron, <i>Transfusion</i> 45, 1768-173, 2005

**Cholamine**

(2-aminoethyl) trimethyl-ammonium chloride hydrochloride

Blasie, C.A. and Berg, J.M., Structure-based thermodynamic analysis of a coupled metal binding-protein folding reaction involving a zinc finger peptide, *Biochemistry* 41, 15068-15073, 2002; Zwiorek, K., Kloeckner, J., Wagner, E., and Coester, C., Gelatin nanoparticles as a new and simple gene delivery system, *J.Pharm.Pharm.Sci.* 7, 22-28, 2005.

**Citric Acid**

2-hydroxy-1,2,3-propanetricarboxylic acid

192.1

Compounds found in a variety of biological tissues and cells; involved in energy metabolism (citric acid cycle; Krebs cycle; Krebs, H.A., The citric acid cycle and the Szent-Gyorgyi cycle in pigeon breast muscle, *Biochem.J.* 34, 775-779, 1940). Also used as biological buffer.

Citric acid has three carboxylic acid functions which permits buffering capacity from pH 2.0 to pH 12. Citric acid also chelate divalent cations and is used as an anticoagulant for the collection of blood based its ability to chelate calcium ions. Chelation of metal ions is responsible for the observed inhibition of many enzymes. For early observations, see Smith, E.G., Dipeptidases, *Methods Enzymol.* 2, 93-114, 1955; McDonald, M.R., Deoxyribonucleases, *Methods Enzymol.* 2, 437-447, 1955; Kornberg, A., Adenosine phosphokinase, *Methods Enzymol.* 2, 497-500, 1955; Koshland, D.E., Jr., Preparation and properties of acetyl phosphatase, *Methods Enzymol.* 2, 556-556, 1955. The ability to chelate calcium serves as the basis for use as a decalcification agent. The polyvalent nature of citrate provide some unique characteristics such as the differentiation of muscle fiber types for histochemistry (Matoba, H., and Gollnick, P.D., Influence of ionic composition, buffering agent, and pH on the histochemical demonstration of myofibrillar actomyosin ATPase, *Histochemistry* 80, 609-614, 1984) and the activation of "prothrombin" (Seegers, W.H., McLaughlin, R.I., and Fahey, J.L., Some properties of purified prothrombin and its activation with sodium citrate, *Blood* 5, 421-433, 1950; Lanchantin, G.F., Friedman, J.A., and Hart, D.W., The conversion of human prothrombin to thrombin by sodium citrate. Analysis of the reaction mixture, *J.Biol.Chem.* 240, 3276-3282, 1965; Aronson, D.L. and Mustafa, A.J., The activation of human factor X in sodium citrate: the role of factor VII, *Thromb.Haemostas.* 36, 104-114, 1976). Citrate is a polyvalent anion and like other polyvalent anions such as phosphate and sulfate, citrate can cause a "salting-out" phenomena (Hegardt, F.G. and Pie, A., Sodium citrate salting-out of the human blood serum proteins, *Rev.Esp.Fisiol.* 24, 161-168, 1968; Carrea, G., Pasta, P., and Vecchio, G., Effect of the lyotropic series of anions on denaturation and renaturation of 20-β-hydroxysteroid dehydrogenase, *Biochim.Biophys.Acta* 784, 16-23,

## LIST OF BUFFERS (Continued)

Common Name	Chemical Name	M.W	Properties and Comment
			1984; Nakano, T., Yuasa, H., and Kanaya, Y., Suppression of agglomeration in fluidized bed coating. III. Hofmeister series in suppression of particle agglomeration, <i>Pharm.Res.</i> 16, 1616-1620, 1999; Nakano, T. and Yuasa, H., Suppression of agglomeration in fluidized bed coating. IV. Effects of sodium citrate concentration on the suppression of particle agglomeration and the physical properties of HPMC film, <i>Int.J.Pharm.</i> 215, 3-12, 2001; Mani, N. and Jun, H.W., Microencapsulation of a hydrophilic drug into a hydrophobic matrix using a salting-out procedure. I: Development and optimization of the process using factorial design, <i>J.Microencapsulation</i> 21, 125-135, 2004). Citrate also has an effect on partitioning in aqueous two-phase systems (Andrews, B.A., Schmidt, A.S., and Asenjo, J.A., Correlation for the partition behavior of proteins in aqueous two-phase systems: effect of surface hydrophobicity and charge, <i>Biotechnol.Bioeng.</i> 90, 380-390, 2005). Citrate has proved useful in the solubilization of proteins, usually, but not always, from mineralized/calcified matrices (Faludi, E. and Harsanyi, V., The effect of Na <sub>3</sub> -citrate on the solubility of cryoprecipitate [citrate effect of cryoprecipitate], <i>Haematologia</i> 14, 207-214, 1981; Myllyla, R., Preparation of antibodies to chick-embryo galactosylhydroxylsyl glucosyltransferase and their use for an immunological characterization of the enzyme of collagen synthesis, <i>Biochim.Biophys.Acta</i> 658, 299-307, 1981; Guy, O., Robles-Diaz, G., Adrich, Z., et al., Protein content of precipitates present in pancreatic juice of alcoholic subjects and patients with chronic calcifying pancreatitis, <i>Gastroenterology</i> 84, 102-107, 1983; Collingwood, T.N., Shanmugam, M., Daniel, R.M., and Langdon, A.G., M[III]-facilitated recovery and concentration of enzymes from mesophilic and thermophilic organisms, <i>J.Biochem. Biophys.Methods</i> 19, 281-286, 1989). Citrate is useful for dissociating protein complexes in some situations by binding to specific anion binding sites; the ability of citrate to function as a buffering at low pH is an advantage [Kuo, T.T., Chow, T.Y., Lin, X.T., et al., Specific dissociation of phage Xp12 by sodium citrate, <i>J.Gen.Virol.</i> 10,199-202, 1971(in this case, the dissociation is reflection of metal ion binding; the dissociation is associated with the loss of biological activity – see Lark, K.G. and Adams, M.H., The stability of phage as a function of the ionic environment, <i>Cold Spring Harbor Symposium on Quantitative Biology</i> , 18, 171-183, 1953); Sheffery, M. and Newton, A., Reconstitution and purification of flagellar filaments from <i>Caulobacter crescentus</i> , <i>J.Bacteriol.</i> 132, 1027-1030, 1977; Brooks, S.P. and Nicholls, P., Anion and ionic strength effects upon the oxidation of cytochrome c by cytochrome c oxidase, <i>Biochim.Biophys.Acta</i> 680, 33-43, 1982; Berliner, L.J., Sugawara, Y., and Fenton, J.W., 2nd, Human alpha-thrombin binding to nonpolymerized fibrin-Sepharose: evidence for an anionic binding region, <i>Biochemistry</i> 24, 7005-7009, 1985; Kella, N.K. and Kinsella, J.E., Structural stability of beta-lactoglobulin in the presence of kosmotropic salts. A kinetic and thermodynamic study, <i>Int.J.Pept.Protein Res.</i> 32, 396-405, 1988; Oe, H., Takahashi, N., Doi, E., and Hirose, M., Effects of anion binding on the conformations of the two domains of ovotransferrin, <i>J.Biochem.</i> 106, 858-863, 1989; Polakova, K., Karpatova, M., and Russ, G., Dissociation of $\beta$ -2-microglobulin is responsible for selective reduction of HLA class I antigenicity following acid treatment of cells, <i>Mol.Immunol.</i> 30, 1223-1230, 1993; Lecker, D.N. and Khan, A., Model for inactivation of $\alpha$ -amylase in the presence of salts: theoretical and experimental studies, <i>Biotechnol.Prog.</i> 14, 621-625, 1998; Rabiller-Baudry, M. and Chaufer, B., Small molecular ion adsorption on proteins and DNAs revealed by separation techniques, <i>J.Chromatog.B.Analyt.Technol.Biomed.Life.Sci.</i> 797, 331-345, 2003; Raibekas, A.A., Bures, E.J., Siska, C.C., et al., Anion binding and controlled aggregation of human interleukin-1 receptor antagonist, <i>Biochemistry</i> 44, 9871-9879, 2005). A special application of citrate dissociation of protein complexes is the isolation and dissociation of antigen-antibody complexes (Woodroffe, A.J. and Wilson, C.B., An evaluation of elution techniques in the study of immune complex glomerulonephritis, <i>J.Immunol.</i> 118, 1788-1794, 1977; Ehrlich, R. and Witz, I.P., The elution of antibodies from viable murine tumor cells, <i>J.Immunol.Methods</i> 26, 345-353, 1979; McIntosh, R.M., Garcia, R., Rubio, L., et al., Evidence of an autologous immune complex pathogenic mechanism in acute poststreptococcal glomerulonephritis, <i>Kidney Int.</i> 14, 501-510, 1978; Theofilopoulos, A.N., Eisenberg, R.A., and Dixon, F.J., Isolation of circulating immune complexes using Raji cells. Separation of antigens from immune complexes and production of antiserum, <i>J.Clin.Invest.</i> 61, 1570-1581, 1978; Tomino, Y., Sakai, H., Endoh, M., et al., Cross-reactivity of eluted antibodies from renal tissues of patients with Henoch-Schonlein purpura nephritis and IgA nephropathy, <i>Am.J.Nephrol.</i> 3, 315-318, 1983 ). A more complex and poorly understood application of citrate buffers is in epitope retrieval (Shi, S.R., Chaiwun, B., Young, L., et al., Antigen retrieval techniques utilizing citrate buffer or urea solution for immunohistochemical demonstration of androgen receptor in formalin-fixed paraffin sections, <i>J.Histochem.Cytochem.</i> 41, 1599-1604, 1993; Langlois, N.E., King, G., Herriot, R., and Thompson, W.D., Non-enzymatic retrieval of antigen permits staining of follicle centre cells by the rabbit polyclonal antibody to protein gene product 9.5, <i>J.Pathol.</i> 173, 249-253, 1994; Leong, A.S., Microwaves in diagnostic immunohistochemistry, <i>Eur.J.Morphol.</i> 34, 381-383, 1996; Lucas, D.R., al-Abbadi, M., Teabaczka, P., et al., c-Kit expression in desmoid fibroblastosis. Comparative immunohistochemical evaluation of two commercial antibodies, <i>Am.J.Clin.Pathol.</i> 119, 339-345, 2003). Additional work has indicated that citrate is useful but not unique for epitope retrieval (Imam, S.A., Young, L., Chaiwun, B., and Taylor, C.B., Comparison of two microwave based antigen-retrieval solutions in unmasking epitopes in formalin-fixed tissues for immunostaining, <i>Anticancer Res.</i> 15, 1153-1158, 1995; Pileri, S.A., Roncador, G., Ceccarelli, C., et al., Antigen retrieval techniques in immunohistochemistry: comparison of different methods, <i>J.Pathol.</i> 183, 116-123, 1997; Rocken, C. and Roessner, A., An evaluation of antigen retrieval procedures for immunoelectron microscopic classification of amyloid deposits, <i>J.Histochem.Cytochem.</i> 47, 1385-1394, 1999). Citrate buffer has been useful in affinity chromatography (Ishikawa, K. and Iwai, K., Affinity chromatography of cysteine-containing histone, <i>J.Biochem.</i> 77, 391-398, 1975; Chadha, K.C., Grob, P.M., Mikulski, A.J., et al., Copper chelate affinity chromatography of human fibroblast and leucocyte interferons, <i>J.Gen.Virol.</i> 43, 701-706, 1979; Tanaka, H., Sasaki, I., Yamashita, K. et al., Affinity chromatography of porcine pancreas deoxyribonuclease I on DNA-binding Sepharose under non-digestive conditions, using its substrate-binding site, <i>J.Biochem.</i> 88, 797-806, 1980 Smith, R.L. and Griffin, C.A., Separation of plasma fibronectin from associated hemagglutinating activity by elution from gelatin-agarose at pH 5.5, <i>Thromb. Res.</i> 37, 91-101, 1985). Citrate is also used for immunoaffinity chromatography including chromatography on Protein A (Martin, L.N., Separation of guinea pig IgG subclasses by affinity chromatography on protein A-Sepharose, <i>J.Immunol.Methods</i> 52, 205-212, 1982; Compton, B.J., Lewis, M.A., Whigham, F., et al., Analytical potential of protein A for affinity chromatography of polyclonal and monoclonal antibodies, <i>Anal.Chem.</i> 61, 1314-1317, 1989; Giraudi, G. and Baggiani, C. Strategy for fractionating high-affinity antibodies to steroid hormones by affinity chromatography, <i>Analyst</i> 121, 939-944, 1996; Arakawa, T., Philo, J.S., Tsumoto, K., et al., Elution of antibodies from a Protein-A column by aqueous arginine solutions, <i>Protein Expr. Purif.</i> 36, 244-248, 2004; Ghose, S., McNerney, T., and Hubbard, B., Protein A affinity chromatography for capture and purification of monoclonal antibody and Fc-fusion protein: Practical considerations for process development, in <i>Process Scale Bioseparations for the Biopharmaceutical Industry</i> , ed. A.A. Shukla, M.R. Etzel, and S. Gadam, , ed. A.A. Shukla, M.R. Etzel, and S. Gadam, CRC/Taylor & Francis, Boca Raton, FL., Chapter 16, pps. 462-489, 2007).

**Phosphate**

Phosphate buffers are among the most common buffers used for biological studies. It is noted that the use of phosphate solutions in early transfusion medicine lead to the discovery of the importance of calcium ions in blood coagulation (Hutchin, P., History of blood transfusion: A tercentennial look, *Surgery* 64, 685-700, 1968). Phosphate-buffer saline (PBS; generally 0.01 M sodium phosphate – 0.14 M NaCl, pH 7.2 – Note, an incredible variation in PBS exists so it is necessary to verify composition – the only common factor that this writer finds is 0.01 M (10 mM) phosphate) is extensively used. Sodium phosphate buffers are the most common but there is extensive use of potassium phosphate buffers and mixtures of sodium and potassium. Unfortunately many investigators simply refer to phosphate buffer without respect to counter ion. Also, investigators will prepare a stock solution of sodium phosphate [usually sodium dihydrogen phosphate (sodium phosphate, monobasic) or disodium hydrogen phosphate (sodium phosphate, dibasic) and adjust pH as required with (usually) hydrochloric acid and/or sodium hydrogen. This is not preferable and, if used, must be described in the text to permit other investigators to repeat the experiment. pH changes in phosphate buffers during freezing can be dramatic due to precipitation of phosphate buffer salts (van den Berg, L. and Rose, D., Effect of freezing on the pH and composition of sodium and potassium phosphate solutions: The reciprocal system KH<sub>2</sub>PO<sub>4</sub>-Na<sub>2</sub>PO<sub>4</sub>-H<sub>2</sub>O, *Arch.Biochem.Biophys.* 81, 319-329, 1959; Murase, N. and Franks, F., Salt precipitation during the freeze-concentration of phosphate buffer solutions, *Biophys.Chem.* 34, 393-300, 1989; Pikal-Cleland, K.A. and Carpenter, J.F., Lyophilization-induced protein denaturation in phosphate buffer systems: monomeric and tetrameric beta-galactosidase, *J.Pharm.Sci.* 90, 1255-1268, 2001; Gomez, G., Pikal, M., and Rodriguez-Hornedo, N., Effect of initial buffer composition on pH changes during far-from-equilibrium freezing of sodium phosphate buffer solutions, *Pharm.Res.* 18, 90-97, 2001; Pikal-Cleland, K.A., Cleland, J.L., Anchorodoquy, T.J. and Carpenter, J.F., Effect of glycine on pH changes and protein stability during freeze-thawing in phosphate buffer systems, *J.Pharm.Sci.* 91, 1969-1979, 2002). Phosphate bind divalent cations in solutions

-------------	---------------	-----	------------------------

and can form insoluble salts. Phosphate influences biological reactions by binding cations such as calcium, platinum and iron (Staum, M.M., Incompatibility of phosphate buffer in  $99^m$  Tc-sulfur colloid containing aluminum ion, *J.Nucl.Med.* 13, 386-387, 1972; Frank, G.B., Antagonism by phosphate buffer of the twitch ions in isolated muscle fibers produced by calcium-free solutions, *Can.J.Physiol.Pharmacol.* 56, 523-526, 1978; Hasegawa, K., Hashi, K., and Okada, R., Physicochemical stability of pharmaceutical phosphate buffer solutions. ## BRØNSTED ACIDITIES

Definition: A molecule (conjugate acid) which liberates a proton in solution; the residual molecular ion is a conjugate base

- Acid strength depends on the strength of the E-H bond.
- Electronegativity of E influences the polarity of the E-H bond
- Energy of solvation of  $[\text{EH}_{x-1}]^-$  – small anions have more favorable solvation energies

pKa values of  $\text{EH}_x$

$\text{CH}_4$  -58

$\text{NH}_3$  39

$\text{OH}_2$  14

$\text{SH}_2$  7

$\text{SeH}_2$  4

$\text{TeH}_2$  3

FH 3

Mingo, D.M.P., *Essential Trends of Inorganic Chemistry*, Oxford University Press, Oxford, United Kingdom, 1998

## Lewis acids

Definition: A molecule which can accept electrons.

Lewis Base is an electron donor, for example  $\text{PR}_3$ —which becomes a “stronger” base as the electron donating properties of the R group increases as long as the Lewis acid is a simple electron acceptor and steric effects are not important.

# MEASUREMENT OF pH

Roger G. Bates and Maya Paabo

## Definition of pH

The following definition of pH has received the endorsement of the International Union of Pure and Applied Chemistry.

1. *Operational definition.* In all existing national standards the definition of pH is an operational one. The electromotive force  $E_x$  of the cell:

Pt, H<sub>2</sub> | solution X | concentrated KCl solution | reference electrode

is measured and likewise the electromotive force  $E_s$  of the cell:

Pt, H<sub>2</sub> | solution S | concentrated KCl solution | reference electrode

both cells being at the same temperature throughout and the reference electrodes and bridge solutions being identical in the two cells. The pH of the solution X, denoted by pH(X), is then related to the pH of the solution S, denoted by pH(S), by the definition:

$$\text{pH}(X) = \text{pH}(S) + \frac{E_x - E_s}{(RT \ln 10)/F}$$

where  $R$  denotes the gas constant,  $T$  the thermodynamic temperature, and  $F$  the faraday constant. Thus defined the quantity pH is dimensionless.

To a good approximation, the hydrogen electrodes in both cells may be replaced by other hydrogen ion responsive electrodes, e.g., glass or quinhydrone. The two bridge solutions may be of any molality not less than 3.5 mol kg<sup>-1</sup>, provided they are the same (see *Pure Appl. Chem.*, 1, 163, 1960).

2. *Standards.* The difference between the pH of two solutions having been defined as above, the definition of pH can be completed by assigning a value of pH at each temperature to one or more chosen solutions designated as standards. A series of pH(S) values for seven suitable standard reference solutions is given in Table 1. The constants for calculating pH(S) values over the temperature range for 0 to 95°C are given in Table 2.

If the definition of pH given above is adhered to strictly, then the pH of a solution may be slightly dependent on which standard solution is used. These unavoidable deviations are caused not only by imperfections in the response of the hydrogen ion electrodes but also by variations in the liquid-junction potentials resulting from the different ionic compositions and mobilities of the several standards and from differences in the structure of the liquid-liquid boundary. In fact such variations in measured pH are usually too small to be of practical significance. Moreover, the acceptance of several standards allows the use of the following alternative definition of pH.

The electromotive force  $E_x$  is measured, and likewise the electromotive forces  $E_1$  and  $E_2$ , of two similar cells with the solution X replaced by the standard solutions  $S_1$  and  $S_2$  such that  $E_1$  and  $E_2$  values are on either side of, and as near as possible to,  $E_x$ . The pH of solution X is then obtained by assuming linearity between pH and  $E$ , that is to say

$$\frac{\text{pH}(X) - \text{pH}(S_1)}{\text{pH}(S_2) - \text{pH}(S_1)} = \frac{E_x - E_1}{E_2 - E_1}$$

This procedure is especially recommended when the hydrogen-ion-responsive electrode is a glass electrode.

## Standard solutions

The pH meter or other electrometric pH assembly does not, strictly speaking, measure the pH but rather indicates a difference between the pH of an unknown solution (X) and a standard solution (S), both of which are at the same temperature. The pH meter should always be standardized routinely with two reference solutions of assigned pH, chosen if possible to bracket the pH of the test solution. These standards are prepared as indicated in Table 3. For convenience, air weights of the buffer salts are given. A good grade of distilled or de-ionized water should be used; for the four solutions of highest pH, the water should be freed of dissolved carbon dioxide by boiling or purging. For a detailed discussion of the properties of the primary standard buffer solutions, the reader is referred to chapter 4 of R. G. Bates, *Determination of pH*, 2nd ed., (John Wiley and Sons, Inc., New York, 1973).

Highly pure buffer materials should be used. These materials are obtainable commercially; they are also distributed as certified standard reference materials by the National Bureau of Standards. It should be noted that individual lots show slight variations; hence, the values certified for a particular lot may differ slightly from those given in Table 1.

The use of two or more standard reference solutions may disclose small inconsistencies in the standardization of the pH meter, depending on which standards are chosen. When this is the case, the best results are often obtained by assuming linearity between  $E$  and pH between the two calibrating points bracketing the pH of the unknown.

## Electrodes

Although the hydrogen electrode is the ultimate standard on which the pH scale is based, in practice the convenient and versatile glass electrode is favored for the vast majority of pH measurements. New glass electrodes, or those that have been allowed to dry out, should be conditioned by soaking in water for several hours before use and after exposure to nonaqueous or dehydrating media. Some glass electrodes are designed especially for use at high temperatures, while others are best suited to low-temperature use. Special "high pH" electrodes are also available. For optimum results, careful attention should be paid to selection of the proper electrode for the problem at hand.

Glass electrodes of small dimensions are of great utility when sample volumes are limited. The pH-sensitive glasses are, however, moderately soluble, and small amounts of alkali are dissolved from the glass surface by the solutions in which the electrode is immersed. For this reason, the most accurate results are obtained when the ratio of the electrode area to sample volume is small.

The concentrated solution of potassium chloride that joins the reference electrode with the unknown or standard solution is reasonably effective in reducing the liquid-junction potential to small, fairly constant, values. It is important to assure that the flow of bridge solution into the test solution is neither excessive nor completely interrupted by crystallization of salt in the aperture where liquid-liquid contact is established.

Temperature gradients within the pH cell are a common source of difficulty, marked by variability and inaccuracy in the

TABLE 1 Values of pH(S) for Seven Primary Standard Solutions

<sup>b</sup> This weight of salt to be dissolved in water and diluted to 1 liter at 25°C to provide concentrations indicated in Table 1.

reading. Both of the electrodes, and the standard and test solutions as well, should be within a few degrees Celsius of the same temperature. For results of the highest reliability, temperature control should be provided. It is the function of the temperature compensator of the pH meter to adjust the pH-e.m.f. slope in

such a manner that a difference of e.m.f. (in volts) is correctly converted to a difference of pH. This adjustment cannot compensate for inequalities of temperature through the cell or for differences between the temperature of the standard and test solutions.

## Techniques

Electrodes and sample cups should be washed carefully with distilled or de-ionized water and gently dried with clean absorbent tissue. The electrodes are immersed in the first standard solution and the temperature compensator of the measuring instrument is set at the temperature of the solutions whose pH is to be measured. The standardization control of the instrument is adjusted until the meter is balanced at the known pH of the standard, as given in Table 1. This procedure is repeated with successive portions of the same standard until replacement causes no change in the position of balance. The electrodes are then washed once more and dried.

A second standard solution is selected and the measurement repeated without altering the position of the standardization control. The pH reading of this second solution is noted and the sample replaced with a second portion of the same solution. This replacement is continued until successive readings agree within 0.02 pH unit, when the electrodes and meter may be judged to be functioning properly. It is advisable to make a final check with one of the buffers at the conclusion of a series of measurements.

After the instrument is properly standardized, a portion of the test solution is placed in the sample cup and the pH reading noted. Successive portions are again used until two measurements agree within the limits imposed by the reproducibility of the measuring instrument and the temperature control. With the best meters, measurements on buffered solutions should be reproducible to 0.01 unit or even better. With water or poorly buffered solutions, values agreeing to 0.1 unit may have to be accepted. Some improvement will result if poorly buffered solutions are protected from carbon dioxide of the atmosphere during the period of the measurements.

## Interpretation of pH numbers

The standard values of pH given in the table of an earlier section are based on hydrogen electrode potentials as measured in cells without a liquid junction. The uncertainty of the standard values is estimated at 0.005 unit. The accuracy of the results furnished by a given pH assembly adjusted with these primary standards is, however, further limited by inconsistencies which have their origin in defects of the glass electrode response and variations in the liquid-junction potential. For these reasons, the accuracy of experimental pH numbers can be considered to be better than 0.01 unit only under unusually favorable conditions.

The operational definition of pH fulfills adequately the need for an experimental scale capable of furnishing reproducible pH

numbers. The interpretation of these numbers may be of secondary importance and should only be attempted when the standard and unknown solutions are matched so closely in composition that there is good reason to believe that the liquid-junction potential remains fairly constant when the standard is replaced by the unknown. In general, this will be the case when the unknowns are aqueous solutions of simple salts of total concentration not in excess of 0.2 M with pH values between 2.5 and 11.5.

When these "ideal" conditions prevail, the experimental pH can be considered to approach  $-\log a_{\text{H}}$ , where  $a_{\text{H}}$  is the conventional hydrogen ion activity defined in a manner consistent with the convention on which the standard values of pH(S) were based Bates, R. G., *J. Res. Natl. Bur. Standards*, 66A, 179 (1962). All quantitative applications of pH measurements, when justifiable, should therefore be based on the approximation  $\text{pH(X)} \approx -\log a_{\text{H}} = -\log m_{\text{H}^+} \gamma$ , where  $m$  is molality and  $\gamma$  is the activity coefficient.

## Indicator methods

Acid-base indicators have the property of altering the color of a solution in the region 1 to 2 pH units as the pH changes. They are therefore useful for pH measurements, although in general the accuracy is inferior to that obtainable by electrometric procedures. A list of suitable indicators, their pH ranges and color changes, is given in Table 4.

Equal concentrations of the same indicator are added to the test solution and to each of a series of buffer solutions of known pH selected to bracket the pH of the test solution. Color comparisons are made with a colorimeter or spectrophotometer, and solutions of equal color are assumed to have the same pH. The pH of a series of suitable reference solutions can be determined in advance by electrometric methods. Alternatively, tables of pH as a function of composition can be utilized. The compositions and pH values of a set of useful solutions covering the range pH 1 to 13 are summarized in Table 5.

Note: When not otherwise specified, both stock and buffer solutions should be made up with distilled water free of CO<sub>2</sub>. Only standard reagents should be used. If there is any doubt as to the purity or water content of solutions, their amount of substance concentration must be checked by titration. The volumes x (in ml) of stock solutions required to make up a buffer solution of the desired pH value are given in the table on the next page.

## AMINE BUFFERS USEFUL FOR BIOLOGICAL RESEARCH

Norman Good

All of these amines are highly polar, water-soluble substances. Their advantages and disadvantages must be determined empirically for each biological reaction system. For best buffering performance they should be used at pH's close to the pKa, preferably within  $\pm 0.5$  pH units of the pKa and never more than  $\pm 1.0$  unit from the pKa. Note that the pKa's, and therefore the pH's of buffered solutions, change with temperature in the manner indicated.

Chemical Name	Trivial Name or Acronym	Structure	pKa at 20°C	$\Delta$ pKa/°C
2-( <i>N</i> -Morpholino)ethanesulfonic acid	MES		6.15	-0.011
Bis(2-hydroxyethyl)imino-tris-(hydroxymethyl)methane	Bistris	$(\text{HOCH}_2\text{CH}_2)_2=\text{N}-\text{C}\equiv(\text{CH}_2\text{OH})_3$	6.5	—
<i>N</i> -(2-Acetamido)iminodiacetic acid	ADA <sup>a</sup>		6.6	-0.011

Compiled by Norman Good.

<sup>a</sup> These substances may bind certain di- and polyvalent cations and therefore they may sometimes be useful for providing constant, low level concentrations of free heavy metal ions (heavy metal buffering).

<sup>b</sup> These substances interfere with and preclude the Folin protein assay.

For further information on these and other buffers, see Good and Izawa, in *Methods in Enzymology, Part B*, Vol. 24, Pietro, Ed., Academic Press, New York, 1972, 53.

# PREPARATION OF BUFFERS FOR USE IN ENZYME STUDIES\*

G. Gomori

The buffers described in this section are suitable for use either in enzymatic or histochemical studies. The accuracy of the tables is within  $\pm 0.05$  pH at 23°. In most cases the pH values will not be off by more than  $\pm 0.12$  pH even at 37° and at molarities slightly different from those given (usually 0.05 M).

The methods of preparation described are not necessarily identical with those of the original authors. The titration curves of the majority of the buffers recommended have been redetermined by the writer. The buffers are arranged in the order of ascending pH range. For more complete data on phosphate and acetate buffers over a wide range of concentrations, see Vol. I [10].\*

## BUFFER FOR ACRYLAMIDE GELS WITH MORE THAN ONE LAYER

Gel Layer	Buffer Solutions						Characteristics of System	Apparatus Type <sup>a</sup>	Ref.
	In Gel			In Electrode Vessels					
	Buffer Ions	<i>M</i>	<i>pH</i>	Buffer Ions	<i>M</i>	<i>pH</i>			
Sample (large pore)	Tris	0.062	6.7	Tris	0.005	8.3	The sample is set in the upper-the most gel and concentrates in spacer gel; the actual separation occurs in the bottom gel	D	9
	Chloride	0.06		Glycine	0.038				
Spacer (large pore)	Tris	0.062	6.7						
	Chloride	0.06							
Small-pore gel	Tris	0.37	8.9						
	Chloride	0.06							
Same gel layers as above				Tris	0.05	8.3	Same as Ref. 9 except that improved resolution is obtained if as above carried out at 4-5°C	D	10
				Glycine	0.38				
Spacer (large pore)	Tris	0.075	6.7	Tris	0.05	8.3	Same as Ref. 9 except that sample gel is omitted; the sample is stabilized with sucrose	D	2
	Chloride	0.075		Glycine	0.38				
Small-pore gel	Tris	0.046	8.7						
	Chloride	0.075							
Spacer (large pore)	Tris	0.049	6.7	Tris	0.025	8.4	Same as Ref. 9 except that sample gel is omitted; the sample is stabilized with acrylamide monomer	VP	11
	H <sub>3</sub> PO <sub>4</sub>	0.026		Glycine	0.19				
Small-pore gel	Tris	0.37	8.9						
	Chloride	0.06							
Sample (large pore)	Acetic acid	0.062	6.8	Acetic acid	0.14	4.5	An acid gel suitable for separation of bases	D	13
	KOH	0.06		$\beta$ -Alanine	0.35				
Spacer (large pore)	Acetic acid	0.062	6.8						
	KOH	0.06							
Small-pore gel	Acetic acid	0.75	4.3						
	KOH	0.12							

<sup>a</sup> D: disc; FP: flat plate, in the horizontal; VP: vertical plate.

<sup>b</sup> Molarity based on weight of orthoboric acid, (H<sub>4</sub>BO<sub>3</sub>) taken. For additional buffers see Starch Gels. All buffers recommended for starch gel can be used in acrylamide gels.

## STARCH GELS

**TABLE 1 Starch Gels: Buffer Solutions**

In Gel			In Electrode Vessels			Materials Investigated (Examples Only)	Results
Buffer Ions	M	pH	Buffer Ions	M	pH		
Borate <sup>a,b</sup>	0.025	8.5	Borate	0.3	8.5	Serum <sup>1</sup>	Citrate borate boundary is seen as a brown band The electrophoresis is over in less time compared to borate only
Tris	0.076	8.6	Borate	0.3	8.5	Serum, <sup>2,3</sup> diphtheria toxin, <sup>2</sup> horseradish peroxidase, <sup>2</sup> haptoglobins, <sup>5</sup> and transferins <sup>6</sup>	
Citrate <sup>a</sup>	0.005					Hemoglobins, <sup>4</sup> human and animal sera, <sup>7</sup> staphylococcal enterotoxin B <sup>16</sup>	
Tris	0.045		Tris	0.013			Hb A and F are separated
Borate <sup>a</sup>	0.025	8.4	Borate	0.075	8.4	Hemoglobins <sup>12-14</sup> Serum <sup>17</sup>	
EDTA	0.002		EDTA	0.006			Five bands
Tris	0.1		Tris	0.01			
Malate <sup>a</sup>	0.01	7.4	Malate	0.1	7.4	Hemolysates invested for phosphoglucomutase <sup>20</sup>	
EDTA	0.001		EDTA	0.01			
MgCl <sub>2</sub>	0.001		MgCl <sub>2</sub>	0.01			
Glycine	0.05	8.9	Borate	0.3	8.9	Myeloma $\gamma$ -globulin <sup>8</sup>	
Citrate <sup>a</sup>	0.0027		—	—			Anterior pituitary hormones <sup>15</sup>
Borate <sup>a</sup>	0.0076	8.0	Borate	0.38			
Tris	0.0144		—	—			Tissue dehydrogenases <sup>21</sup>
Lithium	0.0020		Lithium	0.10			
Tris	0.03	8.4	Tris	0.05			Pepsin and gastricsin <sup>23</sup>
HCl	—		HCl	—			
Acetate	0.1	5.0	—	—			

<sup>a</sup> Molarities based on weight of orthoboric (H<sub>3</sub>BO<sub>3</sub>) or other acid taken. When no cation is given, the acids have been adjusted to the pH shown by addition of NaOH.

<sup>b</sup> For optimum results, use borate concentration recommended for each individual batch of starch.

From Gordon, A. H., Ed., *Electrophoresis of Proteins in Polyacrylamide and Starch Gels* (in *Laboratory Techniques in Biochemistry and Molecular Biology*, Work, T. S. and Work, E., Gen. Eds.), North-Holland, New York, 1971, 100. With permission of Elsevier Science Publishers.

**TABLE 2 Starch Gels Containing Urea Buffer Solutions**

Buffer Solutions							Materials Investigated (Examples Only)	Results
In Gel			In Electrode Vessels					
Buffer Ions	M	pH	Urea M	Buffer Ions	M	pH		
Formate	0.05	3.0	8	Formate	0.2	2—3	$\gamma$ -Myeloma, heavy chains, <sup>10</sup> antibodies <sup>18</sup>	Slightly sharper bands were obtained if alkylation was done as well as reduction
Aluminum lactate	0.05	3.1	3	Aluminum lactate			Gliadin <sup>11</sup>	
Glycine	0.035	7—8	8	Borate	0.3	8.2	$\gamma$ -Globulin heavy and light chains <sup>9</sup>	Light chains well separated
Borate <sup>a</sup>	0.025	8.5	8	Borate	0.3	8.5	Haptoglobins <sup>19</sup>	Without prior reduction urea has no effect Urea treatment of $\alpha$ -crystallin, without reduction, leads to formation of many bands
Tris	0.076	8.6	7	Borate	0.3	8.6	$\alpha$ - and $\beta$ -casein <sup>22,25</sup>	
Citrate	0.005							At least 14 bands
Acetate	0.0365	5.6	6	—	—	—	<i>E. coli</i> ribosomal proteins <sup>24</sup>	

<sup>a</sup> Molarities based on weight of orthoboric (H<sub>3</sub>BO<sub>3</sub>) or other acid taken. When no cation is given, the acids have been adjusted to the pH shown by addition of NaOH.

<sup>b</sup> For optimum results, use borate concentration recommended for each individual batch of starch.

## INDICATORS FOR VOLUMETRIC WORK AND pH DETERMINATIONS

Indicator	Chemical Name	Acid Color	pH Range	Basic Color	Preparation
Methyl violet 6B	Tetra and pentamethylated <i>p</i> -rosaniline hydrochloride	Y	0.1–1.5	B	pH: 0.25% water
Metacresol purple (acid range)	<i>m</i> -Cresolsulfonphthalein	R	0.5–2.5	Y	pH: 0.10 g. in 13.6 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water
Metanil yellow	4-Phenylamino-azobenzene-3'-sulfonic acid	R	1.2–2.3	Y	pH: 0.25% in ethanol
<i>p</i> -Xylenol blue (acid range)	1,4-Dimethyl-5-hydroxybenzenesulfonphthalein	R	1.2–2.8	Y	pH: 0.04% in ethanol
Thymol blue (acid range)	Thymolsulfonphthalein	R	1.2–2.8	Y	pH: 0.1 g. in 10.75 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water
Tropaeolin OO	Sodium <i>p</i> -diphenylamino-azobenzenesulfonate	R	1.4–2.6	Y	pH: 0.1% in water Vol.: 1% in water
Quinaldine red	2-( <i>p</i> -Dimethylaminostyryl)quinoline ethiodide	C	1.4–3.2	R	Vol.: 0.1% in ethanol
Benzopurpurine 4B	Ditolyl-diazo-bis- $\alpha$ -naphthyl-amine-4-sulfonic acid	B-V	1.3–4.0	R	pH, vol.: 0.1% in water
Methyl violet 6B	Tetra and pentamethylated <i>p</i> -rosaniline hydrochloride	B	1.5–3.2	V	pH, vol.: 0.25% in water
2,4-Dinitrophenol		C	2.6–4.0	Y	pH, vol.: 0.1 g. in 5 ml. ethanol, diluted to 100 ml. with water
Methyl yellow	<i>p</i> -Dimethylaminoazobenzene	R	2.9–4.0	Y	pH, vol.: 0.05% in ethanol
Bromphenol blue	Tetrabromophenolsulfonphthalein	Y	3.0–4.6	B	pH: 0.1 g. in 7.45 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water
Tetrabromophenol blue	Tetrabromophenol-tetrabromosulfonphthalein	Y	3.0–4.6	B	pH: 0.1 g. in 5.00 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water
Direct purple	Disodium 4,4'-bis(2-amino-1-naphthylazo)-2,2'-stilbenedisulfonate	B-P	3.0–4.6	R	Vol.: 0.1 g. in 7.35 ml. 0.02 <i>N</i> NaOH, diluted to 100 ml. with water
Congo red	Diphenyl-diazo-bis-1-naphthylamine-4-sodium sulfonate	B	3.0–5.2	R	pH: 0.1% in water
Methyl orange	4'-Dimethylaminoazobenzene-4-sodium sulfonate	R	3.1–4.4	Y	Vol.: 0.1% in water
Brom-chlorphenol blue	Dibromodichlorophenolsulfonphthalein	Y	3.2–4.8	B	pH: 0.1 g. in 8.6 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water Vol.: 0.04% in ethanol
<i>p</i> -Ethoxychrysoidine	4'-Ethoxy-2,4-diaminoazobenzene	R	3.5–5.5	Y	Vol.: 0.1% in ethanol
$\alpha$ -Naphthyl red		R	3.7–5.0	Y	Vol.: 0.1% in ethanol
Sodium alizarinsulfonate	Dihydroxyanthraquinone sodium sulfonate	Y	3.7–5.2	V	pH, vol.: 1% in water
Bromcresol green	Tetrabromo- <i>m</i> -cresolsulfonphthalein	Y	3.8–5.4	B	pH: 0.10 g. in 7.15 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water
2,5-Dinitrophenol		C	4.0–5.8	Y	pH, vol.: 0.10 g. in 20 ml. Ethanol, then dilute to 100 ml. with water
Methyl red	4'-Dimethylaminoazobenzene-2-carboxylic acid	R	4.2–6.2	Y	pH: 0.10 g. in 18.6 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water Vol.: 0.1% in ethanol
Lacmoid		R	4.4–6.2	B	Vol.: 0.5% in ethanol
Azolitmin		R	4.5–8.3	B	Vol.: 0.5% in water
Litmus		R	4.5–8.3	B	Vol.: 0.5% in water
Cochineal	Complex hydroxyanthraquinone derivative	R	4.8–6.2	V	Vol.: Triturate 1 g. with 20 ml. Ethanol and 60 ml. water, let stand 4 days, and filter
Hematoxylin		Y	5.0–6.0	V	Vol.: 0.5% in ethanol.
Chlorphenol red	Dichlorophenolsulfonphthalein	Y	5.0–6.6	R	pH: 0.1 g. in 11.8 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water Vol.: 0.04% in ethanol
Bromcresol purple	Dibromo- <i>o</i> -cresolsulfonphthalein	Y	5.2–6.8	Pu	pH: 0.1 g. in 9.25 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml with water Vol.: 0.02% in ethanol
Bromphenol red	Dibromophenolsulfonphthalein	Y	5.2–7.0	R	pH: 0.1 g. in 9.75 ml. 0.02 <i>N</i> NaOH, diluted to 250 ml. with water Vol.: 0.04% in ethanol
Alizarin	1,2-Dihydroxyanthraquinone	Y	5.5–6.8	R	Vol.: 0.1% in ethanol

## INDICATORS FOR VOLUMETRIC WORK AND pH DETERMINATIONS (Continued)

Indicator	Chemical Name	Acid Color	pH Range	Basic Color	Preparation
Dibromophenoltetrabromophenolsulfonphthalein		Y	5.6–7.2	Pu	pH: 0.1 g. in 1.21 ml. 0.1 N NaOH, diluted to 250 ml. with water
<i>p</i> -Nitrophenol		C	5.6–7.6	Y	pH, vol.: 0.25% in water
Bromothymol blue	Dibromothymolsulfonphthalein	Y	6.0–7.6	B	pH: 0.1 g. in 8 ml. 0.02 N NaOH, diluted to 250 ml. with water Vol.: 0.1% in 50% ethanol
Indo-oxine	5,8-Quinolinequinone-8-hydroxy-5-quinolyl-5-imide	R	6.0–8.0	B	Vol.: 0.05% in ethanol
Cucumin		Y	6.0–8.0	Br-R	Vol: saturated aq. soln.
Quinoline blue	Cyanine	C	6.6–8.6	B	Vol.: 1% in ethanol
Phenol red	Phenolsulfonphthalein	Y	6.8–8.4	R	pH: 0.1 g. in 14.20 ml. 0.02 N NaOH, diluted to 250 ml. with water Vol.: 0.1% in ethanol
Neutral red	2-Methyl-3-amino-6-dimethylaminophenazine	R	6.8–8.0	Y	pH, vol.: 0.1 g. in 70 ml. ethanol, diluted to 100 ml. with water
Rosolic acid aurin; corallin		Y	6.8–8.2	R	pH, vol.: 1% in 50% ethanol
Cresol red	<i>o</i> -Cresolsulfonphthalein	Y	7.2–8.8	R	pH: 0.1 g. in 13.1 ml. 0.02 N NaOH, diluted to 250 ml. with water Vol.: 0.1% in ethanol
$\alpha$ -Naphtholphthalein		P	7.3–8.7	G	pH, vol.: 0.1% in 50% ethanol
Metacresol purple (alkaline range)	<i>m</i> -Cresolsulfonphthalein	Y	7.4–9.0	P	pH: 0.1 g. in 13.1 ml. 0.02 N NaOH, diluted to 250 ml. with water Vol.: 0.1% in ethanol
Ethylbis-2,4-dinitrophenylacetate		C	7.5–9.1	B	Vol.: saturated soln. in equal volumes of acetone and ethanol
Tropaeolin OOO No. 1	Sodium $\alpha$ -naphtholazobenzene-sulfonate	Y	7.6–8.9	R	Vol.: 0.1% in water
Thymol blue (alkaline range)	Thymolsulfonphthalein	Y	8.0–9.6	B	pH: 0.1 g. in 10.75 ml. 0.02 N NaOH, diluted to 250 ml. with water Vol.: 0.1% in ethanol
<i>p</i> -Xylenol blue	1,4-Dimethyl-5-hydroxybenzenesulfonphthalein	Y	8.0–9.6	B	pH, vol.: 0.04% in ethanol
<i>o</i> -Cresolphthalein		C	8.2–9.8	R	pH, vol.: 0.04% in ethanol
$\alpha$ -Naphtholbenzein		Y	8.5–9.8	G	pH, vol.: 1% in ethanol
Phenolphthalein	3,3-Bis( <i>p</i> -hydroxyphenyl)-phthalide	C	8.2–10	R	Vol.: 1% in ethanol
Thymolphthalein		C	9.3–10.5	B	pH, vol.: 0.1% in ethanol
Nile blue A	Aminonaphthodiethylaminophenoxazine sulfate	B	10–11	P	Vol.: 0.1% in water
Alizarin yellow GG	3-Carboxy-4-hydroxy-3'-nitroazobenzene	Y	10–12	L	pH, vol.: 0.1% in 50% ethanol
Alizarin yellow R	3-Carboxy-4-hydroxy-4'-nitroazobenzene sodium salt	Y	10.2–12.0	R	pH, vol.: 0.1% in water
Poirrer's blue C4B		B	11–13	R	pH: 0.2% in water
Tropaeolin O	<i>p</i> -Benzenesulfonic acid-azoresorcinol	Y	11–13	O	pH: 0.1% in water
Nitramine	Picrylnitromethylamine	C	10.8–13	Br	pH: 0.1% in 70% ethanol
1,3,5-Trinitrobenzene		C	11.5–14	O	pH: 0.1% in ethanol
Indigo carmine	Sodium indigodisulfonate	B	11.6–14	Y	pH: 0.25% in 50% ethanol

Note: The indicator colors are abbreviated as follows: B, blue; Br, brown; C, colorless; G, green; L, lilac; O, orange; P, pink; Pu, purple; R, red; V, violet; and Y, yellow.

## Mixed Indicators

Composition	Solvent	Transition pH	Acid Color	Transition Color	Basic Color
Dimethyl yellow, 0.05% + Methylene blue, 0.05%	alc.	3.2	Blue-violet	—	Green
Methyl orange, 0.02% + Xylene cyanole FF, 0.28%	50% alc.	3.9	Red	Gray	Green
Methyl yellow, 0.08% + Methylene blue, 0.004%	alc.	3.9	Pink	Straw-pink	Yellow-green
Methyl orange, 0.1% + Indigocarmine, 0.25%	aq.	4.1	Violet	Gray	Yellow-green
Bromcresol green, 0.1% + Methyl orange, 0.02%	aq.	4.3	Orange	Light green	Dark green
Bromcresol green, 0.075% + Methyl red, 0.05%	alc.	5.1	Wine-red	—	Green
Methyl red, 0.1% + Methylene blue, 0.05%	alc.	5.4	Red-violet	Dirty blue	Green
Bromcresol green, 0.05% + Chlorphenol red, 0.05%	aq.	6.1	Yellow-green	—	Blue-violet
Bromcresol purple, 0.05% + Bromthymol blue, 0.05%	aq.	6.7	Yellow	Violet	Violet-blue
Neutral red, 0.05% + Methylene blue, 0.05%	alc.	7.0	Violet-blue	Violet-blue	Green
Bromthymol blue, 0.05% + Phenol red, 0.05%	aq.	7.5	Yellow	Violet	Dark violet
Cresol red, 0.025% + Thymol blue, 0.15%	aq.	8.3	Yellow	Rose	Violet
Phenolphthalein, 0.033% + Methyl green, 0.067%	alc.	8.9	Green	Gray-blue	Violet
Phenolphthalein, 0.075% + Thymol blue, 0.025%	50% alc.	9.0	Yellow	Green	Violet
Phenolphthalein, 0.067% + Naphtholphthalein, 0.033%	50% alc.	9.6	Pale rose	—	Violet
Phenolphthalein, 0.033% + Nile blue, 0.133%	alc.	10.0	Blue	Violet	Red
Alizarin yellow, 0.033% + Nile blue, 0.133%	alc.	10.8	Green	—	Red-brown

## ACID AND BASE INDICATORS

The following is a brief list of some acid-base indicators (a more comprehensive listing is available in the *CRC Handbook of Chemistry and Physics*, CRC Press, Boca Raton, FL, USA, Section 8). There is extensive use of acid-base indicators in the

measurement of intracellular pH, as indicators for enzyme-catalyzed reactions, and in the measurement of material transfer across membranes and detection of changes in solid matrices.

### Some Acid-Base Indicators (pH Indicators)

Indicator Dye	Acid Color	Basic Color	pKa	pH Range
Cresol Red (I) ( <i>o</i> -cresolsulfonephthalein)	Red	Yellow		0.2 – 1.8
Crystal Violet	Green	Blue		0.0 – 2.0
Thymol Blue (I) (thymolsulfonephthalein)	Red	Yellow	1.6	1.2 – 2.8
Cresol Purple (metacresol purple; <i>m</i> -cresolpurple)	Red	Yellow	1.5	1.2 – 2.8
Bromophenol Blue	Yellow	Blue	4.1	3.0 – 4.6
Congo Red	Blue/Violet	Red		3.0 – 5.2
Methyl Red	Red	Yellow	5.1	4.4 – 6.3
Neutral Red	Red	Yellow	7.4	6.8 – 8.0
Phenol Red (phenolsulfonphthalein)	Yellow	Red	8.0	6.8 – 8.4
Cresol Red (II)	Yellow	Purple	8.4	7.3 – 8.8
Cresol Purple (II)	Yellow	Purple	8.3	7.4 – 9.0
Thymol Blue (II)	Yellow	Blue	9.2	8.0 – 9.6
Phenolphthalein	Colorless	Red	9.6	8.3 – 10.0
Nile Blue	Blue	Red	10.0	9.0 – 10.4
Nitramine (picrylmethylnitramine)	Colorless	Orange-Brown		10.8 – 12.8

### Acid-Base Indicators in Organic Solvents

Indicator	pKa		
	H <sub>2</sub> O	Dimethylformamide	2-Propanol
Thymol Blue (I)	1.7		5.0
Cresol Red(I)			4.3
Bromophenol Blue	4.1		8.8
Neutral Red	7.4		7.2
Phenol Red	8.0	15.4	15.4
Cresol Purple	8.3	15.2

## SPECIFIC GRAVITY OF LIQUIDS

Specific gravity and density are not identical although the abbreviation "d" is frequently used to designate specific gravity. Specific gravity and density are numerically equal when water is the standard of reference for specific gravity and g/ml is the unit designation for density.

The numerical value for specific gravity is usually written with a superscript (indicating the temperature of the liquid) and a subscript (indicating the temperature of the liquid to which it is referred), thus  $d_4^{25}$  1.724 or sp. gr.  $1.724_4^{25}$ . When

these are omitted in this table, the specific gravity at 20°C referred to water at 4°C is intended. When the standard of reference is not specified, for liquids and solids, it is understood to be water.

Water is most dense at 4°C, hence the sp. gr. of a liquid with reference to water will be higher at all other temperatures than it is at 4°C. To obtain the sp. gr. with reference to water at the same temperature as the liquid, multiply the sp. gr. of  $\frac{15}{4}$ ,  $\frac{20}{4}$ , or  $\frac{25}{4}$  by 1.001, 1.002, or 1.003, respectively.

### (Items listed in the order of increasing specific gravities)

Liquid	Specific Gravity	Liquid	Specific Gravity
<i>n</i> -Pentane	0.626	Propionitrile	0.783
<i>n</i> -Hexane	0.660	Acetonitrile	0.783 $_{25}^{25}$
1-Butyne	0.668 $_4^0$	<i>n</i> -Butyl ether	0.784 $_4^0$
Dimethylamine	0.680 $_4^0$	Isopropyl alcohol	0.785
Isoprene	0.681	Isovaleronitrile	0.788
<i>n</i> -Heptane	0.684	Butyl alcohol, tertiary	0.789
2-Butyne	0.688 $^{25}$	Methanol, anhydrous	0.791
1,5-Hexadiene	0.688	Acetone	0.792
Isopropylamine	0.694 $_4^{15}$	Isobutyraldehyde	0.794
Butylamine, tertiary	0.696	Acrylonitrile	0.797
Triethylboron	0.696 $^{23}$	Ethyl alcohol, anhydrous	0.798 $_{15.56}^{15.56}$
Ethylamine	0.706 $_4^0$	Valeronitrile	0.801
Diethylamine	0.711 $_4^{18}$	Isovaleraldehyde	0.803 $_4^{17}$
2,4-Hexadiene	0.711	<i>n</i> -Propyl alcohol	0.804
Diethyl ether	0.713	Allyl ether	0.805 $_0^{18}$
<i>n</i> -Nonane	0.716	Ethyl methyl ketone	0.805
Triethylamine	0.723 $_4^{25}$	Isobutyl alcohol	0.806 $_4^{15}$
Butylamine, secondary	0.724	Propionaldehyde	0.807
Isopropyl ether	0.726	Butyl alcohol, secondary	0.808
Ethyl methyl ether	0.726 $_4^0$	Amyl alcohol, tertiary	0.809
2,4-Heptadiene	0.733 $_4^{11.5}$	Methyl propyl ketone	0.809
Isobutylamine	0.724 $_4^{25}$	<i>n</i> -Butyl alcohol	0.810
Propyl ether	0.736	Cycloheptane	0.810
Methyl propyl ether	0.738	Cyclohexene	0.810
Dipropylamine	0.738	Isoamyl alcohol	0.813 $_4^{15}$
Ethyl <i>n</i> -propyl ether	0.739	Ethyl propyl ketone	0.813 $_4^{21.8}$
<i>n</i> -Butylamine	0.740	<i>pri-n</i> -Amyl alcohol	0.814
Undecane	0.741	Heptyl ether	0.815 $_4^0$
<i>N,N</i> -Dimethylamylamine	0.743	Diethyl ketone	0.816 $_4^{19}$
Ethyl isopropyl ether	0.745 $_4^0$	Ethyl alcohol, 95 per cent	0.816 $_{15.56}^{15.56}$
Isoamylamine	0.751	Butyraldehyde	0.817
Cyclopentane	0.751	Dipropyl ketone	0.817
Butyl ethyl ether	0.752	Ethyl butyl ketone	0.818
Isohexylamine	0.758 $_4^{25}$	<i>n</i> -Hexyl methyl ketone	0.819
Isobutyl ether	0.761 $_4^{15}$	1-Hexanol	0.819
Allylamine	0.761	3-Hexanol	0.819
<i>n</i> -Amylamine	0.761	Isoamyl alcohol, secondary	0.819
Butyl methyl ether	0.764 $_4^0$	Pinacolin	0.821 $_4^0$
Allyl ether ether	0.765	Amyl methyl ketone	0.822 $_4^{15}$
<i>n</i> -Dodecane	0.766 $_4^0$	Cycloheptene	0.823
Dibutylamine	0.767	<i>n</i> -Octyl alcohol	0.825
<i>n</i> -Butyl ether	0.769 $_{20}^{20}$	2-Undecanone	0.826
Cyclopentene	0.774	Light Liquid Petrolatum	0.828–0.880 $_{25}^{25}$
<i>n</i> -Heptylamine	0.777	2-Hexanol	0.829 $_4^0$
Cyclohexane	0.778	<i>n</i> -Decyl alcohol	0.829
<i>n</i> -Octylamine	0.779 $_{20}^{20}$	<i>n</i> -Undecylaldehyde	0.830
Isoamyl ether	0.781 $_4^{15}$	Butyl methyl ketone	0.830 $_4^0$

Compiled by Norman G. Anderson based on equations developed by E. J. Barber in *J. Nat. Cancer Inst. Monograph*, 21, 219 (1966).

<sup>a</sup> Original data were stated to a precision of about 1 part in 10,000. Maximum deviation from original data is 7 parts in 10,000.

<sup>b</sup> Precision of original data was between 1 part in 1,000 and 1 part in 10,000. Maximum deviation from original data is 4 parts in 1,000 in the range covered in this set of tables.

**A LISTING OF LOG P VALUES, WATER SOLUBILITY, AND  
MOLECULAR WEIGHT FOR SOME SELECTED CHEMICALS<sup>a</sup>**

Compound	M.W.	Log P <sup>b</sup>	Water Solubility(gm/L) <sup>c</sup>
Acetamide	59.07	-1.26	2.25 × 10 <sup>3</sup>
Acetic acid	60.05	-0.17	10 × 10 <sup>3</sup>
Acetic anhydride	102.09	-0.58	1.2 × 10 <sup>2</sup>
Acetoacetic acid	102.1	-0.98	1 × 10 <sup>3</sup>
Acetoin	88.11	-0.36	1 × 10 <sup>3</sup>
Acetone	58.08	-0.24	1 × 10 <sup>3</sup>
Acetophenone	120.15	1.58	6.13
N-Acetylcysteinamide	162.21	-0.29	5.8
N-Acetylcysteine		-0.64	
N-Acetylmethionine		-0.49	
Acetylsalicylic acid	180.16	1.19	4.6
Acridine	179.22	3.40	0.03
Acrolein	56.06	-0.01	2.13 × 10 <sup>2</sup>
Acrylamide	71.08	-0.67	6.4 × 10 <sup>2</sup>
Adenine	135.13	-0.09	1.0
Adenosine	267.25	-1.05	8.2
Alanine	89.09	-2.96	1.7 × 10 <sup>2</sup>
Aldosterone		1.08	
9-Aminoacridine	194.23	2.74	0.02
4-Aminobenzoic acid ( <i>p</i> -aminobenzoic acid; PABA)	151.17	1.03	9.89
4-Aminobutyric acid ( $\gamma$ -aminobutyric acid; GABA)	103.12	-3.17	1.3 × 10 <sup>3</sup>
6-Aminohexanoic acid ( $\epsilon$ -aminocaproic acid)	131.18	-2.95	5.05 × 10 <sup>2</sup>
Ammonium picrate	246.14	-1.40	1.6 × 10 <sup>2</sup>
Aniline		0.9	
Anisole		2.11	
ANS (1-amino-2-naphthalenesulfonic acid)	222.25	-0.97	2.23
Anthracene		4.45	
Arabinose	150.13	-3.02	1 × 10 <sup>3</sup>
Arginine	174.20	-4.20	1.82 × 10 <sup>2</sup>
Ascorbic acid	176.13	-1.64	1 × 10 <sup>3</sup>
Asparagine	132.12	-3.82	29.4
Aspartic acid	133.10	-3.89	5.0
Barbital (5,5-diethylbarbituric acid)	184.20	0.65	7
Barbituric acid	128.1	-1.47	
Benzamide	121.14	0.64	13.5
Benzamidine	120.16	0.65	27.9
Benzene	78.11	2.13	0.002
Benzoic acid	122.12	1.87	3.4
Betaine	117.15	-4.93	6.11 × 10 <sup>2</sup>
Biuret (imidodicarbonic acid)	103.08		1.5
Bromoacetic acid	138.95	0.41	93
2-Bromopropionic acid	152.98	0.92	29.9
2,3-Butanediol	90.12	-0.36	7.6 × 10 <sup>2</sup>
2,3-Butanedione	86.09	-1.34	2 × 10 <sup>2</sup>
Butyl urea	116.16	0.41	46.3
3-Butyl hydroxy urea	132.16	0.32	23.5
Cacodylic acid	138.00	0.36	2 × 10 <sup>3</sup>
Carbon tetrachloride	153.82	2.83	0.8
Cholesterol	386.67	8.74	0.9
Chloroacetamide	93.51	-0.53	90
Chloroacetic anhydride	170.98	-0.07	68
Chloroacetyl chloride	112.94	-0.22	1.6 × 10 <sup>2</sup>
Chloroform	119.38	1.97	8
6-Chloroindole	151.60	3.25	0.1
<i>p</i> -Chloromercuribenzoic acid	357.16	1.48	0.3
Chlorosuccinic acid	152.54	-0.57	1.8 × 10 <sup>2</sup>
Cholic acid	405.58	2.02	0.2
Citric acid	192.13	-1.72	5.92 × 10 <sup>2</sup>
Congo red	696.68	2.63	1.2 × 10 <sup>2</sup>

<sup>a</sup> Adapted from *Handbook of Physical Properties of Organic Chemicals*, ed. P.H. Howard and W.M. Meylan, CRC Press, Boca Raton, FL, 1997

<sup>b</sup>  $\text{Log } P = \log \frac{[\text{Concentration in 1-octanol}]}{[\text{concentration in water}]}$

See above Howard and Meylan and following for discussion of log P (log of partitioning coefficient for a substance between 1-octanol and water).

<sup>c</sup> Solubility values taken from various literature sources and in some cases are approximations

**Iodoacetamide**

2-iodoacetamide

184.96

Alkylating agents that react with a variety of nucleophiles in proteins and nucleic acids. Reaction is more rapid than the bromo or chloro derivatives.

**CHEMICALS COMMONLY USED IN BIOCHEMISTRY AND MOLECULAR  
BIOLOGY AND THEIR PROPERTIES (Continued)**

Common Name	Chemical Name	M.W.	Properties and Comment
Iodoacetic Acid		185.95	

The amide is neutral and is not susceptible to either positive or negative influence from locally charged groups; iodoacetamide is frequently used to modify sulfhydryl groups as part of reduction and carboxymethylation prior to structural analysis. Name	Type	Composition	Form	CMC*	Cloud Point	Solubility	Applications
Brij 35	Nonionic	Polyoxyethylene lauryl ether (E <sub>23</sub> )	Solid white wax; density 1.18–1.22 (6)	0.058 g/l (4)	100°C (4)	Soluble in H <sub>2</sub> O and (6) most organic solvents insoluble in oils	Column chromatography (7)
Tergitol TMN	Nonionic	Polyoxyethylene trimethyl nonanol (E <sub>6</sub> )	Pale yellow liquid, 90%; density, 1.024 (6)	—	36°C (4)	Completely soluble in H <sub>2</sub> O (6)	Membrane solubilization (2)
Triton X-45	Nonionic	Polyoxyethylene octylphenol (E <sub>5</sub> )	Amber liquid, 100% (6)			Soluble in most organic solvents; insoluble in H <sub>2</sub> O (6)	Membrane solubilization (2)
Triton X-100	Nonionic	Polyoxyethylene tert-octylphenol (E <sub>10</sub> )	Amber liquid (6)	0.16 g/l (4)	64°C (5)	Soluble in H <sub>2</sub> O and (6) alcohols; slightly soluble in aromatic solvents	Membrane solubilization (2) gel electrophoresis (9)
Tween 20 (Polysorbate 20)	Nonionic	Polyoxyethylene sorbitan monolaurate (E <sub>22</sub> )	Yellow oily liquid (6)	0.14 g/l	95°C (4)	Soluble in H <sub>2</sub> O and organic solvents (6)	Solubilizer (1, 4)
Tween 80 (Polysorbate 80)	Nonionic	Polyoxyethylene sorbitan monooleate (E <sub>25</sub> )	Amber liquid; density 1.05–1.10 (6)		93°C (4)	Soluble in H <sub>2</sub> O and most organic solvents; insoluble in oils (6)	Solubilizer (1, 4)
CTAB	Cationic	Cetyltrimethyl-ammonium bromide	Creamy-white voluminous powder (13)	0.33 g/l (10)		Soluble in H <sub>2</sub> O and organic solvents (13)	Membrane solubilization (2)
SDS	Anionic	Sodium dodecyl (lauryl) sulfate	White crystals, flakes, or powder (13)	2.3 g/l (10)		Soluble in H <sub>2</sub> O	Protein solubilization (11), gel electrophoresis (12)
Cholate	Anionic	3, 7, 12-Trihydroxy-5 cholanate	White Powder			Partially soluble in H <sub>2</sub> O; soluble in most organic solvents (13)	Membrane solubilization (2)
Deoxycholate	Anionic	3, 12-Dihydroxy-5 cholanate	White Powder			Partially soluble in H <sub>2</sub> O; soluble in most organic solvents (13)	Membrane solubilization (2)
Lubrol W	Nonionic	A fatty alcohol ethylene oxide condensate	Fawn colored waxy solids (6)		H <sub>2</sub> O, 25°C	Soluble in H <sub>2</sub> O, vegetable oils and fatty acids (6)	Membrane solubilization (14)
Atlas G	Nonionic	Polyoxyethylene (sorbitol) hexanolate					Membrane solubilization (14)
Span 20	Nonionic	Sorbitan mono-laurate					Membrane solubilization (14)

Compiled by A. Fulmer.

CHAPSO <sup>n</sup>	630.9	zwitterionic	66-70

### Footnotes

<sup>a</sup> Tween 20 is a polysorbate surfactant (polyoxyethylene sorbitan fatty acid ester) useful in immunoassays and pharmaceutical development. Tween 20 reduced protein interaction and protein binding to surfaces. It is related to Tween 80. The Tween surfactants are condensation products of mono-substituted fatty acyl derivatives of sorbitan (SPAN<sup>®</sup>, a registered trademark of Atlas Chemical) and ethylene oxide. Span<sup>®</sup> 20 is sorbitan monolaurate and Tween<sup>®</sup> 20 (polyethoxyethylene (20) sorbitan monolaurate) is derived from Span<sup>®</sup> 20. Tween<sup>®</sup> 20 has a viscosity of 200-400 cp at 25°C.

<sup>b</sup> Tween<sup>®</sup> 80 (polysorbate 80) is a polysorbate surfactant (polyoxyethylene sorbitan mono-oleate) is used in pharmaceutical formulation where it stabilizes proteins and in various diagnostics tests. Tween<sup>®</sup> 80 was added early to bacterial culture media and was also demonstrated to enhance the anti-bacterial activity of certain antibiotics. Tween<sup>®</sup> 80 has also been used for protein membrane studies and were originally manufactured by Atlas Power Company. Tween 80 has a viscosity of 600-800 cp at 25°C.

<sup>c</sup> Triton X-100 is a nonionic detergent known as octoxynol, octylphenoxy polyethoxyethanol. The Triton family of surfactants which is manufactured by the condensation of ethylene oxide with alkylphenols and contain between 5 and 15 ethylene oxide units; with Triton X-100, there is 9 or 10 ethylene oxide units while Triton X-30 contains three ethyloxy groups. Triton X-100 is also known as Igepal CA or Polydetergent G. These alkylaryl polyether alcohols were first manufacture by I.G. Farbenindustrie as Igepal products and subsequently manufactured and marketed in the United States as Triton. Triton X-100 is used for the lysis of cells and preparation of subcellular fractions and in the study of membrane proteins.

<sup>d</sup> Nonidet<sup>®</sup> is a registered trademark of the Shell Oil Company; however, it is not clear that Shell Oil Company is still associated with the manufacture and/or distribution of this material. A search of the Shell Oil website did not a result for Nonidet. Nonidet<sup>®</sup> P-40 [octylphenolpoly(ethyleneglycolether)] is a popular alkylphenyl ethoxylate nonionic detergent; also referred to as nonylphenylpolyethylene glycol; polyethyleneglycol-p-isoctylphenyl ether; octylphenoxy polyethoxy ethanol; Igepal CO 630. There is question as to the relation of nonidet P-40 to NP-40. Related to the Triton surfactants. It is useful to assure the provenance of a product labeled Nonidet P40 or NP-40.

<sup>e</sup> Brij<sup>®</sup> detergents are a series of polyoxyethylene ethers such as lauryl polyoxyethylene (dodecyl polyoxyethylate). This class of surfactants is referred to as poloxamers and includes polyoxypropylene. The number of ethylene oxide units determines the solubility of the dodecyl alcohol derivative:

Moles Ethylene Oxide/ Dodecyl Alcohol	Approximate Solubility of Product
0	Insoluble
2	Insoluble
4	Somewhat miscible
6	Slightly soluble
7	Soluble

<sup>f</sup> Lubrol<sup>®</sup> is a trademark of ICI referring to a series of nonionic surfactants similar to the Brij<sup>®</sup> surfactants in being a series of polyoxyethylene alkyl ethers. Lubrol<sup>®</sup> surfactants are used for membrane solubilization and more recently in the study of lipid rafts. While there are similarities between the various nonionic surfactants, there are also distinct differences.

<sup>g</sup> Sodium Dodecyl Sulfate; also known as sodium lauryl sulfate. An anionic detergent used for membrane solubilization and protein denaturation. Used in a popular electrophoretic procedure, SDS-gel electrophoresis where separation is presumed to occur on the basis of molecular weight; there are some exceptions to this assumption (Noel, D., Nikaido, K., and Ames, G.F., A single amino acid substitution in a histidine-transport protein drastically alters its mobility in sodium dodecyl sulfate-polyacrylamide gel electrophoresis, *Biochemistry* 18, 4159-4165, 1979; Briggs, M.M., Klevit, R.E., and Schachat, F.H., Heterogeneity of contractile proteins-purification and characterization of 2 species of troponin-T from rabbit fast skeletal-muscle, *J.Biol.Chem.* 259, 10369-10375, 1984; Sakakura, Y., Hirabayashi, J., Oda, Y. *et al.*, Structure of chicken 16-kDa  $\beta$ -galactoside-binding lectin-complete amino-acid-sequence, cloning of cDNA, and production of recombinant lectin, *J.Biol.Chem.* 265, 21573-21579, 1990; Okumura, N., Terasawa, F., Fujita, K. *et al.*, Difference in electrophoretic mobility and plasmic digestion profile between four recombinant fibrinogens, gamma 308K, gamma 308I, gamma 308A, and wild type (gamma 308N), *Electrophoresis* 21, 2309-2315, 2000). The

counterion to the lauryl sulfate moiety can also influence the interaction with proteins (Kubo, K. and Takagi, T., Modulation of the behavior of a protein in polyacrylamide gel electrophoresis in the presence of dodecyl sulfate by varying the cations, *Anal. Biochem.* 224, 572-579, 1995; Kubo, K., Effect of incubation of solutions of proteins containing sodium dodecyl sulfate on the cleavage of peptide bonds by boiling, *Anal. Biochem.* 225, 351-353, 1995).

<sup>h</sup> Deoxycholic acid (3,12-dihydroxycholestan-24-oic acid (3 $\alpha$ , 5 $\beta$ , 12 $\alpha$ ), MW 392.6) is relatively insoluble, the sodium salt is more soluble. Deoxycholate (desoxycholate) is used for membrane solubilization. A natural constituent of bile secretions in man and other mammals.

<sup>i</sup> Cetylpyridinium chloride (1-hexadecylpyridinium chloride) is a cationic detergents which has pharmaceutical use as a preservative and a topical disinfectant. There has been significant use of this material as an active ingredient in mouthwashes. The interaction of cetylpyridinium chloride with glycosaminoglycans such as heparin is useful for characterization. Cetylpyridinium chloride has been used for the isolation of glycosaminoglycans and for the histochemical staining of glycosaminoglycans.

<sup>j</sup> Cetyltrimethylammonium bromide (*N,N,N*-trimethylhexadecaaminium bromide; CTAB; cetrionium bromide) was developed as a disinfectant and antiseptic. It has been used as detergent in a manner similar to SDS in the determination of protein molecular weight. CTAB is also used for the isolation and assay of nucleic acids.

<sup>k</sup> Tetradecyltrimethyl-ammonium bromide (TTABr). TTABr is one of the components of Cetrimide<sup>®</sup>, a disinfectant. TTABr has seen occasional use for membrane protein solubilization and in the preparation of mixed micelles.

<sup>l</sup> The "parent" compound for this class of surfactants is betaine sulfonate (sulfobetaine). There are non-detergent sulfobetaines (non detergent sulfobetaines such as 3-(1-pyridino)-1-propanesulfonate; NDSB 201) which have been useful in preventing unwanted protein-protein aggregation (Vuillard, L., Braun-Breton, C., and Rabilloud, T., Non-detergent sulfobetaines: a new class of mild solubilization agents for protein purification, *Biochem. J.* 305, 337-343, 1995; Collins, T., D'Amico, S., Georlette, D., *et al.*, A nondetergent sulfobetaine prevents protein aggregation in microcalorimetric studies, *Anal. Biochem.* 352, 299-301, 2006). Detergent sulfobetaines such Zwittergent<sup>®</sup> 3-12 (*n*-Dodecyl-N,N-dimethyl-3-ammonio-1-propanesulfonate) contain a long chain alkyl function (Wollstadt, K.H., Karkhanis, Y.D., Gnozzio, M.J. *et al.*, Potential of the sulfobetaine detergent Zwittergent 3-12 as a desorbing agent in biospecific and bioselective affinity chromatography, *J. Chromatog.* 497, 87-100, 1989). The CHAPS class of detergents are derivatives of sulfobetaine which contain a cholamide function.

<sup>m</sup> 3-[(3-cholamidopropyl)dimethylamino]propanesulfonic acid

<sup>n</sup> 3-[(3-cholamidopropyl)dimethylammonio]-2-hydroxy-1-propanesulfonate

## SOME BIOLOGICAL STAINS AND DYES

Name	Description
<b>Acridine Orange</b> MW 320 as the chloride hydrate	Acridine dyes are strongly yellow fluorescent dyes; stains for nucleic acids and is used for identification of the malaria parasite. Acridine orange is weakly basic, is permeable to membranes and tends to accumulate in intracellular acidic regions. Some use in photodynamic therapy for tumors. The binding of acridine orange to nucleic acids has been extensively studied.

Steiner, R.F. and Beers, R.F., Jr., Spectral changes accompanying binding of acridine orange by polyadenylic acid, *Science* 127, 335-336, 1958; Mayor, H.D. and Hill, N.O., Acridine orange staining of a single-stranded DNA bacteriophage, *Virology* 14, 264-266, 1961; Boyle, R.E., Nelson, S.S., Dollish, F.R., and Olsen, M.J., The interaction of deoxyribonucleic acid and acridine orange, *Arch.Biochem.Biophys.* 96, 47-50, 1962; Leith, J.D., Jr., Acridine orange and acriflavine inhibit deoxyribonuclease action, *Biochim.Biophys.Acta.* 72, 643-644, 1963; Morgan, R.S. and Rhoads, D.G., Binding of acridine orange to yeast ribosomes, *Biochim.Biophys.Acta* 102, 311-313, 1965; Yamabe, S., A spectrophotometric study on binding of acridine orange with DNA, *Mol.Pharmacol.* 3, 556-560, 1967; Stewart, C.R., Broadening by acridine orange of the thermal transition of DNA, *Biopolymers* 6, 1737-1743, 1968; Clerc, S. and Barenholz, Y., A quantitative model for using acridine orange as a transmembrane pH gradient probe, *Anal.Biochem.* 259, 104-111, 1998; Zoccarto, F., Cavallini, L., and Alexandre, A., The pH-sensitive dye acridine orange as a tool to monitor exocytosis/endocytosis, *J.Neurochem.* 72, 625-633, 1999; Lyles, M.B., Cameron, I.L., and Rawls, H.R., Structural basis for the binding efficiency of xanthines with the DNA intercalator acridine orange, *J.Med.Chem.* 44, 4650-4660, 2001; Lyles, M.B. and Cameron, I.L., Interactions of the DNA intercalator acridine orange, with itself, with caffeine, and the double stranded DNA, *Biophys.Chem.* 96, 53-76, 2002; Keiser, J., Utzinger, J., Premji, Z. *et al.*, Acridine orange for malaria diagnosis: its diagnostic performance, its promotion and implementation in Tanzania, and the implications for malaria control, *Ann.Trop.Med.Paristol.* 96, 643-654, 2002; Lauretti, F., Lucas de Mel, F., Benati, F.J., *et al.*, Use of acridine orange staining for the detection of rotavirus RNA in polyacrylamide gels, *J.Virol.Methods* 114, 29-35, 2003; Ueda, H., Murata, H., Takeshita, H., *et al.*, Unfiltered xenon light is useful for photodynamic therapy with acridine orange, *Anticancer Res.* 25, 3979-3983, 2005; Wang, F., Yang, J., Wu, X., *et al.*, Improvement of the acridine orange-protein-surfactant system for protein estimation based on aromatic ring stacking effect of sodium dodecyl benzene sulphonate, *Luminescence* 21, 186-194, 2006; Hiruma, H., Katakura, T., Takenami, T., *et al.*, Vesicle disruption, plasma membrane bleb formation, and acute cell death caused by illumination with blue light in acridine orange-loaded malignant melanoma cells, *J.Photochem.Photobiol.B* 86, 1-8, 2007.

**Azure Dyes** (Azure A, Azure B or azure blue)

Cationic dyes which are used to stain nucleic acid and sulfated glycosaminoglycans such as heparin. The sensitivity for staining sulfated glycosaminoglycans is increased with the presence of silver.

## SOME BIOLOGICAL STAINS AND DYES (Continued)

Name	Description
<b>Blue tetrazolium;</b> (Tetrazolium blue, bimethoxyneotetrazolium), MW 728 as the dichloride salt. Also nitro blue tetrazolium and tetranitro blue tetrazolium	A relatively large hydrophobic cation; histochemical stain, used for oxidoreductases. Forms a blue color in the presence of reducing agents which provided the basis for the early use of sulfhydryl groups and other reducing compounds. Also used to measure free radicals, superoxide, and Amadori glycation products.

Tetrazolium Blue

**Bromothymol Blue** or Bromthymol Blue;  
dibromothymolsulfonphthalein,  
MW as sultone, 624; as sodium salt, 646

A lipophilic dye; serves as a vital stain to trace fluid movements; used as an ion pair reagent for the measurement of certain drugs; extensive use as pH indicator as there is a change from yellow to blue as pH changes from 6 to 8.0

Azzone, G.F., Piemonte, G., and Massari, S., Intramembrane pH changes and bromthymol blue translocation in liver mitochondria, *Eur.J.Biochem.* 6, 207-212, 1968; Mitchell, P., Moyle, J., and Smith, L., Bromthymol blue as a pH indicator in mitochondrial suspensions, *Eur.J.Biochem.* 4, 9-19, 1968; Das Gupta, V. and Cadwallader, D.E., Determination of first pKa' value and partition coefficients of bromthymol blue, *J.Pharm.Sci.* 57, 2140-2142, 1968; Jackson, J.B. and Crofts, A.R., Bromothymol blue and bromocresol purple as indicators of pH changes in chromatophores of *Rhodospirillum rubrum*, *Eur.J.Biochem.* 10, 226-237, 1969; Gromet-Elhanan, Z. and Briller, S., On the use of bromthymol blue as an indicator of internal pH changes in chromatophores from *Rhodospirillum rubrum*, *Biochem.Biophys.Res.Commun.* 37, 261-265, 1969; Smith, L., Bromthymol blue as a pH indicator in mitochondrial suspensions, *Ann.N.Y.Acad.Sci.* 147, 856, 1969; Lowry, J.B., Direct spectrophotometric assay of quaternary ammonium compounds using bromthymol blue, *J.Pharm.Sci.* 68, 110-111, 1979; Mashimo, T., Ueda, I., Shieh, D.D., *et al.*, Hydrophilic region of lecithin membranes studied by bromthymol blue and effects of an inhalation anesthetic, enflurane, *Proc.Natl.Acad.Sci.USA* 76, 5114-5118, 1979; Yamamoto, A., Utsumi, E., Sakane, T. *et al.*, Immunological control of drug absorption from the gastrointestinal tract: the mechanism whereby intestinal anaphylaxis interferes with the intestinal absorption of bromthymol blue in the rat, *J.Pharm.Pharmacol.* 38, 357-362, 1986; Dean, V.S., Dingley, J., and Vaughan, R.S., The use of bromthymol blue and sodium thiopentone to confirm tracheal intubation, *Anaesthesia* 51, 29-32, 1996; Gorbenko, G.P., Bromthymol blue as a probe for structural changes of model membranes induced by hemoglobin, *Biochim.Biophys.Acta* 1370, 107-118, 1998; Ramesh, K.C., Gowda, B.G., Melwanki, M.B., *et al.*, Extractive spectrophotometric determination of antiallergic drugs in pharmaceutical formulations using bromopyrogallol and bromothymol blue, *Anal.Sci.* 17, 1101-1103, 2001; Rahman, N., Ahmed Khan, N. and Hejaz Azmi, S.N., Extractive spectrophotometric methods for the determination of nifedipine in pharmaceutical formulations using bromocresol green, bromophenol blue, bromothymol blue and eriochrome black T, *Farmaco* 59, 47-54, 2004; Erk, N., Spectrophotometric determination of indinavir in bulk and pharmaceutical formulations using bromocresol purple and bromothymol blue, *Pharmazie* 59, 183-186, 2004;

Name

Description

**Fluorescein** (C.I. solvent yellow 94)  
 MW as free acid is 332 while the  
 disodium salt is 376.

Fluorescein is an acidic hydroxyxanthene which exists in a variety of forms. Depending on pH, fluorescein is in equilibrium the free acid and a dianion form. When the dianion is present as the sodium salt, the term uranin has been used to describe the molecule. Fluorescein has a broad range of use including use in large quantities to trace environment water flow. Fluorescein has been used to vascular flow with particular interest in ophthalmology. Fluorescein has been modified to include reactive functional groups (isothiocyanate; for covalent insertion of fluorescent probes into protein and other biological macromolecules. Care must be taken to avoid confusion with fluorescein.

**Methyl Violet** (C.I. Basic violet 1); Molecular weight depends on the degree of methylation

Methyl violet is a mixture of *N*-methylated pararoanilines which is used a pH indicator and a biological stain. The term gentian violet is used for this mixture in Europe and for crystal violet (methyl violet 10B, the hexamethyl derivative) in the United States. There is some use of methyl violet for staining DNA. The industrial use is for dyeing fabrics blue and violet. The depth of color is dependent on the degree of methylation.

## Description

**Rhodamine B** (C.I. Basic Violet 10)  
MW 479

An aminoxanthene which is a lipophilic cation in acid solution and a lipophilic anion in basic solution. Metal binding reagent, a neutral stain; a fluorescent lipid stain; stain for Phosphoproteins for gel electrophoresis. Isothiocyanate derivative used for labeling proteins.

Martin, G., Colorimetric determination of zinc by thiocyanate derivatives; a new method using rhodamine B, *Bull.Soc.Chim.Biol.* 34, 1174-1177, 1952; Webb, J.M., Hansen, W.H., Desmond, A., and Fitzhugh, O.G., Biochemical and toxicological studies of rhodamine B and 3,6-diaminofluoran, *Toxicol.Appl.Pharmacol.* 3, 696-706, 1961; Miketukova, V., Detection of metals on paper chromatograms with Rhodamine B., *J.Chromatog.* 24, 302-304, 1966; Liisberg, M.F., Rhodamine B as an extremely specific stain for cornification, *Acta Anat.* 69, 52-57, 1968; Shelley, W.B., Fluorescent staining of elastic tissue with Rhodamine B and related xanthene dyes, *Histochemie* 20, 244-249, 1969; Oshima, G.T. and Nagasawa, K., Fluorometric method for determination of mercury(II) with Rhodamine B, *Chem.Pharm.Bull.* 18, 687-692, 1970; Zahradnicek, L., Kratochvila, J., and Garcis, A., Determination of inorganic phosphorus using Rhodamine B by the continuous-flow technique, *Clin.Chim.Acta* 80, 431-433, 1977; Wessely, Z., Shapiro, S.H., Klavins, J.V., and Tinberg, H.M., Identification of Mallory bodies with rhodamine B fluorescence and other strains for keratin, *Stain Technol.* 56, 169-176, 1981; Debruyne, I., Inorganic phosphate determination: colorimetric assay based on the formation of a rhodamine B-phosphomolybdate complex, *Anal.Biochem.* 130, 454-460, 1983; Debruyne, I., Staining of alkali-labile Phosphoproteins and alkaline phosphatases on polyacrylamide gels, *Anal.Biochem.* 133, 110-115, 1983; Balcerzak, M., Sensitive spectrophotometric determination of osmium with tin(II) chloride and rhodamine B after flotation using cyclohexane, *Analyst* 113, 129-132, 1988; Glimcher, M.J. and Lefteriu, B., Soluble glycosylated phosphoproteins of cementum, *Calcif.Tissue Int.* 45, 165-172, 1989; Fernandez-Busquets, X. and Burger, M.M., Use of rhodamine B isothiocyanate to detect proteoglycan core proteins in polyacrylamide gels, *Anal.Biochem.* 227, 394-396, 1995; Jung, D.W., Yoo, G.S. and Choi, J.K., Mixed-dye staining method for protein detection in polyacrylamide gel electrophoresis using calconcarboxylic acid and rhodamine B, *Electrophoresis* 19, 2412-2415, 1998; Pal, J.K., Godbole, D., and Sharma, K., Staining of proteins on SDS polyacrylamide gels and on nitrocellulose membranes by Alta, a colour used as a cosmetic, *J.Biochem.Biophys.Methods* 61, 339-347, 2004; dos Santos Silva, A.L., Joekes, I., Rhodamine B diffusion in hair as a probe for structural integrity, *Colloids Surf.B.Biointerfaces* 40, 19-24, 2005; Moreno-Villoslada, I., Jofre, M., Miranda, V., et al., pH dependence of the interaction between rhodamine B and the water-soluble poly(sodium 4-styrenesulfonate), *J.Phys.Chem.B Condens. ## Name

## Description

**Texas Red** (TR, sulphorhodamine 101 acid chloride; MW 625)

The presence of a reactive sulfonyl chloride function allows the labeling of protein amino groups. General probe for proteins and other molecules including DNA and carbohydrate to follow cellular transit.

Titus, J.A., Haugland, R., Sharrow, S.O., and Segal, D.M., Texas Red, a hydrophilic, red-emitting fluorophore for use with fluorescein in dual parameter flow microfluorimetric and fluorescence microscopic studies, *J.Immunol.Methods* 50, 193-204, 1982; Schneider, H., Differential intracellular staining of identified neurones in *Locusta* with texas red and lucifer yellow, *J.Neurosci.Methods* 30, 107-115, 1989; Leonce, S. and Cudennec, C.A., Modification of membrane permeability measured by Texas-Red during cell cycle progression and differentiation, *Anticancer Res.* 10, 369-374, 1990; Srouf, E.F., Lemmhuis, T., Brandt, J.E., *et al.*, Simultaneous use of rhodamine 123, phycoerythrin, Texas red, and allophycocyanin for the isolation of human hematopoietic progenitor cells, *Cytometry* 12, 179-183, 1991; Wessendorf, M.W. and Brelje, T.C., Which fluorophore is brightest? **Thioflavin T** (Basic Yellow 1; 318.9)

Fluorescent dye use to detect  $\beta$ -sheet structures such as amyloid protein; also used to detect conformational changes in therapeutic proteins on drying.

Name	Description
<b>Trypan Blue</b> (diamine blue; C.I. Direct Blue 14) MW 961 as tetrasodium salt	A tetrasulfated anionic dye composed of a large planar aromatic system. Moderately soluble in water, more soluble in ethylene glycol but essentially insoluble in ethanol. Used a biological stain with particular interest as vital stain. Used in the early polychrome stains. Current use also as surgical stain for cataract surgery.

**Zincon**; 2-[1-(2-hydroxy-5-sulfonatophenyl)-3-phenyl-5-formazano] benzoic acid, sodium salt MW 462

A metal complexing formazan dye which is used in histochemistry to demonstrate the presence of zinc; zincon is also used to stain for zinc proteins on solid support electrophoresis. Zincon is also used to demonstrate the presence of zinc in solution using spectrophotometric estimation of the zinc-dye complex

## MORDANT DYES

Mordant dye is a dye that interacts with a tissue, cell, or sub-cellular organelle via an interaction with a substance, a mordant, which interacts with the substrate and the dye. The interaction may involve covalent interaction. A mordant can be defined as a substance which interacts with both the substrate (for example tissue, cell, subcellular organelle) and the dye<sup>1</sup>. Most mordants are metal salts such ferric chloride and those of chromium and vanadium. Other compounds such as tannic acid<sup>1</sup> and galloylglucoses<sup>2</sup> can serve as mordants. Hematoxylin used in Hematoxylin and eosin (H and E) staining which contains a mixture of chelates formed between hematein and aluminum ions<sup>3,4</sup>. Mordant blue 3 (Chromoxane cyanine R) uses iron<sup>5</sup>. There has been a significant increase in our understanding of mordant dyes<sup>4,6</sup>.

### Mordant Dyes

Dye Name	Metal Ion Specificity <sup>a</sup>	Comments
Mordant Blue 1; chrome azurol A; chromoxane pure blue B	Al, B, Ca,	Calcium staining in histochemistry
Mordant Blue 3; eriochrome cyanine R; chromoxane cyanine R	Al, Cr, Fe	Iron staining in histochemistry; also Al
Mordant Blue 10; Galloxyaniline;	Cr, Fe, Pb	Chromium complex for staining DNA and RNA
Mordant Blue 14; Celestine blue;	Fe	Complex with iron use as nuclear stain
Mordant Blue 29; chromoxane pure blue BLD	Be	Be staining in histochemistry
Mordant Blue 45; Gallamine blue	Al, Ca	Al complex for staining nuclei
Mordant Blue 80; Chromotrope 2R	Cr	Cytoplasmic counterstain
Mordant Red 3; Alizarin red S	Al, Ca	Calcified tissue stain
Mordant Violet 39; aurin tricarboxylic acid (ATA); aluminon; chrome violet TG	Al, Be, Cr, Fe	Aluminum staining in histochemistry

<sup>a</sup> Metal ion specificity is broad with most mordant stains so other metal ions can be complexed by the respective mordant stain.

Mordant blue 1; Chrome azurol B

Mordant blue 3; Eriochrome cyanine R

Mordant blue 10; Gallocyanine

Mordant blue 14; Celestine blue

Mordant blue 29; Chromoxane pure blue

Mordant blue 45; Gallamine blue

## Mordant Dyes

845

Mordant blue 80; Chromotrope 2R

Mordant Violet 39; Aurin Tricarboxylic Acid

Mordant red 3; Alizarin red S

## METAL CHELATING AGENTS<sup>a</sup>

Name	M.W.	Description
<b>BAPTA</b> [1,2-bis( <i>o</i> -aminophenoxy)ethane, <i>N,N,N',N'</i> -tetraacetic acid	476.4	Chelating agent with higher affinity for zinc than calcium can be used as with EGTA for chelation of intracellular metal ions. BAPTA-AM, the acetoxymethyl ester, is a useful derivative.

**$\alpha$ -Benzoin oxime** (cupron);  
2-hydroxy-1,2-diphenylethanone  
oxime

227.3

Complexes cupric ions, molybdenum, chromium, lead, or tungsten as well as other metal ions. Used for the analysis of these metal ions. More recently,  $\alpha$ -Benzoin oxime has been immobilized and used as a chelating resin for concentration and separation of metal ions. Copper complexes have been used as biocidal agent.

## METAL CHELATING AGENTS (Continued)

Name	M.W.	Description
EDTA ( ethylenediaminetetraacetic acid)	292	General chelation agent <sup>b</sup> Structure serves as the basis for therapeutic agents which deliver radioactive materials to tumor cells. EDTA is used to detach adherent cells from tissue culture surfaces. Frequently included in protease inhibitor "cocktails." The affinity for metal ions decrease as pH decreases and there may be a change in the relative affinity for specific metal ions <sup>b</sup> .

## METAL CHELATING AGENTS (Continued)

Name	M.W.	Description
<b>8-Quinolinol</b> ; 8-hydroxyquinoline	145.2	Metal chelating agent with higher affinity for Fe, Cu, and Zn. Lower affinity for Ca and Mg. Therapeutic use as antiseptic/bacteriostatic agent.

Fayez, M. and El-Tarras, M., Potentiometric titration of 8-hydroxyquinoline with Cu(II) using Cu(II)sulphide-ion selective electrode, *Pharmazie* 30, 799, 1975; Eskeland, T., The effect of various metal ions and chelating agents on the formation of noncovalently and covalently linked IgM polymers, *Scand.J.Immunol.* 6, 87-95, 1977; Albro, P.W., Corbett, J.T. and Schroeder, J.L., Generation of hydrogen peroxide by incidental metal ion-catalyzed autoxidation of glutathione, *J.Inorg.Biochem.* 27, 191-203, 1986; Yasui, T., Yuchi, A., Wade, H., and Nagagawa, S., Reversed-phase high-performance liquid chromatography of several metal-S-quinolinethiol complexes, *J.Chromatog.* 596, 73-78, 1992; Vieira, N.E., Yergey, A.L., and Abrams, S.A., Extraction of magnesium from biological fluids using 8-hydroxyquinoline and cation-exchange chromatography for isotopic enrichment using thermal ionization mass spectrometry, *Anal.Biochem.* 218, 92-97, 1994; Zachariouis, M., and Hearn, M.T., Adsorption and selectivity characteristics of several human serum proteins with immobilized hard Lewis metal ion-chelate adsorbents, *J.Chromatog.A.* 890, 95-116, 2000; Anfossi, L., Giraudi, G., Grassi, G., *et al.*, Binding properties of a polyclonal antibody directed against toward lead complexes, *Ann.Chim.* 93, 499-512, 2003; Yamada, H., Hayashi, H., and Yasui, T., Utility of 1-octanol/octane mixed solvents for the solvent extraction of aluminum(III), gallium(III), and indium(III) with 8-quinolinol, *Anal.Sci.* 22, 371-376, 2006; Song, K.C., Kim, J.S., Park, S.M., *et al.*, Fluorogenic Hg<sup>2+</sup>-selective chemodosimeter derived from 8-hydroxyquinoline, *Org.Lett.* 8, 3413-3416, 2006; Mittal, S.K., Kumar, A., Gupta, N., *et al.*, 8-Hydroxyquinoline based neutral tripodal ionophore as a Cu(II) selective electrode and the effect of remote substituents on electrode properties, *Anal.Chim.Acta* 585, 161-170, 2007

<sup>a</sup> Metal chelating systems can be viewed as metal ion buffer systems

- MY = metal chelate complex; M is metal and Y is chelating agent. Metal ion are electron acceptors can be viewed as Lewis acids while chelating agents donate electrons and are Lewis bases. Also, chelating agents are polydentate
  - $MY^{n-m} = M^{+n} + M^{-m}$
  - $K_{MY} = [MY^{n+m}]/[M^{+n}][Y^{-m}]$
  - $pM = \log K_{MY} + \log [Y^{-m}]/[MY^{n-m}]$

The values for stability(association constants presented below are dependent of solvent conditions such as pH as well as relative amounts of chelating agent and metal ion.

<sup>b</sup> Stability of some metal ion complexes with EDTA

Metal Ion	Log K (MY)
Ca <sup>2+</sup>	10.96
V <sup>+2</sup>	12.70
Mn <sup>+2</sup>	14.04
Fe <sup>2+</sup>	14.33
Fe <sup>3+</sup>	25.1
Co <sup>2+</sup>	16.31
Ni <sup>2+</sup>	18.62
Cu <sup>2+</sup>	18.80
Zn <sup>2+</sup>	16.50

Adapted from Mingos, D.M.P., *Essential Trends in Inorganic Chemistry*, Oxford University Press, Oxford, United Kingdom, 1998.

<sup>c</sup> Influence of pH on pM for EDTA where pK<sub>1</sub>, 2.0; pK<sub>2</sub>, 2.67; pK<sub>3</sub>, 6.16; pK<sub>4</sub>, 11.26.

pH	Cu(II)	Zn(II)	Mg(II)	Ca(II)	Mn(II)	Fe(III)
4	8.4	6.7	2.0	2.3	4.5	15.7
6	12.6	10.5	3.8	5.5	7.3	19.5
8	15.0	12.8	5.4	7.3	10.1	21.8
10	16.8	14.6	7.2	9.2	12.0	23.7

## WATER

### Water Purity and Water Purity Classification

Water Type	Resistance <sup>a</sup> Megohm @25°C	Bioburden (cfu) <sup>b</sup>	Dissolved Solids (mg/L)
Deionized	0.05	—	10
Purified	0.2	100	1
Apyrogenic	0.8	0.1	1
High Purity	10	1	0.5
Ultrapure	18	1	0.005

<sup>a</sup> Resistance (R), determined by conductivity(A/V<sup>c</sup>), measured in siemens (S), R is measured in ohms (V/A<sup>d</sup>) (Ω)

<sup>b</sup> Colony-forming units

<sup>c</sup> SI unit for conductivity – m<sup>-2</sup> · kg<sup>-1</sup> · s<sup>-3</sup> · A<sup>2</sup>; one S equal to the conductance of one ohm<sup>-1</sup>

<sup>d</sup> SI unit for resistance – m<sup>-2</sup> · kg<sup>-1</sup> · s<sup>-3</sup> · A<sup>-2</sup>; one R is equal to one ohm

#### Some Definitions of Pharmaceutical Water (FDA/ORa)

- Non-potable
- Potable
- USP purified
- USP water for injection (WFI)
- USP sterile water for injection
- USP bacteriostatic water for injection
- USP sterile water for irrigation

See 2007 USP/NE. *The Official Compendia of Standards*, US Pharmacopeia, Rockville, MD, USA, 2007, <http://www.usp.org>;

*British Pharmacopoeia* 2007, TSO Norwich, Norwich, UK, 2007; <http://www.pharmacopoeia.org.uk>

Process water is defined as that water which is used during the pharmaceutical manufacturing process. A higher purity water may be required for formulation of the final drug product and/or reconstitution of final product prior to use. A high purity water is required for a product which is to be injected as opposed to an oral administered product. [http://www.fda.gov/ora/inspect\\_ref/itg/itg46.html](http://www.fda.gov/ora/inspect_ref/itg/itg46.html)

Fischbacher, C., Quality assurance in analytical chemistry, in *Encyclopedia of Analytical Chemistry*, ed. R.A. Meyers, Wiley, New York, NY, USA, pps 13563-13587, 2000

Environmental water quality issues are a separate issue with different classification issues

- Kannel, P.R., Lee, S., Lee, Y.S., *et al.*, Application of water quality indices and dissolved oxygen as indicators for river water classification and urban impact assessment, *Environ. Monit. Assess.*, in press, 2007
- Kowalkowski, T., Zhytniewski, R., Szpejna, J., and Buszewski, B., Application of chemometrics in river water classification, *Water Res.* 40, 7544-752, 2006

## WATER PURIFICATION

### The Following is a Representation of Estimates of Effectiveness.

Technique <sup>a</sup>	Effectiveness of Removal of Contaminant/Impurity			
	Inorganic or Ionized Organic	Organic	Pyrogens	Particulates
Activated Carbon	Partial	Partial	No	No
Ion Exchange	Yes	No	No	No
Distillation	Yes	Yes <sup>b</sup>	Yes	Yes
Reverse Osmosis	Partial	Partial	Yes	Yes
Ultrafiltration	Partial	Partial	Good	Yes

<sup>a</sup> In general, a combination of technologies is required—For example,

1. Input water (outside line)
2. Filtration/settling (depends on quality of input water)
3. Distillation
4. Reverse osmosis
5. Terminal filtration (e.g. 0.2 μ filter)

Other techniques such as ultraviolet irradiation may be used

<sup>b</sup> Effectiveness of separation depends on vapor pressure (boiling point) differences between water and specific contaminant impurity and lack of formation of a azeotropic mixture.

## STABILITY OF SOLUTIONS FOR GLP AND cGMP USE

- A. There are three factors which influence the stability of solutions
1. Purity of solvent used for the preparation of the solution. This is usually water and should be of USP or higher grade. There is an assumption of sterility of water obtained in a GLP or cGMP environment. The presence of trace amounts of metal ions in solution can contribute to stability issues for certain solutes.
  2. Storage conditions – plastic container, glass container, under nitrogen, temperature of storage
  3. Lability of the solute in solutions. Solutes such as sodium chloride are indefinitely stable while solutions of carbohydrates such as glucose or glycerol can undergo oxidation and mutarotation
- B. There is little information of the storage stability of solutions while there is considerable information on the storage stability of reference standards and specific laboratory reagents<sup>1-6</sup>. The several pharmacopeia (US, UK) discuss the stability of certain reagents and standards but do not contain information about solution stability. Compendia of chemical data<sup>7,8</sup> will state if a given chemical decomposes in solution.
- C. It is possible to make the following recommendations with the caveat that there will be exceptions. The preferable approach to stability would involve (1) defining the critical attributes of the solvent for the specific process or analysis and (2) measurement of such property or properties over a period of one year. Storage of a laboratory solvent for more than a period of one year is not acceptable. It is assumed that the solutions are prepared with USP quality or higher water under clean conditions.

No solution should be retained for a period of time longer than 3 months unless it has been documented that effectiveness is retained beyond that time period. There may be some solutions such as dilute phosphate buffers at neutrality that are stable for much shorter periods of time.

Solutions should be stored in the cold (2-4°C) unless it has been documented that storage at 23°C (room temperature) is effective.

Any dating of an solvent used in a GLP or cGMP process shall be consistent with information in the SOP for the preparation of such solvent and information in any run sheet/analytical SOP which uses such solvent.

## GENERAL INFORMATION ON SPECTROSCOPY

Spectroscopy – the study of the interaction of electromagnetic radiation with matter – excluding chemical effects.

Spectrophotometer – an instrument which measures the relationship between the absorption of light by a substance and the wavelength of the incident light

Spectrometer – an instrument which measures the distribution of wavelengths in electromagnetic radiation; also an instrument which measures the energies and masses in a distribution of particles as in a mass spectrometer

Beer's Law (Beer-Lambert Law or Beer-Lambert-Bouguer Law) – states that while the relationship between transmittance and concentration is non-linear, the relationship between absorbance and concentration is linear. The practical consequence is that with high absorbance values, one is measuring small differences in large numbers with attendant inaccuracies.

$I/I_0$ (Transmittance)	%Transmittance ( $I/I_0 \times 100$ )	Absorbance (A)
1.0	100	0
0.1	10	1.0
0.01	1	2.0
0.001	0.1	3.0
0.0001	0.01	4.0
0.00001	0.001	5.0
0.000001	0.0001	6.0

$\log_{10}(I/I_0) = \epsilon cl = A$ ; where I is the intensity of transmitted light;  $I_0$  is the intensity of incident light;  $\epsilon$  is the molar extinction coefficient ( $L \text{ mol}^{-1} \text{ cm}^{-1}$ ), c is concentration ( $\text{mol L}^{-1}$ ), l is pathlength (cm); and A is absorbance.

### Electromagnetic Radiation Ranges Frequently Used in Biochemistry and Molecular Biology

Definition	Range (Wavelength)	Range (Wavenumber)	Comments
Ultraviolet (UV)	190–360 nm		Qualitative and Quantitative
Visible (Vis)	360–780 nm		Qualitative and Quantitative
Near Infrared (NIR)	780–2500 nm	12,800 – 4000 $\text{cm}^{-1}$	Qualitative and Quantitative
Infrared (IR)	2500–40,000 $\text{nm}^a$	4000 – 250 $\text{cm}^{-1}$	Mostly Qualitative
Far Infrared (FIR)	$4 \times 10^4$ – $10^6 \text{ nm}^a$	250 – 10 $\text{cm}^{-1}$	Mostly Qualitative

<sup>a</sup> Usually used reciprocal centimeters ( $\text{cm}^{-1}$ ) for wavelength description. This quantity is the wave number (reciprocal of the wavelength in  $\text{cm}^{-1}$ )

Hyperchromic – increase in absorbance

Hypochromic – decrease in absorbance

Hypsochromic – decrease in wavelength; also known as a “blue” shift

Bathochromic – increase in wavelength; also known as a “red” shift

### UV-Vis Spectroscopy

#### Absorbance Data for Common Solvents

Solvent	UV-VIS “Cut-Off” Wavelength <sup>a</sup>
$\text{CHCl}_3$	240 nm
Hexanes	200 nm
MeOH/EtOH	205 nm
$\text{H}_2\text{O}$	190 nm
Dioxane	205 nm
Acetonitrile	190 nm

<sup>a</sup> In this context, “cut-off” is the lowest wavelength at which the solvent can be used; solvent absorbance is sufficiently high below this wavelength to marginalize results.

Water transmits light satisfactorily between 400 nm and 800 nm; from 600 nm to 900 nm, above 900 nm, transmission decreases by a factor 50 and above 1.3  $\mu\text{m}$ , transmission decreases more rapidly; transmission increases from 400 to 220 while a further decrease in wavelength results in markedly decreased transmission.

- Optical Properties of Water (Morton, R.A., *Biochemical Spectroscopy*, John Wiley & Sons (A Halsted Press Book), New York, New York, 1975.)

### Optical Properties of Plastics Used For Microplate Assays<sup>a,b</sup>

Material	UV “Cut-off” <sup>c</sup>
Quartz	180 nm
Polystyrene <sup>d</sup>	300 nm
Polypropylene <sup>e</sup>	300 nm
Polyvinyl chloride (PVC)	300 nm

<sup>a</sup> These are values for the “common” microplate thickness; with thin-thickness (10  $\mu$ ), the “cut-off” value of polyethylene is 180 nm (Andrady, A.L., *Ultraviolet radiation and polymers*, in *Physical Properties of Polymers Handbook*, ed. J.E. Mark, American Institute of Physics, AIP Press, Woodberry, NY, USA, 1996).

<sup>b</sup> There are a number of UV-transparent microplates available on the market. These are made of proprietary plastics; most likely unique blends. The microplates will permit use at 260 nm and 280 nm making them useful for biochemical analyses. However, since the composition of these microplates is proprietary, the microplates must be evaluated for any unique binding properties.

<sup>c</sup> In this context, “cut-off” is the lowest wavelength at which the microplate can be used; the zero absorbance of the microplate is sufficiently high such to marginalize results.

<sup>d</sup> Tends to be hydrophilic so an aqueous sample tends to “film” and stick the sides of well (surface tension effect)

<sup>e</sup> Tends to be hydrophobic so aqueous sample tends to “bead.”

# PLASTICS

Plastics are a group of materials which are used extensively in biochemistry and molecular biology. Plastics can be defined as non-metallic polymeric materials which can be molded or extruded into a shape. A plastic can be a single polymeric component such as polypropylene, a blend of several polymers or a block copolymer consisting of joined segments of two or more individual polymers such as a block copolymer of polybutadiene and poly(ethylene oxide). The physical properties of a plastic are a combination of the polymeric composition and additives such as plasticizers. Plasticizers are high molecular weight liquids or solids melting a low temperature which are blended with thermoplastic resins such as polyvinyl chloride to change physical properties. Plasticizers including phthalate derivatives such as di(2-ethyl)hexylphthalate, derivatives of organic acids such as di-2-ethylhexyladipate, and polyglycols (polyethylene glycol). Other materials included in the manufacture of plastics include antioxidants, lubricants, stabilizers, and colorants. All of these components can influence the property of the final plastic product. It must be emphasized that the biomedical market for plastics is quite small in volume compared to the overall market. Thus, unless a vendor makes their own raw material, most suppliers to biochemistry and molecular biology purchase bulk product from a large chemical company. As a result there can be batch-to-batch and vendor-to-vendor variation in product. Another issue which confounds the use of plastics is the addition of stabilizers. Stabilizers are chemicals such as hydroxybenzophenones and hydroxyphenylbenzotriazoles which are added to prevent damage from ultraviolet irradiation. These compounds do absorb ultraviolet light in the 200-400 nm range and do present problems in biochemical analyses. The careful investigator will assure the source of the plastics used in products such as microplates and incubation flasks (Clinchy, B., Youssefi, M.R., and Håkansson, L., Differences in adsorption of serum proteins and production of IL-1ra by human monocytes incubated in different tissue culture microtiter plates, *J.Immunol.Methods* 282, 53-61, 2003).

## Some Properties of Plastics Used in Biochemistry and Molecular Biology

Structures for these plastics may be found on p. 866–868

Plastic	Uses	References
Acrylonitrile-Butadiene elastomers (Nitrile rubber)	Soft rubber applications such as gloves and pharmaceutical stoppers	1-4
Nylon (aliphatic polyamides)	Matrix for tissue engineering, suture material, matrix for adsorptive technologies	6-10
Polyacrylamide	Primary use as a matrix for protein electrophoresis (PAGE, polyacrylamide gel electrophoresis). Early use as gel filtration matrix; more recent use as a hydrogel and implant material	11-18
Polyacrylate (PA; polyacrylic acid) <sup>1</sup>	Dental cement, use for manufacture of microparticles and nanoparticles	19-24
Polybutadiene	Chromatographic matrix such as polybutadiene-coated zirconia, microarray plates	25-31
Polycarbonate	Matrix for biological assays; material for tissue culture flasks; implants; filters; use as "solid" component of copolymers; tyrosine-derived polycarbonate used in tissue engineering	32-42
Polyethylene	Implants, tubing	43-45
Polyethylene oxide (PEO)	Component of hydrogels; some use in implant biology; use in copolymers	46-51
Poly(ethylene terephthalate) (PET)	Matrix for tissue engineering; cell culture matrix; used in block copolymers	52-57

### Some Properties of Plastics Used in Biochemistry and Molecular Biology (Continued)

Plastic	Uses	References
Poly(methacrylate) <sup>1</sup>	Used in monolithic chromatographic columns	58
Polypropylene	fiber used in surgery	59-61
Polypropylene oxide	Hydrogels, block copolymers,	62-64
Polystyrene	Microplates, can be modified by irradiation for covalent binding of probes; chromatographic matrices; microbeads for assays; frequently a copolymer with divinylbenzene	65-82
Poly(vinyl chloride)	Use in biosensors; use as flexible tubing when phthalate stabilizers are used; use as copolymer for encapsulation	83-88

<sup>1</sup> The nomenclature for acrylic acid and derivatives can be confusing. The following definitions are used in this text.

Acrolein (2-propenal)

Acrylamide (2-propenamide)

Acrylic acid (propenoic acid)

Acrylonitrile (2-propenenitrile)

Methacrylic acid (2-methylpropenoic acid)

Methyl methacrylic acid (2-methylpropenoic acid methyl ester)

<sup>†</sup>Corresponding author

**Abstract:** The commission has already published two documents on the source-based names of linear copolymers and nonlinear polymers; however, in some cases this nomenclature leads to ambiguous names. The present document proposes a generic source-based nomenclature that solves these problems and yields clearer source-based names. A generic source-based name comprises two parts:

- 1) polymer class (generic) name followed by a colon
- 2) the actual or hypothetical monomer name(s), always parenthesized in the case of a copolymer

The formula, the structure-based name, the source-based name, and the generic source-based name of the polymer are given for each example in the document. In some cases, only generic source-based give unambiguous names, for example, when a polymer has more than one name or when it is obtained through a series of intermediate structures. The rules concern mostly polymers with one or more types of functional group or heterocyclic system in the main chain, but to some extent they are also applicable to polymers with side-groups, carbon-chain polymers such as vinyl or diene polymers, spiro and cyclic polymers, and networks.

## 1. Introduction

The IUPAC Commission on Macromolecular Nomenclature has published three documents [1–3] on the structure-based nomenclature for polymers that enable most polymers, except networks, to be named. The Commission has also produced two documents

[4,5] on the source-based nomenclature of linear copolymers and nonlinear polymers. In general, source-based names are simpler and less rigorous than structure-based names. However, there are cases in which the simplicity of the source-based nomenclature leads to ambiguous names for polymers. For example, the condensation of a dianhydride (A) with a diamine (B) gives first a polyamide-acid, which can be cyclized to a polyimide; however, both products have the same name poly(A-*alt*-B) according to current source-based nomenclature. If the class name of the polymer “amide-acid” or “imide” is incorporated in the name,

differentiation is easily accomplished. Even in cases where only a single product is formed, use of the class name (generic name) may help to clarify the structure of the polymer, especially if it is very complex.

Examples of ambiguous names exist also for homopolymers. The source-based name "polybutadiene" does not indicate whether the structure is 1,2-, 1,4-*cis*-, or 1,4-*trans*-; supplementary information is needed to distinguish between the possibilities.

It is the objective of the present document to introduce a generic nomenclature system to solve these problems, and to yield better source-based names.

Most trivial names, such as polystyrene, are source-based names. Hitherto, the Commission has not systematically recommended source-based names for homopolymers because it considered that the more rigorous structure-based names were more appropriate for scientific communications. However, since the publication of "Nomenclature of Regular Single-Strand Organic Polymers" in 1976, scientists, in both industry and academia, have continued to use trivial names. Even the Commission itself adopted (1985) a source-based nomenclature for copolymers owing to its simplicity and practicality. Based on these facts, the Commission has now decided to recommend source-based nomenclature as an alternative official nomenclature for homopolymers. In this document, the rules for generating source-based names for homopolymers are described. Consequently, source-based and structure-based names are available for most polymers.

Names of the monomers in the source-based names of polymers should preferably be systematic but they may be trivial if well established by usage. Names of the organic groups, as parts of constitutional repeating units (CRU) in structure-based names, are those based on the principles of organic nomenclature and recommended by the 1993 *A Guide to IUPAC Nomenclature of Organic Compounds* [6].

## 2. Source-based nomenclature for homopolymers

### RULE 1

The source-based name of a homopolymer is made by combining the prefix "poly" with the name of the monomer. When the latter consists of more than one word, or any ambiguity is anticipated, the name of the monomer is parenthesized.

#### Example 1.1

Source-based name: Polystyrene  
Structure-based name: poly(1-phenylethylene)

#### Example 1.2

Source-based name: poly(vinyl chloride)  
Structure-based name: poly(1-chloroethylene)

## 3. Generic nomenclature

### 3.1 Fundamental principles

The basic concept for generic source-based nomenclature is very simple; just add the polymer class name to the source-based name of the polymer. Addition of the polymer class name is frequently OPTIONAL; in some cases, the addition is necessary to avoid ambiguity or to clarify. However, the addition is undesirable if it fails to add clarification.

The system presented here can be applied to almost all homopolymers, copolymers, and others, such as networks. However, generic source-based nomenclature should not be considered as a third nomenclature system to be added to the other two systems of nomenclature; it must be considered as an auxiliary system and a simple extension of current source-based nomenclature. When the generic part of the name is eliminated from the name of a polymer, the well-established source-based name remains.

### 3.2 General rules

#### RULE 2

A generic source-based name of a polymer has two components in the following sequence: (1) a polymer class (generic) name (polyG) followed by a colon and (2) the actual or hypothetical monomer name(s) (A, B, etc.), always parenthesized in the case of a copolymer. In the case of a homopolymer, parentheses are introduced when it is necessary to improve clarity.

**Note 1** The polymer class name (generic name) describes the most appropriate type of functional group or heterocyclic ring system.

**Note 2** All the rules given in the two prior documents on source-based nomenclature [4,5] can be applied to the present nomenclature system, with the addition of the generic part of the name.

**Note 3** A polymer may have more than one name; this usually occurs when it can be prepared in more than one way.

**Note 4** If a monomer or a pair of complementary monomers can give rise to more than one polymer, or if the polymer is obtained through a series of intermediate structures, the use of generic nomenclature is essential (see examples 2.1, 2.3, and 2.4).

#### Example 2.1

Generic source-based name:

- I. polyalkylene:vinyloxirane
- II. polyether:vinyloxirane

Source-based names:

I and II have the same source-based name: poly(vinyloxirane).

Structure-based names:

- I. poly(1-oxiranylethylene)
- II. poly[(oxy(1-vinylethylene)]

*Example 2.2*

Generic source-based name:

polyoxadiazole:(4-cyanobenzonitrile *N*-oxide)

Structure-based name:

poly(1,2,4-oxadiazole-3,5-diyl-1,4-phenylene)

*Example 2.3*

Generic source-based name:

- I. polyamide:[(terephthaloyl dichloride)-*alt*-benzene-1,2,4,5-tetramine]
- II. polybenzimidazole:[(terephthaloyl dichloride)-*alt*-benzene-1,2,4,5-tetramine]

Source-based name:

I and II have the same source-based name:

poly[(terephthaloyl dichloride)-*alt*-benzene-1,2,4,5-tetramine]

Structure-based names:

- I. poly[imino (2,5-diamino-1,4-phenylene)iminoterephthaloyl]
- II. poly[(1,5-dihydrobenzo[1,2-*d*:4,5-*d'*]diimidazole-2,6-diyl)-1,4-phenylene]

*Example 2.4*

Generic source-based names:

- I. polyhydrazide:[hydrazine-*alt*-(terephthalic acid)]
- II. polyoxadiazole:[hydrazine-*alt*-(terephthalic acid)]

Source-based name:

I and II have the same source-based name: poly[hydrazine-*alt*-(terephthalic acid)]

Structure-based names:

- I. poly(hydrazine-1,2-diylterephthaloyl)
- II. poly(1,3,4-oxadiazole-2,5-diyl-1,4-phenylene)

*Example 2.5*

Generic source-based names:

polyurethane:[butane-1,4-diol-*alt*-(hexane-1,6-diyl diisocyanate)]-*block*-polyester:[(ethylene glycol)-*alt*-(terephthalic acid)]

Structure-based name:

poly(oxybutane-1,4-diyloxycarbonyliminohexane-1,6-diyliminocarbonyl)-*block*-poly(oxyethyleneoxyterephthaloyl)

*Example 2.6*

+

↓

Generic source-based name:

polyamide:[hexane-1,6-diamine-*alt*-(adipic acid)]-*graft*-polyether: (ethylene oxide)

**Note 5** It is assumed that this reaction is limited to only one graft for each CRU.

### RULE 3

When more than one type of functional group or heterocyclic system is present in the polymer structure, names should be alphabetized; for example, poly(GG):(A-*alt*-B).

**Note 6** It is preferable, but not mandatory, to cite all generic classes.

#### Example 3.1

Generic source-based name:

polyesterurethane:( $\alpha,\omega$ -dihydroxyoligo[(ethylene glycol)-*alt*-(adipic acid)]-*alt*-(2,5-tolylene diisocyanate))

Structure-based name:

poly{[oligo(oxyethyleneoxyadipoyl)]oxyethyleneoxycarbonylimino(x-methyl-1,4-phenylene)iminocarbonyl}

#### Example 3.2

Generic source-based name:

polyetherketone:(4,4'-difluorobenzophenone-*att*-hydroquinone)

Structure-based name:

poly(oxy-1,4-phenyleneoxy-1,4-phenylenecarbonyl-1,4-phenylene)

### RULE 4

Polymer class names relevant only to the main chain are specified in the name; names of side-chain functional groups may also be included after a hyphen if they are formed during the polymerization reaction.

#### Example 4.1

Generic source-based names:

- I. poly(amide-acid):[(pyromellitic dianhydride)-*alt*-(4,4'-oxydianiline)] (Both carboxy groups result from the polymerization reaction.)
- II. polyimide:[(pyromellitic dianhydride)-*alt*-(4,4'-oxydianiline)]

Structure-based names:

- I. poly[oxy-1,4-phenyleneiminocarbonyl(4,6-dicarboxy-1,3-henylene)carbonylimino-1,4-phenylene]
- II. poly[[5,7-dihydro-1,3,5,7-tetraoxobenzo[1,2-*c*:4,5-*c'*]dipyrrole-2,6(1*H*,3*H*)-diyl]-1,4-phenyleneoxy-1,4-phenylene]

#### Example 4.2

Generic source-based names:

poly(ether-alcohol):(epichlorohydrin-*alt*-bisphenol A)

Structure-based name:

poly[oxy(2-hydroxypropane-1,3-diyl)oxy-1,4-phenylene(1-methylethane-1,1-diyl)-1,4-phenylene]

### RULE 5

In the case of carbon-chain polymers such as vinyl polymers or diene polymers, the generic name is to be used only when different polymer structures may arise from a given monomeric system.

Example 5.1

Generic source-based name:

polyalkylene:(buta-1,3-diene)

Source-based name: poly(buta-1,3-diene)

Structure-based name: poly(1-vinylethylene)

Example 5.2

Generic source-based name:

polyalkenylene:buta-1,3-diene

Source-based name:poly(buta-1,3-diene)

Structure-based name: poly(but-1-ene-1,4-diyl)

Example 5.3

Generic source-based name:

polyalkylene: acrylamide

Structure-based name: poly[1-(aminocarbonyl)ethylene]

Example 5.4

Generic source-based name: polyamide:acrylamide

Structure-based name: poly[imino(1-oxopropane-1,3-diyl)]

**Note 7** The terms polyalkylene and polyalkenylene have been defined in ref. 7, p. 149.

## 4. Further applications of generic names

Generic source-based nomenclature can be extended to more complicated polymers such as spiro and cyclic polymers and networks.

Example 6.1

Generic source-based name:

polyspiroketal: {[2,2-bis(hydroxymethyl)-propane-1,3-diol]-*alt*-cyclohexane-1,4-dione} or polyspiroketal: (pentaerythritol-*alt*-cyclohexane-1,4-dione)

Structure-based name:

poly[2,4,8,10-tetraoxaspiro[5.5]undecane-3,3,9,9-tetrayl-9,9-bis(ethylene)]

Example 6.2

Generic source-based name:

*cyclo*-polyester: [(ethylene glycol)-*alt*-(terephthalic acid)]

**Note 8** There is no IUPAC nomenclature for cyclic polymers.

Example 6.3

Generic source-based name:

polyester: {butane-1,4-diol-*alt*-[(maleic anhydride);(phthalic anhydride)]}-*net*-polyalkylene: (maleic anhydride)-*co*-styrene]

**Abstract:** The document defines the terms most commonly encountered in the field of polymer reactions and functional polymers. The scope has been limited to terms that are specific to polymer systems. The document is organized into three sections. The first defines the terms relating to reactions of polymers. Names of individual chemical reactions are omitted from the document, even in cases where the reactions are important in the field of polymer reactions. The second section defines the terms relating to polymer reactants and reactive polymeric materials. The third section defines the terms describing functional polymeric materials.

## Introduction

Chemical reactions of polymers have received much attention during the last two decades. Many fundamentally and industrially important reactive polymers and functional polymers are prepared by the reactions of linear or cross-linked polymers and by

the introduction of reactive, catalytically active, or other groups onto polymer chains. Characteristics of polymer reactions may be appreciably different from both reactions of low-molar-mass compounds and polymerization reactions. Basic definitions of polymerization reactions have been included in the original [1] and revised [2] documents on basic terms in polymer science published by the IUPAC Commission on Macromolecular Nomenclature. Furthermore, the basic classification and definitions of polymerization reactions [3] and some polymer reactions such as degradation, aging, and related chemical transformations

Reproduced from:  
*Pure Appl. Chem.*, Vol. 76, No. 4, pp. 889–906, 2004.  
© 2004 IUPAC

of polymers have been defined [4]. However, in spite of the growing importance of the field, a clear and uniform terminology covering the field of reactions and the functionalization of polymers has not been presented until now. For example, combinatorial chemistry using reactive polymer beads has become a new field in recent years. The development of a uniform terminology for such multidisciplinary areas can greatly aid communication and avoid confusion.

This document presents clear concepts and definitions of general and specific terms relating to reactions of polymers and functional polymers. The document is divided into three sections. In Section 1 terms relating to reactions of polymers are defined. Names of individual chemical reactions (e.g., chloromethylation) are omitted from this document, even in cases where the reactions are important in the field of polymer reactions, because such names are usually already in widespread use and are well defined in organic chemistry and other areas of chemistry [5]. Sections 2 and 3 deal with the terminology of reactive and functional polymers. The term “functional polymer” has two meanings: (a) a polymer bearing functional groups (such as hydroxy, carboxy, or amino groups) that make the polymer reactive and (b) a polymer performing a specific function for which it is produced and used. The function in the latter case may be either a chemical function such as a specific reactivity or a physical function like electric conductivity. Polymers bearing reactive functional groups are usually regarded as polymers capable of undergoing chemical reactions. Thus, Section 2 deals with polymers and polymeric materials that undergo various kinds of chemical reactions (i.e., show chemical functions). Section 3 deals with terms relating to polymers and polymeric materials exhibiting some specific physical functions. For definitions of some physical functions, see also *Compendium of Chemical Terminology* (“Gold Book”) [6].

A functional polymer according to Definition 3.6 of the present document is a polymer that exhibits specified chemical reactivity or has specified physical, biological, pharmacological, or other uses that depend on specific chemical groups. Thus, several terms concerned with properties or the structure of polymers are included in Section 3 whenever they are closely related to specific functions.

Terms that are defined implicitly in the notes and related to the main terms are given in bold type.

## 1. Reactions involving polymers

### 1.1 Chemical amplification

Process consisting of a chemical reaction that generates a species that catalyzes another reaction and also the succeeding catalyzed reaction.

*Note 1:* Chemical amplification can lead to a change in structure and by consequence to a change in the physical properties of a polymeric material.

*Note 2:* The term “chemical amplification” is commonly used in photoresist lithography employing a **photo-acid generator** or **photo-base generator**.

*Note 3:* An example of chemical amplification is the transformation of [(*tert*-butoxycarbonyl)oxy]phenyl groups in polymer chains to hydroxyphenyl groups catalyzed by a photo-generated acid.

*Note 4:* The term “amplification reaction” as used in analytical chemistry is defined in [6], p. 21.

### 1.2 Chemical modification

Process by which at least one feature of the chemical constitution of a polymer is changed by chemical reaction(s).

*Note:* A configurational change (e.g., cis–trans isomerization) is not usually referred to as a chemical modification.

### 1.3 Cross-linking

Reaction involving sites or groups on existing macromolecules or an interaction between existing macromolecules that results in the formation of a small region in a macromolecule from which at least four chains emanate.

*Note 1:* See [6], p. 94 and Definition 1.59 in [2] for cross-link.

*Note 2:* The small region may be an atom, a group of atoms, or a number of branch points connected by bonds, groups of atoms, or oligomeric chains.

*Note 3:* A reaction of a reactive chain end of a linear macromolecule with an internal reactive site of another linear macromolecule results in the formation of a branch point, but is not regarded as a cross-linking reaction.

### 1.4 Curing

Chemical process of converting a prepolymer or a polymer into a polymer of higher molar mass and connectivity and finally into a network.

*Note 1:* Curing is typically accomplished by chemical reactions induced by heating (**thermal curing**), photoirradiation (**photo-curing**), or electron-beam irradiation (**EB curing**), or by mixing with a chemical curing agent.

*Note 2:* Physical aging, crystallization, physical cross-linking, and postpolymerization reactions are sometimes referred to as “curing”. Use of the term “curing” in these cases is discouraged.

*Note 3:* See also Definition 1.22.

### 1.5 Depolymerization

Process of converting a polymer into its monomer or a mixture of monomers (see [6], p. 106 and Definition 3.25 in [2]).

### 1.6 Grafting

Reaction in which one or more species of block are connected to the main chain of a macromolecule as side chains having constitutional or configurational features that differ from those in the main chain.

*Note:* See [6], p. 175 and Definition 1.28 in [2] for graft macromolecule.

### 1.7 Interchange reaction

Reaction that results in an exchange of atoms or groups between a polymer and low-molar-mass molecules, between polymer molecules, or between sites within the same macromolecule.

*Note:* An interchange reaction that occurs with polyesters is called **transesterification**.

### 1.8 Main-chain scission

Chemical reaction that results in the breaking of main-chain bonds of a polymer molecule.

*Note 1:* See [6], p. 64 and Definition 3.24 in [2] for chain scission.

*Note 2:* Some main-chain scissions are classified according to the mechanism of the scission process: **hydrolytic**, **mechanochemical**, **thermal**, **photochemical**, or **oxidative scission**. Others are classified according to their location in the backbone relative to a specific structural feature, for example,  $\alpha$ -**scission** (a scission of the C-C bond alpha to the carbon atom of a photo-excited carbonyl group) and  $\beta$ -**scission** (a scission of the C-C bond beta to the carbon atom bearing a radical), etc.

### 1.9 Mechanochemical reaction

Chemical reaction that is induced by the direct absorption of mechanical energy.

*Note:* Shearing, stretching, and grinding are typical methods for the mechanochemical generation of reactive sites, usually macroradicals, in polymer chains that undergo mechanochemical reactions.

### 1.10 Photochemical reaction

Chemical reaction that is caused by the absorption of ultraviolet, visible, or infrared radiation ([6], p. 302).

*Note 1:* Chemical reactions that are induced by a reactive intermediate (e.g., radical, carbene, nitrene, or ionic species) generated from a photo-excited state are sometimes dealt with as a part of photochemistry.

*Note 2:* An example of a photochemical reaction concerned with polymers is **photopolymerization**.

*Note 3:* See also Definitions 1.1, 1.18, 3.14, and 3.25.

### 1.11 Polymer complexation polymer complex formation

Process that results in the formation of a polymer-polymer complex or a complex composed of a polymer and a low-molar-mass substance.

### 1.12 Polymer cyclization

Chemical reaction that leads to the formation of ring structures in or from polymer chains.

*Note 1:* Examples of cyclization along polymer chains are: (a) cyclization of polyacrylonitrile, (b) acetalization of poly(vinyl alcohol) with an aldehyde, (c) cyclization of polymers of conjugated dienes such as polyisoprene or polybutadiene leading to macrocycles.

*Note 2:* Examples of cyclization of polymer molecules are: (a) cyclization of poly(dimethylsiloxane), (b) back-biting reaction during ionic polymerizations of heterocyclic monomers.

### 1.13 Polymer degradation

Chemical changes in a polymeric material that usually result in undesirable changes in the in-use properties of the material.

*Note 1:* In most cases (e.g., in vinyl polymers, polyamides) degradation is accompanied by a decrease in molar mass. In some cases (e.g., in polymers with aromatic rings in the

main chain), degradation means changes in chemical structure. It can also be accompanied by cross-linking.

*Note 2:* Usually, degradation results in the loss of, or deterioration in useful properties of the material. However, in the case of **biodegradation** (degradation by biological activity), polymers may change into environmentally acceptable substances with desirable properties (see Definition 3.1).

*Note 3:* See Definition 16 in [4] for degradation.

### 1.14 Polymer functionalization

Introduction of desired chemical groups into polymer molecules to create specific chemical, physical, biological, pharmacological, or other properties.

### 1.15 Polymer reaction

Chemical reaction in which at least one of the reactants is a high-molar-mass substance.

### 1.16 Polymer-supported reaction

Chemical reaction in which at least one reactant or a catalyst is bound through chemical bonds or weaker interactions such as hydrogen bonds or donor-acceptor interactions to a polymer.

*Note 1:* The easy separation of low-molar-mass reactants or products from the polymer-supported species is a great advantage of polymer-supported reactions.

*Note 2:* Typical examples of polymer-supported reactions are: (a) reactions performed by use of polymer-supported catalysts, (b) solid-phase peptide synthesis, in which intermediate peptide molecules are chemically bonded to beads of a suitable polymer support.

### 1.17 Protection of a reactive group

Temporary chemical transformation of a reactive group into a group that does not react under conditions where the nonprotected group reacts.

*Note:* For example, **trimethylsilylation** is a typical transformation used to protect reactive functional groups such as hydroxy or amino groups from their reaction with growing anionic species in anionic polymerization.

### 1.18 Radiation reaction

Chemical reaction that is induced by ionizing radiation with  $\gamma$ -ray, X-ray, electron, or other high-energy beams.

*Note 1:* Radiation reactions involving polymers often lead to chain scission and cross-linking.

*Note 2:* A **photochemical reaction** (see Definition 1.10) is sometimes regarded as a type of radiation reaction.

### 1.19 Reactive blending

Mixing process that is accompanied by the chemical reaction(s) of components of a polymer mixture.

*Note 1:* Examples of reactive blending are: (a) blending accompanied by the formation of a polymer-polymer complex, (b) the formation of block or graft copolymers by a combination of radicals formed by the mechanochemical scission of polymers during blending.

*Note 2:* Reactive blending may also be carried out as reactive extrusion or reaction injection molding (RIM).

### 1.20 Sol-gel process

Formation of a polymer network by the reaction of monomer(s), liquid or in solution, to form a gel, and in most cases finally to form a dry network.

*Note:* An inorganic polymer (e.g., silica-gel or organic-inorganic hybrid) can be prepared by the sol-gel process.

### 1.21 Surface grafting

Process in which a polymer surface is chemically modified by grafting or by the generation of active sites that can lead to the initiation of a graft polymerization.

*Note 1:* Peroxidation, ozonolysis, high-energy irradiation, and plasma etching are methods of generating active sites on a polymer surface.

*Note 2:* See also Definition 1.6.

### 1.22 Vulcanization

Chemical cross-linking of high-molar-mass linear or branched polymer or polymers to give a polymer network.

*Note 1:* The polymer network formed often displays rubber-like elasticity. However, a high concentration of cross-links can lead to rigid materials.

*Note 2:* A classic example of vulcanization is the cross-linking of *cis*-polyisoprene through sulfide bridges in the thermal treatment of natural rubber with sulfur or a sulfur-containing compound.

## 2. Polymer reactants and reactive polymeric materials

### 2.1 Chelating polymer

Polymer containing ligand groups capable of forming bonds (or other attractive interactions) between two or more separate binding sites within the same ligand group and a single atom.

*Note 1:* Chelating polymers mostly act as ion-exchange polymers specific to ions that form chelates with chelating ligands of the polymer.

*Note 2:* See [6], p. 68 for chelation.

### 2.2 Ion-exchange polymer

Polymer that is able to exchange ions (cations or anions) with ionic components in solution.

*Note 1:* See [6], p. 208 for ion exchange.

*Note 2:* An ion-exchange polymer in ionized form may also be referred to as a **polyanion** or a **polycation**.

*Note 3:* Synthetic ion-exchange organic polymers are often network polyelectrolytes.

*Note 4:* A membrane having ion-exchange groups is called an **ion-exchange membrane**.

*Note 5:* Use of the term "ion-exchange resin" for "ion-exchange polymer" is strongly discouraged.

### 2.3 Living polymer

Polymer with stable, polymerization-active sites formed by a chain polymerization in which irreversible chain transfer and chain termination are absent.

*Note 1:* See [6], p. 236 and Definition 3.21 in [2] for living polymerization.

### 2.4 Macromonomer

Polymer or oligomer whose molecules each have one end-group that acts as a monomer molecule, so that each polymer or oligomer molecule contributes only a single monomer unit to a chain of the product polymer.

*Note 1:* The homopolymerization or copolymerization of a macromonomer yields a comb or graft polymer.

*Note 2:* In the present definition, Definition 2.35 in [2] has been combined with Definition 1.9 in [2]. See also [6], p. 241.

*Note 3:* Macromonomers are also sometimes referred to as macromers. The use of the term "macromer" is strongly discouraged.

### 2.5 Polymer catalyst

Polymer that exhibits catalytic activity.

*Note 1:* Certain synthetic polymer catalysts can behave like enzymes.

*Note 2:* Poly(4-vinylpyridine) in its basic form and sulfonated polystyrene in its acid form are examples of polymers that can act as catalysts in some base- and acid-catalyzed reactions, respectively.

### 2.6 Polymer-metal complex

Complex comprising a metal and one or more polymeric ligands.

### 2.7 Polymer phase-transfer catalyst

Polymer that acts as a phase-transfer catalyst and thereby causes a significant enhancement of the rate of a reaction between two reactants located in neighboring phases owing to its catalysis of the extraction of one of the reactants across the interface to the other phase where the reaction takes place.

*Note 1:* Polymer phase-transfer catalysts in the form of beads are often referred to as **triphase catalysts** because such catalysts form the third phase of the reaction system.

*Note 2:* See [6], p. 299 for phase-transfer catalyst.

### 2.8 Polymer-supported catalyst

Catalyst system comprising a polymer support in which catalytically active species are immobilized through chemical bonds or weaker interactions such as hydrogen bonds or donor-acceptor interactions.

*Note 1:* Polymer-supported catalysts are often based on network polymers in the form of beads. They are easy to separate from reaction media and can be used repeatedly.

*Note 2:* Examples of polymer-supported catalysts are: (a) a polymer-metal complex that can coordinate reactants, (b) colloidal palladium dispersed in a swollen network polymer that can act as a hydrogenation catalyst.

*Note 3:* **Polymer-supported enzymes** are a type of polymer-supported catalysts.

### 2.9 Polymer reactant polymer reagent polymer-supported reagent

Reactant (reagent) that is or is attached to a high-molar-mass linear polymer or a polymer network.

*Note:* The attachment may be by chemical bonds, by weaker interactions such as hydrogen bonds, or simply by inclusion.

### 2.10 Prepolymer

Polymer or oligomer whose molecules are capable of entering, through reactive groups, into further polymerization and thereby contributing more than one structural unit to at least one type of chain of the final polymer.

*Note:* Definition 2.37 in [2] has been combined with Definition 1.11 in [2]. See also [6], p. 318.

### 2.11 Reactive polymer

Polymer having reactive functional groups that can undergo chemical transformation under the conditions required for a given reaction or application.

### 2.12 Redox polymer electron-exchange polymer oxidation-reduction polymer

Polymer containing groups that can be reversibly reduced or oxidized.

*Note 1:* Reversible redox reaction can take place in a polymer main-chain, as in the case of polyaniline and quinone/hydroquinone polymers, or on side-groups, as in the case of a polymer carrying ferrocene side-groups.

*Note 2:* See [7] p. 346.

*Note 3:* Use of the term "redox resin" is strongly discouraged.

### 2.13 Resin

Soft solid or highly viscous substance, usually containing prepolymers with reactive groups.

*Note 1:* This term was used originally because of its analogy with a natural resin (rosin) and designated, in a broad sense, any polymer that is a basic material for plastics, organic coatings, or lacquers. However, the term is now used in a more narrow sense to refer to prepolymers of thermosets (thermosetting polymers).

*Note 2:* The term is sometimes used not only for prepolymers of thermosets, but also for cured thermosets (e.g., epoxy resins, phenolic resins). Use of the term for cured thermosets is strongly discouraged.

*Note 3:* Use of the term "resin" to describe the polymer beads used in solid-phase synthesis and as polymer supports, catalysts, reagents, and scavengers is also discouraged.

### 2.14 Telechelic polymer telechelic oligomer

Prepolymer capable of entering into further polymerization or other reactions through its reactive end-groups.

*Note 1:* Reactive end-groups in telechelic polymers come from initiator or termination or chain-transfer agents in

chain polymerizations, but not from monomer(s) as in polycondensations and polyadditions.

*Note 2:* See [6], p. 414 and the Note to Definition 1.11 in [2] for telechelic molecule.

### 2.15 Thermosetting polymer

Prepolymer in a soft solid or viscous state that changes irreversibly into an infusible, insoluble polymer network by curing.

*Note 1:* Curing can be by the action of heat or suitable radiation, or both.

*Note 2:* A cured thermosetting polymer is called a **thermoset**.

## 3. Functional polymeric materials

### 3.1 Biodegradable polymer

Polymer susceptible to degradation by biological activity, with the degradation accompanied by a lowering of its molar mass.

*Note 1:* See also Note 2 to Definition 1.13.

*Note 2:* See [6], p. 43 for biodegradation. In the case of a polymer, its biodegradation proceeds not only by catalytic activity of enzymes, but also by a wide variety of biological activities.

### 3.2 Conducting polymer

Polymeric material that exhibits bulk electric conductivity.

*Note 1:* See [6], p. 84 for conductivity.

*Note 2:* The electric conductivity of a conjugated polymer is markedly increased by doping it with an electron donor or acceptor, as in the case of polyacetylene doped with iodine.

*Note 3:* A polymer showing a substantial increase in electric conductivity upon irradiation with ultraviolet or visible light is called a **photoconductive polymer**; an example is poly(*N*-vinyl-carbazole) (see [6], p. 302 for photoconductivity).

*Note 4:* A polymer that shows electric conductivity due to the transport of ionic species is called an **ion-conducting polymer**; an example is sulfonated polyaniline. When the transported ionic species is a proton as, e.g., in the case of fuel cells, it is called a **proton-conducting polymer**.

*Note 5:* A polymer that shows electric semiconductivity is called a **semiconducting polymer** (See [6], p. 372 for semiconductor).

*Note 6:* Electric conductance of a nonconducting polymer can be achieved by dispersing conducting particles (e.g., metal, carbon black) in the polymer. The resulting materials are referred to as **conducting polymer composites** or **solid polymer-electrolyte composites**.

### 3.3 Electroluminescent polymer

Polymeric material that shows luminescence when an electric current passes through it such that charge carriers can combine at luminescent sites to give rise to electronically excited states of luminescent groups or molecules.

*Note 1:* Electroluminescent polymers are often made by incorporating luminescent groups or dyes into conducting polymers.

*Note 2:* Electrogenerated chemiluminescence (see [6], p. 130) directly connected with electrode reactions may also be called electroluminescence.

### 3.4 Ferroelectric polymer

Polymer in which spontaneous polarization arises when dipoles become arranged parallel to each other by electric fields.

*Note 1:* See [6], p. 153 for ferroelectric transition.

*Note 2:* Poly(vinylidene fluoride) after being subjected to a corona discharge is an example of a ferroelectric polymer.

### 3.5 Ferromagnetic polymer

Polymer that exhibits magnetic properties because it has unpaired electron spins aligned parallel to each other or electron spins that can easily be so aligned.

### 3.6 Functional polymer

(a) Polymer that bears specified chemical groups

or

(b) Polymer that has specified physical, chemical, biological, pharmacological, or other uses which depend on specific chemical groups.

*Note:* Examples of functions of functional polymers under definition (b) are catalytic activity, selective binding of particular species, capture and transport of electric charge carriers or energy, conversion of light to charge carriers and vice versa, and transport of drugs to a particular organ in which the drug is released.

### 3.7 Impact-modified polymer

Polymeric material whose impact resistance and toughness have been increased by the incorporation of phase microdomains of a rubbery material.

*Note:* An example is the incorporation of soft polybutadiene domains into glassy polystyrene to produce high-impact polystyrene.

### 3.8 Liquid-crystalline polymer

Polymeric material that, under suitable conditions of temperature, pressure, and concentration, exists as a liquid crystalline mesophase (Definition 6.1 in [7]).

*Note 1:* See [4], p. 235 for liquid-crystal.

*Note 2:* A liquid-crystalline polymer can exhibit one or more liquid state(s) with one- or two-dimensional, long-range orientational order over certain ranges of temperatures either in the melt (**thermotropic liquid-crystalline polymer**) or in solution (**lyotropic liquid-crystalline polymer**).

### 3.9 Macroporous polymer

Glass or rubbery polymer that includes a large number of macropores (50 nm–1  $\mu$ m in diameter) that persist when the polymer is immersed in solvents or in the dry state.

*Note 1:* Macroporous polymers are often network polymers produced in bead form. However, linear polymers can also be prepared in the form of macroporous polymer beads.

*Note 2:* Macroporous polymers swell only slightly in solvents.

*Note 3:* Macroporous polymers are used, for example, as precursors for ion-exchange polymers, as adsorbents, as supports for catalysts or reagents, and as stationary phases in size-exclusion-chromatography columns.

*Note 4:* Porous polymers with pore diameters from ca. 2 to 50 nm are called **mesoporous polymers**.

### 3.10 Nonlinear optical polymer

Polymer that exhibits an optical effect brought about by electromagnetic radiation such that the magnitude of the effect is not proportional to the irradiance.

*Note 1:* See [6], p. 275 for nonlinear optical effect.

*Note 2:* An example of nonlinear optical effects is the generation of higher harmonics of the incident light wave.

*Note 3:* A polymer that exhibits a nonlinear optical effect due to anisotropic electric susceptibilities when subjected to electric field together with light irradiation is called an **electro-optical polymer**. A polymer that exhibits electro-optical behavior combined with photoconductivity is called a **photorefractive polymer**.

### 3.11 Optically active polymer

Polymer capable of rotating the polarization plane of a transmitted beam of linear-polarized light.

*Note 1:* See [6], p. 282 for optical activity.

*Note 2:* The optical activity originates from the presence of chiral elements in a polymer such as chiral centers or chiral axes due to long-range conformational order in a polymer (helicity) (see [6], p. 182 for helicity).

### 3.12 Photoelastic polymer

Polymer that under stress exhibits birefringence.

### 3.13 Photoluminescent polymer

Polymer that exhibits luminescence (i.e., fluorescence or phosphorescence arising from photo-excitation).

*Note:* See [6], p. 304 for photoluminescence.

### 3.14 Photosensitive polymer

Polymer that responds to ultraviolet or visible light by exhibiting a change in its physical properties or its chemical constitution.

*Note 1:* Examples of the changes in photosensitive polymers are a change in molecular shape (**photoresponsive polymer**), a change in its constitution (**photoreactive polymer**), and a reversible change in color (**photochromic polymer**).

*Note 2:* Photosensitivity in photosensitive polymers means that the polymers are sensitive to the irradiated light

leading to some change in properties or structure. It is different from photo-sensitization defined in [6], p. 307.

*Note 3:* See [6], p. 307 for photoreaction and [6], p. 302 for photochromism.

### 3.15 Piezoelectric polymer

(a) Polymer that exhibits a change in dielectric properties on application of pressure

or

(b) Polymer that shows a change in its dimensions when subjected to an electric field.

### 3.16 Polyelectrolyte

Polymer composed of molecules in which a portion of the constitutional units has ionizable or ionic groups, or both.

*Note 1:* A polymer bearing both anionic and cationic groups in the same molecule is called an **amphoteric polyelectrolyte**.

*Note 2:* A polymer bearing acid or basic groups is called a polymer acid or a polymer base, respectively.

*Note 3:* A polymer acid or a polymer base can be used as a matrix for ion-conducting polymers.

*Note 4:* Definition 2.38 in [2] has been combined with Definition 1.65 in [2]. The present definition replaces the one in [6], p. 312.

### 3.17 Polymer compatibilizer

Polymeric additive that, when added to a blend of immiscible polymers, modifies their interfaces and stabilizes the blend.

*Note:* Typical polymer compatibilizers are block or graft copolymers.

### 3.18 Polymer drug

Polymer that contains either chemically bound drug molecules or pharmacologically active moieties.

*Note:* A polymer drug is usually used to provide drug delivery targeted to an organ and controlled release of an active drug at the target organ.

### 3.19 Polymer gel

Gel in which the network component is a polymer network.

*Note 1:* A gel is an elastic colloid or polymer network that is expanded throughout its whole volume by a fluid.

*Note 2:* The polymer network can be a network formed by covalent bonds or by physical aggregation with region of local order acting as network junctions.

*Note 3:* An example of covalent polymer gels is *net*-poly(*N*-isopropylacrylamide) swollen in water, which shows volume phase transition during heating.

*Note 4:* Examples of physically aggregated polymer gels are poly(vinyl alcohol) gel and agarose gel, which show reversible sol-gel transitions.

*Note 5:* See Definition 1.58 in [2] for network.

*Note 6:* The definition for gel in [6], p. 170 does not include a polymer gel.

### 3.20 Polymer membrane

Thin layer of polymeric material that acts as a barrier permitting mass transport of selected species.

*Note:* See [6], p. 251 for membrane.

### 3.21 Polymer solvent

Polymer that acts like a solvent for compounds of low molar mass.

*Note:* An example of a polymer solvent is poly(oxyethylene); it can dissolve various inorganic salts by complexation.

### 3.22 Polymer sorbent

Polymer that adsorbs or absorbs a certain substance or certain substances from a liquid or a gas.

*Note 1:* A polymer sorbent may be a **polymer adsorbent** or a **polymer absorbent**. The former acts by surface sorption and the latter by bulk sorption.

*Note 2:* See [6], p. 383 for sorption, [6], p. 11 for adsorption, and [6], p. 3 for absorption.

### 3.23 Polymer support

Polymer to or in which a reagent or catalyst is chemically bound, immobilized, dispersed, or associated.

*Note 1:* A polymer support is usually a network polymer.

*Note 2:* A polymer support is usually prepared in bead form by suspension polymerization.

*Note 3:* The location of active sites introduced into a polymer support depends on the type of polymer support. In a **swollen-gel-bead polymer support** the active sites are distributed uniformly throughout the beads, whereas in a **macroporous-bead polymer support** they are predominantly on the internal surfaces of the macropores.

### 3.24 Polymer surfactant

Polymer that lowers the surface tension of the medium in which it is dissolved, or the interfacial tension with another phase, or both.

*Note:* See [6], p. 409 for surfactant.

### 3.25 Resist polymer

Polymeric material that, when irradiated, undergoes a marked change in solubility in a given solvent or is ablated.

*Note 1:* A resist polymer under irradiation either forms patterns directly or undergoes chemical reactions leading to pattern formation after subsequent processing.

*Note 2:* A resist material that is optimized for use with ultraviolet or visible light, an electron beam, an ion beam, or X-rays is called a **photoresist** (see [6], p. 307),

**electron-beam resist, ion-beam resist, or X-ray resist,** respectively.

*Note 3:* In a **positive-tone resist**, also called a **positive resist**, the material in the irradiated area not covered by a mask is removed, which results in an image with a pattern identical with that on the mask. In a **negative-tone resist**, also called a **negative resist**, the non-irradiated area is subsequently removed, which results in an image with a pattern that is the complement of that on the mask.

### 3.26 Shape-memory polymer

Polymer that, after heating and being subjected to a plastic deformation, resumes its original shape when heated above its glass-transition or melting temperature.

*Note:* Crystalline *trans*-polyisoprene is an example of a shape-memory polymer.

### 3.27 Superabsorbent polymer

Polymer that can absorb and retain extremely large amounts of a liquid relative to its own mass.

*Note 1:* The liquid absorbed can be water or an organic liquid.

*Note 2:* The swelling ratio of a superabsorbent polymer can reach the order of 1000:1.

*Note 3:* Superabsorbent polymers for water are frequently polyelectrolytes.

<sup>†</sup>Corresponding author

**Abstract:** The document defines the terms most commonly encountered in the field of polymer blends and composites. The scope has been limited to mixtures in which the components differ in chemical composition or molar mass and in which the continuous phase is polymeric. Incidental thermodynamic descriptions are mainly limited to binary mixtures although, in principle, they could be generalized to multicomponent mixtures.

The document is organized into three sections. The first defines terms basic to the description of polymer mixtures. The second defines terms commonly encountered in descriptions of phase domain behavior of polymer mixtures. The third defines terms commonly encountered in the descriptions of the morphologies of phase-separated polymer mixtures.

## Introduction

It is the intent of this document to define the terms most commonly encountered in the field of polymer blends and composites. The scope has been limited to mixtures in which the components differ in chemical composition or molar mass or both and in which the continuous phase is polymeric. Many of the materials described by the term "multiphase" are two-phase systems that may show a multitude of finely dispersed phase domains. Hence, incidental thermodynamic descriptions are mainly limited to binary mixtures, although they can be and, in the scientific literature, have been generalized to multi-component mixtures. Crystalline polymers and liquid-crystal polymers have been considered in other documents [1,2] and are not discussed here.

This document is organized into three sections. The first defines terms basic to the description of polymer mixtures. The second defines terms commonly encountered in descriptions of phase-domain behavior of polymer mixtures. The third defines terms commonly encountered in the descriptions of the morphologies of phase-separated polymer mixtures.

General terms describing the composition of a system as defined in ref. [3] are used without further definition throughout the document. Implicit definitions are identified in boldface type throughout the document.

### 1. Basic terms in polymer mixtures

#### 1.1 Polymer blend

Macroscopically homogeneous mixture of two or more different species of polymer [3,4].

*Notes:*

1. See the Gold Book, p. 312 [3].
2. In most cases, blends are homogeneous on scales larger than several times the wavelengths of visible light.
3. In principle, the constituents of a blend are separable by physical means.
4. No account is taken of the miscibility or immiscibility of the constituent macromolecules, i.e., no assumption is made regarding the number of phase domains present.
5. The use of the term "polymer alloy" for "polymer blend" is discouraged, as the former term includes multiphase copolymers but excludes incompatible polymer blends (see 1.3).
6. The number of polymeric components which comprises a blend is often designated by an adjective, viz., binary, ternary, quaternary,

#### 1.2 Miscibility

Capability of a mixture to form a single phase over certain ranges of temperature, pressure, and composition.

*Notes:*

1. Whether or not a single phase exists depends on the chemical structure, molar-mass distribution, and molecular architecture of the components present.
2. The single phase in a mixture may be confirmed by light scattering, X-ray scattering, and neutron scattering.
3. For a two-component mixture, a necessary and sufficient condition for stable or metastable equilibrium of a homogeneous single phase is

$$\left( \frac{\partial^2 \Delta_{\text{mix}} G}{\partial \phi^2} \right)_{T,p} > 0$$

where  $\Delta_{\text{mix}} G$  is the Gibbs energy of mixing and  $\phi$  the composition, where  $\phi$  is usually taken as the volume fraction of one of the components. The system is unstable if the above second derivative is negative. The borderline (spinodal) between (meta)stable and unstable states is defined by the above second derivative equalling zero. If the compositions of two conjugate (coexisting) phases become identical upon a change of temperature or pressure, the third derivative also equals zero (defining a critical state).

4. If a mixture is thermodynamically metastable, it will demix if suitably nucleated (see 2.5). If a mixture is thermodynamically unstable, it will demix by spinodal decomposition (see 2.8) or by nucleation and growth if suitably nucleated, provided there is minimal kinetic hindrance.

#### 1.3 Miscible polymer blend homogeneous polymer blend

Polymer blend that exhibits miscibility (see 1.2).

*Notes:*

1. For a polymer blend to be miscible, it must satisfy the criteria of miscibility (see 1.2).
2. Miscibility is sometimes erroneously assigned on the basis that a blend exhibits a single  $T_g$  or optical clarity.
3. A miscible system can be thermodynamically stable or metastable (see note 4 in 1.2).
4. For components of chain structures that would be expected to be miscible, miscibility may not occur if molecular architecture is changed, e.g., by crosslinking.

#### 1.4 Homologous polymer blend

Mixture of two or more fractions of the same polymer, each of which has a different molar-mass distribution.

### 1.5 Isomorphic polymer blend

Polymer blend of two or more different semi-crystalline polymers that are miscible in the crystalline state as well as in the molten state.

*Notes:*

1. Such a blend exhibits a single, composition-dependent glass-transition temperature,  $T_g$ , and a single, composition-dependent melting point,  $T_m$ .
2. This behavior is extremely rare; very few cases are known.

### 1.6 Polymer-polymer complex

Complex, at least two components of which are different polymers [3].

*Notes:*

1. See the Gold Book, p. 313 [3].
2. A **complex** is a molecular entity formed from two or more components that can be ionic or uncharged (see the Gold Book, p. 81) [3].
3. Although the intrinsic binding energy between the individual interacting sites giving rise to the complex is weaker than a covalent bond, the total binding energy for any single molecule may exceed the energy of a single covalent bond.
4. The properties of a complex defined here differ from those given in ref. [3] because, owing to the repeating nature of a polymer molecule, many interacting sites may be present, which together will provide stronger bonding than a single covalent bond.

### 1.7 Metastable miscibility

Capability of a mixture to exist for an indefinite period of time as a single phase that is separated by a small or zero energy barrier from a thermodynamically more stable multiphase system.

*Notes:*

1. See the Gold Book, p. 255 [3].
2. Mixtures exhibiting metastable miscibility may remain unchanged or they may undergo phase separation, usually by nucleation or spinodal decomposition.

### 1.8 Metastable miscible polymer blend

Polymer blend that exhibits metastable miscibility.

*Note:* In polymers, because of the low mobility of polymer chains, particularly in a glassy state, metastable mixtures may exist for indefinite periods of time without phase separation. This has frequently led to confusion when metastable miscible polymer blends are erroneously claimed to be miscible.

### 1.9 Interpenetrating polymer network

*Recommended acronym:* IPN

Polymer comprising two or more polymer networks which are at least partially interlaced on a molecular scale, but not covalently bonded to each other and cannot be separated unless chemical bonds are broken [4].

*Notes:*

1. See the Gold Book, p. 205 [3].
2. A mixture of two or more preformed polymer networks is not an interpenetrating polymer network.
3. An IPN may be further described by the process by which it is synthesized. When an IPN is prepared by a process in which the second component network is polymerized following the completion of polymerization of the first component network, the IPN may be referred to as a **sequential IPN**. When an IPN is prepared by a process in which both component networks are polymerized concurrently, the IPN may be referred to as a **simultaneous IPN**.

### 1.10 Semi-interpenetrating polymer network

*Recommended acronym:* SIPN

Polymer comprising one or more polymer network(s) and one or more linear or branched polymer(s) characterized by the penetration on a molecular scale of at least one of the networks by at least some of the linear or branched chains [4].

*Notes:*

1. See the Gold Book, p. 372 [3].
2. Semi-interpenetrating polymer networks are different from interpenetrating polymer networks because the constituent linear-chain or branched-chain macromolecule(s) can, in principle, be separated from the constituent polymer network(s) without breaking chemical bonds, and, hence, they are polymer blends.
3. Semi-interpenetrating polymer networks may be further described by the process by which they are synthesized. When an SIPN is prepared by a process in which the second component polymer is polymerized or incorporated following the completion of polymerization of the first component polymer, the SIPN may be referred to as a **sequential SIPN**. When an SIPN is prepared by a process in which both component polymers are polymerized concurrently, the SIPN may be referred to as a **simultaneous SIPN**. (This note has been changed from that which appears in ref. [4] to allow for the possibility that a linear or branched polymer may be incorporated into a network by means other than polymerization, e.g., by swelling of the network and subsequent diffusion of the linear or branched chain into the network.)

### 1.11 Immiscibility

Inability of a mixture to form a single phase.

*Notes:*

1. Immiscibility may be limited to certain ranges of temperature, pressure, and composition.
2. Immiscibility depends on the chemical structures, molar-mass distributions, and molecular architectures of the components.

### 1.12 Immiscible polymer blend heterogeneous polymer blend

Polymer blend that exhibits immiscibility.

**1.13 Composite**

Multicomponent material comprising multiple different (nongaseous) phase domains in which at least one type of phase domain is a continuous phase (see 3.12).

*Note:* Foamed substances, which are multiphased materials that consist of a gas dispersed in a liquid or solid, are not normally considered to be composites.

**1.14 Polymer composite**

Composite in which at least one component is a polymer.

**1.15 Nanocomposite**

Composite in which at least one of the phases has at least one dimension of the order of nanometers.

**1.16 Laminate**

Material consisting of more than one layer, the layers being distinct in composition, composition profile, or anisotropy of properties.

*Notes:*

1. Laminates may be formed by two or more layers of different polymers.
2. Composite laminates generally consist of one or more layers of a substrate, often fibrous, impregnated with a curable polymer, curable polymers, or liquid reactants.
3. The substrate is usually a sheet-like woven or nonwoven material (e.g., glass fabric, paper, copper foil).
4. A single layer of a laminate is termed a **lamina**.

**1.17 Lamination**

Process of forming a laminate.

**1.18 Delamination**

Process that separates the layers of a laminate by breaking their structure in planes parallel to those layers.

**1.19 Impregnation**

Penetration of monomeric, oligomeric, or polymeric liquids into an assembly of fibers.

*Notes:*

1. The term as defined here is specific to polymer science. An alternative definition of "impregnation" applies in some other fields of chemistry (see the Gold Book, p. 197) [3].
2. Impregnation is usually carried out on a woven fabric or a yarn.

**1.20 Prepreg**

Sheets of a substrate that have been impregnated with a curable polymer, curable polymers, or liquid reactants, or a thermoplastic, and are ready for fabrication of laminates.

*Notes:*

1. See 1.16 notes 2 and 3.
2. During the impregnation the curable polymer, curable polymers, or liquid reactants may be allowed to react to a certain extent (sometimes termed **degree of ripening**).

**1.21 Intercalation**

Process by which a substance becomes transferred into pre-existing spaces of molecular dimensions in a second substance.

*Note:* The term as defined here is specific to polymer science. An alternative definition of "intercalation" applies in some other fields of chemistry (see the Gold Book, p. 202 [3]).

**1.22 Exfoliation**

Process by which thin layers individually separate from a multilayered structure.

*Note:* In the context of a nanocomposite material, the individual layers are of the order of at most a few nanometers in thickness.

**1.23 Wetting**

Process by which an interface between a solid and a gas is replaced by an interface between the same solid and a liquid.

**1.24 Adhesion**

Holding together of two bodies by interfacial forces or mechanical interlocking on a scale of micrometers or less.

**1.25 Chemical adhesion**

Adhesion (see 1.25) in which two bodies are held together at an interface by ionic or covalent bonding between molecules on either side of the interface.

**1.26 Interfacial adhesion**

Adhesion (see 1.25) in which interfaces between phases or components are maintained by intermolecular forces, chain entanglements, or both, across the interfaces.

*Notes:*

1. Interfacial adhesion is also referred to as **tack**.
2. **Adhesive strength** (recommended symbol:  $F_a$ , unit:  $\text{N m}^{-2}$ ) is the force required to separate one condensed phase domain from another at the interface between the two phase domains divided by the area of the interface.
3. **Interfacial tension** (recommended symbol:  $\gamma$ , unit:  $\text{N m}^{-1}$ ,  $\text{J m}^{-2}$ ) is the change in Gibbs energy per unit change in interfacial area for substances in physical contact.
4. Use of the term **interfacial energy** for interfacial tension is not recommended.

**1.27 Interfacial bonding**

Bonding in which the surfaces of two bodies in contact with one another are held together by inter-molecular forces.

*Note:* Examples of intermolecular forces include covalent, ionic, van der Waals, and hydrogen bonds.

**1.28 Interfacial fracture**

Brittle fracture that takes place at an interface.

**1.29 Craze**

Crack-like cavity formed when a polymer is stressed in tension that contains load-bearing fibrils spanning the gap between the surfaces of the cavity.

*Note:* Deformation of continua occurs with only minor changes in volume; hence, a craze consists of both fibrils and voids.

### 1.30 Additive

Substance added to a polymer.

*Notes:*

1. The term as defined here is specific to polymer science. An alternative definition of “additive” applies in some other fields of chemistry (see the Gold Book, p. 10) [3].
2. An additive is usually a minor component of the mixture formed and usually modifies the properties of the polymer.
3. Examples of additives are antioxidants, plasticizers, flame retardants, processing aids, other polymers, colorants, UV absorbers, and extenders.

### 1.31 Interfacial agent

Additive that reduces the interfacial energy between phase domains.

### 1.32 Compatibility

Capability of the individual component substances in either an immiscible polymer blend (see 1.12) or a polymer composite (see 1.14) to exhibit interfacial adhesion (see 1.27).

*Notes:*

1. Use of the term “compatibility” to describe miscible systems is discouraged.
2. Compatibility is often established by the observation of mechanical integrity under the intended conditions of use of a composite or an immiscible polymer blend.

### 1.33 Compatibilization

Process of modification of the interfacial properties in an immiscible polymer blend that results in formation of the interphases (see 3.6) and stabilization of the morphology, leading to the creation of a polymer alloy.

*Note:* Compatibilization may be achieved by addition of suitable copolymers or by chemical modification of interfaces through physical treatment (i.e., irradiation or thermal) or reactive processing.

### 1.34 Degree of compatibility

Measure of the strength of the interfacial bonding between the component substances of a composite or immiscible polymer blend (see 1.12).

*Notes:*

1. Estimates of the degree of compatibility are often based upon the mechanical performance of the composite, the interphase thickness (see “Interfacial region interphase”), or the sizes of the phase domains present in the composite, relative to the corresponding properties of composites lacking compatibility.
2. The term **degree of incompatibility** is sometimes used instead of degree of compatibility. Such use is discouraged

as incompatibility is related to the weakness of interfacial bonding.

### 1.35 Compatible polymer blend

Immiscible polymer blend (see 1.12) that exhibits macroscopically uniform physical properties throughout its whole volume.

*Note:* The macroscopically uniform physical properties are usually caused by sufficiently strong interactions between the component polymers.

### 1.36 Compatibilizer

Polymer or copolymer that, when added to an immiscible polymer blend (see 1.12), modifies its interfacial character and stabilizes its morphology.

*Note:* Compatibilizers usually stabilize morphologies over distances of the order of micrometers or less.

### 1.37 Coupling agent adhesion promoter

Interfacial agent comprised of molecules possessing two or more functional groups, each of which exhibits preferential interactions with the various types of phase domains in a composite.

*Notes:*

1. A coupling agent increases adhesion between phase domains.
2. An example of the use of a coupling agent is in a mineral-filled polymer material where one part of the coupling agent molecule can chemically bond to the inorganic mineral while the other part can chemically bond to the polymer.

### 1.38 Polymer alloy

Polymeric material, exhibiting macroscopically uniform physical properties throughout its whole volume, that comprises a compatible polymer blend (see 1.35), a miscible polymer blend (see 1.3), or a multiphase copolymer (see 3.3).

*Note:* See note 5 in 1.1.

### 1.39 Dispersion

Material comprising more than one phase where at least one of the phases consists of finely divided phase domains (see 3.2), often in the colloidal size range, distributed throughout a continuous phase domain.

*Notes:*

1. The term as defined here is specific to polymer science. An alternative definition of “dispersion” applies in some other fields of chemistry (see the Gold Book, p. 118) [3].
2. Particles in the colloidal size range have linear dimensions [3] between 1 nm and 1  $\mu\text{m}$ .
3. The finely divided domains are called the dispersed or discontinuous phase domains (see 3.13).
4. For a definition of continuous phase domain, see 3.12.
5. A dispersion is often further characterized on the basis of the size of the phase domain as a **macrodispersion** or a **microdispersion**. To avoid ambiguity when using these terms, the size of the domain should also be defined.

### 1.40 Dispersing agent dispersing aid dispersant

Additive (see 1.30), exhibiting surface activity, that is added to a suspending medium to promote uniform and maximum

separation of extremely fine solid particles, often of colloidal size (see note 2 in 1.39).

*Note:* Although dispersing agents achieve results similar to compatibilizers (see 1.36), they function differently in that they reduce the attractive forces between fine particles, which allows them to be more easily separated and dispersed.

#### 1.41 Agglomeration aggregation

Process in which dispersed molecules or particles form clusters rather than remain as isolated single molecules or particles.

*Note:* See the Gold Book, p. 13 [3].

#### 1.42 Agglomerate aggregate

Clusters of dispersed molecules or particles that results from agglomeration (see 1.41).

*Note:* The term as defined here is specific to polymer science. An alternative definition of “aggregate” is used in some other fields of chemistry (see the Gold Book, p. 13) [3].

#### 1.43 Extender

Substance, especially a diluent or modifier, added to a polymer to increase its volume without substantially altering the desirable properties of the polymer.

*Note:* An extender may be a liquid or a solid.

#### 1.44 Filler

Solid extender.

*Notes:*

1. The term as defined here is specific to polymer science. An alternative definition of “filler” applies in some other fields of chemistry (see the Gold Book, p. 154) [3].
2. Fillers may be added to modify mechanical, optical, electrical, thermal, flammability properties, or simply to serve as extenders.

#### 1.45 Fill factor

*Recommended symbol:*  $\phi_{fill}$

Maximum volume fraction of a particulate filler that can be added to a polymer while maintaining the polymer as the continuous phase domain.

#### 1.46 Thermoplastic elastomer

Melt-processable polymer blend or copolymer in which a continuous elastomeric phase domain is reinforced by dispersed hard (glassy or crystalline) phase domains that act as junction points over a limited range of temperature.

*Notes:*

1. The behavior of the hard phase domains as junction points is thermally reversible.
2. The interfacial interaction between hard and soft phase domains in a thermoplastic elastomer is often the result

of covalent bonds between the phases and is sufficient to prevent the flow of the elastomeric phase domain under conditions of use.

3. Examples of thermoplastic elastomers include block copolymers and blends of plastics and rubbers.

## 2. Phase domain behavior

### 2.1 Miscibility window

Range of copolymer compositions in a polymer mixture, at least one component substance of which is a copolymer, that gives miscibility (see 1.2) over a range of temperatures and pressures.

*Notes:*

1. Outside the miscibility window immiscible mixtures are formed.
2. The compositions of the copolymers within the miscibility window usually exclude the homopolymer compositions of the monomers from which the copolymers are prepared.
3. The miscibility window is affected by the molecular weights of the component substances.
4. The existence of miscibility windows has been attributed to an average force between the monomer units of the copolymer that leads to those units associating preferentially with the monomer units of the other polymers.

### 2.2 Miscibility gap

Area within the coexistence curve of an isobaric phase diagram (temperature vs. composition) or an isothermal phase diagram (pressure vs. composition).

*Note:* A miscibility gap is observed at temperatures below an upper critical solution temperature (UCST) (see 2.15) or above the lower critical solution temperature (LCST) (see 2.14). Its location depends on pressure. In the miscibility gap, there are at least two phases coexisting.

### 2.3 Flory–huggins theory

#### flory–huggins–staverman theory

Statistical thermodynamic mean-field theory of polymer solutions, formulated independently by Flory, Huggins, and Staverman, in which the thermodynamic quantities of the solution are derived from a simple concept of combinatorial entropy of mixing and a reduced Gibbs-energy parameter, the “ $\chi$  interaction parameter” (see 2.4).

*Notes:*

1. See the Gold Book, p. 158 [3].
2. The Flory–Huggins theory has often been found to have utility for polymer blends; however, there are many equation-of-state theories that provide more accurate descriptions of polymer–polymer interactions.
3. The present definition has been modified from that which appears in ref. [5] to acknowledge the contributions of Staverman and to further clarify the statistical basis of the theory.

### 2.4 $\chi$ Interaction parameter

*Recommended symbol:*  $\chi$

Interaction parameter, employed in the Flory–Huggins theory (see 2.3), to account for the contribution of the noncombinatorial

entropy of mixing and the enthalpy of mixing to the Gibbs energy of mixing.

*Notes:*

1. The definition and the name of the term have been modified from that which appears in ref. [5] to reflect its broader use in the context of polymer blends. In its simplest form, the  $\chi$  parameter is defined according to the Flory–Huggins equation for binary mixtures

$$\frac{\Delta_{\text{mix}}G}{RT} = n_1 \ln \phi_1 + n_2 \ln \phi_2 + \chi x_1 n_1 \phi_2,$$

for a mixture of amounts of substance  $n_1$  and  $n_2$  of components denoted 1 and 2, giving volume fractions  $\phi_1$  and  $\phi_2$ , with the molecules of component 1 each conceptually consisting of  $x_1$  segments whose Gibbs energy of interaction with segments of equal volume in the molecules of component 2 is characterized by the interaction parameter  $\chi$ .

2. The  $\chi$  interaction parameters characterizing a given system vary with composition, molar mass, and temperature.
3.  $B$  is an alternative parameter to  $\chi$ , where  $B = \chi RT/V_m$ , in which  $V_m$  is the molar volume of one of the components of the mixture.

## 2.5 Nucleation of phase separation

Initiation of phase domain formation through the presence of heterogeneities.

*Notes:*

1. See the Gold Book, p. 277 [3].
2. In a metastable region of a phase diagram (see 1.2), phase separation is initiated only by nucleation.

## 2.6 Binodal binodal curve coexistence curve

Curve defining the region of composition and temperature in a phase diagram for a binary mixture across which a transition occurs from miscibility of the components to conditions where single-phase mixtures are metastable or unstable (see note 4 in 1.2).

*Note:* Binodal compositions are defined by pairs of points on the curve of Gibbs energy of mixing vs. composition that have common tangents, corresponding to compositions of equal chemical potentials of each of the two components in two phases.

## 2.7 Spinodal spinodal curve

Curve defining the region of composition and temperature for a binary mixture across which a transition occurs from conditions where single-phase mixtures are metastable to conditions where single-phase mixtures are unstable and undergo phase separation by spinodal decomposition (see 2.8).

*Notes:*

1. The spinodal curve for a binary mixture is defined as the geometrical locus of all states with

$$\left( \frac{\partial^2 \Delta_{\text{mix}}G}{\partial \phi^2} \right)_{T,P} = 0 \text{ (see 1.2, note 4)}$$

2. In the unstable region bounded by the spinodal curve, phase domain separation is spontaneous, i.e., no nucleation step is required to initiate the separation process.

## 2.8 Spinodal decomposition spinodal phase-demixing

Long-range, diffusion-limited, spontaneous phase domain separation initiated by delocalized concentration fluctuations occurring in an unstable region of a mixture bounded by a spinodal curve.

*Note:* Spinodal decomposition occurs when the magnitude of Gibbs energy fluctuations with respect to composition are zero.

## 2.9 Cloud point

Experimentally measured point in the phase diagram of a mixture at which a loss in transparency is observed due to light scattering caused by a transition from a single- to a two-phase state.

*Notes:*

1. The phenomenon is characterized by the first appearance of turbidity or cloudiness.
2. A cloud point is heating rate- or cooling rate-dependent.

## 2.10 Cloud-point curve

Curve of temperature vs. composition defined by the cloud points (see 2.9) over range of compositions of two substances.

*Note:* Mixtures are observed to undergo a transition from a single- to a two-phase state upon heating or cooling.

## 2.11 Cloud-point temperature

Temperature at a cloud point (see 2.9).

## 2.12 Critical point

Point in the isobaric temperature-composition plane for a binary mixture where the compositions of all coexisting phases become identical.

*Notes:*

1. An alternative definition of “critical solution point” refers strictly to liquid-vapor equilibria (see the Gold Book, p. 93) [3].
2. Unless specified atmospheric pressure is assumed.
3. In a phase diagram, the slope of the tangent to the spinodal is zero at this point.
4. At a critical point, binodals and spinodals coincide.
5. Although the definition holds strictly for binary mixtures, it is often erroneously applied to multicomponent mixtures.
6. See note 3 in 1.2.

## 2.13 Lower critical solution temperature

*Recommended acronym: LCST*

Critical temperature below which a mixture is miscible.

*Notes:*

1. See the Gold Book, p. 93 [3].
2. Below the LCST and above the UCST (see 2.14), if it exists, a single phase exists for all compositions.

3. The LCST depends upon pressure and the molar-mass distributions of the constituent polymer(s).
4. For a mixture containing or consisting of polymeric components, these may be different polymers or species of different molar mass of the same polymer.

### 2.14 Upper critical solution temperature

*Recommended abbreviation: UCST*

Critical temperature above which a mixture is miscible.

*Notes:*

1. See the Gold Book, p. 93 [3].
2. Above the UCST and below the LCST (see 2.13), if it exists, a single phase exists for all compositions
3. The UCST depends upon the pressure and molar-mass distributions of the constituent polymer(s).
4. For a mixture containing or consisting of polymeric components, these may be different polymers or species of different molar mass of the same polymer.

### 2.15 Phase inversion

Process by which an initially continuous phase domain becomes the dispersed phase domain and the initially dispersed phase domains become the continuous phase domain.

*Notes:*

1. See the Gold Book, p. 299 [3].
2. Phase inversion may be observed during the polymerization or melt processing of polymer blend systems.
3. The phenomenon is usually observed during polymerization of a monomer containing a dissolved polymer.

### 2.16 Interdiffusion

Process by which homogeneity in a mixture is approached by means of spontaneous mutual molecular diffusion.

### 2.17 Blooming

Process in which one component of a polymer mixture, usually not a polymer, undergoes phase separation and migration to an external surface of the mixture.

### 2.18 Coalescence

Process in which two phase domains of essentially identical composition in contact with one another form a larger phase domain.

*Notes:*

1. See the Gold Book, p. 75 [3].
2. Coalescence reduces the total interfacial area.
3. The flocculation of a polymer colloid, through the formation of aggregates, may be followed by coalescence.

### 2.19 Morphology coarsening phase ripening

Process by which phase domains increase in size during the aging of a multiphase material.

*Notes:*

1. In the coarsening at the late stage of phase separation, volumes and compositions of phase domains are conserved.

2. Representative mechanisms for coarsening at the late stage of phase separation are: (1) material flow in domains driven by interfacial tension (observed in a co-continuous morphology), (2) the growth of domain size by evaporation from smaller droplets and condensation into larger droplets, and (3) coalescence (fusion) of more than two droplets. The mechanisms are usually called (1) Siggia's mechanism, (2) Ostwald ripening (or the Lifshitz-Slyozov mechanism), and (3) coalescence.
3. Morphology coarsening can be substantially stopped by, for example, vitrification, crosslinking, and **pinning**, the slowing down of molecular diffusion across domain interfaces.

## 3. Domains and morphologies

Many types of morphologies have been reported in the literature of multiphase polymeric materials. It is the intent of this document to define only the most commonly used terms. In addition, some morphologies have historically been described by very imprecise terms that may not have universal meanings. However, if such terms are widely used they are defined here.

### 3.1 Morphology

Shape, optical appearance, or form of phase domains in substances, such as high polymers, polymer blends, composites, and crystals.

*Note:* For a polymer blend or composite, the morphology describes the structures and shapes observed, often by microscopy or scattering techniques, of the different phase domains present within the mixture.

### 3.2 Phase domain

Region of a material that is uniform in chemical composition and physical state.

*Notes:*

1. A phase in a multiphase material can form domains differing in size.
2. The term "domain" may be qualified by the adjective microscopic or nanoscopic or the prefix micro- or nano- according to the size of the linear dimensions of the domain.
3. The prefixes micro-, and nano- are frequently incorrectly used to qualify the term "phase" instead of the term "domain"; hence, "microphase domain", and "nanophase domain" are often used. The correct terminology that should be used is **phase microdomain** and **phase nanodomain**.

### 3.3 Multiphase copolymer

Copolymer comprising phase-separated domains.

### 3.4 Domain interface domain boundary

Surface forming a boundary between two phase domains.

*Note:* A representation of the domain interface as a two-dimensional surface over-simplifies the actual structure. All interfaces have a third dimension, namely, the interphase or interfacial region (see 3.6).

**3.5 Domain structure**

Morphology of individual phase domains in a multiphase system.

*Note:* Domain structures may be described for phase domains or domains that are themselves multiphased structures.

**3.6 Interfacial region interphase**

Region between phase domains in an immiscible polymer blend in which a gradient in composition exists.

*Note:* See the Gold Book, p. 205 [3].

**3.7 Phase interaction**

Molecular interaction between the components present in the interphases of a multiphase mixture.

*Note:* The **interphase elasticity** is the capability of a deformed interphase to return to its original dimensions after the force causing the deformation has been removed.

**3.8 Interfacial-region thickness interphase thickness interfacial width**

Linear extent of the composition gradient in an interfacial region.

*Notes:*

1. See the Gold Book, p. 203 [3].
2. The width at half the maximum of the composition profile across the interfacial region (see 3.6) or the distance between locations where  $d\phi/dr$  (with  $\phi$  the composition of a component and  $r$  the distance through the interfacial region) has decreased to  $1/e$  are used as measures of the interfacial-region thickness.

**3.9 Hard-segment phase domain**

Phase domain of microscopic or smaller size, usually in a block, graft, or segmented copolymer (see 3.11), comprising essentially those segments of the polymer that are rigid and capable of forming strong intermolecular interactions.

*Note:* Hard-segment phase domains are typically of 2–15 nm linear size.

**3.10 Soft-segment phase domain**

Phase domain of microscopic or smaller size, usually in a block, graft, or segmented copolymer (see 3.11), comprising essentially those segments of the polymer that have glass transition temperatures lower than the temperature of use.

*Note:* Soft-segment phase domains are often larger than hard-segment phase domains and are often continuous.

**3.11 Segmented copolymer**

Copolymer containing phase domains of microscopic or smaller size, with the domains constituted principally of single types of structural unit.

*Note:* The types of domain in a segmented copolymer usually comprise hard- and soft-segment phase domains.

**3.12 Continuous phase domain matrix phase domain**

Phase domain (see 3.2) consisting of a single phase in a heterogeneous mixture through which a continuous path to all phase domain boundaries may be drawn without crossing a phase domain boundary.

*Note:* In a polymer blend, the continuous phase domain is sometimes referred to as the **host polymer, bulk substance, or matrix**.

**3.13 Discontinuous phase domain discrete phase domain dispersed phase domain**

Phase domain in a phase-separated mixture that is surrounded by a continuous phase but isolated from all other similar phase domains within the mixture.

*Note:* The discontinuous phase domain is sometimes referred to as the **guest polymer**.

**3.14 Dual phase domain continuity co-continuous phase domains**

Topological condition, in a phase-separated, two-component mixture, in which a continuous path through either phase domain may be drawn to all phase domain boundaries without crossing any phase domain boundary.

**3.15 Core-shell morphology**

Two-phase domain morphology, of approximately spherical shape, comprising two polymers, each in separate phase domains, in which phase domains of one polymer completely encapsulate the phase domains of the other polymer.

*Note:* This morphology is most commonly observed in copolymers or blends prepared in emulsion polymerization by the sequential addition and polymerization of two different monomer compositions.

**3.16 Cylindrical morphology**

Phase domain morphology, usually comprising two polymers, each in separate phase domains, in which the phase domains of one polymer are of cylindrical shape.

*Notes:*

1. Phase domains of the constituent polymers may alternate, which results in many cylindrical layers surrounding a central core domain.
2. Cylindrical morphologies can be observed, for example, in triblock copolymers.

**3.17 Fibrillar morphology**

Morphology in which phase domains have shapes with one dimension much larger than the other two dimensions.

*Note:* Fibrillar phase domains have the appearance of fibers.

**3.18 Lamellar domain morphology**

Morphology in which phase domains have shapes with two dimensions much larger than the third dimension.

*Note:* Plate-like phase domains have the appearance of extended planes that are often oriented essentially parallel to one another.

### 3.19 Microdomain morphology

Morphology consisting of phase microdomains.

*Notes:*

1. See 3.2.
2. Microdomain morphologies are usually observed in block, graft, and segmented copolymers.
3. The type of morphology observed depends upon the relative abundance of the different types of structural units and the conditions for the generation of the morphology. The most commonly observed morphologies are spheres, cylinders, and lamellae.

### 3.20 Nanodomain morphology

Morphology consisting of phase nanodomains.

*Note:* See 3.2.

### 3.21 Onion morphology

Multiphase morphology of roughly spherical shape that comprises alternating layers of different polymers arranged concentrically, all layers being of similar thickness.

### 3.22 Ordered co-continuous double gyroid morphology

Co-continuous morphology in which a set of two gyroid-based phase domains exhibits a highly regular, three-dimensional lattice-like morphology with Ia3d space group symmetry.

*Notes:*

1. The domains are composed of tripoidal units as the fundamental building structures.
2. The two domains are interlaced.

### 3.23 Multicoat morphology

Morphology observed in a blend of a block copolymer with the homopolymer of one of the blocks and characterized by alternating concentric shells of the copolymer and the homopolymer.

*Note:* The morphology is identical to onion morphology (see 3.21) within a matrix of homopolymer [6].

### 3.24 Rod-like morphology

Morphology characterized by cylindrical phase domains.

### 3.25 Multiple inclusion morphology salami-like morphology

Multiphase morphology in which dispersed phase domains of one polymer contain and completely encapsulate many phase

domains of a second polymer that may have the same composition as the continuous phase domain (see 3.12).

## Alphabetical Index of Terms

Term	Definition No.	Term	Definition No.
additive	1.30	interfacial-region thickness	3.8
adhesion	1.24	interfacial tension	1.26
adhesion promoter	1.37	interfacial width	3.8
adhesive strength	1.26	interpenetrating polymer network (IPN)	1.9
agglomerate	1.42	interphase	3.6
agglomeration	1.41	interphase elasticity	3.7
aggregate	1.42	interphase thickness	3.8
aggregation	1.41	isomorphic polymer blend	1.5
binodal	2.6	lamellar domain morphology	3.17
binodal curve	2.6	lamina	1.16
blooming	2.17	laminare	1.16
bulk substance	3.12	lamination	1.17
chemical adhesion	1.25	lower critical solution temperature (LCST)	2.13
cloud point	2.9	macrodispersion	1.39
cloud-point curve	2.10	matrix	3.12
cloud-point temperature	2.11	matrix phase domain	3.12
co-continuous phase domains	3.14	metastable miscibility	1.7
coalescence	2.18	metastable miscible polymer blend	1.8
coexistence curve	2.6	microdispersion	1.39
compatibility	1.32	microdomain morphology	3.19
compatibilization	1.33	miscibility	1.2
compatibilizer	1.36	miscibility gap	2.2
compatible polymer blend	1.35	miscibility window	2.1
complex	1.6	miscible polymer blend	1.3
composite	1.13	morphology	3.1
continuous phase domain	3.12	morphology coarsening	2.19
core-shell morphology	3.15	multicoat morphology	3.23
coupling agent	1.37	multiphase copolymer	3.3
craze	1.29	multiple inclusion morphology	3.25
critical point	2.12	nanocomposite	1.15
cylindrical morphology	3.16	nanodomain morphology	3.20
degree of compatibility	1.34	nucleation of phase separation	2.5
degree of incompatibility	1.34	onion morphology	3.21
degree of ripening	1.20	ordered co-continuous double gyroid morphology	3.22
delamination	1.18	phase domain	3.2
discontinuous phase domain	3.13	phase interaction	3.7
discrete phase domain	3.13	phase inversion	2.15
dispersant	1.40	phase microdomain	3.2
dispersed phase domain	3.13	phase nanodomain	3.2
dispersing agent	1.40	phase ripening	2.19
dispersing aid	1.40	pinning	2.19
dispersion	1.39	polymer alloy	1.38
domain boundary	3.4	polymer blend	1.1
domain interface	3.4	polymer composite	1.14
domain structure	3.5	polymer-polymer complex	1.6
dual phase domain continuity	3.14	prepreg	1.20
exfoliation	1.22	rod-like morphology	3.24
extender	1.43	salami-like morphology	3.25
fibrillar morphology	3.17	segmented copolymer	3.11
fill factor	1.45	sequential IPN	1.9
filler	1.44	sequential SIPN	1.10
Flory-Huggins theory	2.3	semi-interpenetrating polymer network (SIPN)	1.10
Flory-Huggins-Staverman theory	2.3	simultaneous IPN	1.9
guest polymer	3.13	simultaneous SIPN	1.10
hard-segment phase domain	3.9	soft-segment phase domain	3.10
heterogeneous polymer blend	1.12	spinodal	2.7
homogeneous polymer blend	1.3	spinodal curve	2.7
homologous polymer blend	1.4	spinodal decomposition	2.8
host polymer	3.12	spinodal phase-demixing	2.8
immiscibility	1.11	tack	1.26
immiscible polymer blend	1.12	thermoplastic elastomer	1.46
impregnation	1.19	upper critical solution temperature (UCST)	2.14
intercalation	1.21	wetting	1.23
interdiffusion	2.16	$\chi$ interaction parameter	2.4
interfacial adhesion	1.26		
interfacial agent	1.31		
interfacial bonding	1.27		
interfacial energy	1.26		
interfacial fracture	1.28		
interfacial region	3.6		

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY

### Akabori Amino Acid Reaction

Reaction in the presence of hydrazine yields hydrazides which can be coupled to aromatic aldehydes

Bose, A.K., *et al.*, Microwave enhanced Akabori reaction for peptide analysis, *J.Am.Soc.Mass Spectrom.* **13**, 839–850, 2002

Originally devised as a method for the conversion of amino acids or amino acid esters to aldehydes. The Akabori reaction has been modified for use in the determination of C-terminal amino acids by performing the reaction in the presence of hydrazine and for the production of derivatives useful for mass spectrometric identification. Ambach, E. and Beck, W., Metal-complexes with biologically important ligands. 35. Nickel, cobalt, palladium, and platinum complexes with Schiff-bases of  $\alpha$ -amino acids – A contribution to the mechanism of the Akabori reaction, *Chemische Berichte-Recueil* **118**, 2722-2737, 1985; Bose, A.K., Ing, Y.H., Pramanik, B.N., *et al.*, Microwave enhanced Akabori reaction for peptide analysis, *J.Am.Soc.Mass Spectrom.* **13**, 839-850, 2002; Pramanik, B.N., Ing, Y.H., Bose, A.K., *et al.*, Rapid cyclopeptide analysis by microwave enhanced Akabori reaction, *Tetrahedron Lett.* **44**, 2565-2568, 2003; Puar, M.S., Chan, T.M., Delgarno, D., *et al.*, Sch 486058: A novel cyclic peptide of actinomycete origin, *J.Antibiot.* **58**, 151-154, 2005.

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Aldol Condensation

Citrate synthase  
an aldol-like condensation

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

Condensation of one carbonyl compound with the enol/enolate form of another to form a  $\beta$ -hydroxyaldehyde; the base-catalyzed reaction proceeds via the enolate form while the acid-catalyzed reaction proceeds via the enol form. The basic chemistry of the aldol condensation is observed in several enzymatic reactions including citrate synthase, fructose-1,6-bisphosphate aldolase, and 2-keto-4-hydroxyglutarate aldolase. See Lane, R.S., Hansen, B.A., and Dekker, E.E., Sulfhydryl groups in relation to the structure and catalytic activity of 2-oxo-4-hydroxyglutarate aldolase from bovine liver, *Biochim.Biophys.Acta* 481, 212-221, 1977; Evans, D.A. and McGee, L.R., Aldol diastereoselection. Zirconium enolates. Product selective, enolate structure independent condensations, *Tetrahedron Lett.* 21, 3975-3978, 1980; Grady, S.R., Wang, J.K., and Dekker, E.E., Steady-state kinetics and inhibition studies of the aldol condensation reaction catalyzed by bovine liver and *Escherichia coli* 2-keto-4-hydroxyglutarate aldolase, *Biochemistry* 20, 2497-2502, 1981; Rokita, S.E., Srere, P.A., and Walsh, C.T., 3-Fluoro-3-deoxycitrate: A probe for mechanistic study of citrate-utilizing enzymes, *Biochemistry* 21, 3765-3774, 1982; Frere, R., Nentwich, M., Gacond, S., *et al.*, Probing the active site of *Pseudomonas aeruginosa* porphobilinogen synthase using newly developed inhibitors, *Biochemistry*, 45, 8243-8253, 2006; Dalsgaard, T.K., Nielsen, J.H., and Larsen, L.B., Characterization of reaction products formed in a model reaction between pentanal and lysine-containing oligopeptides, *J.Agric.Food Chem.* 54, 6367-6373, 2006. A crossed aldol refers to a condensation reaction with two different aldehydes/ketones; the second aldehyde frequently is formaldehyde as it cannot react with itself although this is not a requirement (Kiehlman, E. and Loo, P.W., Orientation in crossed aldol condensation of chloral with unsymmetrical aliphatic ketones, *Canad.J.Chem.* 49, 1588, 1971; Findlay, J.A., Desai, D.N., and McCaulay, J.B., Thermally induced crossed aldol condensations, *Canad.J.Chem.* 59, 3303-3304, 1981; Esmaili, A.A., Tabas, M.S., Nasser, M.A., and Kazemi, F., Solvent-free crossed aldol condensation of cyclic ketones with aromatic aldehydes assisted by microwave irradiation, *Monatshfte fur Chemie* 136, 571-576, 2005).

**Amadori Rearrangement**

Amadori rearrangement

A reaction following the formation of the unstable reaction product between an aldehyde (reducing sugar) and an amino group (formation of a Schiff base, an aldimine) which results in a more stable ketoamine. The Amadori rearrangement is part of the Maillard reaction which is also called the Browning reaction and can result in the formation of advanced glycation end products. See Amadori, M. *Atti.Accad.Nazl.Lincei* 2, 337, 1925; Hodge, J.E., The Amadori rearrangement, *Adv.Carbohydrate Chem.* 10, 169-205, 1955; Acharya, A.S. and Manning, J.M., Amadori rearrangement of glyceraldehyde-hemoglobin Schiff based adducts. **Baeyer-Villiger Reaction**

Baeyer-Villiger reaction

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

The oxidation of a ketone by a peroxy acid to yield an ester. This reaction is catalyzed by bacterial monooxygenases and has proved useful in preparation of optically pure esters and lactones. See Ryerson, C.C., Ballou, D.P. and Walsh, C., Mechanistic studies on cyclohexanone oxygenase, *Biochemistry* 21, 2644-2655, 1982; Bolm, C., Metal-catalyzed asymmetric oxidations, *Med.Res.Rev.* 19, 348-356, 1999; Zambianchi, F., Pasta, P., Carrea, G., *et al.*, Use of isolated cyclohexanone monooxygenase from recombinant *Escherichia coli* as a biocatalyst for Baeyer-Villiger and sulfide oxidations, *Biotechnol.Bioeng.* 78, 489-496, 2002; Alphand, V., Carrea, G., Wohlgemuth, R., *et al.*, Towards large-scale synthetic application of Baeyer-Villiger monooxygenase, *Trends Biotechnol.* 21, 318-323, 2003; Walton, A.Z. and Stewart, J.D., Understanding and improving NADPH-dependent reactions by nongrowing *Escherichia coli* cells, *Biotechnol.Prog.* 20, 403-411, 2004; Malito, E., Alfieri, A., Fraaije, M.W., and Mattevi, A., Crystal structure of a Baeyer-Villiger monooxygenase, *Proc.Nat.Acad.Sci.USA* 101, 13157-13162, 2004; ten Brink, G.J., Arends, I.W., And Sheldon, R.A., The Baeyer-Villiger reaction: new developments toward greener procedures, *Chem.Rev.* 104, 4105-4124, 2004; Boronat, M., Corma, A., Renz, M., *et al.*, A multisite molecular mechanism for Baeyer-Villiger oxidations on solid catalysts using environmentally friendly H<sub>2</sub>O<sub>2</sub> as oxidant, *Chemistry* 11, 6905-6915, 2005; Mihovilovic, M.D., Rudroff, E., Waininger, A., *et al.*, Microbial Baeyer-Villiger oxidation: stereopreference and substrate acceptance of cyclohexanone monooxygenase mutants prepared by directed evolution, *Org.Lett.* 8, 1221-1224, 2006; Baldwin, C.V. and Woodley, J.M., On oxygen limitation in a whole cell biocatalytic Baeyer-Villiger oxidation process, *Biotechnol.Bioeng.* 95, 362-369, 2006.

## Beckmann Rearrangement

An acid (protic or Lewis)-catalyzed conversion of an oxime to a substituted carboxylic amide. See Darling, C.M. and Chen, C.P., Rearrangement of *N*-benzyl-2-cyano(hydroxyimino)acetamide, *J.Pharm.Sci.* 67, 860-861, 1978; Gayen, A.K., and Knowles, C.O., Penetration and fate of methomyl and its oxime metabolite in insects and two spotted spider mites, *Arch.Enviroin.Contam.Toxicol.* 10, 55-67, 1981; Mangold, J.B., Mangold, B.L., and Spina, A., Rat liver aryl sulfotransferase-catalyzed sulfation and rearrangement of 9-fluorenone oxime, *Biochim.Biophys.Acta* 874, 37-43, 1986; De Luca, L., Giacomelli, G., and Procheddu, A., Beckmann rearrangement of oximes under very mild conditions, *J.Org.Chem.* 67, 6272-6274, 2002; Torisawa, Y., Nishi, T., and Minamikawa, J., A study on the conversion of indanones into carbostyrils, *Bioorg.Med.Chem.* 11, 2205-2209, 2003; Furuya, Y., Ishihara, K., and Yamamoto, H., Cyanuric chloride as a mild and active Beckmann rearrangement catalyst, *J.Am.Chem.Soc.* 127, 11240-11241, 2005; Yamabe, S., Tsuchida, N., and Yamazaki, S., Is the Beckmann rearrangement a concerted or stepwise reaction? A computational study, *J.Org.Chem.* 70, 10638-10644, 2005; Ichino, T., Arimoto, H., and Uemura, D., Possibility of a non-amino acid pathway in the biosynthesis of marine-derived oxazoles, *Chem. Commun.* (16), 1742-1744, 2006.

## Benzoin Condensation

The conversion of benzaldehyde to benzoin (aromatic  $\alpha$ -hydroxyketones) via cyanide-mediated condensation; other aromatic aldehydes can participate in this reaction. See Iding, H., Dunnwald, T., Greiner, L., *et al.*, Benzoylformate decarboxylase from *Pseudomonas putida* as stable catalyst for the synthesis of chiral 2-hydroxy ketones, *Chemistry* 6, 1483-1495, 2000; White, M.J. and Leeper, F.J., Kinetics of the thiazolium ion-catalyzed benzoin condensation, *J.Org.Chem.* 66, 5124-5131, 2001; Dunkelmann, P., Kolter-Jung, D., Nitsche, A. *et al.*, Development of a donor-acceptor concept for enzymatic cross-coupling reactions of aldehydes: the first asymmetric cross-benzoin condensation, *J.Am.Chem.Soc.* 124, 12084-12085, 2002; Pohl, M., Lingen, B., and Muller, M., Thiamin-diphosphate-dependent enzymes: new aspects of asymmetric C-C bond formation, *Chemistry* 8, 5288-5295, 2002; Wildemann, H., Dunkelmann, P., Muller, M., and Schmidt, B., A short olefin metathesis-based route to enantiomerically pure arylated dihydropyrans and  $\alpha$ ,  $\beta$ -unsaturated  $\delta$ -valero lactones, *J.Org.Chem.* 68, 799-804, 2003; Murry, J.A., Synthetic methodology utilized to prepare substituted imidazole p38 MAP kinase inhibitors, *Curr.Opin.Drug Discov.Devel.* 6, 945-965, 2003; Reich, B.J., Justice, A.K., Beckstead, B.T., *et al.*, Cyanide-catalyzed cyclizations via aldimine coupling, *J.Org.Chem.* 69, 1357-1359, 2004; Sklute, G., Oizerowich, R., Shulman, H., and Keinan, E., Antibody-catalyzed benzoin oxidation as a mechanistic probe for nucleophilic catalysis by an active site lysine, *Chemistry* 10, 2159-2165, 2004; Breslow, R., Determining the geometries of transition states by use of antihydrophobic additives in water, *Acc.Chem.Res.* 37, 471-478, 2004.

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Cannizzaro Reaction

Cannizzaro reaction

Base-catalyzed disproportionation of an aldehyde to yield a carboxylic acid and the corresponding alcohol; if an  $\alpha$ -hydrogen is present, an aldol condensation is a competing reaction. See Hazlet, S.E. and Stauffer, D.A., Crossed Cannizzaro reactions, *J.Org.Chem.* 27, 2021-2024, 1962; Entezari, M.H. and Shameli, A.A., Phase-transfer catalysis and ultrasonic waves. I. Cannizzaro reaction, *Ultrason.Sonochem.* 7, 169-172, 2000; Matin, M.M., Sharma, T., Sabharwal, S.G., and Dhavale, D.D., Synthesis and evaluation of the glycosidase inhibitory activity of 5-hydroxy substituted isofagomine analogues, *Org.Biomol.Chem.* 3, 1702-1707, 2005; Zhang, L., Wang, S., Zhou, S., *et al.*, Cannizzaro-type disproportionation of aromatic aldehydes to amides and alcohols by using either a stoichiometric amount or a catalytic amount of lanthanide compounds, *J.Org.Chem.* 71, 3149-3153, 2006. Intramolecular Cannizzaro reactions have been described (Glomb, M.A., and Monnier, V.M., Mechanism of protein modification by glyoxal and glycoaldehyde, reactive intermediates of the Maillard reaction, *J.Biol.Chem.* 270, 10017-10026, 1995; Russell, A.E., Miller, S.P., and Morken, J.P., Efficient Lewis acid catalyzed intramolecular Cannizzaro reaction, *J.Org.Chem.* 65, 8381-8383, 2000; Schramm, C. and Rinderer, B., Determination of cotton-bound glyoxal via an internal Cannizzaro reaction by means of high-performance liquid chromatography, *Anal.Chem.* 72, 5829-5833, 2000).

## Claisen Condensation

Claisen condensation

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

The base-catalyzed condensation of two moles of an ester to give a  $\beta$ -keto ester. Claisen condensations are more favorable with thioesters. This reaction is of great importance in the biosynthesis of fatty acids and polyketides (Haapalainen, A.M., Meriläinen, G., and Wierenga, R.K. The thiolase superfamily: condensing enzymes with diverse reaction specificities, *Trends Biochem.Sci.* 31, 64-71, 2006). For general issues see Dewar, M.J. and Dieter, K.M., Mechanism of the chain extension step in the biosynthesis of fatty acids, *Biochemistry* 27, 3302-3308, 1988; Clark, J.D., O'Keefe, S.J., and Knowles, J.R., Malate synthase: proof of a stepwise Claisen condensation using the double-isotope fractionation test, *Biochemistry* 27, 5961-5971, 1988; Nicholson, J.M., Edafiogho, I.O., Moore, J.A., *et al.*, Cyclization reactions leading to  $\beta$ -hydroxyketo esters, *J.Pharm.Sci.* 83, 76-78, 1994; Lee, R.E., Armour, J.W., Takayama, K., *et al.*, Mycolic acid biosynthesis: definition and targeting of the Claisen condensation step, *Biochim.Biophys.Acta* 1346, 275-284, 1997; Shimakata, T. and Minatogawa, Y., Essential role of trehalose in the synthesis and subsequent metabolism of corynomycolic acid in *Corynebacterium matruchotil*, *Arch.Biochem.Biophys.* 380, 331-338, 2000; Olsen, J.G., Madziola, A., von Wettstein-Knowles, P., *et al.*, Structures of  $\beta$ -ketoacyl-acyl carrier protein synthase I complexed with fatty acids elucidate its catalytic machinery, *Structure* 9, 233-243, 2001; Klavins, M., Dipane, J., and Babre, K., Humic substances as catalysts in condensation reactions, *Chemosphere* 44, 737-742, 2001; Heath, R.J. and Rock, C.O., The Claisen condensation in biology, *Nat.Prod.Rep.* 19, 581-596, 2002; Takayama, K., Wang, C., and Besra, G.S., Pathway to synthesis and processing of mycolic acids in *Mycobacterium tuberculosis*, *Clin.Microbiol.Rev.* 18, 81-101, 2005; Ryu, Y., Kim, K.J., Roessner, C.A., and Scott, A.I., Decarboxylative Claisen condensation catalyzed by in vitro selected ribozymes, *Chem.Commun.* (13), 1439-1441, 2006; Kamijo, S. and Dudley, G.B., Claisen-type condensation of vinyllogous acyl triflates, *Org.Lett.* 8, 175-177, 2006.

## Claisen Rearrangement

Zhang Z. and Bruce T.C., Temperature dependence of the structure of the substrate and active site of the *Thermus thermophilus* chorismate mutase E-S complex, *Biochemistry* 45, 8562-8567, 2006

The rearrangement of an allyl vinyl ether or the nitrogen or sulfur analogue or allyl aryl ether to yield a  $\gamma$ ,  $\delta$ -unsaturated ketone or an *o*-allyl substituted phenol. See Hilvert, D., Carpenter, S.H., Nared, K.D., and Auditor, M.T., Catalysis of concerted reactions by antibodies: the Claisen rearrangement, *Proc.Nat.Acad.Sci.USA* 85, 4953-4955, 1988; Campbell, A.P., Tarasow, T.M., Masefski, W., *et al.*, *Proc.Nat.Acad.Sci.USA* 90, 8663-8667, 1993; Swiss, K.A. and Firestone, R.A., Catalysis of Claisen rearrangement by low molecular weight polyethylene(1), *J.Org.Chem.* 64, 2158-2159, 1999; Berkowitz, D.B., Choi, S., and Maeng, J.H., Enzyme-assisted asymmetric total synthesis of (-)-podophyllotoxin and (-)-picropodophyllin, *J.Org.Chem.* 65, 847-860, 2000; Itami, K. and Yoshida, J., The use of hydrophilic groups in aqueous organic reactions, *Chem.Rec.* 2 213-224, 2002; Martin Castro, A.M., Claisen rearrangement over the past nine decades, *Chem.Rev.* 104, 2939-3002, 2004; Sparano, B.A., Shahi, S.P., and Koide, K., Effect of binding and conformation on fluorescence quenching in new 2',7'-dichlorofluorescein derivatives, *Org.Lett.* 6, 1947-1949, 2004; Davis, C.J., Hurst, T.E., Jacob, A.M., and Moody, C.J., Microwave-mediated Claisen rearrangement followed by phenol oxidation: a simple route to naturally occurring 1,4-benzoquinones. ## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Criegee Reactions

Mostly the reaction of a peroxyacid with a tertiary alcohol to form a ketone and an alcohol. The intermediate peroxyester is an intermediate (Criegee adduct or Criegee intermediate) in the Baeyer-Villiger reaction. The Criegee intermediate is important in the ozonolysis of alkenes including fatty acids. See Leffler, J.E. and Scrivener, F.E., Jr., The decomposition of cumyl peracetate in nonpolar solvents, *J.Org.Chem.* 37, 1794-1796, 1978; Srisankar, E.V. and Patterson, L.K., Reactions of ozone with fatty acid monolayer: a model system for disruption of lipid molecular assemblies by ozone, *Arch. ## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

**Dakin Reaction**

Conversion of an aromatic ketone or aldehyde to a phenolic derivative with alkaline hydrogen peroxide. The mechanism is thought to be similar to the Baeyer-Villiger reaction possibly proceeding through a peroxyacid intermediate. The presence of an amino group or a hydroxyl group in the position para to the carbonyl function is required. See Corforth, J.W. and Elliott, D.F., Mechanism of the Dakin and West reaction, *Science* 112, 534-535, 1950.

**Dakin-West Reaction**

Conversion of amino acids to acetamidoketones via the action of acetic anhydride in base where a carboxyl group is replaced by an acyl group in a reaction proceeding through an oxazolone intermediate. This reaction has been used for the synthesis of enzyme inhibitors and receptor antagonists. See Angliker, H. Wikstrom, P., Rauber, P., *et al.*, Synthesis and properties of peptidyl derivatives of arginylfluoromethanes, *Biochem.J.* 256, 481-486, 1988; Cheng, L., Goodwin, C.A., Schully, M.F., *et al.*, Synthesis and biological activity of ketomethylene pseudopeptide analogues as thrombin inhibitors, *J.Med.Chem.* 35, 3364-3369, 1992; Godfrey, A.B., Brooks, D.A., Hay, L.A., *et al.*, Application of the Dakin-West reaction for the synthesis of oxazole-containing dual PPAR $\alpha/\gamma$  agonists, *J.Org.Chem.* 68, 2623-2632, 2003; Loksha, Y.M., el-Barbary, A.A., it-Barbary, M.A., *et al.*, Synthesis of 2-(aminocarbonylmethylthio)-1H-imidazoles as novel Capravirine analogues, *Bioorg.Med.Chem.* 13, 4209-4220, 2005

**Diels-Alder Condensation**

A cycloaddition reaction between a conjugated diene and an alkene resulting in the formation of an alkene ring; construction of a six-membered ring with multiple stereogenic centers resulting in a chiral molecule. See Wasserman, A., *Diels-Alder Reactions. Organic Background and Physico-Chemical Aspects*, Elsevier, Amsterdam, Netherlands, 1965; Fringuelli, F., and Taticchi, A., *The Diels-Alder Reaction. Selected Practical Methods*, John Wiley & Sons, Ltd., Chichester, UK, 2002; Stocking, E.M. and Williams, R.M., Chemistry and biology of biosynthetic Diels-Alder reactions, *Angew.Chem.Int.Ed.* 42, 3078-3115, 2003. ## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Eschweiler-Clarke Reaction

The reductive methylation of amines with formaldehyde in the presence of formic acid. See Lindeke, B., Anderson, B., and Jenden, D.J., Specific deuteromethylation by the Eschweiler-Clarke reaction. Synthesis of differently labelled variants of trimethylamine and their use of the preparation of labelled choline and acetylcholine, *Biomed.Mass Spectrom.* 3, 257-259, 1976; Boldavalli, F., Bruno, O., Mariani, E., *et al.*, Esters of *N*-methyl-*N*-(2-hydroxyethyl or 3-hydroxypropyl)-1,3,3-trimethylbicyclo[2.2.1] heptan-2-endo-amine with hypotensive activity, *Farmaco* 42, 175-183, 1987; Lee, S.S., Wu, W.N., Wilton, J.H., *et al.*, Longiberine and *O*-methyllogiberine, dimeric protoberberine-benzyl tetrahydroisoquinoline alkaloids from *Thalictrum longistrylum*, *J.Nat.Prod.* 62, 1410-1414, 1999; Suma, R and Sai Prakash, P.K., Conversion of sertraline to *N*-methyl sertraline in embalming fluid: a forensic implication, *J.Anal.Toxicol.* 30, 395-399, 2006. The reaction can be accomplished with sodium borohydride or sodium cyanoborohydride and is related to the reductively methylation/alkylation of lysine residues in proteins (Lundblad, R.L., *Chemical Reagents for the Modification of Proteins*, 3<sup>rd</sup> edn., CRC Press, Boca Raton, FL, 2004).

## Favorskii Rearrangement

The rearrangement of an  $\alpha$ -ketone in the presence of an alkoxide to form a carboxylic ester; cyclic  $\alpha$ -ketone undergo ring contraction. March, J. *Advanced Organic Chemistry. Reactions, Mechanisms, and Structures*, 3rd edn. John Wiley & Sons, New York, New York, 1985; Gardner, H.W., Simpson, T.D., and Hamberg, M., Mechanism of linoleic acid hydroperoxide reaction with alkali, *Lipids* 31, 1023-1028, 1996; Xiang, L., Kalaitzis, J.A., Nilsen, G. *et al.*, Mutational analysis of the enterocin favorskii biosynthetic rearrangement, *Org.Lett.* 4, 957-960, 2002; Zhang, L. and Koreeda, M., Stereocontrolled synthesis of kelseone by the homo-favorskii rearrangement, *Org.Lett.* 4, 3755-3788, 2002; Grainger, R.S., Owoare, R.B., Tisselli, P., and Steed, J.W., A synthetic alternative to the type-II intramolecular 4 + 3 cycloaddition, *J.Org.Chem.* 68, 7899-7902, 2003.

## Fenton Reagent/Reaction

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

The reaction of ferrous ions and hydrogen peroxide to yield a hydroxyl radical. See Aust, S.D., Morehouse, L.A., and Thomas, C.E., Role of metals in oxygen radical reactions, *J.Free Radic.Biol.Med.* 1, 3-25, 1985; Goldstein, S., Meyerstein, D. and Czapski, G., The Fenton reagents, *Free Radic.Biol.Med.* 15, 435-445, 1993; Wardman, P. and Candeias, L.P., Fenton chemistry: an introduction, *Radiat.Res.* 145, 523-531, 1996; Held, K.D., Sylvester, F.C., Hopcia, K.L., and Biaglow, J.E., Role of Fenton chemistry in the thiol-induced toxicity and apoptosis, *Radiat.Res.* 145, 542-553, 1996; Merli, C., Petrucci, E., Da Pozzo, A., and Perneti, M., Fenton-type treatment: state of the art, *Ann.Chim.* 93, 761-770, 2003; Groves, J.T., High-valent iron in chemical and biological oxidations, *J.Inorg.Biochem.* 100, 434-447, 2006.

## Fischer Carbene Complexes

A Fischer carbene complex consists of a transition metal with a formal carbon-metal bond containing a carbene in the singlet state; stabilization of the carbene is provided by the metal interaction. The Fischer carbene complex is electrophilic at the carbene carbon as opposed to the Schrock complex which is in the triplet state and nucleophilic at the carbene carbon. The Fischer carbene complex is high reactivity and is used in many synthetic procedures. An example is provided by the  $\alpha,\beta$ -unsaturated carbenepentacarbonylchromium complex (de Meijere, A., Schirmer, H., and Duetsch, M., Fischer carbene complexes as chemical multitools: The incredible range of products from carbenepentacarbonylmetal  $\alpha,\beta$ -unsaturated complexes, *Angew.Chem.Int.Ed.* 39, 3964-4002, 2000). See also Salmann, M., Blais, J.C., Tran-Huy, H., *et al*, Reaction of hen egg white lysozyme with Fischer-type metallocarbene complexes. Characterization of the conjugates and determination of the metal complex binding sites, *Eur.J.Biochem.* 268, 5479-5487, 2001; Merlic, C.A. and Doroh, B.C., Amine-catalyzed coupling of aldehydes and ketenes derived from Fischer carbene complexes: formation of beta-lactones and enol ethers, *J.Org.Chem.* 68, 6056-6069, 2003; Barluenga, J., Santamaria, J., and Tomas, M., Synthesis of heterocycles via group VI Fischer carbene complexes, *Chem.Rev.* 104, 2259-2283, 2004; Barluenga, J., Fananas-Mastral, M., and Aznar, F., A new synthesis of allyl sulfoxides via nucleophilic addition of sulfinyl carbanions to group 6 Fischer carbene complexes, *Org.Lett.* 7, 1235-1237, 2005; Lian, Y. and Wulff, W.D., Iron in the service of chromium: the *o*-benzannulation of *trans,trans*-dienyl Fischer carbene complexes, *J.Am.Chem.Soc.* 127, 17162-17163, 2005; Barluenga, J., Mendoza, A., Dieguez, A., *et al.*, Umpolung reactivity of alkenyl Fischer carbene complexes, copper enolates, and electrophiles, *Angew.Chem.Int.Ed.Engl.* 45, 4848-4850, 2006; Samanta, D., Sawoo, S. and Sarkar, A., *In situ* generation of gold nanoparticles on a protein surface: Fischer carbene complex as reducing agent, *Chem.Commun.* (32), 3438-3440, 2006; Rawat, M., Prutyay, V., and Wulff, W.D., Chromene chromium carbene complexes in the syntheses of naphthoyran and naphthopyrandione units present in photochromic materials and biologically active natural products, *J.Am.Chem.Soc.* 128, 11044-11053, 2006. For general information on carbenes including Fischer carbene complexes and Schrock carbene complexes, see *Carbene Chemistry. From Fleeting Intermediates to Powerful Reagents*, ed. G. Bertrand, Fontis Media/Marcel Dekker, New York, New York, 2002.

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Fischer Indole Synthesis

Fischer indole synthesis

The thermal conversion of arylhydrazones in the presence of a protic acid or a Lewis acid to form an indole ring. See Owellen, R.J., Fitzgerald, J.A., Fitzgerald, B.M., *et al.*, The cyclization phase of the Fischer indole synthesis. ## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Friedel-Crafts Reaction

The alkylation of an aromatic ring by an alkyl halide (order of reactivity  $F > Cl > Br > I$ ) in the presence of a strong Lewis acid such as aluminum chloride; the acylation of an aromatic ring by an acyl halide (order of reactivity usually is  $I > Br > Cl > F$ ) in the presence of a strong Lewis acid. Acids and acid anhydrides can replace the acyl halides. A related reaction is the Derzen-Nenitzescu ketone synthesis. See Olah, G.A., *Friedel-Crafts Chemistry*, John Wiley & Sons, New York, New York, 1973; Roberts, R.M. and Khalaf, A.A., *Friedel-Crafts Alkylation Chemistry: A Century of Discovery*, Marcel Dekker, New York, New York, 1989. See also Retej, J., Enzymatic catalysis by Friedel-Crafts-type reactions, *Naturwissenschaften* 83, 439-447, 1996; White, E.H., Darbeau, R.W., Chen, Y. *et al.*, A new look at the Friedel-Crafts alkylation reaction(1), *J.Org.Chem.* 61, 7986-7987, 1996; Studer, J., Purdie, N., and Krouse, J.A., Friedel-Crafts acylation as a quality control assay for steroids, *Appl.Spectrosc.* 57, 791-796, 2003; Retej, J., Discovery and role of methyldiene imidazolone, a highly reactive electrophilic prosthetic group, *Biochim.Biophys.Acta* 1647, 179-184, 2003; Bandini, M., Melloni, A., and Umami-Ronchi, A., New catalytic approaches in the stereoselective Friedel-Crafts alkylation reaction, *Angew.Chem.Int.Ed.Engl.* 43, 550-556, 2004; Poppe, L. and Retej, J., Friedel-Crafts-type mechanism for the enzymatic elimination of ammonia from histidine and phenylalanine, *Angew.Chem.Int. Ed.Engl.* 44, 3668-3688, 2005; Keni, M., and Tepe, J.J., One-pot Friedel-Crafts/Robinson-Gabriel synthesis of oxazoles using oxazolone templates, *J.Org.Chem.* 70, 4211-4213, 2005; Movassaghi, M. and Ondrus, A.E., Enantioselective total synthesis of tricyclic myrmecarin alkaloids, *Org.Lett.* 7, 4423-4426, 2005; Paizs, C., Katona, A., and Retej, J., The interaction of heteroaryl-acrylates and alanines with phenylalanine ammonia-lyase from parsley, *Chemistry* 12, 2739-2744, 2006. Cuprous ions have been observed to promote a Friedel-Crafts acylation reaction (Kozikowski, A.P. and Ames, A., Copper(I) promoted acylation reactions. A transition metal mediated version of the Friedel-Crafts reaction, *J.Am.Chem.Soc.* 102, 860-862, 1980)

## Friedländer Synthesis

The base-catalyzed formation of quinoline derivatives by condensation of an *o*-aminobenzaldehyde with a ketone; also referred to as the Friedländer quinoline synthesis. The general utility of the reaction is somewhat limited by the availability of *o*-aminobenzaldehyde derivatives. See Maguire, M.P., Sheets, K.R., McVety, K., *et al.*, A new series of PDGF receptor tyrosine kinase inhibitors: 3-substituted quinoline derivatives, *J.Med.Chem.* 37, 2129-2137, 1994; Lindstrom, S., Friedlander synthesis of the food carcinogen 2-amino-1-methyl-6-phenylimidazo[4,5-*b*]pyridine, *Acta Chem.Scand.* 49, 361-363, 1995; Gladiali, S., Chelucci, G., Mudadu, M.S., *et al.*, Friedlander synthesis of chiral alkyl-substituted 1,10-phenanthrolines, *J.Org.Chem.* 66, 400-405, 2001; Patteux, C., Levacher, V., and Dupas, G., A novel traceless solid-phase Friedlander synthesis, *Org.Lett.* 5, 3061-3063, 2003; McNaughton, B.R. and Miller, B.L., A mild and efficient one-step synthesis of quinolines, *Org.Lett.* 5, 4257-4259, 2003; Yasuda, N., Hsiao, Y., Jensen, M.S., *et al.*, An efficient synthesis of an  $\alpha,\beta$  antagonist, *J.Org.Chem.* 69, 1959-1966, 2004.

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Fries Rearrangement

Rearrangement of a phenolic ester to yield *o*- and *p*-acylphenols. The distribution of products between the *ortho* and *para* acyl derivatives depends on reaction conditions. The presence of solvent and a Lewis acid, the *para* product is preferred; with the photolytic process or at high temperature in the absence of solvent, the *ortho* derivative is preferred. See Sen, A.B. and Bhattacharji, S., Fries' rearrangement of aliphatic esters of  $\beta$ -naphthol, *Curr.Sci.* 20, 132-133, 1951; Iwasaki, S., Photochemistry of imidazolides. I. ## Gabriel Synthesis

Gabriel synthesis

The conversion of an alkyl halide to alkyl amine mediated by potassium phthalimide. The intermediate product of the reaction of the alkyl halide and phthalimide is hydrolyzed to the product amine by acid or by reflux in ethanolic hydrazine. See Mikola, H. and Hanninen, E., Introduction of aliphatic amino and hydroxy groups to keto steroids using *O*-substituted hydroxylamines, *Bioconjugate Chem.* 3, 182-186, 1992; Groutas, W.C., Chong, L.S., Venkataraman, R., *et al.*, Mechanism-based inhibitors of serine proteinases based on the Gabriel-Colman rearrangement, *Biochem.Biophys.Res. Commun.* 194, 1491-1499, 1993; Konig, S., Ugi, I., and Schramm, H.J., Facile syntheses of C<sub>2</sub>-symmetrical HIV-1 protease inhibitor, *Arch.Pharm.* 328, 699-704, 1995; Zhang, X.X. and Lippard, S.J., Synthesis of PDK, a novel porphyrin-linked dicarboxylate ligand, *J.Org.Chem.* 65, 5298-5305, 2000; Scozzafava, A. ## Greiss Reaction

Greiss reaction

Greiss reaction as used for the measurement of nitrite

Azo product measured at 520 nm

Diazotization of aromatic amines; used for the assay of nitrites in nitric oxide research. The assay for nitrates uses diazotization of sulfanilamide with subsequent coupling to an aromatic amine (*N*-1-naphthylethylenediamine) to form an chromophoric azo derivative. See Greenberg, S.S., Xie, J., Spitzer, J.J. *et al.*, Nitro containing L-arginine analogs interfere with assays for nitrate and nitrite, *Life Sci.* 57, 1949-1961, 1995; Pratt, P.F., Nithipatikom, K., and Campbell, W.B., Simultaneous determination of nitrate and nitrite in biological samples by multichannel flow injection analysis, *Anal.Biochem.* 231, 383-386, 1995; Tang, Y., Han, C. and Wang, X., Role of nitric oxide and prostaglandins in the potentiating effects of calcitonin gene-related peptide on Lipopolysaccharide-induced interleukin-6 release from mouse peritoneal macrophages, *Immunology* 96, 171-175, 1999; Baines, P.B., Stanford, S., Bishop-Bailey, D., *et al.*, Nitric oxide production in meningococcal disease is directly related to disease severity, *Crit.Care. ## Grignard Reagent or Grignard Reaction

The reaction of alkyl or aryl halides with magnesium in dry ether to yield derivatives which can be used in a variety of organic synthetic reactions. See Nagano, T. and Hayashi, T., Iron-catalyzed Grignard cross-coupling with alkyl halides possessing beta-hydrogens, *Org.Lett.* 6, 1297-1299, 2004; Querner, C., Reiss, P., Bleuse, J., and Pron, A., Chelating ligands for nanocrystals' functionalization, *J.Am.Chem.Soc.* 126, 11574-11582, 2004; Agarwal, S. and Knolker, H.J., A novel pyrrole synthesis, *Org.Biomol.Chem.* 2, 3060-3062, 2004; Hatano, M., Matsumara, T., and Ishihara, K., Highly alkyl-selective addition to ketones with magnesium complexes derived from Grignard reagents, *Org.Lett.* 7, 573-576, 2005; Itami, K., Higashi, S., Mineno, M., and Yoshida, J., Iron-catalyzed cross-coupling of alkenyl sulfides with Grignard reagents, *Org.Lett.* 7, 1219-1222, 2005; Wang, X.J., Zhang, L., Sun, X., *et al.*, Addition of Grignard reagents to aryl chlorides: an efficient synthesis of aryl ketones, *Org.Lett.* 7, 5593-5595, 2005; Hoffman-Emery, F., Hilpert, H., Scalone, M., and Waldmeier, F., Efficient synthesis of novel NK1 receptor antagonists: selective 1,4-addition of Grignard reagents to 6-chloronicotinic acid derivatives, *J.Org.Chem.* 71, 2000-2008, 2006; Werner, T. and Barrett, A.G., Simple method for the preparation of esters from Grignard reagents and alkyl 1-imidazolecarboxylates, *J.Org.Chem.* 71, 4302-4304, 2006; Demel, P., Keller, M., and Breit, B., *o*-DPPB-directed copper mediated and -catalyzed allylic substitution with Grignard reagents, *Chemistry* 12, 6669-6683, 2006.

## Knoevenagel Reaction or Knoevenagel Condensation

Knoevenagel condensation

EWG = electron-withdrawing group such as CHO, COOH, COOR, CN, NO<sub>2</sub>

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

An amine-catalyzed reaction between active hydrogen compounds of the type  $Z-CH_2-Z$  where Z can be a CHO, COOH, COOR,  $NO_2$  SOR, or related electron withdrawing groups and an aldehyde or ketone. For example, the reaction of malonic acid or malonic acid esters and an aldehyde or ketone to yield an  $\alpha,\beta$ -unsaturated derivative. With malonic acid (Z is carboxyl group), decarboxylation occurs *in situ*. See March, J. *Advanced Organic Chemistry. Reactions, Mechanisms, and Structure*, 3rd edn., John Wiley & Sons, New York, New York, 1985; Klavins, M., Dipane, J., and Babre, K., Humic substances as catalysts in condensation reactions, *Chemosphere* 44, 737-742, 2001; Lai, S.M., Martin-Aranda, R., and Yeung, K.L., Knoevenagel condensation reaction in a membrane bioreactor, *Chem. Commun.* (2), 218-219, 2003; Pivonka, D.E. and Empfield, J.R., Real-time *in situ* Ramen analysis of microwave-assisted organic reactions, *Appl.Spectrosc.* 58, 41-46, 2004; Strohmeier, G.A., Haas, W., and Kappe, C.O., Synthesis of functionalized 1,3-thiazine libraries combining solid-phase synthesis and post-cleavage modification reactions, *Chemistry* 10, 2919-2926, 2004; Wirz, R., Ferri, D. and Baiker, A., ATR-IR spectroscopy of pendant  $NH_2$  groups on silica involved in the Knoevenagel condensation, *Langmuir* 22, 3698-3706, 2006.

**Leuckart Reaction**

The reductive amination of carbonyl groups by ammonium formate or amine salts of formic acid; formamides may also be used in the reaction. See Matsueda, G.R. and Stewart, J.M., A *p*-methylbenzhydrylamine resin for improved solid-phase synthesis of peptide amides, *Peptides* 2, 45-50, 1981; Agwada, V.C. and Awachie, P.I., Intermediates in the Leuckart reaction of benzophenone with formamide, *Tetrahedron Lett.* 23, 779-780, 1982; Loupy, A., Monteux, D., Petit, A., *et al.*, Toward the rehabilitation of the Leuckart reductive amination reaction using microwave technology, *Tetrahedron Lett.* 37, 8177-8180, 1996; Adger, B.M., Dyer, U.C., Lennon, I.C., *et al.*, A novel synthesis of *tert*-leucine via a Leuckart type reaction, *Tetrahedron Lett.* 38, 2153-2154, 1997; Lejon, T. and Helland, I., Effect of formamide in the Leuckart reaction, *Acta Chem.Scand.* 53, 76-78, 1999; Kitamura, M., Lee, D., Hayashi, S., *et al.*, Catalytic Leuckart-Wallach type reductive amination of ketones, *J.Org.Chem.* 67, 8685-8687, 2002; Swist, M., Wilamowski, J., and Parczewski, A., Basic and neutral route specific impurities in MDMA prepared by different synthesis methods. ## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Maillard Reaction

The reaction of amino groups with carbonyl groups resulting in the formation of complex products. This process is involved in the tanning of leather and the Browning reaction which is considered unique to the reaction of carbohydrates with proteins and is a critical aspect of food preparation. The Maillard reaction involves the nonenzymatic reaction of sugars with proteins and the formation of advanced glycation end products (AGE products). The Maillard reaction results in the formation of a number of reaction products. See Dills, W.J., Jr., Protein fructosylation: fructose and the Maillard reaction, *Am.J.Clin.Nutr.* 58(Suppl 5), 779S-787S, 1993; Chuyen, N.V., Maillard reaction and food processing. ## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

## Malaprade Reaction

Malaprade reaction

Periodic cleavage of a diol; although this term is seldom used for this extremely common reaction, it would appear to be the correct terminology. Periodic acid is used for the diol cleavage in aqueous solvent while lead tetraacetate can be used in organic solvents. The reaction also occur an amine group vicinal to a hydroxyl function. It would appear that the term Malaprade reaction has been used more in description of analytical techniques for organic diols such as gluconic acid or in the assay of periodate. See Belcher, R., Dryhurst, G., and MacDonal, A.M., Submicro-methods for analysis of organic compounds. 22. Malaprade reaction, *Journal of the Chemical Society*, (July) 3964, 1965; Chen, K.P., Determination of calcium gluconate by selective oxidation with periodate, *J.Pharm.Sci.* 73, 681-683, 1984; Verma, K.K., Gupta, D., Sanghi, S.K., and Jain, A., Spectrophotometric determination of periodate with amodiaquine dihydrochloride and its application to the indirect determination of some organic-compounds via the Malaprade reaction, *Analyst* 112, 1519-1522, 1987; Nevado, J.J.B. and Gonzalez, P.V., Spectrophotometric determination of periodate with salicylaldehyde guanylhydrazone – indirect determination of some organic compounds using the Malaprade reaction, *Analyst* 114, 243-244, 1989; Jie, N.Q., Yang, D.L., Zhang, Q.N., *et al.*, Fluorometric determination of periodate with thiamine and its application to the determination of ethylene glycol and glycerol, *Anal.Chim.Acta* 359, 87-92, 1998; Guillan-Sans, R. and Guzman-Chozas, M., The thiobarbituric acid (TBA) reaction in foods, A review, *Crit.Rev.Food Sci.Nutrition* 38, 315-330, 1998; Pumera, M., Jelinek, I., Jindrich, J., *et al.*, Determination of cyclodextrin content using periodate oxidation by capillary electrophoresis, *J.Chromatog. **Mannich Reaction**

Condensation of an amine with an carbonyl compound which can exist in an enol form, and a carbonyl compound which can not exist as an enol. The reaction frequently use formaldehyde as the carbonyl compound not existing as an enol for condensing with a secondary amine in the first phase of the reaction. See Britton, S.B., Caldwell, H.C., and Nobles, W.L., The use of 2-pipecoline in the Mannich reaction, *J.Am.Pharm.Assoc.Am.Pharm.Assoc.* 43, 641-643, 1954; Nobles, W.L., and Thompson, B.B., Application of the Mannich reaction to sulfones. I. Reactive methylene moiety of sulfones, *J.Pharm.Sci.* 54, 576-580, 1965; Thompson, B.B., The Mannich reaction. Mechanistic and technological considerations, *J.Pharm.Sci.* 57, 715-733, 1968; Nobles, W.L. and Potti, N.D., Studies on the mechanism of the Mannich reaction, *J.Pharm.Sci.* 57, 1097-1103, 1968; Delia, T.J., Scovill, J.P., Munslow, W.D., and Burckhalter, J.H., Synthesis of 5-substituted aminomethyluracils via the Mannich reaction, *J.Med.Chem.* 19, 344-346, 1976; List, B., Pojarliev, P., Biller, W.T., and Martin, H.J., The proline-catalyzed direct asymmetric three-component Mannich reaction: scope, optimization, and application to the highly enantioselective synthesis of 1,2-amino alcohols, *J.Am.Chem.Soc.* 124, 827-833, 2002; Palomo, C., Oiarbide, M., Landa, A., *et al.*, Design and synthesis of a novel class of sugar-peptide hybrids: C-linked glyco  $\beta$ -amino acids through a stereoselective "acetate" Mannich reaction as the key strategic element, *J.Am.Chem.Soc.* 124, 8637-8643, 2002; Cordova, A., The direct catalytic asymmetric Mannich reaction, *Acc.Chem.Res.* 37, 102-112, 2004; Azizi, N., Torkiyan, L., and Saidi, M.R., Highly efficient one-pot three-component Mannich reaction in water catalyzed by heteropoly acids, *Org.Lett.* 8, 2079-2082, 2006; Matsuo, J., Tanaki, Y., and Ishibashi, H., Oxidative Mannich reaction of *N*-carboboxy amines 1,3-dicarbonyl compounds, *Org.Lett.* 8, 4371-4374, 2006. Another important example of the Michael addition in biochemistry and molecular biology is the reaction of 4-hydroxynon-2-enal with amines and sulfhydryl groups (Winter, C.K., Segall, H.J., and Haddon, W.F., Formation of cyclic adducts of deoxyguanosine with the aldehyde *trans*-4-hydroxy-2-hexenal and *trans*-4-hydroxy-2-nonenal *in vitro*, *Cancer Res.* 46, 5682-5686, 1986; Sayre, L.M., Arora, P.K., Iyer, R.S., and Salomon, R.G., Pyrrole formation from 4-hydroxynonenal and primary amines, *Chem.Res.Toxicol.* 6, 19-22, 1993; Hartley, D.P., Ruth, J.A., and Petersen, D.R., The hepatocellular metabolism of 4-hydroxynonenal by alcohol dehydrogenase, aldehyde dehydrogenase, and glutathione-S-transferase, *Arch.Biochem.Biophys.* 316, 197-205, 1995; Engle, M.R., Singh, S.P., Czernik, P.J., *et al.*, Physiological role of mGSTA4-4, a glutathione S-transferase metabolizing 4-hydroxynonenal: generation and analysis of mGst4 null mouse, *Toxicol.Appl.Pharmacol.* 194, 296-308, 2004).

**Meerwein Reaction**

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

The reaction of an aryl diazonium halide with an aliphatic unsaturated compound to yield an  $\alpha$ -halo- $\beta$ -phenyl alkene and alkanes. The reaction is performed in the presence of cupric ions. The presence of an electron-withdrawing group is useful in promoting the reactivity of the alkene. See Kochi, J.K., The Meerwein reaction. Catalysis by cuprous chloride, *J.Am.Chem.Soc.* 77, 5090, 1955; Moraes, L.A. and Eberlin, M.N., The gas-phase Meerwein reaction, *Chemistry* 6, 897-905, 2000; Riter, L.S., Meurer, E.C., Handberg, E.S., *et al.*, Ion/molecule reactions performed in a miniature cylindrical ion trap mass spectrometer, *Analyst* 128, 1112-1118, 2003; Meurer, E.C., Chen, H., Riter, L.S., *et al.*, Meerwein reaction of phosphonium ions with epoxides and thioepoxides in the gas phase, *J.Am.Soc.Mass Spectrom.* 15, 398-405, 2004; Meurer, E.C. and Eberlin, M.N., The atmospheric pressure Meerwein reaction, *J.Mass Spectrom.* 41, 470-476, 2006.

## Michael Addition (Michael Condensation)

Formally a 1,4 addition/conjugate addition of a resonance-stabilized carbanion (the reaction of an active methylene compound such as a malonate and an  $\alpha,\beta$ -unsaturated carbonyl compound or the reaction of a nucleophile with an "activated unsaturated system; a carbanion defined as an anion with an even number of electrons). The addition of a nucleophile to a conjugated double bond. See Flavin, M. and Slaughter, C., Enzymatic elimination from a substituted four-carbon amino acid coupled to Michael addition of a  $\beta$ -carbon to an electrophilic double bond. Structure of the reaction product, *Biochemistry* 5, 1340-1350, 1966; Fitt, J.J. and Gschwend, H.W.,  $\alpha$ -Alkylation and Michael addition of amino acid—a practical method, *J.Org.Chem.* 42, 2639-2641, 1977; Powell, G.K., Winter, H.C., and Dekker, E.E., Michael addition of thiols with 4-methyleneglutamic acid: preparation of adducts, their properties and presence in peanuts, *Biochem.Biophys.Res.Comm.* 105, 1361-1367, 1982; Wang, M., Nishikawa, A. and Chung, F.L., Differential effects of thiols on DNA modifications via alkylation and Michael addition by  $\alpha$ -acetoxy-*N*-nitrosopyrrolidine, *Chem.Res.Toxicol.* 5, 528-531, 1992; Jang, D.P., Chang, C.W., and Uang, B.J., Highly diastereoselective Michael addition of  $\alpha$ -hydroxy acid derivatives and enantioselective synthesis of (+)-crobarbatic acid, *Org.Lett.* 3, 983-985, 2001;

## Schiff Base

## ORGANIC NAME REACTIONS USEFUL IN BIOCHEMISTRY AND MOLECULAR BIOLOGY (Continued)

The formation of an unstable derivative generally between a carbonyl (usually an aldehyde) and an amino group. The Schiff base can be converted to a stable derivative by reduction with sodium borohydride or sodium cyanoborohydride; Schiff bases appear to be resistant to reduction with sulfhydryl-base reducing agents such as 2-mercaptoethanol or dithiothreitol and phosphines. Schiff bases are involved in a diverse group of biochemical events including the interaction of pyridoxal phosphate with proteins, the interaction of reducing carbohydrates with proteins in reaction leading to AGE products, and reductive alkylation of amino groups in proteins. See Feeney, R.E., Blankenhorn, G., and Dixon, H.B., Carbonyl-amine reactions in protein chemistry, *Adv. Protein Chem.* 29, 135-203, 1975; Metzler, D.E. Enzymes in Synthetic Organic Chemistry<sup>a,b</sup> (Continued)**Hydrolases (Esterases)**

A group of enzymes which catalyze the cleavage of ester and amide bonds with addition of water. Esterases, of which lipases are a singularly important group, are important in synthetic organic chemistry. Of particular importance is the stereoselectivity of the reaction<sup>c</sup>. A racemic mixture of an ester can be resolved into enantiomeric pairs by stereospecific hydrolysis. Butyrylcholine esterase and cocaine esterase are listed with the therapeutic enzymes.

dimethyl-beta-hydroxymethylglutarate

<sup>c</sup> A carbon center may be asymmetric in having four different substituents (other atoms such as sulfur can also be asymmetric centers). In the case of carbon, this can be result in a mixture of the two optical isomers resulting in a racemic mixture. Generally there is no driving force for the formation of a racemic mixture so there are equal forms of the D and L isomers. With an enzyme stereoselectivity can be achieved and the quality of an asymmetric mixture may be expressed as enantiomeric excess (enantiomeric excess = (moles of major enantiomer - moles of other enantiomer) / Total moles of both enantiomers)  $\times$  100 and is usually expressed as a percentage.

Enzymes in Synthetic Organic Chemistry<sup>a,b</sup> (Continued)

## Lipases

A group of hydrolytic enzymes that catalyze the release of fatty acids from triglycerides; more specifically the catalysis of the hydrolysis of ester bonds between alkanolic acids and glycerol. Phospholipases are a subclass which uses phospholipids as substrates. The ability to use alcohols and amines as acceptors of the fatty acid hydrolytic product permits the synthesis of chiral products. There has been recent interest in the use of lipases for the synthesis of combinatorial libraries<sup>d</sup>.

Enzymes in Synthetic Organic Chemistry<sup>a,b</sup> (Continued)**Monoxygenase**

Insertion of oxygen into organic frameworks such as the oxidation of olefins (Baeyer-Villiger Reaction); hydroxylation of alkanes and aromatics. The cytochrome P-450-dependent monoxygenase is one of the better-known examples. Monoxygenases also oxidize organic sulfur

## Dioxygenase

An enzyme activity which inserts an oxygen molecule into an organic substrate. Where hydroxyl function(s) is the terminal reaction product, the overall reaction is the sum of two separate enzymatic reactions; an oxidation followed by a reduction.

Enzymes in Synthetic Organic Chemistry<sup>a,b</sup> (Continued)**Cephalosporin Acylase**

Conversion of cephalosporin C or adipyl-7-aminodesacetoxycephalosporonic acid to derivatives useful in the synthesis of semi-synthetic  $\beta$ -lactam antibiotics.

Sio, C.F., Otten, L.G., Cool, R.H., and Quax, W.M., Analysis of substrate specificity switch residue of cephalosporin acylase, *Biochem. Biophys. Res. Commun.* 312, 755-760, 2003; Sio, C.F., and Quax, W., Improved  $\beta$ -lactam acylases and their use as biocatalysts, *Curr. Opin. Biotechnol.* 15, 349-355, 2004; Sonawane, V.C., Enzymatic modifications of cephalosporins by cephalosporin acylase and other enzymes, *Crit. Rev. Biotechnol.* 26, 95-120, 2006.

**Penicillin Acylase**

Catalyzes the conversion of benzylpenicillin (penicillin G) to 6-aminopenicillanic acid for the production of  $\beta$ -lactam antibiotics. Penicillin acylase also converts cephalosporin C to 6-aminopenicillanic acid. There has been considerable work on the engineering and stabilization of the enzyme. Penicillin acylase can catalyze the reverse reaction resulting in a condensation.

<sup>a</sup> Targeting of therapeutic enzymes is a challenge and is the subject of current study. See Ribeiro, C.C. Barrias, C.C., and Barbosa, M.A., Calcium phosphate-alginate microspheres as enzyme delivery matrices, *Biomaterial* 25, 4363-4373, 2004; Vogler, C., Levy, B., Grubb, J.H., *et al.*, Overcoming the blood-brain barrier with high-dose enzyme replacement therapy in murine mucopolysaccharidosis VII, *Proc.Nat.Acad.Sci.USA* 102, 14777-14782, 2005; Fukudo, T., Ahearn, M., Roberts, A., *et al.*, Autophagy and mistargeting of therapeutic enzymes in skeletal muscle in Pompe disease, *Mol.Ther.* 14, 831-839, 2006; Lee, S., Yang, S.C., Hefferman, M.J., *et al.*, Polyketal microparticles: a new delivery vehicle for superoxide dismutase, *Bioconjug.Chem.* 18, 4-7, 2007.

## THERAPEUTIC ENZYMES (Continued)

**DNase**

Originally used for the resolution of localized abscesses by viscosity reduction due to hydrolysis of high-molecular weight DNA arising from tissue damage. There is more recent use in the treatment of cystic fibrosis as Dornase™ alpha. A combination of streptokinase and streptodornase was developed as well and is still used as Varidase<sup>b</sup>

Sherry, S., Johnson, A., and Tillett, W.R., The action of streptococcal desoxyribose nuclease (Streptodornase): *In vitro* and on purulent pleural exudations of patients, *J.Clin.Invest.* 29, 1094-1104, 1949; Johnson, A.J., Cytological studies in association with local injections of streptokinase-streptodornase into patients, *J.Clin.Invest.* 29, 1376-1386, 1950; Bryson, H.M. and Borkin, E.M., Dornase alpha. A review of pharmaco-economic and quality-of-life aspects of its use in cystic fibrosis, *Pharmacoeconomics* 12, 409-422, 1997; Jones, A.F. and Wallis, C.E., Recombinant human deoxyribonuclease for cystic fibrosis, *Cochrane Database Syst.Rev.* (3), CD001127, 2000; Suri, R., The use of human deoxyribonuclease (rhDNase) in the management of cystic fibrosis, *BioDrugs* 19, 135-144, 2005; Fayon, M., CF-emerging therapies: Modulation inflammation, *Pediatr.Respir.Rev.* 7 Suppl 1, S170-S174, 2006

**Digestive Enzymes**

Usually a crude homogenate of pancreas using to treatment pancreatic disease. Lipase is an individual enzyme which is used to treat steatorrhea<sup>c</sup>. An artificial saliva is available to treat salivary gland dysfunction<sup>d</sup>.

Gullo, L., Indication for pancreatic enzyme treatment in non-pancreatic digestive diseases, *Digestion* 54(suppl 2), 43-47, 1993; Kitagawa, M., Naruse, S., Ishiguro, H., and Hayakawa, T., Pharmaceutical development for treating pancreatic disease, *Pancreas* 16, 427-431, 1998; Nakamura, T., Takeuchi, T., and Tando, Y., Pancreatic dysfunction and treatment options, *Pancreas* 16, 329-336, 1998; Divisi, D., Di Tomaso, S., Salvemini, S., *et al.*, Diet and cancer, *Acta Biomed.* 77, 118-123, 2006

**Glucocerebrosidase (Acid  $\beta$ -glucosidase/ lysosomal  $\beta$ -glucosidase/lysosomal  $\beta$ -glucosidase) (Ceredase®/ Cerezyme®)** Replacement of a lysosomal enzyme deficiency which results in Gaucher's Disease

Wiltink, E.H. and Hollak, C.E., Alglucerase (ceredase), *Pharm.World Sci.* 18, 16-19, 1996; Bijsterbosch, M.K., Donker, W., van de Bilt, H., *et al.*, Quantitative analysis of the targeting of mannose-terminal glucocerebrosidase. ## THERAPEUTIC ENZYMES (Continued)

- Superoxide Dismutase**                      Superoxide toxicity; treatment of inflammatory disorders; Also gene therapy<sup>e</sup> target in amyelotropic lateral sclerosis<sup>f</sup>
- Omar, B.A., Flores, S.C., and McCord, J.M., Superoxide dismutase, in *Therapeutic Proteins. Pharmacokinetics and Pharmacodynamics*, ed. A.H.C. King, R.A. Baughman, and J.W. Larrick, W.H. Freeman and Company, New York, New York, Chapter 14, pps. 295-315, 1993; di Napoli, M. and Papa, F., M-40403 Metaphore Pharmaceuticals, *IDrugs* 8, 67-76, 2005; Leite, P.F., Liberman, M., Sandoli de Brito, F., and Laurindo, F.R., Redox processes underlying the vascular repair reaction, *World J.Surg.* 28, 331-336, 2004; Hernandez-Savedra, D., Zhou, H., and McCord, J.M., Anti-inflammatory properties of a chimeric recombinant superoxide dismutase: SOD2/3, *Biomed.Pharmacother.* 59, 204-206, 2005; St. Clair, D., Zhao, Y., Chaiswing, L., and Oberly, T., Modulation of skin tumorigenesis by SOD, *Biomed.Pharmacol.* 59, 209-214, 2005; Emerit, J., Samuel, D., and Pavio, N., Cu-Zn superoxide dismutase as a potential antifibrotic drug for hepatitis C related fibrosis, *Biomed.Pharmacother.* 60, 1-4, 2006; Yasui, K. and Baba, A., Therapeutic potential of superoxide dismutase (SOD) for resolution of inflammation, *Inflamm.Res.* 55, 359-363, 2006
- Streptokinase**                                Plasminogen activator derived from  $\beta$ -hemolytic *Streptococcus* (groups A,C, and G); approximately 40-50 kD; streptokinase does not have any known catalytic activity but functions by formation of a complex with plasminogen which results in plasminogen activation. Now available as a recombinant product. Streptokinase is used in combination with DNase(streptodornase) to treat abscesses and empyema<sup>b</sup>.
- de la Fuente Garcia, J. and Estrade, M.P., Experimental studies with recombinant streptokinase, in *Therapeutic Proteins. Pharmacokinetics and Pharmacodynamics*, ed. A.H.C. King, R.A. Baughman, and J.W. Larrick, W.H. Freeman and Company, New York, New York, Chapter 13, pps. 283-293, 1993; Konstantinides, S., Should thrombolytic therapy be used in patients with pulmonary embolism?, *Am.J.Cardiovasc.Drugs.* 4, 69-74, 2004; Capstick, T. and Henry, M.T., Efficacy of thrombolytic agents in the treatment of pulmonary embolism, *Eur.Respir.J.* 26, 664-674, 2005; Ueshima, S. and Matsuo, O., Development of new fibrinolytic agents, *Curr.Pharm.Des.* 12, 849-857, 2006; Caceres-Loriga, P.M., Perez-Lopez, H., Morlana-Herandez, K., Facundo-Sanchez, H., Thrombolysis as first choice therapy in prosthetic heart valve thrombosis. A study of 68 patients, *J.Thromb.Thrombolysis* 21, 185-190, 2006
- Tissue Plasminogen Activator (tPA)**        A serine protease which activate plasminogen resulting in fibrinolysis. tPA is used for the treatment of myocardial infarction and stroke. The first recombinant protein was manufactured in CHO cells; more recently an engineered form (Retepase<sup>®</sup>) has been developed in *Escherichia coli* and is seeing clinical use.
- Collen, D. and Lijnen, H.R., Tissue-type Plasminogen activator. Mechanisms of action and thrombolytic properties, *Haemostasis* 16(Suppl 3), 25-32, 1986; Anderson, J.L. Recent clinical developments in thrombolysis in acute myocardial infarction, *Drugs* 33(Suppl 3), 22-32, 1987; Hollander, J.J., Plasminogen activators and their potential in therapy, *Crit.Rev.Biotechnol.* 6, 253-271, 1987; Grossbard, E.B., Recombinant tissue plasminogen activators: a brief review, *Pharm.Res.* 4, 375-378, 1987; Montaner, J., Stroke biomarkers: Can they help us to guide stroke thrombolysis?, *Drug News Perspect.* 19, 523-532, 2006; Khaja, A.M. and Grotta, J.C., Established treatments for acute ischaemic stroke, *Lancet* 369, 319-330, 2007; Simpson, D., Siddiqui, M.A., Scott, L.J., and Hilleman, D.E., Spotlight on reteplase in thrombotic occlusive disorders, *BioDrugs* 21, 65-68, 2007
- Thrombin**                                        Therapeutic action based on the clotting of fibrinogen and aggregation of blood platelets. Thrombin is a component in fibrin sealant which is used as a tissue adhesive and is used as free-standing product as a suture support and for the treatment of vascular pseudoaneurysms.
- Lundblad, R.L., Bradshaw, R.A., Gabriel, D., *et al.*, A review of the therapeutic uses of thrombin, *Thromb.Haemost.* 91, 851-860, 2004; Hagberg, R.C., Safi, H.J., Sabik, J., *et al.*, Improved intraoperative management of anastomotic bleeding during aortic reconstruction: results of a randomized controlled trial, *Am.Surg.* 70, 307-311, 2004; Aziz, O., Athanasiou, T., and Darzi, A., Haemostasis using a ready-to-use collagen sponge coated with activated thrombin and fibrinogen, *Surg.Technol.Int.* 14, 35-40, 2005; Valbonesi, M., Fibrin glues of human origin, *Best Pract.Res.Clin.Haematol.* 19, 191-203, 2006; Evans, L.A. and Morey, A.F., Hemostatic agents and tissue glues in urologic injuries and wound healing, *Urol.Clin.North Am.* 33, 1-12, 2006; Stone, P.A., AbuRhama, A.F., Flaherty, S.K., and Bates, M.C., Femoral pseudoaneurysms, *Vasc.Endovascular Surg.* 40, 109-117, 2006; Gabay, M., Absorbable hemostatic agents, *Am.J.Health Syst.Pharm.* 63, 1244-1253, 2006; Drobnik, M., Radosavljevic, D., Ravnik, D., *et al.*, Comparison of four techniques for the fixation of a collagen scaffold in the human cadaveric knee, *Osteoarthritis Cartilage* 14, 337-344, 2006
- Urate oxidase (Rasburicase)**                Catalyzes the oxidation of urate to 5-hydroxyisourate. Used for the treatment of hyperuricemia (excess uric acid). Specifically for tumor lysis syndrome, gout.
- Bessmertny, O., Robitaille, L.M., and Cairo, M.S., Rasburicase: a new approach for preventing and/or treating tumor lysis syndrome, *Curr.Pharm.Des.* 11, 4177-4185, 2005; Oldfield, V. and Perry, C.M., Rasburicase: a review of its use in the management of anticancer therapy-induced hyperuricaemia, *Drugs* 66, 529-545, 2006; Oldfield, V. and Perry, C.M., Spotlight on rasburicase in anticancer therapy-induced hyperuricemia, *BioDrugs* 20, 197-199, 2006; Lee, S.J. and Terkeltaub, R.A., New developments in clinically relevant mechanisms and treatment of hyperuricemia, *Curr.Rheumatol.Rep.* 8, 224-230, 2006; Teng, G.G., Nair, R., and Saag, K.G., Pathophysiology, clinical presentation and treatment of gout, *Drugs* 66, 1547-1563, 2006; Higdon, M.L. and Higdon, J.A., Treatment of oncologic emergencies, *Am.Fam.Physician* 74, 1873-1880, 2006; Sood, A.R., Burry, L.D., and Cheng, D.K., Clarifying the role of rasburicase in tumor lysis syndrome, *Pharmacotherapy* 27, 111-121, 2007

<sup>e</sup> In this context, gene therapy can refer to gene augmentation therapy, gene correction therapy, and RNA silencing.

<sup>f</sup> Xu, Z. and Xia, X.G., RNAi therapy: dominant disease gene gets silenced, *Gene Ther.* 12, 1159-1160, 2005; Hino, T., Yokota, T., Ito, S., *et al.*, *In vivo* delivery of small interfering RNA targeting brain capillary endothelial cells, *Biochem.Biophys.Res. ## THERAPEUTIC ENZYMES (Continued)

**Urokinase**

Originally isolated from urine, urokinase is now available a recombinant protein and is used for the treatment of thrombosis in myocardial infarction and stroke; tPA is more often used for stroke. Urokinase acts by converting plasminogen to plasmin<sup>8</sup>.

Maksimenco, A.V. and Tischenko, E.G., New thrombolytic strategy: bolus administration of tPA and urokinase-fibrinogen conjugate, *J.Thromb. Thrombolysis* 7, 307-312, 1999; Stepanova, V.V., and Tkachuk, V.A., Urokinase as a multidomain protein and polyfunctional cell regulation, *Biochemistry* 67, 109-118, 2002; Bourekas, E.C., Slivka, A.F., and Casavant, M.J., Intra-arterial thrombolysis of a distal internal carotid artery occlusion in an adolescent, *Neurocrit.Care* 2, 179-182, 2005; Roychoudhury, P.K., Khaparde, S.S., Mattisson, R., and Kumar, A., Synthesis, regulation and production of urokinase using mammalian cell culture: a comprehensive review, *Biotechnol.Adv.* 24, 514-526, 2006; Bansal, V. and Roychoudhury, P.K., Production and purification of urokinase: a comprehensive review, *Protein Expr.Purif.* 45, 1-14, 2006; Juttler, E., Kohrmann, M., and Schellinger, P.D., Therapy for early reperfusion after stroke, *Nat.Clin.Pract.Cardiovasc.Med.* 3, 656-663, 2006; Mullen, M.T., McGarvey, M.L., and Kasner, S.E., Safety and efficacy of thrombolytic therapy in postoperative cerebral infarctions, *Neurol.Clin.* 24, 783-793, 2006.

<sup>8</sup> Plasmin is a serine protease which digests fibrin. An acyl-plasmin was developed for therapeutic use – Smith, R.A., Dupe, R.J., English, P.D., and Green, J., Fibrinolysis with acyl-enzymes: a new approach to thrombolytic therapy, *Nature* 290, 505-508, 1981; Dupe, R.J., English, P.D., Smith, R.A., and Green, D.J., Acyl-enzymes as thrombolytic agents in dog models of venous thrombosis and pulmonary embolism, *Thromb.Haemost.* 51, 249-253, 1984; Tomiya, N., Watanabe, K., Awaya, J., *et al.*, Modification of acyl-plasmin-streptokinase complex with polyethylene glycol. Reduction of sensitivity to neutralizing antibody, *FEBS Lett.* 193, 44-48, 1985; Kalindjian, S.B. and Smith, R.A., Reagents for reversible coupling of proteins to the active centres of trypsin-like serine proteinases, *Biochem.J.* 249, 409-413, 1987; Teuten, A.J., Cooper, A., Smith, R.A., and Dobson, C.M., Binding of a substrate analogue can induce co-operative structure in the plasmin-serine proteinase domain, *Biochem.J.* 293, 567-572, 1993; Lijnen, H.R., van Hoef, B., Smith, R.A., and Collen, D., Functional properties of *p*-anisoylated plasmin-staphylokinase complex, *Thromb.Haemost.* 70, 326-331, 1993.

## APPENDIX A: ABBREVIATIONS AND ACRONYMS

- 2D-DIGE:** two-dimensional difference gel electrophoresis  
**2DE:** two-dimensional electrophoresis  
**A:** absorbance  
**A23187:** a calcium ionophore, Calcimycin  
**AAA:** abdominal aortic aneurysm; AAA+. ATPases associated with various cellular activities:  
**AAAA:** Association Against Acronym Abuse  
**AAG box:** an upstream *cis*-element  
**AAS:** aminoalkylsilane; atomic absorption spectroscopy  
**AAT:** amino acid transporter; alpha-1-antitrypsin  
**AAV:** adenoassociated virus  
**ABA:** Abscisic acid, a plant hormone  
**ABC-Transporter Proteins:** ATP-Binding Cassette Transporter Proteins  
**ABC:** ATP-Binding Cassette; antigen-binding cell  
**ABE:** acetone butanol ethanol  
**Ab1:** retroviral oncogene derived from Abelson murine leukemia  
**ABRC:** ABA response complex  
**ABRE:** ABA response element  
**7-ACA:** 7-aminocephalosporanic acid  
**ACES:** 2-[(2-amino-2-oxyethyl)amino]-ethanesulfonic acid  
**ACSF:** Artificial cerebrospinal fluid  
**ACS:** active sequence collection  
**Ach (AcCho):** acetylcholine  
**AChR (AcChoR):** acetylcholine receptor  
**ACME:** arginine catabolic mobile element  
**ACTH:** adrenocorticotropin  
**Can:** acetonitrile  
**Acrylodan:** 6-acryloyl-2-(dimethylamino)-naphthalene  
**ADA:** adenosine deaminase; antidrug antibody  
**ADAM:** a disintegrin and metalloproteinase  
**ADAMTS:** a subfamily of disintegrin and metalloproteinase with thrombospondin motifs.  
**ADCC:** antibody-dependent cell-mediated cytotoxicity as in NK cells attacking antibody-coated cells  
**ADH:** alcohol dehydrogenase; antidiuretic hormone  
**ADME:** adsorption, distribution, metabolism, excretion  
**ADME-Tox:** ADME-Toxicology  
**AdoMet:** S-adenosyl-L-methionine  
**AEC:** alveolar epithelial cell  
**AFLP:** amplified fragment length polymorphism  
**AFM:** atomic force microscopy  
**AGE:** advanced glycation endproducts  
**AGO:** argonaute protein family  
**AGP:** acid glycoprotein  
**AID:** activation-induced cytosine deaminase  
**AKAP:** A-kinase anchoring proteins  
**Akt:** a protein kinase  
**Akt:** a retroviral oncogene derived from AKT8 murine T cell lymphoma  
**Alk:** anaplastic lymphoma kinase; receptor member of insulin superfamily  
**ALL:** acute lymphocytic leukemia  
**ALP:** alkaline phosphatase  
**ALS:** anti-lymphocyte serum  
**ALT:** alanine aminotransferase  
**ALV:** avian leukosis virus  
**AML:** acute myeloid leukemia  
**AMPK:** AMP-activated protein kinase  
**AMS:** accelerator mass spectrometry  
**AMT:** accurate mass tag  
**ANDA:** Abbreviated New Drug Application  
**ANOVA:** analysis of variables (factorial analysis of variables)  
**ANS:** 1-anilino-8-naphthensulfonate; autonomic nervous system  
**ANTH:** AP180 N-terminal homology as in ANTH-domain  
**2-AP:** 2-aminopyridine  
**6-APA:** 6-aminopenicillanic acid  
**APAF1:** apoptotic protease activating factor 1  
**App1:** a serine/threonine protein kinase required for vesicle formation which is essential for autophagy  
**APL:** acute promyelocytic leukemia  
**ApoB:** apolipoprotein B  
**AQP:** adenosine tetraphosphate  
**ARAP3:** a dual Arf and Rho GTPase activating protein  
**ARD:** acute respiratory disease; acireductone dioxygenase; automatic relevance determination; acid rock drainage  
**ARE:** AU-rich elements  
**ARF:** ADP-ribosylation factor  
**ARL:** Arf-like  
**ARM:** arginine-rich motif  
**ARS:** automatic replicating sequence or autonomously replicating sequence  
**ART:** mono-ADP-ribosyltransferase; family of proteins, large group of A-B toxins  
**AS:** antisense  
**ASD:** alternative splicing database; <http://www.ebi.ac.uk/asd>  
**ASPP:** ankyrin-repeat, SH3-domain and proline-rich-region-containing proteins  
**AST:** aspartate aminotransferase  
**ATC:** aspartate transcarbamylase domain  
**ATCase:** aspartate transcarbamylase  
**ATP:** adenosine-5'-triphosphate  
**ATP $\gamma$ S:** adenosine-5'-3-O-(thiotriphosphate)  
**ATR-FTIR:** attenuated total reflectance-Fourier transform infrared  
**ATR-IR:** attenuated total reflection infrared  
**AVT:** arginine vasotocin  
**Axl:** anexelekto; used in reference to a receptor kinase related to the Tyro 3 family  
**BA:** betaine aldehyde  
**BAC:** bacterial artificial chromosome; also blood alcohol concentration  
**BAD:** a member of the Bcl02 protein family considered to be a proapoptotic factor  
**BADH:** betaine aldehyde dehydrogenase  
**BAEC:** bovine aortic endothelial cells  
**BAEE:** Benzoyl-arginine ethyl ester<sup>a</sup>  
**BALT:** bronchial associated lymph tissue  
**BBB:** blood brain barrier  
**B-CAM:** basal cell adhesion molecule  
**BCG:** bacille-Calmette-Guérin  
**BCR:** breakpoint cluster region; B-cell receptor  
**BCR-ABL:** BCR-ABL is the fused gene that results from the *Philadelphia chromosome*, The BCR-ABL gene produces the *BCR-ABL tyrosine kinase*,  
**Bcl-2:** protein family regulating apoptosis  
**BCIP:** 5-bromo, 4-chloro, 3-indoyl phosphate

- BCS:** biopharmaceutical classification system for describing the gastrointestinal absorption of drugs; also Budd-Chiari syndrome
- BDH:** D- $\beta$ -butyrate dehydrogenase
- BDNF:** brain-derived growth factor
- BEBO:** an unsymmetrical cyanine dye for binding to the minor groove of DNA; 4-[(3-methyl-6-(6-methyl-benzothiazol-2-yl)-2,3,-dihydro(benzo-1,3-thiazole)-2-methylidene)]-1-methyl-pyridinium iodide.
- BET:** refers to an isotherm for adsorption phenomena in chromatography; acronym derived from Stephen Brunauer, Paul Emmet, and Edward Teller
- B/F:** bound/free
- bFGF:** basic fibroblast growth factor
- BFP:** blue fluorescent protein
- BGE:** background electrolyte
- Bicine:** *N,N*-bis(2-hydroxyethyl)glycine
- BiFC:** bimolecular fluorescence complementation
- BIND:** biomolecular interaction network database
- BiP:** immunoglobulin heavy chain-binding protein
- Bis-TRIS:** 2,2-bis-(hydroxymethyl)-2,2',2'' nitriloethanol
- BLA:** Biologic License Application
- BLAST:** basic local alignment search tool
- BME:** 2-mercaptoethanol;  $\beta$ -mercaptoethanol
- BMP:** bone morphogenic protein
- BopA:** a secreted protein required for biofilm formation
- BPTI:** bovine pancreatic trypsin inhibitor
- BCRA-1:** breast cancer 1; a tumor suppressor gene associated with breast cancer
- BRE-luc:** a mouse embryonic stem cell line used to study bone morphogenetic protein.
- BRET:** bioluminescence resonance energy transfer, see FRET.
- BrdU:** bromodeoxyuridine
- Brig:** polyoxyethylene lauryl ether
- BSA:** bovine serum albumin
- bZIP:** basic leucine zipper transcription factor
- CIINH:** C1 inhibitor; inhibitor of activated complement component 1, missing in hereditary angioneurotic edema.
- CA125:** cancer antigen 125; a glycoprotein marker used for prognosis in ovarian cancer; also referred to as MUC16
- CAD:** multifunctional protein and initiates and regulate *de novo* pyrimidine biosynthesis; caspases-activated DNase.
- CAK:** Cdk-activating kinase
- CALM:** clathrin assembly lymphoid myeloid leukemia as in CALM gene
- CAM (CaM):** calmodulin; cell adhesion molecule
- CAMK:** Ca<sup>2+</sup>/calmodulin-dependent protein kinase
- CAPS:** cleavable amplified polymorphic sequences; also cationic antimicrobial peptide
- CarG:** a promoter element [CC(A/T)<sub>6</sub>G] gene for smooth muscle  $\alpha$ -actin
- CASP:** critical assessment of structural prediction
- CASPASE:** cysteine-dependent aspartate-specific protease
- CAT:** catalase; chloramphenicol acetyl transferase
- CATH:** class, architecture, topology, homologous superfamily; hierarchical classification of protein domain structure.
- CATP:** Chloramphenicol resistance gene, caged ATP, cation transporting p-type
- Cbl:** a signal transducing protein downstream of a number of receptor-couple tyrosine kinases; a product of the *c-cbl* proto-oncogene
- Cbs:** chromosomal breakage sequence
- CBz:** carbobenzoxy
- CCC:** concordance correlation coefficient
- CCD:** charge couple device
- CCK:** cholecystokinin
- CCV:** clathrin-coated vesicles
- CD:** clusters of differentiation; circular dichroism; cyclodextrin
- CDC:** complement-dependent cytotoxicity; complement-mediated cell death
- CDK (cDK):** cyclin-dependent kinase
- cDNA:** complementary DNA
- CDR:** complementary determining region
- CDTA:** 1,2-cyclohexylenedinitriloacetic acid
- CE:** capillary electrophoresis
- CEC:** capillary electrochromatography
- CE-SDS:** capillary electrophoresis in the presence of sodium dodecyl sulfate
- CELISA:** cellular enzyme-linked immunosorbent assay; enzyme-linked immunosorbent assay on live cells
- CERT:** ceramide transport protein
- CEPH:** Centre d'Etude du Polymorphisme Humain
- CEX:** cation exchange
- CFA:** complete Freund's adjuvant
- CFP:** Cyan Fluorescent Protein
- CFTR:** cystic fibrosis transmembrane conductance region
- Cfuc:** colony forming unit
- CGE:** capillary gel electrophoresis
- CGH:** comparative genome hybridization
- CGN:** *cis*-Golgi network
- CH:** calponin homology
- CHAPS:** 3-[(3-cholamidopropyl)dimethylammonio]-1-propane-sulfonic acid
- CHCA:**  $\alpha$ -cyano-4-hydroxycinnamic acid
- CHEF:** chelation-enhanced fluorescence
- CHES:** 2-(*N*-cyclohexylamino)ethanesulfonic acid
- ChiP:** chromatin immunoprecipitation
- CHO:** chinese hamster ovary; carbohydrate
- CID:** collision-induced dissociation; collision-induced dimerization
- CIDEP:** chemically induced dynamic electron polarization
- CIDNP:** chemically induced dynamic nuclear polarization
- CIEEL:** chemically initiated electron exchange luminescence
- CLIP:** class-II-associated invariant chain (Ii) peptide
- CLT:** clotvinazole [1-( $\alpha$ 2-chlorotriptyl)imidazole]
- CLUSTALW:** A general purpose program for structural alignment of proteins and nucleic acids <http://www.ebi.ac.uk/clustalw/>
- cM:** centimorgan
- CM:** carboxymethyl
- CaMK:** calmodulin kinase, isoforms I, II, III
- CMCA :** competitive metal capture analysis
- CML:** chronic myelogenous leukemia
- CML:** carboxymethyl lysine
- CAN:** bacterial cell wall collagen-binding protein
- Cn:** calcineurin
- CNC:** Cap'n'Collar family of basic leucine zipper proteins
- CNE:** conserved non-coding elements
- dCNE:** duplicated CNE
- COACH:** comparison of alignments by constructing hidden Markov models
- CoA:** coenzyme A
- COFFEE:** consistency based objective function for alignment evaluation
- COFRADIC:** combined fractional diagonal chromatography
- COG:** conserved oligomeric Golgi; cluster of orthologous groups
- COPD:** chronic obstructive pulmonary disease

- COX:** cytochrome C oxidase  
**Cp:** ceruloplasmin  
**CPA:** carboxypeptidase A  
**CPB:** carboxypeptidase B  
**CPD:** cyclobutane pyrimidine dimer  
**CPDK:** calcium-dependent protein kinase  
**CpG:** cytosine-phosphate-guanine  
**CpG-C:** cytosine-phosphate-guanine class C  
**Cdk4:** a Ca<sup>2+</sup> protein kinase  
**CPP:** cell penetrating peptide; combinatorial protein pattern  
**CPase:** carbamoyl-phosphate synthetase  
**CPY:** carboxypeptidase Y  
**CRAC:** calcium-release activated calcium (channels)  
**CRE:** cyclicAMP response element  
**Cre1:** cytokine response 1; a membrane kinase  
**CREA:** creatinine  
**CREB:** cAMP-response element binding protein  
**CRM:** certified reference material  
**CRP:** C-reactive protein; also cAMP receptor protein  
**CRY:** chaperone  
**CS:** chondroitin sulfate  
**CSF:** colony stimulating factor  
**CSP:** cold-shock protein  
**CSR:** cluster-situated regulator; class-switch recombination  
**CSSL:** chromosome segment substitution lines  
**Ct:** chloroplast  
**CT:** charge transfer  
**CTB:** cholera toxin B subunit  
**CTD:** C-terminal domain  
**CTL:** cytotoxic T lymphocytes  
**CTLA:** cytotoxic T lymphocyte-associated antigen  
**CTLL:** cytotoxic T-cell lines  
**CTPSase:** CTP synthetase  
**CtrA:** a master regulator of cell cycle progression  
**CV:** coefficient of variation  
**Cvt:** cytosome to vacuole targeting  
**CW:** continuous wave(non-pulsed source of electromagnetic radiation)  
**CYP:** cytochrome P450 enzyme  
**Cst3:** cystatin 3  
**CZE:** capillary zone electrophoresis  
**D:** diffusion  
**D<sub>ax</sub>:** axial dispersion coefficient  
**DAB(*p*-**dab**):** p-dimethyl amino azo benzene  
**dABs:** domain antibodies  
**DABSYL:** *N,N*-dimethylaminoazobenzene-4'-sulfonyl-usually as the chloride, DABSYL chloride  
**DAD:** diaphanous-autoregulatory domain  
**DAF:** decay accelerating factor  
**DAG:** diacyl glycerol  
**DALI:** distance matrix alignment; <http://www2.ebi.ac.uk/dali/>  
**DANSYL:** 5-dimethylaminonaphthalene-1-sulfonyl; usually as the chloride (DANSYL chloride)  
**DAP:** DNAX-activation protein; also diaminopimelic acid;  
**DAPI2:** DNAX activating protein of 12kDa mass  
**DAS:** distributed annotated system; downstream activation site  
**DBMB:** Dulbecco's modified Eagles Medium  
**DBD-PyNCS:** 4-(3-isocyanatopyrrolidin-1-yl)-7-(*N,N*-dimethylaminosulfonyl)-2-benzoxadiazole  
**DBTC:** "Stains All"; 4,5,4',5'-dibenzo-3,3'-diethyl-9-methylthia-carbocyanine bromide  
**DC:** dendritic cell  
**DCC:** dicyclohexylcarbodiimide  
**DCCD:** *N,N'*-dicyclohexylcarbodiimide  
**DDBJ:** DNA Databank of Japan; <http://www.ddbj.nig.ac.jp>  
**DDRs:** discoidin domain receptors (DDR1, DDR2)  
**DDR1:** discoidin domain receptor1, CAK, CD167a, PTK3, Mck10  
**DDR2:** discoidin domain receptor2, NTRK3, TKT, Tyro10  
**DEAE:** diethylaminoethyl  
**DEG:** differentially expressed gene(s)  
**DEX:** dendritic-cell-derived exosomes  
**DFE:** DNA fragmentation factor  
**DFP:** diisopropylfluorophosphate; diisopropylphosphorofluoridate  
**DHFR:** dihydrofolate reductase  
**DHO:** dihydroorotase domain  
**DHOase:** dihydroorotase  
**DHPLC(dHPLC):** denaturing HPLC  
**DHS:** DNase I hypersensitivity site  
**DIP:** database of interacting proteins - <http://dip.doe-mbi.ucla.edu>; also dictionary of interfaces in proteins - <http://drug-redesign.de/superposition.html>  
**Dipso:** 3-[*N,N*-bis(2-hydroxyethyl)amino]-2-hydroxypropane-sulfonic acid  
**DLS:** dynamic light scattering  
**DM:** an accessory protein located in the lysosome associated with MHC-class-II antigen presentation. It is located in the endosomal/lysosomal system of APC  
**DMBA:** 7,12-dimethylbenzo[ $\alpha$ ]anthracene  
**DMD:** Duchenne muscular dystrophy; also Doctor of Dental Medicine  
**DMF:** dimethylformamide; decayed, missing, filled(denistry)  
**DMS:** dimethyl sulfate  
**DMSO:** dimethyl sulfoxide  
**DMT1:** divalent metal transporter 1  
**ssDNA:** single-stranded DNA  
**DNAa:** a bacterial replication initiation factor  
**DNAX:** DNAase III, tau and gamma subunits  
**dNPT:** deoxynucleoside triphosphate  
**DO:** an accessory protein located in the lysosome associated with MHC-class-II antigen presentation. DO has an accessory role to DM  
**DOTA:** tetraazacyclododecanetetraacetic acid  
**DPE:** downstream promoter element  
**DPI:** dual polarization interferometry  
**DPM:** disintegrations per minute  
**DPN:** diphosphopyridine dinucleotide (currently NAD);  
**DPPC:** dipalmitoylphosphatidylcholine  
**DPPE:** 1,2-dipalmitoyl-*sn*-glycerol-3-phosphoethanolamine  
**DPTA:** diethylenetriaminepentaacetic acid  
**dsDNA:** double-stranded DNA  
**dsRNA:** double-stranded RNA  
**dsRBD:** double-stranded RNA binding domain  
**DRE:** dehydration response element; dioxin response element  
**DRT:** dimensionless retention time (a value for chromatography)  
**DSC:** differential scanning calorimetry  
**DSP:** downstream processing  
**DTAF:** dichlorotriazinyl aminofluorescein  
**DTE:** dithioerythritol  
**DTNB:** 5,5'-dithio-bis(2-nitrobenzoic acid) Ellman's Reagent  
**DTT:** dithiothreitol  
**DUP:** a duplicated yeast gene family  
**DVDF:** polyvinyl difluoride  
**E1:** ubiquitin-activating enzyme  
**E2:** ubiquitin carrier protein  
**E3:** ubiquitin-protein isopeptide ligase

- E-64:** *trans*-epoxysuccinyl-L-leucylamino-(4-guanidino)-butane, proteolytic enzyme inhibitor
- EAA:** excitatory amino acid
- EBA:** expanded bead adsorption
- EBV:** Epstein-Barr virus
- EDC(EADC):** 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide; *N*-ethyl-*N'*-(3-dimethyl-aminopropyl) carbodiimide
- ECF:** extracytoplasmic factor; extracellular fluid
- ECM:** extracellular matrix
- EDC:** 1-ethyl-(3-dimethylaminopropyl)-carbodiimide
- EDI:** electrodeionization
- EDTA:** ethylenediaminetetraacetic acid, Versene, (ethylenedinitrilo) tetraacetic acid;
- EEO:** electroendoosmosis
- EEOF:** electroendoosmotic flow
- EF:** electrofiltration
- EGF:** epidermal growth factor
- EGFR:** epidermal growth factor receptor; Erb $\beta$ -1; HER1
- EGTA:** ethyleneglycol-bis( $\beta$ -aminoethylether)-*N,N,N',N'*-tetraacetic acid;
- eIF:** eukaryotic initiation factor
- EK:** electrokinetic
- EKLF:** erythroid Krüppel-like factor
- ELISA:** enzyme-linked immunosorbant assay
- EMBL:** European Molecular Biology Laboratory
- EMCV:** encephalomyocarditis virus
- EMF:** electromotive force
- EMMA:** enhanced mismatch mutation analysis
- EMSA:** electrophoretic mobility shift assay
- ENaC:** epithelial Na channel
- EndoG:** endonuclease G
- ENTH:** epsin *N*-terminal homology as ENTH-domain
- ENU:** *N*-ethyl-*N*-nitrosourea
- EO:** ethylene oxide
- EOF:** electroosmotic flow
- Epk:** a family of receptor tyrosine kinases; function as receptors/ligands for ephrins
- EPL:** expressed protein ligation
- Epps:** 4-(2-hydroxyethyl)-1-piperazinepropanesulfonic acid
- EPR:** electron paramagnetic resonance
- ER:** endoplasmic reticulum
- ERAD:** endoplasmic reticulum-associated protein degradation
- ErbB2:** epidermal Growth Factor Receptor, HER2
- ErbB3:** epidermal Growth Factor Receptor, HER3
- ErbB4:** epidermal Growth Factor Receptor, HER4
- ERK:** Extracellular-regulated kinase
- Erk ½:** P 42/44 extracellular signal-regulated kinase
- Ero1p:** a thiol oxidase which generates disulfide bonds inside in the endoplasmic reticulum
- ERSE:** endoplasmic reticulum(ER) stress response element
- ES:** embryonic stem as in embryonic stem cell
- ESI:** electrospray ionization
- ESR:** electron spin resonance; also erythrocyte sedimentation rate
- ESS:** exonic splicing silencer
- EST:** expressed sequence tag
- ETAAS:** electrothermal atomic absorption
- 5,6-ETE:** 5,6-epoxyeicosatrienoic acid
- ETS:** family of transcription factors
- EUROFAN:** European functional analysis network - <http://mips.gsf.de/proj/eurofan/>; also European Programme for the Study and Prevention of Violence in Sport
- Exo1:** exonuclease 1
- EXPI:** expansion gene
- FAAH:** fatty acid amide hydrolase
- Fab:** antigen binding fragment from immunoglobulin
- FAB:** fast atom bombardment
- FAB-MS/MS:** fast atom bombardment-mass spectrometry/mass spectrometry
- FACE:** fluorophore-assisted carbohydrate electrophoresis
- FACS:** fluorescence-activated cell sorting
- FADD:** Fas association death domain
- FAD:** flavin adenine dinucleotide
- FAK:** focal adhesion kinase
- FBS:** fetal bovine serum
- Fc:** Fc region of an immunoglobulin representing the C-terminal region
- Fc $\gamma$ R:** cell surface receptor for the Fc domain of IgG
- FDA:** fluorescein diacetate
- FDC:** follicular dendritic cells
- FCCP:** carbonyl cyanide *p*-trifluoromethoxyphenyl-hydrazine
- FEAU:** 2'-fluoro-2'-deoxy- $\beta$ -D-arabinofuranosyl-5-ethyluracil
- FERM:** as in FERM-domain (four-point-one; ezrin, radixin, moesin).
- FFAT:** two phenylalanyl residues in an acidic tract
- FIAU:** 2'-fluoro-2'-deoxy- $\beta$ -D-arabinofuranosyl-5-iodouracil
- FecA:** ferric citrate transporter
- FEN:** flap endonuclease
- Fes:** retroviral oncogene derived from ST and GA feline sarcoma
- FFPE:** formalin-fixed, paraffin-embedded
- FGF:** fibroblast growth factor
- FGFR:** fibroblast growth factor receptor
- Fgr:** retroviral oncogene derived from GR feline sarcoma
- FIGE:** field-inversion gel electrophoresis
- FITC:** fluorescein isothiocyanate
- FTIR:** Fourier-transformed infrared reflection
- FTIR-ATR:** Fourier-transformed infrared reflection-attenuated total reflection
- FLAG™:** an epitope "tag" which can be used as a fusion partner for recombinant protein expression and purification.
- FlhB:** a component of the flagellum-specific export apparatus in bacteria.
- FLIP:** fluorescence loss in photobleaching
- FLK-1:** vascular endothelial growth factor receptor (VEGFR)
- FLT-1:** vascular endothelial growth factor receptor (VEGFR)
- fMLP(FMLP):** *N*-formyl methionine leucine phenylalanine
- fMOC:** 9-Fluorenylmethyloxycarbonyl
- Fms:** retroviral oncogene derived from SM feline sarcoma
- Fok1:** a type IIS restriction endonuclease derived from *Flavobacterium okeanoikoites*
- Fos:** retroviral oncogene derived from FBJ murine osteosarcoma
- FOX:** forkhead box
- FpA:** fibrinopeptide A
- FPC:** fingerprinted contigs
- Fps:** retroviral oncogene from Fujiami avian sarcoma
- FRAP:** fluorescence recovery after photobleaching
- FRET:** fluorescence resonance energy transfer; Förster resonance energy transfer
- FT:** Fourier Transform
- FSSP:** fold classification based on structure alignment of proteins; <http://www2.ebi.ac.uk/dali/fssp/fssp.html>
- FU:** aluorescence unit
- 5-Fu:** 5-fluorouracil
- Fur:** ferric uptake receptor
- Fur:** gene for Fur

- FYVE**: a zinc-binding motif; acronym derived from four proteins containing this domain
- G**: guanine
- G $\alpha$** : heterotrimeric G protein,  $\alpha$ -subunit
- G $\beta$** : heterotrimeric G protein,  $\beta$ -subunit
- G $\gamma$** : heterotrimeric G protein,  $\gamma$ -subunit
- G-6-PD**: glucose-6-phosphate dehydrogenase
- GABA**: gamma ( $\gamma$ )-aminobutyric acid
- GAG**: glycosaminoglycan
- GALT**: gut-associated lymphoid tissues
- GalNac**: *N*-acetylgalactosamine
- GAPDH**: glyceraldehyde 3-phosphate dehydrogenase
- GAPS**: GTPase activating proteins
- GAS6**: a protein, member of the vitamin K-dependent protein family
- GASP**: Genome Annotation Assessment Project; <http://www.fruitfly.org/GASP1/>; also growth advantage in stationary phase
- GBD**: GTPase binding domain
- GC**: gas chromatography; granular compartment
- GC-MS**: gas chromatography-mass spectroscopy
- GC-MSD**: gas chromatography-mass selective detector
- GcrA**: A master regulator of cell cycle progression
- G-CSF**: granulocyte colony stimulating factor
- GCP**: Good Clinical Practice
- GDH**: glutamate Dehydrogenase
- GDNF**: glial-derived neurotrophic factor
- GdnHCl**: guanidine hydrochloride
- GEFs**: guanine nucleotide exchange factors
- GF-AAS**: graphite furnace atomic absorption spectroscopy
- GFP**: green fluorescent protein
- GGDEF**: a protein family
- GGT**: gamma-glutamyl transferase
- GGTC**: German Gene Trap Consortium; a reference library of gene trap sequence tags (GTST) <http://www.genetrap.de/>
- GHG**: greenhouse gas
- GI**: gastrointestinal; genomic islands
- cGK**: cyclic GMP (cGMP)-dependent protein kinase
- GlcNac**: *N*-acetylglucosamine
- GLD**: gelsolin-like domain
- GLP**: Good Laboratory Practice(s)
- GlpD**: glyceraldehyde-3-phosphate dehydrogenase
- GLUT**: a protein family involves in the transport of hexoses into mammalian tissues
- Glut4**: facilitative glucose transporter which is insulin-sensitive
- Glut5**: a fructose transporter, catalyzes the uptake of fructose
- GM**: genetically modified
- GMP-PDE(cyclic GMP-PDE)**: cyclic GMP-phosphodiesterase
- GM-CSF**: granulocyte-macrophage colony stimulating factor
- cGMP**: current Good Manufacturing Practice
- GNSO**: 5-nitrosoglutathione
- GPC**: gel permeation chromatography
- GPCR**: G-protein coupled receptor
- GPI**: glycosyl phosphatidylinositol
- GRIP**: a Golgi-targeting protein domain
- GRP**: glucose-regulated protein
- Grp78**: a glucose regulated protein; identical with BiP
- GSH**: glutathione
- GST**: glutathione-*S*-transferase; gene trap sequencing tag
- GTF**: general Transcription factor
- GTST(GST)**: gene trap sequence tags
- GUS**: beta-glucuronidase
- GXP(s)**: A generic acronymy for good ..... practices including but not limited to good clinical practice, good laboratory practice, good manufacturing processes.
- HA**: hemagglutin-A; hyaluronic acid; hydroxyapatite,  $\text{Ca}_{10}(\text{PO}_4)_6(\text{OH})_2$
- HABA**: [2-(4'-hydroxyazobenzene)] benzoic acid;
- HAS**: human serum albumin; hyaluron synthase
- HAT**: histone acetyltransferase; hypoxanthine, aminopterin and thymidine
- HBSS**: Hanks Balanced Salt Solution
- H/D**: hydrogen/deuterium exchange
- HAD**: heteroduplex analysis
- HDAC**: histone deacetylase
- HDL**: high-density lipoprotein
- HDLA**: human leukocyte differentiation antigen
- HD-ZIP**: homeodomain-leucine zipper proteins
- HEPT**: height equivalent to plate number
- HERV**: human endogenous retrovirus
- 20-HETE**: 20-hydroxyeicosatetraenoic acid
- HETP**: plate height (chromatography);
- HexNac**: *N*-acetylhexosamine
- HGP**: human genome project
- HH**: hereditary hemochromatosis
- HHM**: hidden Markov models
- His-Tag(His<sub>6</sub>; H<sub>6</sub>)**: histidine tag – a hexahistidine sequence
- HLA**: human leukocyte associated antigen
- HLA-DM**: enzyme responsible for loading peptides onto MHC class II molecules
- HLA-DO**: protein factor which modulates the action of HLA-DM
- HMGR**: 3-hydroxy-3-methylglutamyl-coenzyme A reductase
- HMP**: herbal medicinal product(s)
- HMT**: histone
- hnRNA**: heterologous nuclear RNA
- HOG**: high-osmolarity glycerol
- HOPE**: Hepes-glutaminic acid-buffer mediated organic solvent protein effect
- HOX(HOX, *hox*)**: describing a family of transcription factors
- HPAED-PAD**: high performance anion-exchange chromatography-pulsed amperometric detection
- 5-HPETE**: 5-hydroperoxyeicosatetraenoic acid
- HPRD**: human protein reference database
- HPRT**: hypoxanthine phosphoribosyl transferase
- HRP**: horse radish peroxidase
- HS**: heparan sulfate
- HSB**: homologous synteny blocks
- HSC**: hematopoietic stem cell
- HSCQ**: heteronuclear single quantum correlation
- HSE**: heat shock element
- Hsp**: heat-shock protein
- Hsp70**: heat shock protein 70
- 5-HT**: 5-hydroxytryptamine
- HTF**: *HpaII* tiny fragments; distinct fragments from the *HpaII* digestion of DNA; *HpaII* is a restriction endonuclease
- HTH**: helix-turn-helix
- HTS**: high-throughput screening
- htSNP**: haplotype single nucleotide polymorphism
- HUGO**: human genome organization
- HUVEC**: human umbilical vein endothelial cells
- IAA**: iodoacetic acid
- IAEDANS**: *N*-iodoacetyl-*N'*-(5-sulfo-1-naphthyl) ethylenediamine
- IBD**: identical-by-descent; also inflammatory bowel disease
- IC**: ion chromatography

- ICAM:** intercellular adhesion molecule  
**ICAT:** isotope-coded affinity tag  
**ICH:** intracerebral hemorrhage; a gene related to *Ice* involved in programmed cell death; historically, international chick unit; International Conference for Harmonisation  
**ICPMS:** inductively coupled plasma mass spectrometry  
**ID:** internal diameter  
**IDA:** interaction defective allele  
**IDMS:** isotope dilution mass spectrometry  
**IEC:** ion-exchange chromatography  
**IEF:** isoelectric focusing  
**IES:** internal eliminated sequences  
**IFE:** immunofixation electrophoresis  
**IFN:** interferon  
**Ig:** immunoglobulin  
**IGF:** insulin-like growth factor  
**IGFR:** insulin-like growth factor receptor  
**Ihh:** indian hedgehog  
**I $\kappa$ B:** NF- $\kappa$ B inhibitor  
**I $\kappa$ K:** I $\kappa$ B kinase  
**IL:** Interleukin  
**iLAP:** integrated lysis and purification  
**ILGF:** insulin-like growth factor  
**ILGFR:** insulin-like growth factor receptor  
**ILK:** integrin-linked kinase  
**IMAC:** immobilized metal-affinity chromatography  
**IMINO:** Na<sup>+</sup>-dependent alanine-insensitive proline uptake system (SLC6A20)  
**IMP:** integrin-mobilferrin pathway membrane protein system involves in the transport of ferric iron; also inosine-5'- monophosphate  
**IPG:** immobilized pH gradient  
**IPTH:** isopropylthio- $\beta$ -D-galactopyranoside  
**IP<sub>3</sub>:** inositol 1,4,5-triphosphate  
**IPTG:** Isopropylthio- $\beta$ -D-galactosidase  
**IR:** inverted repeat; insulin receptor  
**IRES:** internal ribosome entry site  
**IRS:** insulin receptor substrate  
**ISE:** ion-specific electrode  
**ISO:** International Standards Organization  
**ISS:** immunostimulatory sequence; also intronic splicing silencer  
**ISS-ODN:** immunostimulatory sequence-oligodeoxynucleotide  
**ISSR:** inter-simple sequence repeats  
**IT:** isotocin  
**ITAF:** IRES trans-acting factor  
**ITAM:** immunoreceptor tyrosine-based activation motif  
**ITC:** isothermal titration calorimetry  
**iTRAQ:** isobaric tags for relative and absolute quantitation of proteins in proteomic research  
**JAK:** Janus Kinase  
**JNK:** *c*-Jun *N*-terminal kinase  
**KARAP:** killer cell activating receptor-associated protein  
**Kb, kb :** Kilobase  
**KDR:** kinase insert domain-containing receptor; KDR is the human homolog of the mouse FLK-1 receptor. The KDR and FLK-1 receptors are also known as VEGFR2. See VEGFR  
**Kit:** mast/stem cell growth factor receptor, CD 117  
**Kit:** retroviral oncogene derived from HZ4 feline sarcoma  
**KLF5:** Kruppel-like factor 5, a transcription factor  
**LAK:** lymphokine-activated killer cells  
**LATE-PCR:** linear-after-the-exponential-PCR  
**LB:** Luria-Bertani  
**Lck:** member of the Src family of protein kinases  
**LC<sub>50</sub>:** median lethal concentration in air  
**LC-MS:** liquid chromatography-mass spectrometry  
**LCR:** low-copy repeat; locus control region; low complexity region  
**LCST:** lower critical solution temperature  
**LD:** as in LD motif, a leucine/aspartic acid-rich protein-binding domain; also used to refers to peptidases without stereospecificity; also longin domain; linkage disequilibrium; lactate dehydrogenase  
**LD<sub>50</sub> :** median lethal dose  
**LDL:** low-density lipoprotein  
**LECE:** ligand exchange capillary electrophoresis  
**LED:** light emitting diode  
**Lek:** lymphocyte-specific protein tyrosine kinase  
**LFA:** lymphocyte function-associated antigen  
**LGIC:** ligand-gated ion channel  
**LH:** luteinizing hormone  
**LIF:** laser-induced fluorescence  
**LIM :** a domain involved in protein-protein interaction, originally described in transcription factors LIN1, ISL1, and MED3.  
**LINE:** long interspersed nuclear element  
**LLE:** liquid-liquid extraction  
**LLOD:** lower limit of detection  
**LLOQ:** lower limit of quantification  
**Ln<sub>r</sub>:** initiator element  
**lnRNP:** large nuclear ribonucleoprotein  
**LOD:** limit of detection; log<sub>10</sub> of odds  
**LOLA:** list of lists - annotated  
**LOQ:** limit of quantitation  
**LP:** lysophospholipid  
**LPA:** lysophosphatidic acid  
**LPH:** lipotropic hormone  
**LPS:** lipopolysaccharide  
**LTB<sub>4</sub>:** leukotriene B<sub>4</sub>  
**LTH:** luteotropic hormone  
**Ltk:** leukocyte tyrosine kinase  
**LRP:** low-density lipoprotein receptor-related protein  
**LSPR:** localized surface plasmon resonance  
**LTR:** long terminal repeat  
**LUCA:** last universal cellular ancestor  
**M13:** a bacteriophage used in phage display  
**M $\Phi$ :** macrophage  
**Mab, MABq:** monoclonal antibody  
**MAC:** membrane attack complex  
**MAD:** multiwavelength anomalous diffraction  
**Maf:** retroviral oncogene derived from AS42 avian sarcoma  
**MAGE:** microarray and gene expression  
**MALDI-TOF:** matrix-assisted laser desorption ionization time of flight  
**MAP:** mitogen-activated protein; usually referring to a protein kinase such MAP-kinase  
**MAPK:** MAP-kinase  
**MAPKK:** MAP-kinase kinase  
**MAPKKK:** MAP-kinase kinase kinase  
**MAR:** matrix attachment region  
**Mb, mb:** megabase (10<sup>6</sup>)  
**MB:** molecular beacon  
**MBL:** mannose-binding lectin; maltose-binding protein  
**MBP:** myelin basic protein  
**MCA:** 4-methylcoumaryl-7-acetyl  
**MCAT:** mass coded abundance tag

- MCD:** magnetic circular dichroism  
**MCM:** mini-chromosome maintenance  
**MCS:** multiple cloning site  
**M-CSF:** M-colony stimulating factor (Macrophage-colony stimulating factor)  
**MDA:** malondialdehyde  
**MDMA:** 3,4-methylenedioxyamphetamine  
**MDCK:** Madin-Darby canine kidney  
**MEF:** mouse embryonic fibroblasts  
**MEF-2:** myocyte enhancer factor 2  
**MEGA-8:** octanoyl-*N*-methylglucamide  
**MEGA-10:** decanoyl-*N*-methylglucamide  
**MEK:** mitogen-activated protein kinase/extracellular signal-regulated kinase kinase; also methylethyl ketone  
**MELC:** microemulsion liquid chromatography  
**MELK:** multi-epitope-ligand-kartographie  
**MEM:** minimal essential medium  
**Mer:** a receptor protein kinase; also MERTK, Mer tyrosine kinase  
**MES:** 2-(*N*-morpholinoethanesulfonic acid)  
**Met:** receptor for hepatocyte growth factor  
**MFB:** membrane fusion protein  
**MGO:** methylglyoxal  
**MGUS:** monoclonal gammopathy of undetermined significance  
**MHC:** major histocompatibility complex  
**MIAME:** minimum information about a microarray experiment  
**Mil:** retroviral oncogene derived from Mill Hill-2 chicken carcinoma  
**MIP:** molecularly imprinted polymer; macrophage inflammatory protein; methylation induced premeiotically  
**MIPS:** Munich Information Center for Protein Sequences  
**MIS:** Mullerian Inhibiting Substance  
**MLCK:** myosin light chain kinase  
**MLCP:** myosin light chain phosphatase  
**MMP:** matrix metalloproteinase  
**MMR:** mismatch repair  
**MMTV:** mouse mammary tumor virus  
**MOPS:** 3-(*N*-morpholino)propanesulfonic acid; 4-morpholinopropanesulfonic acid  
**MOPSo:** 3-(*N*-morpholino)-2-hydroxypropanesulfonic acid  
**Mos:** retroviral oncogene derived from Moloney murine sarcoma  
**MPD:** 2-methyl-2,4-pentanediol  
**MPSS:** massively parallel signature sequencing  
**MR:** magnetic resonance  
**MRI:** magnetic resonance imaging  
**mRNA:** messenger RNA  
**MRP:** migratory inhibitory factor-related protein  
**MRTF:** myocardin-related transcription factor  
**MS:** mass spectrometry, also mechanosensitive (receptors), multiple sclerosis  
**MS/MS:** mass spectrometry/mass spectrometry  
**MS<sup>3</sup>:** tandem mass spectrometry/mass spectrometry/mass spectrometry  
**MSP:** macrophage stimulating protein  
**Mt:** mitochondrial  
**mt-DNA:** mitochondrial DNA  
**MTBE:** methyl-*t*-butyl ether  
**MTOC:** microtubule organizing center  
**mTOR:** a eukaryotic regulatory of cell growth and proliferation. See TOR  
**MTSP:** membrane type serine proteases  
**MTT:** methylthiazolotetrazolium  
**MTX:** methotrexate  
**MU:** Miller Units  
**Mu:** Mutator  
**MUSK:** muscle skeletal receptor tyrosine kinase  
**MuDPiT:** multidimensional protein identification technology  
**MuLV:** Muloney leukemia virus  
**MWCO:** molecular weight cut-off  
**My:** million years  
**Myb:** retroviral oncogene derived from avian myeloblastosis  
**Myc:** retroviral oncogene derived from MC29 avian myelocytomatosis  
**MYPT:** myosin phosphatase-targeting  
**Mys:** myristoylation site  
**NAA:** neutron activation analysis  
**Nabs:** neutralizing antibodies  
**nAChR (nAcChoR):** nicotinic acetylcholine receptor  
**NAD:** nicotinamide adenine dinucleotide (DPN)  
**NADP:** nicotinamide adenine dinucleotide phosphate (TPN)  
**NAO:** non-animal origin  
**NAT:** nucleic acid amplification testing; nucleic acid testing.  
**Nbs<sub>2</sub>:** Ellman's Reagent; 5,5'-dithiobis(2-nitrobenzene acid)  
**NBD:** nucleotide-binding domain  
**NBD-PyNCS:** 4-(3-isothiocyanatopyrrolidin-1-yl)-7-nitro-2,1,3-benzoxadiazole  
**NBS:** *N*-bromosuccinimide  
**NBT:** nitroblue tetrazolium  
**NCBI:** National Center for Biotechnology Information  
**NCED:** 9-*cis*-epoxycarotenoid dioxygenase  
**NDA:** New Drug Application  
**NDB:** nucleic acid databank  
**NDMA:** *N*-methyl-*D*-aspartate  
**NDSB:** 3-(1-pyridinio)-1-propanesulfonate (non-detergent sulfobetaine)  
**NEM:** *N*-ethylmaleimide  
**NEO:** Neopterin  
**NEP:** nucleous-encoded polymerase (RNA polymerase)  
**NeuAc:** *N*-acetylneuraminic acid  
**NeuGc:** *N*-glycolylneuraminic acid  
**NF:** National Formulary  
**NFAT:** nuclear factor of activated T cells, a transcription factor  
**NF- $\kappa$ B:** nuclear factor kappa B, a nuclear transcription factor  
**NGF:** nerve growth factor  
**NGFR:** nerve growth factor receptor  
**NHS:** *N*-hydroxysuccinimide  
**NK:** natural killer (as in cytotoxic T cell)  
**NKCF:** natural killer cytotoxic factor  
**NKE:** *N*-formylkynurenine  
**Ni-NTA:** Ni<sup>2+</sup>-nitriloacetate  
**NIR:** near infrared  
**NIRF:** near infrared fluorescence  
**NIST:** National Institute of Standards and Technology  
**NMDA:** *N*-methyl-*D*-aspartate  
**NMM:** nicotinamide mononucleotide  
**NMR:** nuclear magnetic resonance  
**NO:** nitric oxide  
**NOE:** nuclear Overhauser effect  
**NOESY:** nuclear Overhauser effect spectroscopy  
**NOHA:** *N*<sup>w</sup>-hydroxy-*L*-arginine  
**NORs:** specific chromosomal sites of nuclear reformulation  
**NOS:** nitric oxide synthetase  
**iNOS:** inducible oxide synthetase  
**NPC:** nuclear pore complex  
***p*NPP:** *p*-Nitrophenyl phosphate

- NSAID:** non-steroid anti-inflammatory drug(s)
- NSF:** *N*-ethylmaleimide sensitive factor; National Science Foundation; *N*-ethylmaleimide-sensitive fusion
- Nt,nt:** nucleotide
- NTA:** nitriloacetic acid
- NTPDases:** nucleoside triphosphate diphosphohydrolases; also known as apyrases, E-ATPases
- NuSAP:** nucleolar spindle-associated protein
- OCED:** Organization for Economic Cooperation and Development
- ODMR:** optically detected magnetic resonance
- ODN:** oligodeoxynucleotide
- OFAGE:** orthogonal-field-alternation gel electrophoresis
- OHQ:** 8-hydroxyquinoline
- OMG:** Object Management Group
- OMIM:** online Mendelian Inheritance in Man (database) OMIM220100 located at <http://www.ncbi.nlm.nih.gov>
- OMP:** outer membrane protein; A protein family associated with membranes
- OMT:** outer membrane transport
- OPG:** Osteoprotegerin
- ORC:** origin recognition complex
- ORD:** optical rotatory dispersion
- ORF:** open reading frame
- ORFan:** orphan open-reading frame
- ORFome:** the protein-coding ORFs of an organism
- uORF:** upstream open reading frame
- OSBP:** oxysterol-binding proteins
- OVA:** Ovalbumin
- OXPPOS:** oxidative phosphorylation
- OYE:** Old Yellow Enzyme
- p53:** A nuclear phosphoprotein which functions as a tumor suppressor.
- PA:** peptide amphiphile
- PAC:** P1-derived artificial chromosome
- PACAP:** pituitary adenyl cyclase-activating polypeptide
- PAD:** peptidylarginine deiminase; protein arginine deiminase (EC 3.5.5.15)
- PADGEM:** platelet activator-dependent granule external membrane protein; GMP-140
- PAGE:** polyacrylamide gel electrophoresis
- PAH:** polycyclic aromatic hydrocarbon
- PAK:** P21-activated kinase
- PAO:** A redundant gene family (seripaoparin)
- PAR:** protease-activated receptor
- PAS:** preautophagosomal structure
- PAT1:** H<sup>+</sup>-coupled amino acid transporter (slc36a1)
- PAZ:** a protein interaction domain; PIWI-argonaute-zwille
- PBS:** phosphate-buffered saline
- PBST:** phosphate-buffered saline with Tween-20
- PBP:** periplasmic binding protein
- PC:** polycystin; phosphatidyl choline
- PCAF:** p300/CBP-associated factor, a histone acetyltransferase
- PCNA:** proliferating Cell Nuclear Antigen; processing factor
- PDB:** Protein Data Bank
- PDE:** phosphodiesterase
- PDGF:** platelet-derived growth factor
- PDGFR:** platelet-derived growth factor receptor
- pDNA :** plasmid DNA
- PDI:** protein disulfide isomerase
- PDMA:** polydimethylacrylamide
- PDMS:** polydimethylsiloxane
- PE:** phycoerythrin; polyethylene
- PEC:** photoelectrochemistry
- PECAM-1:** platelet/endothelial cell adhesion molecule-1
- PEI:** polyethyleneimine
- PEND protein:** a DNA-binding protein in the inner envelope membrane of the developing chloroplast
- PEP:** phosphoenol pyruvate
- PEPCK-C:** phosphoenolpyruvate carboxykinase, cytosolic form
- PERK:** double-stranded RNA-activated protein kinase-like ER kinase
- PES:** photoelectron spectroscopy
- PET:** positron emission tomography
- PEP:** plastid-encoded polymerase (RNA polymerase)
- Pfam:** a protein family database; protein families database of alignments
- PFGE:** pulsed-field gel electrophoresis;
- PFK:** phosphofructokinase
- PFU:** plaque forming unit
- PG:** phosphatidyl glycerol; prostaglandin,
- 3-PGA:** 3-phospho-D-glycerate
- PGO:** phenylglyoxal
- PGP-Me:** archaetidylglycerol methyl phosphate
- PGT box:** an upstream *cis*-element
- PGx(PGX):** pharmacogenetics (PGx) is the use of genetic information to guide drug choice; prostaglandins(PGX) include thromboxanes and prostacyclins.
- PH:** pleckstrin homology
- PHD:** plant homeodomain
- pHB(*p*-HB):** 4-hydroxybenzoic acid (*p*-hydroxybenzoate)
- PI:** propidium iodide
- PIC:** pre-initiation complex – complex of GTFs
- PINCH:** PINCH-protein; particularly interesting *cis*-his-rich protein
- PIP<sub>3</sub>:** phosphatidylinositol-3,4,5-triphosphate
- PIP<sub>n</sub>:** polyinositol polyphosphate
- PIP<sub>n</sub>S:** polyinositol polyphosphates
- Pipes:** 1,4-piperzainediethanesulfonic acid
- PIRLβ:** paired immunoglobulin-like type 2 receptor β
- PKA:** protein kinase A; cAMP-dependent kinase; pKa, acid dissociation constant
- PKC:** protein kinase C
- Pkl:** paxillin kinase linker
- PLL:** poly-L-Lysine
- PLP:** pyridoxal-5-phosphate
- PMA:** phenyl mercuric acetate; phorbol-12-myristate-13 acetate;
- PMCA:** plasma membrane Ca<sup>2+</sup> as PMCA-ATPase, a PMCA pump
- PMSF:** phenylmethylsulfonyl fluoride
- PNA:** peptide nucleic acid; *p*-nitroanilide
- PNGase:** endoglycosidase
- PNP:** *p*-nitrophenol (4-nitrophenol)
- POD:** peroxidase
- POET:** pooled ORF expression technology
- POINT:** prediction of interactome database
- Pol II:** RNA polymerase II
- POTRA:** polypeptide translocation associated
- PP:** polypropylene
- PPAR:** peroxisome proliferator activated receptor
- PPase:** phosphoprotein phosphatase
- PQL:** protein quantity loci
- PS:** position shift polymorphism
- PSG:** pregnancy-specific glycoprotein(s)
- PS-1:** presenilin-1
- PSI:** photosystem I

- PSI-BLAST:** position specific iterative BLAST; position-shifted iterated BLAST (software program)
- PSII:** photosystem II
- PTB:** polypyrimidine-tract-binding protein; a repressive regulator of protein splicing; also pulmonary tuberculosis
- PTD:** protein transduction domain
- PTEN:** phosphatase and tensin homolog deleted on chromosome 10
- PTFE:** polytetrafluoroethylene
- PTH:** phenylthiohydantoin
- PTGS:** post-transcriptional gene silencing
- PTK:** protein-tyrosine kinase
- PTPase:** protein tyrosine phosphatase
- PVA:** polyvinyl alcohol
- PVDF:** polyvinylidene difluoride
- QA:** quality assurance
- QC:** quality control
- QSAR:** Quantitative Structure-Activity Relationship(s)
- Q-TOF:** quadrupole time-of-flight
- QTL:** quantitative trait loci
- R<sub>i</sub>:** retardation factor
- RA:** rheumatoid Arthritis
- RAB-GAP:** Rab-GTPase-activating protein
- RACE:** rapid amplification of cDNA ends
- Raf:** retroviral oncogene derived from 3611 murine sarcoma
- RAGE:** receptors for Advanced Glycation Endproducts; receptors for AGE; recombinase-activated gene expression
- RAMP:** receptor activity modified protein
- RANK:** receptor activator of NF- $\kappa$ B
- RANK-L:** receptor activator of NF- $\kappa$ B ligand
- Rap:** a family of GTPase-coupled signal transduction factors which are part of the RAS superfamily
- Rap1:** a small GTPase involved in integrin activation and cell adhesion
- RAPD:** randomly amplified polymorphic DNA
- RARE:** RecA-assisted restriction endonuclease
- RAS:** GTP-binding signal transducers
- H-ras:** retroviral oncogene derived from Harvey murine sarcoma
- K-ras:** retroviral oncogene derived from Kirsten murine sarcoma
- RC:** recombinant cogenic
- RCA:** rolling circle amplification
- RCCX:** RP-C4-CYP21-TNX module
- RCFP:** reef coral fluorescent protein
- RCR:** rolling circle replication
- RDP:** receptor component protein
- rDNA:** ribosomal DNA
- REA:** restriction enzyme analysis
- Rel:** avian reticuloendotheliosis
- REMI:** restriction enzyme-mediated integration
- RET:** receptor for the GDNF family
- RF:** a transcription factor, RFX family
- Rfactor:** final crystallographic residual
- RFID:** radio frequency identification device
- RFLP:** restriction fragment length polymorphism
- RGD:** a signature peptide sequence-arginine-glycine-aspartic acid found in protein which bind integrins
- RGS:** regulator of G-protein signaling
- RHD:** Rel homology domain
- Rheb:** Ras homologue enriched in brain
- RhoA:** Ras homologous; signaling pathway
- RI:** random integration
- RIP:** repeat-induced point mutation
- RIS:** radioimmunosciintigraphy
- RISC:** RNA-induced silencing complex
- RIT:** radioimmunotherapy
- RM:** reference material
- RNAi:** RNA interference
- dsRNA:** double-stranded RNA
- hpRNAi:** hairpin RNA interference
- ncRNA:** non-coding RNA
- rRNA:** ribosomal RNA
- shRNA:** small hairpin RNA
- siRNA:** small interfering RNA
- snRNA:** small nuclear RNA
- snoRNA:** small nucleolar RNA
- stRNA:** small temporal RNA
- RNAse/RNAase:** ribonuclease
- RNAse III:** a family of ribonucleases (RNAses)
- RNC:** ribosome-nascent chain complex
- snRNP:** small nuclear ribonucleoprotein particle
- RNS:** reactive nitrogen species
- RO:** reverse osmosis
- ROCK (ROK):** Rho kinase
- ROESY:** rotating frame Overhauser effect spectroscopy
- Ron:** receptor for macrophage stimulating protein
- ROS:** reactive oxygen species
- Ros:** retroviral oncogenes derived from UR2 avian sarcoma
- RP:** reverse-phase; also a nuclear serine/threonine protein kinase
- RP-CEC:** reverse-phase capillary electrochromatography
- RP-HPLC:** reverse-phase high performance liquid chromatography
- RPA:** replication protein A
- RPEL:** a protein motif involved in the cytoskeleton
- RPC:** reverse-phase chromatography
- RPMC:** reverse phase microcapillary liquid chromatography
- RPMI 1640:** growth media for eukaryotic cells
- RPTP:** receptor protein-tyrosine kinase
- RRM:** RNA-recognition motif
- RRS:** Ras recruitment system; resonance Raleigh scattering
- R,S:** designating optical activity of chiral compounds where R is rectus (right) and S is sinister (left)
- RSD:** root square deviation
- RT:** reverse transcriptase; also room temperature
- RTD:** residence time distribution
- RTK:** receptor tyrosine kinase
- RT-PCR:** reverse transcriptase-polymerase chain reaction
- RTX:** repeat in toxins; pore-forming toxin of *E.Coli* type (RTX toxin); also rituximab, resiniteratoxin, renal transplantation
- Rub1:** a ubiquitin-like protein, Nedd8
- S1P:** sphingosine-1-phosphate
- S100:** S100 protein family
- SA:** salicylic acid
- SAGE:** serial analysis of gene expression
- SALIP:** saposin-like proteins
- SAM:** self-assembling monolayers
- SAMK:** a plant MAP kinase
- SAMPL:** selective amplification of microsatellite polymorphic loci
- Sap:** Saposin
- SAP:** sphingolipid activator protein; also serum amyloid P, shrimp alkaline phosphatase
- SAR:** scaffold associated region; structure-activity relationship
- SATP:** heterobifunctional crosslinker; *N*-succinimidyl-*S*-acetylthiopropionate
- SAXS:** small angle x-ray scattering

- scFv**: single chain Fv fragment of an antibody  
**SCID**: severe combined immunodeficiency  
**SCOP**: structural classification of proteins; <http://scop.mrc-lmb.cam.ac.uk/scop>  
**SCOPE**: structure-based combinatorial protein engineering  
**SDS**: sodium dodecyl sulfate  
**SEC**: secondary emission chamber for pulse radiolysis; size exclusion chromatography  
**Sec-**: secretory – usually related to protein translocation  
**SELDI**: surface-enhanced laser desorption/ionization  
**SELEX**: systematic evolution of ligands by exponential enrichment  
**SERCA**: sarco/endoplasmic reticulum Ca<sup>2+</sup> as in SERCA-ATPase, a calcium pump  
**SFC**: supercritical fluid  
**SHAP**: serum-derived hyaluron-associated protein  
**SH2**: *Src* homology domain 2  
**SH3**: *Src* homology domain 3  
**Shh**: sonic hedgehog  
**shRNA**: small hairpin RNA  
**SHO**: yeast osmosensor  
**SILAC**: stable-isotope labeling with amino acids in cell culture  
**SIMK**: a plant MAP kinase  
**SINE**: short interspersed nuclear element  
**SINS**: sequenced insertion sites  
**SIPK**: salicylic-acid induced protein kinase  
*Sis*: retroviral oncogene derived from simian sarcoma  
**SISDC**: Sequence-independent site-directed chimeragenesis  
*Ski*: retroviral oncogene derived from avian SK77  
**Skp**: a chaperone protein  
**SLAC**: serial Lectin Affinity Chromatography  
**SLE**: systemic lupus erythematoses  
**SLN1**: yeast osmosensor  
**S/MAR**: scaffold and matrix attachment region  
**SMC**: smooth muscle cell  
**SNAREs**: soluble *N*-ethylmaleimide-sensitive fusion (NSF; *N*-ethylmaleimide-sensitive factor) protein attachment protein receptors; can be either R-SNAREs or Q-SNAREs depending on sequence homologies  
**SNM**: SNARE motif  
**SNP**: Single nucleotide polymorphism  
**snRNA**: small nuclear RNA  
**snoRNA**: small nucleolar RNA  
**snRNP**: small nuclear ribonucleoprotein particle  
**SOC**: soil organic carbon; store-operated channel  
**SOCS**: suppressors of cytokine signalling  
**SOD**: superoxide dismutase  
**SOD1s**: CuZn-SOD enzyme (Intracellular)  
**SOP**: standard operating procedure  
**SOS**: response of a cell to DNA damage; salt overly sensitive (usually plants); son of Sevenless (signaling cascade protein)  
**SPA**: scintillation proximity assay  
**SPC**: statistical process control  
**SPECT**: sporozite mineneme protein essential for transversal; also single-photon emission computed tomography  
**SPIN**: surface properties of protein-protein interfaces (database)  
**SPR**: surface plasmon resonance  
**SQL**: structured query language  
**SR**: as in the SR protein family (serine- and arginine-rich proteins); also sarcoplasmic reticulum; also scavenger receptor  
**SRCD**: synchrotron radiation circular dichroism  
**SRP**: signal recognition particle  
**SRE**: serum response factor, a ubiquitous transcription factor  
**SRPK**: SR protein kinase  
**SRS**: sequence retrieval system; SOS recruitment system  
**SRWC**: short rotation woody crop  
**SSC**: saline sodium citrate  
**ssDNA**: single-stranded DNA  
**SSLP**: simple sequence length polymorphism  
**SSR**: simple sequence repeats  
**STAT**: signal transducers and activators of transcription  
**STC**: sequence-tagged connector  
**STM**: sequence-tagged mutagenesis  
**STORM**: systematic tailored ORF-data retrieval and management  
**STR**: short tandem repeats  
**STREX**: stress-axis related exon  
**stRNA**: small temporal RNA  
**SUMO**: small ubiquitin-like (UBL) modifier; small ubiquitin-related modifier; sentrin  
**SurA**: a chaperone protein  
**SV40**: simian virus 40  
**SVS**: seminal vesicle secretion  
*S<sub>w,20</sub>*: sedimentation coefficient corrected to water at 20°C  
**SWI/SNF**: Switch/sucrose-non fermenting  
**TAC**: transcription-competent artificial chromosome  
**TACE**: tumor necrosis factor –  $\alpha$ -converting enzyme; also transcatheter arterial chemoembolization  
**TAFs**: TBP-associated factors  
**TAFE**: transversely alternating-field electrophoresis  
**TAG**: triacyl glycerol  
**TAME**: tosyl-arginine methyl ester  
**TAP**: tandem affinity purification; also transporter associated with antigen processing  
**TAR**: transformation-associated recombination; *trans*-activation response region  
**TAT**: *trans*-activator of transcription  
**TATA**: as in the TATA box which is a TATA-rich region located upstream from the initiation RNA-synthesis initiation site in eukaryotes and within the promoter region for the gene in question. Analogous to the Pribnow box in prokaryotes.  
**TBA-Cl**: tetrabutylammonium chloride  
**TBP**: TATA-binding protein; telomere-binding protein  
**TCA**: trichloroacetic acid; tricarboxylic acid  
**TCR**: T-cell receptor  
**TE**: therapeutic equivalence; transposable elements  
**TEA**: triethylamine  
**TEAA**: triethylammonium acetate  
**TEF**: toxic equivalency factor  
**TEM**: transmission electron microscopy  
**TEMED (TMPD)**: *N,N,N',N'*-tetramethylethylenediamine  
**TEV**: tobacco etch protease  
**TF**: tissue factor; transcription factor  
**TFA**: trifluoroacetic acid  
**TFIIIA**: transcription factor IIIA  
**TGN**: *trans*-Golgi network  
**TGS**: transcriptional gene silencing  
**TH**: thyroid hormone  
**THF**: tetrahydrofuran  
**TIGR**: The Institute for Genomic Research  
**TIM**: translocase of inner mitochondrial membrane  
**TIP**: tonoplast intrinsic protein(s)  
**TIR**: toll/IL-1 receptor  
**TI-VAMP**: tetanus neurotoxin-insensitive VAMP  
**TLCK**: tosyl-lysyl chloromethyl ketone

- TLR:** toll-like receptor  
**T<sub>m</sub>:** tubular membrane  
**TM:** transmembrane  
**TMAO:** trimethylamine oxide  
**TMD:** *trans*-membrane domain  
**TMS:** trimethylsilyl; thimersol  
**TMV:** tobacco mosaic virus  
**TNA:** treose nucleic acid  
**TNB:** 5-thio-2-nitrobenzoate  
**TNBS:** trinitrobenzenesulfonic acid  
**TnC:** troponin C  
**TNF:** tumor necrosis factor  
**Tnl:** troponin I  
**TnT:** troponin T  
**TNF- $\alpha$  (TNF $\alpha$ ):** tumor necrosis factor- $\alpha$   
**TNR:** transferrin receptor  
**TNX:** tenascin-X  
**TPD:** temperature programmed desorption  
**TOC:** total organic carbon  
**TOCSY:** total correlated spectroscopy  
**TOF:** time-of-flight  
**TOP:** 5' tandem oligopyrimidine (terminal oligopyrimidine) tract  
**TOPRIN:** Topoisomerase and Primase in reference to a domain  
**TOR:** target of rapamycin; mTOR, mammalian target of rapamycin; dTOR, *Drosophila* target of rapamycin  
**TOX:** toxicology  
**TPCK:** tosylphenylalanylchloromethyl ketone  
**TPEN:** *N,N'*-tetrakis-(2-pyridyl-methyl)ethylenediamine  
**TPN:** triphosphopyridine dinucleotide (now NADP)  
**TRADD:** a scaffold protein  
**TRAP:** tagging and recovery of associated proteins as in RNA-TRAP; also thrombin receptor activation peptide  
**TRE:** thyroid hormone response elements  
**TRH:** thyrotropin-releasing hormone  
**TRI:** as in TRI reagents such as TRIZOL™ reagents used for RNA purification from cells and tissues  
**Tricine:** *N*-(2-hydroxy-1,1-bis(hydroxymethyl)ethyl) glycine  
**TRIF:** TIR domain-containing adaptor-inducing interferon- $\beta$   
**Tris:** tris-(hydroxymethyl)aminomethyl methane; 2-amino-2-hydroxymethyl-1,3-propanediol  
**bis-Tris:** 2-[bis(2-hydroxyethyl)amino]-2-(hydroxymethyl)propane-1,3-diol  
**Trk:** neurotrophic tyrosine kinase receptor  
**TRL:** time-resolved luminescence  
**TRP:** transient receptor potential as in TRP-protein  
**TRs:** thyroid receptors  
**TSP:** thrombospondin; traveling salesman problem  
**TTSP:** transmembrane type serine proteases  
**TUSC:** Trait Utility System for Corn  
**Tween:** polyoxyethylsorbitan monolaurate  
**TX:** thromboxane, also treatment  
**TyroBP:** tyro protein tyrosine kinase binding protein, DNAX-activation protein 12, DAP12, KARAP  
**UAS:** upstream activation site  
**UBL:** ubiquitin-like modifiers  
**UCDS:** universal conditions direct sequencing  
**UDP:** ubiquitin-domain proteins; uridine diphosphate  
**UDP-GlcNAc:** uridine-5'-diphospho-*N*-acetylglucosamine  
**UNG:** uracil DNA glycosylase  
**UPA:** universal protein array; urokinase-like plasminogen activator  
**UPR:** unfolded protein response  
**URL:** uniform resource locator  
**URS:** upstream repression site  
**USP:** United States Pharmacopeia  
**USPS:** ubiquitin-based split protein sensor  
**UTR:** untranslated region  
**VAMP:** vesicle-associated membrane protein  
**VAP:** VAMP-associated protein  
**VDAC:** voltage-dependent anion-selective channel  
**VCAM:** vascular cellular adhesion molecule  
**VDJ:** variable diversity joining; regions of DNA joined in recombination during lymphocyte development; see VDJ recombination.  
**VDR:** vitamin D receptor  
**VEGF:** vascular endothelial growth factor  
**VEGFR:** vascular endothelial growth factor receptor  
**VGH:** non-acronymial use; a neuronal peptide  
**V<sub>H</sub>:** variable heavy chain domain  
**VICKZ:** a family of RNA-binding proteins recognizing specific *cis*-acting elements  
**VIGS:** virus-induced gene silencing  
**VIP:** vasoactive intestinal peptide  
**VLP:** virus-like particle  
**VLDL:** very low density lipoprotein  
**VNC (VNBC):** viable, but not-cultivable (bacteria)  
**VNTR:** variable number tandem repeat; variable number of tandem repeats  
**VOC:** volatile organic carbon  
**VPAC:** VIP PACAP receptors  
**VSG:** variable surface glycoproteins  
**VSP:** vesicular sorting pathway  
**Vsp10:** a type I transmembrane receptor responsible for delivery of protein to lysosome/vacuole  
**vsp10:** gene for Vsp10  
**WGA:** whole-genome amplification  
**WT, Wt:** wild type  
**XBP:** x-box binding protein  
**XO:** xanthine oxidase  
**Y2H:** yeast two-hybrid  
**YAC:** yeast artificial chromosome  
**YCp:** yeast centromere plasmid  
**YE<sub>p</sub>:** yeast episomal plasmid  
**YFP:** yellow fluorescent protein  
**Z:** benzyloxycarbonyl  
**ZDF:** Zucker diabetic factor  
**Zif:** zinc finger domain peptides (i.e. Zif-1, Zif-3)  
**ZIP:** leucine zipper  
**b-ZIP:** basic leucine zipper  
**ZZ Domain:** a tandem repeat dimer of the immunoglobulin-binding protein A from *Staphylococcus aureus*

<sup>a</sup> All compounds are the L isomer unless otherwise indicated

## APPENDIX B: GLOSSARY OF TERMS USEFUL IN BIOCHEMISTRY

### Abbreviated New Drug Application (ANDA)

This document contains data that, when submitted to FDA's Center for Drug Evaluation and Research (CDER), Office of Generic Drugs, provide for the review and ultimate approval of a generic drug product. This document does not contain preclinical or clinical data but must demonstrate that the drug is question is bioequivalent to the currently licensed drug which is also referred to as the innovator drug. See <http://www.fda.gov/cder/drugsatfda/glossary.htm>

### ABC transporter

The ATP-binding cassette transporter family consists of a large number of membrane proteins involved in the transport of variety of substances including ions, steroids, metabolites and drugs across extracellular and intracellular membranes. A defect in an ABC transporter is important in cystic fibrosis. See Schwiebert, E.M., ABC transporter-facilitated ATP conductive transport, *Am.J.Physiol.* 276, C1-C8, 1999; Dean, M., Rzhetsky, A., and Allikmets, R., The human ATP-binding cassette (ABC) transporter superfamily, *Genome Res.* 11, 1156-1166, 2001; Dean, M., Hamon, Y., and Chimini, G., The human ATP-binding cassette (ABC) transporter superfamily, *J.Lipid Res.* 42, 1007-1017, 2001; Georujon, C., Orelle, C., Steinfels, E. *et al.*, A common mechanism for ATP hydrolysis in ABC transporter and helicase super-families, *Trends Biochem.Sci.* 26, 539-544, 2001; Schmitt, L., The first view of an ABC transporter: the X-ray crystal structure of MsbA from E.coli, *ChemBiochem* 3, 161-165, 2002; Holland, I.B., Schmitt, L., and Young, J., Type 1 protein secretion in bacteria, the ABC-transporter dependent pathway, *Mol.Membr.Biol.* 22, 29-39, 2005; Blemans-Oldehinkel, E., Doeven, M.K., and Poolman, B., ABC transporter architecture and regulatory roles of accessory domains, *FEBS Lett.* 580, 1023-1035, 2006; Frelet, A. and Klein, M., Insight in eukaryotic ABC transporter function by mutation analysis, *FEBS Lett.* 580, 1064-1084, 2006; Crouzet, J., Trombik, T., Fraysse, A.S., and Boutry, M., Organization and function of the plant pleiotropic drug resistance ABC transporter family, *FEBS Lett.* 580, 1123-1130, 2006.

### Ablation

A multifunctional word derived from the latin ablatus (to carry away). In medicine, refers to the surgical removal of tissue or the elimination of cells by irradiation or immunological approaches. The surgery approach is used extensively in cardiology (Gillinov, A.M. and Wolf, R.K., Surgical ablation of atrial fibrillation, *Prog.Cardiovasc.Dis.* 48, 169-177, 2005) while irradiation or immunological approaches are used in oncology (Appelbaum, F.R., Badger, C.C., Bernstein, I.D., *et al.*, Is there a better way to delivery total body irradiation, *Bone Marrow Transplantation* 10, Suppl. 1., 77-81, 1992; van Bekkum, D.W., Immune ablation and stem-cell therapy in autoimmune disease. Experimental basis for autologous stem-cell transplantation, *Arthritis Res.* 2, 281-284, 2000). It also refers to the reduction of particles into smaller sizes during erosion by other particles or the surrounding fluid (see Lindner, H., Koch, J., Niema, K., Production of ultrafine particles by nanosecond laser sampling

using orthogonal prepulse laser breakdown, *Anal.Chem.* 77, 7528-7533, 2005). It also has a definition in aerospace technology for the dissipation of heat generated by atmospheric friction upon reentry of a space vehicle.

### Abscisic Acid

A plant hormone. See Leung, J. and Giraudet, J., Abscisic acid signal transduction, *Annu.Rev.Plant Physiol.Plant Mol.Biol.* 25, 199-221, 1998; Finkelstein, R.R., Gampala, S.S. and Rock, C.D., Abscisic acid signaling in sees and seedlings, *Plant Cell* 14 Suppl., S15-S45, 2002.

### Absorption

Generally refers to the ability of a material to absorb another substance (hydration) or energy (the ability of a substance to absorb) light. See adsorption.

### Absolute Oils

See essential oils

### Abzymes

See catalytic antibodies

### Accuracy

The difference between the measured value for an analyte and the true value. Absolute error is the difference between the measured value and the true value while the relative error is that fraction that the absolute error is of the measured amount and is usually expressed as a percentage or at ppt/ppm. See *Handbook of Analytical Chemistry*, ed. L. Meites, McGraw-Hill, New York, New York, 1963; *Analytical Chemistry Handbook*, J.A. Dean, McGraw-Hill, New York, New York, 1995; *Dean's Analytical Chemistry Handbook*, McGraw-Hill, New York, New York, 2005.

### Active Ingredient

Any component of a final drug product that provides pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease or to affect the structure on any function of the body of man or animals. Sometimes referred to as the active pharmaceutical ingredient (API). See <http://www.fda.gov/cber>; <http://www.ich.org> – See Q7, Good Manufacturing Guide for Active Pharmaceutical Ingredients.

### Activity-based Proteomics

Identification of proteins in the proteome by the use of reagents which measure biological activity. Frequently the activity is measured by the incorporation of a "tag" into the active site of the enzyme. The earliest probes were derivatives of alkyl-fluorophosphonates which were well-understood inhibitors of

serine proteases. The technical approach is related to enzyme histochemistry/histocytochemistry. Most often used for enzymes where functional families of proteins can be identified. See Liu, Y., Patricelli, M.P., and Cravatt, B.F., Activity-based protein profiling: the serine hydrolases, *Proc.Nat.Acad.Sci.USA* 96, 14694-14699, 1999; Adam, G.C., Sorensen, E.J., and Cravatt, B.F., Chemical strategies for functional proteomics, *Mol.Cell.Proteomics* 1, 781-790, 2002; Speers, A.E. and Cravatt, B.F., Chemical strategies for activity-based proteomics, *Chembiochem* 5, 41-47, 2004; Kumar, S., Zhou, B., Liang, F., Activity-based probes for protein tyrosine phosphatases, *Proc.Nat.Acad.Sci.USA* 101, 7943-7948, 2004; Berger, A.B., Vitorino, P.M., and Bogoy, M., Activity-based protein profiling: applications to biomarker discovery, in vivo imaging and drug discovery, *Am.J.Pharmacogenomics* 4, 371-381, 2004; Williams, S.J., Hekmat, O., and Withers, S.G., Synthesis and testing of mechanism-based protein-profiling probes for retaining endo-glycosidases, *Chembiochem* 7, 116-124, 2006; Sieber, S.A. and Cravatt, B.F., Analytical platforms for activity-based protein profiling – exploiting the versatility of chemistry for functional proteomics, *Chem.Commun.* (22), 2311-2318, 2006; Schmidinger, H., Hermetter, A., and Birner-Gruenberger, R., Activity-based proteomics: enzymatic activity profiling in complex proteomes, *Amino Acids* 30, 333-350, 2006.

### Accurate Mass Tag (AMT)

A peptide of sufficiently distinctive and accurate mass and elution time from liquid chromatography which can be used a single identifier of a protein. See Conrads, T.P., Anderson, G.A., Veenstra, T.D. *et al.*, *Anal.Chem.* 72, 3349-3354, 2000; Smith, R.D., Anderson, G.A., Lipton, M.S., *et al.*, An accurate mass tag strategy for quantitative and high-throughput proteome measurements, *Proteomics* 2, 513-523, 2002; Strittmatter, E.F., Ferguson, P.L., Tang, K., and Smith, R.D., Proteome analyses using accurate mass and elution time peptide tags with capillary LC time-of-flight mass spectrometry, *J.Am.Soc.Mass Spectrom.* 14, 980-991, 2003; Shen, Y., Tolic, N., Masselon, C. *et al.*, Nanoscale proteomics, *Anal.Bioanal.Chem.* 378, 1037-1045, 2004; Zimmer, J.S., Monroe, M.E., Qian, W.J., and Smith, R.D., Advances in proteomics data analysis and display using an accurate mass and time tag approach, *Mass Spectrom.Rev.* 25, 450-482, 2006.

### Active Sequence Collection (ACS)

A collection of active protein sequences or protein fragments or subsequences, collected in the form of function-oriented databases, <http://bioinformatica.isa.cnr.it/ACS/>

AIRS – Autoimmune Related Sequences

BAC – Bioactive Peptides

CHAMSE – Chameleon Sequences; sequences which can adopt both an alpha helix and beta sheet conformation

DORRS – Database of RGD Related Sequences

DVP – Delivery Vector Peptides

SSP – Structure Solved Peptides

TRANSIT – Transglutamination Sites

### Acute Phase Proteins

Proteins which are either *de novo* or markedly elevated after challenge by infectious disease, inflammation or other challenge to homeostasis. Another definition is any protein whose blood

concentration increases (or decreases) by 25% or more during certain inflammatory disorders. Acute phase proteins include C-reactive protein, fibrinogen, and  $\alpha$ -1-acid glycoprotein. Acute phase proteins are part of the acute phase response. Some acute phase proteins have been used for diagnostic of specific disorders such as C-reactive protein and cardiovascular disease. See Bowman, B.H., *Hepatic Plasma Proteins: Mechanisms of Function and Regulation*, Academic Press, San Diego, CA, USA, 1993; Mackiewicz, A. and Kushner, I., *Acute Phase Proteins: Molecular Biology, Biochemistry, and Clinical Applications*, CRC Press, Boca Raton, FL, 1993; Kerr, M.A. and Thorpe, R., *Immunochemistry Labfax*, Bios Scientific Publishers, Oxford, UK, 1994; Sutton, H.E., The haptoglobins, *Prog.Med.Genet.* 7, 163-216, 1970; Gordon, A.H., Acute-phase proteins in wound healing, *Ciba Found.Symp.* 9, 73-90, 1972; Black, S., Kushner, I., and Samols, D., C-reactive protein, *J.Biol.Chem.* 279, 48487-48490, 2004; Du Clos, T.W. and Mold, C., C-reactive protein: an activator of innate immunity and a modulator of adaptive immunity, *Immunol.Res.* 30, 261-277, 2004; Garlanda, C., Bottazzi, B., Bastone, A., and Mantovani, A., Pentraxins at the crossroads between innate immunity, inflammation, matrix deposition, and female fertility, *Annu.Rev.Immunol.* 23, 337-366, 2005; Ceron, J.J., Eckersall, P.D., and Martynez-Subiela, S., Acute phase proteins in dogs and cats: current knowledge and future perspectives, *Vet.Clin.Pathol.* 34, 85-99, 2005; Sargent, P.J., Farnaud, S., and Evans, R.W., Structure/function overview of proteins involved in iron storage and transport, *Curr.Med.Chem.* 12, 2683-2693, 2005; Bottazzi, B., Garlanda, C., Salvaroli, G., *et al.*, Pentraxins as a key component on innate immunity, *Curr.Opin.Immunol.* 18, 10-15, 2006; Vidt, D.G., Inflammation in renal disease, *Am.J.Cardiol.* 97, 20A-27A, 2006; Armstrong, E.J., Morrow, D.A., and Sabatine, M.S., Inflammatory biomarkers in acute coronary syndromes: part II: acute-phase reactants and biomarkers of endothelial cell activation, *Circulation* 113, e152-e155, 2006. See also heat shock proteins.

### ADAMTS

A disintegrin and metalloproteinase with thrombospondin motifs. A family of multidomain metalloproteinases with a variety of biological activities. ADMETS are part of the reprotolysin family. ADAMTS13 which is involved in the processing of von Willebrand Factor is the best known member of this family. See Hooper, N.M., Families of zinc metalloproteases, *FEBS Lett.* 354, 1-6, 1994; Hurskainen, T.L., Hirohata, S., Seldin, M.F., and Apte, S.S., ADAM-TS5, ADAM-TS6, and ADAM-TS7, novel members of a new family of zinc metalloproteases. General features and genomic distribution of the ADAM-TS family, *J.Biol.Chem.* 274, 2555-2563, 1999; Sandy, J.D. and Verscharen, C., Analysis of aggrecan in human knee cartilage and synovial fluid indicates that aggrecanase (ADAMTS) activity is responsible for the catabolic turnover and loss of aggrecan whereas other protease activity is required for C-terminal processing *in vivo.*, *Biochem.J.* 358, 615-626, 2001; Fox, J.W. and Serrano S.M., Structural considerations of the snake venom metalloproteinases, key members of the M12 reprotolysin family of metalloproteinases, *Toxicon* 45, 969-985, 2005.

### Adjuvant

A substance which increases an immune response. Frequently a component of the excipients in the formulation of vaccine. See Brown, L.E. and Jackson, D.C., Lipid-based self-adjuvanting

vaccines, *Curr.Drug Deliv.* 2, 283-393, 2005; Gluck, R., Burri, K.G., and Metcalfe, I., Adjuvant and antigen delivery properties of virosomes, *Curr.Drug Deliv.* 2, 395-400, 2005; *Topics in Vaccine Adjuvant Research*, ed. D.R. Spriggs and W.C. Koff, CRC Press, Boca Raton, FL, 1991; *Vaccine Design: The Subunit and Adjuvant Approach*, ed. M.F. Powell, Plenum Press, New York, NY, 1995; *Therapeutic Proteins: Methods and Protocols*, ed. M.C. Smales and D.C. James, Humana Press, Totowa, NJ, 2005; *Immunopotential in Modern Vaccines*, ed. V.E.J.C. Schijns and D.T. O'Hagan, Elsevier, Amsterdam, Netherlands, 2006.

## Adrenomedullin

Adrenomedullin is a peptide originally isolated from a pheochromocytoma (Kitamura, K., Kangawa, K., Kawamoto, M., *et al.*, Adrenomedullin: a novel hypotensive peptide isolated from human pheochromocytoma, *Biochem.Biophys.Res.Commun.* 192, 553-560, 1993). Adrenomedullin elevated intracellular cAMP in platelets and caused hypotension. Since its discovery, adrenomedullin has been found in a variety of cells and tissues (Hinson, J.P., Kapas, S., and Smith, D.M., Adrenomedullin, a multifunctional regulatory peptide, *Endocrine Rev.* 21, 138-167, 2000). Adrenomedullin has been suggested to have a variety of physiological activities. See Poyner, D., Pharmacology of receptors for calcitonin gene-related peptide and amylin, *Trends Pharmacol.Sci.* 16, 424-428, 1995; Muff, R., Born, W., and Fischer, J.A., Calcitonin, calcitonin gene-related peptide, adrenomedullin and amylin: homologous peptides, separate receptors and overlapping biological actions, *Eur.J.Endocrinol.* 133, 17-20, 1995; Richards, A.M., Nicholls, M.G., Lewis, L., and Lainchbury, J.G., Adrenomedullin, *Clin. Sci.* 91, 3-16, 1996; Massart, P.E., Hodeige, D., and Donckier, J., Adrenomedullin: view on a novel vasodilatory peptide with natriuretic properties, *Acta Cardiol.* 51, 259-269, 1996; Hay, D.L. and Smith, D.M., Adrenomedullin receptors: molecular identity and function, *Peptides* 22, 1753-1763, 2001; Julian, M., Cacho, M., Garcia, M.A., *et al.*, Adrenomedullin: a new target for the design of small molecule modulators with promising pharmacological activities, *Eur.J.Med.Chem.* 40, 737-750, 2005; Shimosawa, T. and Fujita, T., Adrenomedullin and its related peptides, *Endocr.J.* 52, 1-10, 2005; Zudaire, E., Portal-Núñez, S., and Cuttitta, F., The central role of adrenomedullin in host defense, *J.Leuk.Biol.* 80, 237-244, 2006. Hamid, S.A. and Baxter, G.F., A critical cytoprotective role of endogenous adrenomedullin in acute myocardial infarction, *J.Mol.Cell Cardiol.* 41, 360-363, 2006.

## Adsorption

The transfer of a substance from one medium to another such as the adsorption of a substance from a fluid onto a surface. The **adsorbent** is the substrate onto which material is adsorbed. The **adsorbate** is the material adsorbed onto a matrix.

## Advanced Glycation Endproducts (AGE)

A heterogeneous group of products resulting from a series of chemical reactions starting with the formation of adducts between reducing sugars and protein nucleophiles such as nitrogen bases. Reaction with nucleic acid is also possible but has not been extensively described. The reactions involved are complex involving the Amadori reaction and the Maillard reaction/Some products include triosidines, N<sup>ε</sup>-carboxymethyl-lysine, and pentosidine-adducts. These products can undergo further reactions to form cross-linked products; advanced glycation

endproducts are involved in the generation of reactive oxygen species (ROS). See Deyl, Z. and Mikšík, I., Post-translational non-enzymatic modification of proteins. I. Chromatography of marker adducts with special emphasis to glycation reactions, *J.Chromatog.* 699, 287-309, 1997; Bonnefont-Rousselot, D. D., Glucose and reactive oxygen species, *Curr.Opin.Clin.Nutr.* 5, 561-568, 2002; Tessier, F.J., Monnier, V.M., Sayre, L.M., and Kornfield, J.A., Triosidines: novel Maillard reaction products and cross-links from the reaction of triose sugars with lysine and arginine residues, *Biochem.J.*, 369, 705-710, 2003; Thornally, P.J., Battah, S., Ahmed, N., Karachalias, N., Agalou, S., Babaei-Jadidi, R. and Dawney, A., Quantitative screening of advanced glycation endproducts in cellular and extracellular proteins by tandem mass spectrometry, *Biochem. J.* 375, 581-592, 2003; Ahmed, N., Advanced glycation endproducts—role in pathology of diabetic complications, *Diabetes Res. Clin.Pract.* 67, 3-21, 2005.

## Aeration

The dispersion and/or dissolution of a gas into a liquid; generally refers to the process of dispersing air or an oxygen-gas mixture into a liquid such as culture media (Wang, D.I. and Humphrey, A.E., Developments in agitation and aeration of fermentation systems, *Prog.Ind.Microbiol.* 8, 1-34, 1968; Papoutsakis, E.T., Media additives for protecting freely suspended animal cells against agitation and aeration damage, *Trends Biotechnol.* 9, 316-324, 1991; Barberel, S.I. and Walker, J.R., The effect of aeration upon the secondary metabolism of microorganisms, *Biotechnol. Genet.Eng.Rev.* 17, 281-323, 2000). Also refers to the process of air dispersion in the pulmonary system which can include both the inspiratory process and the exchange between the pulmonary system and the vascular bed; most frequently the latter (Newman, B. and Oh, K.S., Abnormal pulmonary aeration in infants and children, *Radiol.Clin.North Am.* 26, 323-339, 1988; Kothari, N.A. and Kramer, S.S., Bronchial diseases and lung aeration in children, *J.Thorac.Imaging* 16, 207-223, 2001).

## Aerosol

A colloid-like dispersion of a liquid or solid material into a gas. There is considerable interest in the use of aerosols as a drug delivery vehicle. See *Aerosol Science*, ed. C.N. Davies, Academic Press, London, UK, 1996; Sanders, P.A., *Aerosol Science*, Van Nostrand Reinhold, New York, NY, 1970; Sanders, P.A., *Handbook of Aerosol Technology*, Van Nostrand Reinhold, New York, NY, 1979; Adjei, A.L. and Gupta, P.K., *Inhalation Delivery of Therapeutic Peptides and Proteins*, Marcel Dekker, New York, NY, 1997; Macalady, D.L., *Perspectives in Environmental Chemistry*, Oxford University Press, New York, NY, 1998; Hinds, W.C., *Aerosol Technology: Properties, Behavior, and Measurement of Airborne Particles*, Wiley, New York, NY, 1999; Roche, N. and Huchon, G.J., Rationale for the choice of an aerosol delivery system, *J.Aerosol.Med.* 13, 393-404, 2000; Gautam, A., Waldrep, J.C., and Densmore, C.L., Aerosol gene therapy, *Mol. Biotechnol.* 23, 51-60, 2003; Densmore, C.L., The re-emergence of aerosol gene delivery: a viable approach to lung cancer therapy, *Curr.Cancer Drug Targets* 3, 275-286, 2003. See also colloid.

## Affibody

A phage-selected protein developed using a scaffold domain from Protein A. Such a protein can be selected for specific binding characteristics. See Ronnmark, J., Hansson, M., Nguyen, T.,

Uhlen, M., Robert, A., Stahl, S., and Nygren, P.A., Construction and characterization of affibody-Fc chimeras produced in *Escherichia coli*, *J.Immunol.Meth.* 261, 199-211, 2002; Eklund, M., Axelsson, L., Uhlen, M., and Nygren, P.A., Anti-idiotypic protein domains selected from protein A-based affibody libraries, *Proteins* 48, 454-462, 2002; Renberg, B., Shiroshima, I., Engfeldt, T., Nygren, P.A., and Karlström, A.E., Affibody protein capture microarrays: synthesis and evaluation of random and directed immobilization of affibody molecules, *Anal.Biochem.* 341, 334-343, 2005; Orlova, A., Nilsson, F.Y., Wikman, M., *et al.*, Comparative in vivo evaluation of technetium and iodine labels on a n anti-HER2 affibody for single-photon imaging of HER2 expression in tumors, *J.Nucl.Med.* 47, 512-519, 2006; Wahlberg, E. and Hard, T., Conformational stabilization of an engineered binding protein, *J.Am.Chem.Soc.* 128, 7651-7660, 2006; Lendel, C., Dogan, J., and Hard, T., Structural basis of molecular recognition in an affibody: affibody complex, *J.Mol.Biol.*, 359, 1293-1304, 2006.

## Affinity Proteomics

The use of affinity reagents for the study of the proteome. The concept of the design and use of affinity labels for the study of proteins is well understood (see Plapp, B.V. and Chen, W.S., Affinity labeling with omega-bromoacetamide fatty acids and analogs, *Methods Enzymol.* 72, 587-591, 1981; Plapp, B.V., Application of affinity labeling for studying structure and function of enzymes, *Methods Enzymol.* 87, 469-499, 1982; Fan, F. and Plapp, B.V., Probing the affinity and specificity of yeast alcohol dehydrogenase I for coenzymes, *Arch.Biochem.Biophys.* 367, 240-249, 1999). For application of affinity technology to proteomics, see Larsson, T., Bergstrom, J., Nilsson, C. and Karlsson, K.A., Use of an affinity proteomics approach for the identification of low-abundant bacterial adhesins as applied on the Lewis(b)-binding adhesin of *Helicobacter pylori*, *FEBS Lett* 469, 155-158, 2000; Agaton, C., Falk, R., Hoiden Guthenberg, I., Gostring, L., Uhlen, M., and Hober, S., Selective enrichment of monospecific polyclonal antibodies for antibody-based proteomics efforts, *J.Chromatog. A*, 1043, 33-40, 2004; Stults, J.T. and Arnott, D., Proteomics, *Methods Enzymol.* 402, 245-289, 2005; Monti, M., Orru, S., Pagnozzi, D., and Pucci, P., Interaction proteomics, *Biosci.Rep.* 25, 45-56, 2005; Schou, C. and Heegaard, N.H., Recent applications of affinity interactions in capillary electrophoresis, *Electrophoresis* 27, 44-59, 2006; Niwayama, S., Proteomics in medicinal chemistry, *Mini Rev.Med.Chem.* 6, 241-246, 2006; *Capillary Electrophoresis of Proteins and Peptides*, ed. M.A.Strege and Lagu, A.L., Humana Press, Totowa, NJ, 2004; *Chemical Genomics: Reviews and Protocols*, ed. E.D. Zanders, Humana Press, Totowa, NJ, 2005; *New and Emerging Proteomics Techniques*, Humana Press, Totowa, NJ, 2006. See also activity-based proteomics

## Agar/Agarose

Agar is a heterogeneous natural product derived from algae/seaweed. It is used as a "thickening" agent in cooking as a gelatin-like material. Agar is also used as matrix for growing microorganisms. See Johnstone, K.I., *Micromanipulation of Bacteria: The Cultivation of Single Bacteria and Their Spores by the Agar Gel Dissection Techniques*, Churchill-Livingston, Edinburgh, UK, 1973; Watanabe, T., *Pictorial Atlas of Soil and Seed Funfi: Morphologies of Cultured Fungi and Key to Species*, CRC Press, Boca Raton, FL, 1973; Wilkinson, M.H.F., *Digital Image Analysis*

*of Microbes: Imaging, Morphometry, Fluorometry, and Motility Techniques and Applications*, Wiley, Chichester, UK, 1988; Turner, H.A., Theory of assays performed by diffusion in agar gel. I: General considerations, *J.New Drugs* 41, 221-226, 1963; Rees, D.A., Structure, conformation, and mechanism in the formation of polysaccharide gels and networks, *Adv.Carbohydr. Chem.biochem.* 24, 267-332, 1969; Metcalf, D., Clinical applications of the agar culture technique for haematopoietic cells, *Rev.Eur.Etud.Clin.Biol.* 16, 855-859, 1971; Holt, H.M., Gahrn-Hansen, B., and Bruun, B., *Shewanella algae* and *Shewanella putrefaciens*: clinical and microbiological characteristics, *Clin. Microbiol.Infect.* 11, 347-352, 2005; Discher, D.E., Janmey, P. and Wang, Y.L., Tissue cells feel and respond to the stiffness of their substrate, *Science* 310, 1139-1143, 2005. Agar is composed of two primary components, agarose which is a gelling component and agaropectin which is a sulfated, non-gelling component. Agarose is used as a matrix for the separation of large molecules such as DNA. See *Electrophoresis of Large DNA Molecules: Theory and Applications*, ed. Lai, E.H.C. and Birren, B.W., Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1990; Birren, B.W. and Lai, E.H.C., *Pulsed Field Gel Electrophoresis: A Practical Guide*, Academic Press, San Diego, CA, 1993; Bickerstaff, G.F., *Immobilization of Enzymes and Cells*, Humana Press, Totowa, NJ, 1997; *Electrophoresis in Practice: A Guide to Methods and Applications of DNA and Protein Separations*, Wiley-VCH, Weinheim, Germany, 2001.

## Aggregation

The process of forming an ordered or disordered group of particles, molecules, bubbles, drops, or other physical components which bind together in an undefined fashion; a common physical analogy is concrete or brick. Aggregation is used to measure macromolecular interactions and the interactions of cells such as platelets and frequently involves nephelometry. Agglutination is a term used to describe the aggregation or clumping of blood cells or bacteria caused by antibody or other biological or chemical factors. Aggregation of proteins is thought to be involved in the pathogenesis of diseases such as Parkinson's disease and Alzheimer's disease; these diseases are thought to be conformation diseases of proteins resulting in disorder structure and aggregation. Aggregation of blood platelets is an initial step in the hemostatic response. See Born, G.V., Inhibition of thrombogenesis by inhibition of platelet aggregation, *Thromb.Diath. Haemorrh.Suppl.* 21, 159-166, 1966; Zucker, M.B., ADP- and collagen-induced platelet aggregation in vivo and in vitro, *Thromb.Diath.Haemorrh.Suppl.* 26, 175-184, 1967; Luscher, E.F., Pfueller, S.L., and Massini, P., Platelet aggregation by large molecules, *Ser.Haematol.* 6, 382-391, 1973; Harris, R.H. and Mitchell, R., The role of polymers in microbial aggregation, *Ann.Rev.Microbiol.* 27, 27-50, 1973; Harrington, R.A., Kleimna, N.S., Granger, C.B., *et al.*, Relation between inhibition of platelet aggregation and clinical outcomes, *Am.Heart J.* 136(4 Pt 2 Su), S43-S50, 1998; Holyaerts, M.F., Oury, C., Toth-Zamboki, E., and Vermeylen, J., ADP receptors in platelet activation and aggregation, *Platelets* 11, 307-309, 2000; Kopito, R.R., Aggregosomes, inclusion bodies and protein aggregation, *Trends Cell Biol.* 10, 524-530, 2000; Savage, B., Cattaneo, M., and Ruggeri, Z.M., Mechanisms of platelet aggregation, *Curr.Opin.Hematol.* 8, 270-276, 2001; Valente, J.J., Payne, R.W., Manning, M.C., *et al.*, Colloidal behavior of proteins: effects of the second virial coefficient on solubility, crystallization and aggregation of proteins in aqueous solution, *Curr.Pharm.Biotechnol.* 6, 427-436, 2005;

Schwarzinger, S., Horn, A.H., Ziegler, J., Sticht, H., Rare large scale subdomain motions in prion protein can initiate aggregation, *J.Biomol.Struct.Dyn.* 23, 581-590, 2006; Ellis, R.J. and Minton, A.P., Protein aggregation in crowded environments, *Bio.Chem.* 387, 485-497, 2006; Estada, L.D. and Soto, C., Inhibition of protein misfolding and aggregation by small rationally-designed peptides, *Curr.Pharm.Des.* 12, 2557-2567, 2006.

## Agonist

Generally a compound or substance which binds to a receptor site which could be on a cell membrane or a protein and elicits a positive physiological response. See Gowing, L., Ali, R., and White, J., Opioid antagonists with minimal sedation for opioid withdrawal, *Cochrane Database Syst.Rev.* (2), CD002021, 2002; Bernardo, A. and Minghetti, L., PPAR-gamma agonists as regulators of microglial activation and brain inflammation, *Curr.Pharm.Des.* 12, 93-109, 2006; Bonuccelli, U. and Pavese, N., Dopamine agonists in the treatment of Parkinson's disease, *Expert Rev. Neurother.* 6, 81-89, 2006; Thobois, S., Proposed dose equivalence for rapid switch between dopamine receptor agonists in Parkinson's diseases: a review of the literature, *Clin. Ther.* 28, 1-12, 2006; Schwartz, T.W. and Holst, B., Ago-allosteric modulation and other types of allostery in dimeric 7TM receptors, *J.Recept.Signal Transduct.Res.* 26, 107-128, 2006.

## Algorithm

The underlying iterative method or mathematic theory for any particular computer programming technique; a precisely described routine process that can be applied and systematically followed through to a conclusion; a step-by-step procedure for solving a problem or accomplishing some end. There is a variety of algorithms ranging from defining clinical treatment protocols to aligning and predicting sequences of biopolymers. See Rose, G.D. and Seltzer, J.P., A new algorithm for finding the peptide chain turns in a globular protein, *J.Mol. Biol.* 113, 153-164, 1977; Gotoh, O., An improved algorithm for matching biological sequences, *J.Mol.Biol.* 162, 705-708, 1982; Dandekar, T. and Argos, P., Folding the main chain of small proteins with the genetic algorithm, *J.Mol.Biol.* 236, 844-861, 1994; Rarey, M., Kramer, B., Langauer, T., and Klebe, G., A fast, flexible docking method using an incremental construction algorithm, *J.Mol.Biol.* 261, 470-489, 1996; Jones, G., Willett, P., Glen, R.C. *et al.*, Development and validation of a genetic algorithm for flexible docking, *J.Mol.Biol.* 267, 427-448, 1997; Samudrala, R. and Moulton, J., A graph-theoretic algorithm for comparative modeling of protein structure, *J.Mol.Biol.* 279, 287-302, 1998; Chacon, P. Diaz, J.F., Moran, F., and Andreu, J.M., Reconstruction of protein form with X-ray solution scattering and a genetic algorithm, *J.Mol.Biol.* 299, 1289-1302, 2000; Mathews, D.H. and Turner, D.H., Dyalign: an algorithm for finding the secondary structure common to two RNA sequences, *J.Mol.Biol.* 317, 191-203, 2002; Herrmann, T., Guntert, P., and Wuthrich, K., Protein NMR structure determination with automated NOE assignment using the new software CANDID and the torsion angle dynamics algorithm DYANA, *J.Mol.Biol.* 319, 209-227, 2002; Andronescu, M., Fejes, A.P., Hutter, F., *et al.*, A new algorithm for RNA secondary structure design, *J.Mol.Biol.* 336, 607-624, 2004; Fang, Q. and Shortle, D., Protein refolding in silico with atom-based statistical potentials and conformational search using a simple genetic algorithm, *J.Mol.Biol.* 359, 1456-1467, 2006.

## Albumin

A protein, most notably derived from plasma or serum and secondarily from egg (ovalbumin). It is the most abundant protein in blood/plasma constituting approximately half of the total plasma protein. It functions in establishing plasma colloid strength which preserves the fluid balance between the intravascular and extravascular space (Starling, E.H., On the absorption of fluids from the connective tissue spaces, *J.Physiol.* 19, 312-326, 1896). Albumin, particularly bovine serum albumin (BSA), is used as a model protein and as a standard for the measurement of protein concentration. See Foster, J.F., Plasma albumin, in *The Plasma Proteins*, Vol. 1 ed. F.W. Putnam, Academic Press, New York, NY, Chapter 6, pp. 179-239, 1960; Tanford, C., Protein Denaturation, *Adv.Protein Chem.* 23, 121-282, 1968; Peters, T., Jr., Serum albumin, *Adv.Clin.Chem.* 13, 37-111, 1970; Gillette, J.R., Overview of drug-protein binding, *Ann.N.Y.Acad.Sci.* 226, 6-17, 1973; Peters, T., *All about Albumin: Biochemistry, Genetics, and Medical Applications*, Academic Press, San Diego, CA, 1996; Vo-Dinh, T., Protein nanotechnology: the new frontier in biosciences, *Methods Mol.Biol.* 300, 1-13, 2005; Quinlan, G.J., Martin, G.S., and Evans, T.W., Albumin: biochemical properties and therapeutic potential, *Hepatology* 41, 1211-1219, 2005; Rasnik, I., McKenney, S.A., and Ha, T., Surfaces and orientation: much to FRET about? *Acc.Chem.Res.* 38, 542-548, 2005; *Therapeutic Proteins: Methods and Protocols*, ed. C.M. Smales and D.C., James, Humana Press, Totowa, NJ, 2005; Yamakura, F. and Ikeda, K., Modification of tryptophan and tryptophan residues in proteins by reactive nitrogen species, *Nitric Oxide* 14, 152-161, 2006; Chuang, V.T. and Otagiri, M., Stereoselective binding of human serum albumin, *Chirality* 18, 159-166, 2006; Ascenzi, P., Bocedi, A., Notari, S., *et al.*, Allosteric modulation of drug binding to human serum albumin, *Mini Rev.Med.Chem.* 6, 483-489, 2006. Albumin was the first protein biopharmaceutical (Newhauser, L.R. and Loznen, E.L., Studies on human albumin in military medicine: the standard Army-Navy package of serum albumin (concentrated), *U.S.Navy Med.Bull.* 40, 796-799, 1942; Heyl, J.T., Gibson, J.G., 2nd, and Janeway, C.W., Studies on the plasma proteins. V. The effect of concentrated solutions of human and bovine serum albumin in man, *J.Clin.Invest.* 22, 763-773, 1943) and is used for a variety of clinical indications (*Albumin and the Systemic Circulation*, ed. Blauhut, B. and Lundsgaard-Hansen, P., Karger, Berlin, 1986), including use in extracorporeal circulation as "bridge-to-transplant (Sen, S. and Williams, R., New liver support devices in acute liver failure: a critical evaluation, *Semin.Liver Dis.* 23, 283-294, 2003; Tan, H.K., Molecular absorbent recirculating system (MARS), *Ann.Acad.Med.Singapore* 33, 329-335, 2004; George, J., Artificial liver support systems, *J.Assoc.Physicians India* 52, 719-722, 2004; Barshes, N.R., Gay, A.N., Williams, B., *et al.*, Support for the acutely failing liver: a comprehensive review of historic and contemporary strategies, *J.Am.Coll.Surg.* 201, 458-476, 2005. Albumin is also noted for its ability to interact with various dyes and the binding of bromocresol green is an example of a clinical assay method for albumin (Rodkey, F.L., Direct spectrophotometric determination of albumin in human serum, *Clin.Chem.* 11, 478-487, 1965; Hill, P.G., The measurement of albumin in serum and plasma, *Ann.Clin.Biochem.* 22, 565-578, 1985; Doumas, B.T. and Peter, T., Jr., Serum and urine albumin: a progress report on their measurement and clinical significance, *Clin.Chim.Acta* 258, 3-20, 1997; Duly, E.B., Grimason, S., Grimaon, P. *et al.*, Measurement of serum albumin by capillary zone electrophoresis, bromocresol green, bromocresol purple, and immunoassay methods,

*J.Clin.Pathol.* 56, 780-781, 2003). Albumin is a general designation to describe a fraction of simple proteins which are soluble in water and dilute salt solutions as opposed to the globulin fraction which is insoluble in water but soluble in dilute salt solutions. This is a old classification has many exceptions (Taylor, J.F., The isolation of proteins, in *The Proteins. Chemistry, Biological Activity and Methods*, Volume I. Pt.A, ed. H.Neurath and K.Bailey, Chapter 1, pp. 1-85, 1953; Albumins also migrate faster than globulins on electrophoresis which resulted in the development of the classification of plasma proteins as albumins and globulins (Cooper, G.R., Electrophoretic and ultracentrifugal analysis of normal human serum, in *The Plasma Proteins*, ed. F.W. Putman, Academic Press, New York, NY, 1960, Chapter 3, pp. 51-103, 1960.

## Alloantibody

Also an isoantibody. An antibody directed against a cell or tissue from an individual of the same species. Transplantation antibodies, transfusion antibodies and antibodies against blood coagulation factors such as factor VIII inhibitors are examples of alloantibodies. See Glotz, D., Antoine, C., and Duboust, A., Antidonor antibodies and transplantation: how to deal with them before and after transplantation, *Transplantation* 79 (Suppl 3), S30-S32, 2005; Colvin, R.B. and Smith, R.N., Antibody-mediated organ-allograft rejection, *Nat.Rev.Immunol.* 5, 807-817, 2005; Moll, S. and Pascual, M., Humoral rejection of organ allografts, *Am.J.Transplant.* 5, 2611-2618, 2005; Waanders, M.M., Roelen, D.L, Brand, A., and Class, F.H., The putative mechanism for the immunomodulating effect of HLA-DR shared allogeneic blood transfusion on the alloimmune response, *Transfus.Med.Rev.* 19, 281-287, 2005.

## Alloantigen

An antigen present in some, but not all members of a species or strain. The histocompatibility locus antigens (HLA) is an example. See Schiffman, G. and Marcus, D.M., Chemistry of the ABH blood group substances, *Prog.Hematol.* 27, 97-116, 1964; Race, R.R., Contributions of blood groups to human genetics, *Proc.R.Soc.Lond.B.Biol.Sci.* 163, 151-168, 1965; Dausset, J., Leucocyte and tissue groups, *Vox Sang.* 11, 263-275, 1966; Amos, B., Immunologic factors in organ transplantation, *Am.J.Med.* 55, 767-775, 1968; March, D.M., The ABO and Lewis blood-group system. Immunochemistry, genetics and relation to human disease, *N.Engl.J.Med.* 280, 994-1006, 1969; Bach, F.H., Histocompatibility in man – genetic and practical considerations, *Prog.Med.Genet.* 6, 201-240, 1969; Drozina, G., Kohoutek, J., Janrane-Ferrat, N., and Peterlin, B.M., Expression of MHC II genes, *Curr.Top.Microbiol.Immunol.* 290, 147-170, 2005; Serrano, N.C., Millan, P., and Paez, M.C., Non-HLA associations with autoimmune diseases, *Autoimmun.Rev.* 5, 209-214, 2006; Koehn, B., Gangappa, S., Miller, J.D., Ahmed, R., and Larsen, C.P., Patients, pathogens, and protective immunity: the relevance of virus-induced alloreactivity in transplantation, *J.Immunol.* 176, 2691-2696, 2006. Turesson, C. and Matteson, E.L., Genetics of rheumatoid arthritis, *Mayo Clin.Proc.* 81, 94-101, 2006.

## Allosteric

Originally a term which described the interaction of small molecules with an enzyme at a site physically distant from the

active site where such interaction influenced enzyme activity. These small molecules were generally related to the substrate or product of the enzyme action. More recently, it has been used to describe the modulation of enzyme activity by the binding of a large or small molecule to a site distant from the active site. See Changeux, J.-P. and Kvarnme, E., *Regulation of Enzyme Activity and Allosteric Interactions*, Academic Press, New York, 1968; Kurganov, B.I., *Allosteric Enzymes: Kinetic Behavior*, J.Wiley, Chichester, UK, 1982; Perutz, M.F., *Mechanisms of Cooperativity and Allosteric Regulation in Proteins*, Cambridge University Press, Cambridge, UK, 1990; Segal, L.A., *Biological Kinetics*, Cambridge University Press, Cambridge, UK, 1991; Changeux, J.P., Allosteric interactions interpreted in terms of quaternary structure, *Brookhaven Symp.Biol.* 17, 232-249, 1964; Monod, J., From enzymatic adaptation to allosteric transitions, *Science* 154, 475-483, 1966; Stadtman, E.R., Allosteric regulation of enzyme activity, *Adv.Enzymol.Relat.Areas Mol.Biol.* 28, 41-154, 1966; Frieden, C., Protein-protein interaction and enzymatic activity, *Annu.Rev.Biochem.* 40, 653-696, 1971; Matthews, B.W. and Bernhard, S.A., Structure and symmetry of oligomeric enzymes, *Annu.Rev.Biophys.Bioeng.* 2, 257-317, 1973; Hammes, G.G. and Wu, C.W., Kinetics of allosteric enzymes, *Annu.Rev.Biophys. Bioeng.* 3, 1-33, 1974; Ostermeier, M., Engineering allosteric protein switches by domain insertion, *Protein Eng.Des.Sel.* 18, 359-264, 2005; Horovitz, A. and Willison, K.R., Allosteric regulation of chaperonins, *Curr.Opin.Struct.Biol.* 15, 646-651, 2005; Ascenzi, P., Bocedi, A., Notari, S., *et al.*, Allosteric modulation of drug binding to human serum albumin, *Mini Rev.Med.Chem.* 6, 483-489, 2006.

## Alternative Splicing

Alternative splicing is a process by which biological diversity can be increased without change in DNA content. Alternative splicing is a mechanism by a single pre-mRNA is processed in different ways (different splicing sites) to yield a diverse group of messenger RNA molecules. See Choi, E., Kuehl, M. and Wall, R., RNA splicing generates a variant light chain from an aberrantly rearranged kappa gene, *Nature* 286, 776-779, 1980; Mariamn, E.C., van Beek-Reinders, R.J., and van Venrooij, W.J., *J.Mol. Biol.* 163, 239-256, 1983; Lerivray, R., Mereau, A., and Osborne, H.B., Our favorite alternative splice site, *Biol.Cell.* 98, 317-321, 2006; Florea, L., Bioinformatics of alternative splicing and its regulation, *Brief Bioinform.* 7, 55-69, 2006; Xing, Y. and Lee, C., Alternative splicing and RNA selection pressure – evolutionary consequences for eukaryotic genomes, *Nat.Rev.Genet.* 7, 499-509, 2006. Alternative trans-splicing has also been demonstrated. See Maniatis, T. and Tasic, B., Alternative pre-mRNA splicing and proteome expansion in metazoans, *Nature* 418, 236-243, 2002; Garcia-Blanco, M.A., Messenger RNA reprogramming by spliceosome-mediated RNA trans-splicing, *J.Clin.Invest.* 112, 474-480, 2003; Kornblihtt, A.R., de la Mata, M., Fededa, J.P., *et al.*, Multiple links between transcription and splicing, *RNA* 10, 1489-1498, 2004; Horiuchi, T. and Aigaki, T., Alternative trans-splicing: a novel mode of pre-mRNA processing, *Biol.Chem.* 98, 135-140, 2006. The production of variants of fibronectin (is one of the better known examples of alternative splicing. See Schwarzbauer, J.E., Paul, J.T., and Hynes, R.O., On the origin of species of fibronectin, *Proc.Natl.Acad.USA* 82, 1424-1428, 1985; French-Constant, C., Alternative splicing of fibronectin—many different proteins but few different functions.

## Aminophospholipids

Amino-containing phospholipids such as phosphatidyl ethanolamine and phosphatidyl serine. Phosphatidyl serine is involved in specific membrane functions and change in membrane distribution producing asymmetry are considered important for function. These are enzymes described as flippases, floppases, transporters, scramblase, and aminophospholipid translocase which are responsible for this asymmetry which results in aminophospholipids on the cytoplasmic side of the membrane and cholines and sphingolipids on the outer surface. See Devaux, P.F., Protein involvement in transmembrane lipid asymmetry, *Annu.Rev.Biophys.Biomol.Struct.* 21, 417-439, 1992; Schelgel, R.A., Callahan, M.K., and Williamson, *Ann.N.Y.Acad.Sci.* 926, 271-225, 2000; Daleke, D.L. and Lyles, J.V., Identification and purification of aminophospholipid flippases, *Biochem.Biophys.Acta.* 1486, 108-127, 200; Balasubramanian, K., and Schroit, A.J., Aminophospholipid asymmetry: a matter of life and death, *Annu.Rev.Physiol.* 65, 701-734, 2003; Daleke, D.L., Regulation of transbilayer plasma membrane phospholipid asymmetry, *J.Lipid.Res.* 44, 233-242, 2003.

## Ambisense

A genome or genome segment which contains regions that are positive-sense for some genes and negative-sense(antisense) for other genes as in an ambisense RNA as viral ssRNA genome or genome segment. See Bishop, D.H., Ambisense RNA viruses: positive and negative polarities combined in RNA virus genomes, *Microbiol.Sci.* 3, 183-187, 1986; Ngugen, M. and Naenni, A.L., Expression strategies of ambisense viruses, *Virus Res.* 93, 141-150, 2003; van Knippenberg, I., Goldbach, R., and Kormelink, R., *Tomato spotted wilt virus* S-segment mRNAs have overlapping 3'-ends containing a predicted stem-loop structure and conserved sequence motif, *Virus Res.* 110, 125-131, 2005; Barr, J.N., Rodgers, J.W., and Wertz, G.W., The Bunyamwera virus mRNA transcription signal resides within both the 3' and the 5' terminal regions and allows ambisense transcription from a model RNA segment, *J.Virol.* 79, 12602-12607, 2005.

## Amorphous Powder

A solid form of a material which does not have a definite form such as a crystal structure. Differing from a crystal form, an amorphous form is thermodynamically unstable and does not have a defined melting point. The physical characteristics of an amorphous powder make it the desired physical state for drug after lyophilization. See Jennings, T.A., *Lyophilization Introduction and Basic Principles*, Interpharm Press, Denver, Colorado, 1999; Izutsu, K., Yoshioka, S., and Kojima, S., Increased stabilizing effects of amphiphilic excipients on freeze-drying of lactate dehydrogenase (LDH) by dispersion into sugar matrices, *Pharm.Res.* 12, 838-843, 1995; Royall, P.G., Huang, C.Y., Tang, S.W., *et al.*, The development of DMA for the detection of amorphous content in pharmaceutical powdered material, *Int.J.Pharm.* 301, 181-191, 2005; Stevenson, C.L., Bennett, D.B., and Lechuga-Ballesteros, D., Pharmaceutical liquid crystals: the relevance of partially ordered systems, *J.Pharm.Sci.* 94, 1861-1880, 2005; Skakle, J., Applications of X-ray power diffraction in materials chemistry, *Chem.Rec.* 5, 252-262, 2005; Farber, L., Tardos, G.I., and Michaels, J.N., Micro-mechanical properties of drying material bridges of pharmaceutical excipients,

*Int.J.Pharm.* 306, 41-55, 2005; Jovanovic, N., Bouchard, A., Hofland, G.W., *et al.*, Distinct effects of sucrose and trehalose on protein stability during supercritical fluid drying and freeze-drying, *Eur.J.Pharm.Sci.* 27, 336-345, 2006; Reverchon, E. and Atanacci, A., Cyclodextrins micrometric powders obtained by supercritical fluid processing, *Biotechnol.Bioeng.* 94, 753-761, 2006; Jorgensen, A.C., Miroshnyk, I., Karjalainen, M., *et al.*, Multivariate data analysis as a fast tool in evaluation of solid state phenomena, *J.Pharm.Sci.* 95, 906-916, 2006; Shah, S., Sharma, A., and Gupta, M.N., Preparation of cross-linked enzyme aggregates by using bovine serum albumin as a proteic feeder, *Anal.Biochem.* 351, 207-213, 2006.

## Amplicon

(Usually) the DNA product of a PCR reaction, usually an amplified segment of a gene or DNA. An RNA amplicon would be an RNA sequence can be obtained by transcription mediated amplification. See Bustin, S.A., Benes, V., Nolan, T., and Pfaffi, M.W., Quantitative real-time RT-PCR – a perspective, *J.Mol.Endocrinol.* 34, 597-601, 2005; Sarrazin, C., Highly sensitive hepatitis C virus RNA detection methods: molecular backgrounds and clinical significance, *J.Clin.Virol.* 25, S23-S29, 2002). This also refers to herpesvirus vectors for gene therapy (Oehmig, A., Fraefel, C., and Breakfield, X.O., Update on herpesvirus amplicon vectors, *Molecular Therapy* 10, 630-643, 2004).

## Amphipathic (amphiphilic)

A compound which has both hydrophilic (lyophilic) and hydrophobic (lyophobic) properties. This property is important for the interaction of protein with lipids and for the properties of cell-penetrating peptides. Detergents are amphipathic molecules. See Fasman, G.D., *Prediction of Protein Structures and the Principles of Protein Conformation*, Plenum Press, New York, NY, 1989; Epand, R.M., *The Amphipathic Helix*, CRC Press, Boca Raton, FL, 1993; Langel, U., *Cell-Penetrating Peptides: Processes and Applications*, CRC Press, Boca Raton, FL, 2002; *Peptide-Lipid Interactions*, ed. S.A. Simon and T.J. McIntosh, Academic Press, San Diego, CA, 2002; Scow, R.O., Blanchette-Mackie, E.J., and Smith, L.C., Transport of lipid across capillary endothelium, *Fed.Proc.* 39, 2610-2617, 1980; Corr, P.B., Gross, R.W., and Sobel, B.E., Amphipathic metabolites and membrane dysfunction in ischemic myocardium, *Circ.Res.* 55, 135-154, 1984; Anantharamaiah, G.M., Brouillette, C.G., Engler, J.A., *et al.*, Role of amphipathic helices in HDL structure/function, *Adv.Exp.Med.Biol.* 285, 131-140, 1991; Segrest, J.P., Garber, D.W., Brouillette, C.G., *et al.*, The amphipathic alpha helix: a multifunctional structural motif in plasma apolipoproteins, *Adv.Protein Chem.* 45, 303-369, 1994; Lester, J.B. and Scott, J.D., Anchoring and scaffold proteins for kinases and phosphatases, *Recent Prog.Horm.Res.* 52, 409-429, 1997; Lesieur, C., Vecsey-Semjen, B., Abrami, L. *et al.*, Membrane insertion: the strategies of toxins, *Mol.Membr.Biol.* 14, 45-64, 1997; Johnson, J.E. and Cornell, R.B., Amphitropic proteins: regulation by reversible membrane interactions, *Mol.Membr.Biol.* 16, 217-235, 1999; Tossi, A., Sandri, L., and Giangaspero, A., Amphipathic, alpha-helical antimicrobial peptides, *Biopolymers* 55, 4-30, 2000; Garavito, R.M. and Ferguson-Miller, S., Detergents as tools in membrane biochemistry, *J.Biol.Chem.* 276, 32403-32406, 2001; El-Andaloussi, S., Holm, T., and Langel, U., Cell-penetrating

peptides: mechanisms and applications, *Curr.Pharm.Des.* 11, 3597-3611, 2005; Deshayes, S., Morris, M.C., Divita, G., and Heitz, F., Interactions of primary amphipathic cell penetrating peptides with model membranes: consequences on the mechanism of intracellular delivery of therapeutics, *Curr.Pharm.Des.* 11, 3629-3638, 2005.

## Ampholyte

An amphoteric electrolyte. In proteomics, this term is used to describe small multi-charged organic buffer used to establish pH gradients in isoelectric focusing. See Righetti, P.G., Isoelectric focusing as the crow flies, *J.Biochem.Biophys.Methods* 16, 99-108, 1988; Patton, W.F., Pluskal, M.G., Skea, W.M., *et al.*, Development of a dedicated two-dimensional gel electrophoresis system that provides optimal pattern reproducibility and polypeptide resolution, *Biotechniques* 8, 518-527, 1990; Hanash, S.M., Strahler, J.R., Neel, J.V., *et al.*, Highly resolving two-dimensional gels for protein sequencing, *Proc.Natl.Acad.Sci.USA* 88, 5709-5713, 1991; Cade-Treyer, D., Cade, A., Darjo, A., and Jouvion-Moreno, M., Isoelectric focusing and titration curves in biomedicine and in agrofood industries: a multimedia teaching program, *Electrophoresis* 17, 479-482, 1996; Stoyanov, A.V. and Pawliszyn, J., Buffer composition changes in background electrolyte during electrophoretic run in capillary zone electrophoresis, *Analyst* 129, 979-982, 2004; Gorg, A. Weiss, W. and Dunn, M.J., Current two-dimensional technology for proteomics, *Proteomics* 4, 3665-3685, 2004; Kim, S.H., Miyatake, H., Ueno, T., *et al.*, Development of a novel ampholyte buffer for isoelectric focusing: electric charge-separation of protein samples for X-ray crystallography using free-flow isoelectric focusing, *Acta Crystallogr.D Biol.Crystallogr.* 61, 799-802, 2005; Righetti, P.G., The Alpher, Bethe, Gamow of isoelectric focusing, the alpha-Centauri of electrokinetic methods, *Electrophoresis* 27, 923-938, 2006.

## Amphoteric

Referring to a molecule such as protein, peptide, amino acid capable of having a positive charge, negative charge, or zero net charge. When at a zero net charge, it is also referred to as a zwitterion. See Haynes, D., The action of salts and non-electrolytes upon buffer solutions and amphoteric electrolytes and the relation of these effects to the permeability of the cell, *Biochem.J.* 15, 440-461, 1921; Akabori, S., Tani, H., and Noguchi, J., A synthetic amphoteric polypeptide, *Nature* 167, 1591-160, 1951; Coway-Jacobs, A. and Lewin, L.M., Isoelectric focusing in acrylamide gels: use of amphoteric dyes as internal markers for determination of isoelectric points, *Anal.Biochem.* 43, 294-400, 1971; Chiari, M. ## Amyloid

A wax-like translucent insoluble material consisting largely of protein and may or may not contain carbohydrate and is associated with tissue degeneration. Amyloid peptides/proteins are thought to be associated with Alzheimer's disease. Glenner, G.G., The pathogenetic and therapeutic implications of the discovery of the immunoglobulin origin of amyloid fibrils, *Hum.Pathol.* 3, 157-162, 1972; Franklin, E.C. and Zucker-Franklin, D., Current concepts of amyloid, *Adv.Immunol.* 15, 249-304, 1972; Glenner, G.G. and Terry, W.D., Characterization of amyloid, *Annu.Rev.Med.* 25, 131-135, 1974; Glenner, G.G. and Page, D.L., Amyloid, amyloidosis, and amyloidogenesis, *Int.Rev.Exp.Pathol.* 15, 1-92, 1976; Gorevic, P.D., Cleveland, A.B., and Franklin, E.C., The biologic significance of amyloid, *Ann.N.Y.Acad.Sci.* 389, 380-394, 1982; Reinhard, C., Herbert, S.S., and De Strooper, B., The amyloid-beta precursor protein: integrating structure with biological function, *EMBO J.* 24, 3996-4006, 2005; Meersman, F. and Dobson, C.M., Probing the pressure-temperature stability of amyloid fibrils provides new insights into their molecular properties, *Biochem.Biophys.Acta* 1764, 452-460, 2006; Tycko, R., Solid-state NMR as a probe of amyloid structure, *Protein Pept.Lett.* 13, 229-234, 2006; Torrent, J., Balny, C. and Lange, R., High pressure modulates amyloid formation, *Protein Pept.Lett.* 13, 271-277, 2006; Gorbenko, G.P. and Kinnuen, P.K., The role of lipid-protein interactions in amyloid-type protein fibril formation, *Chem.Phys.Lipids* 141, 72-82, 2006; Catalano, S.M., Dodson, E.C., Henze, D.A., *et al.*, The role of amyloid-beta derived diffusible ligands (ADDLs) in Alzheimer's disease, *Curr.Top.Med.Chem.* 6, 597-608, 2006.

## Anaphylatoxin(s)

Fragment(s) of complement proteins released during complement activation. See Corbeil, L.B., Role of the complement system in immunity and immunopathology, *Vet.Clin.North Am.* 8, 585-611, 1978; Hugli, T.E. and Muller-Eberhard, H.J., Anaphylatoxins: C3a and C5a, *Adv.Immunol.* 26, 1-53, 1978; Hugli, T.E., The structural basis for anaphylatoxin and chemotactic functions of C3a, C4a, and C5a, *Crit.Rev.Immunol.* 1, 321-366, 1981; Hawlisch, H., Wills-Karp, M., Karp, C.L., and Kohl, J., The anaphylatoxins bridge innate and adaptive immune responses in allergic asthma, *Mol.Immunol.* 41, 123-131, 2004; Ali, H. and Panettieri, R.A., Jr., Anaphylatoxin C3a receptors in asthma, *Respir.Res.* 6, 19, 2005; Sunyer, J.O., Boshra, H., and Li, J., Evolution of anaphylatoxins, their diversity and novel roles in innate immunity: insights from the study of fish complement, *Vet.Immunol.Immunopathol.* 108, 77-89, 2005; Schmidt, R.E. and Gessner, J.E., Fc receptors and their interactions with complement in autoimmunity, *Immunol.Lett.* 100, 56-67, 2005; Chaplin, H., Jr., Review: the burgeoning history of the complement system 1888-2005, *Immunohematol.* 21, 85-93, 2005; Lambrecht, B.N., An unexpected role for the anaphylatoxin C5a receptor in allergic sensitization, *J.Clin.Invest.* 116, 626-632, 2006.

## Anergy

Lack of an immune response to an allergen (antigen); can refer to an individual cell such as a B-cell or a T-cell, tissue, or intact organism; however, it is used most frequently with respect to B-cells or T-cells and immunological tolerance. See Kantor, F.S., Infection, anergy, and cell-mediated immunity, *N.Engl.J.Med.* 292, 629-634, 1975; Bullock, W.E., Anergy and infection, *Adv. Intern.Med.* 21, 149-173, 1976; Dwyer, J.M., Anergy. The mysterious loss of immunological energy, *Prog.Allergy* 35, 15-92, 1984; Brennan, P.J., Saouaf, S.J., Greene, M.I., and Shen, Y., Anergy and suppression as coexistent mechanisms for the maintenance of peripheral T cell tolerance, *Immunol.Res.* 27, 295-302, 2003; Macian, F., Im, S.H., Garcia-Cozar, F.J., and Rao, A., T-cell anergy, *Curr.Opin.Immunol.* 16, 209-216, 2004; Mueller, D.L., E3 ubiquitin ligases as T cell anergy factors, *Nat.Immunol.* 5, 883-890, 2004; Faria, A.M. and Weiner, H.L., *Immunol.Rev.* 206, 232-259, 2005; Akdis, M., Blaser, K., and Akdis, C.A., T regulatory cells in allergy, *Chem.Immunol.Allergy* 91, 159-173, 2006; Ferry, H., Leung, J.C., Lewis, G. *et al.*, B-cell tolerance, *Transplantation* 81, 308-315, 2006.

## Angiopoietin

A protein family that binds to endothelial cells; specific for Tie2 receptor kinase. See Plank, M.J., Sleeman, B.D., and Jones, P.F., The role of the angiopoietins in tumor angiogenesis, *Growth Factors* 22, 1-11, 2004; Oike, Y., Yasunaga, K., and Suda, T., Angiopoietin-related/angiopoietin-like proteins regulate angiogenesis *Int.J.Hematol.* 80, 21-28, 2004; Giuliani, N., Colla, S., Morandi, E., and Rizzoli, V., Angiopoietin-1 and myeloma-induced angiogenesis, *Leuk.Lymphoma* 46, 29033, 2005; Dhanabal, M., Jeffers, M., LaRochelle, W.J., and Lichenstein, R.S., Angioarrestin: a unique angiopoietin-related protein with anti-angiogenic properties, *Biochem.Biophys.Res.Commu.* 333, 308-315, 2005; Endothelial/pericyte interactions, *Circ.Res.* 97, 512-523, 2005.

## Anisotropy

A difference in a physical property such as melting point when measured in different principle directions; antonym, isotropy. Anisotropy is also defined as the property of being anisotropic as in the case of light transmission where different values are obtained when along axes in different directions Time-resolved fluorescence anisotropy decay measures the time dependence of the depolarization of light emitted from a fluorophore experiencing angular motions. In botany, anisotropy is defined as assuming different positions in response to the action of external stimuli. See Kinoshita, K., Jr., Kawato, S., and Ikegami, A., Dynamic structure of biological and model membranes: analysis by optical anisotropy decay measurement, *Adv.Biophys.* 17, 147-203, 1984; Kinoshita, K., Jr. and Ikegami, A., Dynamic structure of membranes and subcellular components revealed by optical anisotropy decay methods, *Subcell.Biochem.* 13, 55-88, 1988; Bucci, E. and Steiner, R.F., Anisotropy decay of fluorescence as an experimental approach to proteins, *Biophys.Chem.* 30, 199-224, 1988; Matko, J., Jenei, A., Matyus, L. Ameloot, M., and Damjanovich, S., Mapping of cell surface protein-patterns by combined fluorescence anisotropy and energy transfer measurements, *J.Photochem.Photobiol.B* 19, 69-73, 1993; Rachofsky, E.L. and Laws, W.R., Kinetic methods and data analysis methods for fluorescence anisotropy decay, *Methods Enzymol.* 321, 216-238,

2000; Santos, N.C., Prieto, M., and Castanho, M.A., Quantifying molecular partition into model systems of biomembranes: an emphasis on optical spectroscopic methods, *Biochim.Biophys. Acta* 1612, 123-135, 2003; Vrieling, A. and Sampson, N., Sub-angstrom resolution x-ray structures: is seeing believing?, *Curr.Opin.Struct.Biol.* 13, 709-715, 2003; Wang, J., Cao, Z., Jiang, Y., *et al.*, Molecular signaling aptamers for real-time fluorescence analysis of proteins, *IUBMB Life* 57, 123-128, 2005; Dmitrienko, V.E., Ishida, K., Kirfel, A., and Ovchinnikova, E.N., Polarization anisotropy of X-ray atomic factors and 'forbidden' resonant reflections, *Acta Crystallogr.A* 61, 481-493, 2005; Baskin, T.I., Anisotropic expansion of the plant cell wall, *Annu.Rev.Cell Dev. Biol.* 21, 203-222, 2005; Heilker, R., Zemanova, L., Valler, M.J., and Nienhaus, G.U., Confocal fluorescence microscopy for high-throughput screening of G-protein coupled receptors, *Curr.Med. ## Ankyrin-repeat domains/proteins

A domain or motif, named after ankyrin, a cytoskeletal protein, is found in a large number of proteins. This domain which was first described in a yeast cell cycle regulator (Swi6/cdc 10) and *Drosophila* (notch protein) consists of approximately 30 amino acids and is involved in protein-protein interactions. See Liou, H.C. and Baltimore, D., Regulation of the NF-kappa b/rel transcription factor and I kappa B inhibitor system, *Curr.Opin.Cell Biol.* 5, 477-487, 1993; Dedhar, S. and Hannigan, G.E., Integrin cytoplasmic interactions and bidirectional transmembrane signalling, *Curr.Opin.Cell Biol.* 8, 657-669, 1996; Sedgwick, S.G. and Smerdon, S.J., The ankyrin repeat: a diversity of interactions on a common structural framework, *Trends Biochem.Sci.* 24, 311-316, 1999; Yoganathan, T.N., Costello, P., Chen, X., *et al.*, Integrin-linked kinase (ILK): a "hot" therapeutic target, *Biochem. Pharmacol.* 60, 1115-1119, 2000; Hryniewicz-Jankowska, A., Czogalla, A., Bok, E., and Sikorski, A.F., Ankyrins, multifunctional proteins involved in many cellular pathways, *Folia Histochem.Cytobiol.* 40, 239-249, 2002; Lubman, O.Y., Korolev, S.V., and Kopan, R., Anchoring notch genetics and biochemistry; structural analysis of the ankyrin domain sheds light on existing data, *Mol.Cell.* 13, 619-626, 2004; Mosavi, L.K., Cammett, T.J., Desosiers, D.C., and Peng, Z.Y., The ankyrin repeat as molecular architecture for protein recognition, *Protein Sci.* 13, 1435-1448, 2004; Tanke, H.J., Dirks, R.W., and Raap, T., FISH and immunocytochemistry: toward visualizing single target molecules in living cells, *Curr.Opin.Biotechnol.* 16, 49-54, 2005; Trigiante, G. and Lu, X., ASPPs and cancer, *Nat.Rev.Cancer* 6, 217-226, 2006; Legate, K.R., Montañez, E., Kudlacek, O. and Fässler, R., ILK, PINCH and parvin: the tIPP of integrin signalling, *Nat.Rev.Mol. Cell Biol.* 7, 20-31, 2006.

## Annotation

Information added to a subject after the initial overall definition. Most frequently used in molecular biology for the addition of information regarding function to the initial description of a gene/gene sequence in a genome. See Brent, M.R., Genome annotation past, present, and future: how to define an ORF at each locus, *Genome Res.* 15, 177-1786, 2005; Boutros, P.C. and Okey, A.B., Unsupervised pattern recognition: an introduction to the whys and wherefores of clustering microarray data, *Brief Bioinform.* 6, 331-343, 2005; Boeckman, B., Blatter, M.C., Famiglietti, L., *et al.*,

Genet.* 39, 309-338, 2005; Cahan, P., Ahmed, A.M., Burke, H., *et al.*, List of list-annotated (LOLA): a database for annotation and comparison of published microarray gene lists, *Gene* 360, 78-82, 2005; Dong, Q., Kroiss, L., Oakley, F.D., Wang, B.B., and Brendel, V., Comparative EST analyses in plant systems, *Methods Enzymol.* 395, 400-418, 2005; Crockett, D.K., Seiler, C.E., 3rd, Elenitoba-Johnson, K.S., and Kim, M.S., *J.Biomed.Tech.* 16, 341-346, 2005; Hermida, L., Schaad, O., Demougin, P., Descombes, P., and Primig, M., MIMAS: an innovative tool for network-based high density oligonucleotide microarray data management and annotation, *BMC Bioinformatics* 7, 190, 2006; Huang, D., Wei, P., and Pan, W., Combining gene annotation and gene expression data in model-based clustering weighted method, *OMICS* 10, 28, 2006; Snyder, K.A., Feldman, H.J., Dumontier, M., Salama, J.J., and Hogue, C.W., Domain-based small molecule binding site annotation, *BMC Bioinformatics* 7, 152, 2006.

## Anoikis

Apoptosis following loss of attachment to a matrix or specific anchorage site. See Grossman, J., Molecular mechanisms of "detachment-induced apoptosis—Anoikis.", *Apoptosis* 7, 247-260, 2002; Zvibel, I., Smets, F., and Soriano, H., Anoikis: road-block to cell transplantation? *Cell Transplant.* 11, 621-630, 2002; Valentijn, A.J., Zouq, N., and Gilmore, A.P., Anoikis, *Biochem. Soc. Trans.* 32, 421-425, 2004; Zhan, M., Zhao, H., and Han, Z.C., *Histol.Histopathol.* 19, 973-983, 2004; Reddig, P.J. and Juliano, R.L., Clinging to life: cell to matrix adhesion and cell survival, *Cancer Metastasis Rev.* 24, 425-439, 2005; Rennebeck, G., Martelli, M., and Kyprianou, N., Anoikis and survival connections in the tumor microenvironment: is there a role in prostate cancer metastasis? *Cancer Res.* 65, 11230-11235, 2005.

## ANTH-Domain

A protein domain similar to the ENTH-domain and contained in proteins involved in endocytotic processes. See Stahelin, R.V., Long, F., Petter, B.J., *et al.*, Contrasting membrane interaction mechanisms of AP180 N-terminal homology (ANTH) and epsin N-terminal homology (ENTH) domains, *J.Biol.Chem.* 278, 28993-28999, 2003; Sun, Y., Kaksonen, M., Madden, D.T., *et al.*, Interaction of Slap2p's ANTH domain with PtdIns(4,5)P2 is important for actin-dependent endocytotic internalization, *Mol. Biol.Cell* 16, 717-730, 2005; Yao, P.J., Bushlin, I., and Petralia, R.S., Partially overlapping distribution of epsin1 and HIP1 at the synapse: analysis by immunoelectron microscopy, *J.Comp. Neurol.* 494, 368-379, 2006.

## Antibody

A protein synthesized and secreted by a plasma cell. A plasma cell or antibody-secreting cell is derived from an undifferentiated B-cell. Antibodies are designated as the humoral immune response as opposed to the cellular immune response. Antibodies are usually synthesized and secreted in response to a foreign protein or bacteria. Natural antibody preparation are polyclonal in that such preparations are derived from a population of plasma cells. A monoclonal antibody is derived from a signal plasma cell clone. Antibodies can be formed against self; such antibodies are referred to as autoantibodies. Disease resulting from the

formation of antibodies are called autoimmune diseases and can result from disorders of the humoral immune system or the cellular immune system. Antibodies are classified as IgG, IgM, IgE, IgA, and IgD. There are unusual naturally-occurring antibodies such as camelid antibodies and artificial derivatives such as Fab fragments and scFv fragments.

## Antibody Valency

Antibody valency refers to the number of antigen binding sites there are on a single antibody molecule. An IgG molecule which consists of two heavy chain and two light chains (a dimer of heterodimers) has two antibody binding sites and hence is bivalent have a valency of two. IgM which is a pentamer of IgG has a valency of 10. An scFv fragment is monovalent. An antibody with increased valence is considered to have greater avidity. See Marrack, J.R., Hoch, H., and Johns, R.G., The valency of antibodies, *Biochem.J.* 48, xxi-xxii, 1951; Sela, M., Antibodies: shapes, homogeneity, and valency, *FEBS Lett.* 1, 83-85, 1968; van Regenmortel, M.H., Which value of antigenic valency should be used in antibody avidity calculations with multivalent antigens, *Mol.Immunol.* 25, 565-567, 1988; Gerdes, M., Meusel, M., and Spener, F., Influence of antibody valency in a displacement immunoassay for the quantitation of 2,4-dichlorophenoxyacetic acid, *J.Immunol.Methods* 223, 217-226, 1999; Hudson, P.J. and Kortt, A.A., High avidity scFv multimers: diabodies and triabodies, *J.Immunol.Methods* 231, 177-189, 1999; Hard, S.A. and Dimmock, N.J., Valency of antibody binding to virions and its determination by surface plasmon resonance, *Rev.Med.Virol.* 14, 123-135, 2004; Scallion, B., Cai, A., Radewonuk, J., and Naso, M., Addition of an extra immunoglobulin domain to two anti-rodent TNF monoclonal antibodies substantially increased their potency, *Mol.Immunol.* 41, 73-80, 2004; Adams, G.P., Tai, M.S., McCartney, J.E. *et al.*, Avidity-mediated enhancement of in vivo tumor targeting by single-chain Fv dimers, *Clin.Cancer Res.* 12, 1599-1605, 2006.

## Antibody-dependent cellular cytotoxicity (ADCC)

The process of cell death. This is usually the process by which an organism destroys bacterial and viral pathogens but also is the mechanism by which tumor cells are lysed secondary to treatment with antibodies. The process involves the recognition of epitopes by the Fab region of the IgG on the target cell surface resulting in the binding of the antibody. The Fc domain is then recognized by a phagocytic cell such as a natural killer (NK) cell. The Fc region is critical for this process. See Dallegri, F. and Ottonello, D., Neutrophil-mediated cytotoxicity against tumor cells: state of the art, *Arch.Immunol.Ther.Exp.* 40, 39-42, 1992; Muller-Eberhard, H.J., The molecular basis of target cell killing by human lymphocytes and of killer cell self-protection, *Immunol.Rev.* 103, 87-98, 1981; Morretta, L., Moretta, A., Canonica, G.W., *et al.*, Receptors for immunoglobulins on resting and activated human T cells, *Immunol.Rev.* 56, 141-162, 1981; Santonine, A., Herberman, R.B., and Holden, H.T., Correlation between natural and antibody-dependent cell-mediated cytotoxicity against tumor targets in the mouse. II. Characterization of the effector cells, *J.Natl.Cancer Inst.* 63, 995-1003, 1979; Sissons, J.G. and Oldstone, M.B., Antibody-mediated destruction of virus-infected cells, *Adv.Immunol.* 29, 209-260, 2000; Perussia, B. and Loza, M.J., Assays for antibody-directed cell-mediated cytotoxicity (ADCC) and reverse ADCC (redirected

cytotoxicity) in human natural killer cells, *Methods Mol. Biol.* 121, 179-192, 2000; Villamor, N., Montserrat, E., and Colomer, D., Mechanism of action and resistance to monoclonal antibody therapy, *Semin. Role of antibody-dependent cell-mediated cytotoxicity in the efficacy of therapeutic anti-cancer monoclonal antibodies, *Cancer Metastasis Rev.* 24, 487-499, 2005.

### Antibody-Proteomics/Antibody Based Proteomics

The systematic generation and use of antibodies for the analysis of the proteome. An example would be the use of an antibody-based protein microarray. See Agaton, C., Falk, R., Holden Guthenberg, I. *et al.*, Selective enrichment of monospecific polyclonal antibodies for antibody-based proteomics efforts, *J. Chromatog. A* 1043, 33-40, 2004; Nielsen, A.B. and Geierstanger, B.H., Multiplexed sandwich assays in a microwave format. *J. Immunol. Methods* 290, 107-120, 2004; Uhlen, M. and Ponten, F., Antibody-based proteomics for human tissue profiling, *Mol. Cell. Proteom.* 4, 384-393, 2005; Stenvall, M., Steen, J., Uhlen, M., *et al.*, High-throughput solubility assay for purified recombinant protein immunogens, *Biochim. Biophys. Acta.* 1752, 6-10, 2005; Uhlen, M., Bjorling, E., Agaton, C. *et al.*, A human protein atlas for normal and cancer tissues based on antibody proteomics, *Mol. Cell. Proteomics* 4, 1920-1932, 2005. See also immunoproteomics.

### Antigen

A material which can be of diverse substance and origin such as protein or microorganism which elicits an immune response. An immune response can be the formation of an antibody directed against the antigen (humoral response; B-cell response) as well as a cellular response (T cell response). Antigens can be separated into immunogens (complete antigens) which can elicit an immune response and haptens or incomplete immunogens which do not by themselves elicit an immune response but can react with antibodies. Haptens require combination with a larger molecule such as protein to elicit antibody formation. See Nossal, G.J.V., *Antigens, Lymphoid Cells, and the Immune Response*, Academic Press, New York, USA, 1971; Langone, J.J., *Antibodies, Antigens, and Molecular Mimicry*, Academic Press, San Diego, USA, 1989; *Fundamental Immunology*, ed. W. Paul, Raven Press, New York, 1993; Cruse, J.M., Lewis, R.E., and Wang, H., *Immunology Guidebook*, Elsevier, Amsterdam, Netherlands, 2004.

### Antigenic Determinant

An antigenic determinant is also an epitope; this is the region of an antigen which binds to the reactive site of an antibody which is referred to as a paratope. The antigenic determinant which elicits the antibody response. There are linear or continuous

determinants which would be a continuous amino acid sequence in a protein antigen and conformation or discontinuous determinants where, for example, with a protein, the epitope is formed by protein folding. A linear determinant is recognized by T-cells as well as B-cell and antibodies while a discontinuous determinant is recognized only by B-cells and antibodies. See Eisen, H.N., The immune response to a simple antigenic determinant, *Harvey Lect.* 60, 1-34, 1966; Kabat, E.A., The nature of an antigenic determinant, *J. Immunol.* 97, 1-11, 1966; Franks, D., Antigens as markers on cultured mammalian cells, *Biol. Rev. Camb. Philos. Soc.* 43, 17-50, 1968; Stevanovic, S., Antigen processing is predictable: from genes to T cell epitopes, *Transpl. Immunol.* 14, 171-174, 2005; McRobert, E.A., Tikoo, A., Gallicchio, M.A., Cooper, M.E., and Bach, L.A., Localization of the ezrin binding epitope for glycosylated proteins, *Ann. N.Y. Acad. Sci.* 1043, 617-624, 2005; Lovtich, S.B., and Unanue, E.R., Conformational isomers of a peptide-class II major histocompatibility complex, *Immunol. Rev.* 207, 293-313, 2005; Phillips, W.J., Smith, D.J., Bona, C.A., Bot, A., and Zaghoulani, H., Recombinant immunoglobulin-based epitope delivery: a novel class of autoimmune regulators, *Int. Rev. Immunol.* 24, 501-517, 2005; De Groot, A.S., Knopp, P.M., and Martin, W., De-immunization of therapeutic proteins by T-cell epitope modification, *Dev. Biol. (Basel)* 122, 171-194, 2005; Burlet-Schlitz, O., Claverol, S., Gairin, J.E., and Monsarrat, B., The use of mass spectrometry to identify antigens from proteosome processing, *Methods Enzymol.* 405, 264-300, 2005.

### Anti-idiotypic

Usually in reference to antibodies whose specificity is directed against the idiotype region of an antibody; most frequently with naturally occurring antibodies. Since receptors and antibodies share common binding characteristics, this term is sometimes used to describe antibodies directed against receptors. See Couraud, P.O. and Strosberg, A.D., Anti-idiotypic antibodies against hormone and neurotransmitter receptors, *Biochem. Soc. Trans.* 19, 147-151, 1991; Erlanger, B.F., Antibodies to receptors by an auto-anti-idiotypic strategy, *Biochem. Soc. Trans.* 19, 138-143, 1991; Grealley, J.M. Physiology of anti-idiotypic interactions: from clonal to paratopic selection, *Clin. Immunol. Immunopathol.* 60, 1-12, 1991; Friboulet, A., Izadyar, L., Avasse, B., Abzyme generation using an anti-idiotypic antibody as the "internal image" of an enzyme active site, *Appl. Biochem. Biotechnol.* 47, 229-237, 1994; Hebert, J. and Boutin, Y., Anti-idiotypic antibodies in the treatment of allergies, *Adv. Exp. Med. Biol.* 409, 431-437, 1996.

### Antisense

Generally refers a nucleotide sequence that is complementary to a sequence of messenger RNA which is the product of the non-coding sequence of DNA. It also refers to the peptide products from the antisense sequence referred to as antisense peptides. Antisense peptides have been investigated for biological activity. siRNA are based on the processing of antisense RNA. See Korneev, S. and O'Shea, M., Natural antisense RNAs in the nervous system, *Rev. Neurosci.* 16, 213-222, 2005. See also MicroRNA, siRNA, antisense peptides. aptamers

### Antisense Peptides

The products from the translation of antisense RNA. Some antisense peptides have been demonstrated to show affinity properties that appear to be unique to that sequence and not seen in

scrambled sequences. See Schwabe, C., New thoughts on the evolution of hormone-receptor systems, *Comp.Biochem.Physiol.A* 97, 101-106, 1990; Chaiken, I., Interactions and uses of antisense peptides in affinity technology, *J.Chromatog.* 597, 29-36, 1992; Labrou, N. and Clonis, Y.D., The affinity technology in downstream processing, *J.Biotechnol.* 36, 95-119, 1994; Root-Bernstein, R.S. and Holsworth, D.D., Antisense peptides: critical mini-review, *J.Theoret.Biol.* 190, 107-1199, 1998; Siemion, I.Z., Cebrat, M., and Kluczyk, A., The problem of amino acid complementarity and antisense peptides, *Curr.Protein Pept.Sci.* 5, 507-527, 2004.

## Apical

In reference to a differentiated cell, that portion or apex of the cell that is pointed toward the lumen as for example in endothelial cells. The membrane protein distribution is frequently different between the apical domain and the basolateral domain. See basolateral. See Alfalah, M., Wetzel, G., Fischer, I. *et al.*, A novel type of detergent-resistant may contribute to an early protein sorting event in epithelial cells, *J.Biol.Chem.* 280, 42636-42643, 2005; Kellett, G.L., and Brot-Laroche, E., Apical GLUT2: a major pathway of intestinal sugar absorption, *Diabetes* 54, 3056-3062, 2005; Ito, K., Suszuki, H., Horie, T., and Sugiyama, Y., Apical/basolateral surface expression of drug transporters and its role in vectorial drug transport, *Pharm.Res.* 22, 1559-1577, 2005; Anderson, J.M., Van Itallie, C.M., and Fanning, A.S., Setting up a selective barrier at the apical junction complex, *Curr.Opin.Cell Biol.* 16, 140-145, 2004.

## Apoptosis

Programmed cell death; an organized process by which cell undergo degradation and elimination. See Tomei, L.D. and Cope, F.O., *Apoptosis: The Molecular Basis of Cell Death*, Cold Spring Harbor Laboratory Press, Plainview, NY, 1991; Studzinski, G.P., *Cell Growth and Apoptosis: A Practical Approach*, IRL Press at Oxford University Press, Oxford, UK, 1995; Christopher, G.D., *Apoptosis and the Immune Response*, Wiley-Liss, New York, NY, 1995; Kumar, S., *Apoptosis: Mechanisms and Role in Disease*, Springer, Berlin, 1998; Lockshin, R.A. and Zakeri, Z., *When Cells Die: A Comprehensive Evaluation of Apoptosis and Programmed Cell Death*, Wiley-Liss, New York, NY, 1998; Jacobson, M.D., and McCarthy, N.J., *Apoptosis*, Oxford University Press, Oxford, UK, 2002; *Apoptosis Techniques and Protocols*, 2nd edn., ed. A.C. LeBlanc, Humana Press, Totowa, NJ, 2002; *Cell Proliferation and Apoptosis*, ed. D. Hughes and Hm Mehmet, Bios, Oxford, UK, 2003; Potten, C.S. and Wilson, J.W., *Apoptosis: The Life and Death of Cells*, Cambridge University Press, Cambridge, UK, 2004.

## Apoptosome

A multiprotein complex which contains caspases-9 and is thought to represent a holoenzyme involved in apoptosis. See Tsujimoto, Y., Role of Bcl-2 family proteins in apoptosis: apoptosomes or mitochondria, *Genes Cells*, 3, 697-707, 1998; Adrain, C. and Martin, S.J., The mitochondrial apoptosome: a killer unleashed by the cytochrome c, *Trends Biochem.Sci.* 26, 390-397, 2001; Salvesen, G.S. and Renatus, M., Apoptosome: the seven-spoked death machine, *Dev.Cell.* 2, 256-257, 2002; Cain, K., Bratton, S.B., and Cohen, G.M., The Apaf-1 apoptosome: a large caspase-activating complex, *Biochimie* 84, 203-214, 2002; Shi, Y., Apoptosome: the cellular engine for the activation of caspase-9, *Structure* 10, 285-288, 2002; Reed, J.C., Apoptosis-based therapies, *Nat.Rev.Drug Disc.* 1, 111-121, 2002; Adams, J.M., and Cory, S.,

Apoptosomes: engines for caspase activation, *Curr.Opin.Cell Biol.* 14, 715-720, 2002; Hajra, K.M. and Liu, J.R., Apoptosome dysfunction in human cancer, *Apoptosis* 9, 691-704, 2004.

## Aprotinin

A small protein (single chain protein, MW 6.5 kDa; 58 amino acids) also known as basic pancreatic trypsin inhibitor (BPTI) or the Kunitz pancreatic trypsin inhibitor. It is best known as an inhibitor of tryptic-like serine proteases such as plasma kallikrein and plasmin. Aprotinin is also used as model for protein folding. See Kellermeyer, R.W. and Graham, J.C., Jr., Kinins-possible physiologic and pathologic roles in man, *N.Eng.J.Med.* 279, 754-759, 1968; Schachter, M., Kallikreins (kininogenases) – a group of serine proteases with bioregulatory actions, *Pharmacol.Rev.* 31, 1-17, 1979; Creighton, T.E., Experimental studies of protein folding and unfolding, *Prog.Biophys.Mol.Biol.* 33, 231-297, 1978; Fritz, H. and Wunderer, G., Biochemistry and applications of Aprotinin, the kallikrein inhibitor from bovine organs, *Arzneimittelforschung* 33, 479-494, 1983; Sharpe, S., De Meester, I., Hendriks, D. *et al.*, Proteases and their inhibitors: today and tomorrows, *Biochimie* 73, 121-126, 1991; Creighton, T.E., Protein folding pathways determined using disulphide bonds, *Bioessays* 14, 195-199, 1992; Day, R. and Daggett, V., All-atom simulations of protein folding and unfolding, *Adv.Protein Chem.* 66, 373-403, 2003.

## Aptamer

Aptamers are relatively short oligonucleotides (generally 100 bp or less) which have the property of acting as relatively specific ligands to a broad range of targets. Aptamers are generally selected by combinatorial chemistry techniques. See Ellington, A.D. and Szostak, J.W., In vitro selection of RNA molecules that bind specific ligands, *Nature* 346, 818-822, 1990; Burke, J.M., and Berzal-Herranz, A., In vitro selection and evolution of RNA: applications for catalytic RNA, molecular recognition, and drug discovery, *FASEB J.* 7, 106-112, 1993; Stull, R.A. and Szoka, F.C., Jr., Antigen, ribozyme and aptamer nucleic acid drugs: progress and prospects, *Pharm.Res.* 12, 465-483, 1995; Uphoff, K.W., Bell, S.D., and Ellington, A.D., In vitro selection of aptamers: the dearth of pure reason, *Curr.Opin.Struct.Biol.* 6, 281-288, 1996; Collett, J.R., Cho, E.J. and Ellington, A.D., Production and processing aptamers microarrays, *Methods* 37, 4-15, 2005; Nutiu, R. and Li, Y., Aptamers with fluorescence-signaling properties, *Methods* 37, 16-25, 2005; Proske, D., Blank, M., Buhmann, R., and Resch, A., Aptamers—basic research, drug development, and clinical applications, *Appl.Microbiol.Biotechnol.* 69, 367-374, 2005; Pestourie, C., Tavitian, B., and Duconge, F., Aptamers against extracellular targets for in vivo applications, *Biochimie* 87, 921-930, 2005. It is noted that the term intramer is used to describe intracellular aptamers (see Famulok, M., Blind, M., and Mayer, G., Intramers as promising new tools in functional proteomics, *Chem.Biol.* 8, 931-939, 2001; Famulok, M. and Mayer, G., Intramers and aptamers: applications in protein-function analyses and potential for drug screening, *ChemBioChem* 6, 19-26, 2005).

## Aquaporin

Water-specific membrane pores facilitate osmosis. See van Lieburg, A.F., Knoers, N.V., and Deen, P.M., Discovery of aquaporins: a breakthrough in research on renal water transport, *Ped.Nephrol.* 9, 228-234, 1995; Sabolic, I. and Brown, D., Water transport in renal tubules is mediated by aquaporins, *Clin.Investig.*

72, 689-700, 1994; King, L.S. and Agre, P. Pathophysiology of the aquaporin water channels, *Annu.Rev.Physiol.* 58, 619-648, 1996; Chaumont, F., Moshelion, M., and Daniels, M.J., Regulation of plant aquaporin activity, *Biol.Cell.* 97, 749-764, 2005; Castle, N.A., Aquaporins as targets for drug discovery, *Drug.Discov.Today* 10, 485-493, 2005.

## Arabidopsis thaliana

A small plant in the mustard family that is the model for studies of the plant genome. Meinke, D.W., Cheng, D.M., Dean, C., Rounsley, S.D., and Koorneef, M., *Arabidopsis thaliana: A model plant for genome analysis*, *Science* 282, 662-682, 1998; *Methods in Plant Molecular Biology and Biotechnology*, ed. B.R.Glick and J.E.Thompson, CRC Press, Boca Raton, FL, 1993; *Aribidopsis*, ed. E.R. Meyerowitz and C.R. Somerville, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1994; *Aribidopsis*, ed. M. Anderson and J.A. Roberts, Sheffield Academic Press, Sheffield, UK, 1998; *Aribidopsis Protocols*, ed. J. Salinas and J.J. Sánchez-Serrano, Humana Press, Totowa, NJ, 2006.

## ARF Family GTPases

The ADP-ribosylation family of GTPases. The ADP-ribosylation factor small GTPases have a role in the regulation of vesicular function via the recruitment of coat proteins and regulation of phospholipid metabolism. See Goud, B., Small GTP-binding proteins as compartmental markers, *Semin.Cell Biol.* 3, 301-307, 1992; Kjeldgaard, M., Nyborg, J., and Clark, B.F., The GTP binding motif: variations on a theme, *FASEB J.* 10, 1347-1368, 1996; Donaldson, J.G. and Jackson, C.L., Regulators and effectors of the ARF GTPases, *Curr.Opin.Cell Biol.* 12, 475-482, 2000; Takai, Y., Sasaki, T., and Matozaki, T., Small GTP-binding proteins, *Physiol.Rev.* 81, 153-208, 2001; *ARF Family GTPases*, ed. R.A., Kahn, Kluwer Academic Publisher, Dordrecht, Netherlands, 2003; Munro, S., The Arf-like GTPase Arl1 and its role in membrane traffic, *Biochem.Soc.Trans.* 33, 601-605, 2005; Kahn, R.A., Cherfils, J., Elias, M., *et al.*, Nomenclature for the human Arf family of GTP-binding proteins: ARE, ARL, and SAR proteins, *J.Cell Biol.* 172, 645-650, 2006; Nie, Z. and Randazzo, P.A., Arf GAPs and membrane traffic, *J.Cell Sci.* 119, 1203-1211, 2006; D'Souza-Schorey, C. and Chavrier, P., ARF proteins: roles of membrane traffic and beyond, *Nat.Rev.Mol.Cell Biol.* 7, 347-358, 2006. Also includes ARL and SAR proteins.

## Arrhenius Energy of Activation

An operationally defined quantity that relates rate constants to temperature by the following equation:  $k = Ae^{-E_a/R}$  where k is a rate constant; A is a constant, R is the gas constant, T the absolute temperature. A plot of  $\ln k$  vs  $1/T$  (Arrhenius plot) yields the Arrhenius energy of activation. See Van Tol, A., On the occurrence of a temperature coefficient (Q10) of 18 and a discontinuous Arrhenius plot for homogeneous rabbit muscle fructosediphosphatase, *Biochem.Biophys.Res.Communn.* 62, 750-756, 1975; Ceuterick, F., Peeters, J., Heremans, K., *et al.*, Involvement of lipids in the break of the Arrhenius plot of *Azobacter nitrogenase*, *Arch.Int.Physiol. Biochim.* 84, 587-588, 1976; Ceuterick, F., Peeters, J., Heremans, K., *et al.*, Effect of high pressure, detergents and Phospholipase on the break in the Arrhenius plot of *Azobacter nitrogenase*, *Eur.J.Biochem.* 87, 401-407, 1978; Stanley, K.K. and Luzio, J.P., The Arrhenius plot behaviour of rat liver 5'-nucleotidase in different lipid environments, *Biochim.Biophys.Acta* 514, 198-205, 1978; De

Smedt, H., Borghgraef, R., Ceuterick, F., and Heremans, K., The role of lipid-protein interactions in the occurrence of a non-linear Arrhenius plot for (sodium-potassium)-activated ATPase, *Arch. Int.Physiol.Biochim.* 87, 169-170, 1979; Biosca, J.A., Travers, F., and Barman, T.E., A jump in an Arrhenius plot can be the consequence of a phase transition. The binding of ATP to myosin subfragment 1, *FEBS Lett.* 153, 217-220, 1983; Haeffner, E.W. and Friedel, R., Induction of an endothermic transition in the Arrhenius plot of fatty acid uptake by lipid-depleted ascites tumor cells, *Biochim. Biophys.Acta* 1005, 27-33, 1989; Muench, J.L., Kruuv, J., and Lepock, J.R., A two-step reversible-irreversible model can account for a negative activation energy in an Arrhenius plot, *Cryobiology* 33, 253-259, 1996; Rudzinski, W., Borowiecki, T., Panczyk, T., and Dominko, A., On the applicability of Arrhenius plot methods to determine surface energetic heterogeneity of adsorbents and catalysts surfaces from experimental TPD spectra, *Adv.Colloid Interface Sci.* 84, 1-26, 2000.

## Atomic Force Microscopy

A high resolution form of microscopy which involves a probe or tip moving over a surface (alternatively the sample can move with a static tip; the detection method is the same) and as the probe changes position in response to sample topography, the movement is tracked deflection of a laser beam which is recorded by a detector (Gadegaard, N., Atomic force microscopy in biology: technology and techniques, *Biotechnic and Histochem.* 81, 87-97, 2006). See Hansma, P.K., Elings, V.B., Marti, O., and Bracker, C.E., Scanning tunneling microscopy: application to biology and technology, *Science* 242, 209-216, 1988; Yang, J., Tamm, L.K., Somlyo, A.P., and Shao, Z., Promises and problems of biological atomic force microscopy, *J.Microscop.* 171, 183-198, 1993; Hansma, H.G. and Hoh, J.H., Biomolecular imaging with the atomic force microscope, *Annu.Rev.Biophys. Biomol. Struct* 23, 115-139, 1994; Tendler, S.J., Davies, M.C., and Roberts, C.J., Molecules under the microscope, *J.Pharm.Pharmacol.* 48, 2-8, 1996; Lekka, M., Lekki, J., Shoulyarenko, A.P., *et al.*, Scanning force microscopy of biological samples, *Pol.J.Pathol.* 47, 51-55, 1996; Ivanov, Y.D., Govorum, V.M., Bykov, V.A., and Archakov, A.I., Nanotechnologies in proteomics, *Proteomics* 6, 1399-1414, 2006; Connell, S.D. and Smith, D.A., The atomic force microscope as a tool for studying phase separation in lipid membranes, *Mol.Membr.Biol.* 23, 17-28, 2006; Bai, L., Santangelo, T.J., and Wang, M.D., Single-molecule analysis of RNA polymerase transcription, *Annu.Rev.Biophys.Biomol. ## Atomic Radius

A measurement of an atom which is not considered precise; generally half the distance between adjacent atoms of the same type in a crystal or molecule. It may be further described as a covalent radius, an ionic radius or metallic radius. The inability of cysteine to effectively substitute for serine in serine proteases is due, in part, to the increased atomic radius of sulfur

compared to oxygen. See Alterman, M.A., Chaurasia, C.S., Lu, P., and Hanzlik, R.P., Heteroatom substitution shifts regioselectivity of lauric acid metabolism from omega-hydroxylation to (omega-1)-oxidation, *Biochem.Biophys.Res.Commun.* 214, 1089-1094, 1995; Zhang, R., Villeret, V., Lipscomb, W.N., and Fromm, H.J., Kinetics and mechanisms of activation and inhibition of porcine liver fructose-1,6-bisphosphatase by monovalent cations, *Biochemistry* 35, 3038-3043, 1996; Wachter, R.M. and Brachaud, B.P., Thiols as mechanistic probes for catalysis by the free radical enzyme galactose oxidase, *Biochemistry* 35, 14425-14435, 1996; Wagner, M.A., Trickey, P., Chen, Z.W., et al., Monomeric sarcosine oxidase: 1. Flavin reactivity and active site binding determinants, *Biochemistry* 39, 8813-8824, 2000; Lack, J.G., Chaudhuri, S.K., Kelly, S.D. et al., Immobilization of radionucleotides and heavy metals through anaerobic bio-oxidation of Fe(II), *Appl. Environ.Microbiol.* 68, 2704-2710, 2002; Hamm, M.L., Rajguru, S., Downs, A.M., and Cholera, R., Base pair stability of 8-chloro- and 8-iodo-2'-deoxyguanosine opposite 2'-deoxycytidine: implications regarding the bioactivity of 8-oxo-2'-deoxyguanosine, *J.Am.Chem.Soc.* 127, 12220-12221, 2005.

## Autoantigen

A component of self which is able to elicit an immune response, an autoimmune reaction; frequently with pathological complications such as the destruction of pancreatic beta cells (Islets of Langerhans) resulting in Type 1 diabetes. See Sigurdsson, E. and Baekkeskov, S., The 64-kDa beta cell membrane autoantigen and other target molecules of humoral autoimmunity in insulin-dependent diabetes mellitus, *Curr.Top.Microbiol.Immunol.* 164, 143-168, 1990; Werdelin, O., Autoantigen processing and the mechanisms of tolerance to self, *Immunol.Ser.* 52, 1-9, 1990; Manfredi, A.A., Protti, M.P., Bellone, M., et al., Molecular anatomy of an autoantigen: T and B epitopes on the nicotinic acetylcholine receptor in myasthenia gravis, *J.Lab.Clin.Med.* 120, 13-21, 1992; Sedgwick, J.D., Immune surveillance and autoantigen recognition in the central nervous system, *Aust.N.E.J.Med.* 25, 784-792, 1995; Utz, P.J., Gensler, T.J., and Anderson, P., Death, autoantigen modifications, and tolerance, *Arthritis Res.* 2, 101-114, 2000; Narendran, P., Mannering, S.I., and Harrison, L.C., Proinsulin-a pathogenic autoantigen in type 1 diabetes, *Autoimmun.Rev.* 2, 204-210, 2003; Gentile, F., Conte, M., and Formisano, S., Thyroglobulin as an autoantigen: what can we learn about immunopathogenicity from the correlation of antigenic properties with protein structure?, *Immunology* 112, 13-25, 2004; Pendergraft, W.F., 3rd, Pressler, E.M., Jennette, J.C., et al., Autoantigen complementarity: a new theory implicating complementary proteins as initiators of autoimmune disease, *J.Mol.Med.* 83, 12-25, 2005; Wu, C.T., Gershwin, M.E., and Davis, P.A., What makes an autoantigen an autoantigen? *Ann.N.Y.Acad.Sci.* 1050, 134-1045, 2005; Wong, F.S., Insulin-a primary autoantigen in type 1 diabetes?, *Trends Mol.Med.* 11, 445-448, 2005; Jasinski, J.M. and Eisenbarth, G.S., Insulin as a primary autoantigen for type 1A diabetes, *Clin.Dev.Immuol.* 12, 181-186, 2005.

## Autocoid

A internal, physiologically secretion of uncertain or unknown classification. Adenosine is one of the better examples as, apart from its role as purine base in RNA and DNA, it has diverse physiologic functions. See Yan, L., Burbiel, J.C., Maass, A., and Muller, C.E., Adenosine receptor agonists: from basic medicinal chemical to clinical development, *Expert Opin.Emerg.Drugs* 8, 537-576,

2003; Tan, D.X., Manchester, L.C., Hadeland, R., Lopez-Burillo, S., Mayo, J.C., Sainz, R.M., and Reiter, R.J., Melatonin: a hormone, a tissue factor, an autocoid, a paracoid, and an antioxidant vitamin, *J.Pineal Res.* 34, 75-78, 2003; Boyan, B.D., Schwartz, Z., and Swain, L.D., Cell maturation-specific autocrine/paracrine regulation of matrix vesicles, *Bone Miner.* 17, 263-268, 1992; Polosa, R., Holgate, S.T. and Church, M.K., Adenosine as a pro-inflammatory mediator in asthma, *Pulm.Pharmacol.* 2, 21-26, 1989.

## Autocrine

Usually in reference to a hormone or other biological effector such as a peptide growth factor or cytokine which has an effect on the cell or tissue responsible for the synthesis of the given compound. Differentiated from endocrine or paracrine phenomena. See Sporn, M.B. and Roberts, A.B., Autocrine, paracrine, and endocrine mechanisms of growth control, *Cancer Surv.* 4, 627-632, 1985; Heldin, C.H. and Westermark, B., PDGF-like growth factors in autocrine stimulation of growth, *J.Cell Physiol.(Suppl 5)*, 31-34, 1987; Ortenzi, C., Miceli, C. Bradshaw, R.A., and Luporini, P., Identification and initial characterization of an autocrine pheromone receptor in the protozoan ciliate *Euplotes raikovi*, *J.Cell.Biol.* 111, 607-614, 1990; Vallesi, A., Giuli, G., Bradshaw, R.A., and Luporini, P., Autocrine mitogenic activity of pheromones produced by the protozoan ciliate *Euplotes raikovi*, *Nature* 376, 522-524, 1995; Bischof, P., Meissner, A., and Campana, A., Paracrine and autocrine regulators of trophoblast invasion—a review, *Placenta* 21(Suppl. A), S55-S60, 2000; Bilezikjian, L.M., Blount, A.L., Leal, A.M., et al., Autocrine/paracrine regulation of pituitary function of activin, inhibin and follistatin, *Mol.Cell.Endocrinol.* 225, 29-36, 2004; Singh, A.B. and Harris, R.C., Autocrine, paracrine and juxtacrine signaling by EGFR ligands, *Cell Signal.* 17, 1183-1193, 2005; Ventura, C. and Branzi, A., Autocrine and intracrine signaling for cardiogenesis in embryonic stem cells: a clue for the development of novel differentiating agents, *Handb.Exp.Pharmacol.* (174), 123-146, 2006.

## Autophagy

A pathway for the physiological degradation of cellular macromolecules and subcellular structures mediated by intracellular organelles such as lysosomes. It can be considered to be a process by which there is a membrane reorganization to separate or sequester a portion of the cytoplasm or cytoplasmic contents for subsequent delivery to an intracellular organelle such as a lysosome for degradation. This pathway of "self-destruction" is separate from proteasome-mediated degradation of macromolecules internalized from outside the cell. See Kroemer, G. and Jaattela, M., Lysosomes and autophagy in cell death control, *Nat.Rev.Cancer* 5, 886-897, 2005; Deretic, V., Autophagy in innate and adaptive immunity, *Trends Immunol.* 26, 523-528, 2005; Baehrecke, E.H., Autophagy: dual roles in life and death? *Nat.Rev.Mol.Cell Biol.* 6, 505-510, 2005; Wang, C-W., and Klianeky, D.J., The molecular mechanism of autophagy, *Molec.Med.* 9, 65-76, 2003. Klinosky, D.J., Autophagy, *Curr.Biol.* 15, R282-F283, 2005;

## Autophosphorylation

A process by which a substrate protein, usually a receptor, catalyzes self-phosphorylation usually at a tyrosine residue. The mechanism can be either intramolecular (*cis*) or intermolecular (*trans*) although at least one system has been described with both

*cis* and *trans* processes. See Cobb, M.H., Sang, B.-C., Gonzalez, R., Goldsmith, E., and Ellis, L., Autophosphorylation activates the soluble cytoplasmic domain of the insulin receptor in an intermolecular reaction, *J.Biol.Chem.* 264, 18701-18706, 1989; Frattali, A.L., Treadway, J.L., and Pessin, J.E., Transmembrane signaling by the human insulin receptor kinase. Relationship between intramolecular  $\beta$  subunit *trans*- and *cis*- autophosphorylation and substrate kinase activation, *J.Biol.Chem.* 267, 19521-19528, 1992; Rim, J., Faurobert, E., Hurley, J.B., and Oprian, D.D., *In vitro* assay for *trans*-phosphorylation of rhodopsin by rhodopsin kinase, *Biochemistry* 36, 7064-7070, 1997; Cann, A.D., Bishop, S.M., Ablooglu, A.J., and Kobanski, R.A., Partial activation of the insulin receptor kinase domain by juxtamembrane autophosphorylation, *Biochemistry* 37, 11289-11300, 1998; Iwasaki, Y., Nishiyama, H., Suzuki, K., and Koizumi, S., Sequential *cis/trans* autophosphorylation in TrkB tyrosine kinase, *Biochemistry* 36, 2694-2700, 1997; Cohen, P., The regulation of protein function by multisite phosphorylation – a 25 year update, *Trends in Biochem.Sci.* 25, 596-601, 2000; Wick, M.J., Ramos, F.J., Chen, H., Quon, M.J., Dong, L.Q., and Liu, F., Mouse 3-phosphoinositide-dependent protein kinase-1 undergoes dimerization and *trans*-phosphorylation in the activation loop, *J.Biol.Chem.* 278, 42913-42919, 2003; Wu, S. and Kaufman, R.J., *trans*-Autophosphorylation by the isolated kinase domain is not sufficient for dimerization or activation of the dsRNA-activated protein kinase PKR, *Biochemistry* 43, 11027-11034, 2004.

## B-Lymphocytes

Also called B-cells, named derived from original studies involving the cells from the bursa of chickens. B-cells are best known for the production of antibodies but recent studies are showing increased complexity of function. See *T and B Lymphocytes: Origins, Properties and Roles in Immune Responses*, ed. M.F. Greaves, J.J.T. Owen, and M.C. Raff, Excerpta Medica, New York, NY, 1973; *B and T Cells in Immune Recognition*, ed. Loor, F. and Roelants, G.E. Wiley, New York, NY, 1977; *Cells of Immunoglobulin Synthesis*, ed. B. Pernis and H.J. Vogel, Academic Press, New York, NY, 1979; *T and B Lymphocytes: Recognition and Function*, ed. F.H. Bach, Academic Press, New York, NY, 1979; Cambier, J.C., *B-Lymphocyte Differentiation*, CRC Press, Boca Raton, FL, 1986; *B Lymphocytes and Autoimmunity*, ed. N. Chiorazzi, New York Academy of Sciences, New York, NY, 1997; Cruse, J.M. and Lewis, R.E., *Atlas of Immunology*, CRC Press, Boca Raton, FL, 1999; *Fundamental Immunology*, ed. W.E. Paul, Lippincott, Williams, and Wilkins, Philadelphia, PA, 2003.

## Backflushing or Back Flushing

A method for cleaning filters involving reverse flow through the membrane; is occasionally used for cleaning large-scale chromatographic columns. See Tamai, G., Yoshida, H., and Imai, H., High-performance liquid chromatographic drug analysis by direct injection of whole blood samples. III. Determination of hydrophobic drugs adsorbed on blood cell membranes, *J.Chromatog.* 423, 163-168, 1987; Kim, B.S. and Chang, H.N., Effects of periodic backflushing on ultrafiltration performance, *Bioseparation* 2, 23-29, 1991; Dai, X.P., Luo, R.G. and Sirkar, K.K., Pressure and flux profiles in bead-filled ultrafiltration/microfiltration hollow fiber membrane modules, *Biotechnol.Prog.* 16, 1044-1054, 2000; Seghatchian, J. and Krailadsiri, P., Validation of different enrichment strategies for analysis of leucocyte subpopulations: development and application of a new approach,

based on leucofiltration, *Transfus.Apher.Sci.* 26, 61-72, 2002; Kang, I.J., Yoon, S.H. and Lee, C.H., Comparison of the filtration characteristics of organic and inorganic membranes in a membrane-coupled anaerobic bioreactor, *Water Res.* 36, 1803-1813, 2002; Nemade, P.R. and Davis, R.H., Secondary membranes for flux optimization in membrane filtration of biologic suspensions, *Appl.Biochem.Biotechnol.* 113-116, 417-432, 2004.

## Bacterial Artificial Chromosome

A bacterial artificial chromosome (BAC) is a DNA construct based on a fertility plasmid and is used for transforming and cloning in bacterial. It has an average insert size of 150 kbp with a range of approximately 100 kbp to 300 kbp. Bacterial artificial chromosomes are frequently used to sequence genomes where the PCR reaction is used to prepare a region of genomic DNA and then sequenced; in other words, a BAC is a vehicle based on the bacteria *Escherichia coli* that is used to copy, or clone, fragments of DNA that are 150,000 to 180,000 base pairs (bp) long. These DNA fragments are used as starting material for DNA sequencing. See Schalkwyk, L.C., Francis, F., and Lehrach, H., Techniques in mammalian genome mapping, *Curr.Opin.Biotechnol.* 6, 37-43, 1995; Zhang, M.B. and Wing, R.A., Physical mapping of the rice genome with BACs, *Plant Mol.Biol.* 35, 115-127, 1997; Zhu, J., Use of PCR in library screening. An overview, *Methods Mol.Biol.* 192, 353-358, 2002; Ball, K.D. and Trevors, J.T., Bacterial genomics: the use of DNA microarrays and bacterial artificial chromosomes, *J.Microbiol.Methods* 49, 275-284, 2002; Miyake, T. and Amemiya, C.T., BAC libraries and comparative genomics of aquatic chordate species, *Comp.Biochem.Physiol.C Toxicol.Pharmacol.* 138, 233-244, 2004; Ylstra, B., van den Ijssel, P., Carvalho, B., Brakenhoff, R.H., and Maijer, G.A., BAC to the future! or oligonucleotides: a perspective for micro array comparative genomic hybridization (array CGH), *Nucleic Acids Res.* 34, 445-450, 2006.

## Balanced Translocation

A chromosomal relocation which does not involve the net gain or loss of DNA; also referred to as reciprocal translocation. See Fraccaro, M., Chromosome abnormalities and gamete production in man, *Differentiation* 23(Suppl), S40-S43, 1983; Davis, J.R., Rogers, B.B., Hagaman, R.M., Thies, C.A., and Veomett, I.C., Balanced reciprocal translocations: risk factors for aneuploid segregant viability, *Clin.Genet.* 27, 1-19, 1985; Greaves, M.F., Biological models for leukaemia and lymphoma, *IARC Sci. Publ.* 157, 351-372, 2004; Benet, J., Oliver-Bonet, M., Cifuentes, P., Templado, C. and Navarro, J., Segregation of chromosomes in sperm of reciprocal translocation carriers: a review, *Cytogenet. Genome Res.* 111, 281-290, 2005. Aplan, P.D., Causes of oncogenic chromosomal translocation, *Trends Genet.* 22, 46-55, 2006.

## Basolateral

Literally located on the bottom opposite from the apical end of a differentiated cell. See Terada, T. and Inui, K., Peptide transporters: structure, function, regulation and application for drug delivery, *Curr.Drug.Metab.* 5, 85-94, 2004; Brone, B. and Eggermont, J., PDZ proteins retain and regulate membrane transporters in polarized epithelial cell membranes, *Am.J.Physiol.Cell Physiol.* 288, C20-C29, 2005; Rodriguez-Boulan, E. and Musch, A., Protein sorting in the Golgi complex: shifting paradigms, *Biochim.Biophys.Acta* 1744, 455-464, 2005; Vinciguerra, M., Mordasini, D., Vandewalle, A., and Feraille, E.,

Hormonal and nonhormonal mechanisms of regulation of the NA,K-pump in collecting duct principle cells, *Semin.Nephrol.* 25, 312-321, 2005.

## Bathochromic Shift

A shift in the absorption/emission of light to a longer wavelength ( $\lambda > \lambda_0$ ); a "red" shift. See Waleh, A. and Ingraham, L.L., A molecular orbital study of the protein-controlled bathochromic shift in a model of rhodopsin, *Arch.Biochem.Biophys.* 156, 261-266, 1973; Heathcote, P., Vermeglio, A., and Clayton, R.K., The carotenoid band shift in reaction centers from the *Rhodospseudomonas sphaeroides*, *Biochim.Biophys.Acta* 461, 358-364, 1977; Kliger, D.S., Milder, S.J., and Dratz, E.A., Solvent effects on the spectra of retinal Schiff bases—I. models for the bathochromic shift of the chromophore spectrum in visual pigments, *Photochem. Photobiol.* 25, 277-286, 1977; Cannella, C., Berni, R., Rosato, N., and Finazzi-Agro, A., Active site modifications quench intrinsic fluorescence of rhodanese by different mechanisms, *Biochemistry* 25, 7319-7323, 1986; Hermel, H., Holtje, H.D., Bergemann, S., et al., Band-shifting through polypeptide beta-sheet structures in the cyanine UV-Vis spectrum, *Biochim.Biophys.Acta* 1252, 79-86, 1995; Zagalsky, P.F.,  $\beta$ -Crustacyanin, the blue-purple carotenoprotein of lobster carapace: consideration of the bathochromic shift of the protein-bound astaxanthin, *Acta Crystallogr. D Biol.Crystallogr.* 59, 1529-1531, 2003.

## Betaine

Glycine betaine, (carboxymethyl)trimethylammonium inner salt, Cystadane®. Derived from choline; serves as methyl donor in the synthesis of methionine from homocysteine. Also functions as an osmoprotectant and this function is similar to trehalose in plants. See Chambers, S.T., Betaines: their significance for bacteria and the renal tract, *Clin.Sci.* 88, 25-27, 1995; Nuccio, M.L., Rhodes, D., McNeil, S.D., and Hanson, A.D., Metabolic engineering of plants for osmotic stress resistance, *Curr.Opin.Plant Biol.* 2, 129-134, 1999; Zou, C.G. and Banerjee, R., Homocysteine and redox signaling, *Antioxid.Redox.Signal.* 7, 547-559, 2005; Craig, S.A., Betaine in human nutrition, *Am.J.Clin.Nutr.* 80, 539-549, 2004; Fowler, B., Homocysteine: overview of biochemistry, molecular biology, and role in disease processes, *Semin.Vasc.Med.* 5, 77-86, 2005; Ueland, P.M., Holm, P.I. and Hustad, S., Betaine: a key modulator of one-carbon metabolism and homocysteine status, *Clin.Chem.Lab.Med.* 43, 1069-1075 2005.

## Bibody

One scFv fragment coupled to the C-terminus of the C<sub>H1</sub> domain of a Fab fragment. See Schoonjans, R., Willems, A., Schoonooghe, S., et al., Fab chains as an efficient heterodimerization scaffold for the production of recombinant bispecific and trispecific antibody derivatives, *J.Immunol.* 165, 7050-7057, 2000. See also tribody, diabody.

## Bicoid Protein

A transcription-factor protein produced in *Drosophila*. See background to bicoid, *Cell* 54, 1-2, 1988; Stephenson, E.C. and Pokrywka, N.J., Localization of bicoid message during *Drosophila* oogenesis, *Curr.Top.Dev.Biol.* 26, 23-34, 1992; Johnstone, O. and Lasko, P., Translational regulation and RNA localization in *Drosophila* oocytes and embryos, *Annu.Rev.Genet.* 35, 365-406,

2001; Lynch, J. and Desplan, C., Evolution of development: beyond bicoid, *Curr.Biol.* 12, R557-R559, 2003.

## BIND

Biomolecular Interaction Data Base which is designed to store full descriptions of interactions, molecular complexes, and metabolic pathways. See Bader, G.D., Donaldson, I., Wolting, C., Ouellette, B.F., Pawson, T., and Hogue, C.W., BIND—the biomolecular interaction network database, *Nucleic Acids Res.* 29, 242-245, 2001; Alfano, C. Andrade, C.E., Anthony, K. et al., The biomolecular interaction network database and related tools 2005 update, *Nucleic Acids Res.* 33, D418-D424, 2005; Shah, S.P., Huang, Y., Xu, T., Yuen, M.M. Ling, J., and Ouellette, B.F., Atlas – a data warehouse for integrative bioinformatics, *BMC Bioinformatics* 6, 34, 2005; Aytuna, A.S., Gursoy, A., Keskin, O., Prediction of protein-protein interactions by combining structure and sequence conservation in protein interfaces, *Bioinformatics* 21,2850-2855, 2005; Gilbert, D., Biomolecular interaction network database, *Brief Bioinform.* 6, 194-198, 2005.

## Bioassay

Generally used to describe an assay for a drug/biologic after administration to subject. As such, a bioassay usually involves the sampling of a biological fluid such as blood. The term bioassay is also used to describe an assay which uses a biological substrate such as a cell or organism. The term bioassay does not define a technology. See Yamamoto, S. Urano, K., and Nomura, T., Validation of transgenic mice harboring the human prototype c-Ha-ras gene as a bioassay model for rapid carcinogenicity testing, *Toxicol.Lett.* 28, 102-103, 1998; Colburn, W.A. and Lee, J.W., Biomarkers, validation and pharmacokinetic-pharmacodynamic modelling, *Clin.Pharmacokinet.* 42, 997-1022, 2003; Tuomela, M., Stanescu, I., and Krohn, K., Validation overview of bio-analytical methods, *Gene Ther.* 22 (Suppl 1), S131-138, 2005; Indelicato, S.R., Bradshaw, S.L., Chapman, J.W. and Weiner, S.H., Evaluation of standard and state of the art analytical technology-bioassays, *Dev.Biol.(Basal)* 122, 102-114, 2005.

## Bioequivalence

Similarity of biological properties; used in the characterization of pharmaceuticals to demonstrate therapeutic equivalence. See Levy, R.A., Therapeutic inequivalence of pharmaceutical alternatives, *Am.Pharm.* NS23, 28-39, 1985; Durrleman, S. and Simon, R., Planning and monitoring of equivalence studies, *Biometrics* 46, 329-336, 1990; Schellekens, H., Bioequivalence and the immunogenicity of biopharmaceuticals, *Nat.Rev.Drug.Disc.* 1, 457-462, 2002; Lennernas, H. and Abrahamsson, B., The use of biopharmaceutical classification of drugs in drug discovery and development: current status and future extension, *J.Pharm.Pharmacol.* 57, 273-285, 2005; Bolton, S., Bioequivalence studies for levothyroxine, *AAPS J.* 7, E47-E53, 2005.

## Bioinformatics

The use of information technology to analyze data obtained from proteomic analysis. An example is the use of data bases such as SWISSPROT to identify proteins from sequence information determined by the mass spectrometric analysis of peptides. See Baxeavanis, A.D. and Ouellette, B.F.F., *Bioinformatics: A Practical Guide to the Analysis of Genes and Proteins*, Wiley, Hoboken, NJ.,

USA, 2005; Buehler, L.K. and Rashidi, H.H., *Bioinformatics basics: applications in biological sciences and medicine*, Taylor & Francis, Boca Raton, Florida, USA, 2005; Evans, W.J., *Statistical methods in bioinformatics: an introduction*, Springer, New York, New York, USA, 2005; Wang, J.T.L., *Data mining in bioinformatics*, Springer, London, United Kingdom, 2005; Lesk, A.M., *Introduction to bioinformatics*, Oxford, New York, New York, 2005; Englbrecht, C.C. and Facius, A., Bioinformatics challenges in proteomics, *Comb.Chem.High Throughput Screen.* 8, 705-715, 2005; Chandonia, J.M. and Brenner, S.E., The impact of structural genomics: expectations and outcomes, *Science* 311, 347-351, 2006; Chalkley, R.J., Hansen, K.C., and Baldwin, M.A., Bioinformatic methods to exploit mass spectrometric data for proteomic applications, *Methods Enzymol.* 402, 289-312, 2005; Allison, D.B, Cui, X., Page, G.P., and Sabripour, M., Microarray data analysis: from disarray to consolidation and consensus, *Nat.Rev.Genet.* 7, 55-65, 2006; Brent, M.R., Genome annotation past, present, and future: how to define an ORF at each locus, *Genome Res.* 15, 1777-1786, 2005.

## Biologicals

A biological product is any virus, serum, toxin, antitoxin, blood, blood component or derivative, allergenic product, or analogous product applicable to the prevention, treatment, or cure of diseases or injury. Biologic products are a subset of "drug products" distinguished by their manufacturing processes (biological process vs. a chemical process). In general, the term "drugs" includes biological products. Within the United States, the regulation of biological is the purview of the FDA Center for Biologicals Evaluation and Research (CBER) and drugs within the FDA Center for Drug Evaluation and Research (CDER). There has been a recent shift of some drug products which were traditionally in CBER such as monoclonal antibodies and peptide growth factors to CDER. Vincent-Gattis, M., Webb, C., and Foote, M., Clinical research strategies in biotechnology, *Biotechnol.Annu.Rev.* 5, 229-267, 2000; Steinberg, F.M. and Raso, J., Biotech pharmaceuticals and biotherapy: an overview, *J.Pharm.Pharm.Sci.* 1, 48-59, 1998; Stein, K.E. and Webber, K.O., The regulation of biologic products derived from bioengineered plants, *Curr.Opin.Biotechnol.* 12, 308-311, 2001; Morrow, K.S. and Slater, J.E., Regulatory aspects of allergen vaccines in the US, *Clin.Rev.Allergy Immunol.* 21, 141-152, 2001; Hudson, P.J. and Souriau, C., Recombinant antibodies for cancer diagnosis and therapy, *Expert Opin. Biol.Ther.* 1, 845-855, 2001; Monahan, T.R., Vaccine industry perspective of current issues of good manufacturing practices regarding product inspections and stability testing, *Clin.Infect.Dis.* 33(Suppl.4), S356-S361, 2001; Hsueh, E.C. and Morton, D.L., Angigen-based immunotherapy of melanoma: Canvaxin therapeutic polyvalent cancer vaccine, *Semin.Cancer Biol.* 13, 401-407, 2003; Miller, D.L. and Ross, J.J., Vaccine INDs: review of clinical holds, *Vaccine* 23, 1099-1101, 2005; Sobell, J.M., Overview of biologic agents in medicine and dermatology, *Semin.Cutan.Med.Surg.* 23, 2-9, 2005; Morenweiser, R., Downstream processing of viral vectors and vaccines, *Gene Ther.* 12 (Suppl 1), S103-S110, 2005.

## Biomarker

A change in response to an underlying pathology; current examples of molecular changes include C-reactive protein, fibrin D-dimer, and troponin; the term biomarker is also used to include higher level responses such as behavior changes or anatomic changes. See Tronick, E.Z., The neonatal behavioral assessment

scale as a biomarker of the effects of environmental agents on the newborn, *Environ.Health Perspect.* 74, 185-189, 1987; Salvaggio, J.E., Use and misuse of biomarker tests in "environmental conditions", *J.Allergy Clin.Immunol.* 94, 380-384, 1994; Den Besten, P.K., Dental fluorosis: its use as a biomarker, *Adv.Dent.Res.* 8, 105-110, 1994; Lohmander, L.S. and Eyre, D.R., From biomarker to surrogate outcome to osteoarthritis-what are the challenges?, *J.Rheumatol.* 32, 1142-1143, 2005; Vineis, P. and Husgafvel-Pursiainen, K., Air pollution and cancer: biomarker studies in human populations, *Carcinogenesis* 26, 1846-1855, 2005; Seligson, D.B., The tissue micro-array as a translational research tool for biomarker profiling and validation, *Biomarkers* 10(Suppl 1), S77-S82, 2005; Danna, E.A. and Nolan, G.P., Transcending the biomarker mindset: deciphering disease mechanisms at the single cell level, *Curr.Opin.Chem.Biol.* 10, 20-27, 2006; Felker, G.M., Cuculich, P.S., and Gheorghide, M., The Valsalva maneuver: a bedside "biomarker" test for heart failure, *Am.J.Med.* 119, 117-122, 2006; Allam, A. and Kabelitz, D., TCR trans-rearrangements: biological significance in antigen recognition vs the role as lymphoma biomarker, *J.Immunol.* 176, 5707-5712, 2006.

## Biopharmaceutical classification system

The biopharmaceutical classification system (BCS) provides a classification of gastrointestinal absorption. See Amidon, G., Lennernas, H., Shah, V.P., and Crison, J.A., A theoretical basis for a biopharmaceutic drug classification: the correlation of *in vitro* drug product dissolution and *in vivo* bioavailability, *Pharm.Res.* 12, 413-420, 1995; Wilding, I.R., Evolution of the biopharmaceutics classification system (BCS) to oral modified release (MR) formulations: what do we need to consider? *Eur.J.Pharm.Sci.* 8, 157-159, 1999; Dressman, J.B. and Reppas, C., In vitro-in vivo correlations for lipophilic, poorly water-soluble drugs, *Eur.J.Pharm.Sci.* 11(Suppl 2), S73-S80, 2000; Taub, M.E., Kristensen, L. and Frokjaer, S., Optimized conditions for MDCK permeability and turbidimetric solubility studies using compounds representative of BCS class I-IV, *Eur.J.Pharmaceut.Sci.* 15, 311-340, 2002; Huebert, N.D., Dasgupta, M., and Chen, Y.M., Using *in vitro* human tissues-to predict pharmacokinetic properties, *Curr.Opin. Drug.Disc.Dev.* 7, 69-74, 2004; Lennernas, H. and Abrahamsson, B., The use of biopharmaceutic classification of drugs in drug discovery and development: current status and future extension, *J. Pharm.Pharmacol.* 57, 273-285, 2005.

## Bone Morphogenetic Protein(s) (BMP)

A group of peptide/proteins which are multifunctional growth factors that are members of the TGF $\beta$  superfamily. There are multiple forms of bone morphogenetic proteins which all function as differentiation factors for the maturation of mesenchymal cells into chondrocytes and osteoblasts. See Hauschka, P.V., Chen, T.L., and Mavrakos, A.E., Polypeptide growth factors in bone matrix, *Ciba Found.Symp.* 136, 207-225, 1988; Wozney, J.M., Bone morphogenetic proteins, *Prog.Growth Factor Res.* 1, 267-280, 1989; Rosen, V. and Thies, R.S., The BMP proteins in bone formation and repair, *Trends Genet.* 8, 97-102, 1992; Wang, E.A., Bone morphogenetic proteins (BMPs): therapeutic potential in healing bony defects, *Trends Biotechnol.* 11, 379-383, 1993; Kirker-Head, C.A., Recombinant bone morphogenetic proteins: novel substances for enhancing bone healing, *Vet.Surg.* 24, 408-419, 1995; Ramshibi, L.N., Matsaba, J., Teare, L., *et al.*, Tissue engineering: TGF- $\beta$  superfamily members and delivery systems in bone regeneration, *Expert Rev.Mol.Med.* 2002, 1-11, 2002; Monteiro, R.M.,

de Sousa Lopez, S.M., Korchynskiy, O., *et al.*, Spatio-temporal activation of Smad1 and Smad5 in vivo: monitoring transcriptional activity of Smad proteins, *J.Cell Sci.* 117, 4653-4663, 2004; Canalis, E., Deregowski, V., Pereira, R.C., and Gazzero, E., Signals that determine the fate of osteoblastic cells, *J.Endocrinol.Invest.* 28(Suppl 8), 3-7, 2005; Franceschi, R.T., Biological approaches to bone regeneration by gene therapy, *J.Dent.Res.* 84, 1093-1103, 2005; Ripamonti, U., Teare, J., and Petit, J.C., Pleiotropism of bone morphogenetic proteins: from bone induction to cementogenesis and periodontal ligament regeneration, *J.Int.Acad.Periodontol.* 8, 23-32, 2006; Logeart-Avramoglou, D., Bourguignon, M., Oudina, K., Ten Dijke, P., and Petite, H., An assay for the determination of biologically active bone morphogenetic proteins using cells transfected with an inhibitor of differentiation promoter-luciferase construct, *Anal.Biochem.* 349, 78-86, 2006.

## Bottom-up Proteomics

Identification of unknown proteins by analysis of peptides obtained from unknown proteins by enzymatic (usually trypsin) hydrolysis. See Brock, A., Horn, D.M., Peters, E.C., *et al.*, An automated matrix-assisted laser desorption/ionization quadrupole Fourier transform ion cyclotron resonance mass spectrometer for "bottom-up" proteomics, *Anal.Chem.* 75, 3419-3428, 2003; Wennder, B.R. and Lynn, B.C., Factors that affect ion trap data-dependent MS/MS in proteomics, *J.Am.Soc.Mass Spectrom.* 15, 150-157, 2004; Amoutzias, G.D., Robertson, D.L., Oliver, S.G., and Bornberg-Bauer, E., Convergent evolution of gene networks by single-gene duplications in higher eukaryotes, *EMBO Rep.* 5, 274-279, 2004; Ren, D., Julka, S., Inerowicz, H.D., and Regnier, F.E., Enrichment of cysteine-containing peptides from tryptic digests using a quaternary amine tag, *Anal.Chem.* 76, 4522-4530, 2004; Listgarten, J. and Emili, A., Statistical and computational methods for comparative proteomic profiling using liquid chromatography-tandem mass spectrometry, *Mol.Cell.Proteomics* 4, 419-434, 2005; Slys, G.W. and Schriemer, D.C., Blending protein separation and peptide analysis through real-time proteolytic digestion, *Anal.Chem.* 77, 1572-1579, 2005; Zhong, H., Marcus, S.L., and Li, L., Microwave-assisted acid hydrolysis of proteins combined with liquid chromatography MALDI MS/MS for protein identification, *J.Am.Soc.Mass Spectrom.* 16, 471-481, 2005; Putz, S., Reinders, J., Reinders, Y., and Sickmann, A., Mass spectrometry-based peptide quantification: applications and limitations, *Expert Rev. Proteomics* 2, 381-392, 2005; Riter, L.S., Gooding, K.M., Hodge, B.D., and Julian, R.K., Jr., Comparison of the Paul ion trap to the linear ion trap for use in global proteomics, *Proteomics* 6, 1735-1740, 2006.

## Brand Name Drugs

A brand name drug is a drug marketed under a proprietary, trademarked-protected name.

## BRET

Bioluminescence Resonance Energy Transfer. Similar to FRET in BRET is technique which can be used to measure physical interactions between molecules. Intrinsic bioluminescence is used in this procedure such as different fluorescent protein (e.g. green fluorescent protein and blue fluorescent protein). See De, A. and Gambhir, S.S., Noninvasive imaging of protein-protein interactions from live cells and living subjects using bioluminescence resonance energy transfer, *FASEB J.* 19, 2017-2019, 2005.

## Brownian Movement

The random movement of small particles in a suspension where the force of collision between particles is not lost but retained in part by the particle. The practical effect is to set the lower limit of particle size for settling from a suspension. Brownian movements is usually restricted to particles 1  $\mu\text{m}$  in diameter and is not observed with particles of 5  $\mu\text{m}$ .

## Bulk Solution

Bulk solution which would be defined as any macroscopic volume of a substance. In the case of an electrolyte. a bulk solution is charge neutral; intracellular and extracellular solutions possess a neutral charge even the presence of a membrane potential. The term bulk solution is also used to describe the difference between water structure in the hydration layer immediately around a macromolecule such as protein and the bulk solvent space. See Nakasako, M., Large-scale networks of hydration water molecules around proteins investigated by cryogenic X-ray crystallography, *Cell.Mol.Biol.* 47, 767-790, 2001; Lever, M., Blunt, J.W., and Maclagan, R.G., Some ways of looking at compensatory kosmotropes and different water environment, *Comp.Biochem.Physiol. A Mol. Integr.Physiol.* 130, 471-486, 2001; Halle, B., Protein hydration dynamics in solution: a critical survey, *Philos.Trans.R.Soc. Biol.Sci.* 359, 1207-1223, 2004; Levicky, R. and Horgan, A., Physicochemical perspectives on DNA microarray and biosensor technologies, *Trends Biotechnol.* 23, 143-149, 2005.

## CAD

A multifunctional protein that initiates and regulates *de novo* pyrimidine biosynthesis. See Carrey, E.A., Phosphorylation, allosteric effectors and inter-domain contacts in CAD: their role in regulation of early steps of pyrimidine biosynthesis, *Biochem. Soc.Trans.* 21, 191-195, 1993; Davidson, J.N., Chen, K.C., Jamison, R.S., Musmanno, L.A., and Kern, C.B., The evolutionary history of the first three steps in pyrimidine biosynthesis, *Bioessays* 15, 157-164, 1993; Evans, D.R. and Guy, H.I., Mammalian pyrimidine biosynthesis: fresh insights into an ancient pathway, *J.Biol.Chem.* 279, 33035-33038, 2005.

## Cadherins

A group of cell adhesion proteins which enable cells to interact with other cells and extracellular matrix components. See Obrink, B., Epithelial cell adhesion molecules, *Exp.Cell Res.* 163, 1-21, 1986; Takeichi, M., Cadherins: a molecular family important in selective cell-cell adhesion, *Annu.Rev.Biochem.* 59, 237-252, 1990; Geiger, B. and Ayalon, O., Cadherins, *Annu.Rev.Cell Biol.* 8, 307-332, 1992; Tanoue, T. and Takeichi, M., New insights into fat cadherins, *J. Cell Sci.* 118, 2347-2353, 2005; Lecuit, T., Cell adhesion: sorting out cell mixing with echinoid? *Curr.Biol.* 15, R505-R507, 2005; Gumbiner, B.M., Regulation of cadherin-mediated adhesion in morphogenesis, *Nat.Rev.Mol.Cell Biol.* 6, 622-634, 2005; Bamji, S.X., Cadherins: actin with the cytoskeleton to form synapses, *Neuron* 47, 175-178, 2005; Junghans, D., Hass, I.G., and Kemler, R., Mammalian cadherins and protocadherins: about cell death, synapses and processing, *Curr.Opin.Cell Biol.* 17, 446-452, 2005; Cavallaro, U., Liebner, S., and Dejana, E., Endothelial cadherins and tumor angiogenesis, *Exp.Cell Res.* 312, 659-667, 2006; Redies, C., Vanhalst, K., and Roy, F., delta-Protocadherins: unique structures and functions, *Cell Mol.Life Sci.* 62, 2840-2852,

2005; Collona, M., Cytolytic responses: cadherins put out the fire, *J.Exp.Med.* 203, 289-295, 2006; Chan, A.O., E-cadherin in gastric cancer, *World J. Gastroenterol.* 12, 199-203, 2006.

## Caenorhabditis elegans

A free-living roundworm which has been used extensively for genomic studies. It is notable for the discovery of RNA silencing/RNA interference (Fire, A., Xu, S., Montgomery, M.K., *et al.*, Potent and specific genetic interference by double-stranded RNA in *Caenorhabditis elegans*, *Nature* 391, 806-811, 1998). For general aspects of *Caenorhabditis elegans* see Zuckerman, B.M. and Merton, B., *Nematodes as Biological Models*, Academic Press, New York, 1980; *C.elegans* see Emmons, S.W., Mechanisms of *C.elegans* development, *Cell* 51, 881-883, 1987; Blumenthal, T. and Thomas, J., *Cis* and *trans* splicing in *C.elegans*, *Trends Genet.* 4, 305-308, 1988; Wood, W.B., *The Nematode Caenorhabditis elegans*, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1988; Greenwald, I., Cell-cell interactions that specify certain cell fates in *C.elegans* development, *Trends Genet.* 5, 237-241, 1989; Coulson, A., Kozono, Y., Lutterbach, B., *et al.*, YACs and the *C.elegans* genome, *Bioessays* 13, 413-417, 1991; Plasterk, R.H., Reverse genetics of *Caenorhabditis elegans*, *Bioessays* 14, 629-633, 1992; Burglin, T.R. and Ruvkun, G., The *Caenorhabditis elegans* homeobox gene cluster, *Curr.Opin.Genet.Dev.* 3, 615-620, 1993; Selfors, L.M. and Stern, M.J., MAP kinase function in *C.elegans*, *Bioessays* 16, 301-304, 1994; Stern, M.J. and DeVore, D.L., Extending and connecting signaling pathways in *C.elegans*, *Dev.Biol.* 166, 443-459, 1994; Kayne, P.S. and Sternberg, P.W., Ras pathways in *Caenorhabditis elegans*, *Curr.Opin.Genet.Dev.* 5, 38-43, 1995; Hope, I.A., *C. elegans; A Practical Approach*, Oxford University Press, Oxford, UK, 1999; Brown, A., *In the Beginning was the Worm: Finding the Secrets of Life in a Tiny Hermaphrodite*, Columbia University Press, NY, 2003; Filipowicz, W., RNAi: the nuts and bolts of the RISC machine, *Cell* 122, 17-20, 2005; Grishok, A., RNAi mechanisms in *Caenorhabditis elegans*, *FEBS Lett.* 579, 5932-5939, 2005. Hobert, O. and Loria, P., Uses of GFP in *Caenorhabditis elegans*, *Methods Biochem.Anal.* 47, 203-226, 2006; Hillier, L.W., Coulson, A., Murray, J.I., *et al.*, Genomics in *C.elegans*; so many genes, such a little worm, *Genome Res.* 15, 1651-1660, 2005; <http://www.nematodes.org/Caenorhabditis>; <http://www.wormbook.org>; <http://elegans.swmed.edu>.

## Calcineurin

A protein phosphatase which is involved in the activation of IL-2 transcription; IL-2 stimulated the T-Cell response. Calcineurin is inhibited by immunosuppressive drugs such as cyclosporine and FK506 (tacrolimus). See Pallen, C.J. and Wang, J.H., A multifunctional calmodulin-stimulated phosphatase, *Arch. Biochem.Biophys.* 237, 281-291, 1985; Klee, C.B., Draetta, G.F., and Hubbard, M.J., Calcineurin, *Adv.Enzymol.Relat.Areas Mol. Biol.* 61, 149-200, 1988; Siekierka, J.J. and Sigal, N.H., FK-506 and cyclosporine A: immunosuppressive mechanism of action and beyond, *Curr.Opin.Immunol.* 4, 484-552, 1992; Groenendyk, J., Lynch, J., and Michalak, M., Calreticulin, Ca<sup>2+</sup>, and calcineurin – signaling from the endoplasmic reticulum, *Mol.Cells* 30, 383-389, 2004; Michel, R.N., Dunn, S.E. and Chin, E.R., Calcineurin and skeletal muscle growth, *Proc.Nutr.Soc.* 63, 341-349, 2004; Im, S.H. and Rao, A., Activation and deactivation of gene expression by Ca<sup>2+</sup>/calcineurin-NFAT-mediated signaling, *Mol.Cells* 16, 1-9, 2004; Bandyopadhyay, J., Lee, J. and Bandyopadhyay, A., Regulation of calcineurin, a calcium/calmodulin-dependent

protein phosphatase in *C.elegans*, *Mol.Cells* 18, 10-16, 2004; Taylor, A.L., Watson, C.J., and Bradley, J.A., Immunosuppressive agents in solid organ transplantation: mechanisms of action and therapeutic efficacy, *Crit.Rev.Oncol.Hematol.* 56, 23-46, 2005; Crespo-Leiro, M.G., Calcineurin inhibitors in heart transplantation, *Transplant.Proc.* 37, 4018-4020, 2005.

## Calcium Transients

Physiology phenomena resulting from changes in calcium concentration across membranes such as the diversity in Ca<sup>2+</sup>-stimulated transcriptional phenomena. See Spitzer, N.C., Lautermilch, N.J., Smith, R.D., and Gomez, T.M., Coding of neuronal differentiation by calcium transients, *Bioessays* 22, 811-817, 2000; Afroze, T. and Husain, M., Cell cycle dependent regulation of intracellular calcium concentration in vascular smooth muscle cells: a potential target for drug therapy, *Curr.Drug Targets Cardiovasc.Haematol. Disord.* 1, 23-40, 2001; Thorner, M.O., Holl, R.W., and Leong, D.A., The somatotrope: an endocrine cell with functional calcium transients, *J.Exp.Biol.* 139, 169-179, 1988; Morgan, K.G., Bradley, A., and DeFeo, T.T., Calcium transients in smooth muscle, *Ann.N.Y.Acad.Sci.* 522, 328-337, 1988; Fumagalli, G., Zacchetti, D., Lorenzon, P., and Grohovaz, F., Fluorimetric approaches to the study of calcium transients in living cells, *Cytotechnology (Suppl 5)* 1, 99-102, 1991; Komura, H., and Kumada, T., Ca<sup>2+</sup> transients control CNS neuronal migration, *Cell Calcium* 37, 387-393, 2005; Fossier, P., Tauc, L. and Baux, G., Calcium transients and neurotransmitter release at an identified synapse, *Trends Neurosci.* 22, 161-166, 1999.

## CALM-domain/CALM protein

Clathrin assembly lymphoid myeloid-domain, related to ANTH-domain proteins and involved in endocytosis, formation of clathrin-coated pits; binds to lipids. See Kim, J.A., Kim, S.R., Jung, Y.K., *et al.*, Properties of GST-CALM expressed in *E.coli*, *Exp. Mol.Med.* 32, 93-99, 2000; Kusner, L. and Carlin, C., Potential role for a novel AP180-related protein during endocytosis in MDCK cells, *Am.J.Physiol.Cell Physiol.* 285, C995-C1008, 2003; Archangelo, L.F., Glasner, J., Krause, A., and Bohlander, S.K., The novel CALM interactor CATS influences the subcellular localization of the leukemogenic fusion protein CALM/AF10, *Oncogene*, 25, 4099-4109, 2006.

## Calnexin

A lectin protein associated with the endoplasmic reticulum which functions as a chaperone. See Cresswell, P., Androlewicz, M.J. and Ortmann, B., Assembly and transport of class I MHC-peptide complexes, *Ciba Found.Symp.* 187, 150-162, 1994; Bergeron, J.J., Brenner, M.B., Thomas, D.Y., and Williams, D.B., Calnexin: a membrane-bound chaperone or the endoplasmic reticulum, *Trends Biochem.Sci.* 19, 124-128, 1995; Parham, P., Functions for MHC class I carbohydrates inside and outside the cell, *Trends Biochem.Sci.* 21, 472-433, 1996; Trombetta, E.S. and Helenius, A., Lectins as chaperones in glycoprotein folding, *Curr.Opin.Struct. Biol.* 8, 587-592, 1998; Huari, H., Appenzeller, C., Kuhn, F., and Nufer, O., Lectins and traffic in the secretory pathway, *FEBS Lett.* 476, 32-37, 2000; Ellgaard, L. and Frickel, E.M., Calnexin, calreticulin, and ERp57: teammates in glycoprotein folding, *Cell. Biochem.Biophys.* 39, 223-247, 2003; Spiro, R.G., Role of N-linked polymannose oligosaccharides in targeting glycoproteins for endoplasmic reticulum-associated degradation, *Cell.Mol.Life*

*Sci.* 61, 1025-1041, 2004; Bedard, K., Szabo, E., Michalak, M., and Opas, M., Cellular functions of endoplasmic reticulum chaperones calreticulin, calnexin, and ERp57, *Int.Rev.Cytol.* 245, 91-121, 2005; Ito, Y., Hagihara, S., Matsuo, I., and Totani, K., Structural approaches to the study of oligosaccharides in glycoprotein quality control, *Curr.Opin.Struct.Biol.* 15, 481-489, 2005.

## Calponin

A family of actin-binding proteins which exist in various isoforms. As with other protein isoforms or isoenzymes, the expression of the isoforms is tissue-specific. The interaction of calponin with actin inhibits the actomyosin Mg-ATPase activity. See Winder, S and Walsh, M., Inhibition of the actinomyosin MgATPase by chicken gizzard calponin, *Prog.Clin.Biol.Res.* 327, 141-148, 1990; Winder, S.J., Sutherland, C. and Walsh, M.P., Biochemical and functional characterization of smooth muscle calponin, *Adv.Exp.Med.Biol.* 304, 37-51, 1991; Winder, S.J. and Walsh, M.P., Calponin: thin filament-linked regulation of smooth muscle contraction, *Cell Signal.* 5, 677-686, 1993; el-Mezgueldi, M., Calponin, *Int.J.Biochem.Cell Biol.* 28, 1185-1189, 1996; Szymanski, P.T., Calponin (CaP) as a latch-bridge protein—a new concept in regulation of contractility in smooth muscle, *J.Muscle Res.Cell Motil.* 25, 7-19, 2004; Lehman, W. Craig, R., Kendrick-Jones, J., and Sutherland-Smith, A.J., An open or closed case for the conformation of calponin homology domains on F-actin?, *J.Muscle Res. Cell Motil.* 25, 351-358, 2004; Ferjani, I., Fattoum, A., Maciver, S.K. *et al.*, A direct interaction with calponin inhibits the actin-nucleating activity of gelsolin, *Biochem.J.* 396, 461-468, 2006.

## Calreticulin

A 50-60 kDa protein found in the endoplasmic reticulum. Calreticulin binds calcium ions tightly and it thought to play a role in calcium homeostasis. Calreticulin also functions as chaperone. See Koch, G.L. and Smith, M.J., The analysis of glycoproteins in cells and tissues by two-dimensional polyacrylamide gel electrophoresis, *Electrophoresis* 11, 213-219, 1990; Krause, K.H., Ca(2<sup>+</sup>)-storage organelles, *FEBS Lett.* 285, 225-229, 1991; Herbert, D.N., Simons, J.F., Peterson, J.R., and Helenius, A., Calnexin, calreticulin, and Bip/Kar2p in protein folding, *Cold Spring Harbor Symp.Quant.Biol.* 60, 405-415, 1995; Groenendyk, J., Lynch, J. and Michalak, M., Calreticulin, Ca<sup>2+</sup>, and calcineurin – signaling from the endoplasmic reticulum, *Mol.Cells* 17, 383-389, 2004; Michalak, M., Guo, L., Robertson, M., Lozak, M., and Opas, M., Calreticulin in the heart, *Mol.Cell.Biochem.* 263, 137-142, 2004; Gelebart, P., Opas, M., and Michalak, M., Calreticulin, a Ca<sup>2+</sup>-binding chaperone of the endoplasmic reticulum, *Int.J.Biochem.Cell Biol.* 37, 260-266, 2005; Bedard, K., Szabo, E., Michalak, M., and Opas, M., Cellular functions of endoplasmic reticulum chaperones calreticulin, calnexin, and ERp57, *Int.Rev.Cytol.* 245, 91-121, 2005; Ito, Y., Hagihara, S., Matsuo, I., and Totani, K., Structural approaches to the study of oligosaccharides in glycoprotein quality control, *Curr.Opin.Struct.Biol.* 15, 481-489, 2005; Garbi, N., Tanaka, S., van den Broek, M. *et al.*, Accessory molecules in the assembly of major histocompatibility complex class I/peptide complexes: how essential are they for CD(+) T-cell immune responses? *Immunol.Rev.* 207, 77-88, 2005; Cribb, A.E., Peyrou, M., Muruganandan, S., and Schneider, L., The endoplasmic reticulum in xenobiotic toxicity, *Drug.Metab. Rev.* 37, 405-442, 2005; Hansson, M., Olsson, I., and Nauseef, W.M., Biosynthesis, processing and sorting of human myeloperoxidase, *Archs.Biochem.Biophys.* 445, 214-224, 2006.

## Camelid Antibodies

Unique antibodies from members of the *Camelidae* family. The antibody structure consists of a heavy chain consisting of a variable region V<sub>H</sub>H but no light chain. The structure also misses the first constant domain (C<sub>H1</sub>) but retains the other constants regions C-terminal from the hinge region. Thus, while a classical IgG is a dimer of heterodimers, the camelid antibody described herein is a homodimer. See Ghahroudi, M.A., Desmyter, A., Wyns, L., Hamers, R., and Muyldermans, S., Selection and identification of single domain antibody fragments from camel heavy-chain antibodies, *FEBS Lett.* 414, 521-526, 1997; Nguyen, V.K., Desmyter, A., and Muylderman, S., Functional heavy-chain antibodies in *Camelidae*, *Adv.Immunol.* 79, 261-296, 2001; Muyldermans, S., Single domain camel antibodies: current status, *J.Biotechnol.* 74, 277-302, 2001; Nguyen, V.K., Su, C., Muyldermans, S., and van der Loo, W., Heavy-chain antibodies in *Camelidae*, a case of evolutionary innovation, *Immunogenetics* 54, 39-47, 2002; Conrath, K.E., Wernery, U., Mulydermans, S., and Nguyen, V.K., Emergence and evolution of functional heavy-chain antibodies in *Camelidae*, *Dev.Comp.Immunol.* 27, 87-103, 2003; Rahbarisadeh, F., Rasaeae, M.J., Forouzandeh, M., *et al.*, The production and characterization of novel heavy-chain antibodies against the tandem repeat region of MUC1 mucin, *Immunol.Invest.* 34, 431-452, 2005.

## Cap

Structure at the 5'-end of eukaryotic RNA, introduced after transcription by linking the terminal phosphate of 5'-GTP to the terminal base of the mRNA. The guanine base can be nucleated. <sup>7</sup>MeG<sup>5'</sup>-ppp<sup>5'</sup>Np See Banerjee, A.K., 5'-terminal cap structure in eukaryotic messenger ribonucleic acids, *Microbiol.Rev.* 44, 175-205, 1980; Miura, K., The cap structure in eukaryotic RNA as a mark of a strand carrying protein information, *Adv.Biophys.* 14, 205-238, 1981; Lewin, B., *Genes IV*, Oxford University Press, Oxford, United Kingdom, 1990; Cougot, N., van Dijk, E., Babajko, S., and Seraphin, B., 'Cap-tabolism', *Trends Biochem.Sci.* 29, 436-444, 2004; Gu, M. and Lima, C.D., Processing the message: structural insights into capping and decapping mRNA, *Curr.Opin.Struct. Biol.* 15, 99-106, 2005; Bentley, D.L., Rules of engagement: co-transcriptional recruitment of pre-mRNA processing factors, *Curr.Opin.Cell Biol.* 17, 251-256, 2005; Liu, H. and Kiledjian, M., Decapping the message: a beginning or an end, *Biochem.Soc.Trans.* 34, 35-38, 2006; Simon, E., Camier, S., and Seraphin, B., *Trends Biochem.Sci.* 31, 241-243, 2006. CAP is also acronym for catabolic activator protein.

## Catabolic activator protein

A transcription-regulating protein which binds to DNA in the promoter loop. See Benoff, B., Yang, H., Lawson, C.L., *et al.*, Structural basis of transcription activation: the CAP-alpha CTD-DNA complex, *Science* 297, 1562-1566, 2002; Balaeff, A., Mahadevan, L., and Schulten, K., Structural basis for cooperative DNA binding by CAP and lac repressor, *Structure* 12, 123-132, 2004; Akaboshi, E., Dynamic profiles of DNA: analysis of CAP- and LexA protein-binding regions with endonucleases, *DNA Cell Biol.* 24, 161-172, 2005.

## Cathepsins

A family of intracellular thiol proteases involved in lysosomal digestion of proteins. See Janoff, A., Mediators of tissue damage in human polymorphonuclear neutrophils, *Ser.Haematol.*

3, 96-130, 1970; Harris, E.D., Jr. and Krane, S.M., Collagenases, *N.Engl.J.Med.* 291, 605-609, 1974; Larzarus, G.S., Hatcher, V.B., and Levine, N., Lysosomes and the skin, *J.Invest.Dermatol.* 65, 259-271, 1975; Ballard, F.J., Intracellular protein degradation, *Essays Biochem.* 13, 1-37, 1977; Barrett, A.J., Cathepsin D: the lysosomal aspartic proteinase, *Ciba Found.Symp.* (75), 37-50, 1979; Barrettt, A.J. and Kischeke, H., Cathepsin B, Cathepsin H, and Cathepsin L, *Methods Enzymol.* 80, 535-561, 1981; Groutas, W.C., Inhibitors of leukocyte elastase and leukocyte cathepsin G. Agents for the treatment of emphysema and related ailments, *Med.Res.Rev.* 7, 227-241, 1987; Stoka, V., Turk, B., and Turk, V., Lysosomal cathepsin proteases: structural features and their role in apoptosis, *IUBMB Life* 57, 347-353, 2005; Roberts, R., Lysosomal cysteine proteases: structure, function and inhibition of cathepsins, *Drug News Perspect.* 18, 605-614, 2005; Chwieralski, C.E., Welte, T., and Buhling, F., Cathepsin-regulated apoptosis, *Apoptosis* 11, 143-149, 2006. There is particular interest in the role of cathepsins in antigen processing (Honey, K. and Rudensky, A.Y., Lysosomal cysteine proteases regulate antigen presentation, *Nat.Rev.Immunol.* 3, 472-482, 2003; Bryant, P. and Ploegh, H., Class II MHC peptide loading by the professionals, *Curr.Opin.Immunol.* 16, 96-102, 2004; Liu, W. and Spero, D.M., Cysteine protease cathepsin S as a key step in antigen presentation, *Drug.News Perspect.* 17, 357-363, 2004; Hsing, L.C. and Rudensky, A.Y., The lysosomal cysteine proteases in MHC Class II antigen presentation, *Immunol.Rev.* 207, 229-241, 2005.

## CASP

Critical Assessment of Structure Prediction describes a process for the evaluation of protein model building. See Moulton, J. Predicting protein three-dimensional structure, *Curr.Opin. Biotechnol.* 10, 583-588, 1999; Moulton, J., Fidelis, K., Rost, B., Hubbard, T., and Tramontano, A., Critical assessment of methods of protein structure prediction (CASP) – round 6, *Proteins* 61 Suppl. 7, 3-7, 2005; Giorgetti, A., Raimondo, D., Miele, A.E., and Tramontano, A., Evaluating the usefulness of protein structure models for molecular replacement, *Bioinformatics* 21(Suppl. 2), ii72-ii76, 2005; Espejo, F. and Patarroyo, M.E., Determining the 3D structure of human ASC2 protein involved in apoptosis and inflammation, *Biochem.Biophys.Res.Comm.* 340, 860-864, 2006; Moulton, J., Rigorous performance evaluation in protein structure modeling and implications for computational biology, *Philos.Trans.R.Soc.Lond. B Biol.Sci.* 361, 453-458, 2006.

## Caspases

A family of intracellular cysteine proteases that are involved in the process of apoptosis (programmed cell death). Caspases are synthesized as precursor or zymogen forms which required activation prior to function. One such activation process involves granzymes. Caspases also function in other intracellular processes. See Jacobson, M.D. and Evan, G.I., Apoptosis. Breaking the ice, *Curr.Biol.* 4, 337-340, 1994; Patel, T., Gores, G.B.J., and Kaufmann, S.H., The role of proteases during apoptosis, *FASEB J.* 10, 587-597, 1996; Alnemri, E.S., Mammalian cell death proteases: a family of highly conserved aspartate specific cysteine proteases, *J.Cell Biochem.* 64, 33-42, 1997; Zhivotovsky, B., Caspases: the enzymes of death, *Essays Biochem.* 39, 25-40, 2003; Twomey, C. and McCarthy, J.V., Pathways of apoptosis and importance in development, *J.Cell Mol.Med.* 9, 345-359, 2005; Ashton-Rickardt, P.G., The granule pathway of programmed cell death, *Crit.Rev. Immunol.* 25, 161-182, 2005; Yan, N. and Shi, Y., Mechanisms of

apoptosis through structural biology, *Annu.Rev.Cell Dev.Biol.* 21, 35-56, 2005; Harwood, S.M., Yaqoob, M.M., and Allen, D.A., Caspase and calpain function in cell death: bridging the gap between apoptosis and necrosis, *Ann.Clin.Biochem.* 42, 415-431, 2005; Ho, P.K. and Hawkins, C.J., Mammalian initiator apoptotic caspases, *FEBS J.* 272, 5436-5453, 2005; Fardeel, B. and Orrenius, S., Apoptosis: a basic biological phenomenon with wide-ranging implications in human disease, *J.Intern.Med.* 258, 479-517, 2005; Cathelin, S., Rébe, C., Haddaoui, L., *et al.*, Identification of proteins cleaved downstream of caspases activation in monocytes undergoing macrophage differentiation, *J.Biol.Chem.* 281, 17779-17788, 2006.

## Catalomics

The study of the enzymes in a proteome; the study of catalysis in a proteome. See Hu, Y., Uttamchandani, M., and Yao, S.Q., Microarray: a versatile platform for high-throughput functional proteomics, *Comb.Chem.High Throughput Screen.* 9, 201-212, 2006.

## Catalytic Antibodies

Antibodies which demonstrate catalytic activity. The early development of these antibodies was based on the use of haptens which mirrored transition state intermediates for enzyme-catalyzed reactions. Catalytic antibodies can be referred to as abzymes. See Kraut, J., How do enzymes work? *Science* 242, 533-540, 1988; Lerner, R.A. and Tramontano, A., Catalytic antibodies, *Sci.Am.* 258, 65-70, 1988; Green, B.S., Catalytic antibodies and biomimetics, *Curr.Opin.Biotechnol.* 2, 395-400, 1991; Jacobs, J.W., New perspectives on catalytic antibodies, *Biotechnology* 9, 258-262, 1991; Blackburn, G.M., Kingsbury, G., Jayaweera, S., and Burton, D.R., Expanded transition state analogues, *Ciba Found.Symp.* 159, 211-222, 1991; O'Kennedy, R. and Roben, P., Antibody engineering: an overview, *Essays Biochem.* 26, 59-75, 1991; Stewart, J.D., Krebs, J.F., Siuzdak, G., *et al.*, Dissection of an antibody-catalyzed reaction, *Proc.Nat.Acad.Sci.USA* 91, 7404-7409, 1994; Posner, B., Smiley, J., Lee, I., and Benkovic, S., Catalytic antibodies: perusing combinatorial libraries, *Trends Biochem.Sci.* 19, 145-150, 1994; Kikuchi, K. and Hilvert, D., Antibody catalysis via strategic use of heptenic charge, *Acta Chem.Scand.* 50, 333-336, 1996; Wentworth, P., Jr., and Janda, K.D., Catalytic antibodies: structure and function, *Cell. Biochem.Biophys.* 35, 63-87, 2001; Ostler, E.L., Resmini, M., Brocklehurst, K., and Gallacher, G., Polyclonal catalytic antibodies, *J.Immunol.Methods* 269, 111-124, 2002; Hanson, C.V., Nishiyama, Y., and Paul, S., Catalytic antibodies and their applications, *Curr.Opin.Biotechnol.* 16, 631-666, 2005. There has also been considerable interest in catalytic antibodies in pathological processes and as potential therapeutic agents. See Lacroix-Demazes, S., Kazatchkine, M.D. and Kaveri, S.V., Catalytic antibodies to factor VIII in haemophilia A., *Blood Coag.Fibrinol.* 14(Suppl 1), S31-S34, 2003; Poloukhina, D.I., Kanyshkova, T.G., Doronin, B.M., *et al.*, Hydrolysis of myelin basic protein by polyclonal catalytic IgGs from the sera of patients with multiple sclerosis, *J.Cell.Mol.Med.* 8, 359-368, 2004; Paul, S., Nishiyama, Y., Planque, S., *et al.*, Antibodies as defensive enzymes, *Springer Semin.Immunopathol.* 26, 485-503, 2005; Ponomarenko, N.A., Vorobiev, I.I., Alexandrova, E.S., *et al.*, Induction of a protein-targeted catalytic response in autoimmune prone mice: antibody-mediated cleavage of HIV-1 glycoprotein GP120, *Biochemistry* 45, 324-330, 2006; Lacroix-Desazes, S., Wootla, B., Delignat, S., *et al.*, Pathophysiology of catalytic antibodies, *Immunol.Lett.* 103, 3-7, 2006.

## CATH

A classification process for protein domain structures based on class(C), architecture(A), topology(T), and homology superfamily (H). See Orengo, C.A., Michie, A.D., Jones, S., Jones, D.T., Swindells, M.B., and Thornton, J.M., CATH—a hierarchic classification of protein domain structures, *Structure* 5, 1093-1108, 1997; Bray, J.E., Todd, A.E., Pearl, F.M., Thornton, J.M., and Orengo, C.A., The CATH dictionary of homologous superfamilies (DHS): a consensus approach for identifying distant structural homologues, *Protein Eng.* 13, 153-165, 2000; Ranea, J.A., Buchan, D.W., Thornton, J.M., and Orengo, C.A., Evolution of protein superfamilies and bacterial genome size, *J.Mol.Biol.* 336, 871-887, 2004; Velazquez-Muriel, J.A., Sorzano, C.O., Scheres, S.H., and Carazo, J.M., SPI-EM: towards a tool for predicting CATH superfamilies in 3D-EM maps, *J.Mol.Biol.* 345, 759-771, 2005. Sillitoe, I., Dibley, M., Bray, J., Addou, S., and Orengo, C., Assessing strategies for improved superfamily recognition, *Protein Sci.* 14, 1800-1810, 2005.

## CELISA

Enzyme-linked immunoassay on live cells. See Geraghty, R.J., Jogger, C.P., and Spear, P.B., Cellular expression of alphaherpesvirus gD interferes with entry of homologous and heterologous alphaviruses by blocking access to a shared gD receptor, *Virology* 68, 147-156, 2000; Lee, R.B., Hassone, D.C., Cottle, D.L., and Pickett, C., Interactions of *Campylobacter jejuni* cytolethal distending toxin subunits CdtA and CdtC with HeLa cells, *Infect. Immun.* 71, 4883-4890, 2003.

## Cell-based assays

This is a broad classification for assays where cells are used as the substrate or indicator for the action of a drug. Examples include platelet aggregation, cell-based ELISA (see below), gene expression assays, receptor-ligand interactions, etc. See Nuttall, M.E., Drug discovery and target validation, *Cells Tissues Organs* 169, 265-271, 2001; Bhadriraju, K. and Chen, C.S., Engineering cellular microenvironments to improve cell-based drug testing, *Drug Discov. Today* 7, 612-620, 2002; Indelicato, S.R., Bradshaw, S.L., Chapman, J.W., and Weiner, S.H., Evaluation of standard and state of the art analytical technology-bioassays, *Dev.Biol.* 122, 103-114, 2005; Stacey, G.N., Standardisation of cell lines, *Dev.Biol.* 111, 259-272, 2002; Qureshi, S.A., Sanders, P., Zeh, K., et al., A one-arm homologous recombination approach for developing nuclear receptor assays in somatic cells, *Assay Drug Dev.Technol.* 1, 767-776, 2003; Wei, X., Swanson, S.J., and Gupta, S., Development and validation of a cell-based bioassay for the detection of neutralizing antibodies against recombinant human erythropoietin in clinical studies, *J.Immunol.Methods* 293, 115-126, 2004; Pietrak, B.L., Crouthamel, M.C., Tugusheva, K., et al., Biochemical and cell-based assays for characterization of BACE-1 inhibitors, *Anal. Biochem.* 342, 144-151, 2005; Chen, T., Hansen, G., Beske, O., et al., Analysis of cellular events using Cell Card System in cell-based high-content multiplexed assays, *Expert Rev. Mol.Diagn.* 5, 817-829, 2005.

## Cell-based ELISA

Cell-based ELISA are indirect or direct ELISA systems which use intact cells as the antigen sample. Cells may be dried onto the microplate surface or a microplate surface treated with polylysine,

chemical fixed with glutaraldehyde or similar reagents, or pelleted onto the surface. Hoffman, T. and Herberman, R.B., Enzyme-linked immunosorbent assay for screening monoclonal antibody production: use of intact cells as antigen, *J.Immunol.Methods* 39, 309-316, 1980; Krakauer, H., Hartman, R.J., and Johnson, A.H., Monoclonal antibodies specific for human polymorphic cell surface antigens. I. Evaluation of methodology. Report of a workshop, *Human Immunol.* 4, 167-181, 1982; Bishara, A., Brautbar, C., Marbach, A., Bonvida, B., and Nelken, D., Enzyme-linked immunosorbent assay for HLA determination on fresh and dried lymphocytes, *J.Immunol.Methods* 62, 265-271, 1983; Sharon, R., Duke-Cohan, J.S., and Galili, U., Determination of ABO blood group zygosity by an antiglobulin resetting technique and cell-based enzyme immunoassay, *Vox Sang.* 50, 245-249, 1986; Zhao, Q., LU, H., Schols, D., de Clercq, E., and Jiang, S., Development of a cell-based enzyme-linked immunosorbent assay for high-throughput screening of HIV type enzyme inhibitors targeting the coreceptor CXCR4, *Aids Res.Human Retrovirus* 19, 947-955, 2003; Yang, X.Y., Chen, E., Jiang, H. et al., Development of a quantitative cell-based ELISA, for a humanized anti-IL-2/IL-15 receptor beta antibody (HuMikbeta(1)), and correlation with functional activity using an antigen-transferred murine cell line. In some cases, a cell homogenate could be used as the sample. See Franciotta, D., Martino, G., Brambilla, E., et al., TE671 cell-based ELISA for anti-acetylcholine receptor antibody determination in myasthenia gravis, *Clin.Chem.* 45, 400-405, 1999. The cell-based ELISA is distinct from the ELISPOT assay where there a capture antibody on the membrane (Arvilommi, H., Elispot for detecting antibody-secreting cells in response to infections and vaccination, *APMIS* 104, 401-410, 1996).

## Cell Culture

The maintenance of dispersed animal or plant cells in a specialized media (cell culture media). In biotechnology manufacturing, cell culture is used for the production of protein biopharmaceuticals using cells such as Chinese hamster ovary (CHO) cells or baby hamster kidney (BHK) cells. The use of the term cell culture differentiates such a process from fermentation. See Mantell, S.H. and Smith, H., *Plant Biotechnology*, Cambridge University Press, Cambridge, UK, 1983; *Applications of Plant Cell and Tissue Culture*, Chichester, UK, 1988; Freshney, R.I., *Animal Cell Culture: A Practical Approach*, IRL Press at Oxford University Press, Oxford, UK, 1992; Morgan, S.J. and Darling, D.C., *Animal Cell Culture*, Bios/Biochemical Society, London, UK, 1993; Davis, J.M., *Basic Cell Culture: A Practical Approach*, IRL Press at Oxford University Press, Oxford, UK, 1994; Dodds, J.H. and Roberts, L.W., *Experiments in Plant Tissue Culture*, Cambridge University Press, Cambridge, UK, 1995; Spier, R., *Encyclopedia of Cell Technology*, Wiley-Interscience, New York, NY, 2000; Hesse, F. and Wagner, R., Development and improvements in the manufacture of human therapeutics with mammalian cell culture, *Trends Biotechnol.* 18, 173-180, 2000; James, E. and Lee, J.M., The production of foreign proteins from genetically modified plant cells, *Adv.Biochem.Eng.Biotechnol.* 72, 127-156, 2001; Kaeffer, B., Mammalian intestinal epithelial cells in primary culture: a mini-review, *In Vitro Cell Dev.Biol.-Animal* 38, 128-134, 2002; Ikonomou, L., Schneider, Y.J., and Agathos, S.N., Insect cell culture for industrial production of recombinant proteins, *Appl.Microbiol.Biotechnol.* 62, 1-20, 2003; Kallos, M.S., Sen, A., and Behie, L.A., Large-scale expansion of mammalian neural stem cells: a review, *Med.Biol.Eng.Comput.* 41, 271-282, 2003; Schiff, L.J., Review: production, characterization, and testing of

banked mammalian cell substrates used to produce biological products, *In Vitro Cell Dev.Biol.-Animal* 41, 65-70, 2005; Evan, M.S., Sandusky, C.B. and Barnard, N.D., Serum-free hybridoma culture: ethical, scientific and safety considerations, *Trends Biotechnol.* 24, 105-108, 2006.

## Cell Penetrating Peptide

Cell-penetrating peptides are relatively small peptides, usually less than 30 amino acids in length, which have the ability to pass through or translocate the cellular membrane in via a mechanisms which appears to be both receptor-independent as well as distinct from an endocytotic process. Such peptides have been demonstrated to "transport" diverse cargo and are being evaluated for drug delivery. See Lundberg, P. and Langel, U., A brief introduction to cell-penetrating peptides; Tamsamani, J. and Vidal, P., The use of cell-penetrating peptides for drug delivery, *Drug Discovery Today* 9, 1012-1019, 2004; Gupta, B., Levchenko, T.S., and Torchilin, V.P., Intracellular delivery of large molecules and small particles by cell-penetrating proteins and peptides, *Adv.Drug.Deliv.Rev.* 57, 637-651, 2005; Deshayes, S., Morris, M.C., Divta, G., and Heitz, F., Cell-penetrating peptides: tools for intracellular delivery of therapeutics, *Cell.Mol.Life.Sci.* 62, 1839-1849, 2005. See also amphipathic.

## CentiRay

A measure of the frequency of chromosome breakage between DNA markers in radiation-reduced somatic cell hybrids (radiation hybrids). One centiRay is equivalent to a 1% probability that a chromosome break (CentiRay distances are generally proportional to physical distance and are measured in centimorgans. See Hukriede, N.A., Joly, L., Tsang, M., *et al.*, Radiation hybrid mapping of the zebrafish genome, *Proc.Nat.Acad.Sci.USA* 96, 9745-9750, 1999; Hamasima, N. Suzuki, H., Mikawa, A. Morozumi, T., Plastow, G., and Mitsuhashi, T., Construction of a new porcine whole-genome framework map using a radiation hybrid panel, *Anim.Genet.* 34, 216-220, 2003; Voigt, C., Moller, S., Ibrahim, S.M., and Serrano-Fernandez, P., Non-linear conversion between genetic and physical chromosomal distances, *Bioinformatics* 20, 1966-1977, 2004.

## Centimorgan

A measure of genetic distance that tells how far apart physically two genes are based on the frequency of recombination or crossover between the two gene loci. A frequency of 1% recombination in meiosis is one centimorgan and equals about 1 million base pairs. See Southern, E.M., Prospects for a complete molecular map of the human genome, *Philos.Trans.R.Soc.Lond. B Biol.Sci.* 319, 299-307, 1988; White, R., Lalauel, J.M., Leppert, M., Lathrop, M., Nakamura, Y., and O'Connell, P., Linkage maps of human chromosomes, *Genome* 31, 1066-1072, 1989; Smith, L.H., Jr., Overview of hemochromatosis, *West.J.Med.* 153, 296-308, 1990; Crabbe, J.C., Alcohol and genetics: new models, *Am.J.Med.Genet.* 114, 969-974, 2002.

## Chameleon Sequences

Identical sequences in a protein which can adopt either an alpha helical conformation or a beta sheet conformation: see Minor, D.L., Jr. and Kim, P.S., Context-dependent secondary structure formation of a designed peptide sequence, *Nature* 380, 730-734,

1996; Mezei, M., Chameleon sequences in the PDB, *Protein.Eng.* 11, 411-414, 1998; Tidow, H., *et al.*, The solution structure of a chimeric LEKTI domain reveals a chameleon sequence, *Biochemistry* 43, 11238-11247, 2004.

## Chaotropic

Describing a reagent which disrupts the structure of water and macromolecules such as proteins. Chaotropic is sometimes confined to uncharged molecules such as urea or thiourea but is usually extended to include reagents such as guanidine hydrochloride and sodium thiocyanate. See Dandliker, W.B., Alonso, R., de Saussure, V.A., Kierszenbaum, F., *et al.*, The effect of chaotropic ions on the dissociation of antigen-antibody complexes, *Biochemistry* 6, 1460-1467, 1967; Hanstein, W.G., Davis, K.A., and Hatefi, Y., Water structure and the chaotropic properties of haloacetates, *Arch.Biochem.Biophys.* 147, 534-544, 1971; Sawyer, W.H. and Puckridge, J., The dissociation of proteins by chaotropic salts, *J.Biol.Chem.* 248, 8429-8433, 1973; Hatefi, Y. and Hanstein, W.G., Destabilization of membranes with chaotropic ions, *Methods Enzymol.* 31, 770-790, 1974; McLaughlin, S., Bruder, A., Chen, S., and Moser, C., Chaotropic anions and the surface potential of bilayer membranes, *Biochim.Biophys. Acta* 394, 304-313, 1975; Stein, M., Lazaro, J.J., and Wolsiuk, R.A., Concerted action of cosolvents, chaotropic anions and thioredoxin on chloroplast fructose-1,6-bisphosphatase. Reactivity to iodoacetate, *Eur.J.Biochem.* 185, 425-431, 1989; Lever, M., Blunt, J.W., and MacLagan, R.G., Some ways of looking at compensatory kosmotropes and different water environments, *Comp. Biochem.Physiol.A Integr.Physiol.* 130, 471-486, 2001; Pilorz, K. and Choma, I., Isocratic reversed-phase high-performance liquid chromatographic separation of tetracyclines and flumequine controlled by a chaotropic effect, *J.Chromatog.A.* 1031, 303-306, 2004; Moelbert, S., Normand, B., and De Los Rios, P., Kosmotropes and chaotropes: modelling preferential exclusion, binding and aggregate stability, *Biophys.Chem.* 112, 45-57, 2004; Salvi, G., De Los Rios, P., and Vendruscolo, M., Effective interactions between chaotropic agents and proteins, *Proteins* 61, 492-499, 2005; LoBrutto, R. and Kazakevich, Y.V., Chaotropic effects in RP-HPLC, *Adv.Chromatog.* 44, 291-315, 2006.

## Chaperone

An intracellular factor, most frequently a protein, which guides the intracellular folding/assembly of another protein. Examples include heat shock proteins, chaperonins, See Gregerson, N., Bolund, L., and Bross, P., Protein misfolding, aggregation, and degradation in disease, *Mol.Biotechnol.* 31, 141-150, 2005; Anken, E., Braakman, I. and Craig, E., Versatility of the endoplasmic reticulum protein folding factory, *Crit.Rev.Biochem.Mol.Biol.* 40, 191-288, 2005; Macario, A.J., and Conway de Marcario, E., Sick chaperones, cellular stress, and disease, *New Eng.J.Med.* 353, 1489-1501, 2005; Weibezahn, J., Schlieker, C., Tessarz, P., Mogk, A., and Bukau, B., Novel insights into the mechanism of chaperone-assisted protein disaggregation, *Biol.Chem.* 386, 739-744, 2006.

## Chemical Biology

The application of chemical techniques to problems in biology – the emphasis is directed toward study of the interaction of small molecules with proteins and other macromolecules. See Li, C.H., Current concepts on the chemical biology of pituitary hormones,

*Perspect.Biol.Med.* 11, 498-521, 1968; Malmstrom, B.G. and Leckner, J., The chemical biology of copper, *Curr.Opin.Chem.Biol.* 2, 286-292, 1998; Bertini, I. and Luchinat, C., New applications of paramagnetic NMR in chemical biology, *Curr.Opin.Chem.Biol.* 3, 145-151, 1999; Volkert, M., Wagner, M., Peters, C. and Waldmann, H., The chemical biology of Ras lipidation, *Biol.Chem.* 382, 1133-1145, 2001; Hahn, M.E. and Muir, T.W., Manipulating proteins with chemistry: a cross-section of chemical biology, *Trends Biochem.Sci.* 30, 26-34, 2005; Cambell-Valois, F.X., and Michnick, S., Chemical biology on PINs and NeedLes, *Curr.Opin.Chem.Biol.* 9, 31-37, 2005; Doudna, J.A., Chemical biology at the crossroads of molecular structure and mechanism, *Nat.Chem.Biol.* 1, 300-303, 2005.

## Chemical Proteomics

Use of chemical modification to identify enzymes in the proteome and to identify signalling pathways. See Jeffery, D.A. and Bogyo, M., Chemical proteomics and its application to drug discovery, *Curr.Opin.Biotechnol.* 14, 87-95, 2003; Daub, H., Godl, K., Brehmer, D., *et al.*, Evaluation of kinase inhibitor selectivity by chemical proteomics, *Assay Drug Dev.Technol.* 2, 215-224, 2004; Piggott, A.M. and Karuso, P., Quality, not quantity: the role of natural products and chemical proteomics in modern drug discovery, *Comb.Chem.High Throughput Screen.* 7, 607-630, 2004; Beillard, E. and Witte, O.N., Unraveling kinase signaling pathways with chemical genetic and chemical proteomic approaches, *Cell Cycle* 4, 434-437, 2005; Sem, D.S., Chemical proteomics from a nuclear magnetic resonance spectroscopy perspective, *Expert Rev. Proteomics* 1, 165-178, 2004; Daub, H., Characterization of kinase-selective inhibitors by chemical proteomics, *Biochim. Biophys.Acta* 1754, 183-190, 2005; Verdoes, M., Berkers, C.R., Florea, B.I., *et al.*, Chemical proteomics profiling of proteasome activity, *Methods Mol.Biol.* 328, 51-69, 2006.

## Chemokines

A large family of cytokines having a wide variety of biological actions but are generally associated with inducing mobilization and activation of immune cells; a contraction of chemotactic cytokines. See Horuk, R., *Chemokine Receptors*, Academic Press, San Diego, CA, USA, 1997; Vaddi, K., Keller, M., and Newton, R.C., *The Chemokine Factbook*, Academic Press, San Diego, CA, USA, 1997; Hebert, C., *Chemokines in Disease: Biology and Clinical Research*, Humana Press, Totowa, NJ, USA, 1999; Proudfoot, A.E.I. and Well, T.N.C., *Chemokine Protocols*, Humana Press, Totowa, NJ, USA, 2000; Schwiebert, L.M., *Chemokines, Chemokine Receptors, and Disease*, Elsevier, Amsterdam, NL, 2005; Atkins, P.C. and Wasserman, S.I., Chemotactic mediators, *Clin.Rev.Allergy* 1, 385-395, 1983; Hayashi, H., Honda, M., Shimokawa, Y., and Hirashima, M., Chemotactic factors associated with leukocyte emigration in immune tissue injury: their separation, characterization, and functional specificity, *Int.Rev.Cytol.* 89, 179-250, 1984; Bignold, L.P., Measurement of chemotaxis of polymorphonuclear leukocytes in vitro. The problems of the control of gradients of chemotactic factors, of the control of the cells and of the separation of chemotaxis from chemokinesis, *J.Immunol.Methods* 108, 1-18, 1988; Schwarz, M.K., and Wells, T.N.C., New therapeutics that modulate chemokine networks, *Nat.Rev.Drug Disc.* 1, 342-358, 2002; White, F.A., Bhangoo, S.K., and Miller, R.J., Chemokines: integrators or pain and inflammation, *Nat.Rev.Drug Discov.* 4, 834-844, 2005; Steinke, J.W. and Borish, L., Cytokines and chemokines, *J.Allergy Clin.Immunol.* 117 (Suppl 2), S441-S445, 2006;

Charo, I.F., and Ransohoff, R.M., The many roles of chemokines and chemokine receptors in inflammation, *N.Engl.J.Med.* 354, 610-621, 2006; Laudanna, C. and Alon, R., Right on the spot. Chemokine triggering of integrin-mediated arrest of rolling leukocytes, *Thromb.Haemostas.* 95, 5-11, 2006.

## Chemoproteomics

The use of small molecules as affinity materials for the discovery of specific binding proteins in the proteome; the application of chemogenomics for proteomic research. See Beroza, P., Villar, H.O., Wick, M.M., and Martin, G.R., Chemoproteomics as a basis for post-genomic drug discovery, *Drug Discov.Today* 7, 807-814, 2002; Gagna, C.E., Winokur, D., Lambert, W.C., Cell biology, chemogenomics and chemoproteomics, *Cell Biol.Int.* 28, 755-764, 2004; Shin, D., Heo, Y.S., Lee, K.J., *et al.*, Structural chemoproteomics and drug discovery, *Biopolymers* 80, 258-263, 2005; Hall, S.E., Chemoproteomics-driven drug discovery: addressing high attrition rates, *Drug Discov.Today* 11, 495-502, 2006.

## Chondrocyte

A cartilage cell. See von der Mark, K. and Conrad, G., Cartilage cell differentiation: review, *Clin.Orthop.Relat.Res.* (139), 195-205, 1979; Serni, U. and Mannoni, A., Chondrocyte physiopathology and drug efficacy, *Drug Exp.Clin.Res.* 17, 75-79, 1991; Urban, J.P., The chondrocytes: a cell under pressure, *Br.J.Rheumatol.* 33, 901-908, 1994; Yates, K.E., Shortkroff, S., and Reish, R.G., Wnt influence on chondrocyte differentiation and cartilage function, *DNA Cell Biol.* 24, 446-457, 2005; Wendt, D., Jakob, M., and Martin, I., Bioreactor-based engineering of osteochondral grafts: from model systems to tissue manufacturing, *J.Biosci.Bioeng.* 100, 489-494, 2005; Goldring, M.B., Tsduchmochi, K., and Ijiri, K., The control of chondrogenesis, *J. ## Chromatin

Chromatin consists of a repeating fundamental nucleoprotein complex, the nucleosome; DNA wrapped around histones where the histones mediate the folding of DNA into chromatin. see Wolfe, A., *Chromatin. Structure and Function*, 3rd Ed., Academic Press, San Diego, CA, 1998; Woodcock, C.L., Chromatin architecture, *Curr.Opin.Struct.Biol.* 16, 213-220, 2006; Aligianni, S. and Varga-Weisz, P., Chromatin-remodelling factors and the maintenance of transcriptional states through DNA replication, *Biochem.Soc.Symp.* (73), 97-108, 2006; de la Serna, I.L., Ohkawa, Y., and Imbalzano, A.N., Chromatin remodelling in mammalian differentiation: lessons from ATP-dependent remodellers, *Nat.Rev.Genet.* 7, 461-473, 2006; Mersfelder, E.L., and Parthun, M.R., The tail beyond the tail: histone core domain modifications and the regulation of chromatin structure, *Nucleic Acids Res.* 34, 2653-2662, 2006.

## Chromatin Remodeling

The dynamic structural change in chromatin by nucleosome sliding or post-translational modifications (acetylation, methylation) of the histones. See Becker, P.B., The chromatin accessibility

complex: chromatin dynamics through nucleosome sliding, *Cold Spring Harb. Symp. Quant. Biol.* 69, 281-287, 2004; Henikoff, S. and Ahmed, K., Assembly of variant histones into chromatin, *Annu. Rev. Cell Dev. Biol.* 21, 133-153, 2005; Dhananjayan, S.C., Ismail, A., and Nawaz, Z., Ubiquitin and control of transcription, *Essays Biochem.* 41, 69-80, 2005; Lucchesi, J.C., Kelly, W.G., and Panning, B., Chromatin remodeling in dosage compensation, *Annu. Rev. Genet.* 39, 615-651, 2005; Saha, A., Wittmeyer, J., and Cairns, B.R., Chromatin remodelling: the industrial revolution of DNA around histones, *Nat. Rev. Mol. Cell Biol.* 7, 437-447, 2006.

## Chromatography

The physical separation of two or more components of a solution mixture based on the distribution of said individual components between a stationary phase and a mobile phase. Chromatography can occur within an enclosed column or tube (column chromatography, gas chromatography being a variant of column chromatography with a gaseous mobile phase) or a planar surface as in paper chromatography or thin-layer chromatography. A **chromatogram** is (usually) a graphical representation of specific solute concentration at a given moment either in time or elution volume. In the case of planar chromatography, the term chromatography can refer to the actual paper or layer on which separation has occurred. The stationary phase may be a solid, gel, or liquid adsorbed onto a solid matrix. The mobile phase may be liquid or gaseous in nature. See Ettre, L.S., Nomenclature for chromatography, *Pure Appl. Chem.* 65, 819-872, 1993; Lederer, E. and Lederer, M., *Chromatography: A Review of Principles and Applications*, Elsevier, Amsterdam, 1957; Bobbit, J.M., *Thin-Layer Chromatography*, Reinhold, New York, NY, USA, 1963; Zweig, G. and Sherma, J., *CRC Handbook of Chromatography*, CRC Press, Cleveland, OH, USA, 1972; Snyder, L.R., Kirkland, J.J., and Glajch, J.L., *Practical HPLC- Method Development*, 2nd edn., John Wiley & Sons, Inc., New York, NY, USA, 1997; Miller, J.M., *Chromatography: Concepts and Contrasts*, Wiley, New York, NY, USA, 2005; Wall, P.E., *Thin-Layer Chromatography: A Modern Practical Approach*, Royal Society of Chemistry, Cambridge, UK, 2005; Cazes, J., *Encyclopedia of Chromatography*, Taylor & Francis, Boca Raton, FL, USA, 2005; Perssen, P., Gustavsson, P.-E., Zacchi, G., and Nilsson, B., Aspects of estimating parameter dependencies in a detailed chromatography model based on frontal experiments, *Process Biochem.* 41, 1812-1821, 2006; Alpert, A.J., Chromatography of difficult and water-soluble proteins with organic solvents, *Adv. ## Circadian

Used to describe an approximate 24 hour period; a phenomena has demonstrates a circadian variation if it occurs with a certain frequency within an approximate 24 hour period. See Mills, J.N., Human circadian rhythms, *Physiol. Rev.* 46, 128-171, 1966; Brady, J., How are insect circadian rhythms controlled?, *Nature* 223, 781-784, 1969; Menaker, M., Takahashi, J.S., and Eskin, A., The physiology of circadian pacemakers, *Annu. Rev. Physiol.* 40, 501-526, 1978; Soriano, V., The circadian rhythm embraces the variability that occurs within 24 hours, *Int. J. Neurol.* 15, 7-16, 1981; Gardner, M.J., Hubbard, K.E., Hatta, C.T., *et al.*, How plants tell the time, *Biochem. J.* 397, 15-24, 2006; McClung, C.R., Plant circadian rhythms, *Plant Cell* 18, 792-803, 2006; Brunner, M. and Schafmeier, T., Transcriptional and post-transcriptional

regulation of the circadian clock of cyanobacteria and *Neurospora*, *Genes Dev.* 20, 1061-1074, 2006; Hardin, P.E. and Yu, W., Circadian transcription: passing the HAT to CLOCK, *Cell* 125, 424-426, 2006; Lewy, A.J., Emens, J., Jackman, A., and Yuhas, K., Circadian uses of melatonin in humans, *Chronobiol. ## Cis-element; cis-locus; cis-factors

A region or regions on a DNA molecule which affects activity of DNA sequences on its own DNA molecule; an intramolecular effect; usually but not always does not code for the expression of protein; A *cis*-element or regulatory region can be complex and may contain several regulatory sequences. See Gluzman, Y., *Eukaryotic Transcription: The Role of Cis- and Trans-Acting Elements in Initiation*, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, New York, USA, 1985; Hames, B.D. and Higgins, S.J., *Gene Transcription: A Practical Approach*, IRL Press at Oxford, Oxford, UK, 1993; Tanaka, N. and Taniguchi, T., Cytokine gene regulation: regulatory *cis*-elements and DNA binding factors involved in the interferon system, *Adv. Immunol.* 52, 263-281, 1992; Galson, D.L., Blanchard, K.L., Fandrey, J., Goldberg, M.A., and Bunn, H.F., *Cis* elements that regulate the erythropoietin gene, *Ann. N.Y. Acad. Sci.* 718, 21-30, 1994; Hapgood, J.P., Riedemann, J., and Scherer, S.D., Regulation of gene expression by GC-rich DNA *cis*-elements, *Cell Biol. Int.* 25, 71-81, 2001; Tumpel, S., Maconochie, M., Wiedmann, L.M., and Krumlauf, R., Conservation and diversity in the *cis*-regulatory networks that integrate information controlling expression of *Hoxa2* in hindbrain and cranial neural crest cells in vertebrates, *Dev. Biol.* 246, 45-56, 2002; Moolla, N., Kew, M., and Arbutnot, P., Regulatory elements of hepatitis B virus transcription, *J. Viral Hepat.* 9, 323-331, 2002; Manna, P.R., Wang, X.J., and Stocco, D.M., Involvement of multiple transcription factors in the regulation of steroidogenic acute regulatory protein gene expression, *Steroids* 68, 1125-1134, 2003; Gambari, R., New trends in the development of transcription factor decoy (TFD) pharmacotherapy, *Curr. Drug Targets* 5, 419-430, 2004; McBride, D.J. and Kleinjan, D.A., Rounding up active *cis*-elements in the triple C corral: combining conservation, cleavage and conformation capture for the analysis of regulatory gene domains, *Brief Funct. Genomic Proteomic* 3, 267-279, 2004.

## Circular Dichroism

The differential absorption of plane polarized light passing through a solution and is expression as molar ellipticity  $[\theta]_m$ . See Greenfield, N.J., Analysis of circular dichroism data. *Meth. Enzymol.* 383, 282-317, 2004; Bayer, T.M., Booth, L.N., Knudsen, S.M., and Ellington, A.D., Arginine-rich motifs present multiple interfaces for specific binding by RNA, *RNA* 11, 1848-1857, 2005; Miles, A.J., and Wallace, B.A., Synchrotron radiation circular dichroism spectroscopy of proteins and applications in structural and functional genomics, *Chem. Soc. Rev.* 35, 39-51, 2006; Paramonov, S.E., Jun, H.W., and Hartgerink, J.D., Modulation of peptide-amphiphile nanofibers via phospholipid inclusions, *Biomacromolecules* 7, 24-26, 2006; Harrington, A., Darboe, N., Kenjale, R., *et al.*, Characterization of the interaction of single tryptophan containing mutants of IpaC from *Shingella flexneri* with phospholipid membranes, *Biochemistry* 45, 626-636, 2006.

## Claisen Condensation

Base-catalyzed reaction of an ester with an  $\alpha$ -carbon hydrogen with another ester (same or different) to yield a  $\beta$ -keto ester. A model for thiolase reactions. See Claisen, L and Lowman, O., *Berichte* 20, 651, 1887; Clark, J.D., O'Keefe, S.J., and Knowles, J.R., Malate synthase: proof of a stepwise Claisen condensation using the double-isotope fractionation test, *Biochemistry* 27, 5961-5971, 1988; Modia, Y. and Wierenga, R.K., A biosynthetic thiolase in complex with a reaction intermediate: the crystal structure provides new insight into the catalytic mechanism, *Structure* 7, 1279-1290, 1999; Watanabe, A. and Ebizuka, Y., Unprecedented mechanism of chain length determination in fungal aromatic polyketide synthases, *Chem.Biol.* 11, 1101-1106, 2004; Veyron-Churlet, R., Bigot, S., Guerrini, O. *et al.*, The biosynthesis of mycolic acids in *Mycobacterium tuberculosis* relies on multiple specialized elongation complexes interconnected by specific protein-protein interactions, *J.Mol.Biol.* 353, 847-858, 2005; von Wettstein-Knowles, P., Olsen, J.G., McGuire, K.A. and Henriksen, A., Fatty acid synthesis. Role of active site histidines and lysine in Cys-His-His-type beta-ketoacyl-acyl carrier protein synthases, *FEBS J.* 273, 695-710, 2006; Ryu, Y., Kim, K.J., Rosensner, C.A., and Scott, A., Decarboxylative Claisen condensation catalyzed by in vitro selected ribozymes, *Chem.Commun.* 7, 1439-1441, 2006.

## Class Switch Recombination

A process by which one constant region gene segment is switched with another gene segment during B-cell development when immunoglobulin production changes from IgM to IgA, IgE, or IgG. See Davis, M.M., Kim, S.K., and Hood, L.E., DNA sequences mediating class switching in alpha-immunoglobulin, *Science* 209, 1360-1365, 1980; Geha, R.S., Jabara, H.H., and Brodeur, S.R., The regulation of immunoglobulin E class-switch recombination, *Nat.Rev.Immunol.* 3, 721-732, 2003; Yu, K. and Lieber, M.R., Nucleic acid structures and enzymes in the immunoglobulin class switch recombination mechanism, *DNA Repair* 2, 1163-1174, 2003; Diamant, E. and Melamed, D., Class switch recombination in B lymphopoiesis: a potential pathway for B cell autoimmunity, *Autoimmun.Rev.* 3, 464-469, 2004; Min, I.M. and Selsing, E., Antibody class switch recombination: roles for switch sequence and mismatch repair proteins, *Adv.Immunol.* 87, 297-328, 2005.

## Classical Proteomics

Proteomic analysis based on the direct analysis of the expressed proteome such an extract obtained from lysis of a cell; also referred to as forward proteomics as compared to reverse proteomics. More generally, classically proteomics is taken to mean protein separation followed by characterization. See Klade, C.S., Proteomics approaches toward antigen discovery and vaccine development, *Curr.Opin.Mol.Ther.* 4, 216-223, 2002; Vondriska, T.M. and Ping, P., Functional proteomics to study protection of the ischaemic myocardium, *Expert Opin.Ther.Targets* 6, 563-570, 2002; Thiede, B. and Rudel, T., Proteome analysis of apoptotic cells, *Mass Spectrom.Rev.* 23, 333-349, 2004; Gottlieb, D.M., Schultz, J., Bruun, S.W., *et al.*, Multivariate approaches in plant science, *Phytochemistry* 65, 1531-1548, 2004.

## Clinomics

Application of oncogenomics to cancer care. See Workman, P. and Clarke, P.A., Innovative cancer drug targets: genomics, transcriptomics, and clinomics, *Expert Opin.Pharmacother.* 2, 911-915, 2001.

## Clone

A cell or organism descended from and genetically identical to a single common ancestor. Clone is also used to refer to a DNA sequence encoding a product or an entire gene sequence from an organism which is replicated by genetic engineering. Such material can be transferred to another organism for the expression of such cDNA or gene. See Cunningham, A.J., Antibody formation studied at the single-cell level, *Prog.Allergy* 17, 5-50, 1973; Hamer, D.H. and Thomas, C.A., Jr., Molecular cloning, *Adv. Pathobiol.* (6), 306-319, 1977; von Boehmer, H., Haas, W., Pohlit, H., Hengartner, H., and Nabholz, M., T cell clones: their use for the study of specificity, induction, and effector-function of T cells, *Springer Semin.Immunopathol.* 3, 23-37, 1980; Fung, J.J., Gleason, K., Ward, R., and Kohler, H., Maturation of B-cell clones, *Prog. Clin.Biol.Res.* 42, 203-214, 1980; Veitia, R.A., Stochasticity or the fatal 'imperfection' of cloning, *J.Biosci.* 30, 21-30, 2005; Kettman, J.R., from clones of cells to cloned genes and their proteinpaedia, *Scand.J.Immunol.* 62, Suppl 1, 119-122, 2005; Vats, A., Bielby, R.C., Tolley, N.S., Nerem, R., and Polak, J.M., Stem cells, *Lancet* 366, 592-602, 2005; Wells, D.N., Animal cloning: problems and prospects, *Rev.Sci.Tech.* 24, 251-264, 2005; Diep, B.A., Gill, S.R., Chang, R.F., *et al.*, Complete genome sequence of USA300, an epidemic clone of community-acquired methicillin-resistant *Staphylococcus aureus*, *Lancet* 367, 731-739, 2006.

## Clonal Selection

Literally, the selection of a clone. Most often used to describe the process by which a B-cell is challenged by a specific antigen to produce a committed plasma cell or the differentiation of T-cells. More generally, the selection a stem cell to become committed to a specific antigen. See Williamson, A.R., The biological origin of antibody diversity, *Annu.Rev.Biochem.* 45, 467-500, 1976; D'Eustachio, P., Rutishauser, U.S., and Edelman, G.M., Clonal selection and the ontogeny of the immune response, *Int.Rev.Cytol. Suppl.* (5), 1-60, 1977; Coutinho, A., Beyond clonal selection and network, *Immunol.Rev.* 110, 63-87, 1989; Cohen, I.R., Antigenic mimicry, clonal selection and autoimmunity, *J.Autoimmun.* 16, 337-340, 2001; Defrance, T., Casamayor-Palleja, M., and Krammer, P.H., The life and death of a B cell, *Adv.Cancer Res.* 86, 195-225, 2002; van Boehmer, H., Aifantis, I., Gounari, F., *et al.*, Thymic selection revisited: how essential is it?, *Immunol. Rev.* 191, 62-78, 2003; McHeyzer-Williams, L.J. and McHeyzer-Williams, M.G., Antigen-specific memory B cell development, *Annu.Rev.Immunol.* 23, 487-513, 2005; Bock, K.W. and Kohle, C., Ah receptor- and TCDD-mediated liver tumor promotion: clonal selection and expansion of cells evading growth arrest and apoptosis, *Biochem.Pharmacol.* 69, 1403-1408, 2005; Burnet, F.M., *The Clonal Selection Theory of Acquired Immunity*, Vanderbilt University Press, Nashville, TN, USA, 1959; Mazumdar, P.M.H., *Immunology 1930-1980: Essays on the History of Immunology*, Wall & Thompson, Toronto, Canada, 1989; Podolsky, S.H. and Tauber, A.I., *The Generation of Diversity: Clonal Selection Theory and the Rise of Molecular Immunology*, Harvard University Press, Cambridge, MA, USA, 1997.

## Coefficient of Linear Thermal Expansion (CLTE)

Ration of the change in length per degree C to length at O°C. The coefficient of linear thermal expansion (CLTE) is used to described the changes in the structure of proteins and other

polymers as a function of temperature; the CTLE has also been used to describe thermal changes in micelles. See Frauenfelder, H., Hartmann, H., Karplus, M., *et al.*, Thermal expansion of a protein, *Biochemistry* 26, 254-261, 1987; Schulenberg, P.J., Rohr, M., Gartner, W., and Braslavsky, S.E., Photoinduced volume changes associated with the early transformations of bacteriorhodopsin: a laser-induced optoacoustic spectroscopy study, *Biophys.J.* 66, 838-843, 1994; Marsh, D., Intrinsic curvature in normal and inverted lipid structures and I membranes, *Biophys.J.* 70, 2248-2255, 1996; Daniels, B.V., Schoenborn, B.P., and Korszun, Z.R., A low-resolution low-temperature neutron diffraction study of myoglobin, *Acta Crystallogr.D.Biol. Crystallogr.* 53, 544-550, 1997; Cordier, F. and Grzesiek, S., Temperature-dependence of protein hydrogen bond properties as studied by high-resolution NMR, *J.Mol.Biol.* 317, 739-752, 2002; Pereira, F.R., Machado, J.C., and Foster, F.S., Ultrasound characterization of coronary artery wall in vitro using temperature-dependent wave speed, *IEEE Trans Ultrason. Ferroelectr.Freq.Control* 50, 1474-1485, 2003; Bhardwaj, R., Mohanty, A.K., Drzal, L.T., *et al.*, Renewable resource-based composites from recycled cellulose fiber and poly(3-hydroxybutyrate-co-3-hydroxyvalerate) bioplastic, *Biomacromolecules* 7, 2044-2051, 2006.

## Cold-chain product

A product or reagent which must be kept cold during transit and storage; most often between 4° and 8°C. See Elliott, M.A. and Halbert, G.W., Maintaining the cold chain shipping environment for phase I clinical trial distribution, *Int.J.Pharm.* 299, 49-54, 2005; Streatfield, S.J., Mucosal immunization using recombinant plant-based oral vaccines, *Methods* 38, 150-157, 2005.

## Cold Shock Protein

A group of proteins which are synthesized by plant cells, prokaryotic and eukaryotic cells in response to cold stress. It has been suggested that cold shock proteins (CSPs) function as "chaperones" for mRNA. Graumann, P.L. and Marshiel, M.A., A superfamily of proteins that contain the cold-shock domain, *Trends.Biochem.Sci.* 23, 286-290, 1998; Phadtare, S., Alsina, J., and Inouye, M., Cold-shock response and cold-shock proteins, *Curr.Opin.Microbiol.* 2, 175-180, 1999; Sommerville, J., Activities of cold-shock domain proteins in translational control, *Bioessays* 21, 319-325, 1999; Graumann, P.L. and Marahiel, M.A., Cold shock response in *Bacillus subtilis*, *J.Mol.Microbiol. Biotechnol.* 1, 203-209, 1999; Loa, D.A. and Murata, N., Responses to cold shock in cyanobacteria, *J.Mol.Microbiol. Biotechnol.* 1, 221-230, 1999; Ermolenko, D.N. and Makhatadze, G.I., Bacterial cold-shock proteins, *Cell.Mol.Life.Sci.* 59, 1902-1913, 2002; Alfageeh, M.B., Marchant, R.J., Carden, M.J., and Smales, C.M., The cold-shock response in cultured mammalian cells: harnessing the response for the improvement of recombinant protein production, *Biotechnol.Bioeng.* 93, 829-835, 2006; Al-Fageeh, M.B. and Smales, C.M., Control and regulation of the cellular response to cold shock: the responses in yeast and mammalian systems, *Biochem.J.* 397, 247-259, 2006; Fraser, K.r., Tuite, N.L., Bhagwat, A., and O'byrne, C.P., Global effects of homocysteine on transcription in *Escherichia coli*; induction of the gene for the major cold-shock protein, CspA, *Microbiology* 152, 221-2231, 2006; Magg, C., Kubelka, J., Holtermann, G., *et al.*, Specificity of the initial collapse in the folding of the cold shock protein, *J.Mol. Biol.* 360, 1067-1080, 2006; Sauvageot, N., Beaufile, S., Maze, A., Cloning and characterization of a gene encoding a cold-shock

protein in *Lactobacillus casei*, *FEMS Microbiol.Lett.* 254, 55-62, 2006; Narberhaus, F., Waldminghaus, T., and Chowdhury, S., RNA thermometers, *FEMS Microbiol.Lett.* 30, 3-16, 2006.

## Colloid

The term colloid refers to a particle with dimensions between 1 nm and 1 µm although it is not necessary for all three dimensions to be in this size range. For example, a thin fiber might only have two dimensions in this size range. A colloidal dispersion is a system where colloid particles are dispersed in a continuous phase of a different composition such as a suspension (particles in a liquid), an emulsion (colloids of one liquid are suspended in another liquid where the two liquids are immiscible such as oil and water), a foam (gas dispersed in a liquid or gel), or an aerosol (a colloid in a gas such as air; a fog is a liquid colloid dispersed in a gas). See Tolson, N.D., Boothroyd, B., and Hopkins, C.R., Cell surface labelling with gold colloid particulates: the use of avidin and staphylococcal protein A-coated gold in conjunction with biotin and fc-bearing ligands, *J.Microsc.* 123, 215-226, 1981; Rowe, A.J., Probing hydration and the stability of protein solution—a colloid science approach, *Biophys.Chem.* 93, 93-101, 2001; Bolhuis, P.G., Meijer, E.J., and Louis, A.A., Colloid-polymer mixtures in the protein limit, *Phys.Rev.Lett.* 90:068304, 2003; Zhang, Z and van Duijneveldt, J.S., Experimental phase diagram of a model colloid-polymer mixture in the protein limit, *Langmuir* 22, 63-66, 2006; Xu, L.C. and Logan, B.E., Adhesion forces between functionalized latex microspheres and protein-coated surfaces evaluated using colloid probe atomic force microscopy, *Colloids Surf. B. Biointerfaces* 48, 84-94, 2006.

## Colloid Osmotic Strength/Colloid Osmotic Pressure Combination Electrode

An ion-selective electrode and an external reference electrode combined into a single functional unit. A separate reference electrode is not required.

## Combination Product

A regulatory term used to describe a final drug product composed of, for example, two separate drugs, a drug and a biologic or a drug and a device. See Leyden, J.J., Hickman, J.G., Jarratt, M.T., *et al.*, The efficacy and safety of a combination benzoyl peroxide/clindemycin topical gel compared with benzoyl peroxide alone and a benzoyl peroxide/erythromycin combination product, *J.Cutan.Med.Surg.* 5, 37-42, 2001; Bays, H.E., Extended-release niacin/lovastatin: the first combination product for dyslipidemia, *Expert Rev.Cardiovasc.Ther.* 2, 485-501, 2004; anon, Definition of the primary mode of action of a combination product. Final rule, *Fed.Regist.* 70, 49848-49862, 2005.

## Complement

A combination or system of plasma/serum proteins which interact to form a membrane attack complex which results in the lysis of bacterial pathogens and other cell targets such as tumor cells. There are three pathways of complement activation; the classical pathway, the alternative pathway, and the MBLectin (mannose-binding lectin; a plasma protein) pathway. The classical pathway is activated by an antigen-antibody complex (free antibody does not activate complement) via the Fc domain of the antibody; there are other mechanisms for classical pathway activation

which make minor contributions. The alternative pathway is activated by direct recognition of foreign materials in an antibody-independent manner and is driven by the autocatalytic action of C3b. The alternative pathway is thought the oldest of the three pathways is phylogenetic development. The MBlectin pathway is initiated by the interaction of the MBlectin with a bacterial cell surface polysaccharide. The activation of complement component C3 is common to all three pathways. It is noted that there similarities to the blood coagulation cascade. See Proding, W.M., Würznen, R., Erdei, A., and Dierich, M.P., Complement, in *Fundamental Immunology*, ed. W.E.Paul, Lippincott-Raven, Philadelphia, USA, Chapter 29, pps. 967-995, 1999; *Activators and Inhibitors of Complement*, ed. R.B. Sim, Kluwer Academic, Dordrecht, Netherlands, 1993; *Complement in Health and Disease*, 2nd edn., ed. K Whaley, M. Loos, and J. Weiler, Kluwer Academic, Dordrecht, Netherlands, 1993; *The Complement System*, 2nd edn., ed., K. Rother, G.O. Till, and G.M Hansch, Springer, Berlin, 1998; *The Human Complement System in Health and Disease*, ed. J.E. Volanakis and M.M. Frank, Marcel Dekker, New York, 1998; *Therapeutic Interventions in the Complement System*, ed. J.D. Lambis and K.M., Holer, Humana, Totowa, New Jersey, 2000; Szebeni, J., *The Complement System Novel Roles in Health and Disease*, Kluwer Academic, Boston, 2004.

## Complement Fixation

Complement fixation refers to the binding of the first component of the complement pathway, C1, to an IgG- or IgM-antigen complex. The antigen is usually a cell surface protein. Free antibody does not fix complement. Productive binding of the antigen-antibody complex (binding involves the Fc portion of the antibody and a minimum of two Fc domains is required; thus two intact antibody molecules) results in complement activation. An antibody that activates complements is describes as having fixed complement. Complement fixation has formed the basis for many serological tests but most have been replaced by ELISA assays for the diagnosis of infectious disease. See Juji, T., Saji, H., Sataki, M., and Tukinaga, K., Typing for human platelet alloantigens, *Rev.Immunogenet.* 1, 239-254, 1999; Pappagianus, D., Serological studies in coccidiomycosis, *Semin.Respir.Infect.* 16, 242-250, 2001; Nielsen, K., Diagnosis of brucellosis by serology, *Vet.Microbiol.* 90, 447-459, 2000; Al-Dahouk, S., Tomaso, H., Nackler, E. *et al.*, Laboratory-based diagnosis of brucellosis - review of the literature. Part I. Techniques for direct detection and identification of *Brucella sp.*, *Clin.Lab.* 49, 387-404, 2003; Taggart, E.W., Hill, H.R., Martins, T.B., and Litwin, C.M., Comparison of complement fixation with two enzyme-linked immunosorbent assays for the detection of antibodies to respiratory viral antigens, *Amer.J.Clin.Path.* 125, 460-466, 2006. Complement fixation is usually measured by the lysis of sensitized cells (e.g hemolysis of sensitized sheep red blood cells; CH<sub>50</sub> assay), See Morgen, P.B., Complement, in *Immunochemistry*, ed. C.J. van Oss and M.C.H., van Regenmortel, Marcel Dekker, New York, 1994, Chapter 34, pp. 903-923, 1994. The concept of complement fixation is still discussed with respected to *in vivo* antigen-antibody reactions such as those seen with transplantation antigens and alloantibodies. See Feucht, H.E., Felber, E., Gokel, M.J., *et al.*, Vascular deposition of complement-split products in kidney allografts with cell-mediated rejection, *Clin.Exp.Immunol.* 86, 464-470, 1991; Feucht, H.E., Complement C4d in graft capillaries—the missing link in the recognition of humoral alloreactivity, *Am.J.Transplant.* 3, 646-652, 2003; Colvin, R.B. and Smith, R.N., Antibody-mediated organ-allograft rejection, *Nat.Rev.Immunol.* 5, 807-817, 2005;

Rickert, R.C., Regulation of B lymphocyte activation by complement C<sub>3</sub> and the B cell coreceptor complex, *Curr.Opin.Immunol.* 17, 237-243, 2005.

## Confocal Microscopy

A fluorescent microscopy technique which uses a highly focused beam of light with suppression of fluorescence above and below the point of optimum focus. An image is obtained by moving the excitation beam and measurement aperture over the sample with point-by-point measurement. See Cherry, R.J., *New Techniques of Optical Microscopy and Microspectroscopy*, CRC Press, Boca Raton, FL, 1991; Stelzer, E.H., Wacker, I., and De Mey, J.R., Confocal fluorescence microscopy in modern cell biology, *Sermin.Cell Biol.* 2, 145-152, 1991; Stevens, J.K. and Mills, L.R., *Three-Dimensional Confocal Microscopy: Volume Investigation of Biological Specimens*, Academic Press, San Diego, CA, 1994; Smith, R.F., *Microscopy and Photomicrography: A Working Manual*, CRC Press, Boca Raton, FL, 1994; Pawley, J.B., *Handbook of Biological Confocal Microscopy*, Plenum Press, New York, NY, 1995; Fay, F.S., Optical methods in cell physiology, in *Handbook of Physiology, Section 14, Cell Physiology*, ed. J.F. Hoffman and J.D. Jamieson, Oxford University Press (for the American Physiological Society), New York, NY, 1997; Paddock, S.W., *Confocal Microscopy Methods and Protocols*, Humana Press, Totowa, NJ, 1999; Brelje, T.C. ## Conjugate Vaccine

Coupling of a weak immunogen such as a polysaccharide to a protein to improve/enhance immunogenicity. See Cryz, S.J., Jr., Furer, E., Sadoff, J.C., *et al.*, Use of *Pseudomonas aeruginosa* toxin A in the construction of conjugate vaccines and immunotoxins, *Rev.Infect.Dis.* 9(Suppl. 5), S644-S649, 1987; Garner, C.V. and Pier, G.B. Dis.* 24, 729-730, 2005; Lee, C.J., Lee, L.H., and Gu, X.X., Mucosal

immunity induced by pneumococcal glycoconjugate, *Crit.Rev. Microbiol.* 31, 137-144, 2005.

## Connexins

A protein subunit of connexon which form gap junctions critical for intercellular communication. Mutations in the connexins are responsible for a diversity of diseases, including deafness, skin disorders and idiopathic atrial fibrillation. Connexins have been designated by their molecular mass while another system separate connexins on the basis of sequence homology. See Beyer, E.C., Paul, D.L., and Goodenough, D.A., Connexin family of gap junction proteins, *J.Membr.Biol.* 116, 187-194, 1990; Revel, J.P., Nicholson, B.J., and Yancey, S.B., Chemistry of gap junctions, *Annu.Rev.Physiol.* 47, 263-279, 1985; Revel, J.P., Yancey, S.B., Nicholson, B., and Hoh, J., Sequence diversity of gap junction proteins, *Ciba Found.Symp.* 125, 108-127, 1987; Gollob, M.H., Cardiac connexins as candidate genes for idiopathic atrial fibrillation, *Curr.Opin.Cardiol.* 21, 155-158, 2006; Stains, J.P. and Civitelli, R., Gap junctions in skeletal development and function, *Biochim.Biophys.Acta* 1719, 69-81, 2005; Anand, R.J., and Hackam, D.J., The role of gap junctions in health and disease, *Crit.Care Med.* 33 (Suppl 12), S535-S535, 2005; Michon, L., Nlend Nlend, R., Bavamian, S., et al., Involvement of gap junctional communication in secretion, *Biochim.Biophys.Acta* 1719, 82-101, 2005; Vinken, M., Vanhaecke, T., Papeleu, P., et al., Connexins and their channels in cell growth and cell death, *Cell Signal.* 18, 592-600, 2006; Petit, C., From deafness genes to hearing mechanisms: harmony and counterpoint, *Trends Mol.Med.* 12, 57-64, 2006; Evans, W.H., De Vuyst, E., and Leybaert, L., The gap junction cellular internet: connexin hemichannels enter the signalling limelight, *Biochem.J.* 397, 1-14, 2006.

## Contig

The term contig was originally defined as a set of overlapping DNA sequences and has been expanded to include a set of overlapping DNA clones. Specifically, it refers to a set of gel bands which can be related to each other by overlaps sequences – see <http://staden.sourceforge.net/contig.html> See Staden, R., A new computer method for the storage any manipulation of DNA gel reading data, *Nucleic Acids Res.* 8, 3673-3694, 1980; Presting, G.G., Budiman, M.A., Wood, T., et al., A framework for sequencing the rice genome, *Novartis Found.Symp.* 236, 13-24, 2001; Dodgson, J.B., Chicken genome sequence: a centennial gift to poultry genetics, *Cytogenet.Genome Res.* 102, 291-296, 2003; Schalkwyk, L.C., Francis, F., and Lehrach, H., Techniques in mammalian genome mapping, *Curr.Opin.Biotechnol.* 6, 37-43, 1995; Carrano, A.V., de Jong, P.J., Branscomb, E., et al., Constructing chromosome- and region-specific cosmid maps for the human genome, *Genome* 31, 1059-1065, 1989.

## Contour Length

End-to-end length of a stretched DNA molecule (see Wellauer, P., Weber, R., and Wyler, T., Electron microscopic study of the influence of the preparative conditions on contour length and structure of mitochondrial DNA of mouse liver, *J.Ultrastruct.Res.* 42, 377-393, 1973; Geller, K. and Reinert, K.E., Evidence for an increase of DNA contour length at low ionic strength, *Nucleic Acids Res.* 8, 2807-2822, 1980; Motejlek, K., Schindler, D., Assum, G., and Krone, W., Increased amount and contour length distribution of

small polydisperse circular DNA (spcDNA) in Fanconi anemia, *Mutat.Res.* 293, 205-214, 1993; Gast, F.U. and Sanger, H.L., Gel dependence of electrophoretic mobilities of double-stranded and viroid RNA and estimation of the contour length of a viroid by gel electrophoresis, *Electrophoresis* 15, 1493-1498, 1994; Sanchez-Sevilla, A., Thimonier, J., Marilley, M., et al., Accuracy of AFM measurements of the contour length of DNA fragments adsorbed on mica in air and in aqueous buffer, *Ultramicroscopy* 92, 151-158, 2002) although the term has been used to describe very long proteins such as titin (Helmes, M., Trombitas, K., Centner, T., et al., Mechanically driven contour-length adjustment in rat cardiac titin's unique N2B sequence: titin is an adjustable spring, *Circ. Res.* 84, 1339-1352, 1999).

## Core Promoter

A region immediately (+/-30 bp) around the transcription start site that contain consensus sequence elements (TATA boxes, Inr, DPEs); *in vitro*, the core promoter is the minimal required sequence that is recognized by general transcription factors that activate correct transcription by RNA polymerase II. See Gill, G., Transcriptional initiation, *Curr.Biol.* 4, 374-376, 1994; Gill, G., Regulation of the initiation of eukaryotic transcription, *Essays Biochem.* 37, 33-43, 2001; Butler, J.E. and Kadonaga, J.T., The RNA polymerase II core promoter: a key component in the regulation of gene expression, *Genes Dev.* 16, 2583-2592, 2002; Kadonaga, J.T., The DPE, a core promoter element for transcription by RNA polymerase II, *Exp.Mol.Med.* 34, 259-264, 2002; Smale, C.T. and Kadonaga, J.T., The RNA polymerase II core promoter, *Annu.Rev. Biochem.* 72, 449-479, 2003; Lewis, B.A. and Reinberg, D., The mediator coactivator complex: functional and physical roles in transcriptional regulation, *J.Cell Sci.* 116, 3667-3675, 2003; Mülle, F. and Tora, L., The multicolored world of promoter recognition complexes, *EMBO J.* 23, 2-8, 2004; Chen, K., Organization of MAO A and MAO B promoters and regulation of gene expression, *Neurotoxicity* 25, 31-36, 2004; Hasselbach, L., Haase, S., Fischer, D., Kolberg, H.C., and Sturzbecher, H.W., Characterization of the promoter region of the human DNA-repair gene Rad51, *Eur.J.Gynecol. Oncol.* 26, 589-598, 2005.

## Cosolvent

A miscible solvent added a primary solvent to enhance salvation or stability of a specific solute. Such solvents have been used extensively in studies on enzymes where cosolvents were required to dissolve the substrate. Cosolvents are also used in the formulation of pharmaceuticals and in liquid chromatography. See Tan, K.H. and Lovrien, R., Enzymology in aqueous-organic cosolvent binary mixtures, *J.Biol.Chem.* 247, 3278-3285, 1972; Richardson, N.E. and Meakin, B.J., The influence of cosolvents and substrate substituents on the sorption of benzoic acid derivatives by polyamides, *J.Pharm.Pharmacol.* 27, 145-151, 1975; Pescheck, P.S. and Lovrien, R.E., Cosolvent control of substrate inhibition I cosolvent stimulation of beta-glucuronidase activity, *Biochem.Biophys.Res.Comm.* 79, 417-421, 1977; Bulone, D., Cupane, A. and Cordone, L., Conformational and functional properties of hemoglobin in water-organic cosolvent mixtures: effect of ethylene glycol and glycerol on oxygen affinity, *Biopolymers* 22, 119-123, 1983; Rubino, J.T. and Berryhill, W.S., Effects of solvent polarity on the acid dissociation constants of benzoic acids, *J.Pharm.Sci.* 75, 182-186, 1986; Buck, M., Trifluoroethanol and colleagues: cosolvents come of age. Recent studies with peptides and proteins, *Q.Rev.Biophys.* 31, 297-355,

1998; Jouyban-Gharamaleki, A., Valaee, L., Barzegar-Jalali, M., *et al.*, Comparison of various cosolvency models for calculating solute solubility in water-cosolvent mixtures, *Int.J.Pharm.* 177, 93-101, 1999; Lee, J.C., Biopharmaceutical formulation, *Curr.Opin.Biotechnol.* 11, 81-84, 2000; Moelbert, S., Normand, B., and de los Rios, P., Kosmotropes and chaotropes: modeling preferential exclusion, binding and aggregate stability, *Biophys. Chem.* 112, 45-57, 2004; Scharnagl, C., Reif, M., and Friedrich, J., Stability of proteins: temperature, pressure and the role of solvent, *Biochim.Biophys.Acta.* 1749, 17-213, 2005.

## Coupled Enzyme Systems

Most metabolic systems are composed of enzymes in a pathway where there is the sequential transformation of a substrate into a product through a series of separate enzyme-catalyzed reactions. One of the more simple coupled systems is the detoxification of ethyl alcohol (Plapp, B.V., Rate-limiting steps in ethanol metabolism and approaches to changing these rates biochemically, *Adv.Expt.Biol.Med.* 56, 77-109, 1975) or more complex (Brooks, S.P.J., *Enzymes in the cell. What's really going on? in Function and Metabolism*, ed. K.B. Storey, Wiley-Liss, Hoboken, NJ, USA, Chapter 3, pp. 55-86, 2004). Coupled enzyme systems are also used extensively in clinical chemistry where they are also referred to as indicator enzyme systems (Russell, C.D. and Cotlove, E., Serum glutamic-oxaloacetic transaminase: evaluation of a coupled-reaction enzyme assay by means of kinetic theory, *Clin.Chem.* 17, 1114-1122, 1971; Bais, R. and Pateghini, M., Principles of clinical enzymology, in *Tietz Textbook of Clinical Chemistry and Molecular Diagnostics*, ed. C.A. Burtis, E.R. Ashwood, and D.E. Bruns, Elsevier/Saunders, St. Louis, MO, USA, Chapter 9, pp. 191-218, 2006). The assay for creatine kinase is a coupled enzyme system as are some of the assays for glucose oxidase. An enzyme assay system is coupled to an immunological reaction in many solid-phase immunoassays such as ELISA assays (Kircks, L.J., Selected strategies for improving sensitivity and reliability of immunoassays, *Clin.Chem.* 40, 347-357, 1994). See Wimmer, M.C., Artiss, J.D., and Zak, B., Peroxidase-coupled method for kinetic colorimetry of total creatine kinase activity in serum, *Clin.Chem.* 31, 1616-1620, 1965; Shin, T., Murao, S., and Matsumura, E., A chromogenic oxidative coupling reaction of laccase: applications for laccase and angiotensin I converting enzyme assay, *Anal.Biochem.* 166, 380-388, 1987.

## Creatine

A nitrogenous compound which is synthesized from arginine, glycine and S-adenosylmethionine (Van Pilsom J.F., Stephens, G.C., and Taylor, D., Distribution of creatine, guanidinoacetate and the enzymes for their biosynthesis in the animal kingdom, *Biochem.J.* 126, 325-345, 1972; Walker, J.B. and Hannan, J.K., Creatine biosynthesis during embryonic development. False feedback suppression of liver amidinotransferase by N-acetyl-L-sarcosine and 1-carboxymethyl-2-iminoimidazolidine (Cyclocreatine), *Biochemistry* 15, 2519-2522, 1976; Walker, J.B., Creatine: biosynthesis, regulation, and function, *The Enzymes* 50 (ed. A.Meister, Academic Press, New York, NY), 177-242, 1979; Wyss, M. and Wallimann, T., Creatine metabolism and the consequences of creatine depletion in muscle, *Mol.Cell.Biochem.* 133-134, 51-66, 1994; Wu, G. and Morris, S.M., Jr., Arginine metabolism: nitric oxide and beyond, *Biochem.J.* 336, 1-17, 1998; Brosnan, M.E. and Brosnan, J.T., Renal arginine metabolism, *J.Nutr.* 134(Suppl

10), 2791S-2795S, 1994; Morris, S.M., Jr., Enzymes of arginine metabolism, *J.Nutr.(Suppl.)* 10, 2743S-2747S, 1994). Creatine is used as a biomarker for erythrocytes (Beyer, C. and Alting, I.H., Enzymatic measurement of creatine in erythrocytes, *Clin.Chem.* 42, 313-318, 1996; Jiao, Y., Okumiya, T., Saibara, T., *et al.*, An enzymatic assay for erythrocyte creatine as an index of the erythrocyte life time, *Clin.Biochem.* 31, 59-65, 1998; Takemoto, Y., Okumiya, T., Tsuchida, K., *et al.*, Erythrocyte creatine as an index of the erythrocyte life span and erythropoiesis, *Nephron* 86, 513-514, 2000; Okumiya, T., Ishikawa-Nishi, M., Doi, T., *et al.*, Evaluation of intravascular hemolysis with erythrocyte creatine in patients with cardiac valve prostheses, *Chest* 125, 2115-2120, 2004). There is increased use of creatine as a nutritional supplement (Korzun, W.J., Oral creatine supplements lower plasma homocysteine concentrations in humans, *Clin.Lab.Sci.* 17, 102-106, 2004; Pearlman, J.P. and Fielding, R.A., Creatine monohydrate as a therapeutic aid in muscular dystrophy, *Nutr.Rev.* 64, 80-88, 2006; Hespel, P., Maughan, R.J., and Greenhaff, P.L., Dietary supplements for football, *J.Sports Sci.* 24, 749-761, 2006; Shao, A. and Hathcock, J.N., Risk assessment for creatine monohydrate, *Regul.Toxicol. Pharmacol.*, 45, 242-251, 2006.

## Creatine Kinase

Adenosine triphosphate: creatine N-phosphotransferase (EC 2.7.3.2) also creatine phosphokinase. Creatine kinase is found in muscle and is responsible for the formation of creatine phosphate from creatine and adenosine triphosphate; creatine phosphate is a higher energy source for muscle contraction. Creatine kinase is elevated in all forms of muscular dystrophy. Creatine kinase is dimer and is present as isozymes (CK-1, BB; CK-2, MB; CK-3, MM) and Ck-mt(mitochondrial). Creatine kinase is also used for measure cardiac muscle damage in myocardial infarction. See Bais, R. and Edwards, J.B., Creatine kinase, *CRC Crit.Rev.Clin. Lab.Sci.* 16, 291-355, 1982; McLeish, M.J. and Kenyon, G.L., Relating structure to mechanism in creatine kinase, *Crit.Rev.Biochem.Mol.Biol.* 40, 1-20, 2005.

## Creatinine

A catabolic product of creatine which should be in blood as a constant quantity. An increase in urinary creatinine is associated with a loss of kidney function. See Hodgkinson, A. and Edwards, N.A., Laboratory determinations of renal function, *Biochem.Clin.* 2, 77-86, 1963; Blainey, J.D., The renal excretion of higher molecular weight substances, *Curr.Probl.Clin.Biochem.* 2, 85-100, 1968; Cook, J.G., Factors influencing the assay of creatinine, *Ann.Clin.Biochem.* 12, 219-232, 1975; Greenberg, N., Smith, T.A., and VanBrunt, N., Interference in the Vitros CREA method when measuring urine creatinine on samples acidified with acetic acid, *Clin.Chem.* 50, 1273-1275, 2004.

Price, C.P., Newall, R.G., and Boyd, J.C., Prediction of significant proteinuria: a systematic review, *Clin.Chem.* 51, 1577-1586, 2005; Verhoeven, N.M., Salmons, G.S., and Jakobs, C., Laboratory diagnosis of defects of creatine biosynthesis and transport, *Clin.Chim.Acta* 361, 1-9, 2005; Wishart, D.S., Metabolomics: the principles and potential applications to transplantation, *Am.J.Transplant.* 5, 2814-2820, 2005; Seron, D., Fulladosa, X., and Moreso, F., Risk factors associated with the deterioration of renal function after kidney transplantation, *Kidney Int.Suppl.* 99, S113-S117, 2005; Schrier, R.W., Role of diminished renal function in cardiovascular mortality: marker or pathogenic factor? *J.Am. Coll.Cardiol.* 47, 1-8, 2006.

## Critical Pressure

The minimum pressure required to condense gas to liquid at the critical temperature.

## Critical Temperature

The critical point (end of a vapor pressure curve in a phase diagram); above this temperature, a gas cannot be liquefied.

## Crowding

A term used to describe general effect of polymers including proteins and polysaccharides on the solution properties of proteins. See Zimmerman, S.B., Macromolecular crowding effects on macromolecular interactions: some implications for genome structure and function, *Biochim.Biophys.Acta* 1216, 175-185, 1993; Minton, A.P., Molecular crowding: analysis of effects of high concentrations of inert cosolutes on biochemical equilibria and rates in terms of volume exclusion, *Methods Enzymol.* 295, 127-149, 1998; Johansson, H.O., Brooks, D.E., and Haynes, C.A., Macromolecular crowding and its consequences, *Int.Rev.Cytol.* 192, 155-170, 2000; Ellis, R.J., Macromolecular crowding: obvious but underappreciated, *Trends Biochem.Sci.* 26, 597-604, 2001; Bernardo, P., Garcia de la Torre, J., and Pons, M., Macromolecular crowding in biological systems: hydrodynamic and NMR methods, *J.Mol.Recognit.* 17, 397-407, 2004; Martin, J., Chaperon function – effects of crowding and confinement, *J.Mol.Recognit.* 17, 465-472, 2004; Minton, A.P., Influence of macromolecular crowding upon the stability and state of association of proteins: predictions and observations, *J.Pharm.Sci.* 94, 1668-1675, 2005; del Alamo, M., Rivas, G., and Mateu, M.G., Effect of macromolecular crowding agents on human immunodeficiency virus type 1 capsid protein assembly in vitro, *J.Virol.* 79, 14271-14281, 2005; Despa, F., Orgill, D.P., and Lee, R.C., Molecular crowding effects on protein stability, *Ann.N.Y.Acad.Sci.* 1066, 54-66, 2006; Szymanski, J., Patkowski, A., Gapinski, J. *et al.*, Movement of proteins in an environment crowded by surfactant micelles: anomalous versus normal diffusion, *J.Phys.Chem.B.Condens.Matter.Mater.Surf.Interfaces Biophys.* 110, 7367-7373, 2006; Derham, B.K. and Harding, J.J., The effect of the presence of globular proteins and elongated polymers on enzyme activity, *Biochim.Biophys.Acta* 1764, 1000-1006, 2006; Grailhe, R., Merola, F., Ridard, J. *et al.*, Monitoring protein interactions in the living cell through the fluorescence decays of the cyan fluorescent protein, *Chemphyschem.* 7, 1442-1454, 2006. McPhie, P., Ni, Y.S., and Minton, A.P., Macromolecular crowding stabilizes the molten globule form of apomyoglobin with respect to both cold and heat unfolding, *J.Mol.Biol.* 361, 7-10, 2006.

## Crown Gall Disease/Crown Gall Tumors

Crown Gall is caused by a bacteria (*Agrobacterium tumefaciens*). These galls begin with tumor-like cell growth at or just below the soil's surface, near the base of the plant and commonly on bud unions. Galls usually begin as green, pliable tissue; then develop into dark, crusty growths. Crown Gall Disease has been used to study transformation with relevance to tumor formation. See Knof, U.C., Crown-gall and *Agrobacterium tumefaciens*: survey of a plant-cell-transformation system of interest to medicine and agriculture, *Subcell.Biochem.* 6, 143-173, 1978; Zhu, J., Oger, P.M., Schrammeijer, B. *et al.*, The bases of crown gall tumorigenesis, *J.Bacteriol.* 182, 3885-3895, 2000; Escobar, M.A., and

Dadekar, A.M., *Agrobacterium tumefaciens* as an agent of disease, *Trends Plant.Sci.* 8, 380-386, 2003; Brencic, A. and Winans, S.C., Detection of and response to signals involved in host-microbe interactions by plant-associated bacteria. *Micobiol.Mol.Biol.Rev.* 69, 155-194, 2005;

## Cryosection

A tissue section cut from a frozen specimen; in this situation, ice is the supporting matrix. See Yamada, E. and Watanabe, H., High voltage electron microscopy of critical-point dried cryosection, *J.Electron Microsc.* 26(Suppl), 339-342, 1977; Maddox, P.H., Tay, S.K., and Jenkins, D., A new fixed cryosection technique for the simultaneous immunocytochemical demonstration of T6 and S100 antigens, *Histochem.J.* 19, 35-38, 1987; Sod, E.W., Crooker, A.R. and Morrison, G.H., Biological cryosection preparation and practical ion yield evaluation for ion microscopic analysis, *J.Microsc.* 160, 55-65, 1990; Lewis Carl, S.A., Gillette-Ferguson, I., and Ferguson, D.G., An indirect immunofluorescence procedure for staining the same cryosection with two mouse monoclonal primary antibodies, *J.Histochem.Cytochem.* 41, 1273-1278, 1993; Jensen, H.L. and Norrild, B., Easy and reliable double-immunogold labelling of herpes simplex virus type-1 infected cells using primary antibodies and studied by cryosection electron microscopy, *Histochem.J.* 31, 525-533, 1999; Gou, D. and Catchpoole, D.R., Isolation of intact RNA following cryosection of archived frozen tissue, *Biotechniques* 34, 48-50, 2003; Rieppo, J., Hyttinen, M.M. Jurvelin, J.S., and Helminen, H.J., Reference sample method reduces the error caused by variable cryosection thickness in Fourier transform infrared imaging, *Appl.Spectrosc.* 58, 137-140, 2004; Takizawa, T. and Robinson, J.M., Thin is better! Ultrathin cryosection immunocytochemistry, *J.Nippon Med.Sch.* 71, 306-307, 2004.

## Cyanine Dyes (CyDyes)

A family of fluorescent polymethine dyes containing a -CH= group linking two nitrogen-containing heterocyclic rings; developed as sensitizer for photographic emulsions. Used in biochemistry and molecular biology on nucleic acid probes for DNA microarrays and for labeling proteins for electrophoretic analysis. See Ernst, L.A., Gupta, R.K., Mujumdar, R.B., and Waggoner, A.S., Cyanine dye labeling reagents for sulfhydryl groups, *Cytometry* 10, 3-10, 1989; Mujumdar, P.S., Ernst, L.A., Mujumdar, S.R., and Waggoner, A.S., Cyanine dye labeling reagents containing isothiocyanate groups, *Cytometry* 10, 11-19, 1989; Southwick, P.L., Ernst, L.A., Tauriello, E.W., *et al.*, Cyanine dye labeling reagents—carboxymethylindocyanine succinimidyl esters, *Cytometry* 11, 418-430, 1990; Mujumdar, R.B., Ernst, L.A., Mujumdar, S.R., *et al.*, Cyanine dye labeling reagents: sulfoindocyanine succinimidyl esters, *Bioconjug.Chem.* 4, 105-111, 1993; Benchaib, M., Delorme, R., Pluvinage, M., *et al.*, Evaluation of five green fluorescence-emitting streptavidin-conjugated fluorochromes for use in immunofluorescence microscopy, *Histochem.Cell Biol.* 106, 253-256, 1996; Mujumdar, S.R., Mujumdar, R.B., Grant, C.M., and Waggoner, A.S., Cyanine-labeling reagents: sulfobenzindocyanine succinimidyl esters, *Bioconjug.Chem.* 7, 356-362, 1996; Karp, N.A. and Lilley, K.S., Maximizing sensitivity for detecting changes in protein expression: experimental design using minimal CyDyes, *Proteomics* 5, 3105-3115, 2005; Heilmann, M., Margeat, E., Kasper, R., *et al.*, Carbocyanine dyes as efficient reversible single-molecule optical switch, *J.Am.Chem.Soc.* 127, 3801-3806, 2005; Wu, T.L., Two-dimensional difference gel electrophoresis, *Methods Mol.Biol.*

328, 71-95, 2006; Boisseau, S., Mabrouk, K., Ram, N., *et al.*, Cell penetration properties of maurocalcine, a natural venom peptide active on the intracellular ryanodine receptor, *Biochim.Biophys. Acta.* 1758, 308-319, 2006. There is also use of these dyes for the measurement of membrane potentials. See Miller, J.B. and Koshland, D.E., Effects of cyanine dye membrane probes on cellular properties, *Nature* 272, 83-84, 1978; Klausner, R.D. and Wolf, D.E., Selectivity of fluorescent lipid analogues for lipid domains, *Biochemistry* 19, 6199-6203, 1980; Kragh-Hansen, U., Jorgensen, K.E., and Sheikh, M.I., The use of potential-sensitive cyanine dye for studying ion-dependent electrogenic renal transport of organic solutes. Acta* 1558, 54-62, 2002.

## Cyclitols

Term used to describe derivatives of hexahydroxyhexane (1,2,3,4,5,6-hexahydroxyhexane). An analogue to saccharides and serves a matrix for the development of inhibitors and activators based on saccharide structure. See Tentative rules for cyclitol nomenclature, *Biochim.Biophys.Acta* 165, 1-21, 1968; Orthen, B. and Popp, M., Cyclitols as cryoprotectants for spinach and chickpea thylakoids, *Environ.Exp.Bot.* 44, 125-132, 2000; Pelyvas, I.F., Toth, Z.G., Vereb, G., *et al.*, Synthesis of new cyclitol compounds that influence the activity of phosphatidylinositol 4-kinase isoforms, PI4K230, *J.Med.Chem.* 44, 627-632, 2001; Sureshan, K.M., Shashidhar, M.S. and Varma, A.J., Cyclitol-based metal-complexing agents. Effect of the relative orientation of oxygen atoms in the ionophoric ring on the cation-binding ability of myo-inositol-based crown ethers, *J.Org.Chem.* 67, 6884-6888, 2002; Freeman, C., Liu, L., Banwell, M.G., *et al.*, Use of sulfated linked cyclitols as heparin sulfate mimetics to probe the heparin/heparin sulfate binding specificity of proteins, *J.Biol.Chem.* 280, 8842-8849, 2005; Cochran, S., Li, C.P., and Bytheway, I., An experimental and molecular-modeling study of the binding of linked sulfated tetracyclitols to FGF-1 and FGF-2, *ChemBioChem* 6, 1882-1890, 2005.

## Cytochrome P-450 Enzymes (CPY)

A family of enzymes which have monooxygenase activity and are involved in the metabolism/catabolism of drugs. Cytochrome P450 proteins are found in high concentration in the liver. See Jung, C., Schunemann, V., and Lendzian, F. Freeze-quenched iron-oxo intermediate in cytochrome P450, *Biochem.Biophys. Res.Comm.* 338, 355-364, 2005; Johnson, E.F. and Stout, C.D., Structural diversity of human xenobiotic-metabolizing cytochrome P450, *Biochem.Biophys.Res.Comm.* 338, 331-336, 2005; Tang, W., Wang, R.W., and Lu, A.Y., Utility of recombinant cytochrome p450 enzymes: a drug metabolism perspective, *Curr. Drug Metab.* 6, 503-517, 2005; Krishna, D.R. and Shekar, M.S., Cytochrome P450 3A: genetic polymorphisms and inter-ethnic differences, *Methods Find.Exp.Clin.Pharmacol.* 27, 559-567, 2005; Sarlis, N.J. and Gourgiotis, L, Hormonal effects on drug metabolism through the CYP system: perspectives on their potential significance in the era of pharmacogenomics, *Curr.Drug Targets Immune Endocr.Metabol.Disord.* 5, 439-448, 2005; Grengerich, E.P., Cytochrome P405 enzymes in the generation of commercial products, *Nat.Rev.Drug.Disc.* 1, 359-366, 2002.

## Cytokeratin

Cytokeratin describes intermediate filament keratins found in epithelial tissue. There are two types of cytokeratins the acidic type I cytokeratins and the basic or neutral type II cytokeratins. Cytokeratins are thought to play role in the activation of plasma prekallikrein and plasminogen. See Crewther, W.G., Fraser, R.D., Lennox, F.G., and Lindley, H., The chemistry of keratins, *Adv. Protein Chem.* 20, 191-346, 1965; Masri, M.S. and Friedman, M., Interactions of keratins with metal ions: uptake profiles, mode of binding, and effects on the properties of wool, *Adv.Exp.Med. Biol.* 48, 551-587, 1974; Fuchs, E. and Green, H., Multiple keratins of cultured human epidermal cells are translated from different mRNA molecules, *Cell* 17, 573-582, 1979; Fraser, R.D. and Macrae, T.P., Molecular structure and mechanical properties of keratins, *Symp.Soc.Exp.Biol.* 34, 211-246, 1980; Moll, R., Franke, W.W., Schiller, D.L., *et al.*, The catalog of human cytokeratins: patterns for expression in normal epithelia, tumors and cultured cells, *Cell* 31, 11-24, 1982; Lazarides, E., Intermediate filaments: a chemically heterogeneous, developmentally regulated class of proteins, *Annu.Rev.Biochem.* 51, 219-250, 1982; Gonias, S.L., Hembrough, T.A., and Sankovic, M., Cytokeratin 8 functions as a major plasminogen receptor in select epithelial and carcinoma cells, *Front. Biosci.* 6, D1403-D1411, 2001; Kaplan, A.P., Joseph, K., and Silverberg, M., Pathways for bradykinin formation and inflammatory diseases, *J.Allergy Clin.Immunol.* 109, 195-209, 2002; Shariat-Madar, Z., Mahdi, F. and Schmaier, A.H., Assembly and activation of the plasma kallikrein/kinin system: a new interpretation, *Int.Immunopharmacol.* 2, 1841-1849, 2002; Langbein, L. and Schweizer, J., Keratins of the human hair follicle, *Int.Rev.Cytol.* 243, 1-78, 2005; Gusterson, B.A., Ross, D.T., Heath, V.J., and Stein, T., Basal cytokeratins and their relationship to the cellular origin and functional classification of breast cancer, *Breast Cancer Res.* 7, 143-148, 2005; Skakle, J., Applications of X-ray powder diffraction in materials chemistry, *Chem.Rec.* 5, 252-262, 2005. See also keratin.

## Cytokines

Non-antibody proteins secreted by immune system cells. This is a large category and include the various interferon and interleukins as a well as other protein substances. See DeMaeyer, E.M. and Demaeyer-Guignard, J., *Interferons and other Regulatory Cytokines*, Wiley, New York, NY, USA, 1988; Plotnkoff, N.P., *Cytokines: Stress and Immunity*, CRC Press, Boca Raton, FL, USA, 1999; Cruse, J.M. and Lewis, R.E., *Atlas of Immunology*, CRC Press, Boca Raton, FL, 1999; Rott, I.M. and Brostoff, J., *Immunology*, Mosby, Edinburgh, UK, 2001; Keisari, Y. and Ofek, I., *The Biology and Pathology of Innate Immunity Mechanisms*, Kluwer Academic, New York, NY, 2002; Henle, W., Interference and interferon in persistent viral infections of cell cultures, *J.Immunol.* 91, 145-150, 1963; Isaacs, A., Interferon, *Adv.Virus Res.* 10, 1-38, 1963; Baron, S. and Levy, H.B., Interferon, *Annu.Rev.Microbiol.* 20, 291-318, 1966; Silverstein, S., Macrophages and viral immunity, *Semin. Hematol.* 7, 185-214, 1970; Bloom, B.R., In vitro approaches to the mechanism of cell-mediated immune reactions, *Adv.Immunol.* 13, 101-208, 1971; Granger, G.A., Lymphokines-the mediators of cellular immunity, *Ser.Hematol.* 5, 8-40, 1972; Valentine, F.T., Soluble factors produced by lymphocytes, *Ann.N.Y.Acad.Sci.* 221, 317-323, 1974; Ward, P.A., Leukotaxis and leukotactic disorders. A review, *Am.J.Pathol.* 77, 520-538, 1974; Salazar-Mather, T.P. and Hokeness, K.L., Cytokine and chemokine networks: pathways to viral defense, *Curr.Top.Microbiol.Immunol.* 303, 29-46, 2006; Akira, S., Uematsu, S., and Takeuchi, O., Pathogen recognition

and innate immunity, *Cell* 124, 783-801, 2006; Tedgui, A. and Mallat, Z., Cytokines in atherosclerosis: pathogenic and regulatory pathways, *Physiol.Rev.* 86, 515-581, 2006.

## Cytokinesis

Cell division; the division of the cytoplasm of a cell following the division of the nucleus. See Robinson, D.N. and Spudich, J.A., Mechanics and regulation of cytokinesis, *Curr.Opin.Cell Biol.* 16, 181-188, 2004; Mayer, U. and Jurgens, G., Cytokinesis: lines of division taking shape, *Curr.Opin.Plant Biol.* 7, 599-604, 2004; Albertson, R., Riggs, B., and Sullivan, W., Membrane traffic: a driving force in cytokinesis, *Trends Cell Biol.* 15, 92-101, 2005; Glotzer, M., The molecular requirements for cytokinesis, *Science* 307, 1735-1739, 2005; Burgess, D.R., Cytokinesis: new roles for myosin, *Curr.Biol.* 15, R310-R311, 2005; Darenfeld, H. and Mandato, C.A., Wound-induced contractile ring: a model for cytokinesis, *Biochem.Cell Biol.* 83, 711-720, 2005; Konopka, C.A., Scheede, J.B., Skop, A.R., and Bednarek, S.Y., Dynamin and cytokinesis, *Traffic* 7, 239-247, 2006.

## Cytomics

The molecular analysis of heterogeneous cellular systems; Davies, E., Stankovic, B., Azama, K., *et al.*, Novel components of the plant cytoskeleton: a beginning to plant 'cytomices,' *Plant Sci.* 160, 185-196, 2001; Bernas, T., Gregori, G., Asem, E.K., and Robinson, J.P., Integrating cytomics and proteomics, *Mol.Cell.Proteomics* 5, 2-13, 2006; Van Osta, P., Ver Donck, K., Bols, L., and Geysen, J. Cytomics and drug discovery, *Cytometry A* 69, 117-118, 2006; Tarnok, A., Slide-based cytometry for cytomics – a minireview, *Cytometry A* 69, 555-562, 2006; Herrera, G., Diaz, L., Martinez-Romero, A., *et al.*, Cytomics: a multiparametric, dynamic approach to cell research, *Toxicol. In Vitro*, 21, 176-182, 2006; Valet, G., Cytomics as a new potential for drug discovery, *Drug Discov.Today* 11, 785-791, 2006.

## Cytoskeleton

The internal framework of the cell; the cytoskeleton is composed largely of actin filaments and microtubules. See Wasteneys, G.O. and Yang, Z., New views on the plant cytoskeleton, *Plant Physiol.* 136, 3884-3891, 2004; Moller-Jensen, J. and Lowe, J., Increasing complexity of the bacterial cytoskeleton, *Curr.Opin.Cell Biol.* 17, 75-81, 2005; Smith, L.G. and Oppenheimer, D.G., Spatial control of cell expansion by the plant cytoskeleton, *Annu.Rev.Cell Dev. Biol.* 21, 271-295, 2005; Munro, E.M., PAR proteins and the cytoskeleton: a marriage of equals, *Curr.Opin.Cell Biol.* 18, 86-94, 2006; Boldogh, I.R. and Pon, L.A., Interactions of mitochondria with the actin cytoskeleton, *Biochim.Biophys.Acta* 1763, 405-462, 2006; Larsson, C., Protein kinase C and the regulation of the actin cytoskeleton, *Cell Signal.* 18, 276-284, 2006; Logan, M.R. and Mandato, C.A., Regulation of the actin cytoskeleton by PIP2 in cytokinesis, *Biol.Cell.* 98, 377-388, 2006; Sheetz, M.P., Sable, J.E., and Dobereiner, H.G., Continuous membrane-cytoskeleton adhesion requires continuous accommodation to lipid and cytoskeleton dynamics, *Annu.Rev.Biophys.Biomol.Struct.* 35, 417-434, 2006; Becker, B.E. and Gard, D.L., Visualization of the cytoskeleton in *Xenopus* oocytes and eggs by confocal immunofluorescence microscopy, *Methods Mol.Biol.* 322, 69-86, 2006; Popowicz, G.M., Scheicher, M., Noegel, A.A., and Holak, A.A., Filamins: promiscuous organizers of the cytoskeleton, *Trends Biochem.Sci.* 31, 411-419, 2006.

## Cytotoxic T-cells; cytotoxic T-lymphocytes

Also known as killer cells, killer T-cells, null cells, A differentiated T cell (CD8 positive) that attacks and lyses target cells bearing specific antigens. Used in patient-specific immunotherapy with cells grown in culture. See Gillis, S., Baker, P.E., Ruscetti, F.W., and Smith, K.A., Long-term culture of human antigen-specific cytotoxic T-cell lines, *J.Exptl.Med.* 148, 1093-1098, 1978.

## Database of Interacting Proteins (DIP)

The database of interacting proteins integrates the experimental evidence available on protein interactions into a single online resource: <http://dip.doe-mbi.ucla.edu> See Xenarios, I., Fernandez, E., Salwinski, L., Duan, X.J. *et al.*, DIP: the database of interacting proteins: 2001 update, *Nucleic Acids Res.* 29, 239-241, 2001; Deane, C.M., Salwinski, L., Xenarios, I., and Eisenberg, D., Protein interactions: two methods for assessment of the reliability of high throughput observations, *Mol.Cell Proteomics* 1, 349-356, 2002; Salwinski, L., Miller, C.S., Smith, A.J., *et al.*, *Nucleic Acids Res.* 32, D449-451, 2004; Han, D., Kim, H.S., Seo, J., and Jang, W., A domain combination based probabilistic framework for protein-protein interaction prediction, *Genome Inform.Ser.Workshop Genome Inform.* 14, 250-259, 2003; Espadaler, J., Romero-Isart, O., Jackson, R.M., and Oliva, B., Prediction of protein-protein interactions using distant conservation of sequence patterns and structure relationships, *Bioinformatics* 21, 3360-3368, 2005.

## Deconvolution

An algorithm used in electrospray mass spectrometry to translate the spectra of multiply charged ions into a spectrum of molecular species.

## Dendrimers

A novel polymeric material containing a highly branched and well-defined structure. Dendrimers have been used for drug delivery, a biological matrix and for model drug distribution studies. Dendrimers are similar to dendrites which are branched crystals in which branches of crystallization proceeds at different rates. See Meldal, M. and Hilaire, P.M., Synthetic methods of glycopeptides assembly, and biological analysis of glycopeptides products, *Curr. Opin.Chem.Biol.* 1, 552-563, 1997; Sadler, K. and Tam, J.P., Peptide dendrimers: applications and synthesis, *J.Biotechnol.* 90, 195-229, 2002; Turnbull, W.B., and Stoddart, J.F., Design and synthesis of glycodendrimers, *J.Biotechnol.* 90, 231-255, 2002; Kobayashi, H. and Brechbiel, M.W., Dendrimer-based macromolecular MRI contrast agents: characteristics and application, *Mol.Imaging* 2, 1-10, 2003; Lee, C.C., MacKay, J.A., Frechet, J.M., and Szoka, F.C., Designing dendrimers for biological applications, *Nat.Biotechnol.* 23, 1517-1526, 2005; Qiu, L.Y. and Bae, Y.H., Polymer architecture and drug delivery, *Pharm.Res.* 23, 1-30, 2006. Gupta, V., Agashe, H.B., Asthana, A., and Jain, N.K., Dendrimers: novel polymeric nanoarchitecture for solubility enhancement, *Biomacromolecules* 7, 649-658, 2006; Söntjens, S.H.M., Nettles, D.L., Carnahan, M.A., *et al.*, Biodendrimer-based hydrogel scaffolds for cartilage tissue repair, *Biomacromolecules* 7, 310-316, 2006.

## Desorption

Process by which molecules in solid or liquid form are transformed into a gas phase.

## Detergent Perturbation

Treatment of total human plasma proteins with sodium cholate and subsequent removal; resulting in "remodeling" of the lipoproteins; see Pownall, H.J., Remodeling of human plasma lipoproteins by detergent perturbation, *Biochemistry* 44, 9714-9722, 2005.

## Deterministic Series

A series or model which contains no random or probabilistic elements. *The Cambridge Dictionary of Statistics*, ed. B.S. Everitt, Cambridge University Press, Cambridge, United Kingdom, 1998.

## Diabodies

An engineered non-covalent dimer of an scFv fragment which has two antigen binding sites which may be homologous or heterologous. The normal linker engineered between the  $V_H$  and  $V_L$  domains is 15 residues (usually glycine and serine to promote maximum flexibility) which yields as monomer; if the linker is reduced to 10 residues, a dimer (diabody) is formed while with no linker there is a trimer or higher order polymer. See Atwell, J.L., Breheny, K.A., Lawrence, L.J. *et al.*, scFv multimers of the anti-neuraminidase antibody NC10: length of the linker between  $V_H$  and  $V_L$  domains dictates precisely the transition between diabodies and triabodies, *Protein Eng.* 12, 597-604, 1999. Todorovska, A., Roovers, R.C., Dolezal, O., *et al.*, Design and application of diabodies, triabodies and tetrabodies for cancer targeting, *J.Immunol.Methods* 248, 47-66, 2001; Holliger, P. and Hudson, P.J., Engineered antibody fragments and the rise of single domains, *Nature Biotechnol.* 23, 1126-1136, 2005. While diabodies are non-covalent complexes of engineered scFv constructs based on the association of the  $V_H$  domain with the most available  $V_L$  domain. A covalent diabody was observed with an engineered anti-carcinoembryonic antigen (CEA) diabody with cysteine residues inserted for coupling with a radiolabel. The formation of a disulfide-linked diabody was an unexpected consequence. See Olafsen, T., Cheung, C.-w., Yazaki, P.J. *et al.*, Covalent disulfide-linked anti-CEA diabody allows site-specific conjugation and radiolabeling for tumor targeting applications, *Prot.Eng.Des.Sel.* 17, 21-27, 2004. Note: It has been observed that if the order of the variable regions are switch in scFv construct ( $V_L$ - $V_H$  instead of  $V_H$ - $V_L$ ), the engineered scFv with a zero-length linker formed a dimer (diabody) instead of the expected trimer - See Arndt, M.A.E., Krauss, J., and Rybak, S.M., Antigen binding and stability properties of non-covalently linked anti-CD22 single-chain Fv dimers, *FEBS Lett.* 578, 257-261, 2004. See single chain Fv fragment, bibody, triabody.

## Diapedesis

The migration of a leukocyte through the interendothelial junction space and the extracellular matrix/basement membrane to the site of tissue inflammation; a process driven by chemotaxis.

## Dicer

Dicer is an RNase III nuclease (class III) which is specific for double-stranded RNA and yields siRNAs. Structurally it consists of an amino terminal helicase domain, a PAZ domain, two RNase III motifs, and a dsRNA binding motif. See Carmell, M.A., and Hannan, G.J., RNase III enzymes and their initiation of gene silencing, *Nat.Struct.Mol.Biol.* 11, 214-218, 2004;

Myers, J.W. and Ferrell, J.E., Jr., Silencing gene expression with Dicer-generated siRNA pools, in *RNA Silencing. Methods and Protocols*, ed. G.G. Carmichael, Humana Press, Totowa, New Jersey, 2005; Hammond, S.M., Dicing and slicing. The core machinery of the RNA interference pathway, *FEBS Lett.* 579, 5822-5829, 2005.

## Dictionary of Interfaces in Proteins (DIP)

The dictionary of interfaces in proteins is a database collecting the 3D structures of protein domains involved in interactions (patches). See Preissner, R., Goode, A., and Frommel, C., Dictionary of interfaces in proteins (DIP). Data bank of complementary molecules, *J.Mol.Biol.* 280, 535-550, 1998.

Frommel, C., Gille, C., Goede, A., *et al.*, Accelerating screening of 3D protein data with a graph theoretical approach, *Bioinformatics* 19, 2442-2447, 2003.

## Differential Scanning Calorimetry (DSC)

A physical technique for the study of conformation based on measuring changes in heat capacity of a molecule under various conditions. See Zecchinon, L., Oriol, A., Netzel, U., *et al.*, Stability domains, substrate-induced conformational changes, and hinge-bending motions in a psychrophilic phosphoglycerate kinase. A microcalorimetric study, *J.Biol.Chem.* 280, 41307-41314, 2005;

## Dipolar Couplings

Also residual dipolar couplings, measures the interaction between nuclei in an applied magnetic field; used for the determination of the solution structure of peptides, proteins, nucleic acids, and carbohydrates; also ligand binding, see Post, C.B., Exchange-transferred NOE spectroscopy and bound ligand structure determination, *Curr.Opin.Struct.Biol.* 13, 581-588, 2003; Bush, C.A., Martin-Pastor, M., and Imberty, A., Structure and conformation of complex carbohydrates of glycoproteins, glycolipids, and bacterial polysaccharides, *Ann.Rev.Biophys.Biomol.Struct.* 28, 269-293, 1999; MacDonald, D., and Lu, P., Residual dipolar couplings in nucleic acid structure determination, *Curr.Opin.Struct.Biol.* 12, 337-343, 2002.

## Directed Library

Also focused library. A screening library of chemical compounds which may be prepared by parallel synthesis, combinatorial chemistry, phage displayed or similar multiplexed technologies. See Miller, J.L., Recent developments in focused library design: targeting gene-families, *Curr.Top.Med.Chem.* 6, 19-29, 2006; Xu, Y., Shi, J., Yamamoto, N., *et al.*, A credit-card library approach for disrupting protein-protein interactions, *Bioorg.Med.Chem.*, 14, 2660-2673, 2005; Subramanian, T., Wang, Z., Troutman, J.M., *et al.*, Directed library of anilinoeranyl analogues of farnesyl diphosphate via mixed solid- and solution-phase synthesis, *Org.Lett.* 7, 2109-2112, 2005; McGregor, M.J., and Muskal, S.M., Pharmacophore fingerprinting. 1. Application to QSAR and focused library design, *J.Chem.Inf.Comput.Sci.* 39, 569-574, 1999.

## Distributed Annotation System (DAS)

The distributed annotation system is a communication protocol for the exchange of biological annotations (In genetics, the process of identifying the locations and coding regions of genes

in a genome and determining what those genes do. An annotation is note added with comment on the function of the gene and/or coding region). See Hubbard, T., Biological information: making it accessible and integrated (and trying to make sense of it), *Bioinformatics* 18 (Suppl 2):S140, 2002; Olason, P.I., Integrating protein annotation resources through the Distributed Annotation System, *Nucleic Acids Res.* 33, W468-470, 2005; Prlic, A., Down, T.A., and Hubbard, J.T., Adding some SPICE to DAS, *Bioinformatics* 21 (Suppl 2), ii40-ii41, 2005; Stamm, S., Riethovan, J.J., Le Texier, V., Gopalakrishnan, C., Kumanduri, V., Tang, Y., Barbosa-Morais, N.L., and Thanaraj, T.A., ASD: a bioinformatics resource on alternative splicing, *Nucleic Acids Res.* 32, D46-D55, 2006. See also <http://www.cbs.dtu.dk/>; <http://www.cbs.dtu.dk/cgi-bin/das>

## DNA Fingerprinting

This procedure is also referred to as chromosomal fingerprinting, restriction enzyme analysis (REA). This is process where DNA is cleaved by a restriction endonuclease (restriction enzyme). The resulting DNA fragments are separated by gel electrophoresis and detected by specific and non-specific probes. DNA fingerprinting is extensively used for forensic purposes. See Gazit, E. and Gazit, E., DNA fingerprinting, *Isr.J.Med.Sci.* 26, 158-162, 1990; Owen, R.J., Chromosomal DNA fingerprinting –a new method of species and strain identification applicable to microbial pathogens, *J.Med.Microbiol.* 30, 89-99, 1989; Cawood, A.H., DNA fingerprinting, *Clin.Chem.* 35, 1832-1837, 1989; de Gouyon, B., Julier, C., Avner, P., Georges, M., and Lathrop, M., Human variable number of tandem repeat probes as a source of polymorphic markers in experimental animals, *EXS* 58, 85-94, 1991; Webb, M.B. and Debenham, P.G., Cell line characterization by DNA fingerprinting: a review, *Dev.Biol.Stand.* 76, 39-42, 1992; Debenham, P.G., Probing identity: the changing face of DNA fingerprinting, *Trends Biotechnol.* 10, 96-102, 1992; McClelland, M. and Welsh, J., DNA fingerprinting by arbitrarily primed PCR, *PCR Methods Appl.* 4, S59-S65, 1994; Kuff, E.L. and Mietz, J.A., Analysis of DNA restriction enzyme digests by two-dimensional electrophoresis in agarose gels, *Methods Mol.Biol.* 31, 177-186, 1994; Caetano-Anolles, G., Scanning of nucleic acids by in vitro amplification: new developments and applications, *Nat.Biotechnol.* 14, 1668-1674, 1996.

## DNA Footprinting

DNA is incubated with a putative binding protein and then modified with dimethyl sulfate. Methylation of DNA bases occurs at regions not protected by the protein binding. The DNA can be cleaved at guanine residues which are then cleaved by piperidine. Footprinting can also be achieved by the use of DNase I hydrolysis, reaction with hydroxyl radicals or with metal ion-chelate complexes. With either enzymatic or chemical fragmentation, the DNA is end-labeled with <sup>32</sup>P-phosphate to permit identification by autoradiography. This has been used to identify the sites of transcription factor binding to *cis*-regions on DNA. See Guille, M.J. and Kneale, G.G., Methods of the analysis of DNA-protein interactions, *Mol.Biotechnol.* 8, 35-52, 1997; Gao, B. and Kunos, G., DNase I Footprinting analysis of transcription factors recognizing adrenergic receptor gene promoter sequences, *Methods Mol.Biol.* 126, 419-429, 2000; Cappabianca, L., Thomassin, H., Pictet, R. and Grange, T., Genomic footprinting using nucleases, *Methods Mol. Biol.* 199, 427-442, 1999; Angelov, D., Khochbin, S., Dimitrov, S., US laser Footprinting and protein-DNA crosslinking. Application

to chromatin, *Methods Mol.Biol.* 119, 481-495, 1999; Brenowitz, M., Chance, M.R., Dhavan, G., and Takamoto, K., Probing the structural dynamics of nucleic acids by quantitative time-resolved and equilibrium hydroxyl radical "Footprinting". *Curr.Opin. Struct.Biol.* 12, 648-653, 2002; Knight, J.C., Functional implications of genetic variation in non-coding DNA for disease susceptibility and gene regulation, *Clin.Sci.* 104, 493-501, 2003.

## DNA Methylation

Modification (methylation) of DNA catalyzed by DNA methyltransferase enzymes. Modification occurs at cytosine and adenine. In multicellular organisms, methylation appears to be confined to cytosine residues. See van Steensel, B. and Henikoff, S., Epigenomic profiling using microarrays, *Biotechniques* 35, 346-350, 2003; El-Maarri, O., Methods: DNA methylation, *Adv. Exp.Med.Biol.* 544, 197-204, 2003; Gut, I.G., DNA analysis by MALDI-TOF mass spectrometry, *Hum.Mutat.* 23, 437-441, 2004; Kapoor, A., Agius, F., and Zhu, J.K., Preventing transcriptional gene silencing by active DNA demethylation, *FEBS Lett.* 579, 5889-5898, 2005; Klose, R.J. and Bird, A.P., Genomic DNA methylation: the mark and its mediators, *Trends in Biochem.Sci.* 31, 81-97, 2006.

## DNase I Hypersensitivity site

Preferred site(s) of DNA I cleavage; typically at regions where clusters of transcriptional activators bind to DNA and usually reflect a change in chromatin structure. See McGinnis, W., Shermoen, A.W., Heemskerk, J., and Beckendorf, S.K., DNA sequence changes in an upstream DNase I-hypersensitive region are correlated with reduced gene expression, *Proc.Nat.Acad. Sci.USA* 80, 1063-1067, 1983; Cereghini, S., Saragosti, S., Yaniv, M. and Hamer, D.H., SV40-alpha-globulin hybrid minichromosomes. Differences in DNase I hypersensitivity of promoter and enhancer sequences, *Eur.J.Biochem.* 144, 545-553, 1984; Rothenberg, E.V. and Ward, S.B., A dynamic assembly of diverse transcription factors integrates activation and cell-type information for interleukin 2 gene regulation, *Proc.Nat.Acad.Sci.USA* 93, 9358-9365, 1996; Ishii, H., Sen, R., and Pazin, M.J., Combinatorial control of DNase I-hypersensitive site formation and erasure by immunoglobulin heavy chain enhancer-binding proteins, *J.Biol. Chem.* 279, 7331-7338, 2004; Hermann, B.P. and Heckert, L.L., Silencing of Fshr occurs through a conserved, hypersensitive site in the first intron, *Mol.Endocrinol.* 19, 2112-2131, 2005; Sun, D., Guo, K., Rusche, J.J., and Hurley, L.H., Facilitation of a structural transition in the polypurine/polypyrimidine tract within the proximal promoter region in the human VEGF gene by the presence of potassium and G-quadruplex-interactive agents, *Nucleic Acids Res.* 33, 6070-6080, 2005.

## DNAzyme

A DNA molecule that contains a catalytic motif that cleaves bound RNA in a hydrolytic reaction; also known as deoxyribozymes or DNA enzymes. See Joyce, G.F., Directed evolution of nucleic acid enzymes, *Annu.Rev.Biochem.* 73, 791-836, 2004; Achenbach, J.C., Chiuman, W., Cruz, R.P., and Li, Y., DNAzymes: from creation *in vitro* to application *in vivo*. *Curr.Pharm.Biotechnol.* 5, 321-336, 2004; Sioud, M. and Iversen, P.O., Ribozymes, DNAzymes and small interfering RNAs as therapeutics, *Curr.Drug.Targets* 6, 647-653, 2005; Fiammengio, R. and Jaschke, A., Nucleic acid enzymes, *Curr.Opin.Biotechnol.* 16, 614-621, 2005.

## Domain

A contiguous (usually) series of monomer units (amino acids in proteins; nucleic acid bases in nucleic acids; monosaccharide in oligosaccharides/polysaccharides). A domain can be continuous or discontinuous and is identified by a unique function such as catalysis or binding; domains are frequently identified by homology and used to group proteins into families.

## Domain Antibodies

Antibodies containing a single antigen-binding domain, most often the  $V_H$  region or the highly variable regions from the  $V_H$  and  $V_L$  regions. These antibodies are naturally occurring in camels (members of the order *Camelidae* which includes llamas and camels). See Dick, H.M., Single domain antibodies, *BMJ* 300, 959, 1990; Riechman, L. and Muyldermans, S., Single domain antibodies: comparison of camel  $V_H$  and camelized human  $V_H$  domains, *J.Immunol.Methods* 231, 25-38, 1999; Stockwin, L.H. and Holmes, S., Antibodies as therapeutic agents: vive la renaissance! *Expert Opin.Biol.Ther.* 3, 1133-1152, 2003; Holt, L.J., Herring, C., Jespers, L.S., Woolven, B.P., and Tomlinson, I.M., Domain antibodies: proteins for therapy, *Trends Biotechnol.* 21, 484-490, 2003.

## Drosha

A member of the RNase III family of double-stranded specific endonucleases. Drosha is a member of Class II in which each member contains tandem RNase III catalytic motifs and one C-terminal dsRNA-binding domain. Class I proteins contain only one RNase III catalytic domain and a dsRNA binding domain. Class III (see Dicer) contain a PAZ domain, a DUF283 domain, the tandem nuclease domains and a dsRNA-binding domain. See Carmell, M.A., and Hannan, G.J., RNase III enzymes and their initiation of gene silencing, *Nat.Struct.Mol.Biol.* 11, 214-218, 2004.

## Drug

A drug is defined as (1) a substance recognized by an official pharmacopoeia or formulary; (2) a substance intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease; (3) a substance (other than food) intended to affect the structure or any function of the body; (4) a substance intended for use as a component of a medicine but not a device or a component, part or accessory of a device; (5) biological products are included within this definition and are generally covered by the same laws and regulations, but differences exist regarding their manufacturing processes (chemical processes vs. biological processes).

## Drug Master File

Drug Master Files (DMF) contain information on the processes and facilities used in drug or drug component manufacture and storage and are submitted to the FDA for examination and approval.

## Drug Product

The final dosage form which contains a drug substance or drug substances as well as inactive materials which are also considered as excipients. The drug product is differentiated from the drug substance but may or may not be the same as the drug substance. See <http://www.fda.gov/cder/drugsatfda/glossary.htm>; [http://www.fda.gov/cder/ondc/Presentations/2002/01-10-19\\_DIA\\_JS.pp](http://www.fda.gov/cder/ondc/Presentations/2002/01-10-19_DIA_JS.pp).

## Drug Targeting

The ability to target a compound to a specific organ or cell type within an organism. The compound can be a drug/pharmaceutical or it can be a compound, such as a radioisotope, which can be used as a diagnostic. See Muzykantov, V.R., Biomedical aspects of targeted delivery of drugs to pulmonary endothelium, *Expert Opin.Drug Deliv.* 2, 909-926, 2005; Weissig, V., Targeted drug delivery to mammalian mitochondria in living cells, *Expert Opin.Drug Deliv.* 2, 89-102, 2005; Hilgenbrink, A.R. and Low, P.S., Folate-receptor-mediated drug targeting: from therapeutics to diagnostics, *J.Pharm.Sci.* 94, 2135-2146, 2005.

## Dye(s)

A chemical compound with a structure which yields a color (a chromophore) which can be coupled either covalently or non-covalently to a substrate matrix. The ability of the compound to yield color is based on its ability to absorb light in the visible spectrum (400 – 700 nm). Dyes can be classified by various characteristics including mechanism/chemistry (e.g. basic dyes, acid dyes; acid/base indicators/redox dyes), structure (nitroso, acridine dyes, thiazole dyes) and process use (e.g. vat dyes). A dye is a colorant (a substance which yields color) as are pigments. A dye is chemically different from a pigment which is a particle suspended in a medium as particles in paint. More recently, the term dye has expanded to include fluorescent compounds. See Venkataraman, K., *The Chemistry of Synthetic Dyes*, Academic Press, New York, NY, 1952; Conn, H.J., *Biological Stains: A Handbook on the Nature and Uses of the Dyes Employed in the Biological; Handbook*, Williams & Wilkins, Baltimore, MD, 1961; Gurr, E., *Synthetic Dyes in Biology, Medicine, and Chemistry*, Academic Press, London, UK, 1971; Venkataraman, K., *The Chemistry of Synthetic Dyes*, Academic Press, New York, NY, 1978; Egan, H. and Fishbein, L., *Some Aromatic Amines and Azo Dyes in the General and Industrial Environment*, International Agency for Research on Cancer, Lyon, France, 1981; Clark, G. and Koastan, F.H., *History of Staining*, 3rd edn., Williams & Wilkins, Baltimore, MD, 1983; Zollinger, H. *Color Chemistry. Syntheses, Properties, and Applications of Organic Dyes and Pigments*, 2nd edn., VCH, Weinheim, Germany, 1991; *Physico-Chemical Principles of Color Chemistry*, ed. A.T. Peters and H.W. Mondal, K. and Gupta, M.N., The affinity concept in bioseparation: evolving paradigms and expanding range of applications, *Biomol. Eng.* 23, 59-76, 2006.

## Ectodomain

The extracellular domain of a transmembrane protein. The proteolysis of the ectodomain regions of specific proteins is described as ectodomain shedding and is catalyzed by ADAM proteases. See Rapraeger, A. and Bernfield, M., Cell surface proteoglycan of mammary epithelial cells. Protease releases a heparan sulfate-rich ectodomain from a putative membrane-anchored domain, *J.Biol. Chem.* 260, 4103-4109, 1985; Johnson, J.D., Wong, M.L., and Rutter, W.J., Properties of the insulin receptor ectodomain, *Proc.Natl. Acad.Sci.USA* 85, 7516-7520, 1988; Schaefer, E.M., Erickson, H.P., Federwisch, M., *et al.*, Structural organization of the human insulin receptor ectodomain, *J.Biol.Chem.* 267, 23393-23402, 1992; Attia, J., Hicks, L., Oikawa, K., *et al.*, Structural properties of the myelin-associated glycoprotein ectodomain, *J.Neurochem.* 61, 718-726, 1993; Couet, J., Sar. Acta* 1751, 110-117, 2005; Garton, K.J., Gough, P.J., and Raines, E.W., Emerging roles for ectodomain shedding in the regulation of inflammatory responses, *J.Leuk.Biol.* 79, 1105-1116, 2006.

## Electrode Potential ( $E^\circ$ )

The potential measured with an electrode in contact with a solution of its ions. Electrode potential values will predict whether a substance will be reduced or oxidized. Values are usually expressed as a reduction potential ( $M^{n+} \rightarrow M$ ). A positive electrode potential would indicate that reduction is spontaneous. A negative potential for this reaction would suggest that the oxidation reaction ( $M \rightarrow M^{n+}$ ) would be spontaneous.

## Electronegativity

The tendency of an atom to pull electron towards its in a chemical bond; the difference in electronegativity between atoms in a molecule indicates polarity such that in bromoacetic acetamide permitting attack on a nucleophile such as cysteine in the protein.

## Electrophoresis/MS

Proteins are separated by one-dimension or more often two-dimensional gel electrophoresis. The separated proteins are subjected to *in situ* tryptic digestion and the peptides separated by liquid chromatography and identified by mass spectrometry; Nishihara, J.C. and Champion, K.M., Quantitative evaluation of

proteins in one- and two-dimensional polyacrylamide gels using a fluorescent stains, *Electrophoresis* 23, 2203-2215, 2002.

## ELISA

Enzyme-Linked Immunosorbent Assay – an assay based on the reaction of antibody and antigens. There are direct, indirect, direct sandwich, and indirect sandwich assay. See Maggio, E.T., *Enzyme-Immunoassay*, CRC Press, Boca Raton, Florida, USA, 1980; Kemeny, D.M. and Challacombe, S.J., *ELISA and Other Solid Phase Immunoassays: Theoretical and Practical Aspects*, Wiley, Chichester, UK, 1988; Kemeny, D.M., *A Practical Guide to ELISA*, Pergamon Press, Oxford, UK, 1991; Kerr, M.A. and Thorpe, R., *Immunochemistry LabFax*, Bios Scientific Publishers, Oxford, UK, 1994; Law, B., *Immunoassay: A Practical Guide*, Taylor & Francis, London, UK, 1996; Crowther, J.R., *The ELISA Guidebook*, Humana Press, Totowa, New Jersey, USA, 2001; Burns, R., *Immunochemical Protocols*, Humana Press, Totowa, NJ, USA, 2005.

## Elispot

The use of membranes to measure cells secreting a specific product such as an antibody or a cytokine. A membrane (nitrocellulose or PDVF) containing an antibody or other specific binding protein is placed in a microtiter plate. Cells secreting a product, such as a cytokine, are grown in this plate and the secretion of the specific product evaluated in response to stimuli. As product is secreted from an individual cell, it is captured immediately by the antibody or other specific binding protein on the membrane and subsequently detected with a probe. An individual spot then corresponds to the secretion from a single cell. There are a number of instruments designed to measure such spots. See Kalyuzhny, A., *Handbook of ELISPOT: Methods and Protocols*, Totowa, NJ, USA, 2005; Stot, D.I., Immunoblotting, dot-blotting, and ELISPOT assay: methods and applications, in *Immunochemistry*, ed. C.J. van Oss and M.H.V. van Regenmortel, Marcel Dekker, New York, New York, Chapter 35, pp. 925-948, 1994; Arvilommi, H., ELISPOT for detecting antibody-secreting cells in response to infections and vaccination, *APMIS* 104, 401-410, 1996; Stott, D.I., Immunoblotting, dot-blotting, and ELISPOT assays: methods and applications, *J.Immunoassay* 21, 273-296, 2000; Anthony, D.D. and Lehmann, P.V., T-cell epitope mapping using the ELISPOT approach, *Methods* 29, 260-269, 2003; Ghanekar, S.A. and Maecker, H.T., Cytokine flow cytometry: multiparametric approach to immune function analysis, *Cytotherapy* 5, 1-6, 2003; Letsch, A. and Scheibenbogen, C., Quantification and characterization of specific T-cells by antigen-specific cytokine production using ELISPOT assay or intracellular cytokine staining, *Methods* 31, 143-149, 2003; Hernandez-Fuentes, M.P., Warrens, A.N., and Lechler, R.I., Immunologic monitoring, *Immunol.Rev.* 196, 247-264, 2003; Kalyuzhny, A.E., Chemistry and biology of the ELISPOT system, *Methods Mol.Biol.* 302, 15-31, 2005; Periwal, S.B., Spagna, K., Shahabi, K., *et al.*, Statistical evaluation for detection of peptide specific interferon-gamma secreting T-cells induced by HIV vaccine determined by ELISPOT assay, *J.Immunol.Methods* 305, 128-134, 2005.

## Embedding

Infiltration of a specimen with a liquid medium (paraffin) that can be solidified/polymerized to form a matrix to support the tissue for subsequent manipulation

## Endocrine

Usually in reference to a hormone or other biological effector such as peptide growth factor or cytokine which has a systemic effect.

## Endoplasmic reticulum-associated protein degradation (ERAD)

A highly specific pathway for the degradation of misfolded proteins in the endoplasmic reticulum which serves as a control mechanism for protein synthesis: see Yamaski, S., Yagishita, N., Tsuchimochi, K., Nishioka, K., and Nakajima, T., Rheumatoid arthritis as a hyper-endoplasmic reticulum-associated degradation disease, *Arthritis Res.Ther.* 7, 181-186, 2005; Meusser, B., Hirsch, C., Jarosch, E., and Sommer, T., ERAD: the long road to destruction, *Nature Cell Biol.* 7, 766-772, 2005; Werner, E.D., Brodsky, J.L., and McCracken, A.A., Proteasome-dependent endoplasmic reticulum-associated protein degradation: an unconventional route to a familiar fate, *Proc.Natl.Acad.Sci.USA* 93, 13797-13801, 1996.

## Endosome

A physically distinct compartment resulting from the process of endocytosis and isolated from the rest of the cell with a permeable membrane. The endosome provides a pathway for transport of ingested materials to the lysosome. There is particular interest in this pathway for the process of antigen presentation. See Stahl, P. and Schwartz, A.L., Receptor-mediated endocytosis, *J.Clin.Invest.* 77, 657-662, 1986; Wagner, H., Heit, A., Schmitz, F., and Bauer, S., Targeting split vaccines to the endosome improves vaccination, *Curr.Opin.Biotechnol.* 15, 538-542, 2004; Boes, M., Cuvillier, A., and Ploegh, H., Membrane specializations and endosome maturation in dendritic cells and B cells, *Trends Cell Biol.* 14, 175-183, 2004; Karlsson, L., DM and DO shape the repertoire of peptide-like-MHC-class-II complexes, *Curr.Opin.Immunol.* 17, 65-70, 2005; Li, P., Gregg, J.L., Wang, N., Zhou, D., O'Donnell, P., Blum, J.S., and Crozter, V.L., Compartmentalization of class II antigen presentation: contribution of cytoplasmic and endosomal processing, *Immunol.Rev.* 207, 206-217, 2005.

## Enhancer Elements

DNA sequences which increase transcription from a linked promoter region independent of operation and position (in contrast to proximal promoter elements). Enhancer elements are located at varying distances upstream and downstream of the linked gene. See Hankinson, O., Role of coactivators in transcriptional activation by the aryl hydrocarbon receptor, *Archs.Biochem.Biophys.* 433, 379-386, 2005; West, A.G. and Fraser, P., Remote control of gene transcription, *Hum.Mol.Genet.* 14, Spec. No. 1, R101-R111, 2005; Sipos, L. and Gyurkovics, H., Long-distance interactions between enhancers and promoters, *FEBS J.* 272, 3253-3259, 2005; Zhao, H. and Dean, A., Organizing the genome: enhancers and insulators, *Biochem.Cell.Biol.* 83, 516-524, 2005.

## Enlargosome

An organelle resulting from a calcium-dependent, cholesterol-independent non-secretory event; Perret, E., Lakkaraju, A., Deborde, S., Schreiner, R., and Rodriguez-Boulan, E., *Curr.Opin. Cell Biol.* 17, 423-434, 2005.

## Ensembl

A data base (<http://www.ensembl.org>) maintained by the European Bioinformatics Institute (EMBL). This data base organizes large amounts of biological information around the sequences of large genomes. See Birney, E., Andrews, T.D., Bevan, P., *et al.*, An overview of Ensembl, *Genome Res.* 14, 925-928, 2004; Baxeavanis, A.D., Using genomic databases for sequence-based biological discovery, *Mol.Med.* 9, 185-192, 2003; Stabenau, A., McVicker, G., Melsopp, C., Procter, G., Clamp, M., and Birney, E., The Ensembl core software libraries, *Genome Res.* 14, 929-933, 2004; Yanai, I., Korbil, J.O., Boue, S., McWeeney, S.K., Bork, P., and Lercher, M.J., Similar gene expression profiles do not imply similar tissue functions, *Trends Genet.* 22, 132-138, 2006.

## Ensemble Theory

A proposition that several discrete compounds (proteins, nucleic acids, carbohydrate) form a structural whole or functional whole. The term ensemble is frequently used to describe the population of discrete intermediates during the process of protein folding. See Thirumalai, D. and Hyeon, C., RNA and protein folding: common themes and variations, *Biochemistry* 44, 4957-4970, 2005; Dietrich, A., Buschmann, V., Muller, C., and Sauer, M., Fluorescence resonance energy transfer (FRET) and competing processes in donor-acceptor substituted DNA strands: a comparative study of ensemble and single-molecule data, *J.Biotechnol.* 82, 211-231, 2002; Sridevi, K., Lakshmikanth, G.S., Krishnamoorthy, G., and Udgaonkar, J.B., Increasing stability reduces conformational heterogeneity in a protein folding ensemble, *J.Mol.Biol.* 337, 699-711, 2004.

## Enthalpy ( $\Delta H^\circ$ )

This is the energy change or heat of reaction for either synthetic or degradative reaction in the standard state. See standard free energy.

## Entropy (s)

A thermodynamic quantity that is a measure of the "disorder" or randomness in a system. For example, a crystal structure going to a liquid is associated with an increase in entropy as, for example, the melting of ice crystals to form water under standard conditions. Entropy increases for a spontaneous process.  $S^\circ$  refers to entropy values in standard states of substances.

## Eosinophil

"Acid" staining leukocyte; associated with allergic inflammation. See Lee, J.J. and Lee, N.A, Eosinophil degranulation: an evolutionary vestige or a universally destructive effector function, *Clin.Exp.Allergy* 35, 986-994, 2005.

## Eph Receptors/Ephrin

Eph receptors are the largest family of receptor tyrosine kinases. The structure of Eph receptors is comprised of an extracellular domain, an intracellular domain which are linked by a transmembrane segment. Ephrin ligands bind to Eph receptors which are classified on the quality of the ephrin ligand; ephrin-A ligands bind to EphA receptors while ephrin-B ligands bind to EphB receptors. Eph receptors and ephrin ligand are integral components of cell

surfaces and their interactions mediate growth and development. See Foo, S.S., Turner, C.J., Adams, S., *et al.*, Ephrin-B2 controls cell motility and adhesion during blood-vessel-wall assembly, *Cell* 124, 161-173, 2006; Zhang, J., and Hughes, S., Role of the ephrin and Eph receptor tyrosine kinase families in angiogenesis and development of the cardiovascular system, *J.Pathol.* 208, 453-461, 2006; Haramis, A.P. and Perrakis, A., Selectivity and promiscuity in eph receptors, *Structure* 14, 169-171, 2006; Chrencik, J.E., Brooun, A., Recht, M.I., *et al.*, Structure and thermodynamic characterization of the EphB4/Ephrin-B2 antagonist peptide complex reveals the determinants for receptor stability, *Structure* 14, 321-330, 2006.

## Epistasis

Masking of a phenotype caused by mutation of one gene by a mutation in another gene; Epistasis analysis can be used to define order of gene expression in a genetic pathway.

## Epitome

All epitopes present in the antigenic universe; Also defined as example, paradigm; a brief presentation or statement in most dictionaries.

## Erk ½

p42/44 extracellular signal-regulated kinase, phosphorylated as a result of GPCR activation. A number of GPCR appear to converge at Erk 1/2. See Dhillon, A.S. and Kolch, W., Untying the regulation of the Raf-1 kinase, *Arch.Biochem.Biophys.* 404, 3-9, 2002; Chu, C.T., Levinthal, D.J., Kulich, S.M., *et al.*, Oxidative neuronal injury. The dark side of ERK1/2, *Eur.J.Biochem.* 271, 2060-2066, 2004; Clark, M.J. and Traynor, J.R., Assays for G-protein-coupled receptor signaling using RGS-insensitive Galpha subunits, *Methods Enzymol.* 389, 155-169, 2004; Clark, A. and Sugden, P.M., Signaling through the extracellular signal-regulated kinase 1/2 cascade in cardiac myocytes, *Biochem.Cell Biol.* 82, 603-609, 2004.

## Essential Oils

A heterogeneous mixture of lipophilic substances obtained from a plant. Also referred to as absolute oils. Originally referred to as the steam distillate of the rinds of certain citrus fruits but extends for more recently used materials such as tea tree oil which is suggested to have some pharmacological use. These products are also used in aromatherapy. See Halcon, L. and Milkus, K., *Staphylococcus aureus* and wounds: a review of tea tree oil as a promising antimicrobial, *Amer.J.Infect.Control* 32, 402-408, 2004; Kalemba, D. and Kunicka, A., Antibacterial and antifungal properties of essential oils, *Curr.Med.Chem.* 10, 813-829, 2003; Ranganna, S., Govindarajan, V.S., and Ramana, K.V., Citrus fruits—varieties, chemistry, technology, and quality evaluation. A Chemistry, *Crit.Rev.Food Sci.Nutri.* 18, 313-386, 1983.

## EUROFAN

EUROFAN (European Functional Analysis Network) was established to elucidate the physiological and biochemical functions of open reading frames in yeast; <http://mips.gsf.de/proj/eurofan/> See Sanchez, J.C., Golaz, O., Frutiger, S., *et al.*, The yeast SWISS-2DPAGE database, *Electrophoresis* 17, 556-565, 1996; Dujon, B., European Functional Analysis Network (EUROFAN) and the functional analysis of the *Saccharomyces cerevisiae*

*genome*, *Electrophoresis* 19, 617-624, 1998; Bianchi, M.M., Ngo, S., Vandenberg, M., *et al.*, Large-scale phenotypic analysis reveals identical contributions to cell functions of known and unknown yeast genes, *Yeast* 18, 1397-1412, 2001; Avaro, S., Belgareh, N., Sibella-Arguelles, C., *et al.*, Mutants defective in secretory/vacuolar pathways in the EUROFAN collection of yeast disruptants, *Yeast* 19, 351-371, 2002; Castrillo, J.I., Hayes, A., Mohammed, S., Gaskell, S.J., and Oliver, S.G., An optimized protocol for metabolome analysis in yeast using direct infusion electrospray mass spectrometry, *Phytochemistry* 62, 929-937, 2003; Davydenko, S.G., Juselius, J.K., Munder, T., Bogengruber, E., Jantti, J., and Keranen, S., Screening for novel essential genes of *Saccharomyces cerevisiae* involved in protein secretion, *Yeast* 21, 463-471, 2004.

## Eutectic

A mixture of components in such proportions that said mixture melts and solidifies as a single temperature lower than the melting points of the constituents or any other mixture thereof; a minimum transformation temperature between a solid solution and a mechanical mixture. This is an issue with cryobiology and therapeutic protein processing processes such as lyophilization. See Gutierrez-Merino, C., Quantitation of the Forster energy transfer for two-dimensional systems. II. Protein distribution and aggregation state in biological membranes, *Biophys.Chem.* 14, 259-266, 1981; Gatlin, L.A. and Nail, S.L., Protein purification process engineering. Freeze drying: a practical overview, *Bioprocess Technol.* 18, 317-367, 1994; Nail, S.L., Jiang, S., Chongprasert, S., and Knopp, S.A., Fundamentals of freeze-drying, *Pharm. Biotechnol.* 14, 281-360, 2002; Han, B., and Bischof, J.C., Thermodynamic nonequilibrium phase change behavior and thermal properties of biological solutions for cryobiology applications, *J.Biomech.Eng.* 126, 196-203, 2004.

## Exosome

A precise definition is a work in program but an exosome can be considered to be an intracellular membrane vesicle derived from fusion of endosomes with the plasma membrane. It is suggested that exosomes are involved in the intracellular transfer of molecules. See Févier, B. and Raposo, G., Exosomes: endosomal-derived vesicles shipping extracellular messages, *Curr.Opin.Cell Biol.* 16, 415-421, 2004; de Gassart, A., Géminard, C., Hoekstra, D., and Vidal, M., Exosome secretion: the art of reutilizing nonrecycled proteins? *Traffic* 5, 896-903, 2004; Chaput, N., Taïeb, Schartz, N., Flament, C., Novault, S., André, F., and Zitvogel, L. The potential of exosomes in immunotherapy of cancer, *Blood Cells, Molecules, and Diseases* 35, 111-115, 2005; Seaman, M.N.J., Recycle your receptors with retromer, *Trends Cell Biol.* 15, 68-75, 2005; Lencer, W.I. and Blumberg, R.S., A passionate kiss, then run: exocytosis and recycling of IgG by FcRn, *Trends Cell Biol.* 15, 5-9, 2005.

## Exotoxicogenomics

Study of the expression of genes important in the adaptive responses important in adaptive responses to toxic exposures.

## Expansins

Family of plant proteins essential for acid-induced cell wall loosening. See Cosgrove, D.J., Relaxation in a high-stress environment: The molecular basis of extensible cell walls and cell enlargement, *Plant Cell* 9, 1031-1041, 1997.

## Expressed Sequence Tag

Usually an incomplete DAN sequence which can be “read” from either end of a gene fragment which is used as a “marker” or a “window” of gene presence in a genome; a short strand of DNA (approximately 200 base pairs long) which is usually unique to a specific cDNA and therefore can be used to identify genes and map their position in a genome. See Hartl, D.L., EST!EST!!EST!!!, *Bioessays* 18, 1021-1023, 1996; Gerhold, D. and Caskey, C.T., It's the genes! EST access to human genome content, *Bioessays* 18, 973-981, 1996; Wilcox, A.S., Khan, A., Hopkins, J.A., and Sikela J.M., Use of 3' untranslated sequences of human cDNA for rapid chromosome assignment and conversion to STS's: implications for an expression map of the genome, *Nucl. Acid Res.* 19, 1837-1842, 1991; Hoffman, M., Gene expression patterns in human and mouse B cell development, *Curr. Top. Microbiol. Immunol.* 294, 19-29, 2005; Robson, P., The maturing of the human embryonic stem cell transcriptome profile, *Trends Biotech.* 22, 609-612, 2004.

## Expression Profiling

The measurement or determination of DNA expression by the measurement RNA (transcriptomics); also used to refer to protein expression as determined by proteomic technology.

## Expressional Leakage

A concept where the functionally important expression of one gene can result in the ectopic expression of a neighboring gene resulting in apparent expression similarity between tissues. See de Marco, A. and de Marco, V., Bacteria co-transformed with recombinant proteins and chaperones cloned in independent plasmids are suitable for expression tuning, *J. Biotechnol.* 109, 45-52, 2004; Yanai, I., Korbil, J.O., Boue, S., McWeeney, S.K., Bork, P., and Lercher, M.J., Similar gene expression profiles do not imply similar tissue functions, *Trends Genet.* 22, 132-138, 2006.

## Families of Structurally Similar Proteins (FSSP)

A database based on three-dimensional comparisons of protein structures - <http://ekhidna.biocenter.helsinki.fi/dali/start> See Holm, L., Ouzounis, C., Sander, C., Tuparev, G., and Vriend, G., A database of protein structure families with common folding motifs, *Protein Sci.* 1, 1691-1698, 1992; Holm, L. and Sander, C., The FSSP database: fold classification based on structure alignment of proteins, *Nucleic Acids Res.* 24, 206-209, 1996; Notredame, C., Holm, L., and Higgins, D.G., COFFEE: an objective function for multiple sequence alignments, *Bioinformatics* 14, 407-422, 1998. Hadley, C. and Jones, D.T., A systematic comparison of protein structure classifications: SCOP, CATH and FSSP, *Structure* 7, 1099-1112, 1999; Getz, G., Vendruscolo, M., Sachs, D. and Domany, E., Automated assignment of SCOP and CATH protein structure classifications from FSSP scores, *Proteins* 46, 405-415, 2002; Edgar, R.C. and Sjolander, K., A comparison of scoring functions for protein sequence profile alignment, *Bioinformatics* 20, 1301-1308, 2004; Edgar, R.C. and Sjolander, K., COACH: profile-profile alignment of protein families using hidden Markov models, *Bioinformatics* 20, 1309-1318, 2004.

## Fenton Reaction

Ferrous ion-dependent formation of hydroxyl radical from hydrogen peroxide; can be coupled with the oxidation of hydroxyl function to ketone/aldehydes; see Fenton, H.J.H., Oxidation of certain organic acids in the presence of ferrous salts, *Proc. Chem. Soc.* 15, 224-228, 1899; Goldstein, S., Meyerstein, D., and Czapski, G., The Fenton reagents, *Free Rad. Biol. Med.* 15, 435-445, 1993; Odyuo, M.M. and Sharan, R.N., Differential DNA strand breaking abilities of ·OH and ROS generating radiomimetic chemicals and  $\gamma$ -rays: study of plasmid dNA, pMTa4, *in vitro*, *Free Rad. Res.* 39, 499-505, 2005. Stadtman, E.R., Role of oxidized amino acids in protein breakdown and stability, *Meth. Enzymol.* 258, 379-393, 1995.

## Fermentation

The controlled aerobic or anaerobic process where a product is produced by yeast, molds, or bacteria from a substrate. Historically, fermentation was used to describe the action of a leaven (yeast) on a carbohydrate (saccharine) as in the production of beers and wines or a dough such as in making bread. In biotechnology manufacturing, the term fermentation is used to describe the product of a biopharmaceutical by yeast or bacteria while the term cell culture is used to describe the use of animal cells or plants cells. See Wiseman, A., *Principles of Biotechnology*, Chapman and Hall, New York, NY, 1983; Sinclair, C.G., Kristiansen, B., and Bu'Lock, L.D., *Fermentation Kinetics and Modelling*, Open University Press, New York, NY, 1987; *The Encyclopedia of Bioprocess Technology*, ed. M.C. Flickinger and S.W. Drew, Wiley, New York, NY, 1999; *Molecular Biology and Biotechnology*, ed. J.M. Walker and R. Rapley, Royal Society of Chemistry, Cambridge, UK, 2000; *Fermentation Biotechnology*, ed. S.C. Badal, American Chemical Society, Washington, DC, 2003.

## Ferredoxin

A small protein which functions in the transport of electrons (reducing potential) in a variety of organisms. There are several classes of ferredoxins based on the nature of the chemistry of iron binding; Fe<sub>2</sub>S<sub>2</sub>, Fe<sub>3</sub>S<sub>4</sub>, Fe<sub>4</sub>S<sub>4</sub>. The iron is bound to cysteine residues in a cluster which also contains inorganic sulfur. See Mortenson, L.E., Nitrogen fixation: role of ferredoxin in anaerobic metabolism, *Annu. Rev. Microbiol.* 17, 115-138, 1963; Knaff, D.B., and Hirasawa, M., Ferredoxin-dependent chloroplast enzymes, *Biochim. Biophys. Acta* 1056, 93-125; Dai, S., Schwendtmayer, C., Johansson, K. *et al.*, How does light regulate chloroplast enzymes? Structure-function studies of the ferredoxin/thioredoxin system, *Q. Rev. Biophys.* 33, 67-108, 2000; Schurmann, P., Redox signaling in the chloroplast: the ferredoxin/thioredoxin system, *Antioxid. Redox. Signal.* 5, 69-78, 2003; Carrillo, N., and Ceccarelli, E.A., Open questions in ferredoxin-NADP<sup>+</sup> reductase catalytic mechanism, *Eur. J. Biochem.* 270, 1900-1915, 2003; Karplus, P.A. and Faber, H.R., Structural aspects of plant ferredoxin: NADP<sup>+</sup> oxidoreductases, *Photosynth. Res.* 81, 303-315, 2004; Glastas, P., Pinotsis, N., Efthymiou, G., *et al.*, The structure of the [2[4Fe-4S] ferredoxin from *Pseudomonas aeruginosa* at 1.32-Å resolution: comparison with other high-resolution structures of ferredoxins and contributing structural features to reduction potential values, *J. Biol. Inorg. Chem.* 11, 445-458, 2006; Eckardt, N.A., Ferredoxin-thioredoxin system plays a key role in plant response to oxidative stress, *Plant Cell* 18, 1782, 2006.

## Ferret Diameter

The longest chord of the project of a regular or irregular object as specific angles maximum, minimum, and average Ferret diameters can be determined by successive measurements. A value used in particle characterization; see M. Levin, Particle characterization – Tools and Methods, *Laboratory Equipment*, November, 2005.

## Fibrillation

The process of forming fibers from small, soluble polymeric materials. It is observed with amyloid fibrils in Alzheimer's disease and with proteins during pharmaceutical processing. The term fibrillation was used in the 19th century to describe the physical changes in blood before the elucidation of fibrinogen clotting. The term fibrillation is also used to describe physical changes in structural materials with ligaments and tendons. See Arvinte, T., Cudd, A., and Drake, A.F., The structure and mechanism of formation of calcitonin fibrils, *J.Biol.Chem.* 268, 6415-6422, 1993; Ghosh, P. and Smith, M., The role of cartilage-derived antigens, pro-coagulant activity and fibrinolysis in the pathogenesis of osteoarthritis, *Med.Hypotheses* 41, 190-194, 1993; Bronfman, F.C., Garrido, J., Alvarez, A., Morgan, C. and Inestrosa, N.C., Laminin inhibits amyloid-beta-peptide fibrillation, *Neurosci.Lett.* 218, 201-203, 1996; Martin, J.A. and Buckwalter, J.A., Roles of articular cartilage aging and chondrocytes senescence in the pathogenesis of osteoarthritis, *Iowa Orthop.J.* 21, 1-7, 2001; Seyferth, S. and Lee, G., Structural studies of EDTA-induced fibrillation of salmon calcitonin, *Pharm.Res.* 20, 73-80, 2003; Librizzi, F. and Rischel, C., The kinetic behavior of insulin fibrillation is determined by heterogeneous nucleation pathways, *Protein Sci.* 14, 3129-3134, 2005; Westermark, P., Aspects on human amyloid forms and their fibril polypeptides, *FEBS J.* 272, 5942-5949, 2005; Pedersen, J.S., Dikov, D., Flink, J.L., *et al.*, The changing face of glucagon fibrillation: structural polymorphism and conformational imprinting, *J.Mol. Biol.* 355, 501-523, 2006.

## Fibroblast Growth Factor

A group of peptide growth factors which regulate cell growth and proliferation.

## Fibroblast Growth Factor Receptor(s)

Receptor kinases which are activated by dimerization after ligand binding; Include FGFR1, FGFR2, FGFR3, FGFR4, FGFR5.

## FixJ-FixL

A two-component transcription regulatory system which is a global regulator of nitrogen fixation in *Rhizobium meliloti*, *Mol. Microbiol.* 5, 987-997, 1991. Sousa, F.H.S., Gonzalez, G. and Gilles-Gonzalez, M.-A., Oxygen blocks the reaction of FixL-FixJ complex with ATP but does not influence binding of FixJ or ATP to FixL, *Biochemistry* 44, 15359-15365, 2005.

## FLAG™

FLAG™ has the sequence of AspTyrLysAspAsp-AspLys which includes an enterokinase cleavage site. This epitope tag can be used as a fusion partner for the expression and purification of recombinant proteins. See Einhauer, A. and Jungbauer, A.,

The FLAG™ peptide, a versatile fusion tag for the purification of recombinant proteins, *J.Biochem.Biophys.Methods* 49, 455-465, 2001; Terpe, K., Overview of tag protein fusions: from molecular and biochemical fundamentals to commercial systems, *Appl. Microbiol.Biotechnol.* 60, 523-533, 2003; Lichty, J.J., Malecki, J.L., Agnew, H.D., Michelson-Horowitz, D.J., and Tan, S., Comparison of affinity tags for protein purification, *Protein Exp.Purif.* 41, 98-105, 2005.

## FLAP-Endonuclease (FEN; FEN-1)

An enzyme with endonuclease and exonuclease activity encoded by the *FEN1* gene. Cleaves branched DNA structures including the 5'-end of Okazaki fragments. See Kunkel, T.A., Resnick, M.A., and Gordenin, D.A., Mutator specificity and disease: looking over the FENce, *Cell* 88, 155-158, 1997; Shen, B., Qiu, J., Hosfield, D., and Tainer, J.A., Flap endonuclease homologs in archaeobacteria exist as independent proteins, *Trends Biochem.Sci.* 23, 171-173, 1998; Henneke, G., Freidrich-Heineken, E., and Hubscher, U., Flap endonuclease 1: a novel tumour suppressor protein, *Trends Biochem.Sci.* 28, 384-390, 2003; Kao, H.I. and Bambara, R.A., The protein components and mechanism of eukaryotic Okazaki fragment maturation, *Crit.Rev.Biochem.Mol. Biol.* 38, 433-452, 2003; Garg, P. and Burgers, P.M., DNA polymerases that propagate the eukaryotic DNA replication fork, *Crit.Rev.Biochem.Mol.Biol.* 40, 115-128, 2005; Olivier, M., The invader assay for SNF genotyping, *Mutat.Res.* 573, 103-110, 2005; Shen, B., Singh, B., Liu, R., *et al.*, Multiple but dissectible functions of FEN-1 nucleases in nucleic acid processing, genome stability and diseases, *Bioessays* 27, 717-729, 2005.

## Flux

Flux is the continuous flow of a substance. Flux can occur with electrons (Gutman, M., Electron flux through the mitochondrial ubiquinone, *Biochim.Biophys.Acta* 594, 53-84, 1980) and protons (Wang, J.H., Coupling of proton flux to the hydrolysis and synthesis of ATP, *Annu.Rev.Biophys.Bioeng.* 12, 21-34, 1983) as well and ions and other substances. Schwartz, A., Cell membrane Na<sup>+</sup>, K<sup>+</sup>-ATPase and sarcoplasmic reticulum: possible regulators of intracellular ion activity, *Fed.Proc.* 35, 1279-1282, 1976; Meissner, G., Monovalent ion and calcium ion fluxes in sarcoplasmic reticulum, *Mol.Cell.Biochem.* 55, 65-82, 1983; Jones, D.P., Intracellular diffusion gradients of O<sub>2</sub> and ATP, *Am.J.Physiol.* 250, C663-675, 1986; Hunter, M., Kawahara, K., and Giebisch, G., Calcium-activated epithelial potassium channels, *Miner.Electrolyte Metab.* 14, 48-57, 1988; , *Cation Flux across Biomembranes*, ed. Y. Mukohata, and L. Packer, Academic Press, New York, NY, 1979; Weir, E.K. and Hume, J.R., *Ion Flux in Pulmonary Vascular Control*, Plenum Press, New York, NY, 1993. Flux is defined in several ways: unidirectional influx is defined as the molar quantity of a solute passing across 1 cm<sup>2</sup> membrane in a unit period of time; unidirectional efflux is defined as the molar quantity of a solute crossing 1 cm<sup>2</sup> membrane outward from a cell in a unit period of time. Net flux is the difference between unidirectional influx and unidirectional efflux in a unit period of time. Understanding net flux is of importance in the design and interpretation of microdialysis studies (Schuck, V.J., Rinas, I., and Derendorf, H., In vitro microdialysis sample of docetaxel, *J.Pharm.Biomed.Anal.* 36, 807-813, 2004; Cano-Cebrian, M.J., Zornoza, T., Polache, A., and Granero, L., Quantitative in vivo microdialysis in pharmacokinetic studies: some reminders,

*Curr. Drug. Metab.* 6, 83-90, 2005; Abrahamsson, P. and Winso, O., An assessment of calibration and performance of the microdialysis system, *J. Pharm. Biomed. Anal.* 39, 730-734, 2005.

## Focal Adhesion

A membrane area for cellular adhesion via actin filaments to the extracellular matrix/fibronectin resulting from the clustering of integrins. The interaction with fibronectin results in the formation of fibrillar adhesions considered to be more mature structures. Other intracellular proteins such as vincullin and focal adhesion kinase (FAK) are recruited to the actin cytoskeleton structure. See Otey, C.A. and Burridge, K., Patterning of the membrane cytoskeleton by the extracellular matrix, *Semin. Cell Biol.* 1, 391-399, 1990; Arikama, S.K., Integrins in cell adhesion and signaling, *Hum. Cell* 9, 181-186, 1996; Bershadsky, A.D. Balaban, N.Q., and Geiger, B., Adhesion-dependent cell mechanosensitivity, *Annu. Rev. Cell Dev. Biol.* 19, 677-695, 2003; Wozniak, M.A., Modzelewska, K., Kwong, L., and Keeley, P.J., Focal adhesion regulation of cell behavior, *Biochim. Biophys. Acta* 1692, 103-119, 2004; Small, J.V. and Resch, G.P., The comings and goings of actin: coupling protrusion and retraction in cell motility, *Curr. Opin. Cell Biol.* 17, 517-523, 2005; Wu, M.H., Endothelial focal adhesions and barrier function, *J. Physiol.* 569, 359-366, 2005; Cohen, L.A. and Guan, J.L., Mechanisms of focal adhesion kinase regulation, *Curr. Cancer Drug Targets* 5, 629-643, 2005; Romer, L.H., Birukov, K.G., and Garcia, J.G., Focal adhesions: paradigm for a signaling nexus, *Circ. Res.* 98, 606-616, 2006; Legate, K.R., Montañez, O. and Fassler, R., ILK, PINCH and parvin: the tIPP of integrin signalling, *Nat. Rev. Mol. Cell. Biol.* 7, 20-31, 2006.

## FokI Restriction endonuclease

A type II restriction endonuclease isolated from *Flavobacterium okeanokoites* which has been used to identify DNA polymorphisms. There has been extensive use in the study of the vitamin D receptor gene (VDR gene). See Sugisaki, H. and Kanazawa, S., New restriction endonucleases from *Flavobacterium okeanokoites* (FokI) and *Micrococcus luteus* (MluI), *Gene* 16, 73-78, 1981; Kato, A., Yakura, K., and Tanifuji, S., Sequence analysis of *Vicia faba* repeated DNA, the FokI repeat element, *Nucleic Acids Res.* 24, 6415-6426, 1984; Kita, K., Kotani, H., Sugisaki, H., and Tanami, M., The foci restriction-modification system. I. Organization and nucleotide sequences of the restriction and modification genes, *J. Biol. Chem.* 264, 5751-5756, 1989; Posfai, G. and Szybalski, W., A simple method for locating methylated based in DNA using class-IIIS restriction enzymes, *Gene* 74, 179-181, 1988; Aggarwal, A.K. and Wah, D.A., Novel site-specific DNA endonucleases, *Curr. Opin. Struct. Biol.* 8, 19-25, 1998; Kovall, R.A. and Matthews, B.W., Type II restriction endonucleases: structural, functional and evolutionary relationships, *Curr. Opin. Chem. Biol.* 3, 578-583, 1999; Akar, A., Orkunoglu, F.E., Ozata, M., Sengul, A., and Gur, A.R., Lack of association between vitamin D receptor FokI polymorphism and alopecia areata, *Eur. J. Dermatol.* 14, 156-158, 2004; Guy, M., Lowe, L.C., Bretherton-Watt, D., et al., Vitamin D receptor gene polymorphisms and breast cancer risk, *Clin. Cancer Res.* 10, 5472-5481, 2004; Claassen, M., Nouwen, J., Fang, Y., et al., *Staphylococcus aureus* nasal carriage is not associated with known polymorphism in the vitamin D receptor gene, *FEMS Immunol. Med. Microbiol.* 43, 173-176, 2005; Bolu, S.E., Orkunoglu Suer, F.E., Deniz, F., et al., The vitamin D receptor foci start codon polymorphism and bone mineral density in male hypogonadotropic hypogonadism, *J. Endocrinol. Invest.* 28, 810-814, 2005.

## Foldamers

Single chain polymers which can adopt secondary structure in solution and thus mimic proteins, nucleic acids, and polysaccharides; polymeric backbones which have well-defined and predictable folding properties in the solvent of choice. See Appella, D.H., Christianson, L.A., Klein, D.A., et al., Residue-based control of helix shape in beta-peptide oligomers, *Nature* 387, 381-384, 1997; Tanatani, A., Mio, M.J., and Moore, J.S., Chain length-dependent affinity of helical foldamers for a rod-like guest, *J. Amer. Chem. Soc.* 123, 1792-1793, 2001; Cubberley, M.S. and Iverson, B.L., Models of higher-order structure: foldamers and beyond, *Curr. Opin. Chem. Biol.* 5, 650-653, 2001; Hill, D.J., Mio, M.J., Prince, R.B., Hughes, T.S. and Moore, J.S., A field guide to foldamers, *Chem. Rev.* 101, 393-4012, 2001; Martinek, T.A. and Fulop, F., Side-chain control of beta-peptide secondary structures, *Eur. J. Biochem.* 270, 3657-3666, 2003; Sanford, A.R., Yamato, K., Yang, X., Yuan, L., Han, Y., and Gong, B., Well-defined secondary structures, *Eur. J. Biochem.* 271, 1416-1425, 2004; Cheng, R.P., Beyond de novo protein design—de novo design of non-natural folded oligomers, *Curr. Opin. Struct. Biol.* 14, 512-520, 2004; Stone, M.T., Heemstra, J.M., and Moore, J.S., The chain-length dependence test, *Acc. Chem. Res.* 39, 11-20, 2006; Schmitt, M.A., Choi, S.H., Guzei, I.A., and Gellman, S.H., New helical foldamers: heterogeneous backbones with 1:2 and 2:1 alpha:beta-amino acid residue patterns, *J. Am. Chem. Soc.* 128, 4538-4539, 2006.

## Fragnomics

The use of smaller molecules in the drug discovery process; Zartler, E.R. and Shapiro, M.J., Fragnomics: fragment-based drug discovery, *Curr. Opin. Chem. Biol.* 9, 366-370, 2005.

## Frass

Frass is debris or excrement produced by insects. This material is thought to be involved with role of cockroaches in the development of asthma (See Page, K., Hughes, V.S., Bennett, G.W., and Wong, H.R., German cockroach proteases regulate matrix metalloproteinase-9 in human bronchial epithelial cells, *Allergy* 61, 988-995, 2006.

## Free Radical/radical

A molecule containing an unpaired electron can be electrically neutral. Free radicals may be created by the hemolytic cleavage of a precursor molecule free radicals can be formed by thermolytic cleavage, photolysis (ultraviolet light photolysis of hydrogen peroxide to form hydroxyl radical), radiolysis (ionizing radiation of water to form hydroxyl radical) or by homolytic cleavage with the participation of another molecule (i.e. Fenton Reaction). Perkins, J., *Radical Chemistry: The Fundamentals*, Oxford University Press, Oxford, United Kingdom, 2000.

## FRET (Fluorescence Resonance Energy Transfer)

A technique for assaying the proximity of region by observed energy transfer between fluorophores. A concept similar to fluorescence quenching. With two-photon excitation, studies can be extended to the study of *in vivo* interactions with microscopy. See also BRET. See Milligan, G. and Bouvier, M., Methods to monitor the quaternary structure of G protein-coupled receptors,

*EASEB J.* 272, 2914-2925, 2005; Rasnik, I., McKinney, S.A., and Ha, T., Surfaces and orientations: much to FRET about? *Acc. Chem. Res.* 38, 542-548, 2005; Gertler, A., Biener, E., Ramamujan, K.V., Dijiane, J., and Herman, B., Fluorescence resonance energy transfer (FRET) microscopy in living cells as a novel tool for the study of cytokine action, *J.Dairy Res.* 72, Spec. No., 14-19, 2005; Cudakov, D.M., Lukyanov, S. and Lukyanov, K.A., Fluorescent proteins as a toolkit for in vivo imaging, *Trends Biotechnol.* 23, 605-613, 2005; Zal, T. and Gascoigne, N.R., Using live FRET imaging to reveal early protein-protein interactions during T cell activation, *Curr.Opin.Immunol.* 16, 674-683, 2004.

## Freund's Adjuvant

A mixture of killed/lyophilized *Mycobacterium bovis* or *Mycobacterium tuberculosis* cells and oil resulting in an emulsion (referred to as Complete Freund's adjuvant) used with an antigen to improve the immune response (antibody formation secondary to B-cell activation). Incomplete Freund's adjuvant does not contain the bacterial cells and is used to avoid an inflammatory response. See White, R.G., Factor affecting the antibody response, *Br.Med.Bull.* 19, 207-213, 1963; White, R.G., Antigen adjuvants, *Mod.Trends Immunol.* 2, 28-52, 1967; Myrvik, Q.N., Adjuvants, *Ann.N.Y.Acad.Sci.* 221, 324-330, 1974; Osebold, J.W., Mechanisms for action by immunologic adjuvants, *J.Am.Vet.Med.Assoc.* 181, 983-987, 1982; Warren, H.S., Vogel, F.R., and Chedid, L.A., Current status of immunological adjuvants, *Annu. Rev.Immunol.* 4, 369-388, 1986; Claassen, E., de Leeuw, W., de Greeve, P., Hendriksen, C., and Boersma, W., Freund's complete adjuvant: an effective but disagreeable formula, *Res.Immunol.* 143, 478-483, 1992; Billiau, A. and Matthys, P., Modes of action of Freund's adjuvants in experimental models of autoimmune diseases, *J.Leukoc.Biol.* 70, 849-860, 2001; Cachia, P.J., Kao, D.J., and Hodges, R.S., Synthetic peptide vaccine development: measurement of polyclonal antibody affinity and cross-reactivity using a new peptide capture and release system for surface plasmon resonance spectroscopy, *J.Mol.Recog.* 17, 540-557, 2004; Stills, H.F., Jr., Adjuvants and antibody production: dispelling the myths associated with Freund's complete and other adjuvants, *ILARJ.* 46, 280-293, 2005; Miller, L.H., Saul, A., and Mahanty, S., Revisiting Freund's incomplete adjuvant for vaccines in the developing world, *Trends Paristol.* 21, 412-414, 2005.

## Functional Genomics

Functional genomics refers to establishing a verifiable link between gene expression and cell/organ/tissue function/dysfunction. Functional genomics refers to establishing a verifiable link between gene expression and cell/organ/tissue function/dysfunction. See Evans, M.J., Carlton, M.B., and Russ, A.P., Gene trapping and functional genomics, *Trends Genet.* 13, 370-374, 1997; Schena, M., Heller, R.A., Thieriault, T.P., et al., Microarrays: biotechnology's discovery platform for functional genomics, *Trends Biotechnol.* 16, 301-306, 1998; Holtorf, H., Guitton, M.C., and Reski, R., Plant functional genomics, *Naturewissenschaften* 89, 235-249, 2002; Bader, G.D., Heilbut, A., Andrews, B., et al., Functional genomics and proteomics: charting a multidimensional map of the yeast cell, *Trends Cell Sci.Biol.* 13, 344-356, 2003; Kemmeren, P. and Holstege, F.C., Integrating functional genomics data, *Biochem.Soc.Trans.* 31, 1484-1487, 2003; Werner, T., Proteomics and regulomics: the yin and yang of functional genomics, *Mass Spectrom.Rev.* 23, 25-33, 2004; Brunner, A.M., Busov, V.B., and Strauss, S.H., Poplar genome sequence: functional

genomics in an ecologically dominant plant species, *Trends Plant Sci.* 9, 49-56, 2004; Hughes, T.R., Robinson, M.D., Mitsakakis, N., and Johnston, M., The promise of functional genomics: completing the encyclopedia of a cell, *Curr.Opin.Microbiol.* 7, 546-554, 2004; Kramer, R. and Cohen, D., Functional genomics to new drug targets, *Nat.Rev.Drug Discov.* 3, 965-972, 2004; Vanhecke, D. and Janitz, M., Functional genomics using high-throughput RNA interference, *Drug Discov.Today* 10, 205-212, 2005; Sauer, S., Lange, B.M., Gobom, J., et al., Miniaturization in functional genomics and proteomics, *Nat.Rev.Genet.* 6, 465-476, 2005; Stoeckert, C.J., Jr., Functional genomic databases on the web, *Cell Microbiol.* 7, 1053-1059, 2005; Foti, M., Grannuci, F., Pelizzola, M., et al., Dendritic cells in pathogen recognition and induction of immune response: a functional genomics approach, *J.Leukoc. Biol.* 79, 913-916, 2006; Hunt, S.P. and Livesey, R., *Functional Genomics: A Practical Approach*, Oxford University Press, Oxford, UK, 2000; *Functional Genomics Methods and Protocols*, ed. ## Functional Proteomics

A broad area of enquiry encompassing the study of the function of proteins in the proteome, study of changes in protein expression within the proteome, and the use of reactive chemical probes to identify enzymes in the proteome. This short list is not meant to be wholly inclusive. See Lawrence, D.S., Functional proteomics: large-scale analysis of protein kinase activity, *Genome Biol.* 2, REVIEWS1007, 2001; Famulok, M., Blind, M., and Mayer, G., Intramers as promising new tools in functional proteomics, *Chem.Biol.* 8, 931-939, 2001; Guengerich, F.P., Functional genomics and proteomics applied to the study of nutritional metabolism, *Nutr.Rev.* 59, 259-263, 2001; Strosberg, A.D., Functional proteomics to exploit genome sequences, *Cell.Mol.Biol.* 47, 1295-1299, 2001; Yanagida, M., Functional proteomics: current achievements, *J.Chromatog.B.Anal.Technol.Biomed.Life Sci.* 771, 89-106, 2002; Hunter, T.C., Andon, N.L., Koller, A., Yates, J.R., and Haynes, P.A., *J.Chromatogr.B.Analyt.Technol.Biomed.Life Sci.* 782, 165-181, 2002; Graves, P.R. and Haystead, T.A., A functional proteomics approach to signal transduction, *Recent Prog. Horm.Res.* 58, 1-14, 2003; Ilag, L.L., Functional proteomic screens in therapeutic protein drug discovery, *Curr.Opin.Mol.Ther.* 7, 538-542, 2005; Wagner, V., Gessner, G., and Mittag, M., Functional proteomics: a promising approach to find novel components of the circadian system, *Chronobiol.Int.* 22, 403-415, 2005; Monti, M., Orru, S., Pagnozzi, D., and Pucci, P., Functional proteomics, *Clin.Chim.Acta* 357, 140-150, 2005.

## Furin

Furin is a subtilisin-like regulatory protease (subtilisin-like pro-protein convertases located in the trans-Golgi network which functions in processing precursor proteins in the secretory pathway. See Molloy, S.S., Bresnahan, P.A., Leppla, S.H. et al., Human furin is a calcium-dependent serine endoprotease that recognizes the sequence Arg-X-X-Arg and efficiently cleaves anthrax protective antigen, *J.Biol.Chem.* 267, 16396-16402, 1992; Yanagita, M., Hoshimo, H., Nakayama, K., and Takeuchi, T., Processing of mutated proteins with tetrabasic cleavage sites to mature insulin reflects the expression of furin in nonendocrine cell lines, *Endocrinology* 133, 639-644, 1993; Brennan, S.O. and

Nakayama, K., Furin has the proalbumin substrate specificity and serpin inhibitor properties of an in situ convertase, *FEBS Lett.* 338, 147-151, 1994; Roebroek, A.J., Creemers, J.W., Ayoubi, T.A., and Van de Ven, W.J., Furin-mediated proprotein processing activity: involvement of negatively charged amino acid residues in the substrate binding site, *Biochimie* 76, 210-216, 1994; Denault, J.B. and Leduc, R., Furin/PACE/SPC1: a convertase involved in exocytic and endocytic processing of precursor proteins, *FEBS Lett.* 379, 113-116, 1996; Nakayama, K., Furin: a mammalian subtilisin/Kex2p-like endoprotease involved in processing of a wide variety of precursor proteins, *Biochem.J.* 327, 625-635, 1997; Rockwell, N.C., Krysan, D.J., Komiya, T., and Fuller, B.S., Precursor processing by kex2/furin proteases, *Chem. Rev.* 102, 4525-4548, 2002; Fugere, M., Limperis, P.C., Beaulieu-Audy, V., Gagnon, F., et al., Inhibitory potency and specificity of subtilisin-like pro-protein convertase (SPC) prodomains, *J.Biol.Chem.* 277, 7648-7656, 2002; Rockwell, N.C. and Thorner, J.W., The kindest cuts of all: crystal structures of kex2 and furin reveal secrets of precursor processing, *Trends Biochem.Sci.* 29, 80-87, 2004; The first proprotein processing proteins was described as Kex2 protease(kexin) in *Saccharomyces cerevisiae* (Leibowitz, M.J. and Wickner, R.B., A chromosomal gene required for killer plasmid expression, mating, and spore maturation in *Saccharomyces cerevisiae*, *Proc.Natl.Acad.Sci.USA* 73, 2061-2065, 1976; Rogers, D.T., Saville, D., and Bussey, H., *Saccharomyces cerevisiae* expression mutant kex2 has altered secretory proteins and glycoproteins, *Biochem.Biophys.Res. Commun.* 90, 187-193, 1979; Julius, D. Brake, A., Blair, L., et al., Isolation of the putative structural gene for the lysine-arginine-cleaving endopeptidase required for processing of yeast prepro-alpha-factor, *Cell* 37, 1075-1089, 1984). Furin is important for the secretion of recombinant proteins in mammalian cell lines (Mark, M.R., Lokker, N.A., Zioncheck, T.F., et al., Expression and characterization of hepatocyte growth factor receptor-IgG fusion proteins: effects of mutations in the potential proteolytic cleavage site on processing and ligand binding, *J.Biol.Chem.* 267, 26166-26171, 1992; Bristol, J.A., Freedman, S.J., Furie, B.C., and Furie, B., Profactor IX: the propeptide inhibits binding to membrane surfaces and activation by factor IXa., *Biochemistry* 33, 14136-14143, 1994; Groskreutz, D.J., Sliwkowski, M.X., and Gorman, C.M., Genetically engineering proinsulin constitutively processed and secreted as mature, active insulin, *J.Biol. Chem.* 269, 6241-6245, 1994; Lind, P., Larsson, K., Spira, J., et al., Novel forms of B-domain deleted recombinant factor VIII molecules. Construction and biochemical characterization, *Eur.J.Biochem.* 232, 19-27, 1995; Ayoubi, T.A., Meulemans, S.M. Roebroek, A.J., and Van de Ven, W.J., Production of recombinant proteins in Chinese hamster ovary cells overexpressing the subtilisin-like proprotein converting enzyme furin, *Mol.Biol. Rep.* 23, 87-95, 1996; Chiron, M.F., Fryling, C.M., and Fitzgerald, D., Furin-mediated cleavage of Pseudomonas exotoxin-derived chimeric toxins, *J.Biol.Chem.* 272, 31707-31711, 1997. Furins are functionally related to secretases in being protein precursor processing enzymes (Anders, L., Mertins, P., Lammich, S., et al., Furin-, ADAM 10-, and  $\gamma$ -secretase-mediated cleavage of a receptor tyrosine phosphatase and regulation of  $\beta$ -catenin's transcriptional activity, *Mol.Cell.Biol.* 26, 3917-3924, 2006). There has been some work on the possible role of furin in the processing of  $\beta$ -secretase (Bennett, B.D., Denis, P., Haniu, M., et al., A furin-like convertase mediates propeptide cleavage of BACE, the Alzheimer's  $\beta$ -secretase, *J.Biol.Chem.* 275, 37712-37717, 2000; Creemers, J.W.M., Dominguez, D.I., Plets, E., et al., Processing of  $\beta$ -secretase by furin and others members of the proprotein

convertase family, *J.Biol.Chem.* 276, 4211-4217, 2001; Pinnix, I., Council, J.E., Roseberry, B., et al., Convertases other than furin cleave  $\beta$ -secretase to its mature form, *FASEB J.* 15, 1810-1812, 2001.

## Gamma( $\gamma$ )-secretase

A membrane-associated regulatory protease responsible for the cleavage of amyloid precursor protein and notch protein. Gamma( $\gamma$ )-secretase is composed of four subunits, presenilin, nicastrin, Aph-1 and Pen-2. Presenilin is responsible for the catalytic gamma( $\gamma$ )-secretase activity and nicastrin and Aph-2 have a function in substrate recognition and complex stabilization while Pen-2 assists in catalytic function. Gamma( $\gamma$ )-secretase is a therapeutic treatment for Alzheimer's disease. See Mundy, D.L., Identification of the multicatalytic enzyme as a possible  $\gamma$ -secretase for the amyloid precursor protein, *Biochem.Biophys.Res. Commun.* 204, 333-341, 1994; Wolfe, M.S. and Haass, C., The role of presenilins in gamma-secretase activity, *J.Biol.Chem.* 276, 5413-5416, 2001; Sisodia, S.S. and St. George-Hyslop, P.H.,  $\gamma$ -Secretase, Notch,  $\alpha\beta$  and Alzheimer's disease: Where do the presenilins fit in?, *Nat.Rev.Neurosci.* 3, 281-290, 2002; Kimberly, W.T. and Wolfe, M.S., Identify and function of gamma-secretases, *J.Neurosci.Res.* 74, 353-360, 2003; Iwatsubo, T., The gamma secretase complex: machinery for intramembrane proteolysis, *Curr.Opin.Neurobiol.* 14, 379-383, 2004; Raemakers, T., Esselens, C., and Annaert, W., Presenilin 1: more than just gamma-secretase, *Biochem.Soc.Trans.* 33, 559-562, 2005; De Strooper, B., Nicastrin: gatekeeper of the gamma-secretase complex, *Cell* 122, 318-320, 2005; Churcher, I., and Beher, D., Gamma-secretase as a therapeutic target for the treatment of Alzheimer's disease, *Curr.Pharm.Des.* 11, 3363-3382, 2005; Barten, D.M., Meredith, J.E., Jr., Zaczek, R., et al., Gamma-secretase inhibitors for Alzheimer's disease: balancing efficacy and toxicity, *Drugs R & D* 7, 87-97, 2006. Wolfe, M.S., The  $\gamma$ -secretase complex: membrane-embedded proteolytic ensemble, *Biochemistry* 45, 7931-7939, 2006.

## G protein

A heteromeric protein which functions in signal transduction via modulation by G protein-coupled receptors (GPCRs). See Spiegel, A.M. and Downs, R.W., Jr., Guanine nucleotides: key regulators of hormone receptor-adenylate cyclase, *Endocr.Rev.* 2, 275-305, 1981; Cooper, D.M. and Londos, C., GTP-stimulation and inhibition of adenylate cyclase, *Horiz.Biochem.Biophys.* 6, 309-333, 1982; Poste, G., New insights into receptor regulation, *J.Appl. Physiol.* 57, 1297-1305, 1984; Cuatrecasas, P., Hormone receptors, membrane phospholipids, and protein kinases, *Harvey Lect.* 80, 89-128, 1984-1985; Neer, E.J., Guanine nucleotide-binding proteins involved in transmembrane signaling, *Symp.Fundam. Cancer Res.* 39, 123-136, 1986; Spiegel, A.M., Signal transduction by guanine nucleotide binding proteins, *Mol.Cell.Endocrinol.* 49, 1-16, 1987; Bockaert, J., Homburger, V., and Rouot, B., GTP binding proteins: a key role in cellular communication, *Biochimie* 69, 329-338, 1987; Zhang, Z., Melia, T.J., He, F., et al., How a G protein binds a membrane, *J.Biol.Chem.* 279, 33937-33945, 2004; Gavi, S., Shumay, E., Wang, H.Y., and Malbon, C.C., G-protein-coupled receptors and tyrosine kinases: crossroads in cell signaling and regulation, *Trends Endocrinol.Metab.* 17, 48-54, 2006; Sato, M., Blumer, J.B., Simon, V., and Lanier, S.M., Accessory proteins for G proteins: partners in signaling, *Annu.Rev.Pharmacol. Toxicol.* 46, 151-187, 2006; Houslay, M.D. and Milligan, G., *G-Proteins as Mediators of Cellular Signaling Processes*, Wiley, Chichester, UK, 1990; Naccache, P.H., *G Proteins and Calcium*

*Signaling*, CRC Press, Boca Raton, FL, 1990; Johnson, R.A. and Corbin, J.D., *Adenyl Cyclase, G Proteins, and Guanylyl Cyclase*, Academic Press, San Diego, CA, 1991; Ravi, I., *Heterotrimeric G Proteins*, Academic Press, San Diego, CA, 1994; Watson, S.P., and Arkininstall, S., *The G-Protein Linked Receptor Factbooks*, Academic Press, London, UK, 1994; Siderovski, D.P., *G Proteins and Calcium Signaling*, Elsevier Academic Press, Amsterdam, Netherlands, 2004.

## G-Protein Coupled Receptor (GPCR)

A membrane receptor which is functional linked to the activation of a trimeric G protein complex characterized by the presence of seven transmembrane segments.

## G $\alpha$ Protein

The alpha-subunit of the heterotrimeric G protein which separates into a G $\alpha$ -protein-GTP complex when GTP replaces GDP. See Albert, P.R. and Robillard, L., G protein specificity: traffic direction required, *Cell Signalling* 14, 407-418, 2002; Kurose, H., G $\alpha_{12}$  and G $\alpha_{13}$  as key regulatory mediator in signal transduction, *Life Sci.* 74, 155-161, 2003; Kostenis, E., Waelbroeck, M., and Milligan, G., Techniques: promiscuous G $\alpha$  proteins in basic research and drug discovery, *Trends Pharmacol.Sci.* 26, 595-602, 2005; Herrman, R., Heck, M., Henklein, P., *et al.*, Signal transference from GPCRs to G proteins: role of the G $\alpha$  N-terminal region in rhodopsin-transducin coupling, *J.Biol.Chem.* 281, 30234-30241, 2006.

## Gelsolin; Gelsolin-like domains

Gelsolin is signature protein for a family of protein which interact with actin and influence the structure of the cytoskeleton. Gelsolin is a calcium-dependent actin-binding protein that modulates actin filament length. See Yin, H.L., Hartwig, J.H., Maruyama, K., and Stossel, T.P., Ca<sup>2+</sup> control of actin filament length. Effects of macrophage gelsolin on actin polymerization, *J.Biol.Chem.* 256, 9693-9697, 1981; Matasudaira, P., Jakes, R., and Walker, J.E., A gelsolin-like Ca<sup>2+</sup>-dependent actin-binding domain in villin, *Nature* 315, 248-250, 1985; Dixon, R.A.F., Kobilka, B.K., Strader, D.J., Cloning of the gene and cDNA for mammalian  $\beta$ -adrenergic receptor and homology with rhodopsin, *Nature* 321, 75-79, 1986; Libert, F., Parmentier, M., Lefort, A., *et al.*, Selective amplification and cloning of four new members of the G protein-coupled receptor family, *Science* 244, 569-572, 1989; Yu, F.X., Zhou, D.M., and Yin, H.L., Chimeric and truncated gCap39 elucidate the requirements for actin filament severing and end capping by the gelsolin family of proteins, *J.Biol.Chem.* 266, 19269-19275, 1991; Wen, D., Corina, K., Chow, E.P., *et al.*, The plasma and cytoplasmic forms of human gelsolin differ in disulfide structure, *Biochemistry* 35, 9700-9709, 1996; Isaacson, R.L., Weeds, A.G., and Fersht, A.R., Equilibria and kinetics of folding of gelsolin domain 2 and mutants involved in familial amyloidosis-Finnish type, *Proc.Natl.Acad.Sci.USA* 96, 11247-11252, 1996; Liu, Y.T. and Yin, H.L., Identification of the binding partners for flightless I, A novel protein bridging the leucine-rich repeat and the gelsolin superfamilies, *J.Biol.Chem.* 273, 7920-7927, 1998; Benyamini, H., Gunasekaran, K., Wolfson, H., and Nussinov, R., Conservation and amyloid formation: a study of the gelsolin-like family, *Proteins* 51, 266-282, 2003; Uruno, T., Remmert, K., and Hammer, J.A., 3rd., CARMIL is a potent capping protein antagonist: identification of a conserved CARMIL domain that inhibits the activity of capping

protein and uncaps capped actin filaments, *J.Biol.Chem.* 281, 10635-10650, 2006.

## General Transcription Factors

These are protein cofactors for RNA polymerase II which are required for the function of the basal transcription apparatus. The basal apparatus can be described as the functional unit required for the accurate transcription of DNA and is directed to the 5'-end of a transcriptional unit by the core promoter. See Zheng, X.M., Moncollin, V., Egly, J.M., and Chambon, P., A general transcription factor forms a stable complex with RNA polymerase B(II), *Cell* 50, 361-368, 1987; DeJong, J., Bernstein, R. and Roeder, R.G., Human general transcription factor TFIIA: characterization of a cDNA encoding the small subunit and requirement for basal and activated transcription, *Proc.Natl.Acad.Sci. USA* 92, 3313-3317, 1995; Zaid, A., Li, R., Luciakova, K., *et al.*, On the role of the general transcription factor Sp1 in the activation and repression of diverse mammalian oxidative phosphorylation genes, *J.Bioenerg.Biomembr.* 31, 129-135, 1999; Smale, J.T., Core promoter architecture for eukaryotic protein-coding genes, in *Transcription: Mechanism and Regulation*, ed. R.C. Conoway and J.W. Conoway, Raven Press, New York, NY, Chapter 5, pps. 63-81, 1999; Serizawa, H., Conoway, J.W. and Conoway, R.C., Transcriptional initiation by mammalian RNA polymerase II, in *Transcription: Mechanism and Regulation*, ed. R.C. Conoway and J.W. Conoway, Raven Press, New York, NY, Chapter 3, pps. 27-43, 1999; Pugh, B.R., RNA polymerase II transcription machinery, in *Transcription Factors*, ed. J. Locker, Bios/Academic Press, Oxford, UK, Chapter 1, pp. 1-16, 2001; Reid, J., Murray, I., Watt, K., *et al.*, The androgen receptor interacts with multiple regions of the large subunit of general transcription factor TFIIF, *J.Biol.Chem.* 277, 41247-41253, 2002; Vullhorst, D. and Buonanno, A., Characterization of general transcription factor 3, a transcription factor involved in slow muscle-specific gene expression, *J.Biol.Chem.* 278, 8370-8379, 2003; Takagi, Y. and Kornberg, R.D., Mediator as a general transcription factor, *J.Biol.Chem.* 281, 80-89, 2006; Choudhry, M.A., Ball, A., and McEwan, I.J., The role of the general transcription factor TFIID in androgen receptor-dependent transcription, *Mol.Endocrinol.*, 20, 2052-2061, 2006.

## Generic Drug

A generic drug is the same as a brand name drug is dosage, safety, and efficacy. Prior to approval, a generic drug must demonstrate bioequivalence or therapeutic equivalence.

## Gene Expression Domain

A genomic region that contains a gene and all of the *cis*-acting elements that are required to obtain the homeostatic level and timing of gene expression *in vivo*. Gene expression domains are generally defined by their ability to function independently of the site of integration into a transgene.

## General Transcription Factors

A group of *trans*-acting factors which have a central role in the initiation of transcription by RNA polymerase II (pol II). The components are likely similar to the earlier described basal transcription factors. Greenblatt, J., RNA polymerase-associated transcription factors, *Trends Biochem.Sci.* 16, 408-411, 1991; Corden, J.L., RNA polymerase II transcription cycles, *Curr Opin.*

*Genet.Dev.* 3, 213-218, 1993; Travers, A., Transcription: building an initiation machine, *Curr.Biol.* 6, 401-403, 1996; Reese, J.C., Basal transcription factors, *Curr.Opin.Genet.Dev.* 13, 114-118, 2003; Asturias, F.J., RNA polymerase II structure, and organization of the preinitiation complex, *Curr.Opin.Struct.Biol.* 14, 121-129, 2004; Boeger, H., Bushnell, D.A., Davis, R., *et al.*, Structural basis of eukaryotic gene transcription, *FEBS Lett.* 579, 899-903, 2005; Szutarisz, H., Dillon, N., and Tora, L., The role of enhancers as centres for general transcription factor recruitment, *Trends Biochem.Sci.* 30, 593-599, 2005; Gross, P. and Oelgeschlager, T., Core promoter-selective RNA polymerase II transcription, *Biochem. Soc.Symp.* (73), 225-236, 2006.

## Generic Drug

A generic drug is the same as a brand name drug is dosage, safety, strength, administration, quality, and intended use. The suitability of a generic drug is based on "therapeutic equivalence." By law, a generic product must contain the identical amounts of the same active ingredient(s) as the brand name product. See Verbeeck, R.K., Kanfer, I., and Walker, R.B., Generic substitution: the use of medicinal products containing different salts and implications for safety and efficacy, *Eur.J.Pharm.Sci.* 28, 1-6, 2006; Devine, J.W., Cline, R.R., and Farley, J.F., Follow-on biologics: competition in the biopharmaceutical marketplace, *J.Am.Pharm.Assoc.* 46, 193-201, 2006.

## Genome

The complete gene complement of any organism, contained in a set of chromosomes in eukaryotes, a single chromosome in bacteria, or a DNA or RNA molecule in viruses; the complete set of genes inside the cell or virus. Singer, M. and Berg, P., *Genes & Genomes: A Changing Perspective*, University Science Book, Mill Valley, CA, USA, 1991; Murray, T.H. and Rothstein, R.A., *The Human Genome Project and the Future of Health Care*, Indiana University Press, Bloomington, Indiana, USA, 1996; Brown, T.A., *Genome*, Bios Scientific Publishers/Wiley-Liss, New York, NY, 1999; Ridley, M., *Genome: The Autobiography of a Species of 23 Chapters*, HarperCollins, New York, NY, 1999.

## Genome-Based Proteomics

Gene-based analysis of the proteome; analytical strategies based on the knowledge of the genome. See Rosamond, J. and Allsop, A., Harnessing the power of the genome in the search for new antibiotics, *Science* 287, 1973-1976, 2000; Agaton, C., Uhlen, M., and Hober, S., Genome-based proteomics, *Electrophoresis* 25, 1280-1288, 2004; Wisz, M.S., Suarez, M.K., Holmes, M.R., and Giddings, M.C., GFSWeb: a web tool for genome-based identification of proteins from mass spectrometric samples, *J.Proteome Res.* 3, 1292-1295, 2004; Romero, P., Wagg, J., Green, M.L., *et al.*, Computational prediction of human metabolic pathways from the complete human genome, *Genome Biol.* 6, R2, 2005; Ek, S., Adreasson, U., Hober, S., *et al.*, From gene expression analysis to tissue microarrays: a rational approach to identify therapeutic and diagnostic targets in lymphoid malignancies, *Mol.Cell. Proteomics* 5, 1072-1081, 2006.

## Genomic Databases

See Baxevaris, A.D., Using genomic databases for sequence-based biological discovery, *Molec.Med.* 9, 185-192, 2003.

## Genomics

The study of the structure and function of the genome, including information about the sequence, mapping, and expression, and how genes and their products work in the organism; the study of the genetic composition of organisms.

## Genotype

The internally coded, inheritable information carried by all living organisms; the genetic constitution of an organism.

## Glass/Glasses

A large inhomogenous class of materials with highly variable mechanical and optical properties that solidify from the molten state without crystallization. The cooling of the melt must occur without crystallization. Glasses are most frequently derived from silicates by fusing with boric oxide, aluminum oxide, or phosphorus pentoxide. Glasses are generally hard, brittle, and transparent or translucent, and are considered to be supercooled liquids rather than true solids. See Santoro, M., Gorelli, F.A., Bini, F., *et al.*, Amorphous silica-like carbon dioxide, *Nature* 441, 857-860, 2006; Huang, W., Day, D.E., Kittiratanapiboon, K., and Rahaman, M.N., Kinetics and mechanisms of the conversion of silicate (45S5), borate, and borosilicate glasses to hydroxyapatite in dilute phosphate solutions, *J.Mater.Sci.Mater.Med.* 17, 583-596, 2006; Abraham, S., Mallia, V.A., Ratheesh, K.V., *et al.*, Reversible thermal and photochemical switching of liquid crystalline phases and luminescence in diphenylbutadiene-based mesogenic dimers, *J.Am.Chem.Soc.* 128, 7692-7698, 2006; Lehner, A., Corbinea, F., and Bailly, C., Changes in lipid status and glass properties in cotyledons of developing sunflower seeds, *Plant Cell Physiol.*, 47, 818-828, 2006; Chang, R. and Yethiraj, A., Dynamics of chain molecules in disordered materials, *Phys.Rev.Lett.* 96, 107802, 2006; Katritzky, A.R., Singh, S., Kirichenko, K. *et al.*, In search of ionic liquids incorporating azolate anions, *Chemistry* 12, 4630-4641, 2006.

## Glass Transition/Glass Transition Temperature

The glass transition generally refers to change of a polymer from an amorphous material to a brittle material. The glass transition of a non-crystalline material is the critical temperature at which the material changes its behavior from being a glass or brittle material to an amorphous rubber-like material. For lyophilization, it is a critical temperature during the drying cycle which is important to the final product cake. See MacKenzie, A.P., Non-equilibrium freezing behavior of aqueous systems, *Philos.Trans.R.Soc.Lond.B.Biol.Sci.* 278, 167-189, 1977; Schenz, T.W., Israel, B., and Rosolen, M.A., Thermal analysis of water-containing systems, *Adv.Exp.Med.Biol.* 302, 199-214, 1991; Craig, D.Q., Royall, P.G., Kett, V.L., and Hopton, M.L., The relevance of the amorphous state to pharmaceutical dosage forms: Glassy drugs and freeze dried systems, *Int.J.Pharm.* 179, 179-207, 1999; Oliver, A.E., Hincha, D.K., and Crowe, J.H., Looking beyond sugars: the role of amphiphilic solutes in preventing adventitious reactions in anhydrobiotes at low water contents, *Comp.Biochem.Physiol.A Mol.Integr.Physiol.* 131, 515-525, 2002; Nail, S.L., Jiang, S., Chongprasert, S., and Knopp, S.A., Fundamentals of freeze-drying, *Pharm.Biotechnol.* 14, 281-360, 2002; Franks, F., Scientific and technological aspects of aqueous glasses, *Biophys.Chem.* 105, 251-261, 2003; Vranic, E., Amorphous pharmaceutical solids,

*Bosn.J.Basic Med. Sci.* 4, 35-39, 2004; Hilden, L.R. and Morris, K.R., Physics of amorphous solids, *J.Pharm.Sci.* 93, 3-12, 2004.

## Global Proteomics

Analysis of all proteins in a cell or a tissue or an organism. See Hancock, W.S., Wu, S.L., Stanley, R.R., and Gombocz, E.W., Publishing large proteome datasets: scientific policy meets emerging technologies, *Trends Biotechnol.* 20(Suppl 12), S39-S44, 2002; Godovac-Zimmermann, J. and Brown, L.R., Proteomics approaches to elucidation of signal transduction pathways, *Curr. Opin.Mol.Ther.* 5, 241-249, 2003; Kumar, G.K. and Klein, J.B., Analysis of expression and posttranslational modification of proteins during hypoxia, *J.Appl.Physiol.* 96, 1178-1186, 2004; Hoskisson, P.A. and Hobbs, G., Continuous culture – making a comeback? *Microbiology* 151, 3153-3159, 2005.

## Globulin

A classic definition of proteins which are insoluble in water and soluble in dilute salt solutions and migrate more slowly than albumin in an electrophoretic system. See Cooper, G.R., Electrophoretic and ultracentrifugal analysis of normal human serum, in *The Plasma Proteins*, ed. F.W. Putnam, Academic Press, New York, NY, Chapter 3, pp. 51-103, 1960; . The globulins were separated into several fractions including the  $\gamma$ -globulins which contain the various immunoglobulin fractions and were defined as the most slowly moving protein fraction on electrophoresis at pH 8.6 (Porter, H.R.,  $\gamma$ -Globulins and antibodies, in *The Plasma Proteins*, ed. F.W. Putnam, Academic Press, New York, NY, Chapter 7, pp. 241-277, 1960). See Gehrke, C.W., Oh, Y.H., and Freeark, C.W., Chemical fractionation and starch gel-urea electrophoretic characterization of albumins, globulins, gliadins, and glutenins in soft wheat, *Anal.Biochem.* 7, 439-460, 1964; Nilsson, U.R. and Mueller-Eberhard, H.J., Isolation of beta IF-globulin from human serum and its characterization as the fifth component of complement, *J.Exp.Med.* 122, 277-298, 1965; Sun, S.M. and Hall, T.C., Solubility characteristics of globulins from *Phaseolus sees* in regard to their isolation and characterization, *J.Agric. Food Chem.* 23, 184-189, 1975; Hauptman, S.P., Macromolecular insoluble cold globulin (MICG): a novel protein form mouse lymphocytes—I. Isolation and characterization, *Immunochemistry* 15, 415-422, 1978.

## Glucose Oxidase

An flavoprotein(FAD) enzyme(EC 1.1.3.4;  $\beta$ -D-glucose:oxygen 1-oxidoreductase) which catalyzes the oxidation of  $\beta$ -D-glucose to glucoactone/gluconic acid and hydrogen peroxide. The enzyme is highly specific for this form of glucose (Keilin, D. and Hartree, E.F., The use of glucose oxidase (Notatin) for the determination of glucose in biological material and for the study of glucose-producing systems by manometric methods, *Biochem.J.* 42, 230-238, 1942; Sols, A. and de la Fuente, G., On the substrate specificity of glucose oxidase, *Biochim.Biophys.Acta* 24, 206-207, 1957; Wurster, B. and Hess, B., Anomeric specificity of enzymes for D-glucose metabolism, *FEBS Lett.* 40(Suppl), S112-S118, 1974) and is the basis of most of the assays for glucose in blood and bioreactors. The vast majority of assays measure the hydrogen peroxide released in the reaction (Kiang, S.W., Kuan, J.W., Kuan, S.S., and Guilbault, G.G., Measurement of glucose in plasma, with use of immobilized glucose oxidase and peroxidase, *Clin.Chem.* 22, 1378-1382, 1976; Chua, K.S. and Tan, I.K., Plasma glucose measurement with the

Yellow Springs glucose analyzer, *Clin.Chem.* 24, 150-152, 1978; Artiss, J.D., Strandbergh, D.R., and Zak, B., On the use of a sensitive indicator reaction for the automated glucose oxidase-peroxidase coupled reaction, *Clin.Biochem.* 1, 334-337, 1983; *Tietz Textbook of Clinical Chemistry and Molecular Diagnostics*, 4th Edn., ed. C.A. Burtis, E.R. Ashwood, and D.F. Bruns, Elsevier-Saunders, St. Louis, MO, USA, 2006). Glucose oxidase was discovered the early 1900's and originally described an antibacterial factor derived from moulds such as *Penicillium notatum* and *Aspergillus niger* (Coulthard, C.E., Michaelis, R., Short, W.F. *et al.*, Notatin: an antibacterial glucose aerodehydrogenase from *Penicillium notatum* and *Penicillium resitculosum* sp. nov, *Biochem.J.* 39, 24-36, 1945). Glucose oxidase has subsequently been identified as the antibacterial/antibiotic activity in honey (White, J.W., Jr., Subers, M.H., and Schepartz, A.I., The identification of inhibine, the antibacterial factor in honey, as hydrogen peroxide and its origin in a honey glucose-oxidase system, *Biochim.Biophys.Acta* 73, 57-70, 1963; Schepartz, A.T. and Subers, M.H., The glucose oxidase of honey. I. Purification and some general properties of the enzyme, *Biochim.Biophys.Acta* 85, 228-237, 1964; Bang, L.M., Bunting, C., and Molan, P., The effect of dilution on the rate of hydrogen peroxide production in honey and its implications for wound healing, *J.Alternative Complementary Med.* 9, 267-273, 2003; Badawy, O.F., Shafil, S.S., Tharwat, E.E., and Kamal, A.M., *Rev.Sci.Tech.* 23, 1011-1022, 2004) and a critical component of the honey bee invertebrate immune system (Xang, X. and Cox-Foster, D.L., Impact of an ectoparasite on the immunity and pathology of an invertebrate: evidence for host immunosuppression and viral amplification, *Proc. Natl.Acad.Sci.USA* 102, 7470-7475, 2005. Glucose oxidase is also involved in herbivore offense in plants (Musser, R.O., Cipollini, D.F., Hum-Musser, S.M. *et al.*, Evidence that the caterpillar salivary enzyme glucose oxidase provides herbivore offense in solanaceous plants, *Archs.Insect Biochem.Physiol.* 58, 128-137, 2005.

## Glucose regulated protein, 78kD

Grp78; glucose regulated protein, identical with BiP, a chaperone-like protein which was also described as the immunoglobulin heavy-chain-binding protein. See Munro, S. and Pelham, H.R., An Hsp70-like protein in the ER: identity with the 78 kd glucose-regulated protein and immunoglobulin heavy chain binding protein, *Cell* 46, 291-300, 1986; Hendershot, L.M., Ting, J., and Lee, A.S., Identity of the immunoglobulin heavy-chain-binding protein with the 78,000 dalton glucose-regulated protein and the role of posttranslational modifications in its binding function, *Mol.Cell Biol.* 8, 4250-4256, 1988; Haas, I.G., BiP (Grp78), an essential hsp70 resident protein in the endoplasmic reticulum, *Experientia* 50, 1012-1020, 1994; Kleizen, B. and Braakman, I., Protein folding and quality control in the endoplasmic reticulum, *Curr.Opin.Cell Biol.* 16, 343-349, 2004; Okudo, H., Kato, H., Arakaki, Y. and Urade, R., Cooperation of ER-60 and BiP in the oxidative refolding of denatured proteins in vitro, *J.Biochem.* 138, 773-780, 2005; Sorgjerd, K., Ghafouri, B., Jonsson, B.H. *et al.*, Retention of misfolded mutant transhyretin by the chaperone BiP/GRP78 mitigates amyloidogenesis, *J.Mol.Biol.* 356, 469-482, 2006; Panayi, G.S., and Corrigan, V.M., BiP regulates autoimmune inflammation and tissue damage, *Autoimmune Rev.* 5, 140-142, 2006; Li, J. and Lee, A.S., Stress induction of GRP78/BiP and its roles in cancer, *Curr.Mol. Med.* 6, 45-54, 2006; Tajima, H., and Koizumi, N., Induction of BiP by sugar independent of a cis-element for the unfolded protein response in *Arabidopsis thaliana*, *Biochem.Biophys.Res. Commun.* 346, 926-930, 2006.

## Glucosyltransferase

A glucosyltransferase specific for the transfer of glucosides. See Doyle, R.J. and Ciardi, J.E., *Glucosyltransferases, Glucans, Sucrose and Dental Caries*, IRL Press, Washington, DC, USA, 1983; Bleicher, R.J. and Cabot, M.C., Glucosylceramide synthesis and apoptosis, *Biochim.Biophys.Acta* 1585, 172-178, 2002; Yang, J., Hoffmeister, D., Liu, L., *et al.*, Natural product glycorandomization, *Bioorg.Med.Chem.* 12, 1577-1584, 2004; Lorenc-Kukula, K., Korobczak, A., Aksamit-Stachurska, A., *et al.*, Glucosyltransferase: the gene arrangement and enzyme function, *Cell Mol.Biol.Lett.* 9, 935-946, 2004; Trombetta, E.S. and Parodi, A.J., Glycoprotein reglucosylation, *Methods* 35, 328-337, 2005.

## GLUT

A family of membrane transporters which mediate the uptake of hexoses in mammalian cells. See Gould, G.W. and Holman G.D., The glucose transporter family—structure, function and tissue-specific expression, *Biochem. J.* 295, 329-341, 1993; Yang, J., Dowden, J., Tatibouet, A., Hatanaka, Y., Holman, G.D., Development of high-affinity ligands and photoaffinity labels for the D-fructose transporter GLUT5, *Biochem.J.* 367, 533-539, 2002;

## Glycome

The total carbohydrates within an organism. See Feizi, T., Progress in deciphering the information content of the 'glycome'—a crescendo in the closing years of the millennium, *Glycoconj.J.* 17, 553-565, 2001; Hirabayashi, J., Arata, Y., and Kasai, K., Glycome project: concept, strategy, and preliminary application to *Caenorhabditis elegans*, *Proteomics* 1, 295-303, 2001; Loel, A., Glycome: a medical paradigm, *Adv.Exp.Biol.Med.* 546, 445-451, 2004; Hsu, K.L., Pilobello, K.T., and Mahal, L.K., Analyzing the dynamic bacterial glycome with a lectin microarray approach, *Nat.Chem.Biol.* 2, 125-126, 2006; Freeze, H.H., Genetic defects in the human glycome, *Nat.Rev.Genet.* 7, 537-551, 2006.

## Glycomics

The study of the structure, function, and interactions of carbohydrates within the glycome. See Drickhamer, K. and Taylor, M.E., Glycan arrays for functional glycomics, *Genome Biol.* 3, REVIEWS1034, 2002; Love, K.R. and Seeberger, P.H., Carbohydrate arrays as tools for glycomics, *Angew.Chem.Int.Ed.Engl.* 41, 3583-3586, 2002; Hirabayashi, J., Oligosaccharide microarrays for glycomics, *Trends Biotechnol.* 21, 141-143, 2003; Feizi, T., Fazio, F., Chai, W. and Wong, C.H., Carbohydrate microarrays - a new set of technologies at the frontiers of glycomics, *Curr.Opin.Struct.Biol.* 13, 637-645, 2003; Morelle, W. and Michalski, J.C., Glycomics and mass spectrometry, *Curr.Pharm.Des.* 11, 2615-2645, 2005; Raman, R., Raguram, S., Venkataraman, G., *et al.*, Glycomics: an integrated systems approach to structure-function relationships of glycans, *Nat.Methods* 2, 817-824, 2005.

## Glycosidase

An enzyme that hydrolyzes glycosidic bonds; most often in oligosaccharides and polysaccharides. See Allen, H.J. and Kisailus, E.C., *Glycoconjugates: Composition, Structure, and Function*, Dekker, New York, New York, 1992; *Guide to Techniques in Glycobiology*, ed. W.J. Lennarz and G.W. Hart, Academic Press, San Diego, CA,

1994; Bucke, C., *Carbohydrate Biotechnology Protocols*, Humana Press, Totowa, NJ, 1999; Himmel, M.E. and Baker, J.O., *Glycosyl Hydrolases for Biomass Conversion*, American Chemical Society, Washington, DC, 2001.

## Glycosyltransferase

An enzyme which synthesizes compounds with glycosidic bonds by catalyzing the transfer of glycosyl groups. See Carib, E., Carbohydrate metabolism, *Annu.Rev.Biochem.* 32, 321-354, 1963; Heath, E.C., Complex polysaccharides, *Annu.Rev.Biochem.* 40, 29-56, 1971; Honjo, T. and Hayashi, O., Enzymatic ADP-ribosylation of proteins and regulation of cellular activity, *Curr.Top.Cell Regul.* 7, 87-127, 1973; *Glycoimmunology*, ed. Alavi, A. and Axford, J.S., Plenum Press, New York, New York, 1995; *Molecular Glycobiology*, ed. M. Fukuda and O. Hindsgaul, Oxford University Press, Oxford, UK, 1994; Endo, T., Aberrant glycosylation of alpha-dystroglycan and congenital muscular dystrophies, *Acta Myol.* 24, 64-69, 2005; Serafini-Cessi, F., Monti, A., and Cavallone, D., N-Glycans carried by Tamm-Horsfall glycoprotein have a crucial role in the defense against urinary tract diseases, *Glycoconj.J.* 22, 383-394, 2005; Milewski, S., Gabriel, I., and Olchow, J., Enzymes of UDP-GlcNAc in yeast, *Yeast* 23, 1-14, 2006; Millar, C.M. and Brown, S.A., Oligosaccharide structures of von Willebrand factor and their potential role in von Willebrand disease, *Blood Rev.* 20, 83-92, 2006; Koch-Nolte, F., Adriouch, S., Bannas, P., *et al.*, ADP-ribosylation of membrane proteins: unveiling the secrets of a crucial regulatory mechanism in mammalian cells, *Ann. Med.* 38, 189-199, 2006.

## Goblet Cell

A type of cell found in the epithelium with high occurrence in respiratory/digestive tracts which secrete mucus. See Rogers, D.F., Motor control of airway goblet cells and glands, *Respir.Physiol.* 125, 129-144, 2001; Jeffery, P. and Zhu, J., Mucin-producing elements and inflammatory cells, *Novartis Found.Symp.* 248, 51-68, 2002; Rogers, D.F., The airway goblet cell, *Int.J.Biochem.Cell Biol.* 35, 1-6, 2003; Kim, S. and Nadel, J.A., Role of neutrophils in mucus hypersecretion in COPD and implications for therapy, *Treat.Respir.Med.* 3, 147-159, 2004; Bai, T.R. and Knight, D.A., Structural changes in the airways in asthma: observations and consequences, *Clin.Sci.* 108, 463-477, 2005; Rose, M.C., and Voynow, J.A., Respiratory tract mucin genes and mucin glycoproteins in health and disease, *Physiol.Rev.* 86, 245-278, 2006; Lievin-Le Moal, V. and Servin, A.L., The front line of enteric host defense against unwelcome intrusion of harmful microorganisms: mucins, antimicrobial peptides, and microbiota, *Clin.Microbiol. Rev.* 19, 315-337, 2006.

## Golgi Apparatus

A subcellular organelle consisting of a series of membrane structures; the Golgi apparatus can be considered as a single membrane structure containing a number of membrane-bound vesicles. The Golgi apparatus functions in the protein secretory pathway by transporting and packing of proteins for distribution elsewhere in the cell. The Golgi has a *cis*-side facing the endoplasmic reticulum and a *trans*-side which interfaces with the plasma membrane and components of the endocytotic pathway. See Whaley, W.B., *The Golgi Apparatus*, Springer-Verlag, New York, NY, 1975; Pavelka, M., *Functional Morphology of the*

*Golgi Apparatus*, Springer-Verlag, Berlin, Germany, 1987; Loh, Y.P., *Mechanisms of Intracellular Trafficking and Processing of Preproteins*, CRC Press, Boca Raton, FL, 1993; *Guidebook to the Secretory Pathway*, ed J. Rothblatt and Novak, P., Oxford University Press, Oxford, UK, 1997; *The Golgi Apparatus*, ed. Berger, E.G. and Roth, J., Birkhäuser Verlag, Basel, 1997; Robinson, D.G., *The Golgi Apparatus and the Plant Secretory Pathway*, CRC Press, Boca Raton, FL, 2003; Northcote, D.H., The Golgi apparatus, *Endeavor* 30, 26-33, 1971; Shnitka, T.K. and Seligman, A.M., Ultrastructural localization of enzymes, *Annu.Rev.Biochem.* 40, 375-396, 1971; Schachter, H., The sub-cellular sites of glycosylation, *Biochem.Soc.Trans.* 40, 47-71, 1974; Novikoff, A.B., The endoplasmic reticulum: a cytochemist's view, *Proc.Nat.Acad.Sci.USA* 73, 2781-2787, 1976; Hawes, C. and Satiat-Jeunemaitre, B., The plant Golgi apparatus – going with the flow, *Biochim.Biophys.Acta* 1744, 466-480, 2005; Meyer, H.H., Golgi reassembly after mitosis: the AAA family meets the ubiquitin family, *Biochim.Biophys.Acta* 1744, 481-492, 2005; Toivola, D.M., Tao, G.Z., Hbtezion, A., Liao, J., and Omary, M.B., Cellular integrity plus: organelle-related and protein-targeting functions of intermediate filaments, *Trends Cell Biol.* 15, 608-617, 2005; Jolliffe, N.A., Craddock, C.P., and Frigerio, L., Pathways for protein transport to see storage granules, *Biochem.Soc.Trans.* 33, 1016-1018, 2005; Ungar, D., Oka, T., Kreiger, M., and Hughson, F.M., Retrograde transport on the COG railway, *Trends Cell Biol.* 16, 113-120, 2006; Quatela, S.E. and Phillips, M.R., Ras signaling on the Golgi, *Curr.Opin.Cell Biol.* 18, 162-167, 2006; D'Souza-Schorey, C. and Chavrier, P., ARF proteins: roles in membrane traffic and beyond, *Nat.Rev.Mol.Cell Biol.* 7, 347-358, 2006.

## Golgins

A family of proteins found in the Golgi apparatus. The members of this protein family are characterized by the presence of a long region of coiled-coil segments thus having a tendency to form long rod-like structures. See Fritzler, M.J., Hamel, J.C., Ocha, R.L., and Chan, E.K., Molecular characterization of two human autoantigens: unique cDNAs encoding 95- and 160-kD proteins of a putative family in the Golgi complex, *J.Exp.Med.* 178, 49-62, 1993; Kjer-Nielsen, L., Teasdale, R.D., van Vliet, C., and Gleeson, P.A., A novel Golgi-localization domain shared by a class of coiled-coil peripheral membrane proteins, *Curr.Biol.* 9, 385-388, 1999; Munro, S. and Nichols, B.J., The GRIP domain – a novel Golgi-targeting domain found in several coiled-coil proteins, *Curr.Biol.* 9, 377-380, 1999; Pfeffer, S.R., Constructing a Golgi complex, *J.Cell Biol.* 155, 873-883, 2001; Barr, F.A. and Short, B., Golgins in the structure and dynamics of the Golgi apparatus, *Curr.Opin.Cell Biol.* 15, 405-413, 2003; Darby, M.C., vanVliet, C., Brown, D. *et al.*, Mammalian GRIP domain proteins differ in their membrane binding properties and are recruited to distinct domains of the TGN, *J.Cell Biol.* 177, 5865-5874, 2004; Fridmann0Sirkis, Y., Siniouoglou, S., and Pelham, H.R., TMF is a golgin that binds Rab6 and influences Golgi morphology, *BMC Cell Biol.* 5, 18, 2004; Malsam, J., Satch, A., Pelletier, L., and Warren, G., Golgin tethers define subpopulations of COPI vesicles, *Science* 307, 1095-1098, 2005; Short, B., Haas, A., and Barr, F.A., Golgins and GTPases, giving identity and structure to the Golgi apparatus, *Biochim.Biophys.Acta* 1744, 383-395, 2005; Satoh, A., Beard, M., and Warren, G., Preparation and characterization of recombinant golgin tethers, *Methods Enzymol.* 404, 279-296, 2005.

## Granzyme

Granzymes are exogenous serine proteases that are contained in cytoplasmic granules in cytotoxic T cells and natural killer cells. Granzyme enter the target cell through pores created by perforin and induce apoptosis through a variety of mechanisms including caspase-dependent and caspase-independent pathways. See Jenne, D.E. and Tchopp, J., Granzymes, a family of serine proteases released from granules of cytolytic T lymphocytes upon T cell receptor stimulation, *Immunol.Rev.* 103, 53-71, 1988; Smyth, M.J. and Trapani, J.A., Granzymes: exogenous proteinases that induce target cell apoptosis, *Immunol.Today* 16, 202-206, 1995; Lieberman, J. and Fan, Z., Nuclear war: the granzyme A-bomb, *Curr.Opin.Immunol.* 15, 553-559, 2003; Andrade, F., Casciola-Rosen, L.A., and Rosen, A., Granzyme B-induced cell death, *Acta Haematol.* 111, 28-41, 2004; Waterhouse, N.J., Clarke, C.J., Sedelies, K.A., Teng, M.W., and Trapani, J.A., Cytotoxic lymphocytes; instigators of dramatic target cell death, *Biochem. Pharmacol.* 68, 1033-1040, 2004; Ashton-Rickardt, P.G., The granule pathway of programmed cell death, *Crit.Rev.Immunol.* 25, 161-182, 2005; Bleackely, R.C., A molecular view of cytotoxic T lymphocyte induced killing, *Biochem.Cell Biol.* 83, 747-751, 2005.

## Growth

Can be defined as weight or mass increases with age in a multiplicative way from Medawar, P., Size, shape and Age; *Essays in Growth and Form presented to D'Arcy Wentworth Thompson*, Clarendon Press, Oxford, United Kingdom, p. 708, 1945 as cited by Smith, R.W. and Ottema, C., Growth, oxygen consumption and protein and RNA synthesis rates in the yolk sac larvae of the African catfish (*Clarias gariepinus*), *Comp.Biochem.Physiol. Part A* 143, 315-325, 2006.

## GTP-Binding Protein

Intracellular proteins which bind GTP and have a wide variety of functions including signal transduction and in turn protein synthesis and cell proliferation. These proteins are "active" when GTP is bound; on hydrolysis of the GTP to GDP, "activity" is lost. See Rouot, B., Brabet, P., Homberger, V., *et al.*, Go, a major brain GTP binding protein in search of a function: purification, immunological and biochemical characterization, *Biochimie* 69, 339-349, 1987; Obar, P.A., Shpetner, H.S., and Vallee, R.B., Dynamin: a microtubule-associated GTP-binding protein, *J.Cell Sci.(Suppl)* 14, 143-145, 1991; Lillie, T.H. and Gomperts, B.D., A cell-physiological description of GE, a GTP-binding protein that mediates exocytosis, *Ciba Found.Symp.* 176, 164-179, 1993; Kjeldgaard, M., Nyborg, J. and Clark, B.G., The GTP binding motif: variations on a theme, *FASEB J.* 10, 1347-1386, 1996; Im, M.J., Russell, M.A., and Feng, J.F., Transglutaminase II: a new class of GTP-binding protein with new biological functions, *Cell Signal.* 9, 477-482, 1997; Ridley, A.J., The GTP-binding protein Rho, *Int.J.Biochem. Cell Biol.* 29, 1225-1229, 1997; Sugden, P.H. and Clerk, A., Activation of the small GTP-binding protein Ras in the heart by hypertrophic agonists, *Trends Cardiovasc.Med.* 10, 1-8, 2000; Caron, E., Cellular functions of the Rap1 GTP-binding protein: a pattern emerges, *J. Cell Sci.* 116, 435-440, 2003; Gasper, R., Scrima, A., and Wittinghofer, A., Structural insights into HypB, a GTP-binding protein that regulates metal binding, *J.Biol.Chem.*, 281, 27492-27502, 2006.

## Haber-Weiss Reaction

A cycle consisting of the reaction of hydroxyl radicals with hydrogen peroxide generating the superoxide with the subsequent reaction of superoxide with peroxide generating hydroxyl anion and hydroxyl radical; it is possible that this second reaction is catalyzed by ferric ion: see Kehrer, J.P., The Haber-Weiss reaction and mechanisms of toxicity, *Toxicology* 149, 43-50, 2000; Koppenol, W.H., The Haber-Weiss cycle – 70 years later, *Redox Rep.* 6, 229-234, 2001.

## Heat Capacity ( $C_p$ )

The quantity of thermal energy needed to raise the temperature of an object by 1°C;  $C_p$  = mass x specific heat; see specific heat. Heat capacity in proteins is measured with techniques such as differential scanning calorimetry and isothermal titration calorimetry. An understanding of heat capacity is important in understanding the glass transition in the lyophilization of proteins. See Cooper, A., Heat capacity effects in protein folding and ligand binding: a re-evaluation of the role of water in biomolecular thermodynamics, *Biophys.Chem.* 115, 89-97, 2005; Prabhu, N.V. and Sharp, K.A., Heat capacity of proteins, *Annu.Rev.Phys.Chem.* 56, 521-548, 2005; Lemaster, D.M., Heat capacity-independent determination of differential free energy of stability between structurally homologous proteins, *Biophys. Chem.* 119, 94-100, 2006; van Teeffelen, A.M., Melinders, M.B., and de Jongh, H.H., Identification of pitfalls in the analysis of heat capacity changes of beta-lactoglobulin A, *Int.J.Biol.Macromol.* 30, 28-34, 2005; Kozlov, A.G. and Lohman, T.M., Effects of monovalent anions on a temperature-dependent heat capacity change for *Escherichia coli* SSB tetramer binding to single-stranded DNA, *Biochemistry* 45, 5190-5205, 2006; Gribenko, A.V., Keiffer, T.R., and Makhatazde, G.I., Amino acid substitutions affecting protein dynamics in eglin C do not affect heat capacity change upon unfolding, *Proteins* 64, 295-300, 2006.

## Heat Shock Proteins

Heat shock proteins (HSP) are a family of proteins with chaperone activity. Heat shock proteins are involved in protein synthesis and folding, vesicular trafficking, and antigen presentation. Glucose-regulated protein 78 kDa (GRP78) which is also known as immunoglobulin heavy chain binding protein (BiP) is one of the better known members of this family and is constitutively expressed in the endoplasmic reticulum (ER) in a wide variety of cell types. Heat shock proteins were first described as part of the response of the cell to heat shock and other stress situations such as hypoxia. See Tissières, A., Mitchell, H.K., and Tracy, U.M., Protein synthesis in salivary glands of *Drosophila melanogaster*: relation to chromosome puffs, *J.Mol.Biol.* 84, 389-398, 1974; Schedl, P., Artavanis-Tsakonas, S., Steward, R., *et al.*, Two hybrid plasmids with *D. melanogaster* DNA sequences complementary to mRNA coding for the major heat shock protein, *Cell* 14, 921-929, 1978; Artavanis-Tsakonas, S., Schedl, P., Mirault, M.E., *et al.*, Genes for the 70,000 dalton heat shock protein in two cloned *D. melanogaster* DNA segments, *Cell* 17, 9-18, 1979; McAlister, L. and Finklestein, D.B., Heat shock proteins and thermal resistance in yeast, *Biochem. Biophys.Res.Comm.* 93, 819-824, 1980; Wang, C., Gomer, R.H., and Lazarides, E., Heat shock proteins are methylated in avian and mammalian cells, *Proc.Natl.Acad. Sci. USA* 78, 3531-3535, 1981; Roccheri, M.C., Di Bernardo, M.G., and Giudice, G., Synthesis of heat-shock proteins in developing sea urchins, *Dev.Biol.* 83, 173-177, 1981; Lindquist, S., Regulation of protein synthesis during

heat shock, *Nature* 283, 311-314, 1981; Loomis, W.F., Wheeler, S., and Schmidt, J.A., Phosphorylation of the major heat shock protein of *Dictyostelium discoideum*, *Mol.Cell Biol.* 2, 484-489, 1982; Neidhardt, F.C., VanBogelen, R.A., and Vaughn, V., The genetics and regulation of heat-shock proteins, *Annu.Rev.Genet.* 18, 295-329, 1984; Schlesinger, M.J., Heat shock proteins: the search for functions, *J.Cell Biol.* 103, 321-325, 1986; Lanks, K.W., Modulators of the eukaryotic heat shock response, *Exp.Cell Res.* 165, 1-10, 1986; Lindquist, S. and Craig, E.A., The heat-shock proteins, *Annu. Rev. Genet.* 22, 631-677, 1988; Tanguay, R.M., Transcriptional activation of heat-shock genes in eukaryotes, *Biochem.Cell Biol.* 66, 584-593, 1988; Pelham, H.R., Control of protein exit from the endoplasmic reticulum, *Annu.Rev.Cell Biol.* 5, 1-23, 1989; Bukau, B., Weissman, J., and Horwich, A., Molecular chaperones and protein quality control, *Cell* 125, 443-451, 2006; Panyai, G.S. and Corrigan, V.W., BiP regulates autoimmune inflammation and tissue damage, *Autoimmun.Rev.* 5, 140-142, 2006. More recently, there has been interest in heat shock proteins as therapeutic targets in oncology. See Dai, C. and Whitesell, L., HSP90: a rising star on the horizon of anticancer targets, *Future Oncol.* 1, 529-540, 2005; Li, J. and Lee, A.S., Stress induction of GRP78/BiP and its role in cancer, *Curr.Mol.Med.* 6, 45-54, 2006; Kim, Y., Lillo, A.M., Steiniger, S.C.J., *et al.*, Targeting heat shock proteins on cancer cells: selection, characterization, and cell-penetrating properties of a peptidic GRP78 ligand, *Biochemistry* 45, 9434-9444, 2006.

## Hedgehog

A family of proteins important in tissue formation during embryonic development; generally expressed on exterior of cell and bind to receptor on adjacent cells. Sonic hedgehog is a glycoprotein important as signal molecule during differentiation. See Lum, L. and Beachy, P.A., The Hedgehog response network: sensors, switches, and routers, *Science* 304, 1755-1759, 2004; Ishibashi, M., Saito, H., Komada, M., and Shiota, K., Signaling cascade coordinating growth of dorsal and ventral tissues of the vertebrate brain, with special reference to the involvement of Sonic Hedgehog signaling, *Anat.Sci.Int.* 80, 30-36, 2005; Hooper, J.A. and Scott, M.P., Communicating with Hedgehogs, *Nat.Rev. Mol.Cell Biol.* 6, 206-317, 2005; Kalderon, D., The mechanism of hedgehog signal transduction, *Biochem.Soc.Trans.* 33, 1509-512, 2005; Echelard, Y., Epstein, D.J., St-Jacques, B., *et al.*, Sonic hedgehog, a member of a family of putative signaling molecules, is implicated in the regulation of CNS polarity, *Cell* 75, 1417-1430, 1993; Bumcrot, D.A. and McMahon, A.P., Somite differentiation. Sonic signals somites, *Curr.Biol.* 5, 612-614, 1995; Johnson, R.L., Riddle, R.D., Laufer, E., and Tabin, C., Sonic hedgehog: a key mediator of anterior-posterior patterning of the limb and dorso-ventral patterning of axial embryonic structures, *Biochem.Soc. Trans.* 22, 59-574, 1994. Davy-Grosjean, L. and Couve-Privat, S., Sonic hedgehog signaling in basal cell carcinomas, *Cancer Lett.* 225, 181-192, 2005.

## Heterochromatin

"Condensed" or modified chromatin not conducive to gene transcription. See Hyde, B.B., Ultrastructure in chromatin, *Prog.Biophys.Mol.Biol.* 15, 129-148, 1965; Brown, S.W., Heterochromatin, *Science* 151, 417-425, 1966; Back, F., The variable condition of heterochromatin and heterochromatin, *Int.Rev. Cytol.* 45, 25-64, 1976; Lewis, J. and Bird, A., DNA methylation and chromatin structure, *FEBS Lett.* 285, 155-159, 1991; Wu, C.T., Transvection, nuclear structure, and chromatin proteins,

*J.Cell.Biol.* 120, 587-590, 1993; Karpen, G.H., Position-effect variegation and the new biology of heterochromatin, *Curr.Opin.Genet.Dev.* 4, 281-291, 1994; Kornberg, R.D. and Lorch, Y., Interplay between chromatin structure and transcription, *Curr.Opin.Cell Biol.* 7, 371-375, 1995; Zhimulev, I.F., Polytene chromosomes, heterochromatin, and position effect variegation. *Adv.Genet.* 37, 1-566, 1998; Martin, C. and Zhang, Y., The diverse functions of histone, lysine methylation, *Nat.Rev.Mol.Cell Biol.* 6, 838-849, 2005 Wallace, J.A., and Orr-Weaver, T.L., Replication of heterochromatin: insights into mechanisms of epigenetic inheritance, *Chromosoma* 114, 389-402, 2005; Hiragami, K. and Festenstein, R., Heterochromatin protein 1: a pervasive controlling influence, *Cell.Mol.Life Sci.* 62, 2711-2726, 2005.

## Heterolytic Cleavage, Heterolysis

An uneven division of a molecule such as  $\text{HCl} \rightarrow \text{H}^+ + \text{Cl}^-$  which usually generates ions. The hydrogenase reaction and the oxygen radical oxidation of fatty acids are example of heterolytic cleavages. See Gardner, H.W., Oxygen radical chemistry of polyunsaturated fatty acids, *Free Radic.Biol.Med.* 7, 65-86, 1989; Fontecilla-Camps, J.C., Frey, M., Garcin, E., *et al.*, Hydrogenase: a hydrogen-metabolizing enzyme. What do the crystal structures tell us about its mode of action? *Biochimie* 79, 661-666, 1997; Richard, J.P. and Amyes, T.L., Proton transfer at carbon, *Curr.Opin.Chem.Biol.* 5, 626-633, 2001; Solomon, E.I., Decker, A., and Lehnert, N., Non-heme iron enzymes: contrasts to heme catalysis, *Proc.Natl.Acad.Sci.USA* 100, 3589-3594, 2003; Zampella, G., Bruschi, M., Fantucci, P., and De Gioia, L., Investigation of  $\text{H}_2$  activation by  $[\text{M}(\text{NHPnPr}_3)(\text{S}^3)]$  (M = Ni, Pd). Insight into key factors relevant to the design of hydrogenase functional models, *J.Amer.Chem.Soc.* 127, 13180-13189, 2005.

## His-Tag

Generally a hexahistidine sequence which can be attached to the carboxyl-terminal or amino-terminal end of an expressed protein. This tag can be used for the affinity purification or separation of a protein by binding to an IMAC (immobilized metal affinity chromatography) column. The tag can also be used to provide an affinity site for interaction with another molecule in solution. See Sigal, G.B., Bamdad, C., Barberis, A., Strominger, J., and Whitesides, G.M., A self-assembled monolayer for the binding and study histidine-tagged proteins by surface plasmon resonance, *Anal.Chem.* 68, 490-497, 1996; Hengen, P., Purification of His-Tag fusion proteins from *Escherichia coli*, *Trends Biochem.Sci.* 20, 285-286, 1995; Müller, K.M., Arndt, K.M., Bauer, K., and Plückthun, A., Tandem immobilized metal-ion affinity chromatography/immunoaffinity purification of His-tagged proteins-evaluation of two anti-his-tag monoclonal antibodies, *Anal.Biochem.* 259, 54-61, 1998; Altendorf, K., Stalz, W., Greie, J., Deckers-Hebestreit, G., Structure and function of the F(o) complex of the ATP synthase from *Escherichia coli*, *J.Exptl.Biol.* 203, 19-28, 2000; Terpe, K., Overview of tag protein fusions: from molecular and biochemical fundamentals to commercial systems, *Appl.Microbiol.Biotechnol.* 60, 523-533, 2003; Jenny, R.J., Mann, K.G., and Lundblad, R.L., A critical review of the methods for cleavage of fusion proteins with thrombin and factor Xa, *Protein Expr.Purif.* 31, 1-11, 2003; Meredith, G.D., Wu, H.Y., and Albritton, N.L. Targeted protein functionalization using his tags, *Bioconjugate Chem.* 15, 969-982, 2004; Zhao, Y., Benita, Y., Lok, M., *et al.*, Multi-antigen immunization using IgG binding domain ZZ as carrier, *Vaccine* 23, 5082-5090, 2005.

## Hofmeister Series

Also known as the lyotropic; the order of certain ions to "salt out" or precipitate certain hydrophilic materials from aqueous solution. Polyvalent anions such as citrate and sulfate tend to precipitate while monovalent anions such as chloride and thiocyanate tend to solubilize. A similar series exists for cations. It is thought that this phenomena is related to the ability of the various ions to bind water – hence the term "salting out." See Cacace, M.G., Landau, E.M., and Ramsden, J.J., The Hofmeister series: salt and solvent effects on interfacial phenomena, *Quart.J.Biophys.* 30, 241-277, 1997; Boström, M., Tavares, F.W., Finet, S., Skouri-Panet, F., Tardieu, A., and Ninham, B.W., Why forces between proteins follow different Hofmeister series for pH above and below PI, *Biophys.Chem.* 117, 217-224, 2005.

## Holliday Junction

A transient structure formed between two adjoining DNA molecules during homologous recombination which provides for the transfer of DNA sequence between the adjacent strands. See Symington, L.S. and Kolodner, R., Partial purification of an enzyme from *Saccharomyces cerevisiae* that cleaves Holliday junctions, *Proc.Natl.Acad.Sci.USA* 82, 7247-7251, 1985; Churchill, M.E., Tullius, T.D., Kallenbach, N.R., and Seeman, N.C., Holliday recombination intermediate is twofold symmetric, *Proc.Natl.Acad.Sci.USA* 85, 4653-4656, 1988; Dukett, D.R., Murchie, A.I., Diekmann, S., *et al.*, The structure of the Holliday junction, and its resolution, *Cell* 55, 79-89, 1988; Jeyaseelan, R. and Shanmugam, G., Human placental endonuclease cleaves Holliday junctions, *Biochem.Biophys.Res. Commun.* 156, 1054-1060, 1988; Sharples, G.J., Ingleston, S.M., and Lloyd, R.G., Holliday junction processing in bacteria: insights from the evolutionary conservation of RuvABC, RecG, and RusA, *J.Bacteriol.* 181, 5543-5550, 1999; Sharples, G.J., The X philes: structure-specific endonuclease that resolve Holliday junctions, *Mol.Microbiol.* 39, 823-834, 2001; Ho, P.S. and Eichman, B.F., The crystal structures of DNA Holliday junctions, *Curr.Opin.Struct.Biol.* 11, 302-308, 2001; Heyer, W.D., Ehmsen, K.T., and Solinger, J.A., Holliday junctions in the eukaryotic nucleus: resolution in sight? *Trends Biochem.Sci.* 28, 548-557, 2003; Heyer, W.D., Recombination: Holliday junction resolution and crossover formation, *Curr.Biol.* 14, R56-R58, 2004; Khuu, P.A., Voth, A.R., Hays, F.A., and Ho, P.S., The stacked-X DNA Holliday junction and protein recognition, *J.Mol.Recognit.* 19, 234-242, 2006.

## Holoenzyme

The intact function enzyme unit which could consist of a protein, metal ions, coenzymes and other protein components. This term was originally used to describe the combination of a coenzyme or other low-molecular weight cofactor such as metal ion with a protein component designated as the apoenzyme to form the holoenzyme. More recently, the term holoenzyme has been used to describe DNA and RNA polymerases. See Hokin, L.E., Purification and molecular properties of the (sodium + potassium)-adenosinetriphosphatase and reconstitution of coupled sodium and potassium transport in phospholipid vesicles containing purified enzyme, *J.Exp.Zool.* 194, 197-205, 1975; Dalziel, K., McFerran, N.V., and Wonacott, A.J., Glyceraldehyde-3-phosphate dehydrogenase, *Philos.Trans.R.Soc.Lond.B Biol.Sci.* 293, 105-118, 1981; McHenry, C.S., DNA polymerase III holoenzyme. Components, structure, and mechanism of a true replicative complex,

*J.Biol.Chem.* 266, 19127-19130, 1991; Ishihama, A., A multi-functional enzyme with RNA polymerase and RNase activities: molecular anatomy of influenza virus RNA polymerase, *Biochimie* 78, 1097-1102, 1996; Greenblatt, J., RNA polymerase II holoenzyme and transcriptional regulation, *Curr.Opin.Cell Biol.* 9, 310-319, 1997; Amieux, P.S. and McKnight, G.S., The essential role of RI alpha in the maintenance of regulated PKA activity, *Ann.N.Y.Acad.Sci.* 968, 75-95, 2002; Taggart, A.K. and Zakian, V.A., *Curr.Opin.Cell Biol.* 15, 275-280, 2003; Borukhov, S. and Nudler, E., RNA polymerase holoenzyme: structure, function and biological significance, *Curr.Opin.Microbiol.* 6, 93-100, 2003; McHenry, C.S., Chromosomal replicases as asymmetric dimers: studies of subunit arrangement and functional consequences, *Mol.Microbiol.* 49, 1157-1165, 2003.

## Holotype

The single specimen or illustration designated as the type for naming a species or subspecies when no type was specified. See Crickmore, N., Zeigler, D.R., Feitelson, J. *et al.*, Revision of the nomenclature for the *Bacillus thuringiensis* pesticidal crystal proteins, *Microbiol.Mol.Biol.Rev.* 62, 807-813, 1998; Pecher, W.T., Robledo, J.A., and Vasta, G.R., Identification of a second rRNA gene unit in the *Parkinsus andrewsi* genome, *J.Eukaryot. Microbiol.* 51, 234-245, 2004.

## Homeobox

A brief sequence of nucleotides whose base sequence is virtually identical in all the genes that contain said sequence. Originally described in *Drosophila*, it has now been found in many organisms including *Homo sapiens*. In the fruit fly, a homeobox appears to determine when particular groups of genes are expressed during development. Homeobox regions encode proteins containing homeodomain regions. See Gehring, W.J. and Hiromi, Y., Homeotic genes and the homeobox, *Annu.Rev.Genet.* 20, 147-173, 1986; Stern, C.D. and Keynes, R.J., Spatial patterns of homeobox gene expression in the developing mammalian CNS, *Trends Neurosci.* 11, 190-192, 1988; Kappen, C., Schughart, K., and Ruddle, F.H., Organization and expression of homeobox genes in mouse and man, *Ann.N.Y.Acad.Sci.* 567, 243-252, 1989; Wray, G.A., Transcriptional regulation and the evolution of development, *Int.J.Dev.Biol.* 47, 675-684, 2003; Del Bene, F. and Wittbrodt, J., Cell cycle control by homeobox genes in development and disease, *Semin.Cell Dev. Biol.* 16, 449-460, 2005; Samuel, S. and Naora, H., Homeobox gene expression in cancer: insights from developmental regulation and deregulation, *Eur.J.Cancer* 41, 2428-2437, 2005.

## Homeodomain

A domain in a protein that is encoded for by a homeobox; these proteins are transcription factors; the homeodomains are approximately 60 amino acids in length and are composed of three  $\alpha$ -helices and bind DNA. See Scott, M.P., Tamkun, J.W., and Hartzell, G.W., 3rd, The structure and function of the homeodomain, *Biochim.Biophys.Acta.* 989, 25-48, 1989; Affolter, M., Schier, A., and Gehring, W.J., Homeodomain proteins and the regulation of gene expression, *Curr.Opin.Cell Biol.* 2, 485-495, 1990; Izpisua-Belmonte, J.C. and Debole, D., Homeobox genes and pattern formation in the vertebrate limb, *Dev.Biol.* 152, 26-36, 1992; Yates, A. and Chambers, I., The homeodomain protein Nanog and pluripotency in mouse embryonic stem cells, *Biochem.Soc.Trans.* 33, 1518-1521, 2005; Towle, H.C., Glucose as

regulator of eukaryotic gene transcription, *Trends Endocrinol. Metab.* 16, 489-494, 2005.

## Homeotic

A shift in structural development as in a major shift in the developmental fate of an organ or body. See Dessain, S. and McGinnis, W., Regulating the expression and function of homeotic genes, *Curr.Opin.Genet.Dev.* 1, 275-282, 1991; Morata, G., Homeotic genes of *Drosophila*, *Curr.Opin.Genet.Dev.* 3, 606-614, 1993; Doboule, D. and Morata, G., Colinearity and functional hierarchy among genes of the homeotic complexes, *Trends Genet.* 10, 358-364, 1994; Mann, R.S., The specificity of homeotic gene function, *Bioessays* 17, 855-863, 1995; Duncan, I., How do single homeotic genes control multiple segment identities? *Bioessays* 18, 91-94, 1996; Graba, Y., Aragnol, D., and Pradel, J., *Drosophila* Hox complex downstream targets and the function of homeotic genes, *Bioessays* 19, 379-388, 1997; Reichert, H. and Simone, A., Conserved usage of gap and homeotic genes in patterning the CNS, *Curr.Opin.Neurobiol.* 9, 589-595, 1999; Irish, V.F., The evolution of floral homeotic gene function, *Bioessays* 25, 637-646, 2003; Zubko, M.K., Mitochondrial tuning fork in nuclear homeotic functions, *Trends Plant Sci.* 9, 61-64, 2004. See also *HOX* genes.

## Homolytic Cleavage, Homolysis

An even division of a molecule such as  $\text{HCl} \rightarrow \text{H} + \text{Cl}$  which generates free radicals. The decomposition of a precursor molecules can proceed via either a homolytic pathway, a heterolytic pathway, or both. See White, R.E., Sligar, S.G., and Coon, M.J., Evidence for a homolytic mechanism of peroxide oxygen-oxygen bond cleavage during substrate hydroxylation by cytochrome P-450, *J.Biol. Chem.* 255, 11108-11011, 1980; Yang, G., Candy, T.E., Boaro, M. *et al.*, Free radical yields from the homolysis of peroxyxynitrous acid, *Free Radic.Biol.Med.* 12, 327-330, 1992; Correia, M.A., Yao, K., Allentoff, A.J. *et al.*, Interactions of peroxy quinols with cytochromes P450 2B1, 3A1, and 3A5: influence of the apoprotein on heterocyclic versus hemolytic O-O bond cleavage, *Arch.Biochem. Biophys.* 317, 471-478, 1995; Barr, D.P., Martin, M.V., Guengerich, F.P., and Mason, R.P., Reaction of cytochrome P450 with cumene hydroperoxide: ESR spin-trapping evidence for the homolytic scission of the peroxide O-O bond by ferric cytochrome P450 1A2, *Chem.Res.Toxicol.* 9, 318-325, 1996; Marsh, E.N. and Ballou, D.P., Coupling of cobalt-carbon bond homolysis and hydrogen atom abstraction in adenosylcobalamin-dependent glutamate mutase, *Biochemistry* 37, 11864-11872, 1998; Licht, S.S., Booker, S., and Stubbe, J., Studies on the catalysis of carbon-cobalt bond homolysis by ribonucleoside triphosphate reductase: evidence for concerted carbon-cobalt bond homolysis and thiyl radical formation, *Biochemistry* 38, 1221-1233, Vlasie, M.D. and Banerjee, R., Tyrosine 89 accelerates Co-carbon bond homolysis in methylmalonyl-CoA mutase, *J.Am.Chem.Soc.* 125, 5431-5435, 2003; Lyman, S.V., Khairutdinov, R.F., and Hurst, J.K., Hydroxyl radical formation by O-O bond homolysis in peroxyxynitrous acid, *Inorg.Chem.* 42, 5259-5266, 2003; Rees, M.D. and Davies, M.J., Heparan sulfate degradation via reductive homolysis of its *N*-chloro derivatives, *J.Am.Chem.Soc.* 128, 3085-3097, 2006.

## Homotype

A structure having the same general/function as another which may or may not be opposing. For example, the left arm is a homotype of the right arm. A selectin can be a homotype of another

selectin. Homotypic is a descriptor referring to homotype. See Rouhandeh, H., Yau, T., and Lang, P.A., Homotypic and heterotypic interference among picornovirus ribonucleic acids, *Arch. Gesamte Virusforsch.* 27, 236-243, 1969; Bendini, C., Lanfranchi, A., Nobili, R., and Miyake, A., Ultrastructure of meiosis-inducing (heterotypic) and non-inducing (homotypic) cell unions in conjugation of *Blepharisma*, *J.Cell Sci.* 32, 31-43, 1978; Daunter, B., Immune response: tissue specific T-lymphocytes, *Med.Hypotheses* 37, 76-84, 1992; Wagner, M.C., Molnar, E.E., Molitoris, B.A., and Goebel, M.G., Loss of the homotypic fusion and vacuole protein sorting or golgi-associated retrograde protein vesicle tethering complexes results in gentamicin sensitivity in the yeast *Saccharomyces cerevisiae*, *Antimicrob.Agents Chemother.* 50, 587-595, 2006; Karaulanov, E.E., Bottcher, R.T., and Niehrs, C., A role for fibronectin-leucine-rich transmembrane cell-surface proteins in homotypic cell adhesion, *EMBO Rep.* 7, 283-290, 2006; Brandhorst, D., Zwilling, D., Rizzoli, S.O., et al., Homotypic fusion of early endosomes: SNAREs do not determine fusion specificity, *Proc.Natl.Acad.Sci.USA* 103, 2701-2706, 2006; Decker, B.L. and Wickner, W.T., Enolase activates homotypic vacuole fusion and protein transport to the vacuole in yeast, *J.Biol.Chem.*, 281, 14523-14528, 2006; Stroupe, C., Collins, K.M., Fratti, R.A., and Wickner, W., Purification of active HOPS complex reveals its affinities for phosphoinositides and the SNARE Vam7p, *EMBOJ.* 25, 1579-1589, 2006; Brereton, H.C., Carvell, M.J., Asare-Anane, H., et al., Homotypic cell contact enhances insulin but not glucagon secretion, *Biochem.Biophys.Res.Commun.* 344, 995-1000, 2006.

## Hoogsteen Bond

The hydrogen bonds formed in the hybridization of DNA chains to form a triple helix. See Searle, M.S. and Wickham, G., Hoogsteen versus Watson-Crick A-T basepairing in DNA complexes of a new group of 'quinomycin-like' antibiotics, *FEBS Lett.* 272, 171-174, 1990; Raghunathan, G., Miles, H.T., and Sasisekharan, V., Symmetry and structure of RNA and DNA triple helices, *Biopolymers* 36, 333-343, 1995; Soliva, R., Luque, F.J., and Orozco, M., Can G-C Hoogsteen-wobble pairs contribute to the stability of d(G, C-C) triplexes, *Nucleic Acids Res.* 27, 2248-2255, 1999; Li, J.S., Shikiya, R., Marky, L.A., and Gold, B., Triple helix forming TRIPside molecules that target mixed purine/pyrimidine DNA sequences, *Biochemistry* 43, 1440-1448, 2004.

## Hormonology

The term hormonology is used to describe the study of hormones and has been proposed as a substitute for endocrinology. See Ross, J.W., Hormonology in obstetrics, *J.Natl.Med.Assoc.* 46, 19-21, 1954; Swain, C.T., Hormonology, *N.Engl.J.Med.* 280, 388-389, 1969; Kulinskii, V.I. and Kolesnichenko, L.S., Current aspects of hormonology, *Biochemistry(Mosc.)* 62, 1171-1173, 1997; Holland, M.A., Occam's razor applied to hormonology (Are cytokines produced by plants?), *Plant Physiol.* 115, 865-868, 1997; Hadden, D.R., 100 years of hormonology: a view from No. 1 Wimpole Street, *J.R.Soc.Med.* 98, 325-326, 2005; Hsueh, A.J.W., Bouchard, P. and Ben-Shlomo, I., Hormonology: a genomic perspective on hormonal research, *J.Endocrinol.* 187, 333-338, 2005.

## HOX genes

Encodes a family of transcription factors, Hox proteins. See Morgan, S., *HOX genes: a continuation of embryonic patterning?* *Trends in Genetics* 22, 67-69, 2006; Hoegg, S. and Meyer, A., HOX

clusters as models for vertebrate genome evolution, *Trends in Genetics* 21, 421-424, 2005; Sekimoto, T., Yoshinobu, K., Yoshida, M., et al., Region-specific expression of murine *Hox* genes implies the HOX code-mediated patterning of the digestive tract, *Genes to Cells* 3, 51-64, 1998.

## Hydrogels

An easily deformed pseudo-solid mass formed from largely hydrophilic colloids dispersed in an aqueous medium (dispersion medium or continuous phase). There is considerable interest in the use of hydrogels for drug delivery. See Jhon, M.S. and Andrade, J.D., Water and hydrogels, *J.Biomed.Mat.Res.* 7, 509-522, 1973; Roorda, W., Do hydrogels contain different classes of water, *J.Biomater.Sci. Polym.Ed.* 5, 383-395, 1994; Omidian, H., Rocca, J.G., and Park, K., Advances in superporous hydrogels, *J.Control.Release* 102, 3-12, 2005; Frokjaer, S. and Otzen, D.E., Protein drug stability: a formulation challenge, *Nat.Rev.Drug Discov.* 4, 298-306, 2005; Kashyap, N., Kumar, N., and Kumar, K.N., Hydrogels for pharmaceutical and biomedical applications, *Crit.Rev.Ther.Drug Carrier Syst.* 22, 107-149, 2005; Fairman, R. and Akerfeldt, K.S., Peptides as novel smart materials, *Curr.Opin.Struct.Biol.* 15, 453-463, 2005; Young, S., Wong, M., Tabata, Y., and Mikos, A.G., Gelatin as a delivery vehicle for the controlled release of bioactive molecules, *J.Control.Release* 109, 256-274, 2005; Dusek, K., *Reponsive Gels: Volume Transitions*, Springer-Verlag, Berlin, 1993; Dumitriu, S., *Polymeric Biomaterials*, Marcel Dekker, New York, 1994; Zrinyi, N., *Gels*, Springer, Darmstadt, 1996; McCormick, C.L., *Simuli-Responsive Water Soluble and Amphiphilic Polymers*, American Chemical Society, Washington, DC, 2001; Dumitriu, S., *Polymeric Biomaterials*, Marcel Dekker, New York, 2002.

## Hydrophobic, Hydrophobic Effect, Hydrophobic Forces

Literally, the tendency of a molecular structure to avoid water which results in an association or clustering of hydrophobic groups. The term nonpolar is frequently used to describe such groups or molecules. Polar and nonpolar groups or functions can exist in the same molecule; for example, the  $\epsilon$ -amino group of lysine is polar but the methylene carbon chain between the  $\epsilon$ -amino group and the  $\alpha$ -carbon is nonpolar. See Chander, D., Interfaces and the driving force of hydrophobic assembly, *Nature* 437, 640-647, 2005; Kauzmann, W., Some forces in the interpretation of protein denaturation, *Adv.Prot.Chem.* 14, 1-63, 1959; Tanford, C., The hydrophobic effect and the organization of living matter, *Science* 200, 1012-1018, 1978; Kumar, S. and Nussinov, R., Close-range electrostatic interactions in proteins, *ChemBioChem* 3, 604-617, 2002; Kyte, J., The basis of the hydrophobic effect, *Biophys.Chem.* 100, 193-203, 2003; Lesk, A.M., Hydrophobicity-getting into hot water, *Biophys.Chem.* 105, 179-182, 2003; Seelig, J., Thermodynamics of lipid-peptide interactions, *Biochim. Biophys.Acta* 1666, 40-50, 2004; Hofinger, S. and Zerbetto, F., Simple models for hydrophobic hydration, *Chem.Soc.Rev.* 34, 1012-1020, 2005.

## Hydrophobins

Hydrophobins are secreted proteins functioning in fungal growth and development. Hydrophobins self-assemble at hydrophilic/ hydrophobic interfaces forming amphipathic membranes. See Wessels, J., De Vries, O., Asgeirsdottir, S.A., and Schuren, F., Hydrophobin genes involved in formation of aerial hyphae

and fruit bodies in *Schizophyllum*, *Plant.Cell*, 3, 793-799, 1991; Wessels, J.G., Hydrophobins: proteins that change the nature of the fungal surface, *Adv.Microb.Physiol.* 38, 1-45, 1997; Ebbole, D.J., Hydrophobins and fungal infection of plants and animals, *Trends Microbiol.* 5, 405-408, 1997; Wosten, H.A., Hydrophobins: multipurpose proteins, *Annu.Rev.Microbiol.* 55, 625-646, 2001; Linder, M.B., Szilvay, G.R., Nakari-Setälä, T., and Penttilä, M.E., Hydrophobins: the protein-amphiphiles of filamentous fungi, *FEMS Microbiol.Rev.* 29, 877-896, 2005.

## Hypsochromic

A shift of light absorption or emission to a shorter wavelength ( $\lambda < \lambda_0$ ); a "blue" shift. See Crescitelli, F. and Karvaly, B., The gecko visual pigment: the anion hypsochromic shift, *Vision Res.* 31, 945-950, 1991; Zalis, S., Sieger, M., Greulich, S., et al., Replacement of the 2,2'-bipyridine by 1,4-diazabutadiene acceptor ligands: why the bathochromic shift for [N empty set N]IrCl(C5Me5) + complexes but the hypsochromic shift for (N empty set N)Ir(C5Me5)? *Inorg.Chem.* 42, 5185-5191, 2003; Meier, H., Gerold, J., Kolshrn, H., and Muhling, B., Extension of conjugation leading to bathochromic or hypsochromic effects in OPV series, *Chemistry* 23, 360-370, 2004; de Garcia Ventrini, C., Andreato, J., Machado, V.G., and Machado, C., Solvent effects in the interaction of methyl- $\beta$ -cyclodextrin with solvatochromic merocyanine dyes, *Org.Biomol.Chem.* 3, 1751-1756, 2005; Kidman, G. and Northrop, D.B., Effect of pressure on nucleotide binding to yeast alcohol dehydrogenase, *Protein Pept.Lett.* 12, 495-497, 2005; Li, Y., He, W., Dong, Y. et al., Human serum albumin interaction with formononetin studied using fluorescence anisotropy, FT-IR spectroscopy, and molecular modeling methods, *Bioorg.Med.Chem.* 14, 1431-1436, 2006; Schonefeld, K., Ludwig, R., and Feller, K.H., Fluorescence studies of host-guest interaction of a dansyl amide labelled calyx[6]arene, *J.Fluoresc.* 16, 449-454, 2006; Correa, N.M. and Levinger, N.E., What can you learn from a molecular probe? New insights on the behavior of C343 in homogeneous solutions and AOT reverse micelles, *J.Phys.Chem. B Condens. Matter Surf. Interfaces Biophys.* 110, 13050-13061, 2006.

## Idiotypic

Idiotypic as in referring to idio type where idio type is that portion of the variable region of an antibody which confers specificity. See Bigazzi, P.E., Regulation of autoimmunity and the idiotypic network, *Immunol.Ser.* 54, 39-64, 1991; Schoenfeld, Y., Idiotypic induction of autoimmunity: do we need an autoantigen? *Clin.Exptl.Rheumatol.* 12(Suppl 11), S37-S40, 1994; Schoenfeld, Y. and George, J., Induction of autoimmunity. A role for the idiotypic network, *Ann.N.Y.Acad.Sci.* 815, 342-349, 1997; Bianchi, A. and Massaia, M., Idiotypic vaccination in B-cell malignancies, *Mol.Med.Today* 3, 435-441, 1997; Lacroix-Desmazes, S., Bayry, J., Misra, N., et al., The concept of idiotypic vaccination against factor VIII inhibitors in haemophilia A, *Haemophilia* 8 (Suppl 2), 55-59, 2002; Coutinho, A., Will the idiotypic network help to solve natural tolerance? *Trends Immunol.* 24, 53-54, 2003.

## IMAC (Immobilized metal affinity chromatography)

A chromatographic fractionation procedure which uses a matrix consisting of a metal ion tightly bound to a matrix. Nickel is the most common metal ion used but there is use of copper and other transition metals. See Porath, J. and Olin, B., Immobilized

metal ion affinity adsorption and immobilized metal ion affinity chromatography of biomaterials. Serum protein affinities for gel-immobilized iron and nickel ions, *Biochemistry* 23, 1621-1630, 1982; Porath, J., Immobilized metal ion affinity chromatography, *Protein Expr.Purif.* 3, 263-281, 1992; Skerra, A., Engineered protein scaffolds for molecular recognition, *J.Mol.Recognit.* 13, 167-187, 2000; Gaberc-Proekar, V. and Menart, V., Perspectives of immobilized-metal affinity chromatography, *J.Biochem.Biophys. Methods* 49, 335-360, 2001; Ueda, E.K., Gout, P.W., and Morganti, L., Current and prospective applications of metal ion-protein binding, *J.Chromatog.A.* 988, 1-23, 2003.

## Inhibin

Inhibin is a dimeric glycoprotein secreted by the follicular cells of the ovary and the Sertoli cells of the testis that regulates secretion of follicle stimulating hormone from the anterior pituitary. Inhibin has received recent attention as a biomarker for ovarian cancer. See Chari, S., Chemistry and physiology of inhibin—a review, *Endokrinologie* 70, 99-107, 1977; Grady, R.R., Charlesworth, M.C., and Schwartz, N.B., Characterization of the FSH-suppressing activity in follicular fluids, *Recent Prog.Horm. Res.* 38, 409-456, 1982; Schwartz, N.B., Role of ovarian inhibin (folliculostatin) in regulating FSH secretion in the female rat, *Adv.Exp.Med.Biol.* 147, 15-36, 1982; Burger, H.G. and Igarashi, M., Inhibin: definition and nomenclature, including related substances, *Mol.Endocrinol.* 2, 391-392, 1988; Robertson, D.M., Stephenson, T., Cahir, N., et al., Development of an inhibin  $\alpha$  subunit ELISA with broad specificity, *Mol.Cell.Endocrinol.* 180, 79-86, 2001; Robertson, D.M., Stephenson, T., Pruyssers, E., et al., Inhibins/activins as diagnostic markers for ovarian cancers, *Mol.Cell.Endocrinol.* 191, 97-103, 2002; Khosravi, J., Krishna, R.G., Khaja, N., Bodani, U., and Diamandi, A., Enzyme-linked immunosorbent assay of total inhibin: direct determination based on inhibin  $\alpha$  subunit-specific monoclonal antibodies, *Clin.Biochem.* 37, 370-376, 2004; Cook, R.W., Thompson, T.B., Jardtzyk, T.S., and Woodruff, T.K., Molecular biology of inhibin action, *Semin.Reprod.Med.* 22, 269-276, 2004.

## Imino Sugars

A class of carbohydrate mimetics which contain nitrogen in the place of oxygen in the ring. These sugars inhibit glycosylation reactions by acting as transition state analogues. See Paulsen, H. and Brockhausen, I., From imino sugars to cancer glycoproteins, *Glycoconjugate J.* 18, 867-870, 2001; Dwek, R.A., Butters, T.D., Platt, F.M., and Zitzmann, N., Targeting glycosylation as a therapeutic approach, *Nat.Rev Drug Disc.* 1, 65-75, 2002; El-Ashry, el-Sh, and El Nemr, A., Synthesis of mono- and di-hydroxylated prolines and 2-hydroxymethylpyrrolidines from non-carbohydrate precursors, *Carbohydr.Res.* 338, 2265-2290, 2003; Butters, T.D., Dwek, R.A., and Platt, F.M., New therapeutics for the treatment of glycosphingolipid lysosomal storage diseases, *Adv.Exp.Med.Biol.* 535, 219-226, 2003; Butters, T.D., Dwek, R.A., and Platt, F.M., Imino sugar inhibitors for treating the lysosomal glycosphingolipidoses, *Glycobiology* 14, 43R-52R(epub), 2005.

## Immunoblotting

A technique for the identification of immunoreactive substances such as proteins. Most frequently, detection by immunoblotting first involves a gel-based electrophoretic separation step followed by electrophoretic transfer to another matrix such as

nitrocellulose or PVDF in a manner such that the original separation pattern is retained. The separated protein or proteins are measured by reaction with a primary probe such as antibody labeled with an enzyme or other signal; it is also possible to use a secondary probe which would react with the primary probe. A secondary probe could be an antibody with a signal such as an enzyme directed against the primary probe. This latter situation is similar to an indirect ELISA. See *CRC Handbook of Immunoblotting of Proteins*, ed. O.J. Bjerrum and N.H.H. Heegaard, CRC Press, Boca Raton, USA., 1988; *Antibodies: A Laboratory Manual*, ed E.Harlow and D. Lane, Cold Spring Harbor, New York, USA, 1988; Manchenko, G.P., *Handbook of Detection of Enzymes on Electrophoresis*, CRC Press, Boca Raton, USA, 1994; Stot, D.I., Immunoblotting, dot-blotting, and ELISPOT assay: methods and applications, in *Immunochemistry*, ed. C.J. Van Oss and M.H.V. van Regenmortel, Marcel Dekker, New York, USA, Chapter 35, pp. 925-948, 1994; Burns, R., *Immunochemical Protocols*, Humana Press, Totowa, New Jersey, USA, 2005. Western blotting is a form of immunoblotting. See Western Blotting, ELISA, Elispot.

## Immunoglobulin

A group of plasma proteins (Ig) which are synthesized by plasma cells which are formed from B-cells. There are five general class of immunoglobulins: IgA, IgE., IgD, IgG, and IgM. With the exception of some unique immunoglobulins such as camelids, immunoglobulin are based on a structure of dimers or heterodimers where the heterodimers are composed of a light chain and a heavy chain. IgM is a pentamer of this basic building block while IgA can be a monomer, dimer or trimer of the basic building block. The basic building block is bivalent in that each heterodimer can bind an antigen; IgA may be bivalent, tetravalent or hexavalent while IgM is decavalent. See B. Pernis and H.J. Vogel, *Cells of Immunoglobulin Synthesis*, Academic Press, New York, New York, 1979; Calabi, F. and Neuberger, M.S., *Molecular Genetics of Immunoglobulin*, Elsevier, Amsterdam, Netherlands, 1987; Langone, J.J., *Antibodies, Antigens, and Molecular Mimicry*, Academic Press, San Diego, CA, USA, 1989; Kuby, J., *Immunology*, W.H. Freeman, New York, New York, 1992; Cruse, J.M. and Lewis, R.E., *Atlas of Immunology*, CRC Press, Boca Raton, Florida, USA, 1999.

## Immunoglobulin Superfamily

A family of cell surface glycoproteins which contain an extracellular domain homologous to immunoglobulin(Ig), a transmembrane component, and a cytoplasmic extension which interact with other cell adhesion molecules such as integrins in homotypic interactions. See Anderson, P., Morimoto, C., Breitmeyer, J.B., and Schlossman, S.F., Regulatory interactions between members of the immunoglobulin superfamily, *Immunol.Today* 9, 199-203,1988; Hunkapiller, T. and Hood, L., Diversity of the immunoglobulin gene superfamily, *Adv.Immunol.* 44, 1-63, 1989; Barclay, A.N., Membrane proteins with immunoglobulin-like domains—a master superfamily of interaction molecules, *Semin. Immunol.* 15, 215-223, 2003; Naka, Y., Bucciarelli, L.G., Wendt, T., et al., RAGE axis: animal models and novel insights into the vascular complications of diabetes, *Arterioscler.Thromb.Vasc. Biol.* 24, 1342-1349, 2004; Mittler, R.S., Foell, J., McCausland, M., et al., Anti-CD137 antibodies in the treatment of autoimmune disease and cancer, *Immunol.Res.* 29, 197-208, 2004; Du Pasquier, L., Zucchetti, I., and De Santis, R., Immunoglobulin superfamily receptors in protochordates: before RAG time, *Immunol.Rev.* 198, 233-248, 2004; Peggs, K.S. and Allison, J.P., Co-stimulatory

pathways in lymphocyte regulation: the immunoglobulin superfamily, *Br.J.Haematol.* 130,809-824, 2005.

## Immunomics

Study of the molecular functions associated with all immune-related coding and non-coding mRNA transcripts. See Maecker, B., von Bergwelt-Baildon, Anderson, K.S., Vonderheide, R.H., and Schultze, J.L., Linking genomics to immunotherapy by reverse immunology—‘immunomics’ in the new millennium, *Curr.Mol. Med.* 1, 609-619, 2001. Schonbach, C., From immunogenetics to immunomics: functional prospecting of genes and transcripts, *Novartis Found.Symp.* 254, 177-188, 2003.

## Immunoproteomics

Definition is a work in progress varying from the screening of two-dimensional gels for reactive antibodies to the use of mass spectrometry to study targets of the immune system; in general, the use of proteomics to study the cellular and humoral immune systems. See Haas, G., Karaali, G., Ebermayer, K., et al., Immunoproteomics of *Helicobacter pylori* infection and relation to gastric disease, *Proteomics* 2, 313-324, 2002; Purcell, A.W. and Gorman, J.J., Immunoproteomics: mass spectrometry-based methods to study the targets of the immune response, *Mol.Cell. Proteomics* 3, 193-208, 2004; Hess, J.L., Blazer, L., Romer, T. et al., Immunoproteomics, *J.Chromatog.B.Anal.Technol Biomed.Life Sci.* 815, 65-75, 2005; Chen, Z., Peng, B., Wang, S., and Peng, X., Rapid screening of highly efficient vaccine candidates by immunoproteomics, *Proteomics* 4, 3203-3213, 2004; Paul-Satyaseela, M., Karched, M., Bian, Z., et al, Immunoproteomics of *Actinobacillus actinomycetemcomitans* outer-membrane proteins reveal a highly immunoreactive peptidoglycan-associated lipoprotein, *J.Med. Microbiol.* 55, 931-942, 2006; Falisse-Poirrier, N., Ruelle, V. et al., Advances in immunoproteomics for serological characterization of microbial antigens, *J.Microbiol.Methods*, 67, 593–596, 2006.

## Immuno Proteasome

A type of proteasome which is involved in the processing proteins for MHC class I antigen presentation. See Aki, M., Shimbara, N., Takashina, M., et al., Interferon-gamma induces different subunit organizations and functional diversity of proteasomes, *J.Biochem.* 115, 257-269, 1994; Dahlmann, B., Ruppert, T., Kuehn, L., et al., Different proteasome subtypes in a single tissue exhibit different enzymatic properties, *J.Mol.Biol.* 303, 643-653, 2000; Tenzer, S., Stoltze, L., Schonfisch, B., et al., Quantitative analysis of prion-protein degradation by constitutive and immuno-20S proteasomes indicates differences correlated with disease susceptibility, *J.Immunol.* 172, 1083-1091, 2004; Dahlmann, B., Proteasomes, *Essays Biochem.* 41, 31-48, 2005; Ishii, K., Hisaeda, H., Duan, X., et al., The involvement of immunoproteomics in induction of MHC class I-restricted immunity targeting *Toxoplasma SAG1*, *Microbes Infect.* 8, 1045-1053, 2006.

## Immunostimulatory Sequence (ISS); Immunostimulatory Sequence Oligodeoxynucleotide (ISS-ODN)

A specific sequence non-methylated DNA containing cytosine and guanine which has immunostimulatory properties and can serve as an adjuvant. See Horner, A.A., Ronaghy, A., Cheng, P.M.

*et al.*, Immunostimulatory DNA is a potent mucosal adjuvant, *Cell.Immunol.* 190, 77-82, 1998; Miyazaki, D., Liu, G., Clark, L., and Ono, S.J., Prevention of acute allergic conjunctivitis and late-phase inflammation with immunostimulatory DNA sequences, *Invest.Ophthalmol.* 41, 3850-3855, 2000; Horner, A.A. and Raz, E., Immunostimulatory sequence oligodeoxynucleotide: a novel mucosal adjuvant, *Clin.Immunol.* 95, S19-S29, 2000; Marshall, J.D., Abtahi, S., Eiden, J.J. *et al.*, Immunostimulatory sequence DNA linked to the Amb a 1 allergen promotes T(H) 1 cytokine expression while downregulating T(H)2 cytokine expression in PBMCs from human patients with ragweed allergy, *J.Allergy Clin.Immunol.* 108, 191-197, 2001; Horner, A.A. and Raz, E., Immunostimulatory sequence oligodeoxynucleotide-based vaccination and immunomodulation: two unique but complementary strategies for the treatment of allergic diseases, *J.Allergy Clin.Immunol.* 110, 706-712, 2002; Teleshova, N., Kenney, J., Williams, V., *et al.*, CpG ISS-ODN activation of blood-derived B cells from healthy and chronic immunodeficiency virus-infected macaques, *J.Leukoc.Biol.* 79, 257-267, 2006.

## Industrial Plantation

A large-scale, usually single crop forestry or agricultural enterprise.

## Infrared Spectroscopy

The common range for infrared spectroscopy is 10 – 12,800 cm<sup>-1</sup> (780 – 10<sup>6</sup> nm). Absorption spectra are described as function of the wavenumber of the incident; the wavenumber is the reciprocal of the wavelength and has the advantage of being linear with energy. The infrared region can be divided into the near-infrared, the mid-infrared, and far-infrared regions.

## Insulin Receptor

A heterotetramer consisting of two extracellular alpha subunits which bind insulin and two transmembrane beta subunits which have tyrosine kinase activity. See Chang, L., Chiang, S.-H., and Saltiel, A.R., Insulin signaling and the regulation of glucose transport, *Molec.Med.* 10, 65-71, 2004; Kanzaki, M., Insulin receptor signals regulating GLUT4 translocation and actin dynamics, *Endocr.J.* 53, 267-293, 2006; Martinez, S.C., Cras-Meneur, C., Bernal-Mizrachi, E., and Permutt, M.A., Glucose regulates FoxO1 through insulin receptor signaling in the pancreatic islet  $\beta$ -cells, *Diabetes* 55, 1581-1591, 2006; Marine, S., Zamiara, E., Todd Smith, S., *et al.*, A miniaturized cell-based fluorescence resonance energy transfer assay for insulin-receptor activation, *Anal.Biochem.* 355, 267-277, 2006; Hao, C., Whittaker, L., and Whittaker, J., Characterization of a second ligand binding site of the insulin receptor, *Biochem.Biophys.Res. Commun.* 347, 334-339, 2006; Sisci, D., Morelli, C., Garofalo, C., Expression of nuclear insulin receptor substrate 1 (IRS-1) in breast cancer, *J.Clin.Pathol.*, 60, 633–641, 2007.

## Integrins

Cell membrane glycoproteins which function as receptor for extracellular matrix components. Integrins are heterodimers containing an  $\alpha$ -subunit and a  $\beta$ -subunit. The  $\beta$ -subunit contains RGD sequences which “recognize” ligands such as fibronectin, platelet glycoprotein II b/IIIa, and extracellular matrix components or structural analogues or homologues. See Hynes, R.O., Integrins: a family of cell surface receptors, *Cell* 48, 549-554,

1987; Malech, H.L. and Gallin, J.I., Current concepts: immunology. Neutrophils in human diseases, *N.Engl.J.Med.* 317, 687-694, 1987; Akiyama, S.K., Yamada, K.M., and Hayashi, J., The structure of fibronectin and its role in cellular adhesion, *J.Supramol. Struct.Cell.Biochem.* 16, 345-348, 1981; Mosher, D.F., Physiology of fibronectin, *Annu.Rev.Med.* 35, 561-575, 1984; Bennett, J.S., Structure and function of the platelet integrin  $\alpha$ IIb $\beta$ 3, *J.Clin.Invest.* 115, 3363-3369, 2005; Serini, G., Valdembrì, D., and Bussolino, F., Integrins and angiogenesis: a sticky business, *Exp.Cell Res.* 312, 651-658, 2005; Caswell, P.T. and Norman, J.C., Integrin trafficking and the control of cell migration, *Traffic* 7, 14-21, 2006; Legate, K.R., Montanez, E., Kudlacek, O., and Fassler, R., ILK, PINCH and parvin: the tIPP of integrin signalling, *Nat.Rev.Mol.Cell.Biol.* 7, 20-31, 2006.

## Integrin-mobilferrin pathway (IMP)

Pathway involved in the membrane transport of ferric iron. See Conrad, M.E., Umbreit, J.N., Peterson, R.D., *et al.*, Function of integrin in duodenal mucosal uptake of iron, *Blood* 81, 517-521, 1993; Wolf, G. and Wessling-Resnick, M., An integrin-mobilferrin iron transport pathway in intestine and hematopoietic cells, *Nutr.Rev.* 52, 387-389, 1994; Conrad, M.E. and Umbreit, J.N., Iron absorption and transport – an update, *Amer.J.Hematol.* 64, 287-298, 2000; Umbreit, J.N., Conrad, M.E., Hainsworth, L.N., and Simovich, M., The ferrireductase paraferitin contains divalent metal transporter as well as mobilferrin, *Am.J.Physiol.Gastrointest.Liver Physiol.* 282, G534-G539, 2002.

## Intein

Intervening protein sequences which are removed by post-translational self-splicing; analogous to exon splicing. Intein regions are surrounded by an N-terminal extein and a C-terminal extein. Intein splicing has proved useful for the preparation of N-terminal cysteine residues which can be coupled to a matrix. See Eckenroth, B., Harris, K., Turanov, A.A., *et al.*, Semisynthesis and characterization of mammalian thioredoxin reductase, *Biochemistry* 45, 5158-5170, 2006; Hackenberger, C.P., Chen, M.M., and Imperiali, B., Expression of N-terminal cys-protein fragments using an intein refolding strategy, *Bioorg. Med.Chem.*, 14, 5043–5048, 2006; Sharma, S.S., Chong, S., and Harcum, S.W., Intein-mediated protein purification of fusion proteins expressed under high-cell density conditions in *E.coli*, *J.Biotechnol.*, 125, 48–56, 2006; Kwon, Y., Coleman, M.A., and Camarero, J.A., Selective immobilization of proteins onto solid supports through split-intein-mediated protein trans-splicing, *Angew.Chem.Int.Ed. Engl.* 45, 1726-1729, 2006; Colston, M.J., and Davies, E.O., The ins and outs of protein splicing elements, *Mol.Microbiol.* 12, 359-363, 1994; Cooper, A.A. and Stevens, T.H., Protein splicing: self-splicing of genetically mobile elements at the protein level, *Trends Biochem.Sci.* 20, 351-356, 1995; Paulus, H., Protein splicing and related forms of protein autoprocessing, *Annu.Rev.Biochem.* 69, 447-496, 2000; Xu, M.Q. and Evans, T.C., Jr., Intein-mediated ligation and cyclization of expressed proteins, *Methods* 24, 257-277, 2001; Durek, T. and Becker, C.F., Protein semi-synthesis: new problems for functional and structural studies, *Biomol.Eng.* 22, 153-172, 2005; Tan, L.P. and Yao, S.Q., Intein-mediated, in vitro and in vivo protein modifications with small molecules, *Protein Pep.Lett.* 12, 769-775, 2005; Anderson, L.L., Marshall, G.R., and Baranski, T.J., Expressed protein ligation to study protein interactions:

semi-synthesis of the G-protein alpha subunit, *Protein Pep.Lett.* 12, 783-787, 2005.

## Intercalation

The insertion of a molecule, usually planer, between adjacent base pairs of DNA.

## Interactome

The protein-protein interactions within a proteome. See Ito, T., Chiba, T., and Yoshida, M., Exploring the protein interactome using comprehensive two-hybrid projects, *Trends Biotechnol.* 19 (Suppl 10), S23-S27, 2001; Ito, T., Ota, K., Kubota, H., *et al.*, Roles for the two-hybrid system in exploration of the yeast protein interactome, *Mol.Cell.Proteomics* 1, 561-566, 2002; Vidal, M., Interactome modeling, *FEBS Lett.* 579, 1834-1838, 2005; Cusick, M.E., Klitgord, N., Vidal, M., and Hill, D.E., Interactome: gateway into systems biology, *Hum.Mol.Genetics* 15, 14 Spec.No.2, R171-R181, 2005; Ghavidel, A., Cagney, G., and Emili, A., A skeleton on the human protein interactome, *Cell* 122, 830-832, 2005.

## Interleukin

A functionally defined group of small proteins which "communicate" between various immune cell types (inter + leukocytes = interleukin) (Aardem. L.A., Brunner, T.K., Creottini, J.C. *et al.*, Revised nomenclature for antigen-nonspecific T-cell proliferation and helper factors, *J. Immunol.* 123, 2928-2929, 1979; Paul, W.E., Kishimoto, T., Melchers, F., *et al.*, Nomenclature for secreted regulatory proteins of the immune system (interleukins), *Clin.Immunol.Immunopathol.* 64, 3-4, 1992; IUIS/WHO Standing Committee on Interleukin Designation, Nomenclature for secreted regulatory proteins of the immune system (interleukins): update, *Bull.World Health Org.* 75, 175, 1997). This term was developed to rationalize the nomenclature for these materials as the different terms/names were selected on the basis of activity in a particular assay system rather than an intrinsic physical or biological property; this situation is not unlike that which occurred in blood coagulation somewhat earlier. Thus, lymphocyte activating factor (LAF; mitogenic protein, B-cell differentiation factor) is IL-1 while thymocyte stimulating factor (TSE, T-cell growth factor, killer cell helper factor) is IL-2. See Watson, J. and Mochizuki, D., Interleukin 2: a class of T cell growth factors, *Immunol.Rev.* 51, 287-278, 1980; Mizel, S.B., Interleukin 1 and T cell activation, *Immunol.Rev.* 63, 51-72, 1982; Wagner, H., Hardt, C., Heeg, K. *et al.*, The in vivo effects of interleukin 2 (TCGF), *Immunobiology* 161, 139-156, 1982; Farrar, J.J., Benjamin, W.R., Hilfiker, M.L., *et al.*, The biochemistry, biology, and role of interleukin 2 in the induction of cytotoxic T cell and antibody-forming B cell responses, *Immunol.Rev.* 63, 129-166, 1982; Gillis, S., Interleukin 2: Biology and Biochemistry, *J.Clin.Immunol.* 3, 1-13, 1983; Durum, S.K., Schmidt, J.A., and Oppenheim, J.J., Interleukin 1: an immunological perspective, *Annu.Rev.Immunol.* 3, 263-287, 1985. Work on the interleukins is usually considered within the greater area of cytokines. See Porter, J.R. and Jezová, D., *Circulating Regulatory Factors and Neuroendocrine Function*, Plenum Press, New York, NY, 1990; Kimball, E.S., *Cytokines and Inflammation*, CRC Press, Boca Raton, FL, 1991; Kishimoto, T., *Interleukins: Molecular Biology and Immunology*, Karger, Basel,

1992; Thompson, A.W., *The Cytokine Handbook*, Academic Press, London, 1994; Austen, K.F., *Therapeutic Immunology*, Blackwell Science, Malden, MA, 2001; Janeway, C.A, Travers, P., Walport, M., and Shlomchik, M., *Immunobiology 5: The Immune System in Health and Disease*, Garland Publishing/Taylor & Francis, New York, NY, 2001; Cruse, J.M., Lewis, R.F., and Wang, H., *Immunology Guidebook*, Elsevier, Amsterdam, Netherland, 2004.

## Internal Standard

A compound or material which is not a analyte but is included in an unknown or standard to correct for issues in the processing or analysis of a analyte or analytes; an internal standard is not a calibration standard. See Coleman, D. and Vanatta, L., Statistics in Analytical Chemistry, Part 19-Internal Standards, *American Laboratory*, December, 2005; Julka, S. and Regnier, F., Quantification in proteomics through stable isotope coding: a review, *J.Proteome Res.* 3, 350-363, 2004; Bronstrup, M., Absolute quantification strategies in proteomics based on mass spectrometry, *Expert Rev.Proteomics* 1, 503-512, 2004.

## Intrabodies

Intrabodies are intracellular antibodies or functional antibody fragments. Intrabodies can be expressed as intracellular antibodies using recombinant DNA technology and used for the study of intracellular pathways and protein-protein interactions using two-hybrid technology. See Lobato, M.N. and Rabbitts, T.H., Intracellular antibodies and challenges facing their use as therapeutic agents, *Trends Mol.Med.* 9, 390-396, 2003; Stocks, M.R., Intrabodies: production and promise, *Drug Discov.Today* 9, 960-966, 2004; Visintin, M., Meli, G.A., Cannistraci, I., and Cattaneo, A., Intracellular antibodies for proteomics, *J.Immunol.Methods* 290, 135-153, 2004; Miller, T.W. and Messer, A., Intrabody applications in neurological disorders: progress and future prospects, *Mol.Ther.* 12, 394-401, 2005; Stocks, M., Intrabodies as drug discovery tools and therapeutics, *Curr.Opin.Chem.Biol.* 9, 359-365, 2005. Antibodies or antibodies fragments can also be introduced into the cell through the use of cell penetrating peptides. Zhao, Y., Lou, D., Burkett, J., and Kohler, H., Chemical engineering of cell penetrating antibodies, *J.Immunol.Methods* 254, 137-145, 2001; Gupta, B., Levchenko, T.S. and Torchilin, V.P., Intracellular delivery of large molecules and small particles by cell-penetrating proteins and peptides, *Adv.Drgu Deliv.Rev.* 57, 637-651, 2005; De Coupade, C., Fittipaldi, A., Chagnas, V., *et al.*, Novel human-derived cell-penetrating peptides for specific subcellular delivery of therapeutic biomolecules, *Biochem.J.* 390, 407-418, 2005; Gupta, B. and Torchilin, V.P., Transactivating transcriptional activator-mediated drug delivery, *Expert Opin. Drug Deliv.* 3, 177-190, 2006.

## Intron

A segment of DNA which is not transcribed into messenger RNA and is designated as non-coding DNA.

## Intron Density

Average number of introns per gene over an entire genome. Grover, D., Mukerji, M., Bhatnagar, P., Kannan, K., and Brahmachari, S.K., Alu repeat analysis in the complete human genome: trends and

variations with respect to genomic composition, *Bioinformatics* 20, 813-827, 2004; Niu, D.K., Hou, W.R., and Li, S.W., mRNA-mediated intron losses: evidence from extraordinary large exons, *Mol.Biol. Evol.* 22, 1475-1481, 2005; Sironi, M., Menozzi, G., Comi, G.P., *et al.*, Analysis of intronic conserved elements indicates that functional complexity might represent a major source of negative selection on non-coding sequences, *Hum.Mol.Genet.* 14, 2533-2546, 2005; Toyoda, T. and Shinozaki, K., and Tiling array-driven elucidation of transcriptional structures based on maximum-likelihood and Markov models, *Plant J.* 43, 611-621, 2005; Keeling, P.J. and Slamovits, C.H. Causes and effects of nuclear genome reduction, *Curr.Opin.Genet.Dev.* 15, 601-608, 2005; Jeffares, D.C., Mourier, T., and Penny, D., The biology of intron gain and loss, *Trends Genet.* 22, 16-22, 2006; de Cambiare, J.C., Otis, C., Lemieux, C., and Turmel, M., The complete chloroplast genome sequence of the chlorophycean green alga *Scenedesmus obliquus* reveals a compact gene organization and a biased distribution of genes on the two DNA strands, *BMC Evol.Biol.* 6, 37, 2006.

## Ion Channel

An integral membrane protein(s) providing for the regulated transport of ions across a membrane via the formation of a pore-like structure. Schonherr, R., Clinical relevance of ion channels for diagnosis and therapy of cancer, *J.Membr.Biol.* 205, 175-184, 2005; Yu, F.H., Yarov-Yarovoy, V., Gutman, G.A., and Catterall, W.A., Overview of molecular relationships in the voltage-gated ion channel superfamily, *Pharmacol.Rev.* 57, 387-395, 2005; Clapham, D.E., Julius, D., Montell, C., and Schultz, G., International Union of Pharmacology XLIX. Nomenclature and structure-function relationships of transient receptor potential channels, *Pharmacol. Rev.* 57, 427-450, 2005.

## Ionization Potential

Energy required to remove a given electron from its atomic orbital; value in electron volts (eV).

## Ionophore

A chemical compound which binds ions and provides transport across a biological membrane. More recent work has led to the development of ion-specific electrodes and other sensors. One of the most common examples is A23187 which functions as a calcium ionophore (Painter, G.R. and Pressman, B.C., Dynamic aspects of ionophore mediated membrane transport, *Top.Curr.Chem.* 101, 83-110, 1982; Haynes, D.H., Detection of ionophore-cation complexes on phospholipid membranes, *Biochim.Biophys.Acta* 255, 406-410, 1972; Scarpa, A. and Inesi, G., Ionophore mediated equilibration of calcium ion gradients in fragmented-sarcoplasmic reticulum, *FEBS Lett.* 22, 273-276, 1972; Reed, P.W. and Lardy, H.A., A23187: a divalent cation ionophore, *J.Biol.Chem.* 247, 6970-6977, 1972; Haynes, D.H., Detection of ionophore-cation complexes on phospholipid membranes, *Biochim.Biophys.Acta* 255, 406-410, 1972; Chaney, M.O., Demarco, P.V., Jones, N.D., Oocolowitz, J.L., The structure of A23187, a divalent cation ionophore, *J.Am.Chem.Soc.* 96, 1932-1933, 1974; Ferreira, H.G. and Lew, V.L., Use of ionophore A23187 to measure cytoplasmic Ca buffering and activation of the Ca pump by internal Ca, *Nature* 259, 47-49, 1976; Estensen, R.D., Reusch, M.E., Epstein, M.L., and Hill, H.R. Role of Ca<sup>2+</sup> and Mg<sup>2+</sup> in some human neutrophil functions as indicated by ionophore A23187, *Infect.Immun.* 13, 146-151, 1976). See Shampsipur, M., Avenes, A., Javanbakht, M., *et al.*, A 9,10-anthraquinone

derivative having two propenyl arms as a neutral ionophore for highly selective and sensitive membrane sensors for Copper(II) ion, *Anal.Sci.* 18, 875-879, 2002; Benco, J.S., Nienaber, H.A., and McGimpsey, W.G., Synthesis of an ammonium ionophore and its application in a planar ion-selective electrode, *Anal.Chem.* 75, 152-156, 2003; Kim, Y.K., Lee, Y.H., Lee, H.Y., *et al.*, Molecular recognition of anions through hydrogen bonding stabilization of anion-ionophore adducts: a novel trifluoroacetatophenone-based binding motif, *Org.Lett.* 5, 4003-4006, 2003; Grote, Z., Lehaire, M.L., Scopelliti, R., and Severin, K., Selective complexation of Li<sup>+</sup> in water at neutral pH using a self-assembled ionophores, *J.Am.Chem.Soc.* 125, 13638-13639, 2003; Dhungana, S., White, P.S., and Crumbliss, A.L., Crystal and molecular structures of ionophore-siderophore host-guest supramolecular assemblies relevant to molecular recognition, *J.Am.Chem.Soc.* 125, 14760-14767, 2003; Mahajan, R.K., Kaur, I., Kaur, R., *et al.*, Lipophilic lanthanide tris (beta-diketonate) complexes as an ionophore for Cl<sup>-</sup> anion-selective electrodes, *Anal.Chem.* 76, 7354-7359, 2004; Fisher, A.E., Lau, G., and Naughton, D.P., Lipophilic ionophore complexes as superoxide dismutase mimetics, *Biochem.Biophys.Res.Comm.* 329, 930-933, 2005; Zhang, Y.L., Dunlop, J., Phung, T., *et al.*, Supported bilayer lipid membranes modified with a phosphate ionophore, *Biosens. Bioelectron.* 21, 2311-2314, 2006; Shirai, O., Yoshida, Y., and Kihara, S., Voltammetric study on ion transport across a bilayer lipid membrane in the presence of a hydrophobic ion or ionophore, *Anal. Bioanal.Chem.*, 386, 494-504, 2006; Rose, L and Jenkins, A.T., The effect of the ionophore valinomycin on biomimetic solid supported lipid DPPTE/EPC membranes, *Bioelectrochemistry*, 70, 387-393, 2006.

## IQ Motif

A linear sequence of amino acids that bind calmodulin and calmodulin-like proteins where IQ are the first conserved amino acids. See Bähler, M. and Rhoads, A., Calmodulin signalling via the IQ motif, *FEBS Lett.* 513, 107-113, 2002; Greeves, M.A. and Holmes, K.C., Structural basis of muscle contraction, *Ann.Rev. Biochem.* 68, 687-728, 1999.

## Isobaric

Having the same molecular mass but different chemical properties and structure; such compounds are called isobars (note: the term isobar also had a meaning in atmospheric science). Also, a process or reaction can be considered isobaric if performed under constant pressure within either space or time. See Uline, M.J. and Corti, D.S., Molecular dynamics in the isothermal-isobaric ensemble: the requirement of a "shell" molecule. II. Simulation results, *J.Chem.Phys.* 123, 164102, 2005; Rosgen, J. and Hinz, H.J., Pressure-modulated differential scanning calorimetry: theoretical background. *Anal.Chem.* 78, 991-996, 2006; Wu, W.W., Wang, G., Baek, S.J., and Shen, R.F., Comparative study of the three proteomic quantitative methods, DIGE, cICAT, and iTRAQ, using 2D gel or LC-MALDI TOF/TOF, *J.Proteome Res.* 5, 651-658, 2006; Sachon, E., Mohammed, S., Bache, N., and Jensen, O.N., Phosphopeptide quantitation using amine-reactive isobaric tagging reagents and tandem mass spectrometry: application to protein isolated by gel electrophoresis, *Rapid Commun.Mass Spectrom.* 20, 1127-1134, 2006; Langrock, T., Czihal, P. and Hoffman, R., Amino acid analysis by hydrophilic interaction chromatography coupled on-line to electrospray ionization mass spectrometry, *Amino Acids*, 30, 291-297, 2006.

## Isocratic

A term used in chromatography to describe a stepwise elution process as opposed to a gradient elution. The term isocratic also refers to a governing system with equality. See Wang, N.W., Ion exchange in purification, *Bioprocess Technol.* 9, 359-400, 1990; Frey, D.D., Feedback regulation in preparative elution chromatography, *Biotechnol.Prog.* 7, 213-224, 1991; Coffman, J.L., Roper, D.K., and Lightfoot, E.N., High-resolution chromatography of proteins in short columns and adsorptive membranes, *Bioseparation* 4, 183-200, 1994; Hajos, P. and Nagy, L., Retention behaviours and separation of carboxylic acids by ion-exchange chromatography, *J.Chromatog.B.Biomed.Sic.Appl.* 717, 72-38, 1998; Marsh, A., Clark, B.J., and Altria, K.D., A review of the background, operating parameters and applications of microemulsion liquid chromatography, *J.Sep.Sci.* 28, 2023-2032, 2005.

## Isoelectric Focusing (IEF)

An electrophoretic method for separating amphoteric molecules in pH gradients. Isoelectric focusing is an integral part of the two-dimensional analysis of proteins/peptides in proteomics using immobilized pH gradients (IPG). See Righetti, P.G. and Drysdale, J.W., Isoelectric focusing in polyacrylamide gels, *Biochim. Biophys.Acta* 236, 17-28, 1971; Haglund, H., Isoelectric focusing in pH gradients—a technique for fractionation and characterization of ampholytes, *Methods Biochem.Anal.* 19, 1-104, 1971; Righetti, P.G., and Drysdale, J.W., Small-scale fractionation of proteins and nucleic acids by isoelectric focusing in polyacrylamide gels, *Ann.N.Y.Acad.Sci.* 209, 163-186, 1973; Righetti, P.G., Molarity and ionic strength of focused carrier ampholytes in isoelectric focusing, *J.Chromatog.* 190, 275-282, 1980; Righetti, P.G., Tudor, G., and Gianazza, E., Effect of 2-mercaptoethanol on pH gradients in isoelectric focusing, *J.Biochem.Biophys.Methods* 6, 219-227, 1982; Righetti, P.G., Isoelectric focusing as the crows flies, *J.Biochem.Biophys. Methods* 16, 99-108, 1988; Strege, M.A., and Lagu, A.L., Capillary electrophoresis of biotechnology-derived proteins, *Electrophoresis* 18, 2343-2352, 1997; Korlach, J., Hagedorn, R., and Fuhr, G., pH-Regulated electroretention chromatography: towards a new method for the separation of proteins according to their isoelectric points, *Electrophoresis* 19, 1135-1139, 1998; Molloy, M.P., Two-dimensional electrophoresis of membrane proteins using immobilized pH gradients, *Anal. ## Isoelectric Point (I<sub>p</sub>)

The pH at which an amphoteric molecule such as a protein has a net charge of zero. It is, however, possible for a protein at the isoelectric point to have localized areas or patches of positivity or negativity. See Ingram, V.M., Isoelectric point of chymotrypsinogen by a Donnan equilibrium method, *Nature* 170, 250-251, 1952; Harden, V.P. and Harris, J.O., The isoelectric point of bacterial

cells, *J.Bacteriol.* 65, 198-202, 1953; Sophianopoulos, A.J. and Sasse, E.A., Isoelectric point of proteins by differential conductimetry, *J.Biol.Chem.* 240, PC1864-PC1866, 1965; Bishop, W.H. and Richards, F.M., Isoelectric point of a protein in the crosslinked crystallized state, *J.Mol.Biol.* 33, 415-421, 1968; McDonagh, P.F. and Williams, S.K., The preparation and use of fluorescent-protein conjugates for microvascular research, *Microvasc.Res.* 27, 14-27, 1984; Palant, C.E., Bonitati, J., Bartholomew, W.R., et al., Nodular glomerulosclerosis associated with multiple myeloma. Role of light chain isoelectric point, *Am.J.Med.* 80, 98-102, 1986; Karpinska, B., Karlsson, M., Schinkel, H., et al., A novel superoxide dismutase with a high isoelectric point in higher plants. Expression, regulation, and protein localization, *Plant Physiol.* 126, 1668-1677, 2001; Lim, T.K., Imai, S., and Matsunaga, T., Miniaturized amperometric flow immunoassay using a glass fiber membrane modified with anion, *Biotechnol.Bioeng.* 77, 758-763, 2002; Cargile, B.J. and Stephenson, J.L., Jr., An alternative to tandem mass spectrometry: isoelectric point and accurate mass for the identification of peptides, *Anal.Chem.* 76, 267-275, 2004; Shi, Q., Zhou, Y., and Sun, Y., Influence of pH and ionic strength on the steric mass-action model parameters around the isoelectric point of protein, *Biotechnol.Prog.* 21, 516-523, 2005; Sillero, A. and Maldonado, A., Isoelectric point determination of proteins and other macromolecules: oscillating method, *Comput. Biol.Med.* 36, 157-166, 2006; Proteins are usually least soluble at their isoelectric point and this has been suggested as a useful tool in crystallization. See Kantaardjieff, K.A. and Rupp, B., Protein isoelectric point as a predictor for increased crystallization screening efficiency, *Bioinformatics* 20, 2162-2168, 2004; Canaves, J.M., Page, R., Wilson, I.A., and Stevens, R.C., Protein biophysical properties that correlate with crystallization success in *Thermotoga maritima*: maximum clustering strategy for structural genomics, *J.Mol.Biol.* 344, 977-991, 2004.

## Isopeptide Bond

An amide bond between a carboxyl group of one amino acid and an amino group of another amino acid where either the carboxyl or amino groups or both are not  $\alpha$  in position; for example, the peptide bond formed between glutamine and lysine in transamidation reaction or the peptide bond formed with the  $\beta$ -carboxyl group of aspartic acid and the proximate amino group under acid conditions in peptides and proteins; also the bond between ubiquitin and ubiquitin-like modifiers and substrate proteins; more recently, isopeptide bonds have been described from the reaction of homocysteine lactone with  $\epsilon$ -amino groups I proteins. See Di Donato, A., Ciardiello, M.A., de Nigris, M., Piccoli, R., Mazzarella, L., and D'Alessio, G., Selective deamidation of ribonuclease A. Isolation and characterization of the resulting isoaspartyl and aspartyl derivatives, *J.Biol.Chem.* 268, 4745-4751, 1993; Chen, J.S. and Mehta, K., Tissue transglutaminase: an enzyme with a split personality, *Int.J.Biochem.Cell Biol.* 31, 817-836, 1999; Pickart, C.M., Mechanisms underlying ubiquitination, *Annu.Rev.Biochem.* 70, 502-533, 2001; Perna, A.F., Capasso, R., Lombardi, C., Acanfora, F., Satat, E., and Ingrosso, D., Hyperhomocysteinemia and macromolecule modifications in uremic patients, *Clin.Chem.Lab.Med.* 43, 1032-1038, 2005.

## Isosteres

Chemical compounds with the same number of valence electrons but different numbers and types of atoms See Rye, C.S. and Baell, J.B., Phosphate isosteres in medicinal chemistry, *Curr.Med.Chem.*

12, 3127-3141, 2005; Showell, G.A. and Mills, J.S., Chemistry challenges in lead optimization: silicon isosteres in drug discovery, *Drug Discov. Today* 8, 551-556, 2003; Venkatesan, N. and Kim, B.H., Synthesis and enzyme inhibitory activities of novel peptide isosteres, *Curr.Med.Chem.* 9, 2243-2270, 2002; Roy, R. and Baek, M.G., Glycodendrimers: novel glycoepitope isosteres unmasking sugar coding. Case study with T-antigen markers from breast cancer MUC1 glycoprotein, *J.Biotechnol.* 90, 291-309, 2002.

## Isotherm

For chromatography, an arithmetic function which describes the partitioning of chromatographic solute (adsorbate) between solvent and the matrix/adsorbent. The Langmuir Isotherm is an empirical isotherm based on a postulated kinetic mechanism describing an equilibrium process for the process of adsorption based on several assumptions; assumptions include absolute uniformity of the adsorbent service, all adsorption occurs by the same mechanism, and adsorbate molecules adsorb in a uniform monolayer on the adsorbent. See Jacobson, J., Frenz, J., and Horvath, C., Measurement of adsorption isotherms by liquid chromatography, *J.Chromatog.* 316, 53-68, 1984; Chang, C. and Lenhoff, A.M., Comparison of protein adsorption isotherms and uptake rates in preparative cation-exchange materials, *J.Chromatog. A*, 827, 281-293, 1998; Di Giovanni, O., Mazzotti, M., Morbidelli, M. *et al.*, Supercritical fluid simulated moving bed chromatography II. Langmuir isotherm, *J.Chromatog.A*. 919, 1-12, 2001; Grajek, H., Comparison of the differential isosteric adsorption enthalpies and entropies calculated from chromatographic data, *J.Chromatog.* 986, 89-99, 2003; Xia, F., Nagrath, D., and Cramer, S.M., Modeling of adsorption in hydrophobic interaction chromatography systems using a preferential interaction quadratic isotherm, *J.Chromatog.A*, 989, 47-54, 2003; Piatkowski, W., Antos, D., Gritti, F., and Guiochon, G., Study of the competitive isotherm model and the mass transfer kinetics for a BET binary system, *J.Chromatog.A*, 1003, 73-89, 2003; Lapizco-Encinas, B.H. and Pinto, N.G., Determination of adsorption isotherms of proteins by H-root method: comparison between open micro-channels and conventional packed column, *J.Chromatog.A* 1070, 201-205, 2005; Cecchi, T., Use of lipophilic ion adsorption isotherms to determine the surface area and the monolayer capacity of a chromatographic packing, as well as the thermodynamic equilibrium constant for its adsorption, *J.Chromatog. A* 1072, 201-206, 2005; Cano, T., Offringa, N.D., and Willson, R.C., Competitive ion-exchange adsorption of proteins: competitive isotherms with controlled competitor concentration, *J.Chromatog.A* 1079, 116-126, 2005; Zhang, W., Shan, Y., and Seidel-Morgenstern, A., Breakthrough curves and elution profiles of single solutes in case of adsorption isotherms with two inflection points, *J.Chromatog.A.*, 1107, 215-225, 2006. This concept is also represented by the Distribution Coefficient (see *British Pharmacopoeia*, 2004). The Distribution Coefficient or Partitioning Coefficient is also used in counter-current distribution.

## Isothermal titration calorimetry (ITC)

A physical method which directly measure the heat of interaction of two or more substances. Changes in temperature are measured as one substance is added another and molar heat (kcal/mol) is determined as function of the amount of material added. This information is used to calculate changes in enthalpy ( $\Delta H$ ). This can be applied to large molecule (ligand-receptor) and small molecule interactions. See Ciulli, A. and Abell, C., Biophysical

tools to monitor enzyme-ligand interactions of enzymes involved in vitamin biosynthesis, *Biochem.Soc.Trans.* 33(4), 767-771, 2005; Holdgate, G.A. and Ward, W.H.J., Measurements of binding thermodynamics in drug discovery, *Drug Discovery Today* 10, 1543-1550, 2005; Velazquez-Campoy, A., Leavitt, S.A., and Freire, E., Characterization of protein-protein interactions by isothermal titration calorimetry, *Methods Mol.Biol.* 261, 35-54, 2004; Rudolph, M.G., Luz, J.G., and Wilson, I.A., Structural and thermodynamic correlates of T cell signaling, *Ann.Rev.Biophys. Biomol.Struct.* 31, 121-149, 2002.

## Isotropy

A physical measurement such as melting point is identical when measured in different principal directions; antonym, anisotropy.

## Isotype

*Iso* (Gr. equal); isotype usually refers to the immunoglobulin subclasses as defined by the chemical and antigenic characteristics of their constant regions. In biological terms, isotype is refers to in terms of holotype (*holo*, GR complete) where an isotype is a biological specimen that is a duplicate of a holotype.

## Isotype Switching

The process where antibody class expression changes as in the rearrangement of genes in B cells resulting from the exposure of the B cell to its antigen. Naive B cells express IgA (secretory immunoglobulin) which stimulated or exposed B cells may express other immunoglobulin isotypes including IgG and IgE. Isotype switching is also referred to as antibody class switching. This is a process separate from that of somatic hypermutation which involves the variable regions of the immunoglobulins and is responsible for antibody functional diversity. See Rothman, P. Li, S.C., and Alt, F.W., The molecular events in heavy chain class-switching, *Semin.Immunol.* 1, 65-77, 1989; Whitmore, A.C., Houghton, G. and Arnold, L.W., Isotype switching in CD5 B cells, *Ann.N.Y.Acad.Sci.* 651, 143-151, 1992; Vercelli, D. and Geha, R.S., Regulation of isotype switching, *Curr.Opin.Immunol.* 4, 794-797, 1992; Rothman, P., Interleukin 4 targeting of immunoglobulin heavy chain class-switch recombination, *Res.Immunol.* 144, 579-583, 1993; Snapper, C. and Mond, J.J., Towards a comprehensive view of immunoglobulin class switching, *Immunol.Today* 14, 15-17, 1993; Diamant, E. and Melamed, D., Class switch recombination in B lymphopoiesis: a potential pathway for B cell autoimmunity, *Autoimmun.Rev.* 3, 464-469, 2004; Frasca, D. Riley, R.L., and Blomberg, B.B., *Crit.Rev.Immunol.* 24, 297-320, 2004; Fiset, P.O., Cameron, L., and Hamid, Q., Local isotype switching to IgE in airway mucosa, *J.Allergy Clin.Immunol.* 116, 233-236, 2005; Min, I.M. and Selsing, E., Antibody class switch recombination: roles for switch sequences and mismatch repair proteins, *Adv. Immunol.* 87, 297-328, 2005; Aplan, P.D., Causes of oncogenic chromosomal translocation, *Trends Genet.* 22, 46-55, 2006.

## JAK (Janus-associated kinase)

A family of tyrosine kinases involved in signal transduction through cytokine receptors. There are four JAK family members, JAK1, JAK2, JAK3 and TYK2. JAK1 and JAK2 are involved in type II interferon (interferon-gamma) signaling, whereas JAK1 and TYK2 are involved type I interferon signaling. The term *Janus* is derived from the Roman god for doors and pathways

frequently depicted with two faces looking in opposite directions. See Karnitz, L.M. and Abraham, R.T., Cytokine receptor signaling mechanisms, *Curr.Opin.Immunol.* 7, 320-326, 1995; Ihle, J.N., The Janus protein tyrosine kinase family and its role in cytokine signaling, *Adv.Immunol.* 60, 1-35, 1995; Gilmour, K.C. and Reich, N.C., Signal transduction and activation of gene transcription by interferon, *Gene Expr.* 5, 1-18, 1995; Gao, B., Cytokines, STATs and liver disease, *Cell.Mol.Immunol.* 2, 92-100, 2005; Yamaoka, K., Saharinen, P., Pesu, M., Holt, V.E., 3rd., Silvennoinen, O. and O'Shea, J.J., The Janus kinases (Jaks), *Genome Biol.* 5, 253 (epub), 2004.

## JASPAR

An data base for transcription factor binding: see Sandelin, A., *et al.*, JASPAR: an open-access database for eukaryotic transcription factor binding profiles, *Nuc.Acid Res.* 32, D91-D94, 2004.

## Karyology

Study of the nucleus of the cell, specifically the chromosomes. Used in the characterization of master cell banks and working cell banks for recombinant DNA products. See Chiarelli, A.B. and Koen, A.L., *Comparative Karyology of Primates*, Moulton, The Hague, Netherlands, 1979; Macgregor, H.C., *An Introduction to Animal Cytogenetics*, Chapman & Hall, London, UK, 1993; Petriciani, J.C. and Horaud, F.N., Karyology and tumorigenicity testing requirements: past, present, and future, *Dev.Biol.Stand.* 93, 5-13, 1998.

## Katal

A International standard (SI; Systems International d'Unites) unit for enzyme activity. A katal (kat) is defined as 1 mol/s. A unit for enzyme activity is defined by the IUBMB as 1  $\mu\text{mol}/\text{min}$ ; then one unit of enzyme activity is equal to  $16.67 \times 10^{-9}$  kat or 16.67 nkat. This term is used in clinical chemistry more than basic biomedical investigation. See Dybkær, R., Problems of quantities and units in enzymology, *Enzyme* 20, 46-64, 1975; Lehmann, H.P., Metrication of clinical laboratory data in SI units, *Am.J.Clin.Pathol.* 65, 2-18, 1976; Lehman, H.P., SI units, *CRC Crit.Rev.Clin.Lab.Sci.* 10, 147-170, 1979; Bowers, G.N., Jr. and McComb, R.B., A unifying reference system for clinical enzymology: aspartate aminotransferase and the International Clinical Enzyme Scale, *Clin.Chem.* 39, 1128-1136, 1984; Powsner, E.R. SI quantities and units for American Medicine, *JAMA* 252, 1737-1741, 1984; van Assendelft, O.W., The international system of units (SI) in historical perspective, *Am.J.Public Health* 77, 1400-1403, 1987; Dybkær, R. and Storrang, P.L., Application of IUPAC-IFCC recommendations on quantities and units to WHO biological reference materials for diagnostic use. International Union of Pure and Applied Chemistry (IUPAC) and International Federation of Clinical Chemistry (IFCC), *Eur.J.Clin.Chem.Clin.Biochem.* 33, 623-625, 1995; Dybkær, R., The tortuous road to the adoption of katal for the expression of catalytic activity by the general conference on weights and measures, *Clin.Chem.* 48, 586-590, 2002.

A fibrous protein found in skin, hair and surface hard tissue such as nails. Keratins are characterized by a relatively high content of sulfur-containing amino acids. See Crewther, W.G., Fraser, R.D., Lennox, F.G., and Lindley, H., The chemistry of keratins, *Adv.Protein Chem.* 20, 191-346, 1965; Roe, D.A., Sulphur metabolism in relation to cutaneous disease, *Br.J.Dermatol.* 81(Suppl 2), 49-60, 1969; Bradbury, J.H., Keratin and its formation, *Curr.Probl.*

*Dermatol.* 6, 34-86, 1976; Fuchs, E. and Green, H., Multiple keratins of cultured human epidermal cells are translated from different mRNA molecules, *Cell* 17, 573-582, 1979; Sun, T.T., Eichner, R., Nelson, W.C. *et al.*, Keratin classes: molecular markers for different types of epithelial differentiation, *J.Invest.Dermatol.* 81 (Suppl 1), 109S-115S, 1983; Steinert, P.M., Jones, J.C., and Goldman, R.D., Intermediate filaments, *J.Cell.Biol.* 99, 22s-27s, 1984; Virtanen, I., Miettinen, M., Lehto, V.P., *et al.*, Diagnostic application of monoclonal antibodies to intermediate filaments, *Ann.N.Y.Acad.Sci.* 455, 635-648, 1985; Dale, B.A., Resing, K.A., and Lonsdale-Eccles, J.D., Filaggrin: a keratin filament associated protein, *Ann.N.Y.Acad.Sci.* 455, 330-342, 1985.

## Keratin

Fuchs, E., Keratin genes, epidermal differentiation and animal models for the study of human skin diseases, *Biochem.Soc.Trans.* 19, 1112-1115, 1991; Oshima, R.G., Intermediate filament molecular biology, *Curr.Opin.Cell Biol.* 4, 110-116, 1992; Coulombe, P.A., The cellular and molecular biology of keratins: beginning a new era, *Curr.Opin.Cell Biol.* 5, 17-29, 1993; Liao, J., Ku, N.O., and Omary, M.B., Keratins and the keratinocyte activation cycle, *J.Invest.Dermatol.* 116, 633-640, 2001; Kierszenbaum, A.L., Keratins: unraveling the coordinated construction of scaffolds in spermatogenic cells, *Mol.Reprod.Dev.* 61, 1-2, 2002; Lane, E.B. and McLean, W.H., Keratins and skin disorders, *J.Pathol.* 204, 355-366, 2004; Zatloukal, K., Stumpter, C., Fuchsbichler, A. *et al.*, The keratin cytoskeleton in liver disease, *J.Pathol.* 204, 367-376, 2004; Gupta, R. and Ramnani, P., Microbial keratinases and their prospective applications: an overview, *Appl.Microbiol.Biotechnol.* 70, 21-33, 2006.

## Kinome

The protein kinases in a proteome of an organism. See Manning, G., Whyte, D.B., Martinez, R., Hunter, T., and Sudarsanam, S., The protein kinase complement of the human genome, *Science* 298, 596-601, 2000; ter Haar, E., Walters, W.P., Pazhanisamy, S., Taslimi, P., Pierce, A.C., Bemis, G.W., Salituro, F.G., and Harbeson, S.L., Kinase chemogenomics: targeting the human kinome for target validation and drug discovery, *Mini Rev.Med.Chem.* 4, 235-253, 2004.

## Kinomics

Analysis of all kinases in the proteome of a given organism. See Vieth, M., Sutherland, J.J., Robertson, D.H., and Campbell, R.M., Kinomics: characterizing the therapeutically validated kinase space, *Drug Discov.Today* 10, 839-846, 2005; Johnson, S.A. and Hunter, T., Kinomics: methods for deciphering the kinome, *Nat.Methods* 2, 17-25, 2005.

## Knockdown

Suppression or inhibition of transcription by the process of RNA interference/RNA silencing.

## krüppel-like Factor

A family of zinc finger transcription factors; the name is derived from the *Drosophila* Krüppel embryonic pattern regulator. See Sugawara, M., Scholl, T., Ponath, P.D., and Strominger, J.L., A factor that regulates the class II major histocompatibility complex

gene DPA is a member of a subfamily of zinc finger proteins that includes a *Drosophila* developmental control protein, *Mol.Cell. Biol.* 14, 8438-8450, 1994; Kaczynski, J., Cook, T., and Urrutia, R., Spl- and Krüppel-like transcription factors, *Genome Biology* 4, article 206, 2003.

## Labile Zinc

Zinc is an essential mineral for most organisms. Zn is either labile or fixed. Fixed Zn is that Zn tightly bound to metalloproteins while labile zinc is bound loosely to proteins or low molecular thiols such as glutathione. Total cellular Zn is measured by atomic absorption analysis while labile Zn can be measured, for example, with fluorophoric reagents. See Pattison, S.E. and Cousins, R.J., Zinc uptake and metabolism by hepatocytes, *Fed. Proc.* 45, 2805-2509, 1986; Truong-Tran, A.Q., Ho, L.H., Chai, F., and Zalewski, P.D., Cellular zinc fluxes and the regulation of apoptosis/gene-directed cell death, *J.Nutr.* 130(5S Suppl), 1459S-1466S, 2000; Paski, S.C., and Xu, Z., Growth factor stimulated cell proliferation is accompanied by an elevated labile intracellular pool of zinc in 3T3 cells, *Can.J.Physiol.Pharmacol.* 80, 790-795, 2002; Eide, D.J., Multiple regulatory mechanisms maintain zinc homeostasis in *Saccharomyces cerevisiae*, *J.Nutr.* 133 (5 Suppl 1), 1532S-1535S, 2003; Sauer, G.R., Smith, D.M., Cahalane, M., Wu, L.N., and Wuthier, R.E., Intracellular zinc fluxes associated with apoptosis in growth plate chondrocytes, *J.Cell.Biochem.* 88, 954-969, 2003; Roschitzki, B. and Vasak, M., Redox labile site in a Zn<sub>4</sub> cluster of Cu<sub>4</sub>Zn<sub>4</sub>-metallothionein-3, *Biochemistry* 42, 9822-9828, 2003; Ho, L.H., Ruffin, R.E., Murgia, C. *et al.*, Labile zinc and zinc transporter ZnT4 in mast cell granules: role in regulation of capases activation and NF- $\kappa$ B translocation, *J.Immunol.* 172, 7750-7760, 2004; Atsriku, C., Scott, G.K., Benz, C.C., and Baldwin, M.A., Reactivity of zinc finger cysteines: chemical modification within labile zinc fingers in estrogen receptors, *J.Am.Soc.Mass Spectrom.* 16, 2017-2026, 2005; Lee, J.Y., Hwang, J.J., Park, M.H., and Koh, J.Y., Cytosolic labile zinc: a marker for apoptosis in the developing rat brain, *Eur.J.Neurosci.* 23, 435-442, 2006; Zalewski, P., Truong-Tran, A., Lincoln, S., *et al.*, Use of a zinc fluorophore to measure labile pools of zinc in body fluids and cell-conditioned media, *BioTechniques* 40, 509-520, 2006; Haase, H., Hebel, S., Engelhardt, G., and Rink, L., Flow cytometric measurement of labile zinc in peripheral blood mononuclear cells, *Anal.Biochem.* 352, 222-230, 2006.

## Lactoferrin

Lactoferrin is an iron binding protein of very high affinity originally described in milk and other secreted biological fluids such as saliva (see Weinberg, E.D., The therapeutic potential of lactoferrin, *Expert Opin.Investig.Drugs* 12, 841-851, 2003; Van Nieuw Amerongen, A., Bolscher, J.G., and Veerman, E.C., Salivary proteins: protective and diagnostic value in cariology? *Caries Res.* 38, 247-253, 2004). Lactoferrin is also found specific granules of neutrophils. Lactoferrin is considered to play an important role in the non-specific defense process by sequestering iron required bacterial growth. See Goldman, A.S. and Smith, C.W., Host resistance factors in human milk, *J.Pediatr.* 82, 1082-1090, 1973; Bullen, J.J., Rogers, H.J., and Griffiths, E., Role of iron in bacterial infection, *Curr.Top.Microbiol. Immunol.* 80, 1-35, 1978; Reiter, B., The biological significance of lactoferrin, *Int.J.Tissue React.* 5, 87-96, 1983; Birgens, H.S., The biological significance of lactoferrin in haematology,

*Scand.J.Haematol.* 33, 225-230, 1984; De Sousa, M., Breedvelt, F., Dynesius-Trentham, R., and Lum, J., Iron, iron-binding proteins and immune system cells, *Ann.N.Y.Acad.Sci.* 526, 310-322, 1988; Levay, P.F. and Viljoen, M., Lactoferrin: a general review, *Haematologica* 80, 252-267, 1995; Legrand, D., Ellass, E., Pierce, A., and Mazurier, J., Lactoferrin and host defense: an overview of its immuno-modulating and anti-inflammatory properties, *Biomaterials* 17, 225-229, 2004; Yalcin, A.S., Emerging therapeutic potential of whey proteins and peptides, *Curr.Pharm Des.* 12, 1637-1643, 2006.

## Latarcins

A newly defined group of antimicrobial and cytolytic peptides from spider venom. See Kozlov, S.A., Vassilevski, A.A., Feofanov, A.V., *et al.*, Latarcins, antimicrobial and cytolytic peptides from the venom of the spider *Lachesana tarabaevi* (Zodariidae) that exemplify biomolecular diversity, *J.Biol.Chem.* 281, 20983-20992, 2006.

## Lectin

A protein which selectively binding carbohydrates. Lectin affinity columns can be used for the purification of carbohydrate chains and glycoproteins. Lectins are also used in histochemistry and cytochemistry. See Cohen, E., *Recognition Proteins, Receptors, and Probes: Invertebrates: Proceedings of a Symposium Entitled Recognition and Receptor Display, Lectin Cell Surface Receptors and Probes*, A.R. Liss, New York, New York, 1984; Gabius, H.J. and Gabius, S., *Lectins and Glycobiology*, Springer-Verlag, Berlin, Germany, 1993; Fukuda, M. and Kobata, A., *Glycobiology: A Practical Approach*, IRL Press at Oxford University Press, Oxford, UK, 1993; Doyle, R.J. and Shifkin, M., *Lectin-Microorganism Interactions*, Marcel Dekker, New York, New York, 1994; Brooks, S.A., Leather, A.J.C., and Schumacher, L., *Lectin Histochemistry: A Concise Practical Handbook*, BIOS Scientific, Oxford, UK, 1997; Caron, M. and Sève, A.-P., *Lectins and Pathology* Harwood Academic, Amsterdam, Netherlands, 2003.

## Linkage Group

A group of genes inherited as a unit such they are described a linked such that disparate phenotypic expressions are also described as linked. See Lamm, LU. and Petersen, G.B., The HLA genetic linkage group, *Transplant Proc.* 11, 1692-1696, 1979; Campbell, R.D., Dunham, I., and Sargent, C.R., Molecular mapping of the HLA-linked complement genes and the RCA linkage group, *Exp.Clin.Immunogenet.* 5, 81-98, 1988; Haig, D., A brief history of human autosomes, *Philos.Trans.R.Soc.Lond. B Biol.Sci.* 354, 1447-1470, 1999.

## Lipofection

Originally described as cellular membrane translocation of DNA for gene therapy via the use of cationic lipids as a micelle. More generally the membrane translocation of RNA or DNA encapsulated in a lipid micelle and is used now for RNAi studies. The liposome and its cargo are referred to as a lipoplex. See Hart, S.L., Lipid carriers for gene therapy, *Curr.Drug.Deliv.* 2, 423-438, 2005; Zuhorn, I.S., Kalicharan, R., and Hoekstra, D., Lipoplex-mediated transfection of mammalian cells occurs through the cholesterol-dependent clathrin-mediated pathway of endocytosis, *J.Biol. Chem.* 277, 18021-18028, 2002.

## Lipophilic

Affinity for hydrophobic materials such as lipids; compounds which will dissolve in organic/non-polar solvents such as benzene or cyclohexane but not in water; also hydrophobicity. This quality is frequently measured by distribution or partitioning in an octanol-water system and can be assigned a value such as Log P. Lipophilicity can also be measured by retention on an HPLC column with a suitable matrix or on thin-layer chromatography. See Markuszewski, M.J., Wiczling, P., and Kalisz, R., High-throughput evaluation of lipophilicity and acidity by new gradient HPLC methods, *Comb.Chem.High Throughput Screen.* 7, 281-289, 2004; Klopman, G. and Zhu, H., Recent methodologies for the estimation of *n*-octanol/water partition coefficients and their use in the prediction of membrane transport properties of drugs, *Mini Rev.Med.Chem.* 5, 127-133, 2005. Mannhold, R., The impact of lipophilicity in drug research: a case report on beta-blockers, *Mini Rev.Med.Chem.* 5, 197-205, 2005; Gocan, S., Cimpan, G., and Comer, J., Lipophilicity measurements by liquid chromatography, *Adv.Chromatog.* 44, 79-176, 2006.

## Liposomes

A relatively large (nano to micro) micelle composed of polar lipids. There is considerable interest in liposomes as models for biological membranes and for drug delivery. See Bangham, A.D., Lipid bilayers and biomembranes, *Annu.Rev.Biochem.* 41, 753-776, 1972; Gulik-Krzywicki, T., Structural studies the association between biological membranes components, *Biochim.Biophys.Acta* 415, 1-28, 1975; Pressman, B.C., Biological applications of ionophores, *Annu.Rev.Biochem.* 45, 501-530, 1976; Schreier, S., Polnaszek, C.F., and Smith, I.C., Spin labels in membranes. Problems in practice, *Biochim.Biophys.Acta* 515, 395-436, 1978; Hart, S.L., Lipid carriers for gene therapy, *Curr.Drug Deliv.* 2, 423-428, 2005; Zamboni, W.C., Liposomal, nanoparticle, and conjugated formulations of anticancer agents, *Clin.Chem.Res.* 11, 8230-8234, 2005; Taylor, T.M., Davidson, P.M., Bruce, B.D., and Weiss, J., Liposomal nanocapsules in food science and agriculture, *Crit.Rev.Food Sci.Nutr.* 45, 587-605, 2005; Kshirsager, N.A., Pandya, S.K., Kirodian, G.B., and Sanath, S., Liposomal drug delivery system from laboratory to clinic, *J.Postgrad.Med.* 51(Suppl 1), S5-S15, 2005; Paleos, C.M. and Tsiourvas, D., Interaction between complementary liposomes: a process leading to multicompartiment systems formation, *J.Mol.Recognit.* 19, 60-67, 2006.

## Localized Surface Plasmon Resonance

The use of noble metal (Ag, Au) nanoparticles as sensors for macromolecular interactions. This phenomena is related to surface plasmon resonance and is based on the spectral properties of nanoparticles as compared to the bulk metal. See Haes, A.J. and Van Duyne, R.P., A unified view of propagating and localized surface plasmon resonance biosensors, *Anal.Bioanal.Chem.* 370, 920-930, 2004; Haes, A.J., Stuart, D.A., Nie, S., and Van Duyne, R.P., Using solution-phase nanoparticles, surface-confined nanoparticle arrays and single nanoparticles as biological sensing platforms, *J.Fluoresc.* 14, 355-367, 2004; Dahlin, A., Zach, M., Rindzevicius, T., *et al.*, Localized surface plasmon resonance sensing of lipid-membrane-mediated biorecognition events, *J.Am.Chem.Soc.* 127, 5043-5048, 2005; Endo, T., Kerman, K., Nagatani, N., Takamura, Y., and Tamiya, E., Label-free detection of peptide nucleic acid-DNA hybridization using localized surface plasmon resonance based optical biosensor, *Anal.Chem.*

77, 6976-6984, 2005; Wang, Y., Chen, H., Dong, S., and Wang, E., Surface enhanced Raman scattering of *p*-aminothiophenol self-assembled monolayers in sandwich structure fabricated on glass, *J.Chem.Phys.* 124, 74709, 2006.

## Locus Control Region

A *cis*-acting region on a gene locus which controls the expression of a transgene *in vivo*; a region in a gene sequence which regulatory the independent expression of a gene in transgenic mice; a regulatory element critical for globin gene expression. See Festenstein, R. and Kioussis, D., Locus control regions and epigenetic chromatin modifiers, *Curr.Opin.Genet.Dev.* 10, 199-203, 2000; Levings, P.P. and Bungert, J., The human  $\beta$ -globin locus region. A center of attraction. *Eur.J.Biochem.* 269, 1589-1599, 2002; Dekker, J., A closer look at long-range chromosomal interactions, *Trends Biochem.Sci.* 28, 277-280, 2003; Harrow, F. and Ortiz, B.D., The TCR $\alpha$  locus control region specifies thymic, but not peripheral patterns of TCR $\alpha$  gene expression, *J.Immunol.* 175, 6659-6667, 2005; Dean, A., On a chromosome far, far away: LCRs and gene expression, *Trends Genet.* 22, 38-45, 2006.

## Longin Domain

An *N*-terminal domain in non-syntaxin soluble *N*-ethylmaleimide-sensitive factor (NSF) attachment protein receptors (SNARE) which have been suggested to regulate membrane trafficking processes. Such proteins are described as longins (longin domains are also found in YKT-like proteins). The term longin was suggested to differentiate such domains from "brevins" which are shorter *N*-terminal regions found in vesicle-associated membrane proteins. See Filippini, E., Rossi, V., Galli, T., *et al.*, Longins: a new evolutionary conserved VAMP family sharing a novel SNARE domain, *Trends Biochem.Sci.* 26, 407-409, 2001; Dietrich, L.E.P., Boeddinghaus, C., LaGrassa, T.J., and Ungermann, C., Control of eukaryotic membrane fusion by *N*-terminal domain of SNARE proteins, *Biochim.Biophys.Acta* 1641, 111-119, 2003; Martinez-Arca, S., Rudge, R., Vacca, M. *et al.*, A dual mechanism controlling the localization and function of exocytic v-SNAREs, *Proc.Natl.Acad.Sci.USA* 100, 9011-9016, 2003; Rossi, V., Picco, R., Vacca, M. *et al.*, VAMP subfamilies identified by specific R-SNARE motifs, *Biology of the Cell* 96, 251-256, 2004; Uemura, T., Sato, M.H., and Takeyasu, K., The longin domain regulates subcellular targeting of VAMP7 in *Arabidopsis thaliana*, *FEBS Lett.* 579, 2842-2846, 2005; Schlenker, O., Hendricks, A., Sinning, I., and Wild, K., The structure of the mammalian signal recognition particle (SRP) receptor as prototype for the interaction of small GTPases with longin domains, *J.Biol.Chem.* 281, 8898-8906, 2006.

## Luminescence

The emission of electromagnetic radiation from an excited molecule when an electron returns to ground state from an excited state (other than from thermal energy changes). Fluorescence, phosphorescence and chemiluminescence are forms of luminescence. The decay time for fluorescence is shorter than phosphorescence and both phenomena result from irradiation of compounds with electromagnetic irradiation while chemiluminescence is the result of a chemical reaction, usually oxidation. Phosphorescence also shows a larger shift in the wavelength of emitted light than fluorescence. Electrochemiluminescence differs from all of the above in that in that chemiluminescence is generated at the surface of an electrode. Hemmila, I. and Laitala, V., Progress in lanthanides as

luminescent probes, *J.Fluoresc.* 15, 529-542, 2005; Tsuji, F.I., Role of molecular oxygen in the bioluminescence of the firefly squid, *Watasenia scintillans*, *Biochem.Biophys.Res.Comm.* 338, 250-253, 2005; Abrams, B.L. and Hollaway, P.H., Role of the surface in luminescent processes, *Chem.Rev.* 104, 5783-5801, 2004; Aslan, K., Lakowicz, J.R., and Geddes, C.D., Plasmon light scattering in biology and medicine: new sensing approaches, visions, and perspectives, *Curr.Opin.Chem.Biol.* 9, 538-544, 2005; Richter, M.M., Electrochemiluminescence, *Chem.Rev.* 104, 3003-3036, 2004. Medlycott, E.A. and Hanan, G.S., Designing tridentate ligands for ruthenium(II) complexes with prolonged room temperature luminescence lifetimes, *Chem.Soc.Rev.* 34, 133-142, 2005.

## Lutheran Glycoprotein

The Lutheran glycoprotein is one of the two components of the Lutheran blood group system, a family of red blood cell antigens. The Lutheran glycoprotein together with basal cell adhesion molecule which are together recognized as CD239 are members of the immunoglobulin superfamily. See Telen, M.J., Lutheran antigens, CD44-related antigens, and Lutheran regulatory genes, *Transfus.Clin.Biol.* 2, 291-301, 1995; Daniels, G. and Crew, V., The molecular basis of the Lutheran blood group antigens, *Vox.Sang.* 83(Suppl 1), 189-192, 2002; Kikkawa, Y. and Miner, J.H., Review: Lutheran/B-CAM: a laminin receptor on red blood cells and in various tissues, *Connect.Tissue Res.* 46, 193-199, 2005; Eyley, C.E. and Telen, M.J., The Lutheran glycoprotein; a multifunction adhesion receptor, *Transfusion* 46, 668-667, 2006.

## Lysosomes

An intracellular organelle in a eukaryotic cell responsible for **controlled** intracellular digestion. Lysosomal protein degradation is also involved in MHC class II antigen preparation. Lysosomes contain a variety of hydrolytic enzymes having an acid pH optimum. See Wolf, D.H., From lysosome to proteasome: the power of yeast in the dissection of proteinase function in cellular regulation and waste disposal, *Mol.Life Sci.* 61,1601-1614, 2004; Luzio, J.P., Pryor, P.R., Gray, S.R., Gratian, M.J., Piper, R.C., and Bright, N.A., *Biochem.Soc.Symp.* 72, 77-86, 2005; Bagshaw, R.D., Mahuran, D.J., and Callahan, J.W., Lysosomal membrane proteomics and biogenesis of lysosomes, *Mol.Neurobiol.* 32, 27-41, 2005; Hsing, L.C., and Rudensky, A.Y., The lysosomal cysteine proteases in MHC class II antigen presentation, *Immunol.Rev.* 207, 229-241, 2005; Hideshima, T., Bradner, J.E., Chauhan, D., and Anderson, K.C., Intracellular protein degradation and its therapeutic implications, *Clin.Cancer Res.* 11, 8530-8533, 2005. Mellman, T. Antigen processing and presentation by dendritic cells: cell biological mechanisms, *Adv.Exp.Med.Biol.* 560, 63-67, 2005; Lip, P., Gregg, J.L., Wang, N., Zhou, D., O'Donnell, P., Blum, J.S., and Crotzer, V.L., Compartmentalization of class II antigen presentation: contribution of cytoplasmic and endosomal processing, *Immunol.Rev.* 207, 206-217, 2005; Gatti, E. and Pierre, P., Understanding the cell biology of antigen presentation: the dendritic cell contribution, *Curr.Opin.Cell Biol.* 15, 468-473, 2003; Honey, K. and Rudensky, A.Y., Lysosomal cysteine proteases regulate antigen presentation, *Nat.Rev.Immunol.* 3, 472-482, 2003.

## Macrolide

A large ring structure with many functional groups. An example is provided by the kabiramides. See Petchprayoon, C., Swanbonriux, K., Tanaka, J., Yan, Y., Sakata, T., and Marriotti, G.,

Fluorescent kabiramides: new probes to quantify actin in vitro and in vivo, *Bioconjugate Chem.* 16, 1382-1389, 2005.

## Macrophage

An immune system cell which is derived from a monocyte after passage through the endothelium and is a phagocytic cell and an antigen presenting cell. See *The Macrophage*, ed. N.N. Pearsall and R.S. Weiser, Lea & Febiger, Philadelphia, PA, 1970; Carr, I., *The Macrophage: A Review of Ultrastructure and Function*, Academic Press, London, 1973; *Immunobiology of the Macrophage*, ed. D.S. Nelson and P. Alexander, Academic Press, New York, NY, 1976; Horst, M., *The Human Macrophage System: Activity and Functional Morphology*, Karger, Basel, 1988; *Macrophage Biology and Activation*, ed. S.W. Russell and S. Gordon, Springer-Verlag, Berlin, 1992; *Macrophage-Pathogen Interactions*, ed. B.S.Zwilling and T.K. Eisenstein, M. Dekker, New York, NY., 1992; *The Macrophage*, ed. B. Bernard and C.E. Lewis, Oxford University Press, Oxford, UK, 2002. Foam cells which are derived from macrophages play an important role in the pathogenesis of atherosclerosis (Schwartz, C.J., Valente, A.J., Sprague, E.A., et al., The pathogenesis of atherosclerosis: an overview, *Clin.Cardiol.* 14(2 Suppl 1), I1-I16, 1991; Osterud, B. and Bjorklid, E., Role of monocytes in atherogenesis, *Physiol.Rev.* 83, 1069-1112, 2003; Linton, M.F. and Fazio, S., Macrophages, inflammation, and atherosclerosis, *Int.J.Obes.Relat.Metab.Disord.* 27(supp 3), S35-S40, 2003; Shashkin, P., Dragulev, B., and Ley, K., Macrophage differentiation to foam cells, *Curr.Pharm.Des.* 11, 3061-3072, 2005; Bobryshev, Y.V., Monocyte recruitment and foam cell formation in atherosclerosis, *Micron* 37, 208-222, 2006.

## Macropinocytosis

Actin-mediated endocytotic process possessing unique ultrastructural features such as the formation of the macropinosome. See Pratten, M.K. and Lloyd, J.B., Effects of temperature, metabolic inhibitors and some other factors on fluid-phase and adsorptive pinocytosis by rat peritoneal macrophages, *Biochem.J.* 180, 567-571, 1979; Sallusto, F., Cella, M., Danieli, C. and Lanzavecchia, A., Dendritic cells use macro-pinocytosis and the mannose receptor to concentrate macromolecules in the major histocompatibility complex class II compartment: downregulation by cytokines and bacterial products, *J.Exp.Med.* 182, 389-400, 1995; Kaplan, I.M., Wadia, J.S., and Dowdy, S.F., Cationic TAT peptide transduction domain enters cells by macropinocytosis, *J.Control.Release* 192, 247-253, 2005; Chia, C.P., Gomathinayagam, S., Schmaltz, R.J., and Smoyer, L.K., Glycoprotein gp130 of dictyostelium discodeum influences macropinocytosis and adhesion, *Mol. Biol.Cell* 16, 2681-2693, 2005; Melikov, K. and Chernomordik, L.V., Arginine-rich cell penetrating peptides: from endosomal uptake to nuclear delivery, *Cell.Mol.Life Sci.* 62, 2739-2749, 2005; Kirkham, M. and Parton, R.G., Clathrin-independent endocytosis: new insights into caveolae and non-caveolar lipid raft carriers, *Biochim.Biophys.Acta* 1746, 349-363, 2005; Zaro, J.L., Rajapaksa, T.E., Okamoto, C.T., and Shen, W.C., Membrane transduction of oligoarginine in HeLa cells is not mediated by macropinocytosis, *Mol.Pharm.* 3, 181-186, 2006; Mettlen, M., Platek, A., Van Der Smissen, P., et al., Src triggers circular ruffling and macropinocytosis at the apical surface of polarized MDCK cells, *Traffic* 7, 589-603, 2006; von Delwig, A., Hilken, C.M., Altmann, D.M. et al., Inhibition of macropinocytosis blocks antigen presentation of type II collagen in vitro and in vivo in HLA-DR1 transgenic mice, *Arthritis Res.Ther.* 8, R93, 2006.

## Madin-Darby canine Kidney (MDCK)

Used in reference to a mammalian cell line (MDCK cells) used to represent polarized epithelial cells. See Hidalgo, I.J., Assessing the absorption of new pharmaceuticals, *Curr.Top.Med.Chem.* 1, 385-401, 2001; Cohen, D. and Musch, A., Apical surface formation in MDCK cells: regulation by the serine/threonine kinase EMK1, *Methods* 30, 69-276, 2003; Sidorenko, Y. and Reichl, U., Structured model of influenza virus replication in MDCK cells, *Biotechnol.Bioeng.* 88, 1-14, 2004; Urquhart, P., Pang, S., and Hooper, N.M., N-Glycans as apical targeting signals in polarized epithelial cells, *Biochem.Soc.Symp.* 72, 39-45, 2005.

## Maillard Reaction

A reaction (named after Louis-Camille Maillard) between a protein amino group, usually the epsilon-amino group of lysine and a reducing sugar/aldose. There is an initial condensation reaction to form a Schiff base which undergoes rearrangement to form an Amadori product. This process can initiate a chain reaction resulting in protein cross-linking and the formation of complex chemicals referred to as advanced glycation end products (AGE). Reaction with chemicals such as glucose and methylglyoxal results Maillard Reactions. The browning of foods and the tanning of animal skin are examples of the Maillard reaction. See Waller, G.R. and Feather, M.S., *The Maillard Reaction in Foods and Nutrition*, American Chemical Society, Washington, DC, 1983; Labuza, T.P., *Maillard Reactions in Chemistry, Food and Nutrition*, Royal Society of Chemistry, Cambridge, UK, 1994; Ikan, R., *The Maillard Reaction: Consequences for the Chemical and Life Sciences*, Wiley, Chichester, West Sussex, UK, 1996; Fayle, S.E. and Gerrard, J.A., *The Maillard Reaction*, Royal Society of Chemistry, Cambridge, UK, 2002; Nursten, H., *The Maillard Reaction. Chemistry, Biochemistry, and Implications*, Royal Society of Chemistry, Cambridge, UK, 2005; Hodge, J.E., Chemistry of the browning reactions in model systems, *J.Agric.Food Chem.* 1, 928-943, 1953; Njoroge, F.G. and Monnier, V.M., The chemistry of the Maillard reaction under physiological conditions: a review, *Prog.Clin.Biol.Res.* 304, 85-107, 1989; Kaanane, A. and Labuza, T.P., The Maillard reaction in foods, *Prog.Clin.Biol.Res.* 304, 301-327, 1989; Marko, D., Habermeyer, M., Keméy, M., *et al.*, Maillard reaction products modulating the growth of human tumor cells in vitro, *Chem.Res.Toxicol.* 16, 48-55, 2003; Takeguchi, M., Yamagishi, S., Iwaki, M., *et al.*, Advanced glycation end product (age) inhibitors and their therapeutic implications in diseases, *Int.J.Clin.Pharmacol.Res.* 24, 95-1010, 2004; Jing, H. and Nakamura, S., Production and use of Maillard products as oxidative stress modulators, *J.Med.Food* 8, 291-298, 2005; Lederer, M.O., Gerum, F., and Severin, T., Cross-linking of proteins by Maillard processes-model reactions of D-glucose or methylglyoxal with butylamine and guanidine derivatives, *Bioorg.Med.Chem.* 6, 993-1002, 1998; Oya, T., Hattori, N., Mizuno, Y. *et al.*, Methylglyoxal modification of protein. Relationship with diabetes, *J.Biol.Chem.* 280, 12310-12315, 2005.

## Major Groove And Minor Groove – DNA structure

The channels or grooves formed when two complementary strands of DNA hybridize with each other to form a double helix. The major groove is ~22 Å wide and the minor groove

~11 Å wide. See Jovin, T.M., McIntosh, L.P., Anrdt-Jovin, D.J., *et al.*, Left-handing DNA: from synthetic polymers to chromosomes, *J.Biomol.Struct.Dyn.* 1, 21-57, 1983; Uberbacher, E.C., and Bunick, G.J., Structure of the nucleosome core particle at 8 Å resolution, *J.Biomol.Struct.Dyn.* 7, 1-18, 1989; Reddy, B.S., Sondi, S.M., and Iown, J.W., Synthetic DNA minor groove-binding drugs; Haq, I., Thermodynamics of drug-DNA interactions, *Arch.Biochem.Biophys.* 403, 1-15, 2002; Sundaralingam, M. and Pan, B., Hydrogen and hydration of DNA and RNA oligonucleotides, *Biophys.Chem.* 95, 273-282, 2002; Susbielle, G., Blatters, R., Brevet, V., Monod, C., and Kas, E., Target practice: aiming at satellite repeats with DNA minor groove binders, *Curr.Med.Chem.Anticancer Agents* 5, 409-420, 2005; Dragan, A.I., Li, Z., Makeyeva, E.I., *et al.*, Forces driving the binding of homeodomains to DNA, *Biochemistry* 45, 141-151, 2006; Horton, J.R., Zhang, X., Maunus, R., *et al.*, DNA nicking by HikPII endonuclease: bending, based flipping and minor groove expansion, *Nucleic Acids Res.* 34, 939-948, 2006; Lamoureux, J.S. and Glover, J.N., Principles of protein-DNA recognition revealed in the structural analysis of Ndt80-MSE DNA complexes, *Structure* 14, 555-565, 2006.

## Major Histocompatibility Complex (MHC)

The major histocompatibility complex (MHC) or locus is a cluster of genes on chromosome 6 (chromosome 17 in the mouse) which encodes a family of membrane glycoproteins referred to as MHC protein or molecules. There are some non-membrane proteins such as HLA-DM and HLA-DO which are encoded by the MHC and function in the processing of peptides for delivery to the MHC membrane glycoproteins. MHC membrane glycoproteins are found in antibody presenting cells (APCs; professional antigen presenting cells, dendritic cells, macrophages, and B-cells) and "present" antigens to effector CD-4 and CD-8 T-cells. MHC membrane glycoproteins are divided into two groups; MHC class I and MHC class II. MHC class I proteins present peptides generated in the cytoplasm to CD 8 T-cells stimulating the formation of cytotoxic T-cells. Peptides for MHC class I receptors are processed by proteasomes and can be derived from virus-infected cells. MHC class II receptors present peptides to CD-4 T-cells which activate B-cells to form plasma cells which synthesize and secrete antibody. Peptides for MHC class II receptors are derived from the action of lysosomal proteases on endosomes. See Janeway, C.A., Jr., Travers, P., Walport, M., and Capra, J.D., *Immunobiology. The Immune System in Health and Disease*, 4th edn., Garland Publishing, New York, New York, 1999; Lyczak, J.B., The major histocompatibility complex, in *Immunology, Infection, and Immunity*, ed. G.B. Pier, J.B. Lyczak, and L.M. Wetzler, ASM Press, Washington, DC, 2004, Chapter 11, pp. 261-282; Krawczyk, M. and Reith, W., Regulation of MHC class II expression, a unique regulatory system identified by the study of a primary immunodeficiency disease, *Tissue Antigens* 67, 183-197, 2006; Serrano, N.C., Millan, P., and Paez, M.C., Non-HLC associations with autoimmune diseases, *Autoimmune Rev.* 5, 209-214, 2006; Drozina, G., Kohoutek, J., Jabrane-Ferrat, N., and Peterlin, B.M., Expression of MHC II genes, *Curr.Top.Microbiol. Immunol.* 290, 147-170, 2005; Hoglund, P., Induced peripheral regulatory T cells: the family grows larger, *Eur.J.Immunol.* 36, 264-266, 2006; Wucherpfennig, K.W., The structural interactions between T cell receptors and MHC-peptide complexes place physical limits on self-nonsel discrimination, *Curr.Top. Microbiol.Immunol.* 296, 19-37, 2005.

## MAPPER

Search engine for the identification of putative transcription factor binding sites (TFBSs): see Marinescu, V.D., Kohane, I.S., and Riva, A., MAPPER: a search engine for the computational identification of putative transcription factor binding sites in multiple genomes, *BMC Informatics* 6, 79, 2005.

## Mass Spectrometer

A device that assigns mass-to-charge ratios to ions based on their momentum, cyclotron frequency, time-of-flight, or other parameters. See Kiser, R.W., *Introduction to Mass Spectrometry and Its Applications*, Prentice-Hall, Englewood Cliffs, NJ, 1965; Blauth, E.W., *Dynamic Mass Spectrometers*, Elsevier, Amsterdam, Netherlands, 1966; Majer, J.R., *The Mass Spectrometer*, Wykeham Publications, London, UK, 1977; Herbert, C.G. and Johnstone, R.A.W., *Mass Spectrometry Basics*, CRC Press, Boca Raton, FL, 2003.

## Mast Cell

A type of leukocyte found in tissues with large basophilic secretory granules containing histamine and other physiological materials such as heparin during inflammatory responses. See Puxeddu, H., Ribetti, D., Crivellato, E., and Levi-Schaffer, F., Mast cells and eosinophils: a novel link between inflammation and angiogenesis in allergic diseases, *J.Allergy Clin.Immunol.* 116, 531-536, 2005. Galli, S.J., Kalesnikoff, J., Grimaldeston, M.A., Piliponsky, A.M., Williams, C.M., and Tsai, M., Mast cells as "tunable" effector and immunoregulatory cells: recent advances, *Annu.Rev.Immunol.* 23, 749-786, 2005; Saito, H., Role of mast cell proteases in tissue remodeling, *Chem.Immunol.Allergy* 87, 80-84, 2005; Vliagoftis, H. and Befus, A.D., Mast cells at mucosal frontiers, *Curr.Mol.Med.* 5, 573-589, 2005; Krishnaswamy, G., Ajitawi, O., and Chi, D.S., The human mast cell: an overview, *Methods Mol.Biol.* 315, 13-34, 2006.

## Metabolipidomics

The study of the metabolism of lipids in the proteome. See Bleijerveld, O.B., Howeling, M., Thomas, M.J., and Cui, Z., Metabolipidomics: profiling metabolism of glycerophospholipid species by stable isotopic precursors and tandem mass spectrometry, *Anal.Biochem.* 352, 1-14, 2006.

## Metabolite/Metabolic Profiling

Identification/quantification of a select group of metabolites, generally part of a specific pathway such as glycolysis or fatty acid synthesis. See Dunn, W.B. and Ellis, D.I., Metabolomics: current analytical platforms and methodologies, *Trends Anal.Chem.* 24, 285-294, 2005.

## Metabolome

The total metabolites produced by the products of the genome. See Tweeddale, H., Notley-McRobb, L. and Perenci, T., Effect of slow growth on metabolism of *Escherichia coli*, as revealed by global metabolite pool ("metabolome") analysis, *J.Bacteriol.* 180, 5109-5116, 1998; Tweeddale, H., Notley-McRobb, L., and Ferenci, T., Assessing the effect of reactive oxygen species on *Escherichia coli* using a metabolome approach, *Redox.Rep.* 4, 237-241, 1999; ter

Kuile, B.H., and Westerhoff, H.V., Transcriptome meets metabolome: hierarchical and metabolic regulation of the glycolytic pathway, *FEBS Lett.* 500, 169-171, 2001; Mendes, P., Emerging bioinformatics for the metabolome, *Brief Bioinform.* 3, 134-145, 2002; Mazurek, S., Grimm, H., Boschek, C.B., Vaupel, P., and Eingebrod, E., Pyruvate kinase type? *Phytochemistry* 62, 837-849, 2003; Nobeli, I., Ponstingl, H., Krissinel, E.B., and Thornton, J.M., A structure-based anatomy of the E.coli metabolome, *J.Mol.Biol.* 334, 697-719, 2003; Parsons, L. and Orban, J., Structural genomics and the metabolome: combining computational and NMR methods to identify target ligands, *Curr.Opin.Drug Discov.Devel.* 7, 62-68, 2004; Soloviev, M. and Finch, P., Peptidomics: bridging the gap between proteome and metabolome, *Proteomics* 6, 744-747, 2006.

## Metabolomics

The study of the metabolome; ideally, the non-biased identification/quantification of all metabolites in a biological system such as a cell or organism. See Reo, N.V., NMR-based metabolomics, *Drug Chem.Toxicol.* 25, 375-382, 2002; German, J.B., Roberts, M.A., Fay, L., and Watkins, S.M., Metabolomics and individual metabolic assessment: the next great challenge for nutrition, *J.Nutr.* 132, 2486-2487, 2002; Watkins, S.M., and German, S.B., Metabolomics and biochemical profiling in drug discovery and development, *Curr.Opin.Mol.Ther.* 4, 224-228, 2002; Phelps, T.J., Palumbo, A.V., and Beliaev, A.S., Metabolomics and microarrays for improved understanding of phenotypic characteristics controlled by both genomics and environmental constraints, *Curr.Opin.Biotechnol.* 13, 20-24, 2002; Grivet, J.P., Delort, A.M., and Portais, J.C., NMR and microbiology: from physiology to metabolomics, *Biochimie* 85, 823-840, 2003; Brown, S.C., Kruppa, G., and Dasseux, J.L., Metabolomics applications of FT-ICR mass spectrometry, *Mass Spectrom.Rev.* 24, 223-231, 2005; Bhalla, R., Narasimhan, K., and Swarup, S., Metabolomics and its role in understanding cellular responses in plants, *Plant Cell Rep.* 24, 562-571, 2005; Fridman, E., and Pichersky, E., Metabolomics, genomics, proteomics, and the identification of enzymes and their substrates and products, *Curr.Opin.Plant Biol.* 8, 242-248, 2005; Rochfort, S., Metabolomics reviewed: a new "omics" platform technology for systems biology and implications for natural product research, *J.Nat.Prod.* 68, 1813-1820, 2005; Griffin, J.L., The Cinderella story of metabolic profiling: does metabolomics get to go to the functional genomics ball? *Philos.Trans.R.Soc. Lond.B Biol.Sci.* 361, 147-161, 2006.

## Metagenomics

The genomic analysis of a mixed microbial population. See Schloss, P.D. and Handelsman, J., Biotechnological prospects from metagenomics, *Curr.Opin.Biotechnol.* 14, 303-310, 2003; Riesenfeld, C.S., Schloss, P.D. and Handelsman, J., Metagenomics: genomic analysis of microbial communities, *Annu.Rev.Genet.* 38, 525-552, 2004; Steele, H.L. and Streit, W.R., Metagenomics: advances in ecology and biotechnology, *FEMS Microbiol.Lett.* 247, 105-111, 2005.

## Metaproteomics

The proteomic analysis of mixed microbial communities. See Wilmes, P. and Bond, P.L., The application of two-dimensional polyacrylamide gel electrophoresis and downstream analyses to a mixed community of prokaryotic microorganisms, *Environ.*

*Microbiol.* 6, 911-920, 2004; Kan, J., Hanson, T.E., Ginter, J.M., Wnag, K., and Chen, F., Metaproteomic analysis of Chesapeake Bay microbial communities, *Saline Systems* 1, 7, 2005; Wilmes, P. and Bond, P.L., Metaproteomics: studying functional gene expression in microbial ecosystems, *Trends Microbiol.* 14, 92-97, 2006; Valenzuela, L., Chi, A., Beard, S. *et al.*, Genomics, metagenomics and proteomics in biomining microorganisms, *Biotechnol. Adv.* 24, 195-209, 2006; Ward, N., New directions and interactions in metagenomics research, *FEMS Microbiol. Ecol.* 55, 331-338, 2006.

## Metazoan

Animals with differentiated cells and tissues and usually a discrete digestive tract with specialized cells.

## Micelles

A small (nanoscale) particle composed of individual molecules which can be considered an aggregate. In biochemistry and molecular biology, micelle usually reference to a structure of polar lipids in aqueous solution which can form an amphipathic layer with the polar groups directed toward solvent and non-polar groups clustered toward the interior. However, a micelle can be composed of proteins or other organic materials. Casein polymers have been extensively studied because of their presence in milk. The term critical micellar concentration (CMC) defines the concentration when, for example, a lipid would move from solution phase to micelle. Micelle are used for drug delivery. The term micelle is also used to refer to small particles of materials used in humus soil formulations. See also liposomes, nanotechnology. See Hartley, G.S., *Aqueous Solutions of Paraffin-Chain Salts: A Study in Micelle Formation*, Hermann and Cie, Paris, 1936; Mukerjee, P., *Critical Micelle Concentrations of Aqueous Surfactant Systems*, US National Bureau of Standards, US Government Printing Office, Washington, DC, 1971; Rosen, M.J., *Surfactants and Interfacial Phenomena*, Wiley-Interscience, Hoboken, NJ, 2004; Gentle, I and Barnes, G., *Interfacial Science: An Introduction*, Oxford University Press, Oxford, UK, 2005; Bloomfield, V.A. and Mead, R.J., Jr., Structure and stability of casein micelles, *J. Dairy Sci.* 58, 592-601, 1975; Kreuter, J., Nanoparticles and nanocapsules – new dosage forms in the nanometer size range, *Pharm. Acta Helv.* 53, 33-39, 1978; Furth, A.J., Removing unbound detergent from hydrophobic proteins, *Anal. Biochem.* 109, 207-215, 1980; Bagchi, B., Water dynamics in the hydration layer around proteins and micelles, *Chem. Rev.* 105, 3197-3129, 2005; Chandler, D., Interfaces and the driving force of hydrophobic assembly, *Nature* 437, 640-647, 2005; Aliabadi, H.M. and Lavasanifar, A., Polymeric micelles for drug delivery, *Expert Opin. Drug Deliv.* 3, 139-162, 2006.

## Microarray

Generally referring to an array of probes displayed on a matrix similar to a microscope slide which are used to analyze complex mixtures for specific analytes. The sample is usually labeled with a signal such as a fluorescent dye. Both sample preparation and analysis are complex. See DNA microarray and protein microarray. See Schena, M., Heller, R.A., Theriault, T.P., *et al.*, Microarrays: biotechnology's discovery platform for functional genomics, *Trends Biotechnol.* 16, 301-306, 1998; Gerhold, D., Rushmore, T., and Caskey, C.T., DNA chips: promising toys have

become powerful tools, *Trends Biochem Sci* 24, 168-173, 1999; Ness, S.A., Basic microarray analysis: strategies for successful experiments, *Methods Mol. Biol.* 316, 13-33, 2006; Wang, S. and Cheng, Q., Microarray analysis in drug discovery and clinical applications, *Methods Mol. Biol.* 316, 49-65, 2006; Kozarova, A., Petrinac, S., Ali, A., and Hudson, J.W., Array of informatics: applications in modern research, *J. Proteome Res.* 5, 10551-1059, 2006; Sievertzon, M., Nilsson, P. and Lundberg, J., Improving reliability and performance of DNA microarrays, *Expert Rev. Mol. Diagn.* 6, 481-492, 2006; Sobek, J., Bartscherer, K., Jacob, A., Hoheisel, J.D., and Angenendt, P., Microarray technology as a universal tool for high-throughput analysis of biological systems. *Comb. Chem. High Throughput Screen.* 9, 365-380, 2006; Pedroso, S. and Guillen, I.A., Microarray and nanotechnology applications of functional nanoparticles, *Comb. Chem. High Throughput Screen.* 9, 389-397, 2006. Microarray analysis can also be applied to the study of multiple tissue specimens with tissue microarrays (Rimm, D.L., Camp, R.L., Charette, L.A., *et al.*, Tissue microarray: a new technology for amplification of tissue resources, *Cancer J.* 7, 24-31, 2001; Bubendorf, L., Nocito, A., Moch, K., and Sauter, G., Tissue microarray (TMA) technology: Miniaturized pathology archives for high-throughput in situ studies, *J. Pathol.* 195, 72-79, 2001; Fedor, H.L. and De Marzo, A.M., Practical methods for tissue microarray construction, *Methods Mol. Biol.* 103, 89-101, 2005).

## Microdialysis

A process for sampling low-molecular weight metabolites in the extracellular space of tissues. This technique is used for the study of tissue metabolism and pharmacokinetic studies. Microdialysis is accomplished through the use of a probe constructed as a concentric tube is implanted into a tissue and a perfusion fluid (a physiological solution such as Hank's Balanced Salt Solution) enters through an inner tube flowing toward the distal end and, entering the space between the inner tube and the outer dialysis membrane flow back toward the proximal end of the probe. Dialysis takes place during the passage of fluid toward the proximal end and the exiting fluid is sampled for the analyte in question. It is viewed a noninvasive method of evaluated tissue metabolism. See Lonroth, P. and Smith, U., Microdialysis—a novel technique for clinical investigations, *J. Intern. Med.* 227, 295-300, 1990; Ungerstedt, U., Microdialysis—principles and applications for studies in animals and man, *J. Intern. Med.* 230, 365-373, 1991; Parsons, L.H. and Justice, J.B., Jr., Quantitative approaches to in vivo brain microdialysis, *Crit. Rev. Neurobiol.* 9, 189-220, 1994; Schuck, V.J., Rinas, I., and Derendorf, H., In vitro microdialysis sampling of docetaxel, *J. Pharm. Biomed. Anal.* 36, 607-613, 2004; Hocht, C., Opezzo, J.A., and Taira, C.A., Microdialysis in drug discovery, *Curr. Drug Discov. Technol.* 1, 269-285, 2004; Rooyackers, O., Thorell, A., Nygren, J., and Ljungqvist, O., Microdialysis method for measuring human metabolism, *Curr. Opin. Clin. Nutr. Metab. Care* 7, 515-52, 2004; Cano-Cebriaqn, M.J., Zornoza, T., Polache, A., and Granero, L., Quantitative in vivo microdialysis in pharmacokinetic studies: some reminders, *Curr. Drug. Metab.* 6, 83-90, 2005; Abrahamsson, P. and Winso, O., An assessment of calibration and performance of the microdialysis system, *J. Pharm. Biomed. Anal.* 39, 730-734, 2005; Ao, X. and Stenken, J.A., Microdialysis sample of cytokines, *Methods* 38, 331-341, 2006. Successful interpretation of microdialysis experiments will require a thorough understanding of the factor influencing membrane flux of the specific analyte or analytes.

## Microsatellite

Tandem repeats of one to six nucleotides; sometimes referred to as simple sequence repeats or simple sequence lengths. These sites are used for genetic mapping and show variability in oncological disorders. Changes are measured by simple sequence length polymorphisms. See Tautz, D. and Schlotterer, C., Simple sequences, *Curr.Opin.Genet.Dev.* 4, 832-837, 1994; Albrecht, A. and Mundlos, S., The other trinucleotide repeat: polyalanine expansion disorders, *Curr.Opin.Genet.Dev.* 15, 285-293, 2005; Di Prospero, N.A. and Fischbeck, K.H., Therapeutics development for triplet repeat expansion diseases, *Nat.Rev.Genet.* 6, 756-765, 2005; Zheng, H.T., Peng, Z.H., Li, S. and He, L., Loss of heterozygosity analyzed by single nucleotide polymorphism array in cancer, *World J.Gastroenterol.* 11, 6740-6744, 2005.

## Minicollagen

A small collagen usually expressed in See Mazzorana, M., Snellman, A., Kivirikko, K.I., van der Rest, M., and Pihlajaniemi, T., Involvement of prolyl-4-hydroxylase in the assembly of trimeric minicollagen XII. Study in a baculovirus expression system, *J.Biol.Chem.* 271, 29003-29008, 1996; Milbradt, A.G., Boulegue, C., Moroder, L., and Renner, C., The two cysteine-rich head domains of minicollagen from *Hydra* nematocysts differ in their cysteine framework and overall fold despite an identical cysteine sequence pattern, *J.Mol.Biol.* 354, 591-600, 2005. Minicollagen is a miniprotein derivative of collagen.

## Miniprotein

The smallest portion of a protein which can fold into a unique three-dimensional structure thus differing from a peptide. See Degradó, W.F. and Sosnick, T.R., Protein minimization: Downsizing through mutation, *Proc.Natl.Acad.Sci.USA* 93, 5680-5681, 1996; Vita, C., Vizzavona, J., Drakopoulou, E., Zinn-Justin, S., Gilquin, B., and Ménez, A., Novel miniproteins engineered by the transfer of active sites to small nature scaffolds, *Biopolymers* 47, 93-100, 1998; Neuweiler, H., Doose, S., and Sauer, M., A microscopic view of miniprotein folding: enhanced folding efficiency through formation of an intermediate, *Proc.Natl.Acad.Sci.USA* 102, 16650-16655, 2005.

## Modulus of Elasticity

The stress required to produce unit strain causing a change in length (Young's modulus) or a twist or shear (shear modulus) or a change volume (bulk modulus); units are dynes/cm<sup>2</sup>. See Nash, G.B. and Gratzler, W.B., Structural determinants of the rigidity of the red cell membrane, *Biorheology* 30, 397-407, 1993; Urry, D.W. and Pattanaik, A., Elastic protein-based materials in tissue reconstruction, *Ann.N.Y.Acad.Sci.* 831, 32-46, 1997; Ambrosio, L., De Santis, R., and Nicolais, L., Composite hydrogels for implants, *Proc.Inst.Mech.Eng.* 212, 93-99, 1998; Roberts, R.J. and Rowe, R.C., Relationships between the modulus or elasticity and tensile strength for pharmaceutical drugs and excipients, *J.Pharm.Pharmacol.* 51, 975-977, 1999; Hegner, M. and Grange, W., Mechanics and imaging of single DNA molecules, *J.Muscle Res.Cell.Motil.* 23, 367-375, 2002; Carr, M.E., Jr., Development of platelet contractile force as a research and clinical measure of platelet function, *Cell.Biochem.Biophys.* 38, 55-78, 2003; Balshakova, A.V., Kiselyova, O.I., and Yaminsky, I.V., Microbial surfaces investigated using atomic force microscopy, *Biotechnol. Prog.* 20, 1615-1622, 2004; Zhang, G., Evaluating the viscoelastic

properties of biological tissues in a new way, *J.Musculoskelet. Neuronal Interact.* 5, 85-90, 2005; Seal, B.L. and Panitch A., Physical matrices stabilized by enzymatically sensitive covalent crosslinks, *Acta Biomater.* 2, 241-251, 2006.

## Molecular Beacons

A DNA probe which is a single chain loop and stem structure. A fluorophore at the 5'-terminus is proximal to a quencher at the 3'-terminus is released on the binding of the probes to a specific DNA sequence. See Piatek, A.S., Tyagi, S., Pol, A.C., et al., Molecular beacon sequence analysis for detecting drug resistance in *Mycobacterium tuberculosis*, *Nature Biotechnol.* 16, 35-363, 1998; Tan, W., Fang, X., Li, J., and Liu, X., Molecular beacons: a novel DNA probe for nucleic acid and protein studies, *Chem.Eur.J.* 6, 1107-1111, 2000; Fang, X., Mi, Y., Li, J.J., Beck, T., Schuster, S., and Tan, W., Molecular beacons: fluorogenic probes for living cell study, *Cell.Biochem.Biophys.* 37, 71-81, 2002; Stöhr, K., Häfner, B., Nolte, O., Wolfrum, J., Sauer, M., and Hertzen, D.-P., Species-specific identification of mycobacterial 16S rRNA PCR amplicons using smart probes, *Anal.Chem.* 77, 7195-7203, 2005.

## Molecular Clock

Places timescales on evolutionary events. See Zuckerkandl, E., On the molecular evolutionary clock, *J.Mol.Evol.* 26, 34-46, 1987; Easteal, S., A mammalian molecular clock, *Bioessays* 14, 415-419, 1992; Seoighe, C., Turning the clock back on ancient genome duplication, *Curr.Opin.Genet.Dev.* 13, 636-643, 2003; Freitas, C., Rodrigues, S., Saude, L., and Palmeirim, I., Running after the clock, *Int.J.Dev.Biol.* 49, 317-324, 2005; Renner, S.S., Relaxed molecular clocks for dating historical plant dispersal events, *Trends Plant Sci.* 10, 550-558, 2005; Ho, S.Y.W. and Larson, G., Molecular clocks: when times are a-changing, *Trends Genet.* 22, 79-83, 2006.

## Monocot (monocotyledon)

Flowering plants that have embryos with only one cotyledon. See Iyer, L.M., Kumpatla, S.P., Chadrasekharan, M.B., and Hall, T.C., Transgene silencing in monocots, *Plant Mol.Biol.* 43, 323-346, 2000; Agrawal, G.K., Iwahashi, H., and Rakwal, R., Rice MAPKs, *Biochem.Biophys.Res.Commun.* 302, 171-180, 2003; Schoof, H. and Karlowski, W.M., Comparison of rice and Arabidopsis annotation, *Curr. Opin. Plant Biol.* 6, 106-112, 2003.

## Monocyte

Circulating white blood cell; an immune system cell which is a precursor to macrophage. See Nelson, D.S. and Alexander, P., *Immunobiology of the Macrophage*, Academic Press, New York, NY, 1976; Schmalzl, F. and Huhn, D., *Disorders of the Monocyte Macrophage System: Pathophysiological and Clinical Aspects*, Springer-Verlag, Berlin, 1981; Russell, S.W. and Siamon, G., *Macrophage Biology and Activation*, Springer-Verlag, Berlin, 1992; Zwilling, B.S. and Eisenstein, T.K., *Macrophage-Pathogen Interactions*, Marcel Dekker, New York, 1994; Mire-Sluis, A.R. and Thorpe, R., *Cytokines*, Academic Press, San Diego, CA, 1998; Bellosta, S. and Bernini, F., Modulation of macrophage function and metabolism, *Handb.Exp.Pharmacol.* (170), 665-695, 2005; Condeelis, J. and Pollard, J.W., Macrophages: obligate partners for tumor cell migration, invasion, and metastasis, *Cell* 124, 263-266, 2006; Noda, M., Current topics in pharmacological research

on bone metabolism: regulation of bone mass by the function of endogenous modulators of bone morphogenetic protein in adult stage, *J.Pharmacol.Sci.* 100, 211-214, 2006; Lews, C.E. and Pollard, J.W., Distinct role of macrophages in different tumor microenvironments, *Cancer Res.* 66, 605-612, 2006; Bobryshev, Y.V., Monocyte recruitment and foam cell formation in atherosclerosis, *Micron* 37, 208-222, 2006; Cathelin, S., Rébe, C., Haddaoui, L., et al., Identification of proteins cleaved downstream of caspases activation in monocytes undergoing macrophage differentiation, *J.Biol.Chem.* 281, 17779-17788, 2006.

## Morphoproteomics

Morphoproteomics combines the technical approaches of histopathology, molecular biology, and proteomics for the study of cell biology and systems biology. See Brown, R.E., Morphoproteomic portrait of the mTOR pathway in mesenchymal chondrosarcoma, *Ann.Clin.Lab.Sci.* 34, 397-399, 2004; Brown, R.E., Morphoproteomics: exposing protein circuitries in tumors to identify potential therapeutic targets in cancer patients, *Expert Rev. Proteomics* 2, 337-348, 2005.

## Mucus/Mucins

A viscous biological fluid containing mucins. Mucins are very large highly glycosylated proteins with considerable asymmetry. The carbohydrate moiety is sulfated resulting in a high negative charge which contributes to the extended conformation. It is the physical properties of mucin that are responsible for the viscosity of mucus. See Rose, M.C. and Voynow, J.A., Respiratory tract mucin genes and mucin glycoproteins in health and disease, *Physiol.Rev.* 86, 245-278, 2006; Gerken, T.A., Biophysical approaches to salivary mucin structure, conformation, and dynamics, *Crit.Rev.Oral Biol.Med.* 4, 261-270, 1993; Dodd, S., Place, G.A., Hall, R.L., and Harding, S.E., Hydrodynamic properties of mucins secreted by primary cultures of guinea-pig tracheal epithelial cells: determination of diffusion coefficients by analytical ultracentrifugation and kinetic analysis of mucus gel hydration and dissolution, *Eur.Biophys.J.* 28, 38-47, 1999; Brockhausen, I., Sulphotransferases acting on mucin-type oligosaccharides, *Biochem.Soc.Trans.* 31, 318-325, 2003; Lafitte, G., Thuresson, K., and Soderman, O., Mixtures of mucin and oppositely charged surfactant aggregates with varying charge density. Phase behavior, association, and dynamics, *Langmuir* 21, 7097-7104, 2005.

## Mullerian Inhibiting Substance (Mullerian Inhibiting Hormone)

A peptide growth factor which is a member of the TGF $\beta$  family which was originally described as a large glycoprotein secreted by neonatal/fetal testis responsible for regression of the Mullerian Duct during the process of sexual differentiation. See Budzik, G.P., Powell, S.M., Kamagata, S. and Donahoe, P.K., Mullerian inhibiting substance fractionation of dye affinity chromatography, *Cell* 34, 307-314, 1983; Visser, J.A., Themmen, A.P.N., Anti-Müllerian hormone and folliculogenesis, *Molec.Cell.Endocrinol.* 234, 81-86, 2005.

## Mutation Rate

The instantaneous rate at which nucleotide changes occur in the genome. Lethal or near-lethal mutations are often ignored in the calculation of maturation rate. See Ellegren, H., Smith, N.G.,

and Webster, M.T., Mutation rate variation in the mammalian genome, *Curr.Opin.Genet.Dev.* 13, 562-568, 2003; Sniegowski, P., Evolution: bacterial mutation in stationary phase, *Curr.Biol.* 14, R245-R246, 2004; Wang, C.L. and Wabl, M., Precise dosage of an endogenous mutagen in the immune system, *Cell Cycle* 3, 983-958, 2004; Pakendorf, B. and Stoneking, M., Mitochondrial DNA and human evolution, *Annu.Rev.Genomics Hum.Genet.* 6, 165-183, 2005.

## Myeloid Progenitor

Precursor of granulocyte, macrophages, and mast cells; involved in chronic myeloid leukemia (CML). Development regulated by colony-simulating factors (CSFs). See Burgess, A.W. and Metcalf, D., The nature and action of granulocyte-macrophage colony stimulating factors, *Blood* 56, 947-958, 1980; Islam, A., Haemopoietic stem cells: a new concept, *Leuk.Res.* 9, 1415-1432, 1985; Cannistra, S.A. and Griffin, J.D., Regulation of the production and function of granulocytes and monocytes, *Semin. Hematol.* 25, 173-188, 1988; Grimwade, D. and Enver, T., Acute promyelocytic leukemia: where does it stem from? *Leukemia* 19, 375-384, 2004; Coulombel, L., Identification of hematopoietic stem/progenitor cells: strength and drawbacks of functional assays, *Oncogene* 23, 7210-7223, 2004; Rosmarain, A.G., Yang, Z., and Resendes, K.K., Transcriptional regulation in myelopoiesis: hematopoietic fate choice, myeloid differentiation, and leukemogenesis, *Exp.Hematol.* 33, 131-143, 2005; Marley, S.B., and Gordon, M.Y., Chronic myeloid leukemia: stem cell derived but progenitor cell driven, *Clin.Sci.* 109, 13-25, 2005.

## Nanofiltration

Filtration of small (nano) particles from solvent using a filter with extremely small pores (0.001 – 0.010 micron); finer than ultrafiltration, not as fine as reverse osmosis. Used for the removal of viruses from plasma protein products. See Yaroshchuk, A.E., Dielectric exclusion of ions from membranes, *Adv.Colloid Interface Sci.* 85, 193-230, 2000; Rossano, R., D'Elia, A., and Riccio, P., One-step separation from lactose: recovery and purification of major cheese-whey proteins by hydroxyapatite—a flexible procedure suitable for small- and medium-scale preparations, *Protein Expr.Purif.* 21, 165-169, 2001; Burnouf, T. and Radosevich, M., Nanofiltration of plasma-derived biopharmaceutical products, *Haemophilia* 9, 24-37, 2003; Bhanushali, D. and Bhattacharyya, D., Advances in solvent-resistant nanofiltration membranes: experimental observations and application, *Ann.N.Y.Acad.Sci.* 984, 159-177, 2003; Weber, R., Chmiel, H., and Mavrov, V., Characteristics and application of ceramic nanofiltration membranes, *Ann.N.Y.Acad.Sci.* 984, 178-193, 2003; Tieke, B., Toutianoush, A., and Jin, W., Selective transport of ions and molecules across layer-by-layer assembled membranes of polyelectrolytes, *p-sulfonato-calixin[n]arenes* and Prussian Blue-type complex salts, *Adv.Colloid Interface Sci.* 116, 121-131, 2005; Berot, S., Compoint, J.P., Larre, C., Malabat, C., and Gueguen, J., Large-scale purification of rapeseed proteins (*Brassica napus* L.), *J.Chromatog.B Anal.Technol.Biomed.Life Sci.* 818, 35-42, 2005; Zhao, K. and Li, Y., Dielectric characterization of a nanofiltration membrane in electrolyte solutions: its double-layer structure and ion permeation, *J.Phys.Chem.B Condens. ## Nanog

Nanog is a homeodomain transcription factor which is found in undifferentiated embryonic stem cells and is considered important for the maintenance of pluripotency. See Mitsui, K., Tokuzawa, Y., Itoh, H., *et al.*, The homeoprotein Nanog is required for maintenance of pluripotency in mouse epiblast and ES cells, *Cell* 113, 631-642, 2003; Chambers, I., Colby, D., Robertson, M., *et al.*, *Cell* 113, 643-655, 2003; Oh, J.H., Do, H.J., Yang, H.M., *et al.*, Identification of a putative transactivation domain in human Nanog, *Exp.Mol.Med.* 37, 250-254, 2005; Xu, Y., A new role for p53 in maintaining genetic stability in embryonic stem cells, *Cell Cycle* 4, 363-364, 2005; Ralston, A. and Rossant, J., Genetic regulation of stem cells origins in the mouse embryo, *Clin.Genet.* 68, 106-112, 2005; Yates, A. and Chambers, I., The homeodomain protein Nanog and pluripotency in mouse embryonic stem cells, *Biochem.Soc.Trans.* 33, 1518-1521, 2005; Silva, J., Chambers, I., Pollard, S., and Smith, A., Nanog promotes transfer of pluripotency after cell fusion, *Nature* 441, 997-1001, 2006.

## Nanotechnology

The study of particles, devices, substances having physical dimensions of 1- 100 nanometers (0.001 to 0.100 micrometers (microns). This includes the study of liposomes for drug delivery, nanofiltration, micelles, dendrimers, and quantum dots. See Wilson, M., *Nanotechnology: Basic Science and Emerging Technologies*, Chapman & Hall, Boca Raton, FL, 2002; Poole, C.P. and Owens, F.J., *Introduction to Nanotechnology*, Wiley, Hoboken, NJ, 2003; Di Ventra, M. and Evoy, S., *Introduction to Nanoscale Science and Technology*, Kluwer Academic, Boston, MA, 2004; Bhushan, B., *Springer Handbook of Nanotechnology*, Springer, Berlin, 2004; Ciofalo, M., Collins, M.W., and Hennessy, T.R., Modelling nanoscale fluid dynamics and transport in physiological flows, *Med.Eng.Phys.* 18, 437-451,1996; Seeman, N.C., DNA nanotechnology: novel DNA constructions, *Annu.Rev.Biophys. Biomol.Struct.* 27, 225-248, 1998; Melo, E.P., Aires-Barros, M.R., and Cabral, J.M., Reverse micelles and protein biotechnology, *Biotechnol.Annu.Rev.* 7, 87-129, 2001; Williams, D.J. and Sebastine, I.M., Tissue engineering and regenerative medicine: manufacturing challenges, *IEE Proc.Nanobiotechnol.* 152, 207-210, 2005; Bhattacharya, D. and Gupta, N.K., Nanotechnology and potential of microorganisms, *Crit.Rev.Biotechnol.* 25, 199-204, 2005; Eijkel, J.C. and van den Berg, A., The promise of nanotechnology for separation devices – from a top-down approach to nature-inspired separation devices, *Electrophoresis* 27, 677-685, 2006; Lange, C.F. and Finlay, W.H., Liquid atomizing: nebulizing and other methods of producing aerosols, *J.Aerosol.Med.* 18, 28-35, 2006; Langford, R.M., Focused ion beam nanofabrication: a comparison with conventional processing techniques, *J.Nanosci. Nanotechnol.* 6, 661-668, Wang, J. and Ren, J., Luminescent quantum dots: a very attractive and promising tool in biomedicine, *Curr.Med.Chem.* 13, 897-909, 2006.

## Nascent peptide exit tunnel

A "tunnel"/pore starting at the peptidyl transferase center on the ribosome and ending on the solvent side on the large ribosomal subunit. See Gabashvili, I.S., Gregory, S.T., Valle, M., *et al.*, The polypeptide tunnel system in the ribosome and its gating in erythromycin resistance mutants of L4 and L22, *Mol.Cell.* 8, 181-188, 2001; Tenson, T. and Ehrenberg, M., Regulatory nascent peptides in the ribosomal tunnel, *Cell* 108, 591-594, 2002; Jenni, S. and

Ban, N., The chemistry of protein synthesis and voyage through the ribosomal tunnel, *Curr.Opin.Struct.Biol.* 13, 212-219, 2003; Vimberg, V., Ziong, L., Bailey, M., Tenson, T., and Mankin, A., Peptide-mediated macrolide resistance reveals possible specific interactions in the nascent peptide exit tunnel, *Mol.Microbiol.* 54, 376-385, 2004; Baram, D. and Yonath, A., From peptide-bond formation to cotranslational folding: dynamic, regulatory and evolutionary aspects, *FEBS Lett.* 579, 948-94, 2005; Egea, P.F., Stroud, R.M., and Walter, P., Targeting proteins to membranes: structure of the signal recognition particle, *Curr.Opin.Struct. Biol.* 15, 213-220, 2005; Markin, A.S., Nascent peptide in the 'birth canal' of the ribosome, *Trends Biochem.Sci.* 31,11-16, 2006.

## NAR gene, nar operon, nar promoter

Promoter region of the *nar* operon which encodes nitrate reductase in *Escherichia coli*. The promoter is generally only maximally induced under anaerobic conditions. It has been shown that the *nar* promoter in some strains of *Escherichia coli* can be induced under condition of very low oxygen tension in the presence of nitrate. This observation has been used to develop some useful processes for recombinant protein expression in *Escherichia coli*. See Li, S.F. and DeMoss, J.A., Promoter region of the *nar* operon of *Escherichia coli*: nucleotide sequence and transcription initiation signals, *J.Bacteriol.* 169, 4614-4620, 1987; Han, S.J., Chang, H.N., and Lee, J., Characterization of an oxygen-dependent inducible promoter, the *nar* promoter of *Escherichia coli*, to utilize in metabolic engineering, *Biotechnol.Bioeng.* 72, 573-577, 2001; Lee, K.H., Cho, M.H., Chung, T., *et al.*, Characterization of an oxygen-dependent inducible promoter: the *Escherichia coli nar* promoter, in gram-negative host strains, *Biotechnol.Bioeng.* 82, 271-277, 2003.

## Nephelometry

Detection of electromagnetic wave scattering in a direction different from the direct path of the transmitted light; for example, electromagnetic energy scattered at a 90° angle from the incident radiation. Nephelometry is widely used for the measurement of immune complexes. See Deverilli, I. and Reeves, W.G., Light scattering and absorption—developments in immunology, *J.Immunol. Methods* 38, 191-204, 1980; Blackstock, R., In vitro methods for detection of circulating immune complexes and other solution protein-protein interactions, *Ann.Clin.Lab.Sci.* 11, 262-268, 1981; Steinberg, K.K., Cooper, G.R., Graiser, S.R., and Rosseneu, M., Some considerations of methodology and standardization of apolipoprotein A-I immunoassays, *Clin.Chem.* 29, 415-426, 1983; Price, C.P., Spencer, K., and Whicher, J., Light-scattering immunoassay of specific proteins: a review, *Ann.Clin.Biochem.* 20, 1-14, 1983; Brinkman, J.W., Bakker, S.J., Gansevoort, R.T., *et al.*, Which method for quantifying urinary albumin excretion gives what outcome? A comparison of immunonephelometry with HPLC, *Kidney Int. Suppl.* (92), S69-S75, 2004; Yeh, A.T. and Hirshburg, J., Molecular interactions of exogenous chemical agents with collagen—implications for tissue optical clearing, *J.Biomed.Opt.* 11, 014003, 2006.

## NF- $\kappa$ B

Nuclear factor kappa B - A transcription factor which is thought to have a major role in the growth of malignant cells. See Kim, H.J., Hawke, N., and Baldwin, A.S., NF-kappaB and IKK as therapeutic targets in cancer, *Cell Death Differ.* 2006. Zingarelli, B.,

Nuclear factor kappaB, *Crit.Care.Med.* 33(Suppl 12), S414-416, 2005; Jimi, E. and Ghosh, S., Role of the nuclear factor-kappaB in the immune system and bone, *Immunol.Rev.* 208, 80-87, 2005; Bubici, C., Papa, S., Pham, C.G., Zazzeroni, F., and Froanzoso, G., The NF-kappaB-mediated control of the ROS and JNK signaling, *Histol.Histopathol.* 21, 69-80, 2006.

### Nonidet P-40™

Nonidet is popular nonionic (polyoxyethylene glycol derivative) detergent that has been used for membrane protein solubilization. See Dunkley, P.R., Holmes, R., and Rodnight, R., Phosphorylation of synaptic-membrane proteins from ox cerebral cortex in vitro. Preparation of fractions enriched in phosphorylated proteins by using extraction with detergents urea, and gel filtration, *Biochem.J.* 163, 369-378, 1977; Sharma, C.B., Lehle, L., and Tanner, W., N-Glycosylation of yeast proteins. Characterization of the solubilized oligosaccharyl transferase, *Eur.J.Biochem.* 116, 101-108, 1981; Perez-Machin, R., Henriquez-Hernandez, L., Perez-Luzardo, O., et al., Solubilization and photoaffinity labeling identification of glucocorticoid binding peptides in endoplasmic reticulum from rat liver, *J.Steroid Biochem.Mol.Biol.* 84, 245-253, 2003; Shiozaki, A., Tsuji, T., Kohno, R., Proteome analysis of brain proteins in Alzheimer's disease: subproteomics following sequentially extracted protein preparation, *J.Alzheimers Dis.* 6, 257-268, 2004; Zintl, A., Pennington, S.R., and Mulcahy, G., Comparison of different methods for the solubilization of *Neospora caninum* (Phylum Apicomplexa) antigen, *Vet.Paristol.* 135, 205-213, 2006; Kalabis, J., Rosenberg, I. and Podolsky, D.K., Vangil protein acts as a downstream effector of intestinal trefoil factor (ITF/TFF3) signaling and regulates wound healing of intestinal epithelium, *J.Biol.Chem.* 281, 6434-6441, 2006. Use in renaturing allergens after blotting (Muro, M.D., Fernandez, C. and Moneo, I., Renaturation of blotting allergens increases the sensitivity of specific IgE detection, *J.Investig.Allergol.Clin.Immunol.* 6, 166-171, 1996) has been described as has used in a aqueous two-phase separation system (Sanchez-Ferrer, A., Bru, R., and Garcia-Carmona, F., Phase separation of biomolecules in polyoxyethylene glycol nonionic detergents, *Crit.Rev.Biochem.Mol.Biol.* 29, 275-313, 1994.

### Northern Blot

A technique similar to the Southern Blot. RNA separated by electrophoresis is transferred to a PDVF membrane. Specific RNA sequences are detected with a labeled cDNA probe. See Hayes, P.C., Wolf, C.R., and Hayes, J.D., Blotting techniques for the study of DNA, RNA, and proteins, *BMJ* 299, 965-968, 1989; Dallman, M.J., Montgomery, R.A., Larsen, C.P., Wanders, A., and Wells, A.F., Cytokine gene expression: analysis using northern blotting, polymerase chain reaction and in situ hybridization, *Immunol.Rev.* 119, 163-179, 1991; Mengod, G., Goudsmit, E., Probst, A., and Palacios, J.M., In situ hybridization histochemistry in the human hypothalamus, *Prog. Brain Res.* 93, 45-55, 1992; Pajor, A.M., Hirayama, B.A., and Wright, E.M., Molecular biology approaches to comparative study of Na(+)-glucose cotransport, *Am.J.Physiol.* 263, R489-R495, 1992; Kroczeck, R.A., Southern and northern analysis, *J.Chromatog.* 618, 133-145, 1993; Raval, P., Qualitative and quantitative determination of mRNA, *J.Pharmacol.Toxicol.Methods* 32, 125-127, 1994; Durrant, I., Enhanced chemiluminescent detection of horseradish peroxidase labeled probes, *Methods Mol.Biol.* 31, 147-161, 1994; Aravin, A. and Tuschi, T., Identification and characterization of small RNAs involved

in RNA silencing, *FEBS Lett.* 579, 5830-5840, 2005; Farrell, R.E., *RNA Methodologies: A Laboratory Guide for Isolation and Characterization*, Academic Press, San Diego, USA, 1993; Darling, D.C. and Brickell, P.M., *Nucleic Acid Blotting: The Basics*, Oxford University Press, Oxford, UK, 1994.

### Northwestern Blot

A protein blotting technique related to the various other blotting techniques such as the Western Blot and the Northern Blot. In the Northwestern Blot, the protein mixture is separated by gel electrophoresis, transferred by electrophoresis to a PVDF or nitrocellulose membrane. Specific proteins are identified through the binding of radiolabeled or fluorophore-labeled RNA oligomers; (double-stranded RNA) dsRNA is used to identify dsRNA binding proteins. See Schiff, L.A., Nibert, M.L., Co, M.S., Brown, E.G., and Fields, B.N., Distinct binding sites for zinc and double-stranded RNA in the reovirus outer capsid protein sigma 3, *Mol. Cell.Biol.* 8, 273-283, 1988; Chen, X., Sadlock, J., and Schon, E.A., RNA-binding patterns in total human tissue proteins: analysis by northwestern blotting, *Biochem.Biophys.Res.Commun.* 191, 18-25, 1993; Kumar, A., Kim, H.R., Sobol, R.W., et al., Mapping of nucleic acid binding in proteolytic domains of HIV-1 reverse transcriptase, *Biochemistry* 32, 7466-7474, 1993; Lin, G.Y., Paterson, R.G., and Lamb, R.A., The RNA binding region of the paramyxovirus SV5 V and P proteins, *Virology* 238, 460-469, 1997; Zhao, S.L., Liang, C.Y., Zhang, W.J., Tang, X.C., and Peng, H.Y., Characterization of the RNA-binding domain in the *Decrolium punctatus* cytoplasmic polyhedrosis virus nonstructural protein p44, *Virus Res.* 114, 80-88, 2005; Sekiya, S., Noda, K., Nishikawa, F., et al., Characterization and application of a novel RNA aptamers against the mouse prion protein, *J.Biochem.* 139, 383-390, 2006.

### Notch

A receptor class which regulates cell differentiation and development. Notch was first identified in *Drosophila* where it is thought to be involved in long-term memory and neuronal plasticity. See Wilkin, M.B., and Baron, M., Endocytic regulation of North activation and down-regulation, *Membrane Molec.Biol.* 22, 279-289, 2005; Lai, E.C., Notch signaling: control of cell communication and cell fate, *Development* 131, 965-973, 2004; Artavanis-Tsakonas, S., The molecular biology of the Notch locus and the fine tuning of differentiation in *Drosophila*, *Trends Genet.* 4, 95-100, 1988; Jones, P.A., Epithelial stem cells, *Bioessays* 19, 683-690, 1997.

### Nuclear Magnetic Resonance

A technique which detects nuclear-spin orientation in an applied magnetic field; detection of a nuclear magnetic moment; usually measured as the chemical shift from a standard such as such as tetramethyl silane for hydrogen and trichlorofluoromethane for fluorine. Coupling constants (spin-spin coupling, J) are also measured in two-dimensional analyses. See Roberts, J.D., *Nuclear Magnetic Resonance: Applications to Organic Chemistry*, McGraw-Hill, New York, NY, 1959; Pople, J.A., *High-Resolution Nuclear Magnetic Resonance*, McGraw-Hill, New York, NY, 1959; Dyer, J.R., *Applications of Absorption Spectroscopy of Organic Compounds*, Prentice-Hall, Englewood Cliffs, NJ, 1965; Knowles, P.R., March, D., and Rattle, H.W.E., *Magnetic Resonance of Biomolecules: An Introduction to the Theory and*

*Practice of NMR and ESR in Biological Systems*, Wiley, New York, NY, 1976; Leyden, D.E. and Cox, R.H., *Analytical Applications of NMR*, Wiley, New York, NY, 1977; Jardetzky, O. and Roberts, G.C.K., *NMR in Molecular Biology*, Academic Press, New York, NY, 1981; Wüthrich, K., *NMR of Proteins and Nucleic Acids*, Wiley, New York, NY, 1986; Paudler, W.W., *Nuclear Magnetic Resonance: General Concepts and Applications*, Wiley, New York, NY, 1987; Schrami, J. and Bellama, J.M., *Two-Dimensional NMR Spectroscopy*, Wiley, New York, NY, 1988; Sanders, J.K.M., and Hunter, B.K., *Modern NMR Spectroscopy: A Guide for Chemists*, Oxford University Press, Oxford, UK, 1993; Hore, P.J. and Jones, J.A., *NMR, The Toolkit*, Oxford University Press, Oxford, UK, 2000; James, T.L. and Schmitz, U., *Nuclear Magnetic Resonance of Biological Molecules*, Academic Press, San Diego, CA., 2001; Lambert, J.B. and Mazzola, E.P., *Nuclear Magnetic Resonance Spectroscopy: An Introduction to Principles, Applications, and Experimental Methods*, Pearson/Prentice Hall, Upper Saddle River, NJ, 2004; Mitchell, T.N. and Costisella, B., *NMR—From Spectra to Structures: An Experimental Approach*, Springer, Berlin, 2004; Friebolin, H., *Basic One- and Two-Dimensional NMR Spectroscopy*, Wiley-VCH, Weinheim, Germany, 2005.

## Nuclear Pore Complex

A large transporter which spans the nuclear envelope (nuclear membrane). This structure forms a channel between the inner and outer nuclear membrane providing for the transport of materials to and from the nucleus and cytoplasm; all transport mechanisms in and out of the nucleus, active and passive, occur through a tubular element in this pore structure. The Karyopherin  $\beta$  family of proteins are involved in these transport processes. See Faberge, A.C., The nuclear pore complex: its free existence and an hypothesis as to its origin, *Cell Tissue Res.* 151, 403-415, 1974; Maul, G.G., Nuclear pore complexes. Elimination and reconstruction during mitosis, *J.Cell Biol.* 74, 492-500, 1977; Wozniak, R. and Clarke, P.R., Nuclear pores: sowing the seeds of assembly on the chromatin landscape, *Curr.Biol.* 13, R970-R972, 2003; Rabut, G., Lenart, P., and Ellenberg, J., Dynamics of nuclear pore complex organization through the cell cycle, *Curr.Opin.Cell Biol.* 16, 314-321, 2004; Sazer, S., Nuclear envelope: nuclear pore complexity, *Curr.Biol.* 15, R23-R26, 2005; Peters, R., Translocation through the nuclear pore complex: selectivity and speed by reduction-of-dimensionality, *Traffic* 6, 421-427, 2005; Devos, D., Dokudovskaya, S., Williams, R., *et al.*, Simple fold composition and modular architecture of the nuclear pore complex, *Proc. Natl.Acad.Sci.USA* 103, 2172-2177, 2006; van der Aa, M.A.E.M., Mastrobattista, E., Oosting, R.S., Hennink, W.E., Koning, G.A., and Commelin, D.J.A., The nuclear pore complex: the gateway to successful nonviral gene delivery, *Pharmaceut.Res.* 23, 447-459, 2006.

## Nucleic Acid Testing

The use of PCR technology to test for the presence of nucleic acid sequences in biological materials. This approach is receiving attention in therapeutics and the screening of blood for viral pathogens. See Tabor, E. and Epstein, J.S., NAT screening of blood and plasma donations: evolution of technology and regulatory policy, *Transfusion* 42, 1230-1237, 2002; Dimech, W., Bowden, D.S., Brestovac, B., *et al.*, Validation of assembled nucleic acid-based tests in diagnostic microbiology laboratories, *Pathology* 36, 45-50, 2004; Valentine-Thon, E., Quality control in nucleic acid testing—where do we stand? *J.Clin.Virol.* 25, S13-S21, 2002.

## Nucleosome

An octamer of histone proteins associated with an approximate 140 bp DNA; the octamer is composed of two each of H2A, H2B, H3, and H4. See Kornberg, R.D. and Lorch, Y., Irresistible force meets immovable object: transcription and the nucleosome, *Cell* 67, 833-836, 1991; Turner, B.M., Decoding the nucleosome, *Cell* 75, 5-8, 1993; Sivolob, A. and Prunell, A., Nucleosome conformational flexibility and implications for chromatin dynamics, *Philos. Transact.A Math.Phys.Eng.Sci.* 362, 1519-1547, 2004; Lieb, J.D. and Clarke, N.D., Control of transcription through intragenic patterns of nucleosome composition, *Cell* 123, 1187-1190, 2005; Decker, P., Nucleosome autoantibodies, *Clin.Chim.Acta* 366, 48-60, 2006; Stockdale, C., Bruno, M., Ferreira, H., *et al.*, Nucleosome dynamics, *Biochem.Soc.Symp.* (73), 109-119, 2006. ## Nutrigenomics

Genomics of nutrition. The science of nutrigenomics seeks to provide a molecular understanding for how common dietary chemicals (i.e., nutrition) affect health by altering the expression and/or structure of an individual's genetic makeup. See van Ommen, B. and Stierum, R., Nutrigenomics: exploiting system biology in the nutrition and health arena, *Curr.Opin.Biotechnol.* 13, 517-721, 2002; Muller, M. and Kersten, S., Nutrigenomics: goals and strategies, *Nat.Rev.Genet.* 4, 315-322, 2003; Bauer, M., Hamm, A., and Pankratz, M.J., Linking nutrition to genomics, *Biol.Chem.* 385, 593-596, 2004; Davis, C.D. and Milner, J., Frontiers in nutrigenomics, proteomics, metabolomics and cancer prevention, *Mutat.Res.* 551, 51-64, 2004; van Ommen, B., Nutrigenomics: exploiting systems biology in the nutrition and health arenas, *Nutrition* 20, 4-8, 2004; Mutch, D.M., Wahli, W., and Williamson, G., Nutrigenomics and nutrigenetics: the emerging faces of nutrition, *FASEB J.* 19, 1602-1616m 2005; Corthesy-Theulaz, I., den Dunnen, J.T., Ferre, P., *et al.*, Nutrigenomics: the impact of biomics technology on nutrition research, *Ann.Nutr.Metab.* 49, 355-365, 2005; Trujillo, E., Davis, C., and Milner, J., Nutrigenomics, proteomics, metabolomics, and the practice of dietetics, *J.Am.Diet.Assos.* 106, 403-413, 2006; Afman, L. and Muller, M., Nutrigenomics: from molecular nutrition to prevention of disease, *J.Am.Diet.Assoc.* 106, 569-576, 2006; <http://nutrigenomics.ucdavis.edu>.

## Ogston Effect

A model for the electrophoretic migration of a polymer within a fiber network which treats the fiber network or soluble polymer network as a molecular sieve and the migrating solute as an undeformable particle. The reptation or biased reptation model treats the migrating solute as a flexible material which can "snake" through the network. There has been interest in the application of this model to the electrophoresis of large DNA molecules. See Ogston, A.G., The spaces in a uniform random suspension of fibers, *Trans.Faraday Soc.* 54, 1754-1757, 1958; Grossman, P.D.

and Soane, D.S., Experimental and theoretical studies of DNA separations by capillary electrophoresis in entangled polymer solutions, *Biopolymers* 31, 1221-1228, 1991; Kotaka, T., Adachi, S., and Shikata, T., Biased sinusoidal field gel electrophoresis for the separation of large DNA, *Electrophoresis* 14, 313-321, 1993; Guttma, A., Lengyel, T., Szoke, M., and Sasvari-Szekely, M., Ultra-thin-layer agarose gel electrophoresis II. Separation of DNA fragments on composite agarose-linear polymer matrices, *J.Chromatog.A.* 871, 289-298, 2000; Labrie, J., Merdier, J.F., and Slater, G.W., An exactly solvable Ogston model of gel electrophoresis. V. Attractive gel-analyte interactions and their effects on the Ferguson plot, *Electrophoresis* 21, 823-833, 2000; Slater, G.W., A theoretical study of an empirical function for the mobility of DNA fragments in sieving matrices, *Electrophoresis* 23, 1410-1416, 2002; Mercier, J.-F. and Slater, G.W., Universal interpolating function for the dispersion coefficient of DNA fragments in sieving matrices, *Electrophoresis* 27, 1453-1461, 2006.

## Okazaki Fragment

Smaller fragments of DNA which are synthesized and then incorporated into larger DNA molecules showing that replication can be a discontinuous process. See Okazaki, R., Okazaki, T., Sakabe, K., Sugimoto, K., and Sugino, A., Mechanism of DNA chain growth. I. Possible discontinuity and unusual secondary structure of newly synthesized chains, *Proc.Natl.Acad.Sci.USA* 59, 598-605, 1968. Hyodo, M. and Suzuki, K., Chain elongation of DNA and joining of DNA intermediates in intact and permeabilized mouse cells, *J.Biochem.* 88, 17-25, 1980; Alberts, B.M., Prokaryotic DNA replication mechanisms, *Philos.Trans.R.Soc.Lond. B Biol. Sci.* 317, 395-420, 1987; Nethanel, T., Reisfeld, S., Dinter-Gottlieb, G., and Kaufmann, G., An Okazaki piece of simian virus 40 may be synthesized by ligation of shorter precursor chains, *J.Virol.* 62, 2867-2873, 1988; Egli, M., Usman, N., Zhang, S.G., and Rich, A., Crystal structure of an Okazaki fragment at 2-Å resolution, *Proc.Natl.Acad.Sci.USA* 89, 534-538, 1992; Kim, J.H., Kang, Y.H., Kang, H.J., *et al.*, In vivo and in vitro studies of Mgs1 suggest a link between genome instability and Okazaki fragment processing, *Nucleic Acids Res.* 33, 6137-6150, 2005; Sporbert, A., Domaing, P., Leonhardt, H., and Cardoso, M.C., PCNA acts as a stationary loading platform for transiently interacting Okazaki fragment maturation proteins, *Nucleic Acids Res.* 33, 3521-3526, 2005.

## OMP85

A protein found in gram-negative bacteria which integrates proteins into bacterial outer membranes. See Gentle, I.E., Burri, L., and Littigow, T., Molecular architecture and function of the Omp85 family of proteins, *Molecular Microbiol.* 58, 1216-1225, 2005.

## Oncogene

A gene that causes the transformation of normal cells into cancerous tumor cells, especially a viral gene that transforms a host cell into a tumor cell; a gene that encodes a protein product which will stimulate uncontrolled cellular proliferation. Oncogenes are derivatives of normal cellular genes. See also proto-oncogenes. See Wiman, K.G. and Hayward, W.S., Rearrangement and activation of the *c-myc* gene in avian and human B-cell lymphomas, *Tumour Biol.* 5, 211-219, 1984; Balmain, A., Transforming *ras* oncogenes and multistage carcinogenesis, *Br.J.Cancer* 51, 1-7, 1985; Newbold, R.F., Malignant transformation of

mammalian cells in culture: delineation of stages and role of cellular oncogenes activation, *IARC Sci.Publ.* 67, 31-53, 1985; Ratner, L., Josephs, S.F., and Wong-Staal, F., Oncogenes: their role in neoplastic transformation, *Annu.Rev.Microbiol.* 39, 419-449, 1985; Giehl, K., Oncogenic *Ras* in tumour progression and metastasis, *Biol.Chem.* 386, 193-205, 2005; Sanchez, P. Clement, V., Ruis, I., and Altaba, A., Therapeutic targeting of the Hedgehog-GLI pathway in prostate cancer, *Cancer Res.* 65, 2990-2992, 2005; Bellacosa, A., Kumar, C.C. Di Cristafano, A., and Testa, J.R., Activation of AKT kinases in cancer: implications for therapeutic targeting, *Adv.Cancer Res.* 94, 29-86, 2005; Kranenburg, O., The *KRAS* oncogenes: past, present, and future, *Biochim.Biophys.Acta* 1756, 81-82, 2005.

## Oncogenomics

The use of molecular medicine tools such as DNA microarray and proteomics to study the oncology process, cancer genomics; study of oncogenes. See Rosell, R., Monzo, M., O'Brate, A., and Taron, M., Translational oncogenomics: toward rational therapeutic decision-making, *Curr.Opin.Oncol.* 14, 171-179, 2002; Strausberg, R.L., Simpson, A.J., Old, L.J., and Riggins, G.J., Oncogenomics and the development of new cancer therapies, *Nature* 429, 469-474, 2004; Jain, K.K., Role of oncoproteomics in the personalized management of cancer, *Expert Rev. Proteomics* 1, 49-55, 2004; Sakamoto, K.M., Oncogenomics: dissecting cancer through genome research, *IDrugs* 4, 392-393, 2001; Lam, S.H. and Gong, Z., Modeling liver cancer using zebrafish: a comparative Oncogenomics approach, *Cell Cycle* 5, 573-577, 2006.

## Onconase

Onconase is a ribonuclease isolated from amphibia. Onconase is homologous to pancreatic ribonuclease and is clinical trials as a biopharmaceutical. See Ardelt, W., Mikulski, S.M., and Shogen, K. Amino acid sequence of an anti-tumor protein from *Rana Pipiens* oocytes and early embryos. Homology to pancreatic ribonuclease, *J.Biol.Chem.* 266, 245-251, 1991; Wu, Y., Mikulski, S.M., Ardelt, W., *et al.*, A cytotoxic ribonuclease. Study of the mechanism of onconase cytotoxicity, *J.Biol.Chem.* 268, 10686-10693, 1993; Leland, P.A., Schultz, L.W., Kim, B.W., and Raines, R.T., Ribonuclease A variants with potent cytotoxic activity, *Proc.Natl.Acad.Sci.USA* 95, 10407-10412, 1998; Notomista, E., Catanzano, F., Graziano, G., *et al.*, Onconase: an usually stable protein, *Biochemistry* 39, 8711-8718, 2000; Bosch, M., Benito, A., Ribo, M., *et al.*, A nuclear localization sequence endows human pancreatic ribonuclease with cytotoxic activity, *Biochemistry* 43, 2167-2177, 2004; Kim, B.-M., Kim, H., Raines, R.T., *et al.*, Glycosylation of onconase increases its conformational stability and toxicity for cancer cells, *Biochem.Biophys.Res. Commun.* 315, 976-983, 2004; Tafach, A., Bassett, T., Sparanese, D., and Lee, C.H., Destroying RNA as a therapeutic approach, *Curr.Med.Chem.* 13, 863-681, 2006; Suhasini, A.N. and Sirdeshmukh, R., Transfer RNA cleavages by onconase reveal unusual cleavage sites, *J.Biol.Chem.* 281, 12201-12209, 2006.

## Opsonization

The process by which an antigen, usually a bacterial cell, is coated with an antibody (an opsonin) and then destroyed by the subsequent process of phagocytosis. The process of opsonization use Fab' portion of the antibody recognized antigen and the Fc domain for complement activation and interaction phagocytic

cells such as neutrophils. See Peterson, P.K., Kim, Y., Schemling, D., *et al.*, Complement-mediated phagocytosis of *Pseudomonas aeruginosa*, *J.Lab.Clin.Med.* 92, 883-894, 1978; Cunnion, K.M., Hair, P.S., and Buescher, E.S., Cleavage of complement C3b to iC3b on the surface of *Staphylococcus aureus* is mediated by serum complement factor I, *Infect.Immun.* 72, 2858-2863, 2004; Mueller-Ortiz, S.L., Drouin, S.M., and Wetsel, R.A., The alternative activation pathway and complement component C3 are critical for a protective immune response against *Pseudomonas aeruginosa* in a murine model of pneumonia, *Infect.Immun.* 72, 2899-2906, 2004; Coban, E., Ozdogan, M., Tuncer, M., Bozcuk, H., and Ersoy, F., The treatment of low-dose intraperitoneal immunoglobulin administration in the treatment of peritoneal dialysis-related peritonitis, *J.Nephrol.* 17, 427-430, 2004; Blasi, E., Mucci, A., Neglia, R., *et al.*, Biological importance of the two Toll-like receptors, TLR2 and TLR4, in macrophage response to infection with *Candida albicans*, *FEMS Immunol.Med.Microbiol.* 46, 69-79, 2005; Tosi, M.F., Innate immune responses to infection, *J.Allergy Clin.Immunol.* 116, 241-249, 2005; Rus, H., Cudrici, C., and Niculescu, F., The role of the complement system innate immunity, *Immunol.Res.* 33, 103-112, 2005; Foster, T.J., Immune invasion by staphylococci, *Nat.Rev.Microbiol.* 3, 948-958, 2005; Arbo, A., Pavia-Ruz, N., and Santos, J.I., Opsonic requirements for the respiratory burst of neutrophils against *Giardia lamblia* trophozoites, *Archs.Med.Res.* 37, 465-473, 2006.

## Optical Activity

The ability of (chiral) chemical compounds to change the plane of polarization of polarized light; compounds may be dextrorotatory (*d*) or levorotatory (*l*). The optical activity of a chemical compound is a chemical property and an index of stereochemical purity. Optical Rotatory Dispersion and Circular Dichroism are measurements of optical activity.

## Optical Rotatory Dispersion

The measurement of the differential change in the velocity of light- and right-circularly polarized light. This technique has been used to study the conformation of molecules. McKenzie, H.A. and Frier, R.D., The behavior of R-ovalbumin and its individual components A1, A2, and A3 in urea solution: kinetics and equilibria, *J.Prot.Chem.* 22, 207-214, 2003; Chen, E., Kumita, J.R., Woolley, G.A., and Kliger, D.S., The kinetics of helix unfolding of an azobenzene cross-linked peptide probed by nanosecond time-resolved optical rotatory dispersion, *J.Amer.Chem.Soc.* 125, 12443-12449, 2003; Chen, E., Goldbeck, R.A., and Kliger, D.S., The earliest events in protein folding: a structural requirement for ultrafast folding in cytochrome C, *J.Amer.Chem.Soc.* 126, 11175-11181, 2004; Giorgio, E., Viglione, R.G., Zanasi, R., and Rosini, C., Ab initio calculation of optical rotatory dispersion (ORD) curves: a simple and reliable approach to the assignment of the molecular absolute configuration, *J.Amer.Chem.Soc.* 126, 12968-12976, 2004.

## Optical Switches

In telecommunication, an optical switch is a switch that enables signals in optical fibers or integrated optical circuits (IOCs) to be selectively switched from one circuit to another. In biology, there are several definitions – one whether an optical switch is chemical probes that undergoes a spectral transition in response to

light where such probe competes for a specific binding partner or ligand when in one but not the other spectral state – See Sakata, T., Yan, Y., and Marriott, G., Family of site-selective molecular optical switches, *J.Org.Chem.* 70, 2009-2013, 2005. Another definition is a spectral probe which is sensitive to a specific intracellular biological event – see Graves, E.E., Weissleder, R., and Ntziachristos, V., Fluorescence molecular imaging of small animal tumors, *Curr.Mol.Med.* 4, 419-430, 2004. The term optical switch is also used in conjunction with optical scissors – Feringa, B.L., In control of motion: from molecular switches to molecular motors, *Acc.Chem.Res.* 34, 504-513, 2001; Capitano, M., Vanzi, F., Broggio, C., *et al.*, Exploring molecular motors and molecular switches at the single-molecule level, *Microsc.Res.Tech.* 65, 194-204, 2004

## ORFeome

The total number of protein-coding open reading frames in an organism. See Rual, J.F., Hill, D.E., and Vidal, M., ORFeome projects: gateway between genomics and omics, *Curr.Opin.Chem.Biol.* 8, 20-25, 2004; Brasch, M.A., Hartley, J.L., and Vidal, M., ORFeome cloning and systems biology: standardized mass production of the parts from a parts list, *Genome Res.* 14, 2001-2009, 2004; Uetz, P., Rajagopala, S.V., Dong, Y.A., and Haas, J., From ORFeomes to protein interaction maps in viruses, *Genome Res.* 14, 2029-2033, 2004; Johnson, N.M., Behm, C.A., and Trowell, S.C., Heritable and inducible gene knockdown in *C.elegans* using Wormgate and the ORFeome, *Gene* 359, 26-34, 2005; Schroeder, B.K., House, B.L., Mortimer, M.W., *et al.*, Development of a functional genomics platform for *Sinorhizobium meliloti* construction of an ORFeome, *Appl.Environ.Microbiol.* 71, 5858-5864, 2005.

## Organelle proteomics

Analysis of subcellular organelles such as mitochondria, nucleus, the endocytotic apparatus by proteomic techniques. See Jan Wijk, K., Proteomics or the chloroplast: experimentation and prediction, *Trends Plant Sci.* 5, 420-425, 2000; Taylor, S.W., Fahy, E., and Ghosh, S.S., Global organellar proteomics, *Trends Biotechnol.* 21, 82-88, 2003; Huber, L.A., Pfaller, K., and Vistor, I., Organelle proteomics: implications for subcellular fractionation in proteomics, *Circ.Res.* 92, 962-968, 2003; Dreger, M., Subcellular proteomics, *Mass Spectrom.Rev.* 22, 27-56, 2003; Brunet, S., Thibault, P., Gagnon, E., *et al.*, *Trends Cell Biol.* 12, 629-638, 2003; Jarvis, P., Organellar proteomics: chloroplasts in the spotlight, *Curr. Biol.* 14, R317-319, 2004; Warnock, D.E., Fahy, E., and Taylor, S.W., Identification of protein associations in organelles, using mass spectrometry-based proteomics, *Mass Spectrom.Rev.* 23, 259-280, 2004; van Wijk, K.J., Plastid proteomics, *Plant Physiol. Biochem.* 42, 963-977, 2004; Yates, J.R., 3rd, Gilchrist, A., Howell, K.E., and Bergeron, J.J., Proteomics of organelles and large cellular structures, *Nat.Rev.Mol.Cell Biol.* 6, 702-714, 2005.

## Orthogonal

Two lines intersecting at right angles (mathematics). The terms is derived from the Greek *orthos* meaning straight, upright, vertical. The term orthogonal has been used to describe a variety of activities in biochemistry and molecular biology including protein purification and analysis. More recently the term orthogonal has been used to describe tRNA/tRNA synthase pairs that will react with each other and not with other pairs in *Escherichia coli* permitting the incorporation of unnatural amino acids

into proteins. See Guilhaus, M., Selby, D. and Miynski, V., Orthogonal acceleration time-of-flight mass spectrometry, *Mass Spectrom.Rev.* 19, 65-107, 2000; Evans, C.R. and Jorgenson, J.W., Multidimension LC-LC and LC-CE for high resolution separations of biologicals, *Anal.Bioanal.Chem.* 378, 1952-1961, 2004; Righetti, P.G., Bioanalysis: its past, present, and future, *Electrophoresis* 25, 2111-2127, 2004; Speers, A.E. and Cravatt, B.F., A tandem orthogonal proteolysis strategy for high-content chemical proteomics, *J.Amer.Chem.Soc.* 127, 10018-10019, 2005; Liu, D.R., Magliery, T.J., Pastrnak, M., and Schultz, P.G., Engineering a tRNA and aminoacyl-tRNA synthetase for the site-specific incorporation of unnatural amino acids into protein *in vivo*, *Proc.Natl.Acad.Sci.USA* 94, 10092-10097, 1997; Chin, J.V., Martin, A.B., King, D.S., Wang, L., and Schultz, P.G., Addition of a photocrosslinking amino acid to the genetic code of *Escherichia coli*, *Proc.Natl.Acad.Sci.USA* 99, 11020-11024, 2002; Köhrer, C., Sullivan, E.L., and RajBhandary, U.L., Complete set of orthogonal 21<sup>st</sup> aminoacyl-tRNA synthetase-amber, ochre and opal suppressor tRNA pairs: concomitant suppression of three different termination codons in an mRNA in mammalian cells, *Nucl.Acids Res.* 21, 6200-6211, 2004.

## Orthologues

Genes in different organisms which have similar function. See Lovejoy, D.A., Peptide hormone evolution: functional heterogeneity within GnRN and CRF families, *Biochem.Cell Biol.* 74, 1-7, 1996; Cole, C.N., mRNA export: the long and winding road, *Nat.Cell Biol.* 2m E55-E58, 2000; Trowsdale, J., Barten, R., Haude, A., *et al.*, The genomic context of natural killer receptor extended gene families, *Immunol.Rev.* 181, 20-38, 2001; Lieschke, G.J., Zebrafish—an emerging genetic model for the study of cytokines and hematopoiesis in the era of functional genomics, *Int.J.Hematol.* 73, 25-31, 2001; Lamotagne, B., Larose, S., Boulanger, J., and Elela, S.A., The RNase III family: a conserved structure and expanding functions in eukaryotic dsRNA metabolism, *Curr.Issues Mol.Biol.* 3, 71-78, 2001; Stothard, P. and Pilgrim, D., Sex-determination gene and pathway evolution in nematodes, *Bioessays* 25, 221-231, 2003; Chen, T.Y., Structure and function of *clc* channels, *Annu.Rev.Physiol.* 67, 809-839, 2005; Nair, V. and Zavolan, M., Virus-encoded microRNAs: novel regulators of gene expression, *Trends Microbiol.* 14, 169-175, 2006.

## Osmosensor

A molecular system sensing osmotic stress and regulating pathways involved in preservation of osmotic equilibrium. See Wurgler-Murphey, S.M. and Saito, H., Two-component signal transducers and MAPK cascades, *Trends Biochem.Sci.* 22, 172-176, 1997; Urao, T., Yamaguchi-Shinozaki, K. and Shinozaki, K., Plant histidine kinases: an emerging picture of two-component signal transduction in hormone and environmental responses, *Sci.STKE* 2001(109), RE18, 2001; Reiser, V., Raitt, D.C., and Saito, H., Yeast osmosensor Sln1 and plant cytokine receptor Cre1 respond to changes in turgor pressure, *J.Cell Biol.* 161, 1035-1040, 2003; Poolman, B., Spitzer, J.J., and Wood, J.M., Bacterial osmosensing: roles of membrane structure and electrostatics in lipid-protein and protein-protein interactions, *Biochim.Biophys. Acta* 1666, 88-104, 2004; Liedtke, W., TRPV4 as osmosensor: a transgenic approach, *Pflugers Arch.* 451, 176-180, 2005; Schiller, D., Ott, V., Kramer, R., and Morbach, S., Influence of membrane composition on osmosensitivity by the betaine carrier BetP from *Corynebacterium glutamicum*, *J.Biol.Chem.* 281, 7737-7746, 2006.

## Osteoclast

Bone-degrading cells, derived from macrophages; opposite function to osteoblasts. See Rifkin, B.R. and Gay, C.V., *Biology and Physiology of the Osteoclast*, CRC Press, Boca Raton, FL, 1992; Abou-Samra, A.-B. and Mundy, G.R., *Physiology and Pharmacology of Bone*, Springer-Verlag, Berlin, 1993; Massaro, E.J. and Rogers, J.M., *The Skeleton: Biochemical, Genetic, and Molecular Interactions in Development and Homeostasis*, Humana Press, Totowa, NJ, 2004; Bronner, F. and Carson, M.C., *Bone Resorption*, Springer, London, 2005; Li, Z., Kong, K., and Qi, W., Osteoclast and its roles in calcium metabolism and bone development and remodeling, *Biochem.Biophys.Res.Commun.* 343, 345-350, 2006; Fukumoto, S., Iwamoto, T., Sakai, E., *et al.*, Current topics in pharmacological research of bone metabolism: osteoclasts differentiation regulated by glycosphingolipids, *J.Pharmacol. Sci.* 100, 195-200, 2006; Wada, T., Nakashima, T., Hiroshi, N., and Penninger, J.M., RANKL-RNAK signaling in osteoclastogenesis and bone disease, *Trends Mol.Med.* 12, 17-25, 2006.

## Osteoprotegerin (OPG)

A protein which suppresses the production of osteoclasts; functions in combination with RANKL regulated bone resorption. See Hofbauer, L.C. and Heufelder, A.E., Osteoprotegerin: a novel local player in bone metabolism, *Eur.J.Endocrinol.* 137, 345-346, 1997; Kong, Y.Y., Boyle, W.J., and Penninger, J.M. Osteoprotegerin ligand: a regulator of immune responses and bone physiology, *Immunol. Today* 21, 495-502, 2000; Hofbauer, L.C., Khosla, S., Dunstan, C.R., *et al.*, The roles of osteoprotegerin and osteoprotegerin ligand in the paracrine regulation of bone resorption, *J.Bone Miner.Res.* 15, 2-12, 2000; Theoleyre, S., Wittrant, Y., Tat, S.K., *et al.*, The molecular triad OPG/RANK/RANKL: involvement in the orchestration of pathophysiological bone remodeling, *Cytokine Growth Factor Rev.* 15, 457-475, 2004; Bezerra, M.C., Carvalho, J.F., Prokopowitsch, A.S., and Pereira, R.M., RANK, RANKL, and osteoprotegerin in arthritic bone loss, *Braz.J.Med.Biol.Res.* 38, 161-170, 2005; Feng, X., RANKing intracellular signaling in osteoclasts, *IUBMB Life* 57, 389-395, 2005; Kostenuik, P.J., Osteoprotegerin and RANKL regulate bone resorption, density, geometry and strength, *Curr.Opin. Pharmacol.* 5, 618-625, 2005; Neumann, E., Gay, S., Muller-Ladner, U., The RANK/RANKL/osteoprotegerin system in rheumatoid arthritis: new insights from animal models, *Arthritis Rheum.* 52, 2960-2967, 2005; Wada, T., Nakashima, T., Hiroshi, N., and Penninger, J.M., RANKL-RANK signaling in osteoclastogenesis and bone disease, *Trends Mol.Med.* 12, 17-25, 2006.

## Oxyanion Hole

A feature of the active sites of hydrolytic enzymes such as lipases or chymotrypsin where the acyl carbonyl of the acyl-enzyme intermediate is stabilized by hydrogen bonding to peptide amide nitrogens on the enzyme. See Menard, R. and Storer, A.C., Oxyanion hole interactions in serine cysteine proteases, *Biol.Chem.Hoppe Seyler* 373, 393-400, 1992; Whiting, A.K. and Peticolas, W.L., Details of the acyl-enzyme intermediate and the oxyanion hole in serine protease catalysis, *Biochemistry* 33, 552-561, 1994; Johal, S.S., White, A.J., and Wharton, C.W., Effect of specificity on ligand conformation in acyl-chymotrypsins, *Biochem.J.* 297, 281-287, 1994; Cui, J., Marankan, F., Fu, W., *et al.*, An oxyanion-hole selective serine protease inhibitor in complex with trypsin, *Bioorg.Med. Chem.* 10, 41-46, 2002; Lee, L.C., Lee, Y.L., Leu, R.J., and Shaw, J.F., Functional role of catalytic triad and oxyanion hole-forming

residues on enzyme activity of *Escherichia coli* thioesterase I/protease I/Phospholipase L1, *Biochem.J.* 397, 69-76, 2006.

## Palindrome

A sequence which reads the same forwards and backwards; usually refers to nucleic acid sequence where opposing strands read the same; that is the 3'→5' sequence in one strand is the same as the 5'→3' sequence in the opposing strand. Palindromic sequences are frequently present at the sites of restriction class II enzyme cleavages. See Leach, D.R., Long DNA palindromes, cruciform structures, genetic instability and secondary structure repair, *Bioessays* 16, 893-900, 1994; Beato, M., Chavez, S., Truss, M., Transcriptional regulation by steroid hormones, *Steroids* 61, 240-251, 1996; Cho-Chung, Y.S., CRE-palindrome oligonucleotide as a transcription factor decoy and an inhibitor of tumor growth, *Antisense Nucleic Acid Drug Dev.* 8, 167-170, 1998.

## Paracrine

Usually in reference to a hormone or other biological effector such as a peptide growth factor or cytokine which has an effect on the cell or tissue immediately surrounding the cell or tissue responsible for the synthesis of the given compound. See Franchimont, P., *Paracrine Control*, Saunders, Philadelphia, PA, 1986; Piva, F., *Cell to Cell Communication in Endocrinology*, Raven Press, New York, NY, 1988; *Autocrine and Paracrine Mechanisms in Reproductive Endocrinology*, ed. L.C. Krey and B.J. Gulyas, Plenum Press, New York, NY, 1989; Habenicht, A., *Growth Factors, Differentiation Factors and Cytokines*, Springer-Verlag, Berlin, Germany, 1990; Hardie, D.G., *Biochemical Messengers: Hormones, Neurotransmitters, and Growth Factors*, Chapman & Hall, London, UK, 1991; Vallesi, A., Giuli, G., Bradshaw, R.A., and Luporini, P., Autocrine mitogenic activity of pheromones produced by the protozoan ciliate *Euplotes raikovi*, *Nature* 376, 522-524, 1995.

## Paralogues

Genes within the same genome that have evolved by gene duplication. See Ohno, S., The one-to-four rule and paralogues of sex-determining genes, *Cell.Mol.Life Sci.* 55, 824-830, 1999; Forterre, P., Displacement of cellular proteins by functional analogues from plasmids or viruses could explain puzzling phylogenies of many DNA informational proteins, *Mol.Microbiol.* 33, 457-465, 1999; Gilbert, J.M., The evolution of engrailed genes after duplication and speciation events, *Dev.Gene.Evol.* 212, 307-318, 2002; Ferrier, D.E., Hox genes: did the vertebrate ancestor have a Hox14? *Curr. Biol.* 14, R210-R211, 2004; Tsuru, T., Kawai, M., Mizutani-Ui, Y., Uchiyama, I., and Kobayashi, I., Evolution of paralogous genes: reconstruction of genome rearrangements through comparison of multiple genomes with *Staphylococcus aureus*, *Mol.Biol.Evol.* 23, 1269-1285, 2006.

## PDZ-Domains

A protein domain involved in protein-protein interactions with a preference for C-terminal regions. PDZ proteins are recognized as component of biological scaffolds. The acronym is derived from the homology of a motif in PSD-95, the *Drosophila* Discs-Large septate junction protein and the epithelial junction protein ZO-1. See Ranganathan, R. and Ross, E.M., PDZ domain proteins; Scaffolds for signaling complexes, *Curr.Biol.* 7, R770-R773, 1997; Harris, B.Z. and Lim, W.A., Mechanism and role of PDZ

domains in signaling complex assembly, *J.Cell Sci.* 114, 3219-3231, 2001; Dev, K.K., Making protein interactions druggable: targeting PDZ domains, *Nat.Rev.Drug Disc.* 3, 1047-1056, 2004; Schlieker, C., Mogk, A. and Bukau, B., A PDZ switch for a cellular stress response, *Cell* 117, 417-419, 2004; Brone, B. and Eggermont, J., PDZ proteins retain and regulate membrane transporters in polarized epithelial cell membranes, *Am.J.Physiol.Cell Physiol.* 3, 1047-1056, 2005.

## Pedigree Rate

Estimate of the mutation rate determined by calculating the number of nucleotide changes observed over of a known number of reproductive events. See Howell, N., Smejkal, C.B., Mackey, D.A., Chinnery, P.F., Turnbull, D.M. and Herrnstadt, C., The pedigree rate of sequence divergence in the human mitochondrial genome: there is a difference between phylogenetic and pedigree rates, *Am.J.Hum.Genet.* 72, 659-670, 2003.

## Pepducins

Cell-penetrating lipidated (palmitic acid) membrane tethered peptides which act as G protein-coupled receptors: see Covic, L., *et al.*, Activation and inhibition of G protein-coupled receptors by cell-penetrating membrane-tethered peptides, *Proc.Natl.Acad. Sci.* 99, 643-648, 2002; Lomas-Neira, J. and Ayala, A., Pepducins: an effective means to inhibit GPCR signaling by neutrophils, *Trends Immunol.* 26, 619-621, 2005. See also cell penetrating peptides.

## Peptidome

The peptide complement of a genome. Peptidomics is the study of the peptidome. See Schrader, M., and Schulz-Knappe, P., Peptidomics technologies for human body fluids, *Trends Biotechnol.* 19(Suppl 10), S55-S60, 2001; Jurgens, M. and Schrader, M., Peptidomic approaches in proteomic research, *Curr.Opin.Mol.Ther.* 4, 236-241, 2002; Schulze-Knappe, M., Schrader, M., and Zucht, H.D., The peptidomics concept, *Comb.Chem.High Throughput.Screen.* 8, 697-704, 2005; Zheng, X., Baker, H., and Hancock, W.S., Analysis of the low molecular weight serum peptidome using ultrafiltration and a hybrid ion trap-Fourier transform mass spectrometry, *J.Chromatog.A.*, 1120, 173-184, 2006; Hortin, G.L., The MALDI TOF mass spectrometric view of the plasma proteome and peptidome, *Clin.Chem.* 52, 1223-1237, 2006.

## Peptergents

Peptide detergents; small, self-assembling peptides with detergent properties. These peptide detergents appear to quite useful for the study of membrane proteins. See Yeh, J.I., Du, S., Tortajada, A., Paulo, J., and Zhang, S., Peptergents: peptide detergents that improve stability and functionality of a membrane protein, Glycerol-3-phosphate dehydrogenase, *Biochemistry* 44, 16912-16919, 2005. Kiley, P., Zhao, X., Vaughn, M., *et al.*, Self-assembling peptide detergents stabilize isolated photosystem I on a dry surface for an extended time, *PLoS Biol.* 3, e230, 2005.

## Perforin

Perforin is a protein located in the granules of CD8 T-cells (cytotoxic T cells) and natural killer cells. Upon degranulation of these cells, perforin inserts itself into the target cell's plasma

membrane, forming a pore resulting in lysis of the target cell. Catalfamo, M., and Henkart, P.A., Perforin and the granule exocytosis cytotoxicity pathway, *Curr.Opin.Immunol.* 15, 522-527, 2003; Smith, M.J., Cretney, E., Kelly, J.M. *et al*, Activation of NK cell cytotoxicity, *Mol.Immunol.* 42, 501-510, 2005; Ashton-Rickardt, P.G., The granule pathway of programmed cell death, *Crit.Rev.Immunol.* 25, 161-182, 2005; Yoon, J.W. and Jun, H.S., Autoimmune destruction of pancreatic beta cells, *Am.J.Ther.* 12, 580-591, 2005; Andersen, M.H., Schrama, D., Thor Straten, P., and Becker, J.C., Cytotoxic T cells, *J.Invest.Dermatol.* 126, 32-41, 2006.

## Peroxiredoxins

Group of antioxidant thioredoxin-dependent enzymes with a catalytic function in the detoxification of cellular-toxic peroxides. See Claiborne, A., Ross, R.P., and Parsonage, D., Flavin-linked peroxide reductases: protein-sulfenic acids and the oxidative stress response, *Trends Biochem.Sci.* 17, 183-186, 1992; Dietz, K-J., Horhing, F., König, J., and Baien, M., The function of chloroplast 2-cysteine peroxiredoxin I peroxide detoxification and its regulation, *J.Expt.Bot.* 53, 1321-1329, 2002; Immenschuh, S. and Baumgart-Vogt, E., Peroxiredoxins, oxidative stress, and cell proliferation, *Antioxid.Redox.Signal.* 7, 768-777, 2005; Rouhier, N. and Jacquot, J.P., The plant multigenic family of thiol peroxidases, *Free Rad.Biol.Med.* 38, 1413-1421, 2005; Rhee, S.G., Chae, H.Z., and Kim, K., Peroxiredoxins: a historical overview and speculative preview of novel mechanisms and emerging concepts in cell signaling, *Free Radic.Biol.Med.* 38, 1543-1552, 2005; Immenschuh, S. and Baumgart-Vogt, E., Peroxiredoxins, oxidative stress, and cell proliferation, *Antioxidants & Redox Sign.* 7, 768-777.

## Peroxynitrite

A oxidizing/nitrating agent derived from the reaction of nitric oxide and superoxide which reacts with proteins, lipids and nucleic acids. The reactions are complex and in addition to oxidation reactions such as carbonyl formation and disulfide formation, there are reactions such as nitrosylation of cysteine and the nitration of tyrosine. See Beckman, J.S. and Crow, J.P., Pathological implications of nitric oxide, superoxide and peroxynitrite formation, *Biochem.Soc.Trans.* 21, 330-334, 1993; Pryor, W.A. and Squadrito, G.L., The chemistry of peroxynitrite: a product from the reaction of nitric oxide with superoxide, *Am.J.Physiol.* 268, L699-L722, 1995; Uppu, R.M., Squadrito, G.L., Cueto, R., and Pryor, W.A., Synthesis of peroxynitrite by azide-ozone reaction, *Methods Enzymol.* 269, 311-321, 1996; Beckman, J.S. and Koppenol, W.H., Nitric oxide, superoxide, and peroxynitrite: the good, the bad, and ugly, *Am.J.Physiol.* 271, C1424-C1437, 1996; Girotti, A.W., Lipid hydroperoxide generation, turnover, and effector action in biological systems, *J.Lipid Res.* 39, 1529-1542, 1998; Radi, R., Denicola, A., and Freeman, B.A., Peroxynitrite reactions with carbon dioxide-bicarbonate, *Methods Enzymol.* 301, 353-357, 1999; Groves, J.T., Peroxynitrite: reactive, invasive and enigmatic, *Curr.Opin.Chem.Biol.* 3, 226-235, 1999; Halliwell, B., Zhao, K., and Whiteman, M., Nitric oxide and peroxynitrite. The ugly, the uglier and the not so good: a personal view of the recent controversies, *Free Radic.Res.* 31, 651-669, 1999; Estevez, A.G. and Jordan, J., Nitric oxide and superoxide, a deadly cocktail, *Ann.N.Y.Acad.Sci.* 962, 207-211, 2002; Ohmori, H., and Kanayama, N. Immunogenicity of an inflammation-associated product, tyrosine nitrated self-proteins, *Autoimmun.Rev.* 4, 224-229, 2005; Hurd, T.R., Filipovska, A., Costa, N.J., *et al.*, Disulfide

formation on mitochondrial protein thiols, *Biochem.Soc.Trans.* 44, 1390-1393, 2005; Sawa, T. and Ohshima, H., Nitrate DNA damage in inflammation and its possible role in carcinogenesis, *Nitric Oxide* 14, 91-100, 2006; Niles, J.C., Wishnok, J.S., and Tannenbaum, S.R., Peroxynitrite-induced oxidation and nitration products of guanine and 8-oxoguanine: structures and mechanisms of product formation, *Nitric Oxide* 14, 109-121, 2006; Uppu, R.M., Synthesis of peroxynitrite using isoamyl nitrite and hydrogen peroxide in a homogeneous solvent system, *Anal.Biochem.* 354, 165-168, 2006. The reaction of tyrosine with peroxynitrite is sensitive to solvent environment with nitration favored in a hydrophobic environment as opposed to oxidation (Zhang, H., Joseph, J., Feix, J., *et al.*, Nitration and oxidation of a hydrophobic tyrosine probe by peroxynitrite in membranes: Comparison with nitration and oxidation of tyrosine by peroxynitrite in aqueous solution, *Biochemistry* 40, 7675-7686, 2001.

## Pescadillo

A nuclear protein originally demonstrated in zebrafish. Pescadillo is thought to be important in a variety of nuclear activities including DNA replication, ribosome formation, and cell cycle control. See Allende, M.L., Amsterdam, A., Becker, T., *et al.*, Insertional mutagenesis in zebrafish identifies two novel genes, pescadillo and dead eye, essential for embryonic development, *Genes Dev.* 10, 3141-3155, 1996; Haque, J., Boger, S., Li, J., and Duncan, D.A., The murine Pes1 gene encodes a nuclear protein containing a BRCT domain, *Genomics* 70, 201-210, 2000; Kinoshita, Y., Jarell, A.D., Flaman, J.M., *et al.*, Pescadillo, a novel cell cycle regulatory protein abnormally expressed in malignant cells, *J.Biol.Chem.* 276, 6656-6665, 2001; Maiorana, A., Tu, X., Cheng, G., and Baserga, R., Role of pescadillo in the transformation and immortalization of mammalian cells, *Oncogene* 23, 7116-7124, 2004; Killian, A., Le Meur, N., Sesboue, R., *et al.*, Inactivation of the RRB1-Pescadillo pathway involved in ribosome biogenesis induces chromosomal instability, *Oncogene* 23, 8597-8602, 2004; Sikorski, E.M., Uo, T., Morrison, R.S., and Agarwal, A., Pescadillo interacts with the cadmium response element of the human heme oxygenase-1 promoter in renal epithelial cells, *J.Biol.Chem.* 281, 24423-24430, 2006.

## Pfam

Protein family; used to describe a protein family data base. See Persson, B., Bioinformatics in protein analysis, *EXS* 88, 215-231, 2000; Bateman, A., Birney, E., Cerruti, L., *et al.*, The Pfam protein families data base, *Nucl.Acids Res.* 30, 276-280, 2002; Lubec, G., Afjehi-Sadat, L., Yang, J.W., and John, J.P., Searching for hypothetical proteins: theory and practice based upon original data and literature, *Prog.Neurobiol.* 77, 90-127, 2005; Anderston, J.N., Del Vecchio, R.L., Kannan, N., *et al.*, Computational analysis of protein tyrosine phosphatases: practical guide to bioinformatics and data resources, *Methods* 35, 90-114, 2005.

## Pharmaceutical Equivalence

Drug products can be considered to be pharmaceutical equivalents if such products (1) contain the same active ingredients, (2) are of the same dosage form and route of administration, and (3) identical in strength and concentration. The term therapeutic equivalence is also used to describe pharmaceutical equivalence. Pharmaceutically equivalent drug products may differ in attributes such as shape, color, excipients and release mechanism.

Pharmaceutical equivalence is of importance in the development of generic drugs. See <http://www.fda.gov>.

## Pharmacogenomics

The use of genomics to study the development and utilization of drugs. Pharmacogenomics will be essential to the development of predictive medicine/personalized medicine. Wilke, R.A., Reif, D.M., and Moore, J.H., Combinatorial Pharmacogenetics, *Nat. Rev. Drug Discov.* 4, 911-918, 2005; Ginsburg, G.S., Konstance, R.P., Allsbrook, J.S., and Schulman, K.A., Implications of pharmacogenomics for drug development and clinical practice, *Arch. Intern. Med.* 165, 2331-2336, 2005; Siest, G., Marteau, J.B., Maumus, S., *et al.*, Pharmacogenomics and cardiovascular drugs: need for integrated biological system with phenotypes and proteomic markers, *Eur. J. Pharmacol.* 527, 1-22, 2005; Robson, B. and Mushlin, R., Genomic messaging system and DNA mark-up language for information-based personalized medicine with clinical and proteome research applications, *J. Proteome Res.* 3, 930-948, 2004.

## Pharmacophore

The collection of structural features of a compound which provide for the pharmacological properties. Uses information derived from QSAR studies. See Glennon, R.A., Pharmacophore identification for sigma-1 (sigma1) receptor binding: application of the "deconstruction-reconstruction-elaboration" approach, *Mini Rev. Med. Chem.* 5, 927-940, 2005; Guner, O.F., The impact of pharmacophore modeling in drug design, *IDrugs* 9, 567-572, 2005; Guner, O., Clent, O., Kurogi, Y., Pharmacophore modeling and three dimensional database searching for drug design using catalyst: recent advances, *Curr. Med. Chem.* 11, 2991-3005, 2004.

## Pharmacoproteomics

The use of proteomics to predict individual reaction to a drug or drugs; also the use of proteomics for drug discovery and development; related to personalized medicine, theranostics, pharmacogenomics. See Di Paolo, A., Danesi, R., and Del Tacca, M., Pharmacogenetics of neoplastic diseases: new trends, *Pharmacol. Res.* 49, 331-342, 2004; Jain, K.K., Role of pharmacoproteomics in the development of personalized medicine, *Pharmacogenomics J.* 5, 331-336, 2004; Witzmann, F.A. and Grant, R.A., Pharmacoproteomics in drug development, *Pharmacogenomics J.* 3, 69-76, 2003.

## Phase Diagram(s)

A graph showing the relationship between phases (i.e. solid/gas/liquid) over a range of physical conditions (usually temperature and pressure). A phase is generally defined as a homogenous part of a heterogeneous system that is clearly separated from other phases by a physical boundary; the separation between ice and water is an example of a boundary between phases. See Ohgushi, M. and Wada, A., Liquid-like state of side chains at the intermediate stage of protein denaturation, *Adv. Biophys.* 18, 75-90, 1984; Dorfler, H.D., Mixing behavior of binary insoluble phospholipid monolayers. Analysis of the mixing properties of binary lecithin and cephalin systems by application of several surface and spreading techniques, *Adv. Colloid Interface Sci.* 31, 1-110, 1990; Diamond, A.D. and Hsu, J.T., Aqueous two-phase systems for

biomolecule separation, *Adv. Biochem. Eng. Biotechnol.* 47, 89-135, 1992; Mason, J.T., Investigation of phase transitions in bilayer monolayers, *Methods Enzymol.* 295, 468-494, 1998; Crowe, J.H., Tablin, F., Tsvetkova, N. *et al.*, Are lipid phase transitions responsible for chilling damage in human platelets? *Cryobiology* 38, 180-191, 1999; Smeller, L., Pressure-temperature phase diagrams of biomolecules, *Biochim. Biophys. Acta* 1595, 11-29, 2002; Dill, K.A., Truskett, T.M., Vlachy, V., and Hribar-Lee, B., Modeling water, the hydrophobic effect, and ion solvation, *Annu. Rev. Biochem. Biomol. Struct.* 34, 173-199, 2005; Scharnagl, C., Reif, M., and Friedrich, J., Stability of proteins: temperature, pressure and the role of the solvent, *Biochim. Biophys. Acta* 1749, 187-213, 2005.

## Phenotype

The physical manifestation of the genes of an organism; the collection of structure and function expressed by the genotype of an organism; the visible properties of an organism that are produced by the interaction of a genotype and the environment. See Padykula, H.A., *Control Mechanisms in the Expression of Cellular Phenotypes*, Academic Press, New York, NY, 1970; Levine, A.J., *The Transformed Phenotype*, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1984; Dewitt, T.J. and Scheiner, S.M., *Phenotypic Plasticity Function and Conceptual Approaches*, Oxford University Press, Oxford, UK, 2004; Pigliucci, M. and Preston, K., *Phenotypic Integration: Studying the Ecology and Evolution of Complex Phenotypes*, Oxford University Press, Oxford, UK, 2004.

## Phospholipase C

A family of intracellular enzymes central to many signal transduction pathways via effects on Ca<sup>2+</sup> and protein kinase C. Phospholipase C catalyzes the hydrolysis of phosphoinositol 4,5-bisphosphate to yield 1,4,5-inositol triphosphate and diacylglycerol. Irvine, R.F., The enzymology of stimulated inositol lipid turnover, *Cell Calcium* 3, 295-309, 1982; Farese, R.V., Phospholipids as intermediates in hormone action, *Mol. Cell Endocrinol.* 35, 1-14, 1984; Majerus, P.W., The production of phosphoinositide-derived messenger molecules, *Harvey Lect.* 82, 145-155, 1986-87; Litosch, I. and Fain, J.N., Regulation of phosphoinositide breakdown by guanine nucleotides, *Life Sci.* 39, 187-194, 1986; Putney, J.W., Jr., Formation and actions of calcium-mobilizing messenger, inositol 1,4,5-trisphosphate, *Am. J. Physiol.* 252, G149-G157, 1987; Lemmon, M.A., Pleckstrin homology domains: two halves make a hole? *Cell* 120, 574-576, 2005; Malbon, C.C., G proteins in development, *Nat. Rev. Mol. Cell Biol.* 6, 689-701, 2005; Gilfillan, A.M. and Tkaczyk, C., Integrated signaling pathways for mast-cell activation, *Nat. Rev. Immunol.* 6, 218-230, 2006; Drin, G., Dounet, D., and Scarlata, S., The pleckstrin homology domain of Phospholipase C $\beta$  transmits enzymatic activation through modulation of the membrane-domain orientation, *Biochem.* 45, 5712-5724, 2006.

## Cis-Phosphorylation or Cis-autophosphorylation

An autophosphorylation event where the kinase catalyzes the phosphorylation of itself as opposed to another molecule of the same kinase. See Frattali, A.L., Treadway, J.L., and Pessin, J.E., Transmembrane signaling by the human insulin receptor kinase. Relationship between intramolecular beta subunit *trans-* and

*cis*-autophosphorylation and substrate kinase activation, *J.Biol.Chem.* 267, 195210-19528, 1992; Cann, A.D. and Kohanski, R.A., Cis-autophosphorylation of juxtamembrane tyrosines in the insulin receptor kinase domain, *Biochemistry* 36, 7681-7689, 1997; Cann, A.D., Bishop, S.M., Ablooglu, A.J., and Kohanski, R.A., Partial activation of the insulin receptor kinase domain by juxtamembrane autophosphorylation, *Biochemistry* 37, 11289-11300, 1998; Leu, T.H. and Maa, M.C., Tyr-863 phosphorylation enhances focal adhesion kinase autophosphorylation at Tyr-397, *Oncogene* 21, 6992-7000, 2002; Iyer, G.H., Moore, M.J., and Taylor, S.S., Consequences of lysine 72 mutation on the phosphorylation and activation state of cAMP-dependent kinase, *J.Biol.Chem.* 280, 8800-8807, 2005; Yang, K., Kim, J.H., Kim, H.J., *et al.*, Tyrosine 740 phosphorylation of discoidin domain receptor 2 by Src stimulates intramolecular autophosphorylation and Shc signaling complex formation, *J.Biol.Chem.* 280, 39058-39066, 2005.

### Trans-Phosphorylation or Trans-autophosphorylation

An autophosphorylation event where the kinase catalyzes the phosphorylation of another molecule of the same kinase as opposed to *cis*-phosphorylation where the kinase phosphorylates itself. A more generic definition is the transfer of a phosphoryl function from one site to another site (transfer of a phosphate function). See Wei, L., Hubbard, S.R., Hendrickson, W.A., and Ellis, L., Expression, characterization, and crystallization of the catalytic core of the human insulin receptor protein-tyrosine kinase domain, *J.Biol.Chem.* 270, 8122-8130, 1995; McKeehan, W.L., Wang, F., and Kan, M., The heparin sulfate-fibroblast growth factor family: diversity of structure and function, *Prog. Nucleic Acid Res.Mol.Biol.* 59, 135-176, 1998; Klint, P. and Claesson-Welsh, L., Signal transduction by fibroblast growth factor receptors, *Front.Biosci.* 4, D165-D177, 1999; DiMaio, D., Lai, C.C., and Mattoon, D., The platelet-derived growth factor beta receptor as a target of the bovine papillomavirus E5 protein, *Cytokine Growth Factor Rev.* 11, 283-293, 2000; DiMaio, D. and Mattoon, D., Mechanisms of cell transformation by papillomavirus E5 proteins, *Oncogene* 20, 7866-7873, 2001; Schwarz, J.K., Lovly, C.M., and Piwnicka-Worms, H., Regulation of the Chk2 protein kinase by oligomerization-mediated *cis*- and *trans*-phosphorylation, *Mol.Cancer Res.* 1, 598-609, 2003; Wu, S. and Kaufman, R.J., *trans*-Autophosphorylation by the isolated kinase domain is not sufficient for dimerization of activation of the dsRNA-activated protein kinase PKR, *Biochemistry* 43, 11027-11034, 2004; Shi, G.W., Chen, J., Concepcion, F. *et al.*, Light causes phosphorylation of nonactivated visual pigments in intact mouse rod photoreceptor cells, *J.Biol.Chem.* 280, 41184-41191, 2005; Gao, X. and Harris, T.K., Steady-state kinetic mechanism of PDK1, *J.Biol.Chem.* 281, 21670-21681, 2006.

### Phylogenetic Rate

Estimate of the substitution rate calculated by comparing the molecular sequence data obtained from different species. See Heyer, E., Zietkiewicz, E., Rochowski, A., Yotova, V., Puymirat, J., and Labuda, D., Phylogenetic and familial estimates of mitochondrial substitution rates: study of control region mutations in deep-rooting pedigrees, *Am.J.Human Genet.* 69, 1113-1126, 2001; Ritchie, P.A., Miller, C.D., Gibb, G.C., Baroni, C., and Lambert, D.M., Ancient DNA enables timing of the pleistocene origin and

holocene expansion of two adelic penguin lineages in Antarctica, *Mol.Biol.Evol.* 21, 240-248, 2004.

### Phytoremediation

Use of plants for remediation of toxic chemicals. This can be separated into phytoremediation/rhizofiltration which describes the removal of toxic materials from water and phytoextraction which describes the removal of toxic materials from soil by plants. See Arthur, E.L., Rice, P.J., Rice, P.J., *et al.*, Phytoremediation – An overview, *Crit.Rev. Plant Sci.* 24, 109-122, 2005.

### Pinocytosis

Transcytosis across an endothelial cell through endosomal vesicles and/or a tubovesicular pathway. See Chapman-Andresen, C., *Studies on Pinocytosis in Amoebae*, Danish Science Press, Copenhagen, Denmark, 1962; LaBella, F.S., *Pinocytosis*, MSS Information Group, New York, NY, 1973; Josefsson, J.-O., *Pinocytosis*, University of Lund, Lund, Sweden, 1973; Stossel, T.P., Contractile proteins in cell structure and function, *Annu.Rev. Med.* 29, 427-457, 1978; Lloyd, J.B., Insights into mechanisms of intercellular protein turnover from studies on pinocytosis, *Ciba Found.Symp.* (75), 151-165, 1979; Barondes, S.H., Lectins: their multiple endogenous cellular function, *Ann.Rev.Biochem.* 50, 207-231, 1981; Besterman, J.M., and Low, R.B., Endocytosis: a review of mechanisms and plasma membrane dynamics, *Biochem.J.* 210, 1-13, 1983; Mansilla, A.O., Arguero, R.S., Rico, F.G., and Alba, C.C., Cellular receptors, acceptors and clinical implications, *Arch.Med.Res.* 24, 127-137, 1993; Meier, O. and Greber, U.F., Adenovirus endocytosis, *J.Gene.Med.* 5, 451-462, 2003; Batahori, G., Cervenak, L. and Karadi, I., Caveolae—an alternative endocytotic pathway for targeted drug delivery, *Crit.Rev.Ther.Drug Carrier Syst.* 21, 67-95, 2004.

### Piranha Solution

A mixture of concentrated sulfuric acid and hydrogen peroxide [as an example, a 7:3(v/v) ratio of 98% H<sub>2</sub>SO<sub>4</sub>(concentrated sulfuric acid) and 30%(w/v) H<sub>2</sub>O<sub>2</sub>] which is used for the cleaning of glass and other surfaces. See Seeboth, A. and Hettrich, W., Spatial orientation of highly ordered self-assembled silane monolayers on glass surfaces, *J.Adhesion Sci.Technol.* pp. 495-505, 1997; Gray, D.E., Case-Green, S.C., Fell, T.S., Dobson, P.J., and Southern, E.M., Ellipsometric and interferometric characterization of DNA probes immobilized on a combinatorial array, *Langmuir* 13, 2833-2842, 1997; Steiner, G., Möller, H., Savchuk, O. *et al.*, Characterization of ultra-thin polymer films by polarization modulation FTIR spectroscopy, *J.Mol.Struct.* 563-564, 273-277, 2001; Guo, W. and Ruckenstein, E., Crosslinked glass fiber affinity membrane chromatography and its application to fibronectin separation, *J.Chromatog.B Technol.Biomed.Life Sci.* 795, 61-72, 2003; Ziegler, K.J., Gu, Z., Peng, H. *et al.*, Controlled oxidative cutting of single-walled carbon nanotubes, *J.Amer.Chem.Soc.* 127, 1541-1547, 2005; Wang, M., Liechti, K.M., Wang, Q., and White, J.M., Self-assembled monolayers: fabrication with nanoscale uniformity, *Langmuir* 21,1848-1857, 2005; Szuneritz, S. and Boukherroub, R., Preparation and characterization of thin films of SiO(x) on gold substrates for surface plasmon resonance studies, *Langmuir* 22, 1660-1663, 2006; Petrovykh, D.Y., Kimura-Suda, H., Opdahl, A., *et al.*, Alkanethiols on platinum: multicomponent self-assembled monolayers, *Langmuir* 14, 2578-2587, 2006.

## Plant Cell

Resulting from the capture of a cyanobacterium by a eukaryotic, mitochondria-possessing cell; the endosymbiont (cyanobacter) lost its identity and become a chloroplast. See Martin, W., Rujan, T., Richly, E., *et al.*, Evolutionary analysis of Arbidopsis, cyanobacterial and chloroplast genomes reveals plastid phylogeny and thousands of cyanobacterial genes in the nucleus, *Proc.Nat. Acad.Sci.USA* 99, 12246-12251, 2002; Grevich, J.J. and Daniell, H., Chloroplast genetic engineering: recent advances and future perspectives, *Crit.Rev.Plant Sci.* 23, 84-107, 2005.

## Plasma/Serum Proteome

The identification and characterization of the proteins in the blood plasma/serum. See Lathrop, J.T., Anderson, N.L., Anderson, N.G., and Hammond, D.J., Therapeutic potential of the plasma proteome, *Curr.Opin.Mol.Ther.* 5, 250-257, 2003; Veenstra, T.D., Conrads, T.P., Hood, B.L., Avellino, A.M., Ellenbogen, R.G., and Morrison, R.S., Biomarkers: mining the biofluid proteome, *Mol. Cell.Proteomics* 4, 409-418, 2005.

## Plastid

Usually refers to a chloroplast before the development of chlorophyll but can refer to any small intracellular pigmented valcuole. Plastids have been described in some bacteria. See Granick, S. and Gibor, A., The DNA of chloroplasts, mitochondria and centrioles, *Prog.Nucleic Acid Res.Mol.Biol.* 6, 143-186, 1967; Gibor, A. and Ganick, S., Plastids and mitochondria: inheritable systems, *science* 145, 890-897, 1964; Lopez-Juez, E. and Pyke, K.A., Plastids unleashed: their development and their integration in plant development, *Int.J.Dev.Biol.* 49, 557-577, 2005; Mackenzie, S.A., Plant organellar protein targeting: a traffic plan still under construction, *Trends Cell. Biol.* 15, 548-554, 2005; Miyagishima, S.Y., Origin and evolution of the chloroplast division machinery, *J.Plant.Res.* 118, 295-306, 2005; Beck, C.F., Signaling pathways for the chloroplast to the nucleus, *Planta* 222, 743-756, 2005; Toyoshima, Onda, Y., Shiina, T. and Nakahira, Y., Plastid transcription in higher plants, *Crit.Rev. ## Plate Number

In chromatography, a plate is a separation instance or moment that a solute encounters during passage through a chromatographic column. The higher the number of plates, the more possibility for high resolution but such resolution depends on the individual behavior of solutes (see resolution). Plates may be theoretical or effective plates. The efficiency of a column is measured in the number of plates referred to as plate number ( $N$ ). One equation for plate number ( $N$ ).  $N = 5.54(t_r/W_{1/2})^2$  where  $t_r$  is band retention time and  $W_{1/2}$  is peak width at peak half-height. See Boyes, B.E. and Kirkland, J.J., Rapid, high-resolution HPLC separation of peptides using small particles at elevated temperatures, *Pept.Res.* 6, 249-258, 1993; Anspach, B., Gierlich, H.U., and Unger, K.K., comparative study of Zorbax Bio series GF 250 and GF 450 and Tsk-Gel 3000 SW and SWXL columns in size-exclusion chromatography of proteins, *J.Chromatog.* 443, 45-54, 1988; Palsson, E., Axelsson, A., and Larsson, P.O., Theories of chromatographic efficiency applied to expanded

base, *J.Chromatog.A* 912, 235-248, 2001; Mahesan, B. and Lai, W., Optimization of selected chromatographic responses using a designed experiment at the fine-tuning stage in reversed-phase high-performance liquid chromatographic method development, *Drug Dev.Ind.Pharm.* 27, 585-590, 2001; Ishizuka, N., Kobayashi, H., Minakuchi, H., *et al.*, Monolithic silica columns for high-efficiency separations by high-performance liquid chromatographic, *J.Chromatog.A.* 960, 85-96, 2002; Jandera, P., Halama, M., and Novotna, K., Stationary-phase effects in gradient high-performance liquid chromatography, *J.Chromatog.A.* 1030, 33-41, 2004; Lim, L.W., Hirose, K., Tatsumi, S., *et al.*, Sample enrichment by using monolithic precolumns in micro-column liquid chromatography, *J.Chromatog.A.* 1033, 205-212, 1033; Okanda, F.M. and Rassi, Z., Capillary electrochromatography with monolithic stationary phases. 4. ## Pleckstrin Homology Domain

A protein domain consisting of approximately 100 amino acids which binds phosphoinositide and other activators such as heterotrimeric G proteins and participates in the process of signal transduction. The name was derived from the platelet protein pleckstrin (platelet and leukocyte C kinase substrate) identified as a substrate for protein kinase C. See Tyers, M., Rachubinski, R.A., Stewart, M.I., *et al.*, Molecular cloning and expression of the major protein kinase C substrate of platelets, *Nature* 333, 470-473, 1988. Mayer, B.J., Ren, R., Clark, K.L., A putative modular domain present in diverse signaling proteins, *Cell* 73, 629-630, 1993; Musacchio, A., Gibson, T., Rice, P., Thompson, J., and Saraste, M., The pH domain: a common piece in the structural patchwork of signalling proteins, *Trends Biochem.Sci.* 18, 343-348, 1993; Ingle, E. and Hemmings, B.A., Pleckstrin homology (PH) domains in signal transduction, *J.Cell.Biochem.* 56, 436-443, 1994; Lemmon, M.A., Ferguson, K.M., and Abrams, C.S., Pleckstrin homology domains and the cytoskeleton, *FEBS Lett.* 513, 71-76, 2002; Philip, F., Guo, Y., and Scarlata, S., Multiple roles of pleckstrin homology domains in the phospholipase Cbeta function, *FEBS Lett.* 531,29-32, 2002; Lemmon, M.A., Phosphoinositide recognition domains, *Traffic* 4, 201-213, 2003; Cozier, G.E., Carlton, J., Bouyoucef, D., and Cullen, P.J., Membrane targeting by pleckstrin homology domains, *Curr. ## Pleiotropic

Having more than one phenotypic expression of a gene; an effector molecule associated with more than a single event depending on the stimulation or, in the case of regulatory proteins and peptides, more than one target receptor. See Takeda, Y., Pleiotropic actions of aldosterone and the effects of eplerenone, a selective mineralocorticoid receptor antagonist, *Hypertens.Res.* 27, 781-789, 2004; Wilkie, A.O., Bad bones, absent smell, selfish testes: the pleiotropic consequences of human FGF receptor mutations, *Cytokine Growth Factor Rev.* 16, 187-203, 2005; Staels, B. and Fruchart, J.C., Therapeutic roles of peroxisome proliferator-activated receptor agonists, *Diabetes* 54, 2460-2470, 2005; Russo, V.C., Gluckman, P.D., Feldman, E.L., and Werther, G.A., The insulin-like growth factor system and its pleiotropic functions in brain, *Endocrine Rev.* 26, 916-943, 2005; Carrillo-Vico, A., Guerrero, J.M., Lardone, P.J., and Reiter, R.J., A review of the multiple actions of melatonin on the immune system, *Endocrine* 27, 189-200, 2005.

## Podosome

A specialized cell-matrix contact point which is structural distinct from focal adhesion complexes. See Linder, S., and Kopp, P., Podosomes at a glance, *J.Cell Sci.* 118, 2079-2082, 2005; McNiver, M.A., Baldassarre, M., and Buccione, R., The role of dynamin in the assembly and function of podosomes and invadopodia, *Front.Biosci.* 9, 1944-1953, 2004; Linder, S. and Aepfelbacher, M., Podosomes: adhesion hot-spots of invasive cells, *Trends Cell Biol.* 13, 376-385, 2003.

## Poisson Distribution

A probability density function that is an approximation to the bimodal distribution and is characterized by its mean being equal to its variance. See Mezei, L.M., *Practical Spreadsheet Statistics and Curve Fitting for Scientists and Engineers*, Prentice Hall, Englewood Cliffs, NJ, 1990; Dowdy, S.M. and Wearden, S., *Statistics for Research*, Wiley, New York, NY, 1991; Balakrishnan, N. and Nevzorov, V.B., *A Primer on Statistical Distributions*, Wiley, Hoboken, NJ, 2003.

## Polyadenylation

The attachment of 200 adenylyl residues to the 3'-end of messenger of RNA protecting the mRNA from degradation by nucleases and aids in transfer of mRNA from nucleus to cytoplasm. The polyadenylation follows a specific cleavage at the termination of transcription. See Wilt, F.H., Polyadenylation of material RNA of sea urchin eggs after fertilization, *Proc.Natl.Acad.Sci.USA* 70, 2345-2349, 1973; Cooper, D.L. and Marzluff, W.F., Polyadenylation of RNA in a cell-free system from mouse myeloma cells, *J.Biol.Chem.* 253, 8375-8380, 1978; Bernstein, P. and Ross, J., Poly(A), poly(A) binding protein and the regulation of mRNA stability, *Trends in Biochem. Sci.* 14, 373-377, 1989; Manley, J.L., Polyadenylation of mRNA precursors, *Biochim.Biophys.Acta* 950, 1-12, 1988; Buratowski, S., Connections between mRNA 3' end processing and transcription termination, *Curr.Opin.Cell.Biol.* 17, 257-261, 2005.

## Polymerase Chain Reaction

A method for synthesizing and amplifying a specific DNA sequence based on the use of specific oligonucleotide primers and unique DNA polymerases such as the thermostable DNA

polymerase from *Thermus aquaticus* (Taq polymerase). PCR amplicons from the amplified sequence are analyzed by size or sequence. See Kleppe, K., Ohtsuka, E., Kleppe, R., *et al.*, Studies on polynucleotides XCVI. Repair replication of short synthetic DNA's as catalyzed by DNA polymerases, *J.Mol.Biol.* 56, 341-346, 1971; Saiki, R.K., Scharf, S., Faloona, F., *et al.*, Enzymatic amplification of beta-globin genomic sequences and restriction site analysis for diagnosis of sickle cell anemia, *Science* 230, 1350-1354, Saiki, R.K., Gelfand, D.H., Stoffel, S., *et al.*, Primer-directed enzymatic amplification of DNA with a thermostable DNA polymerase, *Science* 239, 487-491, 1988; Vosberg, H.P., The polymerase chain reaction: an improved method for the analysis of nucleic acids, *Hum.Genet.* 83, 1-15, 1989; Mullis, K.B., The unusual origin of the polymerase chain reaction, *Sci.Amer.* 262(4), 56-61, 1990; Taylor, G.R. and Robinson, P., The polymerase chain reaction: from functional genomics to high-school practical classes, *Curr.Opin.Biotechnol.* 9, 35-42, 1998; *PCR Protocols: A Guide to Methods and Applications*, ed. Innes, M.A., Academic Press, San Diego, 1990; *PCR Protocols: Current Methods and Applications*, ed. White, B.A., Humana Press, Totowa, NJ, 1993; Dieffenbach, C.W. and Dveksler, G.S., *PCR Primer: A Laboratory Manual*, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1995; *PCR Applications: Protocols for Functional Genomics*, ed. Sninsky, J.J. and Innes, M.A., Academic Press, San Diego, CA, 1999. See RT-PCR (reverse transcriptase-polymerase chain reaction), real-time RT-PCR, and gene expression.

## Polyvinylpyrrolidone

Polyvinylpyrrolidone (PVP) is a polymer similar to poly(ethylene glycol) (PEG) is that is readily soluble in water and is used for the stabilization of proteins. Unlike PEG, PVP is useful in the lyophilization of proteins. PVP is synthesized by the free-radical polymerization of *N*-vinylpyrrolidinone (1-vinyl-2-pyrrolidinone). The final size of the polymer is controlled by choice of experimental conditions. It has a wide application in biotechnology. See Antonsen, K.P., Gombotz, W.R., and Hoffman, A.S., Attempts to stabilize a monoclonal antibody with water soluble synthetic polymers of varying hydrophobicity, *J.Biomater.Sci. Polym.Ed.* 6, 55-65, 1994; Gombotz, W.R., Pankey, S.C., Phan, D., *et al.*, The stabilization of a human IgM monoclonal antibody with poly(vinylpyrrolidone), *Pharm.Res.* 11, 624-632, 1994; Gibson, T.D., Protein stabilization using additives based on multiple electrostatic interactions, *Dev.Biol.Stand.* 87, 207-217, 1996; Anchordoquy, T.J. and Carpenter, J.F., Polymers protect lactate dehydrogenase during freeze-drying by inhibiting dissociation in the frozen state, *Arch.Biochem.Biophys.* 332, 231-238, 1996; Yoshioka, S., Aso, Y., and Kojima, S., The effect of excipients on the molecular mobility of lyophilized formulations, as measured by glass transition temperature and NMR relaxation-based critical mobility temperature, *Pharm.Res.* 16, 135-140, 1999; Sharp, J.M. and Doran, P.M., Strategies for enhancing monoclonal antibody accumulation in plant cell and organ cultures, *Biotechnol.Prog.* 17, 979-992, 2001. PVP has some direct therapeutic use (Kaneda, Y., Tsutsumi, Y., Yoshioka, Y. *et al.* The use of PVP as a polymeric carrier to improve the plasma half-life of drugs, *Biomaterials* 25, 3259-3266, 2004) and as a carrier for iodine as a disinfectant (Art, G., Combination povidone-iodine and alcohol formulations more effective, more convenient versus formulations containing either iodine or alcohol alone: a review of the literature, *J.Infus.Nurs.* 28, 314-320, 2005. An HPLC method for the analysis of PVP in pharmaceutical products has been developed (Jones, S.A., Martin, G.P., and Brown, M.B., Determination of polyvinylpyrrolidone using

high-performance liquid chromatography, *J.Pharm.Biomed.Anal.* 35, 621-624, 2004.

## Post-Translational Modification

A covalent modification of a protein following translation of the RNA to form the polypeptide chain. Such modification may or may not be enzyme catalyzed ( $\gamma$ -carboxylation versus nitration) and may or may not be reversible (phosphorylation versus  $\gamma$ -carboxylation).

## Pre-initiation complex

A complex of general transcription factors (GTFs) that are formed at each core promoter prior to transcriptional activation and required for the action of RNA polymerase II. Recent work suggests that core promoter elements may not be an absolute requirement. See George, A.A., Sharma, M., Singh, B.N., Sahoo, N.C., and Rao, K.V., Transcription regulation from a TATA and INR-less promoter: spatial segregation of promoter function, *EMBO J.* 2006; Maag, D., Algire, M.A., and Lorsch, J.R., Communication between eukaryotic translation initiation factors 5 and 1A within the ribosomal pre-initiation complex plays a role in start site selection, *J.Mol.Biol.* 356, 724-737, 2006; Govind, C.K., Yoon, S., Qiu, H., Govind, S., and Hinnebusch, A.G., Simultaneous recruitment of coactivators by Gcn4p stimulates multiple steps of transcription *in vivo.*, *Mol.Cell.Biol.* 25, 5626-5638, 2005; Svejstrup, J.Q., The RNA polymerase II transcription cycle: cycling through chromatin, *Biochim.Biophys.Acta* 1677, 64-73, 2004.

## Primase

Primase is an enzyme which catalyzes polymerization of ribonucleoside 5'-triphosphates to form RNA primers in as a sequence which is directed by DNA template. See Foiani, M, Lucchini, G., and Plevani, P., The DNA polymerase alpha-primase complex couples DNA replication, cell-cycle progression and DNA-damage response, *Trends Biochem.Sci.* 22, 424-427, 1997; Arezi, B. and Kuchta, R.D., Eukaryotic DNA primase, *Trends Biochem.Sci.* 25, 572-576, 2000; Frick, D.N. and Richardson, C.C., DNA primases, *Annu.Rev.Biochem.* 70, 39-80, 2001; Benkovic, S.J., Valentine, A.M., and Salinas, F., Replisome-mediated DNA replication, *Annu.Rev.Biochem.* 70, 181-208, 2001; MacNeil, S.A., DNA replication: partners in the Okazaki two-step, *Curr.Biol.* 11, F842-F844, 2001; Kleymann, G., Helicase primase: targeting the Achilles heel of herpes simplex viruses, *Antivir.Chem.Chemother.* 15, 135-140, 2004; Lao-Sirieix, S.H., Pellegrini, L., and Bell, S.D., The promiscuous primase, *Trends Genet.* 21, 568-572, 2005; Lao-Sirieix, S.H., Nookala, R.K., Roversi, P., *et al.*, Structure of the heterodimeric core primase, *Nat.Struct.Mol.Biol.* 12, 1137-1144, 2005; Shutt, T.E. and Gray, M.W., Twinkle, the mitochondrial replicative DNA helicase, is widespread in the eukaryotic radiation and may also be the mitochondrial DNA primase in most eukaryotes, *J.Mol.Evol.* 62, 588-599, 2006; Rodina, A. and Godson, G.N., Role of conserved amino acids in the catalytic activity of *Escherichia coli* primase, *J.Bacteriol.* 188, 3614-3621, 2006.

## Promoter Elements

A regions of a segment of DNA (usually *cis*) which regulated the transcription (mRNA synthesis) from information encoded on that segment of DNA. These are elements regulating the nuclear transcription process and bind transcription factors and other

regulatory factors. Kingston, R.E., Baldwin, A.S., and Sharp, P.A., Transcription control by oncogenes, *Cell* 41, 3-5, 1985; Wasylyk, B., Transcription elements and factors of RNA polymerase B promoters of higher eukaryotes, *CRC Crit.Rev.Biochem.* 23, 77-120, 1988; Khokha, M.K. and Loots, G.G., Strategies for characterizing *cis*-regulatory elements in *Xenopus.*, *Brief Funct. Genomic Proteomic.* 4, 58-68, 2005; Sipos, L. and Gyurkovics, H., Long-distance interactions between enhancers and promoters, *FEBS J.* 272, 3253-3259, 2005; Fukuchi, M., Tabuchi, A., and Tsuda, M., Transcriptional regulation of neuronal genes and its effect on neural functions: cumulative mRNA expression of PACAP and BDNF genes controlled by calcium and cAMP signals in neurons, *J.Pharmacol.Sci* 98, 212-218, 2005; Anderson, S.K., Transcriptional regulation of NK cell receptors, *Curr.Top. Microbiol.Immunol.* 298, 59-75, 2006.

## Protamines

A family of basic proteins associated with the chromatin in the nucleus of the cell. Protamines are characterized by a high content of arginine and replace histones in the process of spermiogenesis. See Erin-López, J.M., Frehlich L.J., and Ausió, J., Protamines, in the footsteps of linker histone evolution, *J.Biol. Chem.* 281, 1-4, 2006; Meistrich, M.L., Mohapatra, B., Shirley, C.R., and Zhao, M., Roles of transition nuclear proteins in spermiogenesis, *Chromasoma* 111, 483-488, 2003; Aoki, V.W. and Carrell, D.T., Human protamines and the developing spermatid: their structure, function, expression and relationship with male infertility, *Asian J. Androl.* 5, 315-324, 2003; Lewis, S.D. and Ausió, J., Protamine-like proteins: evidence for a novel chromatin structure, *Biochem.Cell Biol.* 80, 353-361, 2002.

## Protease

A protease/proteolytic enzyme catalyzes the hydrolysis of a peptide bond in a protein. A simple classification of proteases divides these enzymes into two functional categories and four chemical categories. The functional categories are regulatory and digestive. Examples of regulatory proteolysis is proprotein processing by furin and blood coagulation while digestive enzyme include enzyme like pepsin, trypsin, and chymotrypsin found in mammalian digestive systems. Chemical categories describe the functional groups at enzyme active site and include serine proteases such as trypsin or chymotrypsin, cysteine proteases such as papain and the caspases, aspartic acid proteases such as pepsin, and metalloproteinases such as ADAM proteases and matrix metalloproteinase (MMP). See *Regulatory Proteolytic Enzymes and Their Inhibitors*, ed. S. Magnusson, Pergamon, Press, Oxford, UK, 1978; *Mammalian Proteases: A Glossary and Bibliography*, ed. A.J. Barrett and J.K. McDonald, Academic Press, New York, NY, 1980; Polgár, L., *Mechanism of protease action*, CRC Press, Boca Raton, FL, USA, 1989; *Proteases of Infectious Agents*, ed. B.M. Dunn, Academic Press, San Diego, CA, USA, 1999; *The Proteasome-Ubiquitin Protein Degradation Pathway*, ed. P. Zwickl and W. Baumeister, Springer, Berlin, 2002; *Proteases and the Regulation of Biological Processes*, ed. J. Saklatvala, and Nagase, H., Portland Press, London, UK, 2003.

## Protease-Activated Receptor (PAR)

Protease-activated receptors (PAR receptors) are a family of G-protein coupled receptors in which the ligand (tethered ligand) is intrinsic to the receptor protein and exposed by proteolysis in

the N-terminal external region. These receptors may also be activated by peptides where the sequence is identical to or related to the ligand sequence in the receptor. The protease-activated receptor was first described in platelets by Coughlin and colleagues (Vu, T.K., Hung, D.T., Wheaton, V.I., and Coughlin, S.R., Molecular cloning of a functional thrombin receptor reveals a novel proteolytic mechanism of receptor activation, *Cell* 64, 1057-1068, 1991; Coughlin, S.R., Vu, T.K., Hung, D.T., and Wheaton, V.I., Expression cloning and characterization of a functional thrombin receptor reveals a novel proteolytic mechanism of receptor activation, *Semin.Thromb.Hemost.* 18, 161-166, 1992) and by another group in France (Rasmussen, U.B., Vouret-Craviere, V., Jallet, S., et al., cDNA cloning and expression of a hamster alpha-thrombin receptor coupled to Ca<sup>2+</sup> mobilization, *FEBS Lett.* 288, 123-128, 1991) using fibroblasts. Since the original work, four PAR receptors have been described on a wide variety of cell types. See Chen, J., Bernstein, H.S., Chen, M., et al., Tethered ligand library for discovery of peptide agonists, *J.Biol.Chem.* 270, 23398-23401, 1995; Santulli, R.J., Derian, C.K., Darrow, A.L., et al., Evidence for the presence of a proteinase-activated receptor distinct from the thrombin receptor in human keratinocytes, *Proc.Natl.Acad.Sci. USA* 92, 9151-9155, 1995; Ishihara, H., Connolly, A.J., Zeng, D., et al., Protease-activated receptor 3 is a second thrombin receptor in humans, *Nature* 386, 502-506, 1997; Niclou, S.P., Suidan, H.S., Pavlik, A., Vejsada, R., and Monard, D., Changes in the expression of protease-activated receptor 1 and protease nexin-1 mRNA during rat nervous system development and after nerve lesion, *Eur.J.Neurosci.* 10, 1590-1607, 1998; Hou, L., Howells, G.L., Kapas, S., and Macey, M.G., The protease-activated receptors and their cellular expression and function in blood-related cells, *Br.J.Haematol.* 101, 1-9, 1998; Brass, L.F. and Molino, M., Protease-activated G protein coupled receptors on human platelets and endothelial cells, *Thromb.Haemostas.* 78, 234-241, 1997; Brass, L.F., Thrombin receptor antagonists: a work in progress, *Coron.Artery Dis.* 8, 49-58, 1997; Coughlin, S.R., Protease-activated receptors and platelet function, *Thromb.Haemost.* 82, 353-356, 1999; Cooks, T.M. and Moffatt, J.D., Protease-activated receptors: sentries for inflammation, *Trends Pharmacol.Sci.* 21, 103-108, 2000; Macfarlane, S.R., Seatter, M.J., Kanke, T., Hunter, G.D., and Plevin, R., Proteinase-activated receptors, *Pharmacol. ## Protease Inhibitor Cocktail

A mixture of protease inhibitors which is used to preserve protein integrity during the processing of samples for subsequent analysis. The term cocktail refers to a mixture of components. A protease inhibitor cocktail is composed of a broad spectrum of protease inhibitors intends to inhibit the diverse proteolytic

enzymes found in tissue extracts and biological fluids. See Pringle, J.R., Methods for avoiding proteolytic artifacts in studies with enzymes and other proteins from yeasts, *Methods in Cell Biology* 12, 149-184, 1975; Drubin, D.G., Miller, K.G., and Botstein, D., Yeast actin-binding proteins: evidence for a role in morphogenesis, *J.Cell Biol.* 107, 2551-2561, 1988; Nanoff, C., Jacobson, C.A., and Stiles, G.L., The A2 adenosine receptor: guanine nucleotide modulation of agonist binding is enhanced by proteolysis, *Mol. Pharmacol.* 39, 130-135, 1991; Palmer, T.M., Jacobson, K.A. and Stiles, G.L., Immunological identification of A2 adenosine receptors by two antipeptide antibody preparations, *Mol.Pharmacol.* 42, 391-397, 1992; Pyle, L.E., Barton, P., Fujiwara, Y., Mitchell, A., and Fidge, N., Secretion of biologically active human proapolipoprotein A-1 in a baculovirus-insect cell system: protection from degradation by protease inhibitors, *J.Lipid Res.* 36, 2355-2361, 1995; Weidner, M.-F., Grenier, D., and Mayrand, D., Proteolytic artifacts in SDS-PAGE analysis of selected periodontal pathogens, *Oral Microbiol.Immunol.* 11, 103-108, 1996; Hassel, M., Klenk, G., and Frohme, M., Prevention of unwanted proteolysis during extraction of proteins from protease-rich tissue, *Anal.Biochem.* 242, 274-275, 1996; Salvesen, G. and Nagase, H., Inhibition of proteolytic enzymes, in *Proteolytic Enzymes. Practical Approaches*, 2nd edn., ed. R. Benyon and J.S. Bond, Oxford University Press, Oxford, United Kingdom, Chapter 5, pps. 105-130, 2001; North, M.J. and Benyon, R.J., Prevention of unwanted proteolysis, in *Proteolytic Enzymes. Practical Approaches*, 2nd edn., ed. R. Benyon and J.S. Bond, Oxford University Press, Oxford, United Kingdom, Chapter 9, pp. 211-232, 2001. Castellanos-Serra, L. and Paz-Lago, D., Inhibition of unwanted proteolysis during sample preparation: evaluation of its efficiency in challenge experiments, *Electrophoresis* 23, 1745-1753, 2002. Kikuchi, S., Hirohashi, T., and Nakai, M., Characterization of the preprotein translocon at the outer envelope membrane of chloroplasts by blue native PAGE, *Plant Cell Physiol.* 47, 363-371, 2006. The term protease cocktail is also used to refer to the combination of therapeutic protease inhibitors used in AIDS therapy. See Tamamura, H. and Fujii, N., Two orthogonal approaches to overcome multi-drug resistant HIV-1s: development of protease inhibitors and entry inhibitors based on CXCR4 antagonists, *Curr.Drug Targets Infect.Disord.* 3, 103-110, 2004; Wicovsky, A., Siegmund, D., and Wajant, H., Interferons induce proteolytic degradation of TRAILR4, *Biochem.Biophys.Res.Comm.* 337, 184-190, 2005. The term cocktail is also used to describe the combination of chemicals and solvent used for liquid scintillation counting of radioisotopes. See Kobayashi, Y. and Maudsely, D.V., Practical aspects of liquid scintillation counting, *Methods Biochem.Anal.* 17, 55-133, 1969; Wood, K.J., McElroy, R.G., Surette, R.A., and Brown, R.M., Tritium sampling and measurement, *Health Phys.* 65, 610-627, 1993; Jaubert, F., Tartes, I., and Cassette, P., Quality control of liquid scintillation counting, *Appl.Radiat.Isot.*, 64, 1163-1170, 2006.

## Proteasome

The proteasome is a multisubunit complex that functions in the degradation of intracellular proteins in eukaryotic cell. It is composed of catalytic subunits with different specificity and regulatory subunits. In eukaryotic cells, proteins are "marked" for proteasomal degradation by ubiquitinylation. There is a specialized proteasome which function in MHC I antigen presentation. See Arrigo, A.P., Tanaka, K., Goldberg, A.L., and Welch, W.J., Identity of the 19S 'prosome' particle with the large multifunctional protease complex of mammalian cells (the proteasome), *Nature* 331, 192-194, 1988; Falkenberg, P.E., and Kloetzel, P.M.,

Identification and characterization of three different subpopulations of the *Drosophila* multicatalytic proteinase (proteasome), *J.Biol.Chem.* 264, 6660-6666, 1989; Dahlmann, B., Kopp, F., Kuehn, L., *et al.*, The multicatalytic proteinase (prosome, proteasome): comparison of the eukaryotic and archaeobacterial enzyme, *Biomed. Biochim.Acta* 50, 465-469, 1991; Demartino, G.W., Orth, K., McCullough, M.L., *et al.*, The primary structure of four subunits of the human, high-molecular weight proteinase, macropain (proteasome), are distinct but homologous, *Biochim. Biophys.Acta* 1079, 29-38, 1991; Wlodawer, A., Proteasome: a complex protease with a new fold and a distinct mechanism, *Structure* 3, 417-420, 1995; Baumeister, W., Cejka, Z., Kania, M., and Seemuller, E., The proteasome: a macromolecular assembly designed to confine proteolysis to a nanocompartment, *Biol. Chem.* 378, 121-130, 1997; Grune, T., Merker, K., Sandig, G., and Davies, K.J., Selective degradation of oxidatively modified protein substrates by the proteasome, *Biochem.Biophys.Res.Commun.* 305, 709-718, 2003; Hartmann-Petersen, R. and Gordon, C., Proteins interacting with 26S proteasome, *Cell.Mol.Life Sci.* 61, 1589-1595, 2004; Smalle, J. and Veirstra, R.D., The ubiquitin 26S proteasome proteolytic pathway, *Ann.Rev.Plant.Biol.* 55, 555-590, 2004; Dalton, W.S., The proteasome, *Semin.Oncol.* 31(6 Suppl 16), 3-9, 2004; Qureshi, N., Vogel, S.N., Van Way, C., 3<sup>rd</sup>, *et al.*, The proteasome: a central regulator of inflammation and macrophage function, *Immunol.Res.* 31, 243-260, 2005; Glickman, M.H. and Raveh, D., Proteasome plasticity, *FEBS Lett.* 579, 3214-3223, 2005; Ye, Y., The role of the ubiquitin-proteasome system in ER quality control, *Essays Biochem.* 41, 99-112, 2005; Gao, G. and Luo, H., The ubiquitin-proteasome pathway in viral infections, *Can.J.Physiol. Pharmacol.* 84, 5-14, 2006. There is interest in the proteasome as a drug target in oncology. See Montagut, C., Rovira, A., and Albanell, J., The proteasome: a novel target for anticancer therapy, *Clin.Transl.Oncol.* 8, 313-317, 2006. There is a variation in the proteasomes involved in the presentation of MHC I antigens; see immuno proteasome.

## Protein Classification

There are a number of approaches to protein classification. One simple approach is based on environmental conditions and divides proteins into three different groups (see Finkelstein, A.V. and Ptitsyn, O.B., *Protein Physics. A Course of Lectures*, Academic Press, London, UK, 2002). Fibrous proteins are usually in non-aqueous environments and usually form high regular hydrogen-bonded structures such as those seen in cartilage; membrane proteins are also found in non-aqueous environments; water-soluble proteins found in the cytoplasm and extracellular fluids. Water-soluble proteins can be divided into albumins and globulins on the basis of solubility properties. Water-soluble proteins can form three-dimensional structures maintained by a variety of forces including hydrogen bonds and van der Waals forces. Water-soluble proteins can have effects on enzyme activity separate from their intrinsic activity (see Derham, B.K. and Harding, J.J., The effect of the presence of globular proteins and elongated polymers on enzyme activity, *Biochim.Biophys.Acta* 1764, 1000-1006, 2006).

## Protein Disulfide Isomerase/Ero1p

Protein disulfide isomerase and Ero1p are enzymes which participate in the formation of disulfide bonds within the endoplasmic reticulum. These factors are critical for the normal formation of disulfide bonds during protein folding. See Lodi, T.,

Neglia, B. and Donnini, C., Secretion of human serum albumin by *Kluyveromyces lactis* overexpressing *KIPDIUI* and *KIEROI*, *Appl.Environ.Microbiol.* 71, 4359-4364, 2005; Kulp, M.S., Frickel, E.-M., Ellgaard, L., and Weissman, J.S., Domain architecture of protein-disulfide isomerase facilitates its dual role as an oxidase and an isomerase in Ero1p-mediated disulfide formation, *J.Biol. Chem.* 281, 876-884, 2006; Gross, E., Sevier, C.S., Heldman, *et al.*, Generating disulfides enzymatically: reaction products and electron acceptors of the endoplasmic reticulum thiol oxidase Ero1p, *J.Biol.Chem.* 281, 299-304, 2006.

## Protein Profiling

The use of algorithms to determine the relationship of multiple proteins as determined by proteomic analysis such as protein microarray technology, shotgun proteomics, or SELDI-TOF-MS. See Tomlinson, I.M. and Holt, L.J., Protein profiling comes of age, *Genome Biol.* 2, REVIEWS1004, 2001; Kingamore, S.F. and Patel, D.D., Multiplexed protein profiling on antibody-based microarrays by rolling circle amplification, *Curr.Opin.Biotechnol.* 14, 74-81, 2003; Jessani, N. and Cravatt, B.F., The development and application of methods for activity-based protein profiling, *Curr.Opin.Chem.Biol.* 8, 54-59, 2004; Berger, A.B., Vitorino, P.M., and Bogoy, M., Activity-based protein profiling: applications to biomarker discovery, in vitro imaging and drug discovery, *Am.J.Pharmacogenomics* 4, 371-381, 2004; Steel, L.F., Haab, B.B., and Hanash, S.M., Methods of comparative proteomic profiling for disease diagnostics, *J.Chromatog.B.Anal. Technol. Biomed. Life Sci.* 815, 275-284, 2005; Kislinger, T. and Emili, A., Multidimensional protein identification technology: current status and future prospects, *Expert Rev. Proteomics* 2, 27-39, 2005; Katz, J.E., Mallick, P., and Agus, D.B., A perspective on protein profiling of blood, *BJU Int.* 96, 477-482, 2005; Bons, J.A., Wodzig, W.K., and van Diejen-Visser, M.P., Protein profiling as a diagnostic tool in clinical chemistry: a review, *Clin.Chem.Lab.Med.* 43, 1281-1290, 2005.

## Protein Tyrosine Phosphatases

A family of hydrolytic enzymes which catalyze the dephosphorylation of protein-bound *O*-tyrosine phosphate. Dephosphorylation of tyrosine residues can modulate biological activity and may be a specific or non-specific process. See Fischer, E.H., Tonks, N.K., Charbonneau, H., *et al.*, Protein tyrosine phosphatases: a novel family of enzymes involved in transmembrane signaling, *Adv.Second Messenger Phosphoprotein Res.* 24, 272-279, 1990; Calya, X., Goris, J., Hermann, J., *et al.*, Phosphotyrosyl phosphatase activity of the polycation-stimulated protein phosphatases and involvement of dephosphorylation in cell cycle regulation, *Adv.Enzyme Reg.* 39, 265-285, 1990; Saito, H. and Streuli, M., Molecular characterization of protein tyrosine phosphatases, *Cell Growth Differ.* 2, 59-65, 1991; Tonks, N.K., Yang, Q., and Guida, P., Jr., Structure, regulation, and function of protein tyrosine phosphatases, *Cold Spring Harbor Symp.Quant.Biol.* 56, 265-273, 1991; Lawrence, D.S., Signaling protein inhibitors via the combinatorial modification of peptide scaffolds, *Biochim. Biophys.Acta* 1754, 50-57, 2005; Boutros, R., Dozier, C., and Ducommun, B., The when and where of CDC25 phosphatases, *Curr.Opin.Cell Biol.* 18, 185-191, 2006; Ostman, A., Hellberg, C., and Bohmer, F.D., Protein-tyrosine phosphatases and cancer, *Nat.Rev.Cancer* 6, 307-320, 2006; Burrige, K., Sastry, S.K., and Salfee, J.L., Regulation of cell adhesion by protein-tyrosine phosphatases. I. Cell-matrix adhesion, *J.Biol.Chem.* 281, 15593-15596,

2006; Sallee, J.L., Wittchen, E.S., and Burrige, K., Regulation of cell adhesion by protein-tyrosine phosphatases. II. Cell-cell adhesion, *J.Biol.Chem.* 281, 16189-16192, 2006.

## Proteome

The total expressed protein content of a genome. See Wasinger, V.C., Cordwell, S.J., Cerpa-Poljak, A., *et al.*, Progress with gene-product mapping of the Mollicutes: *Mycoplasma genitalium*, *Electrophoresis* 16, 1090-1094, 1995; Kahn, P., From genome to proteome: looking at a cell's proteins, *Science* 270, 369-370, 1995; Wilkens, M.R., Sanchez, J.C., Gooley, A.A., *et al.*, Progress with proteome projects: why all proteins expressed by a genome should be identified and how to do it, *Biotechnol.Genet.Eng.Rev.* 13, 19-50, 1996; Figeys, D., Gygi, S.P., Zhang, Y., *et al.*, Electrophoresis combined with novel mass spectrometry techniques: powerful tools for the analysis of proteins and proteomics, *Electrophoresis* 19, 1811-1818, 1998; Blackstock, W.P. and Weir, M.P., Proteomics: quantitative and physical mapping of cellular proteins, *Trends Biotechnol.* 17, 121-127, 1999; Bradshaw, R.A., Proteomics – boom or bust? *Mol.Cell.Proteomics* 1, 177-178, 2002; Bradshaw, R.A. and Burlingame, A.L., From proteins to proteomics, *IUBMB Life* 57, 267-272, 2005; Domon, B. and Aebersold, R., Mass spectrometry and protein analysis, *Science* 312, 212-217, 2006.

## Proteometabolism

Metabolism of the proteome.

## Proteomics

The study of the proteome; not technology limited; the qualitative and quantitative study of the proteome under various conditions including protein expression, modification, localization, and function, and protein-protein interactions, as a means of understanding biological processes.

## Proto-oncogene

A normal cellular gene whose activation or modification to an oncogene is linked to malignant transformation; a progenitor of an oncogenes; a proto-oncogene can become an oncogenes either by transduction into a virus or by “disturbance” such as chromosomal translocation, amplification or point mutation at their location in a chromosome. *c-Myc* is one of the most studied of the proto-oncogenes. See Bishop, J.M., Oncogenes and proto-oncogenes, *J.Cell.Physiol.Suppl.* 4, 1-5, 1986; Cory, S., Activation of cellular oncogenes in hemopoietic cells by chromosome translocation, *Adv.Cancer Res.* 47, 189-243, 1986; Bishop, J.M., and Hannfusa, W., Proto-oncogenes in normal and neoplastic cells, in *Scientific American Molecular Oncology*, ed. J.M. Bishop and R.A. Weinberg, Scientific American, New York, New York, USA, Chapter 4, pp. 61-83, 1996. Shachaf, C.M. and Felsher, D.W., Rehabilitation of cancer through oncogenes inactivation, *Trends Mol.Med.* 11, 316-321, 2005; Barry, E.L., Baron, J.A., Grau, M.V., Wallace, K., and Haile, R.W., K-ras mutations in incident sporadic colorectal adenomas, *Cancer* 106, 1036-1040, 2006.

## Protparam

A program which allows the calculation of a number of physical and chemical properties for a protein from the known amino acid sequence. see <http://www.expasy.ch/tools/protparam.html>.

## Proximal Promoter Element

A region located 30-200 bp upstream from the transcription start site and usually contains multiple transcription factor binding sites. See van de Klundert, F.A., Jansen, H.J., and Bloemendal, H., A proximal promoter element in the hamster desmin upstream regulatory region is responsible for activation by myogenic determination factors, *J.Biol.Chem.* 269, 220-225, 1994; Petrovic, N., Black, T.A., Fabian, J.R., *et al.*, Role of proximal promoter elements in regulation of rennin gene transcription, *J.Biol.Chem.* 271, 22499-22505, 1996; Mori, A., Kaminuma, Ogama, K., Okudaira, H. and Akiyama, K., Transcriptional regulation of IL-5 gene by nontransformed human T cells through the proximal promoter element, *Intern.Med.* 39, 618-625, 2000; Ghosh-Choudhury, N., Choudhury, G.G., Harris, M.A., *et al.*, Autoregulation of mouse BMP-2 gene transcription is directed by the proximal promoter element, *Biochem.Biophys.Res. Commun.* 286, 101-108, 2001; Rentsendorj, O., Nagy, A., Sinko, I., *et al.*, Highly conserved proximal promoter element harbouring paired Sox9-binding sites contributes to the tissue- and developmental stage-specific activity of the matrilin-1 gene, *Biochem.J.* 389, 705-716, 2005.

## Pseudogenes (retropseudogenes)

Copies of cellular RNA that have been reverse transcribed and inserted into the genome. See Vanin, E.F., Processed pseudogenes: characteristics and evolution, *Annu.Rev.Genet.* 19, 253-272, 1985; Weiner, A.M., Deininger, P.L. and Efstartiadis, A., Nonviral retroposons, genes, pseudogenes, and transposable elements generated by the reverse flow of genetic information, *Annu.Rev.Biochem.* 55, 631-661, 1986; Pascual, V. and Capra, J.D., Human immunoglobulin heavy-chain variable region genes: organization, polymorphism, and expression, *Adv. Immunol.* 49, 1-74, 1991; King, C.C., Modular transposition and the dynamical structure of eukaryote regulatory evolution, *Genetica* 86, 127-142, 1992; D'Errico, I., Gadaleta, G., and Saccone, C., Pseudogenes in metazoan: origin and features, *Brief Funct.Genomic Proteomic.* 3, 157-167, 2004; Rodin, S.N., Parkhomchuk, D.V., Rodin, A.S., Holmquist, G.P., and Riggs, A.D., Retroposition-dependent fate of duplicate genes, *DNA Cell Biol.* 24, 529-542, 2005; Pavlicek, A., Gentles, A.J., Pačes, J. *et al.*, Retroposition of processed pseudogenes: the impact of RNA stability and translational control, *Trends Genet.* 22, 69-73, 2006.

## Psychogenomics

The process of applying the tools of genomics, transcriptomics, and proteomics to understand the molecular basis of behavioral abnormalities.

## Psychrophilic

Functioning more efficiently at cold temperatures. See Feller, G. and Gerday, C., Psychrophilic enzymes: hot topics in cold adaptation, *Nat.Rev.Microbiol.* 1, 200-208, 2003; Bolter, M., Ecophysiology of psychrophilic and psychrotolerant microorganisms, *Cell.Mol.Biol.* 50, 563-573, 2004; Zecchinon, L., Oriol, A., Netzels, U., *et al.*, Stability domains, substrate-induced conformational changes and hinge-bending motions in a psychrophilic phosphoglycerate kinase. A microcalorimetric study, *J.Biol. Chem.* 280, 41307-41314, 2005.

## Pullulanase

Enzyme degrading pullulan, a branched starch; pullulanase catalyzes the hydrolysis of the  $\alpha$ -1,6-glucosidic linkage in  $\alpha$ -glucans. Pullulanase preferentially hydrolyzes pullulan while isoamylase has a preference for glycogen and amylopectin. See Wallenfels, K., Bender, H., and Rached, J.R., Pullulanase from *Aerobacter aerogenes*; production in a cell-bound state. Purification and properties of the enzymes, *Biochem.Biophys.Res.Commun.* 22, 254-261, 1966; Hardie, D.G. and Manners, D.J., A viscometric assay for pullulanase-type, debranching enzymes, *Carbohdr.Res.* 36, 207-210, 1974.

Harada, T., Special bacterial polysaccharides and polysaccharidases, *Biochem.Soc.Symp.* 48, 97-116, 1983; Vihinen, M. and Mantsala, P., Microbial amyolytic enzymes, *Crit.Rev.Biochem.Mol.Biol.* 24, 329-418, 1989; Doman-Pytka, M. and Bardowski, J., Pullulan degrading enzymes of bacterial origin, *Crit.Rev.Microbiol.* 30, 107-121, 2004; Lammerts van Bueren, A., Finn, R., Ausio, J., and Boraston, A.B., Alpha-glucan recognition by a new family of carbohydrate-binding modules found primarily in bacterial pathogens, *Biochemistry* 43, 15633-15642, 2004; Mikami, B., Iwamoto, H., Malle, D., *et al.*, Crystal structure of pullulanase: evidence for parallel binding of oligosaccharides in the active site, *J.Mol.Biol.* 359, 690-707, 2006; Hytonen, J., Haataja, S., and Finne, J., Use of flow cytometry for the adhesion analysis of *Streptococcus pyogenes* mutant strains to epithelial cells: investigation of the possible role of surface pullulanase and cysteine protease, and the transcriptional regulation Rgg, *BMC Microbiol.* 6, 18, 2006

## “Pull-Down”

The process of the capture of a protein, a protein complex, or other biological by binding to an immobilized capture reagent such as an antibody. See Cavailles, V., Dauvois, S., Danielian, P.S., and Parker, M.G., Interaction of proteins with transcriptionally active estrogen receptors, *Proc.Natl.Acad.Sci.USA* 91, 10009-10013, 1994; Magnaghi-Jaulin, L., Masutani, H., Robin, P., Lipinski, M., and Harel-Bellan, A., SRE elements are binding sites for the fusion protein EWS-FLI-1, *Nucleic Acids Res.* 24, 1052-1058, 1996; Dombrosky-Ferlan, P.M. and Corey, S.J., Yeast two-hybrid in vivo association of the Src kinase Lyn with the proto-oncogene product Cbl but not with the p85 subunit of PI 3-kinase, *Oncogene* 14, 2019-2024, 1997; Graves, P.R. and Haystead, T.A., A functional proteomics approach to signal transduction, *Recent Prog.Horm. Res.* 58, 1-24, 2003.

## Pulsed-Field Gel Electrophoresis

An gel electrophoretic technique for the analysis of very large DNA molecules. It usually uses an agarose gel matrix with alternating current in that the direction of the electric field is changed (or pulsed) periodically for separation. See Cantor, C.R., Smith, C.L., and Mathew, M.K., Pulsed-field gel electrophoresis of very large DNA molecules, *Ann.Rev.Biophys.Biophys.Chem.* 17, 287-304, 1988; Lat, E., Birren, B.W., Clark, S.M., Simon, M.I., and Hood, L., Pulsed field gel electrophoresis, *Biotechniques* 7, 34-42, 1989; Olson, M.V., Separation of large DNA molecules by pulsed-field gel electrophoresis. A review of the basic phenomenology, *J.Chromatog.* 470, 377-383, 1989; Dukhin, A.S. and Dukhin, S.S., Aperiodic capillary electrophoresis method using an alternating current electric field for separation of macromolecules, *Electrophoresis* 26, 2149-213, 2005; Aires de Sousa, M. and de Lencastre, H., Bridges from hospitals to the laboratory: genetic

portraits of methicillin-resistant *Staphylococcus aureus* clones, *FEMS Immunol.Med. Microbiol.* 40, 101-111, 2004.

## Pulse Radiolysis

A technique related to flash photolysis; pulse radiolysis uses very short (nanosecond) intense pulses of ionizing radiation to generate transient high concentrations of reactive species. See Salmon, G.A. and Sykes, A.G., Pulse radiolysis, *Methods Enzymol.* 227, 522-534, 1993; Bataille, C., Baldacchino, G., Cosson, R.P., *et al.*, Effect of pressure on pulse radiolysis reduction of proteins, *Biochim.Biophys. Acta* 1724, 432-439, 2005; Nakuna, B.N., Sun, G., and Anderson, V.E., Hydroxyl radical oxidation of cytochrome c by aerobic radiolysis, *Free Radic.Biol.Med.* 37, 1203-1213, 2004; Maleknia, S.D., Kieselar, J.G., and Downard, K.M., Hydroxyl radical probe of the surface of lysozyme by synchrotron radiolysis and mass spectrometry, *Rapid Commun.Mass Spectrom.* 16, 53-61, 2002.

## Quadrupole Mass Spectrometry

Mass spectrometry where only electric fields are used to separate ions on the basis of mass as they pass along the central axis of four parallel rods having an applied DC charge and alternative voltage applied (Herbert, C.G. and Johnstone, R.A.W., *Mass Spectrometry Basics*, CRC Press, Boca Raton, FL, Chapter 25, 2003). These instruments are generally referred to as quadrupole/time-of-flight mass spectrometers. See Horning, E.C., Carroll, D.I., Dzidic, I., *et al.*, Development and use of analytical systems based on mass spectrometry, *Clin.Chem.* 23, 13-21, 1977; Yost, R.A. and Boyd, R.K., Tandem mass spectrometry: quadrupole and hybrid instruments, *Methods Enzymol.* 193, 154-200, 1990; Jonscher, K.R. and Yates, J.R., 3rd., The quadrupole ion trap mass spectrometry—a small solution to a big challenge, *Anal.Biochem.* 244, 1-15, 1997; Chernushevich, I.V., Loboda, A.V., and Thomson, B.A., An introduction to quadrupole-time-of-flight mass spectrometry, *J.Mass Spectrom.* 36, 849-865, 2001; Ens, W. and Standing, K.G., Hybrid quadrupole/time-of-flight mass spectrometers for analysis of biomolecules, *Methods Enzymol.* 402, 49-78, 2005; Payne, A.H. and Glish, G.L., Tandem mass spectrometry in quadrupole ion trap and ion cyclotron resonance mass spectrometers, *Methods Enzymol.* 402, 109-148, 2005.

## Quantum Dots

Fluorescent semiconducting (usually CdSe surrounded by a passivation shell) nanocrystals used in the imaging of cells and sub-cellular particles. It is considered to have considerable advantage over other fluorescent imaging approaches. See Penner, R.M., Hybrid electrochemical/chemical synthesis of Q dots, *Acc.Chem. Res.* 33, 78-86, 2000; Lidke, D.S. and Arndt-Jovin, D.J., Imaging takes a quantum leap, *Physiology* 19, 322-325, 2004; Arya, H., Kaul, Z., Wadhwa, R., Taira, K., Hirano, T., and Kaul, S.C., Quantum dots in bio-imaging: revolution by the small, *Biochem.Biophys. Res.Commun.* 378, 1173-1177, 2005; Bentzen, E.L., Tomlinson, I.D., Mason, J., *et al.*, Surface modification to reduce nonspecific binding of quantum dots in live cell assays, *Bioconjugate Chem.* 16, 1488-1494, 2005.

## Quantum Yield

Efficiency of fluorescence; percentage of incident energy emitted after absorption. The higher the quantum yield, the greater the intensity of the fluorescence, luminescence, or phosphorescence.

See Papp, S. and Vanderkooi, J.M., Tryptophan phosphorescence at room temperature as a tool to study protein structure and dynamics, *Photochem.Photobiol.* 49, 775-784, 1989; Plasek, J. and Sigler, K., Slow fluorescent indicators of membrane potential: a survey of different approaches to probe response analysis, *J.Photochem.Photobiol.* 33, 101-124, 1996; Vladimirov, Y.A., Free radicals in primary photobiological processes, *Membr.Cell Biol.* 12, 645-663, 1998; Maeda, M., New label enzymes for bioluminescent enzyme immunoassay, *J.Pharm.Biomed.Anal.* 30, 1725-1734, 2003; Imahori, H., Porphyrin-fullerene linked systems as artificial photosynthetic mimics, *Org.Biomol.Chem.* 2, 1425-1433, 2004; Katerinopoulos, H.E., The coumarin moiety as chromophore of fluorescent ion indicators in biological systems, *Curr.Pharm.Des.* 10, 3835-3852, 2004.

## Quelling

A term used to describe the forceful suppression of a political uprising; to reduce to submission. In biology, quelling is suggested to uniquely describe post-translational gene silencing in *Neurospora* and, by extension, to other fungi. Quelling has some characteristic similar to RNA interference (RNAi) and cosuppression(post-translational gene silencing) in plants. Quelling involves the silencing of gene expression by segments of DNA in excess of the normal number. See Morel, J.B. and Vaucheret, H., Post-transcriptional gene silencing mutants, *Plant Mol.Biol.* 43, 275-284, 2000; Fagard, M., Boutet, S., Morel, J.B., et al., AGO1, QDE-2, and RDE-1 are related proteins required for post-transcriptional gene silencing in plants, quelling in fungi, and RNA interference in animals, *Proc.Natl.Acad.Sci. USA* 97, 11650-11654, 2000; Shiu, P.K., Raju, N.B., Zickler, D., and Metzberg, R.L., Meiotic silencing by unpaired DNA, *Cell* 107, 905-916, 2001; Pickford, A.S., Catalanotto, C., Cogoni, C., and Macino, G., Quelling in *Neurospora crassa*, *Adv.Genet.* 46, 277-303, 2002; Goldoni, M., Azzalin, G., Macino, G., and Cogoni, C., Efficient gene silencing by expression of double stranded RNA in *Neurospora crassa*, *Fungal Genet.Biol.* 4, 1016-1024, 2004; Nakayashi, H., RNA silencing in fungi: mechanisms and applications, *FEBS Lett.* 579, 5950-5957, 2005.

## Raman Spectroscopy (also called Raman Scattering)

A form of spectroscopy which uses inelastic light scattering which provides information on molecular vibrations. It is similar to infrared spectroscopy but can be used for aqueous solutions. See Warshel, A., Interpretation of resonance Raman spectra of biological molecules, *Annu.Rev.Biophys.Bioeng.* 6, 273-300, 1977; Mathlouthi, M. and Koenig, J.L., Vibrational spectra of carbohydrates, *Adv.Carbohydr.Chem.Biochem.* 44, 7-89, 1986; Ghomi, M., Letellier, R., Liquier, J., and Taillandier, E., Interpretation of DNA vibrational spectra by normal coordinate analysis, *Int.J.Biochem.* 22, 691-699, 1990; Kitagawa, T., Investigation of higher order structures of proteins by ultraviolet resonance Raman spectroscopy, *Prog.Biophys.Mol.Biol.* 58, 1-18, 1992; Loehr, T.M. and Sanders-Loehr, J., Techniques for obtaining resonance Raman spectra of metalloproteins, *Methods Enzymol.* 226, 431-470, 1993; Barron, L.D., Hecht, L., Blanch, E.W., and Bell, A.F., Solution structure and dynamics of biomolecules from Raman optical activity, *Prog.Biophys.Mol.Biol.* 73, 1-49, 2000; Blanch, E.W., Hecht, L., and Barron, L.D., Vibrational Raman optical activity of proteins, nucleic acids, and viruses, *Methods* 29, 196-209, 2003; Spiro, T.G. and Wasbotten, I.H., CD as a vibrational probe

of heme protein active sites, *J.Inorgan.Biochem.* 99, 34-44, 2005; Scheidt, W.R., Durbin, S.M., and Sage, J.T., Nuclear resonance vibrational spectroscopy—NRVS, Nuclear resonance vibrational spectroscopy—NRVS, *J.Inorgan.Biochem.* 99, 60-71, 2005; Aroca, R.F., Alvarez-Puebla, R.A., Pieczonka, N., Sanchez-Cortez, S., and Garcia-Ramos, J.V., Surface-enhanced Raman scattering on colloidal nanostructures, *Adv.Colloid Interface Sci.* 116, 45-61, 2005; Hammond, B.R. and Wooten, B.R., Resonance Raman spectroscopy measurement of carotenoids in the skin and retina, *J.Biomed.Opt.* 10:054002, 2005; Owen, C.A., Selvakumaran, J., Nottingher, I., Jell, G., Hench, L.L., and Stevens, M.M., In vitro toxicology evaluation of pharmaceuticals using Raman microspectroscopy, *J.Cell.Biochem.*, 99, 178–186, 2006; Vandenberghe, P. and Moens, L., Introducing students to Raman spectroscopy, *Anal.Bioanal.Chem.* 385, 209-211, 2006.

## Randomization

An unbiased process by which individual sample units (e.g., wells in microplate, experimental subjects) are assigned to experimental classes. An example is the assignment of subjects to two or more treatment groups). See Lachin, J.M., Statistical properties of randomization in clinical trials, *Control.Clin.Trials* 9, 289-311, 1988; Greenland, S., Randomization, statistics, and causal interference, *Epidemiology* 1, 421-429, 1990; Kernan, W.N., Viscoli, C.M., Makuch, R.W., et al., Stratified randomization for clinical trials, *J.Clin.Epidemiol.* 52, 19-26, 1999; Abel, U. and Koch, A., The role of randomization in clinical trials: myths and beliefs, *J.Clin.Epidemiol.* 52, 487-497, 1999. Mendelian randomization refers to the randomization of genes which are transferred from parent to offspring at the time of gamete formation (Nitsch, D., Molokhia, M., Smeeth, L., et al., Limits to causal inference based on Mendelian randomization: a comparison with randomized controlled trials, *Am.J.Epidemiol.* 163, 397-403, 2006; Zoccali, C., Testa, A., Spoto, B. et al., Mendelian randomization: a new approach to studying epidemiology in ESRD, *Am.J.Kidney Dis.* 47, 332-341, 2006.

## Real-Time PCR; Real-time RT-PCR

Real time PCR permits the assay of the rate of amplicon formation during replication in the PCR reaction. Conventional PCR amplicons are measured either by size analysis or sequence analysis and while there is a relation of amplicon number to target number in the early phases, such a quantitative relationship is lost at high levels of amplification. The use of a fluorescent compounds such as SYBR Green I to bind to double-stranded DNA with an increase in fluorescence. Another approach uses FRET with a donor/acceptor pair. The use of fluorescence to measure the synthesis of amplicons permits the measurement of amplification in real time with the use of appropriate instrumentations. Real-time RT-PCR is an approach to quantitative use of the reverse transcriptase-polymerase chain reaction (RT-PCR) to measure messenger RNA and viral pathogen RNA. This is an adaptation of techniques which were based on the use of fluorescent tags to measure PCR amplicons in real time and has proved useful for the study of gene expression where real-time RT-PCR is used to "validate" other approaches to gene expression analysis such as the use of DNA microarrays. See *Real Time PCR. An Essential Guide*, ed. K. Edwards, J. Logan, and N. Saunders, *Horizon Biosciences*, Wymandham, Norfolk, UK, 2004; Lie, Y.S. and Petropoulos, C.J., Advances in quantitative PCR technology: 5' nuclease assays, *Curr.Opin.Biotechnol.* 9, 43-48, 1998; Kubista, M., Andrade, J.M., Bengtsson, M., et al.,

The real-time polymerase chain reaction, *Mol.Aspects Med.* 27, 95-125, 2006; Kuypers, J., Wright, N., Ferrenberg, J., *et al.*, Comparison of real-time PCR assays with fluorescent-antibody assays for diagnosis of respiratory virus infections in children, *J.Clin.Microbiol.* 44, 2382-2388, 2006; Diederer, B.M., de Jong, C.M., Kluytmans, J.A., *et al.*, Detection and quantification of *Legionella pneumonia* DNA in serum: case reports and review of the literature, *J.Med.Microbiol.* 55, 639-642, 2006; Transcriptome amplification methods in gene expression profiling, *Expert Rev. ## Receptor Activity Modifying Proteins (RAMP)

Receptor activity modifying proteins (RAMPs) were identified as part of an effort to clone calcitonin gene-related peptide. There are three members of the family and have been demonstrated to modulate the activity of G-protein coupled receptors. See McLatchie, L.M., Fraser, M.J., Main, M.J., *et al.*, RAMPs regulate the transport and ligand specificity of the calcitonin-receptor-like receptors, *Nature* 393, 333-339, 1998; Foord, S.M. and Marshall, F.H., RAMPs: accessory proteins for seven transmembrane domain receptors, *Trends Pharmacol.Sci.* 20, 184-187, 1999; Sexton, P.M., Abiston, A., Morfis, M., *et al.*, Receptor activity modifying proteins, *Cell Signal.* 13, 73-82., 2001; Fischer, J.A., Muff, R., and Born, W., Functional relevance of G-protein-coupled-receptor-associated proteins, exemplified by receptor-activity-modifying proteins (RAMPs), *Biochem.Soc.Trans.* 30, 455-460, 2002; Morfis, M., Christopolous, A., and Sexton, P.M., RAMPs: 5 years on. Where to now? *Trends Pharmacol.Sci.* 34, 596-601, 2003; Hay, D.L., Conner, A.C., Howitt, S.G., *et al.*, The pharmacology of CGRP-responsive receptors in cultured and transfected cells, *Peptides* 25, 2019-2026, 2004; Udawala, M., Hay, D.L., and Sexton, P.M., The receptor activity modifying protein family of G protein coupled receptor accessory proteins, *Sem.Cell Dev.Biol.* 15, 299-308, 2004; Young, A., Receptor pharmacology, *Adv.Pharmacol.* 52, 47-65, 2005.

## Receptor Tyrosine Kinase

A relatively simple transmembrane protein with an extracellular ligand-binding domain and an intracellular protein kinase domain. Receptor tyrosine kinases are coupled with receptors

such as epidermal growth factor receptor, insulin receptor, etc. See Gourley, D.R., Isolation and characterization of membrane drug receptors, *Prog.Drug Res.* 20, 323-346, 1976; Adamson, E.D. and Rees, A.R., Epidermal growth factor receptors, *Mol.Cell. Biochem.* 34, 129-152, 1981; Carpenter, G., The biochemistry and physiology of the receptor-tyrosine kinase for epidermal growth factor, *Mol.Cell.Endocrinol.* 31, 1-19, 1983; Alaoui-Jamali, M.A., Paterson, J., Al Moustafa, A.E. and Yen, L., The role of Erb-2 tyrosine kinase receptor in cellular intrinsic chemoresistance: mechanisms and implications, *Biochem.Cell.Biol.* 75, 315-325, 1997; Smit, L. and Borst, J., The Cbl family of signal transduction molecules, *Crit.Rev.Oncog.* 8, 359-379, 1997; Elchebly, M., Cheng, A., and Tremblay, M.L., Modulation of insulin signaling by protein tyrosine phosphatases, *J.Mol.Med.* 78, 473-482, 2000; Carraway, K.L., Ramsauer, V.P., Haq, B., Carrothers Carraway, C.A., Cell signaling through membrane mucins, *Bioessays* 25, 66-71, 2003; Murai, K.K. and Pasquale, E.B., Eph receptors, ephrins, and synaptic function, *Neuroscientist* 10, 304-314, 2004; Monteiro, H.P., Rocha Oliveira, C.J., Curcio, M.F., Moraes, M.S., and Arai, R.J., Tyrosine phosphorylation in nitric oxide-mediated signaling events, *Methods Enzymol.* 396, 350-358, 2005; Heroult, M., Schaffner, F., and Augustin, H.G., Eph receptor and ephrin ligand-mediated interactions during angiogenesis and tumor progression, *Exp.Cell Res.* 312, 642-650, 2006; Perona, R., Cell signaling: growth factors and tyrosine kinase receptors, *Clin.Transl. Oncol.* 8, 77-82, 2006; Li, E. and Hristova, K., Role of receptor tyrosine kinase transmembrane domains in cell signaling and human pathologies, *Biochemistry* 45, 6242-6251, 2006.

## Receptor-activator of NF- $\kappa$ B (RANK)

A member of the neuroregulin/tumor necrosis factor superfamily. See Roundy, K., Smith, R., Weis, J.J., and Weis, J.H., Overexpression of RANKL (receptor-activator of NF- $\kappa$ B ligand) implicates IFN-beta-mediated elimination of B-cell precursors in the osteopetrotic bone of microphthalmic mice, *J.Bone Miner.Res.* 18, 278-288, 2003; Huang, W., Drissi, M.H., O'Keefe, R.J. and Schwarz, E.M., A rapid multiparameter approach to study factors that regulate osteoclastogenesis: demonstration of the combinatorial dominant effects of TNF-alpha and TGF-ss in RANKL-mediated osteoclastogenesis, *Calcif.Tissue Int.* 73, 584-593, 2003; Neumann, E., Gay, S., and Muller-Ladner, U., The RANK/RANKL/osteoprotegerin system in rheumatoid arthritis: new insights from animal models, *Arthritis Rheum.* 2, 3257-3268, 2005; Hamdy, N.A., Osteoprotegerin as a potential therapy for osteoporosis, *Curr.Osteoporos.Rep.* 3, 121-125, 2005; Wada, T., Nakashima, T., Hiroshi, N., Penniger, J.M., RANKL-RANK signaling in osteoclastogenesis and bone disease, *Trends Mol.Med.* 12, 17-25, 2006.

## Receptors for AGE (RAGE)

Cell-surface receptors for advanced glycation endproducts (AGE). These receptors are members of the immunoglobulin superfamily and are involved in the processes of inflammation and are suggested to be involved in the pathogenesis of diseases such as diabetes and neurodegenerative diseases such as Alzheimer's disease. It is also noted that RAGE are also receptors for S100/calgranulin. See Bucciarelli, L.G., Wendt, T., Rong, L., *et al.*, RAGE is a multiligand receptor of the immunoglobulin superfamily: implications for homeostasis and chronic disease, *Cell.Mol.Life. Sci.* 59, 1117-1128, 2002; Yan, S.F., Ramasamy, R., Naka, Y., and Schmidt, A.M., Glycation, inflammation, and RAGE. A scaffold

for the macrovascular complications of diabetes and beyond, *Circ.Res.* 93, 1159-1169, 2003. Ramasamy, R., Vannucci, S.J., Yan, S.S., Herold, K., San, S.F. and Schmidt, A.M., Advanced glycation end products and RAGE: a common thread in aging, diabetes, neurodegeneration, and inflammation, *Glycobiology* 15, 16R-28R, 2005; Jensen, L.J., Ostergaard, J., and Flyvbjerg, A., AGE-RAGE and AGE cross-link interaction: important players in the pathogenesis of diabetic kidney disease, *Horm.Metab.Res.* 37, (Suppl. 1) 26-34, 2005; Bierhaus, A., Humpert, P.M., Stern, D.M., Arnold, B., and Nawroth, P.P., Advanced glycation end product receptor-mediated cellular dysfunction, *Ann.N.Y.Acad.Sci.* 1043, 676-680, 2005; Ding, Q. and Keller, J.N., Evaluation of rage isoforms, ligands, and signaling in the brain, *Biochim.Biophys.Acta* 1746, 18-27, 2005.

## Receptorome

That portion of the proteome that function via ligand recognition. This category is subject to subdivision by receptor type as the GPCR receptorome. See Setola, V., Hufeisne, S.J., Grande-Allen, K.J., *et al.*, 3,4-methylenedioxymethamphetamine (MDMA, "Ecstasy") induces fenfluramine-like proliferative actions on human cardiac valvular interstitial cells in vitro, *Mol.Pharmacol.* 62, 1223-1229, 2003; Armbruster, B.N. and Roth, B.L., Mining the receptorome, *J.Biol.Chem.* 280, 5129-5132, 2005; Roth, B.L., Receptor systems: will mining the receptorome yield novel targets for pharmacotherapy, *Pharmacol.Ther.* 108, 59-64, 2005.

## Receptosome

An intracellular organelle resulting from receptor-mediated endocytosis of a ligand; Willingham, M.C. and Pastan, I., The receptosome: an intermediate organelle of receptor-mediated endocytosis in cultured fibroblasts, *Cell* 21, 67-77, 1980; Pastan, I.L. and Willingham, M.C., Journal of the center of the cell: role of the receptosome, *Science* 214, 504-509, 1981; Chitambar, C.R. and Zivkovic-Gilgenbach, Z., Role of the acidic receptosome in the uptake and retention of <sup>67</sup>Ga by human leukemic HL60 cells, *Cancer Res.* 50, 1484-1487, 1990. While this specific term has not seen extensive use, there is interest in receptor-mediated endocytosis coupled with "specific" vesicular transport (Sano, H., Higashi, T., Matsumoto, K., *et al.*, Insulin enhances macrophage scavenger receptor-mediated endocytotic uptake of advanced glycation end products, *J.Biol.Chem.* 273, 8630-8637, 1998). There is some interest in receptor-mediated endocytosis for drug delivery (Selbo, P.K., Hogset, A., Prasmickaite, L., and Berg, K., Photochemical internalization: a novel drug delivery system, *Tumour Biol.* 23, 102-112, 2002).

## Refractive Index (Index of Refraction)

Ration of wavelength or phase velocity of an electromagnetic wave in a vacuum to that in a substance. Changes in the refractive index of solutions have been used to measure solute concentration in techniques such as analytical ultracentrifugation and chromatography. Techniques based on refractive index have been used to study cells. More recently, refractive index has provided the basis for measurement of macromolecules on surfaces. See Hawkes, J.B. and Astheimer, R.W., Thermal coefficient of the refractive index of water, *Science* 110, 717, 1949; Barer, R. and Tkaczyk, S., Refractive index of concentrated protein solutions, *Nature* 173, 821-822, 1954; Barer, R. and Dick, D.A., Interferometry and refractometry of cells in tissue culture, *Exp.Cell Res.* 13(Suppl 4),

103-135, 1957; Fishman, H.A., Greenwald, D.R., and Zare, Z.N., Biosensors in chemical separations, *Annu.Rev. Biophys. Biomol. Struct.* 27, 165-198, 1998; Van Regenmortel, M.H., Altschuh, D., Chatellier, J., *et al.*, Measurement of antigen-antibody interactions with biosensors, *J.Mol.Recognit.* 11, 163-167, 1998; Eremeeva, T., Size-exclusion chromatography of enzymatically treated cellulose and related polysaccharides, *J.Biochem.Biophys.Methods* 56, 253-264, 2003; Mogridge, J., Using light-scattering to determine the stoichiometry of protein complexes, *Methods Mol.Biol.* 261, 113-118, 2004; Hut, T.S., Biophysical methods for monitoring cell-substrate interactions in drug discovery, *Assay Drug Dev.Technol.* 1, 479-488, 2003; Haes, A.J. and Van Duynne, R.P., A unified view of propagating and localized surface plasmon resonance, *Anal.Bioanal.Chem.* 379, 920-930, 2004; Stuart, D.A., Haes, A.J., Yonzon, C.R., Hicks, E.M., and Van Duynne, R.P., Biological applications of localized surface plasmonic phenomena, *IEE Proc. Nanobiotechnol.* 152, 13-32, 2005; Yuk, J.S., Hong, D.G., Jung, J.W., *et al.*, Sensitivity enhancement of spectral surface plasmon resonance biosensors for the analysis of protein arrays, *Eur.Biophys.J.* 35, 469-476, 2006; Ogusu, K., Suzuki, K., and Nishio, H., Simple and accurate measurement of the absorption coefficient of an absorbing plate by use of the Brewster angle, *Opt.Lett.* 31, 909-911, 2006; Cardenas-Valencia, A.M., Dlutowski, J., Fries, D., and Langdebrake, L., Spectrometric determination of the refractive index of optical wave guiding materials used in lab-on-a-chip applications, *Appl.Spectrosc.* 60, 322-329, 2006; Coelho Neto, J., Agero, U., Gazzinelli, R.T., and Mesquita, O.N., Measuring optical and mechanical properties of a living cell with defocusing microscopy, *Biophys.J.*, 91, 1108-1115, 2006. Friebel, M. and Meinke, M., Model function to calculate the refractive index of native hemoglobin in the wavelength range of 250-1100 nm, *Appl.Opt.* 45, 2838-2842, 2006.

## Regulators of G Protein Signaling (RGS)

Regulators of G protein signaling are a family of protein which bind to the activated  $\alpha$ -subunit of the heterotrimer G protein complex where GDP has been replaced by GTP and block signal transmission. There is increasing evidence for a broader role for RGS proteins in cell function. See Dohlman, H.G. and Thorner, J., RGS proteins and signaling by heterotrimeric G proteins, *J.Biol.Chem.* 272, 3871-3874, 1997; Berman, D.M. and Gilman, A.G., Mammalian RGS proteins: barbarians at the gate, *J.Biol.Chem.* 273, 1269-1272, 1998; Hepler, J.R., Emerging roles for RGS proteins in cell signaling, *Trends Pharmacol.Sci.* 20, 376-382, 1999; Hepler, J.R., Emerging roles for RGS proteins in cell signaling, *Trends Pharmacol.Sci.* 20, 376-382, 1999; Burchett, S.A., Regulators of G protein signaling: a bestiary of modular protein binding domains, *J.Neurochem.* 75, 1335-1351, 2000; Hollinger, S. and Hepler, J.R., Cellular regulation of RGS proteins: modulators and intergrators of G protein signaling, *Pharmacol.Rev.* 54, 527-559, 2002; Kehrl, J.H., G-protein-coupled receptor signaling, RGS proteins, and lymphocyte function, *Crit.Rev.Immunol.* 24, 409-423, 2004; Wilkie, T.M. and Kinch, L., New roles for  $G\alpha$  and RGS proteins: communication continues despite pulling sisters apart, *Curr.Biol.* 15, R843-R854, 2005.

## Regulatory Transcription Factors

A *trans*-acting component, usually a protein or protein complex, which interacts with a *cis*-regulatory region on a gene distant from the transcription initiation site to enhance or suppress the rate of transcription. A regulatory transcription factor is not considered a part of the basal transcription apparatus. See Fujita, T., Kimura, Y.,

Miyamoto, M., *et al.*, Induction of endogenous IFN- $\alpha$  and IFN- $\beta$  genes by a regulatory transcription factor, IRF-1, *Nature* 337, 270-272, 1989.

Wingender, E., *Gene Regulation in Eukaryotes*, VCH, Weinheim, Germany, 1993; Gopakrishnan, R.V., Dolle, P., Mattei, M.G., *et al.*, Genomic structure and developmental expression of the mouse cell cycle regulatory transcription factor DP1, *Oncogene* 13, 2671-2680, 1996; Bachmaier, K., Neu, N., Pummerer, C., *et al.*, iNOS expression and nitrotyrosine formation in the myocardium in response to inflammation is controlled by the interferon regulatory transcription factor 1, *Circulation* 96, 585-591, 1997; Larochelle, O., Stewart, G., Moffatt, P., *et al.*, Characterization of the mouse metal-regulatory-element-binding proteins, metal element protein-1 and metal regulatory transcription factor-1, *Biochem.J.* 353, 591-601, 2001; Courey, A.J., Regulatory transcription factors and regulatory regions, in *Transcription Factors*, ed. J.Locker, Chapter 2, pp. 17-34, 2001; Willmore, W.G., Control of transcription in eukaryotic cells, in *Functional Metabolism: Regulation and Adaptation*, ed. K.B. Storey, Wiley-Liss, Hoboken, NJ, USA, Chapter 6, pp. 153-187, 2004.

## Resolution (Chromatographic)

The chromatographic separation between components in a mixture of components. A number of equations can be developed for the expression of resolution such as  $R = 2(t_2 - t_1)/W_1 + W_2$  where  $t_1$  is the elution time of component 1 having peak width of  $W_1$  and  $t_2$  is the elution time of component 2 having peak width of  $W_2$ . See Hearn, M.T., General strategies in the separation of proteins by high-performance liquid chromatographic methods, *J.Chromatog.* 418, 3-26, 1987; Feibush, B. and Santasania, C.T., Hydrophilic shielding of hydrophobic, cation- and anion-exchange phases for separation of small analytes: direct injection of biological fluids onto high-performance liquid chromatographic columns, *J.Chromatog.* 544, 41-49, 1991; Hagan, R.L., High-performance liquid chromatography for small-scale studies of drug stability, *Am.J.Hosp.Pharm.* 51, 2162-2175, 1994; Coffman, J.L., Roper, D.K., and Lightfoot, E.N., High-resolution chromatography of proteins in short columns and adsorptive membranes, *Bioseparation* 4, 183-200, 1994; Myher, J.J., and Kuksis, A., General strategies in chromatographic analysis of lipids, *J.Chromatog.B.* 671, 3-33, 1995; Chen, H. and Horvath, C., High-speed high-performance liquid chromatography of peptides and proteins, *J.Chromatog.A.* 705, 3-20, 1995; Bojarski, J. and Aboul-Enein, H.Y., Recent applications of chromatographic resolution of enantiomers in pharmaceutical analysis, *Biomed.Chromatog.* 10, 297-302, 1996; Dolan, J.W., Temperature selectivity in reversed-phase high performance liquid chromatography, *J.Chromatog.A.* 965, 195-205, 2002; Jupille, T.H., Dolan, J.W., Snyder, L.R., and Molnar, I., Two-dimensional optimization using different pairs of variables for the reversed-phase high-performance liquid chromatographic separation of a mixture of acidic compounds, *J.Chromatog.A.* 948, 35-41, 2002; Pellett, J., Lukulay, P., Mao, Y. *et al.*, "Orthogonal" separations for reversed-phase liquid chromatography, *J.Chromatog.A.* 1101, 122-135, 2006; Nageswara Rao, R., Narasa Raju, A., and Nagaraju, D., Development and validation of a liquid chromatographic method for determination of enantiomeric purity of citalopram in bulk drugs and pharmaceuticals, *J.Pharm.Biomed.Anal.* 41, 280-285, 2006.

## Resurrection Plants

Plants usually found in arid regions which adopt a compact shape during water deprivation and changes shape upon rehydration. See Kranner, I., Beckett, R.P., Wornik, S., Zorn, M., Preifhofer,

H.W., Revival of a resurrection plant correlates with its antioxidant status, *Plant J.* 31, 13-24, 2002; Schluepmann, H., Pellny, T., van Dijken, A., Smeecken, S., and Paul, M., Trehalose 6-phosphate is indispensable for carbohydrate utilization and growth in *Arabidopsis thaliana*, *Proc.Natl.Acad.Sci.USA* 100, 6849-6854, 2003; Jones, L. and McQueen-Mason, S., *FEBS Lett.* 559, 61-65, 2004; Helseth, L.E. and Fischer, T.M., Physical mechanisms of rehydration in *Polypodium polypodioides*, a resurrection plant, *Phys.Rev.E. Stat. Nonlin. Soft Matter. Phys.* 71(6 Pt 1):061903, epub, 2005.

## Retention Time

For chromatography, the retention time ( $t_r$ ) is the time from injection of solute to the apex (zenith) of the peak of the respective solute. For planar chromatography such as thin-layer chromatography or paper chromatography, the Retardation Factor ( $R_f$ ) is ratio of the distance traveled by solvent (solvent front) and the distance traveled by the solute. See Palmblad, M., Ramstrom, M., Bailey, C.G., *et al.*, Protein identification by liquid chromatography-mass spectrometry using retention time prediction, *J.Chromatog.B Anal.Technol.Biomed.Life Sci.* 803, 131-135, 2004; Joutovsky, A., Hadzi-Nesic, J., and Nardi, M.A., HPLC retention time as a diagnostic tool for hemoglobin variants and hemoglobinopathies: a study of 60000 samples in a clinical diagnostic laboratory, *Clin.Chem.* 50, 1736-1747, 2004; Pierce, K.M., Wood, L.F., Wright, B.W., and Synovec, R.E., A comprehensive two-dimensional retention time alignment algorithm to enhance chemometric analysis of comprehensive two-dimensional separation data, *Anal.Chem.* 77, 7735-7743, 2005. The term retention time is also used to describe the period of time that a material resides in the digestive tract, Bernard, L. and Doreau, M., Use of rare earth elements as external markers for mean retention time measurements in ruminants, *Reprod.Nutr.Dev.* 40, 89-101, 2000; Pearson, R.A., Archibald, R.F., and Muirhead, R.H., A comparison of the effect of forage type and level of feeding on the digestibility and gastrointestinal mean retention time of dry forages given to cattle, sheep, ponies, and donkeys, *Br.J.Nutr.* 95, 88-98, 2006); retention in filtration system (Lee, Y.W., Chung, J., Jeong, Y.D. *al.*, Backwash based methodology for the estimation of solids retention time in biological aerated filter, *Environ.Technol.* 27, 777-787, 2006); and retention time of solid waste in a bioreactor (Maase, A., Sperandio, M., and Cabassud, C., Comparison of sludge characteristics and performance of a submerged membrane bioreactor and an activated sludge process at high solids retention time, *Water Res.* 40, 2405-2415, 2006).

## Retention Volume

For chromatography, the retention volume is a function of the flow rate of the mobile phase and the retention time (Frigon, R.P., Leyboldt, J.K., Uyeji, S., and Henderson, L.W., Disparity between Stokes radii of dextrans and proteins as determined by retention volume in gel permeation chromatography, *Anal.Chem.* 55, 1349-1354, 1983; Dyr, J.E. and Suttner, J., On the increased retention volume of human hemoglobin in high-performance gel filtration, *J.Chromatog.* 408, 303-307, 1987; Griotti, F. and Guiochon, G., Influence of the pressure on the properties of chromatographic columns. III. Retention time of thiourea, hold-up volume, and compressibility of the  $C_{18}$ -bonded layer, *J.Chromatog.A.* 1075, 117-126, 2005). The term is also used to refer to urine retention (Dutkiewicz, S., Witeska, A., and Stepień, K., Relation between prostate-specific antigen, prostate volume, retention volume and

age in benign prostatic hypertrophy (BPH), *Int.Urol.Nephrol.* 27, 762-768, 1995; Demaria, F., Amar, N., Blau, D., *et al.*, Prospective 3D ultrasonographic evaluation of immediate postpartum urine retention volume in 100 women who delivered vaginally, *Int. Urogynecol.J.Pelvic Floor Dysfunct.* 15, 281-285, 2004).

## Retromer

A multi-protein complex thought to function in endosome-Golgi retrieval. See Pfeffer, S.R., Membrane transport: retromer to the rescue, *Curr.Biol.* 11, R109-R111, 2001; Seaman, M.N.J., Recycle your receptors with retromer, *Trends Cell Biol.* 15, 68-75, 2005; Griffin, C.T., Trejo, J., and Magnuson, T., Genetic evidence for a mammalian retromer complex containing sorting nexins 1 and 2, *Proc.Natl.Acad.Sci. USA* 102, 15173-15177, 2005; Gullapalli, A., Wolfe, B.L., Griffin, C.T., Magnuson, T., and Trejo, J., An essential role of SNX1 in lysosomal sorting of protease-activated receptor-1: evidence for retromer-, Hrs-, and Tsg101-independent functions of sorting nexins, *Mol.Biol.Cell*, 2006.

## Retro-translocation (retrotranslocation)

A process by which misfolded proteins or other incorrect translation products are transported from the lumen of the endoplasmic reticulum to the cytoplasm for subsequent degradation by the proteasome. See Johnson, A.E. and Haigh, N.G., The ER translocon and retrotranslocation: is the shift into reverse manual or automatic? *Cell* 102, 709-712, 2000; Svedine, S., Wang, T., Halaban, R., and Herbert, D.N., Carbohydrates act as sorting determinants in ER-associated degradation of tyrosinase, *J.Cell. Sci.* 117, 2937-2949, 2004; Schulze, A., Sandera, S., Buerger, E., *et al.*, The ubiquitin-domain protein HERP forms a complex with components of the endoplasmic reticulum associated degradation pathway, *J.Mol.Biol.* 354, 1021-1027, 2005.

## Reverse Immunology

Prediction of antigen structure based on peptide reactivity with cytotoxic T cell MHC proteins; most frequently used in the study of tumor antigens: see Boon, T. and van der Bruggen, P., Human tumor antigens recognized by T lymphocytes, *J.Exptl.Med.* 183, 725-729, 1996; Maecker, B., *et al.*, Linking genomics to immunotherapy by reverse immunology—'immunomics' in the new millennium, *Cur.Mol.Med.* 1, 609-619, 2001; Anderson, K.S. and LaBaer, J., The sentinel within: exploiting the immune system for cancer biomarkers, *J.Proteome Res.* 4, 1123-1133, 2005. see SEREX.

## Reverse Micelle

A reverse micelle or inverted micelle is a stable assembly of a surfactant around an aqueous core where the lipophilic part of the surfactant is directed toward the exterior which is a non-polar solvent and the charged portion is directed toward the aqueous core. Reverse micelles have been used for the stabilization of proteins in organic solvents, for protein purification and for drug delivery. See Bernert, J.T., Jr. and Sprecher, H., Solubilization and partial purification of an enzyme involved in rat liver microsomal fatty acid chain elongation: beta-hydroxyacyl-CoA dehydrase, *J.Biol.Chem.* 254, 11584-11590, 1979; Grandi, C., Smith, R.E. and Luisi, P.L., Micellar solubilization of biopolymers in organic solvents. Activity and conformation of lysozyme in isoctane reverse micelles, *J.Biol.Chem.* 256, 837-843, 1981; Leser, M.E., Wei, G., Luisi, P., and Maestro, M.,

Application of reverse micelles for the extraction of proteins, *Biochem.Biophys.Res.Comm.* 135, 629-635, 1986; Luisi, P.L., and Magid, L.J., Solubilization of enzymes and nucleic acids in hydrocarbon micellar solutions, *CRC Crit.Rev.Biochem.* 20, 409-474, 1986; Huruguen, J.P. and Pileni, M.P., Drastic change of reverse micellar structure by protein or enzyme addition, *Eur.Biophys.J.* 19, 103-107, 1991; Bru, R., Sanchez-Ferrer, A., and Garcia-Caroma, F., Kinetic models in reverse micelles, *Biochem.J.* 310, 721-739, 1995; Nicot, C. and Waks, M., Proteins as invited guests of reverse micelles: conformational effects, significance, applications, *Biotechnol.Genet.Eng.Rev.* 13, 267-314, 1996; Tuena de Gomez-Puyou, M. and Gomez-Puyou, A., Enzymes in low-water systems, *CRC Rev.Biochem.Mol.Biol.* 33, 53-89, 1998; Orlich, B. and Schomacker, R., *Adv.Biochem.Eng. Biotechnol.* 75, 185-208, 2002; Krishna, S.H., Srinivas, N.D., Ragnavarao, K.S., and Karanth, N.G., Reverse micellar extraction for downstream processing of proteins/enzymes, *Adv. Biochem.Eng. Biotechnol.* 75, 1190183, 2002; Marhuenda-Egea, F.C. and Bonete, M.J., Extreme halophilic enzymes in organic solvents, *Curr.Opin.Biotechnol.* 13, 385-389, 2002; Muller-Goymann, C.C., Physicochemical characterization of colloidal drug delivery systems such as reverse micelles, vesicles, liquid crystals, and nanoparticles for topical administration, *Eur.J. Pharm.Biopharm.* 58, 343-356, 2004.

## Reverse Proteomics

Proteomic analysis where genomic sequence information is used to predict the resulting proteome providing the basis for experiment design. See Lamesch, P., Milstein, S., Hao, T., *et al.*, *C.elegans* ORFeome version 3.1: increasing the coverage of ORFeome resources with improved gene production, *Genome Res.* 14, 2064-2069, 2004; Rual, J.F., Hirozane-Kishikawa, T., Hao, T., *et al.*, Human ORFeome version 1.1: a platform for reverse proteomics, *Genome Res.* 14, 2128-135, 2004; Gillette, W.K., Esposito, D., Frank, P.H., *et al.*, Pooled ORF expression technology (POET), *Mol.Cell.Proteom.* 4, 1647-1652, 2005.

## Reverse Transcriptase

An enzymes which catalyzes the formation of DNA from an RNA template. This is an enzyme critical for the replication of RNA viruses such as HIV and is major drug targets for AIDS and other RNA viral diseases. See O'Conner, T.E., Reverse transcriptase-progress, problems and prospects, *Bibl.Haematol.* 39, 1265-1181, 1973; Wu, A.M. and Gallo, R.C., Reverse transcriptase, *CRC Crit. Rev.Biochem.* 3, 289-347, 1975; Verma, I.M., The reverse transcriptase, *Biochim.Biophys.Acta* 473, 1-38, 1977; Chandra, P., Immunological characterization of reverse transcriptase from human tumor tissues, *Surv.Immunol.Res.* 2, 170-177, 1983; Lim, D. and Maas, W.K., Reverse transcriptase in bacteria, *Mol. Microbiol.* 3, 1141-1144, 1989; Barber, A.M., Hizi, A., Maizel, J.V., Jr., and Hughes, S.H., HIV-1 reverse transcriptase: structure predictions for the polymerase domain, *AIDS Res.Hum.Retroviruses* 6, 1061-1072, 1990; Durantel, D., Brunelle, M.N., Gros, E., *et al.*, Resistance of human hepatitis B virus to reverse transcriptase inhibitors: from genotypic to phenotypic testing, *J.Clin.Vitrol.* 34(Suppl 1), S34-S43, 2005; Menendez-Arias, L., Matamoros, T., and Cases-Gonzalez, C.E., Insertions and deletions in HIV-1 reverse transcriptase: consequences for drug resistance and viral fitness, *Curr.Pharm.Des.* 12, 1811-1825, 2006; Srivastava, S., Sluis-Cremer, N., and Tachedjian, G., Dimerization of human immunodeficiency virus type 1 reverse transcriptase as an antiviral target, *Curr.Pharm.Des.* 12, 1879-1894, 2006.

## Reverse Transcriptase – Polymerase chain reaction (RT-PCR)

A variation of the PCR technique in which cDNA is made from RNA via reverse transcription. The cDNA is then amplified using standard PCR protocols. See Mocharla, H., Mocharla, R., and Hodes, M.E., Coupled reverse transcription-polymerase chain reaction (RT-PCR) as a sensitive and rapid method for isozyme genotyping, *Gene* 93, 271-275, 1990; Weis, J.H., Tan, S.S., Martin, B.K., and Willwer, C.T., Detection of rare mRNAs via quantitative RT-PCR, *Trends Genet.* 8, 263-264, 1992; Akoury, D.A., Seo, J.J., James, C.D., and Zaki, S.R., RT-PCR detection of mRNA recovered from archival glass slide smears, *Mol.Pathol.* 6, 195-200, 1993; Silver, J., Maudru, T., Fujita, K. and Repaske, R., An RT-PCR assay for the enzyme activity of reverse transcriptase capable of detecting single virions, *Nucleic Acids Res.* 21, 3593-3594, 1993; Taniguchi, A., Kohsaka, H., and Carson, D.A., Competitive RT-PCR ELISA: a rapid, sensitive and non-radioactive method to quantitate cytokine mRNA, *J.Immunol.Methods* 169, 101-109, 1994; Prediger, E.A., Quantitating mRNAs with relative and competitive RT-PCR, *Methods Mol.Biol.* 160, 49-63, 2001; Lion, T., Current recommendations for positive controls in RT-PCR assays, *Leukemia* 15, 1033-1037, 2001; Joyce, C., Quantitative RT-PCR. A review of current methodologies, *Methods Mol.Biol.* 193, 83-92, 2002; Ransick, A., Detection of mRNA by in situ hybridization and RT-PCR, *Methods Mol.Biol.* 74, 601-620, 2004; Tallini, G. and Brandao, G., Assessment of RET/PTC oncogene activation in thyroid nodules utilizing laser microdissection followed by nested RT-PCR, *Methods Mol.Biol.* 293, 103-111, 2005; Ooi, C.P., Rohani, A., Zamree, I., and Lee, H.L., Temperature related storage evaluation of an RT-PCR test kit for the detection of dengue infection in mosquitoes, *Trop.Biomed.* 22, 73-76, 2005.

## Rho factor

A ring-shaped homohexameric bacterial protein encoded by the *rho* gene which regulates RNA polymerase. See Lathe, R., RNA polymerase of *Escherichia coli*, *Curr.Top.Microbiol.Immunol.* 83, 37-91, 1978; Adhya, S. and Gottesman, M., Control of transcription termination, *Annu.Rev.Biochem.* 47,967-996, 1978; Aktories, K., Schmidt, G., and Just, I., Rho GTPases as targets of bacterial protein toxins, *Biol.Chem.* 381, 421-426, 2000; Anston, A.A., Single-stranded-RNA binding proteins, *Curr.Opin.Struct.Biol.* 10, 87-94, 2000; Richardson, J.P., Rho-dependent termination and ATPases in transcript termination, *Biochim.Biophys.Acta* 1577, 251-260, 2002; Banerjee, S., Chalissery, J., Bandey, I., and Sen, R., Rho-dependent transcription termination: more questions than answers, *J.Microbiol.* 44, 11-22, 2006.

## Rhomboid

A family of transmembrane proteins with proteolytic activity and considered to be a regulatory of EGF signaling. Rhomboid was originally described in *Drosophila* as protease cleaving Spitz, a membrane-bound EGF. See Noll, R., Sturtevant, M.A., Gollapudi, R.R., and Bier, E., New functions of the *Drosophila* rhomboid gene during embryonic and adult development are revealed by a novel genetic method, enhancer piracy, *Development* 120, 2329-2338, 1994; Lage, P., Yan, Y.N., and Jarman, A.P., Requirement for EGF receptor signaling in neural recruitment during formation of *Drosophila* chordotonal sense organ clusters, *Curr.Biol.* 7, 166-175, 1997; Sturtevant, M.A., Roark, M., and Bier, E., The *Drosophila* rhomboid gene mediates the localized formation of wing veins

and interacts genetically with components of the EGF-R signaling pathway, *Genes Dev.* 7, 961-973, 1993; Klambt, C., EGF receptor signalling: the importance of presentation, *Curr.Biol.* 10, R399-R391, 2000; Guichard, A., Roark, M., Ronshaugen, M., and Bier, E., Brother of rhomboid, a rhomboid-related gene expressed during early *Drosophila* oogenesis, promotes EGF-R/MAPK signaling, *Dev.Biol.* 226, 255-266, 2000; Urban, S., Lee, J.R., and Freeman, M., *Drosophila* rhomboid-1 defines a family of putative intramembrane serine proteases, *Cell* 107, 173-182, 2001; Urban, S., Lee, J.R., and Freeman, M., A family of Rhomboid intramembrane proteases activates all *Drosophila* membrane-tethered EGF ligands, *EMBO J.* 21, 4277-4286, 2002; Jaszai, J. and Brand, M., Cloning and expression of Ventrhold, a novel vertebrate homologue of the *Drosophila* EGF pathway gene rhomboid, *Mech.Dev.* 113, 73-77, 2002; Zhou, X.W., Blackman, M.J., Howell, S.A., and Carruthers, V.B., *Mol. Cell.Proteomics* 3, 565-576, 2004; Sik, A., Passer, B.J., Koonin, E.V., and Pellegrini, L., Self-regulated cleavage of the mitochondrial intramembrane-cleaving protease PARL yields Pbeta, a nuclear-targeted peptide, *J.Biol.Chem.* 279, 15323-15329, 2004; Kanaoko, M.M., Urban, S., Freeman, M., and Okada, K., An *Arabidopsis* Rhomboid homolog is an intermediate proteases in plants, *FEBS Lett.* 579, 5723-5728, 2005; Howell, S.A., Hackett, F., Johgco, A.M. et al., Distinct mechanisms govern proteolytic shedding of a key invasion protein in apicomplexan pathogens, *Mol.Microbiol.* 57, 1342-1356, 2005; Uban, S. and Wolfe, M.S., Reconstitution of intramembrane proteolysis *in vitro* reveals that pure rhomboid is sufficient for catalysis and specificity, *Proc.Natl.Acad.Sci.USA* 102, 1883-1888, 2005; Nakagawa, T., Guichard, A., Castro, C.P., et al., Characterization of a human rhomboid homolog, p100hRho/RHBDF1, which interacts with TGF-alpha family ligands, *Dev.Dyn.* 233, 1315-1331, 2005. Rhomboid also described a geometric shape such as a parallelogram or rhombus and, as such, has been used to describe intracellular crystal formation (Machhi, J., Kouzova, M., Komorowski, D.J. et al., Crystals of alveolar soft part sarcoma in a fine needle aspiration biopsy cytology smear. A case report, *Acta Cytol.* 46, 904-908, 2002; Duan, X., Bruneval, P., Hammadeh, R., et al., Metastatic juxtglomerular cell tumor in a 52-year old man, *Am.J.Surg.Pathol.* 28, 1098-1102, 2004; Stewart, C.J. and Spagnolo, D.V. Crystalline plasma cell inclusions in Helicobacter-associated gastritis, *J.Clin.Pathol.*, 59, 851-854, 2006. The term rhomboid is an anatomical term (Dong, H.W. and Swanson, L.W., Organization of axonal projections from the anterolateral area of the bed nuclei of the stria terminalis, *J.Comp.Neurol.* 468, 277-298, 2004).

## Riboswitch

A discrete RNA sequence in the leader sequences (UTR regions) of certain mRNAs which encode enzymes involved in metabolism. Earlier described as the *RFN* element (Gefland, M.A., Mironov, A.A., Jomantas, J., et al., A conserved RNA structure element involved in the regulation of bacterial riboflavin synthesis genes, *Trends Genet.* 15, 439-442, 1999). Riboswitches are conceptually similar to aptamers where there is specific binding of a ligand. Binding of a ligand to a specific riboswitch influences the expression of the cognate gene at both the transcriptional and translational level. See Winkler, W., Nahvi, A., and Breaker, R.R., Thiamine derivatives bind messenger RNAs directly to regulate bacterial gene expression, *Nature* 419, 952-956, 2002; Winkler, W.C., Cohen-Chalamish, S., and Breaker, R.R., An mRNA structure that controls gene expression by binding FMN, *Proc.Natl.Acad.Sci.USA* 99, 15908-15913, 2002; Sudarsan, N., Wickiser, J.K., Nakamura, S., et al., An mRNA structure in bacteria that controls

gene expression by binding lysine, *Gene Dev.* 17, 2688-2697, 2003; Nudler, E. and Mironov, A.S., The riboswitch control of bacterial metabolism, *Trends Biochem.Sci.* 29, 11-17, 2004; Batey, R.T., Gilbert, S.D., and Montange, R.K., Structure of a natural guanine-responsive riboswitch complexed with the metabolite hypoxanthine, *Nature* 432, 411-415, 2004; Winkler, W.C., Riboswitches and the role of noncoding RNAs in bacterial metabolic control, *Curr.Opin.Chem.Biol.* 9, 594-602, 2005.

Montange, R.K. and Batey, R.T., Structure of the S-adenosylmethionine riboswitch regulatory mRNA element, *Nature* 441, 1172-1175, 2006.

## Ring-Finger Proteins/Ring-Finger Domains

Ring-finger, which is related to zinc finger, describes a family of proteins defined a zinc-binding ring finger motif. This motif was first described in RING1 protein but occurs in a wide variety of proteins including proteins involved in Ubiquitinylation and c-Cbl oncoprotein. See Lovering, R., Hanson, I.M., Borden, K.L., *et al.*, Identification and preliminary characterization of a protein motif related to the zinc finger, *Proc.Natl.Acad.Sci.USA* 90, 2112-2116, 1993; Fremont, P.S., The RING finger. A novel protein sequence motif related to the zinc finger, *Ann.N.Y.Acad.Sci.* 684, 174-192, 1993; Hu, H.M., O'Rourke, K., Boguski, M.S., and Dixit, V.M., A novel RING finger protein interacts with the cytoplasmic domain of CD40, *J.Biol.Chem.* 269, 30069-30072, 1994; Borden, K.L. and Fremont, P.S., The RING finger domain: a recent example of a sequence-structure family, *Curr.Opin.Struct.Biol.* 6, 395-401, 1996; Smit, L. and Borst, J., The Cbl family of signal transduction molecules, *Crit.Rev.Oncol.* 8, 359-379, 1997; Jackson, P.K., Eldridge, A.G., Freed, E., *et al.*, The lore of the RINGs: substrate recognition and catalysis by ubiquitin ligases, *Trends Cell Biol.* 10, 429-439, 2000; Gregorio, C.C., Perry, C.N., and McElhinny, A.S., Functional properties of the titin/connectin-associated proteins, the muscle-specific RING finger proteins (MURFs), in striated muscle, *J.Muscle Res. Cell Motil.* 14, 1-12, 2006.

## RNA-induced silencing complex (RISC)

The functional complex formed from the interaction of interfering RNA (RNA interference, RNAi) from small interfering RNAs (siRNA) or microRNAs (miRNAs) with mRNA-protein (Argonaut protein) to form a complex which results in post-transcriptional gene silencing as a result of mRNA cleavage from the siRNA/miRNA. See Sontheimer, E.J., Assembly and function of RNA silencing complexes, *Nat.Rev.Mol.Cell Biol.* 6, 127-138, 2005; Tang, G., siRNA and miRNA: an insight into RISCs, *Trends Biochem.Sci.* 30, 106-114, 2005; Filipowicz, W., RNAi: the nuts and bolts of the RISC machine, *Cell* 122, 17-20, 2005; Hutvagner, G., Small RNA asymmetry in RNAi: function in RISC assemble and gene regulation, *FEBS Lett.* 579, 5850-5857, 2005; Hammond, S.M., Dicing and slicing: the core machinery of the RNA interference pathway, *FEBS Lett.* 579, 5822-5829, 2005; Gilmore, I.R., Fox, S.P., Hollins, A.J., and Akhtar, S., Delivery strategies for siRNA-mediated gene silencing, *Curr.Drug Deliv.* 3, 147-155, 2006.

## RNA Interference (RNAi)

The inhibition of gene transcription mediated through the production of small interfering RNA fragments (siRNA) and binding of these fragments and protein to messenger RNA. RNA interference is also referred to as RNA silencing. See Fire, A., Xu, S.,

Montgomery, M.K., *et al.*, Potent and specific genetic interference by double-stranded RNA in *Caenorhabditis elegans*, *Nature* 391, 806-811, 1998; Boshier, J.M., Dufourcq, P., Sookharea, S., and Labousse, M., RNA interference can target pre-mRNA: consequences for gene expression in a *Caenorhabditis elegans* operon, *Genetics* 153, 1245-1256, 1999; Tabara, H., Sarkissian, M., Kelly, W.G., *et al.*, The rde-1 gene, RNA interference, and transposon silencing in *C. elegans*, *Cell* 99, 123-132, 1999; Plasterk, R.H. and Ketting, R.F., The silence of the genes, *Curr.Opin.Genet. Dev.* 10, 562-567, 2000; Barstead, R., Genome-wide RNAi, *Curr. Opin.Chem.Biol.* 5, 63-33, 2001; Tuschli, T., RNA interference and small interfering RNAs, *Chembiochem* 2, 239-245, 2001; Baulcombe, D., RNA silencing, *Trends Biochem.Sci.* 30, 290-293, 2005; Filipowicz, W., Jaskiewicz, L., Kolb, F.A., and Pillai, R.S., Post-transcriptional gene silencing by siRNAs and miRNAs, *Curr.Opin.Struct.Biol.* 15,331-341, 2005; Shearwin, K.E., Callen, B.P., and Egan, J.B., Transcriptional interference-a crash course, *Trends Genet.* 21, 339-345, 2005; Sarov, M., and Stewart, A.F., The best control for the specificity of RNAi, *Trends Biotechnol.* 23, 446-448, 2005; Collins, R.E. and Cheng, X., Structural domains in RNAi, *FEBS Lett.* 579, 541-5849, 2005; Zamore, P.D. and Haley, B., Ribo-genome: the big world of small RNAs, *Science* 309, 1519-1524, 2005; Yeung, M.L., Bennasser, Y., Le, S.Y., and Jeang, K.T., siRNA, miRNA, and HIV: promises and challenges, *Cell.Res.* 15, 935-946, 2005; Fanning, G.C. and Symonds, G., Gene-expressed RNA as a therapeutic: issues to consider, using ribozymes and small hairpin RNA as specific examples, *Handb.Exp.Pharmacol.* (173), 289-303, 2006; *RNA Silencing. Methods and Protocols*, ed. G.C. Carmichael, Humana Press, Totowa, NJ, USA, 2005; Galun, E., *RNA Silencing*, World Scientific Publishing, Pte, Ltd, Singapore, 2005.

## RNA Isolation ("tri-reagents")

Study of gene expression can involve the isolation of mRNA from cells and tissues for analysis by microarray technology, RT-PCR, and northern blot analysis. A variety of approaches are involved including the treatment of water with diethylpyrocarbonate (ethoxyformic anhydride), the use of RNase inhibitors and various extraction technologies having the prefix "tri" such as Tri Reagent<sup>®</sup> and TRIzol<sup>®</sup>. These reagents use a solution of guanidine isothiocyanate and phenol (see Chomczynski, P. and Sacchi, N., Single-step method of RNA isolation by acid guanidinium thiocyanate-phenol-chloroform extraction, *Anal. Biochem.* 162, 156-159, 1987) for extraction of cells and tissue followed by a phenol extraction which yields an aqueous phase with RNA. A variety of other technologies are available and there are several excellent comparative studies. See Verhofstede, C., Fransen, K., Marissens, D., *et al.*, Isolation of HIV-1 RNA from plasma: evaluation of eight different extraction methods, *J.Virol.Methods* 60, 155-159, 1996; Chadderton, T., Wilson, C., Bewick, M., and Gluck, S., Evaluation of three rapid RNA extraction reagents: relevance for use in RT-PCR's and measurement of low level gene expression in clinical samples, *Cell.Mol.Biol.* 43, 1227-1234, 1997; Weber, K., Bolander, M.E., and Sarkar, G., PIG-B: a homemade monophasic cocktail for the extraction of RNA, *Mol.Biotechnol.* 73-77, 1998; Mannhalter, C., Koizar, D., and Mitterbauer, G., Evaluation of RNA isolation methods and reference genes for RT-PCR analyses of rare target RNA, *Clin. Chem.Lab.Med.* 38, 171-177, 2000; Deng, M.Y., Wang, H., Ward, G.B., Beckham, T.R., and McKenna, T.S., Comparison of six RNA extraction methods for the detection of classical swine

fever virus by real-time and conventional reverse transcription-PCR, *J.Vet.Diagn.Invest.* 17, 574-578, 2005; Culley, D.E., Kovacic, W.P., Jr., Brockman, F.J., and Zhang, W., Optimization of RNA isolation from the archaeobacterium *Methanosarcina barkeri* and validation for oligonucleotide microarray analysis, *J.Microbiol. Methods*, 67, 36-43, 2006. Prezeau, N., Silvy, M., Gabert, J., and Picard, C., Assessment of a new RNA stabilizing reagent (Tempus Glood RNA) for minimal residual disease in onco-hematology using the EAC-protocol, *Leuk.Res.* 30, 569-574, 2006.

## RNA Polymerase

The enzymes responsible for the biosynthesis of DNA-directed RNA synthesis. RNA polymerase is a nucleotide transferase that synthesizes RNA from ribonucleotides. In bacteria there is only one RNA polymerase (see Lathe, R., RNA polymerase of *Escherichia coli*, *Curr.Top.Microbiol.Immunol.* 83, 37-91, 1978); archaea also has a single RNA polymerase (Geiduschek, E.P. and Ouhammouch, M., Archaeal transcription and its regulators, *Mol. Microbiol.* 56, 1397-1407, 2005). Eukaryotic cells have three RNA polymerases: RNA polymerase I (polI) catalyzes the synthesis of ribosomal RNA species in the form of a precursor pre-rRNA (45S) which is processed into other species such as 28 S and 18S RNAs; RNA polymerase III (polIII) synthesizes tRNA (transfer RNAs) and other smaller RNA species. RNA polymerase II (polII) (Hahn, S. Structure and mechanism of the RNA polymerase II transcription machinery, *Nature Struct.Mol.Biol.* 11, 394-403, 2004) is responsible for the synthesis of the various pre-mRNAs (messenger RNAs) which mature into the mRNA species responsible for the direction of protein biosynthesis. Viral RNA polymerases appear to be different from other RNA polymerases and appear to be derived from DNA polymerases. See *RNA Polymerase*, ed. R. Losick and M. Chamberlin, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, USA, 1976; *Viral Polymerases and Related Proteins*, ed. L.C. Kuo and D.B. Olsen, Academic Press, San Diego, CA, 1996; Adhya, S.L., *RNA Polymerase and Associated Factors*, Academic Press, San Diego, CA, 1996; *Eukaryotic Gene Transcription*, ed. S. Goodbourn, IRL Press at Oxford University Press, Oxford, UK, 1996; Richter, J.D., *mRNA Formation and Function*, Academic Press, San Diego, CA, 1997; Borukhov, S. and Nudler, E., RNA polymerase holoenzyme: structure, function and biological implications, *Curr.Opin.Microbiol.* 6, 93-100, 2003; Murakami, K.S. and Darst, S.A., Bacterial RNA polymerases: the whole story, *Curr.Opin. Struct.Biol.* 13, 31-39, 2003; Studitsky, V.M., Walter, W., Kireev, M., et al., Chromatin remodeling by RNA polymerases, *Trends Biochem.Sci.* 29, 127-136, 2004; Bartlett, M.S., Determinants of transcription initiation by archaeal RNA polymerase, *Curr.Opin. Microbiol.* 8, 677-684, 2005; Boeger, H., Bushnell, D.A., Davis, R., et al., Structural basis of eukaryotic gene transcription, *FEBS Lett.* 579, 899-903, 2005; Gralla, J.D., *Escherichia coli* ribosomal RNA transcription: regulatory roles for ppGpp, NTPs, architectural proteins and a polymerase-binding protein, *Molec.Microbiol.* 55, 973-977, 2005; Banerjee, S., Chalissery, J., Bandey, I., and Sen, R., Rho-dependent transcription: more questions than answers, *J.Microbiol.* 44, 11-22, 2006.

## RNA Splicing

The removal of introns from the sequence of an mRNA following transcription to form an uninterrupted coding sequence. During this process, introns or intervening regions are removed and the remaining regions, exons, are joining together in a splicing process to form the mature RNA transcript. See Sharp, P.A.,

The discovery of split genes and RNA splicing, *Trends Biochem. Sci.* 30, 279-281, 2005; Matlin, A., Clark, F., and Smith, C.W., Understanding alternative splicing: toward a cellular code, *Nat. Rev.Mol.Cell.Biol.* 6, 386-398, 2005; Stetefeld, J. and Ruegg, M.A., Structural and functional diversity generated by alternative mRNA splicing, *Trends Biochem.Sci.* 30, 510-521, 2005.

## (RNase III) Ribonuclease III

A family of ribonucleases which are involved in RNA silencing or RNA interference. See Conrad, C. and Rauhut, R., Ribonuclease III: new sense from nuisance, *Int.J.Biochem.* 34, 116-129, 2002.

## Rolling

The initial interaction between a leukocyte and the endothelium; also known as margination.

## RTX Toxins

RTX family of bacterial toxins are a group of cytolysins and cyto-toxins. Hemolysin (HlyA) is often quoted as the model for RTX toxins. See Coote, J.G., Structural and functional relationship among the RTX toxin determinants of Gram-negative bacteria, *FEMS Microbiol.Rev.* 8, 137-161, 1992.

## S100 Proteins

A multifunctional family of intracellular proteins distinguished by solution in saturated ammonium sulfate (100% saturation) and their interactions with calcium ions. The seminal member of the family, S100 protein, was described as protein unique to the nervous system. See Moore, B.W., A soluble protein characteristic of the nervous system, *Biochem.Biophys.Res.Communic.* 19, 739-744, 1965; Donato, R., Perspectives in S-100 protein biology, *Cell Calcium* 12, 713-726, 1991; Passey, R.J., Xu, K., Hume, D.A., and Geczy, C.L., S100A8: emerging functions and regulations, *J.Leukocyte Biol.* 66, 549-556, 1999; Heizmann, C.W., The multifunctional S100 protein family, *Methods Mol.Biol.* 172, 69-80, 2002; Emberley, E.D., Murphy, L.C. and Watson, P.H., S100 proteins and their influence on pro-survival pathways in cancer, *Biochem.Cell Biol.* 82, 508-515, 2004.

## Saposins

Sphingolipid activator proteins; small heat-stable proteins which appear to be cofactors in the hydrolysis of sphingolipids. There are four saposins, A,B,C, and D, which are generated from a common precursor, prosaposin - Vaccaro, A.M., Salvioli, R., Tatti, and Ciaffoni, F., Saposins and their interactions with lipids, *Neurochemical Res.* 24, 307-314, 1999.

## Scaffold

In combinatorial chemistry or parallel synthetic strategy, the common platform which serves the core for synthesis of individual scaffold family members; also the matrix for tissue development such as bone. See Hosse, R.J., Rothe, A., and Power, B.E., A new generation of protein display scaffolds for molecular recognition, *Protein Science* 15, 14-27, 2006; Hammond, J.S., Beckingham, I.J., and Shakesheff, K.M., Scaffolds for liver tissue engineering, *Expert Rev.Med.Devices* 3, 21-27, 2006; Hollister, S.J., Porous scaffold design for tissue engineering, *Nat.Mater.* 4,

518-524, 2005; Li, C., Vepari, C., Jin, H.J., Kim, H.J., and Kaplan, D.L., Electrospun silk-BMP-2 scaffolds for bone tissue engineering, *Biomaterials*, 2006; van Lieshout, M.I., Vaz, C.M., Rutten, M.C., Peters, G.W., and Baaijens, F.P., Electrospinning versus knitting: two scaffolds for tissue engineering of the aortic valve, *J.Biomater.Sci.Polym.Ed.* 17, 77-89, 2006.

## Scattering

As in light scattering. Scattering may be elastic where energy is conserved and the scattered electromagnetic waves are of the same frequency as the incident electromagnetic radiation; the frequency of the scattered radiation is different from the incident radiation, the scattering is inelastic. Reflection and refraction are types of light scattering. Turbidimetry and nephelometry are applications of light scattering. Raman spectroscopy is an example of inelastic light scattering.

## Sec-dependent

Secretory protein translocation. See Sec-dependent protein translocation across biological membranes. Evolutionary conservation of an essential protein transport pathway, *Molec.Membrane Biol.* 22, 17-28, 2005.

## Secretase

The term secretase is used to describe those proteolytic activities involved in the processing of amyloid precursor protein (APP) to yield the soluble circulating amyloid protein. See Stephens, B.J. and Austen, B.M., Characterization of beta-secretase, *Biochem.Soc.Trans* 26, 500-504, 1998; Wolfe, M.S., Secretase targets for Alzheimer's disease: identification and therapeutic potential, *J.Med.Chem.* 44, 2039-2060, 2001; Vassar, R., The beta-secretase, BACE: a prime target for Alzheimer's disease, *J.Mol.Neurosci.* 17, 157-170, 2001; Hooper, N.M. and Turner, A.J., The search for alpha-secretase and its potential as a therapeutic approach to Alzheimer's disease, *Curr.Med.Chem.* 9, 1107-1119, 2002; Pollack, S.J. and Lewis, H., Secretase inhibitors for Alzheimer's disease: challenges of a promiscuous protease, *Curr.Opin.Invest. Drugs* 6, 35-47, 2005. There is a more general definition as a secretase as a "shedase" responsible for the proteolysis of type I and type II membrane proteins (Hooper, N.M., Karran, E.H., and Turner, A.J., Membrane protein secretases, *Biochem. J.* 321, 265-279, 1997; Wolfe, M.S., and Kopan, R., Intramembrane proteolysis, *Science* 305, 1119-1123, 2004; The term secretase has been used to describe the activity responsible for the release of TNF from membranes; (Mezyk, R., Browska, M., and Bereta, J., Structure and functions of tumor necrosis factor-alpha converting enzyme, *Acta Biochim.Pol.* 50, 625-645, 2003). There is a relationship between ADAM proteases and secretases (Fahrenholz, F., Gilbert, S., Kojro, E., et al., Alpha-secretase activity of the disintegrin metalloprotease ADAM 10. Influence of domain structure, *Ann.N.Y.Acad.Sci.* 920, 215-222, 2000; Higashiyama, S. and Nanba, D., ADAM-mediated ectodomain shedding of HB-EGF in receptor cross-talk, *Biochim.Biophys.Acta* 1751, 111-117, 2005) See also Gamma( $\gamma$ )-secretase.

## Selectivity and Selectivity Factor

The discrimination shown by a compound in reacting with two or more position on the same compound or several compounds It is quantitatively expressed by ratios of rate constants of the

competing reactions, or by the decadic logarithms of such ratios. It also refers to the differential affinity of compounds to a chromatographic matrix. Chromatographic selectivity is a determining factor in resolution; it is noted that the use of selectivity is discouraged in favor of the use of the term separation factors.

## SELDI

Surface-enhanced laser/desorption ionization mass spectrometry; ProteinChip<sup>®</sup>: Tang, N., Tornatore, P., and Weinberger, S.R., Current developments in SELDI affinity technology, *Mass Spectrom.Rev.* 23a, 34-44, 2004.

## SELEX

Systematic evolution of nucleic acid ligands (aptamers) by exponential enrichment. This represents an approach to the development of nucleic acid ligands for affinity chromatography and therapeutic aptamers by selection from combinatorial oligonucleotide libraries directed against a putative target. See Klug, S.J. and Famulok, M., All you wanted to know about SELEX, *Mol.Biol.Rep.* 20, 97-107, 1994; Joyce, G.J., In vitro evolution of nucleic acids, *Curr.Opin.Struct.Biol.* 4, 331-336, 1994; Gold, L., Brown, D., He, Y., et al., From oligonucleotide shapes to genomic SELEX: novel biological regulatory loops, *Proc.Natl.Acad.Sci.USA* 94, 59-64, 1997; Jayasena, S.D., Aptamers: an emerging class of molecules that rival antibodies in diagnostics, *Clin.Chem.* 45, 1628-1650, 1999; Clark, S.L. and Remcho, V.T., Aptamers as analytical reagents, *Electrophoresis* 23, 1335-1340, 2002; Tuerk, C. and Gold, L., Systematic evolution of ligands by exponential enrichment: RNA ligands to bacteriophage T4 DNA polymerase, *Science* 249, 505-510, 1990; Liu, J. and Stormo, G.D., Combining SELEX with quantitative assays to rapidly obtain accurate models of protein-DNA interactions, *Nuc.Acid Res.* 33, e141, 2005; Guthrie, J.W., Hamula, C.L., Zhang, H., et al., Assays for cytokines using aptamers, *Methods* 39, 324-330, 2006; Ulrich, H., RNA aptamers: from basic science towards therapy, *Handb.Exp. Pharmacol.* (173), 305-326, 2006.

## Separase

A regulatory protease which initiates the metaphase-anaphase transition by cleavage of the Sec1 subunit of cohesion, a chromosomal protein complex. This is process which is regulated by shugoshin ("guardian spirit"). See Yanagida, M., Cell cycle mechanisms of sister chromatid separation: roles of Cut1/separin and Cut2/securin. *Genes Cells* 5, 1-8, 2000; Amon, A., Together until separin do us part, *Nat.Cell Biol.* 3, E12-E14, 2001; Uhlmann, F., Secured cutting: controlling separase at the metaphase to anaphase transition, *EMBO Rep.* 2, 487-492, 2001; Hearing, C.H. and Nasmyth, K., Building and breaking bridges between sister chromatids, *Bioessays* 25, 1178-1191, 2003; Uhlmann, F., The mechanism of sister chromatid cohesion, *Exp.Cell Res.* 296, 80-85, 2004; Watanabe, Y. and Kitajima, T.S., Shugoshin protects cohesion complexes at centromeres, *Philos Tran. R Soc. Lond.B.Biol.Sci.* 360, 515-521, 2005; Watanabe, Y., Shugoshin: guardian spirit at the centromere, *Curr.Opin.Cell Biol.* 17, 590-595, 2005.

## Separation Factor

Designated by the term  $\alpha$  and refers to the relative affinity of two components for a chromatographic matrix and related to the resolution. By definition the separation factor is larger than 1 and

could be described by the following expression;  $\alpha = t_2/t_1$  where  $t_2$  is the elution time for the apex of the more slowly moving solute and  $t_1$  is the elution time for the apex of the more rapidly moving solute. See Chen, Y., Kele, M., Quinones, I., Sellergren, B., and Guiochon, G., Influence of the pH on the behavior of an imprinted polymeric stationary phase – supporting evidence for a binding site model, *J.Chromatog.A* 927, 1-17, 2001; Avramescu, M.E., Borneman, Z., and Wessling, M., Mixed-matrix membrane adsorbers for protein separation, *J.Chromatog.A* 1006, 2003; Ziomek, G., Kaspereit, M., Jezowski, J., Seidel-Morgenstern, A., and Antos, D., Effect of mobile phase composition on the SMB processes efficiency. Stochastic optimization of isocratic and gradient operation, *J.Chromatog.A* 1070, 111-124, 2005; Lesellier, E. and Tchaplal, A., A simple subcritical chromatographic test for an extended ODS high performance liquid chromatography column classification, *J.Chromatog.A* 1100, 45-59, 2005; Lapointe, J.F., Gauthier, S.F., Pouliot, Y. and Bouchard, C., Selective separation of cationic peptides from a tryptic hydrolyzate of beta-lactoglobulin by electrofiltration, *Biotechnol.Bioeng.* 94, 223-233, 2006.

## SERCA

Sarcoplasmic reticulum Ca<sup>2+</sup> ATPase, responsible for calcium ion transport. See Martonosi, A.N., and Pikula, S., The structure of the Ca<sup>2+</sup>-ATPase of sarcoplasmic reticulum, *Acta Biochim. Pol.* 50, 337-365, 2003; Strehler, E.E. and Treiman, M., Calcium pumps of plasma membrane and cell interior, *Curr.Mol.Med.* 4, 323-335, 2004.

## SEREX

Serological identification of antigens by recombinant expression cloning; see Sahin, U., *et al.*, Human neoplasms elicit multiple specific immune responses in the autologous host, *Proc.Natl.Acad. Sci.USA* 92, 11810-11813, 1995; Chen, Y.-T., *et al.*, A testicular antigen aberrantly expressed in human cancers detected by autologous antibody screening, *Proc.Natl.Acad.Sci. USA*, 94, 1914-1918, 1997; Fernandez, M.F., *et al.*, Improved approach to identify cancer-associated autoantigens, *Autoimmun. Rev.* 4, 230-235, 2005. [www.licr.org/SEREX.html](http://www.licr.org/SEREX.html); [www2.licr.org/CancerImmunomeDB/](http://www2.licr.org/CancerImmunomeDB/).

## Serial Lectin Affinity Chromatography

The use of a series of two or more lectin affinity chromatography columns of known specificity for the fractionation of oligosaccharides, glycoproteins, or glycopeptides into structurally distinct groups. See Cummings, R.D. and Kornfeld, S., Fractionation of asparagine-linked oligosaccharides by serial lectin-agarose affinity chromatography. A rapid, sensitive, and specific technique, *J.Biol.Chem.* 257, 11235-11240, 1982; Qiu, R. and Regnier, F.E., Comparative glycoproteomics of N-linked complex-type glycoforms containing sialic acid in human serum, *Anal.Chem.* 77, 7275-7281, 2005.

## Serpin

A term now in own right. It was developed as an acronym for serine protease inhibitor (Carroll, R.W. and Travis, J.,  $\alpha$ -1-antitrypsin and the serpins: variation and countervariation, *Trends Biochem. Sci.* 10, 20-24, 1985). It is considered to be a structurally homologous superfamily (Hunt, L.T. and Dayhoff, M.O., A surprising new protein superfamily containing ovalbumin, antithrombin-III,

and  $\alpha$ 1-proteinase inhibitor, *Biochem.Biophys.Res.Comm.* 95, 864-871, 1980) of proteins having masses in the range of 40 kDa to 100 kDa. See Gettins, P., Patson, P.A., and Schapira, M., The role of conformational change in serpin structure and function, *Bioessays* 15, 461-467, 1993; Schulze, A.J., Huber, R., Bode, W., and Engh, R.A., Structural aspects of serpin inhibition, *FEBS Lett.* 344, 117-124, 1994; Potempa, J., Korzus, E. and Travis, J., The serpin superfamily of proteinase inhibitors: structure, function, and regulation, *J.Biol.Chem.* 269, 15957-15960, 1994; Lawrence, D.A., The role of reactive-center loop mobility in the serpin inhibitory mechanism, *Adv.Exp.Med.Biol.* 425, 99-108, 1997; Whisstock, J., Skinner, R. and Lesk, A.M., An atlas of serpin conformations, *Trends Biochem.Sci.* 23, 63-67, 1998; Gettins, P.G., Serpin structure, mechanism, and function, *Chem.Rev.* 102, 4751-4804, 2002; Huntington, J.A., Shape-shifting serpins – advantages of a mobile mechanism, *Trends Biochem.Sci.* 31, 427-435, 2006.

## Shot Gun Proteomics

Identification of peptides (usually by mass spectrometry) obtained by the enzymatic or chemical digestion of the entire proteome.

A naturally occurring protein mixture such as cell extract, blood plasma or other biological fluid is reduced, alkylated, and subjected to tryptic hydrolysis. The tryptic hydrolysis is fractionated by liquid chromatography and analyzed by mass spectrophotometry: Wolters, D.A., Washburn, M.P., and Yates, J.R., III, An automated multidimensional protein identification technology for shotgun proteomics, *Anal.Chem.* 73, 5683-5690, 2001; Liu, H., Sadygov, R.G., and Yates, J.R., III, A model for random sampling and estimation of relative protein abundance in shotgun proteomics, *Anal.Chem.* 76, 4193-4201, 2004.

## Shugoshin

A protein family having a role in the centromeric protection of cohesion; protects the centromeric cohesion at meiosis I by inhibiting the action of separase on cohesion. See Kitajima, T.S., Kawashima, S.A., and Watanabe, Y., The conserved kinetochore protein shugoshin protects centromeric cohesion during meiosis, *Nature* 427, 510-517, 2005; Salic, A., Waters, J.C., and Mitchison, T.J., Vertebrate shugoshin links sister centromere cohesion and kinetochore microtubule stability in mitosis, *Cell* 118, 567-578, 2004; Goulding, S.E. and Earnshaw, W.C., Shugoshin: a centromeric guardian senses tension, *Bioessays* 27, 588-591, 2005; Watanabe, Y., Shugoshin: guardian spirit at the centromere, *Curr. Opin.Cell.Biol.* 17, 590-595, 2005; Stemmann, O., Boos, D., and Gorr, I.H., Rephrasing anaphase: separase FEARS shugoshin, *Chromosoma* 113, 409-417, 2005; Mcgee, P., Molecular biology: chromosome guardian on duty, *Nature* 441, 35-37, 2006.

## Sigma Factor

A factor which binds to RNA polymerase and provides specificity for the transcriptional process. It also provides for DNA strand separation during the transcriptional process. Sigma factors could be considered to be subunits of the RNA polymerase enzyme. See Kazmierczak, M.J., Wiedmann, M., and Boor, K.J., Alternative sigma factors and their roles in bacterial virulence, *Microbiol. Mol.Biol.Rev.* 69, 527-543, 2005; Mooney, R.A., Darst, S.A., and Landick, R., Sigma and RNA polymerase: an on-again, off-again relationship? *Mol.Cell.* 20, 335-345, 2005; Kill, K., Binnewies, T.T., Sicheritz-Ponten, T., *et al.*, Genome update: sigma factors in 240 bacterial genomes, *Microbiology* 151, 3147-3150, 2005;

Wigneshweraraj, S.R., Burrows, P.C., Bordes, P., *et al.*, The second paradigm for activation of transcription, *Prog.Nucl.Acids Res.Mol. Biol.* 79, 339-369, 2005.

## Signalosome

An endosome with an active signaling component which is transported to a juxtannuclear position; Perret, E., Lakkaraju, A., Deborde, S., Schreiner, R., and Rodriguez-Boulan, E., *Curr.Opin. Cell Biol.* 17, 423-434, 2005.

## Signal Recognition Particle

A targeting chaperone involved in the transmembrane transport of proteins; involves the recognition of the signal peptide. See Pool, M.R, Signal recognition particles in chloroplasts, bacteria, yeast, and mammals, *Molec.Membrane Biol.* 22, 3-15, 2004.

## Signature Domain

An amino acid sequence which is closely conserved within a group of proteins and is considered unique to that group of proteins which is also called a protein family. The sequences may or may not have homologous function (see Khuri, S., Bakker, F.T., and Dunwell, J.M., Phylogeny, function, and evolution of the cupins, a structurally conserved, functionally diverse superfamily of proteins, *Mol.Biol.Evolution* 18, 593-605, 2001). In this sense, the use of the term signature is related to historical use of this term to describe a physical property or feature of a plant or other natural object as an indication of pharmacological impact because of relation of such feature to the body part (see *Oxford English Dictionary*, Oxford University Press, Oxford, United Kingdom, 1989; Webster's Third International Dictionary, Unabridged, 1996). One of the most studied example is the C1q domain (See Bérubé, N.G., Swanson, X.H., Bertram, M.J., *et al.*, Cloning and characterization of CRE, a novel C1q-related factor, expressed in areas of the brain involved in motor function, *Mol.Brain Res.* 63, 233-240, 1999; Kishore, U., Gaboriaud, C., Waters, P., *et al.*, C1q and tumor necrosis factor superfamily: modularity and versatility, *Trends Immunol.* 25, 551-561, 2004). For general considerations, see Tousidou, E., Nanopoulos, A., and Manolopoulos, Y., Improved methods for signature-tree construction, *The Computer Journal* 43, 301-314, 2000; Ye, Y. and Godzik, A., Comparative analysis of protein domain organization, *Genome Res.* 14, 343-353, 2004).

## Single-chain Fv fragment (scFv)

A synthetic (usually recombinant) peptide/protein composed of the V<sub>L</sub> and V<sub>H</sub> domains of an antibody linked by a peptide. It is relatively small (30 kDa) and as a single peptide chain is easily expressed in bacterial systems. It is possible to express the scFv inside the cell (intracellular expression) as intrabodies for analytical and therapeutic purposes. It also possible to increase the avidity of these engineered fragments by dimerization to form diabodies and higher order polymers. Also on occasion referred to as minibodies. See Pluckthun, A. and Pack, P., New protein engineering approaches to multivalent and bispecific antibody fragments, *Immuntechnology* 3, 93-105, 1997; Hudson, P.J. and Kortt, A.A., High avidity scFv multimers; diabodies and triabodies, *J.Immunol.Methods* 231, 177-189, 1999; de Graaf, M., van der Meulen-Mulleman, I.H., Pinedo, H.M., and Haisma, H.J., Expression of scFvs and scFv fusion proteins in eukaryotic cells,

*Methods Mol.Biol.* 178, 379-387, 2002; Lennard, S., Standard protocols for the construction of scFv libraries, *Methods Mol. Biol.* 178, 59-71, 2002; Lunde, E., Lauvrak, V., Rasmussen, I.B., *et al.*, Troybodies and pepbodies, *Biochem.Soc.Trans.* 30, 500-506, 2002; Leath, C.A., 3rd., Douglas, J.T., Curiel, D.T., and Alvarez, R.D., Single-chain antibodies: A therapeutic modality for cancer gene therapy, *Int.J.Oncol.* 24, 765-771, 2004; Visintin, M., Meli, G.A., Cannistraci, I., and Cattnaeo, A., Intracellular antibodies for proteomics, *J.Immunol.Methods* 290, 135-153, 2004; Lobato, M.N. and Rabbitts, T.H., Intracellular antibodies as specific reagents for function ablation: future therapeutic molecules, *Curr.Mol.Med.* 4, 519-528, 2004; Holliger, P. and Hudson, P.J. Methods* 254, 67-84, 2001.

## Small interfering RNA (siRNA)

A short-length double-stranded RNA (21-27 nucleotides in length) derived from intracellular double-stranded RNA by the action of specific endonucleases such as RNAse III (see Dicer, Drosha). The siRNA stimulates the cellular machinery to cut up messenger RNA thus inhibiting the process of transcription; this is process called knockdown. See Myers, J.W. and Ferrell, J.E., Jr., Silencing gene expression with Dicer-generated siRNA pools, in RNA Silencing. Methods and Protocols, ed. G.G. Carmichael, Humana Press, Totowa, New Jersey, Chapter 8, pp. 93-196, 2005; Aravin, A. and Tuschl, T., Identification and characterization of small RNAs involved in RNA silencing, *FEBS Lett.* 579, 5830-5840, 2005; Kim, V.N., Small RNAs: Classification, biogenesis, and function, *Molecules and Cells* 19, 1-15, 2005; Bass, B.L., Double-stranded RNA as a template for gene silencing, *Cell* 101, 235-238, 2000.

## Small temporal RNA

Messenger RNAs which are expressed only a specific stage in development and encode proteins involved in specific developmental timing events (see Moss, E.G., RNA interference: It's a small RNA world, *Current Biology* 11, R772-R775, 2001; Pasquinelli, A.E., Reinhart, B.J., Slack, R., *et al.*, Conservation of the sequence and temporal expression of *let-7* heterochronic regulatory RNA, *Nature* 408, 86-89, 2000).

## Small nuclear ribonucleoprotein (RNA plus protein) particle

Component of the spliceosome, the intron-removing apparatus in eukaryotic nuclei. See: Graveley, B.R., Sorting out the complexity of SR protein functions, *RNA* 6, 1197-1211, 2000; Will, C.L. and Luhrmann, R., Spliceosomal UsnRNP biogenesis, structure and function, *Curr.Opin.Cell Biol.* 13, 290-301, 2001; Turner, I.A., Norman, C.R., Churcher, M.J., and Newman, A.J., Roles of the U5 snRNP in spliceosome dynamics and catalysis, *Biochem.Soc. Trans.* 32, 928-931, 2004.

## Smart Probes

Usually a nucleic acid probe which emits a signal only when bound to a specific target. An example is a molecular beacon. See Stöhr, K., Häfner, B., Nolte, O., Wolfrum, J., Sauer, M., and Herten, D.-P., Species-specific identification of Mycobacterial 16S rRNA PCR amplicons using smart probes, *Anal.Chem.* 77, 7195-7203, 2005. There are other example of smart probes including proteins (Wunder, A., Tung, C.-H., Müller-Ladner, U., Weissleder, R., and Mahmood, U., In vivo imaging of protease activity in arthritis, A novel approach for monitoring treatment response, *Arthritis & Rheumatism* 50, 2459-2465, 2004) and chiral compounds (Tsukube, H. and Shinoda, S., Lanthanide complexes as smart CD probes for chirality sensing of biological substrates, *Enantiomer* 5, 13-22, 2000). "Smart" contrast reagents have also been developed for magnetic resonance studies (Lowe, M.P., Activated MR contrast reagents, *Curr.Pharm.Biotechnol.* 5, 519-528, 2004).

## SNARE Proteins

SNARE (soluble NSF attachment protein receptors) participate in eukaryotic membrane fusion. It is suggested that vesicle SNARE proteins fuse with target SNARE proteins during processes such as exocytosis. Most SNARE proteins have a C-terminal transmembrane domain, a substantial cytosolic domain, and a variable N-terminal domain (brevin domain, longin domain, YKT-domain, which regulate membrane fusion reactions. SNARE protein can be classified as Q-SNAREs or R-SNAREs depending on amino acid sequence homology. There are other classification systems as well. See Ferro-Novick, S. and Jahn, R., Vesicle fusion from yeast to man, *Nature* 370, 191-193, 1994; Rothman, J.E. and Warren, G., Implications of the SNARE hypothesis for intracellular membrane topology and dynamics, *Curr.Biol.* 4, 220-233, 1994; Morgan, A., Exocytosis, *Essays Biochem.* 30, 77-95, 1995; Burgoyne, R.D., Morgan, A., Barnard, A.J., Chamberlain, L.H., Glenn, D.E., and Kibble, A.V., SNAPs and SNAREs in exocytosis in chromaffin cells, *Biochem.Soc. Trans.* 24, 653-657, 1996; Wilson, M.C., Mehta, P.P., and Hess, E.J., SNAP-25, ensnared in neurotransmission and regulation of behavior, *Biochem.Soc. Trans.* 24, 670-676, 1996; Hya, J.C. and Scheller, R.H., SNAREs and NSF in targeted membrane fusion, *Curr.Opin.Cell Biol.* 9, 505-512, 1997; Pelham, H.R., SNAREs and the secretory pathway-lessons from yeast, *Exp.Cell Res.* 247, 1-8, 1997; Whiteheart, S.W., Schraw, T. and Matleeva, E.A., N-ethylmaleimide sensitive factor (NSF) structure and function, *Int.Rev.Cytol.* 207, 71-112, 2001; Hay, J.C., SNARE complex structure and function, *Exp.Cell Res.* 271, 10-21, 2001; Dietrich, L.E.P., Boedinghaus, C., LaGrassa, J.T., and Ungermann, C., Control of eukaryotic membrane fusion by N-terminal domains of SNARE proteins, *Biochim.Biophys.Acta* 1641, 111-119, 2003; Hong, W., SNAREs and traffic, *Biochim. Biophys.Acta* 1744, 493-517, 2005; Montecucco, C., Schiavo, G.

and Pantano, S., SNARE complexes and neuroexocytosis: how many, how close? *Trends Biochem.Sci.* 30, 367-372, 2005.

## Soft-Ionization

Ionization techniques such as fast atom bombardment (FAD), electrospray ionization (ESI), or matrix-assisted laser desorption/ionization (MALDI) that initiate the desorption and ionization of non-volatile thermally labile compounds such as proteins or peptides. See Fenn, J.B., Mann, M., Meng, C.K., *et al.*, Electrospray ionization for mass spectrometry of large biomolecules, *Science* 246, 64-71, 1989; Reinhold, V.N., Reinhold, B.B., and Costello, C.B., Carbohydrate molecular weight profiling, sequence, linkage, and branching data: ES-MS and CID, *Anal.Chem.* 67, 1772-1784, 1995; Griffiths, W.J., Jonsson, A.P., Liu, S., Rai, D.K. and Wang, Y., Electrospray and tandem mass spectrometry in biochemistry, *Biochem.J.* 355, 545-561, 2001; Schalley, C.A., Molecular recognition and supramolecular chemistry in the gas phase, *Mass Spectrom.Rev.* 20, 253-309, 2001; Kislinger, T., Humeny, A., and Pischetsrider, M., Analysis of protein glycation products by matrix-assisted laser desorption ionization time-of-flight mass spectrometry, *Curr.Med.Chem.* 11, 2185-2193, 2004; Laskin, J. and Futrell, J.H., Activation of large ions in FT-ICR mass spectrometry, *Mass Spectrom.Rev.* 24, 135-167, 2005; Bolbach, G., Matrix-assisted laser desorption/ionization analysis of non-covalent complexes: fundamentals and applications, *Curr.Pharm.Des.* 11, 2535-2537, 2005; Baldwin, M.A., Mass spectrometers for the analysis of biomolecules, *Methods Enzymol.* 402, 3-48, 2005.

## Somatic Hypermutation

The increased mutation in the variable region of immunoglobulin genes which allows for diversity of immune recognition. See Steele, E.J., Rothenfluh, H.S. and Both, G.W., Defining the nucleic acid substrate for somatic Hypermutation, *Immuno.Cell Biol.* 70, 129-144, 1992; Jacob, J., Miller, C. and Kelsoe, G., In situ studies of the antigen-driven somatic Hypermutation of immunoglobulin genes, *Immunol.Cell Biol.* 70, 145-152, 1992; George, J. and Clafin, L., Selection of B cell clones and memory B cells, *Semin.Immunol.* 4, 11-17, 1992; Neuberger, M.S. and Milstein, C.S., Somatic Hypermutation, *Curr.Opin.Immunol.* 7, 24-254, 1995; Hengstschlager, M., Maizels, N. and Leung, H., Targeting and regulation of immunoglobulin gene somatic Hypermutation and isotype switch recombination, *Prog.Nucleic Acid Res.Mol. Biol.* 50, 67-99, 1995; Steele, E.J., Rothenflug, H.S., and Blanden, R.V., Mechanism of antigen-driven somatic Hypermutation of rearranged immunoglobulin V(D)J genes in the mouse, *Immuno. Cell Biol.* 75, 82-95, 1997; Rajewsky, K., Clonal selection and learning in the antibody system, *Nature* 381, 751-758, 1996; Storb, U., Peters, A., Klotz, E., *et al.*, Cis-acting sequences that affect somatic hypermutation of Ig genes, *Immunol.Rev.* 162, 153-160, 1998; Neuberger, M.S., Ehrenstein, M.R., Klix, N. *et al.*, Monitoring and interpreting the intrinsic features of somatic Hypermutation, *Immunol.Rev.* 162, 107-116, 1998; Kuppens, R., Goossens, T., and Klein, U., The role of somatic Hypermutation in the generation of deletions and duplications in human Ig V region genes and chromosomal translocations, *Curr.Top.Microbiol. Immunol.* 246, 193-198, 1999; Harris, R.S., Kong, Q., and Maizels, N., Somatic Hypermutation and the three R's: repair, replication and recombination, *Mutat.Res.* 436, 157-178, 1999; Jacobs, H. and Bross, L., Towards an understanding of somatic hypermutation, *Curr.Opin.Immunol.* 13, 208-218, 2001; Seki, M., Gearhart, P.J., and Wood, R.D., DNA polymerases and somatic hypermutation

of immunoglobulin genes, *EMBO Rep.* 6, 1143-1148, 2005; Neuberger, M.S., Di Noia, J.M., Beale, R.C., *et al.*, Somatic hypermutation at A.T pairs: polymerase error versus dUTP incorporation, *Nat.Rev.Immunol.* 5, 171-178, 2005.

## Southern Blotting

The use of a complement oligonucleotide/polynucleotide to identify denatured DNA transferred by absorption from an agarose gel to another matrix, such as a nitrocellulose membrane. See Southern, E.M., Detection of specific sequences among DNA fragments separated by gel electrophoresis, *J.Mol.Biol.* 98, 503-517, 1975; Southern, E.M., Detection of specific sequences among DNA fragments separated by gel electrophoresis, 1975, *Biotechnology* 24, 122-139, 1992; Southern, E.M., Blotting at 25, *Trends Biochem.Sci.* 25, 585-588, 2000; Darbre, P.D., *Introduction to Practical Molecular Biology*, Wiley, Chichester, UK, 1988; Issac, P.G., *Protocols for Nucleic Acid Analysis by Nonradioactive Probes*, Humana, Totowa, New Jersey, USA, 1994; Darling, D.C. and Brickell, P.M., *Nucleic Acid Blotting; The Basics*, Oxford, Oxford, UK, 1994; Kelly, K.F., Southern Blotting, *Proc.Nutr.Soc.* 55, 591-597, 1996; Keichle, F.L., DNA technology in the clinical laboratory, *Arch.Pathol.Lab.Med.* 123, 1151-1153, 1999; Porchet, N. and Aubert, J.P., Southern blot analysis of large DNA fragments, *Methods Mol.Biol.* 125, 313-321, 2000; Voswinkel, J. and Gause, A., From immunoglobulin gene fingerprinting to motif-specific hybridization: advances in the analysis of B lymphoid clonality in rheumatic diseases, *Arthritis Res.* 4, 1-4, 2002; Wong, L.J. and Boles, R.G., Mitochondrial DNA analysis in clinical laboratory diagnostics, *Clin.Chim.Acta* 354, 1-20, 2005; Rose, M.G., Degar, B.A., and Berliner, N., Molecular diagnostics of malignant disorders, *Clin.Adv.Hematol.Oncol.* 2, 650-660, 2004.

## Southwestern Blotting

An analytical procedure used to identify the specific binding of a nucleic acid sequence to a protein which uses a technical approach similar to Southern Blot and Western Blot. A protein mixture is separated by electrophoresis and the resulting electrophoretograms is transferred to a PVDF membrane electrophoresis. The proteins are renatured on the membrane and a <sup>32</sup>P-labeled oligonucleotide probe of defined sequence is used to identify specific binding protein(s). Other labels such as cyanine dyes or fluorescein can be used for the oligonucleotide probe. See Zhu, Q., Andrisani, O.M., Pot, D.A., and Dixon, J.E., Purification and characterization of a 43-kDa transcription factor required for rat somatostatin gene expression, *J.Biol.Chem.* 264, 6550-6556, 1989; Ogura, M., Takatori, T., and Tsuru, T., Purification and characterization of NF-R1 that regulates the expression of the human multidrug resistance (MDR1) gene, *Nucleic Acids Res.* 20, 5811-5817, 1992; Kwast-Welfeld, J., de Belle, I., Walker, P.R., Whitfield, J.F., and Sikorska, M., Identification of a new cAMP response element-binding factor by southwestern blotting, *J.Biol.Chem.* 268, 19851-19855, 1993; Liu, Z. and Jacob, S.T., Characterization of a protein that interacts with the rat ribosomal gene promoter and modulates RNA polymerase I transcription, *J.Biol.Chem.* 269, 16618-16625, 1994; Handen, J.S. and Rosenberg, H.F., An improved method for Southwestern blotting, *Front.Biosci.* 2, c9-c11, 1997; Coffman, J.A. and Yuh, C.H., Identification of sequence-specific DNA binding proteins, *Methods Cell Biol.* 74, 653-675, 2004; Fedorov, A.V., Lukyanov, D.V., and Podgornaya, O.T., Identification of the proteins specifically binding to the

rat LINE1 promoter, *Biochem.Biophys.Res.Commun.* 340, 553-559, 2006. There is southwestern approach used for histochemistry (Hishikawa, Y., Damavandi, E., Izumi, S., and Koji, T., Molecular histochemical analysis of estrogen receptor alpha and beta expression in the mouse ovary: in situ hybridization and Southwestern histochemistry, *Med.Electron Microsc.* 36, 67-73, 2003) and for ELISA (Fukuda, I., Nishiumi, S., Yabushita, Y., *et al.*, A new southwestern chemistry-based ELISA for detection of aryl hydrocarbon receptor transformation: application to the screening of its receptor agonists and antagonists, *J.Immunol. Methods* 287, 187-201, 2004).

## Specific Heat

The amount of heat required to raise the temperature of one gram of a substance by 1°C; specific heat of water is one calorie (4.184 joule); **Heat of fusion** is the amount of thermal energy to melt one mole of a substance at the melting point; also referred to as latent heat of fusion, kcal/mole or kJ/mole. **Heat of vaporization** is the amount of energy required to convert one mole of a substance to vapor at the boiling point; also referred to as the latent heat of vaporization, kcal/mole or kJ/mole.

## Specificity

In assay validation, the ability of an assay to recognize a single analyte in a sample which might contain closely related species; for example, in DNA microarray assays, specificity would be the ability of a probe to bind to a unique target sequence and produce a signal proportional of the amount of that specific target sequence only. Also referred to as selectivity. In statistics, specificity is the proportion of negative tests to the total number of negative tests.

## Spectrometry/Spectroscopy

The interaction of electromagnetic radiation with materials including scattering, absorption, and emission. It does not include chemical effects such as bond formation or free radical formation. It does include some aspects of photochemistry which is a specialized form of energy transduction. See Campbell, I.D. and Dwek, R.A., *Biological Spectroscopy*, Benjamin Cummings, Menlo Park, California, USA, 1984; Stuart, B., *Infrared Spectroscopy*, John Wiley & Sons, Ltd., Chichester, United Kingdom, 2004.

## Spectrum

A pattern of emissions from a particle following the application of energy. The emissions may be in form of electromagnetic waves such as observed in spectroscopy or in the form of mass such as that observed in mass spectrometry.

## Sp1-like transcription factors

A family of zinc finger transcription factors in mammalian cells which binds to GC-rich promoter element. Originally described for SV40 virus. See Dynan, W.S. and Tjian, R., Isolation of transcription factors that discriminate between different promoters recognized by RNA polymerase II, *Cell* 32, 669-680, 1983; Lomberk, G. and Urrutia, R., The family feud: turning off Sp1 by Sp1-like KLF proteins, *Biochem.J.* 392, 1-11, 2005.

## Spliced-Leader Trans-Splicing

Spliced-leader trans-splicing is a process mediated by a spliceosome where a short RNA sequence derived from the 5'-end of a non-mRNA to an acceptor site (3'-splice acceptor site) on a pre-RNA molecule. As a result, a diverse group of mRNA molecules in an organism acquire a common 5'-sequence. This process does appear to occur in the same nuclear location as cis-splicing. See Murphey, W.J., Watkins, K.P., and Agabian, N., Identification of a novel Y branch structure as an intermediate in trypanosome mRNA processing: evidence for trans splicing, *Cell* 47, 517-525, 1986; Bruzik, J.P., Van Doren, K., Hirsh, D., and Steitz, J.A., Trans splicing involves a novel form of small nuclear ribonucleoprotein particles, *Nature* 335, 559-562, 1988; Layden, R.E. and Eisen, H., Alternate trans-splicing in *Trypanosoma equiperdum*: implication for splice site selection, *Mol.Cell.Biol.* 8, 1352-1360, 1988; Hastings, K.E.M., SL trans-splicing: easy come or easy go? *Trends Genet.* 21,240-247, 2005.

## Spliceosome

A complex of RNA and protein components which function to assist the process of RNA splicing in ribosomes. Prokaryote RNA mRNA is less complex than eukaryotic mRNA and are not subject to RNA splicing. Eukaryotic RNA species that participate in spliceosome function include U1, U2, U4, U5 and U6. These RNA species are rich in uridine which recognize species sequences at the 5' and 3' sites on the pre-mRNA. The regions between these specific sites is excised that the two remaining exons are joined together in the splicing process. See: Robash, M. and Seraphin, B., Who's on first? The U1 snRNP-5' splice site interaction and splicing, *Trends in Biochem.Sci.* 16, 187-190, 1991; Garcia-Blanco, M.A., Messenger RNA reprogramming by spliceosome-mediated RNA trans-splicing, *J.Clin.Invest.* 112, 474-480, 2003; Kramer, A., Frefoglia, F., Huang, C.J., Malhaupt, F., Nesic, D., and Tanackovic, G., Structure-function analysis of the U2 snRNP-associated splicing factor SF3a, *Biochem.Soc. Trans.* 33, 439-442, 2005.

## Splicing Silencer(s)

Weakly interacting *cis*- and *trans*- factors which repress constitutive and alternative splicing during mRNA processing. There are exonic splicing silencers (ESS) and intronic splicing silencers (ISS). Distinct from transcriptional silencing also known as transcriptional repression. See Staffa, A. and Cochrane, A., Identification of positive and negative splicing regulatory elements within the terminal tat-rev exon of human immunodeficiency virus type 1, *Mol.Cell.Biol.* 15, 4597-4605, 1995; Amendt, B.A., Si, Z.H., and Stoltzfus, C.M., Presence of exon splicing silencers with human immunodeficiency virus type 1 tat exon 2 and tat-rev exon 3: evidence for inhibition mediated by cellular factors, *Mol.Cell.Biol.* 15, 4606-4615, 1995; Chew, S.L., Baginsky, L., and Eperon, I.C., An exonic splicing silencer in the testes-specific DNA ligase III beta exon, *Nucleic Acids Res.* 28, 402-410, 2000; Puzzoli, U. and Sironi, M., Silencers regulate both constitutive and alternative splicing events in mammals, *Cell.Mol. Life Sci.* 62, 1579-1604, 2005; Paca-Uccaralertkun, S., Damgaard, C.K., Auewarakul, P., *et al.*, The effect of a single nucleotide substitution in the splicing silencer in the tat/rev intron on HIV type 1 envelope expression, *AIDS Res.Human Retroviruses* 22, 76-82, 2006.

## SR Family of Proteins

A family of phylogenetically conserved proteins which are essential cofactors in the splicing which occurs during the maturation of messenger RNA. SR proteins are essential for both constitutive and alternative splicing events. SR proteins are characterized by the presence of an N-terminal RNA recognition motif or motifs and a C-terminal region characterized by repeated arginine/serine residues. See Birney, E., Kumar, S., and Krainer, A.R., Analysis of the RNA-recognition motif and RS and RBB domains: conservation in metazoan pre-mRNA splicing factors, *Nuc.Acids Res.* 25, 503-5816, 1993; Ramchatesingh, J., Zahler, A.M., Neugebauer, K.M., Roth, M.B., and Cooper, T.A., A subset of SR proteins activates splicing of the cardiac troponin T alternative exon by direct interactions with an exonic enhancer, *Mol. Cell.Biol.* 15, 4898-4907, 1995; McNally, L.M. and McNally, M.T., SR protein splicing factors interact with the Rous sarcoma virus negative regulator of splicing elements, *J. Virol.* 70, 1163-1172, 1996; Katsarou, M.E., Papakyriakou, A., Katsaros, N., and Scorilas, A., Expression of the C-terminal domain of novel human SR-A1 protein: interaction with the CTD domain of RNA polymerase II, *Biochem.Biophys.Res. Commun.* 334, 61-68, 2005; Zahler, A.M., Purification of SR protein splicing factors, *Methods.Mol.Biol.* 118, 419-432, 1999; Sanford, J.R., Ellis, J., and Cáceres, J.F., Multiple roles of arginine/serine-rich splicing factors in RNA processing, *Biochem.Soc.Trans.* 33, 443-446, 2005; Rasheva, V.I., Knight, D., Borko, P., Marsh, K., and Frolov, M.V., Specific role of the SR protein splicing factors B52 in cell cycle control in *Drosophila*, *Mol.Cell.Biol.* 26, 3468-3477, 2006.

## Staining

A process by which contrast is introduced into a sample such as a tissue section or electrophoretograms. In positive staining, the item of interest is "staining" (absorbs the stain); in negative staining, the item of interest is unreactive and the background absorbs the stain.

## Standard Conditions (Standard State)

1 atm, 25°C (298°K)

## Standard Electrode Potential

The value ( $E^\circ$ ) for the standard electromotive force of a cell in which hydrogen under standard conditions is oxidized to hydrogen ions (solvated protons) at the left hand electrode. This value is used as a standard to measure electrode potentials.

## Standard Free Energy

A thermodynamic function designated G (After Walter Gibbs, frequently referred to as the Gibbs free energy). The change in G ( $\Delta G$ ) for a given reaction provides the information on the amount of energy derived from the reaction and is a product of the changes in enthalpy and entropy:  $\Delta G = \Delta H - T\Delta S$ . The standard free energy designated  $\Delta G^\circ$  indicates the values are those obtained for standard conditions.  $\Delta G$  is negative for a thermodynamically favorable reaction. See enthalpy and entropy.

## Stark Effect

The effect of an electrical field on the absorption/emission of spectra of a probe such as fluorescein or a coumarin derivative. It is derived from the interaction of the induced dipole(s) in the probe

interacting with the charged group. See Sitkoff, D., Lockhart, D.J., Sharp, K.A., and Honig, B., Calculation of electrostatic effects at the amino terminal of an  $\alpha$  helix, *Biophys.J.* 67, 2251-2260, 1994; Pierce, D.W. and Boxer, S.A., Stark effect spectroscopy of tryptophan, *Biophysical J.* 68, 1583-1591, 1995; Klymchenko, A.S., Avilov, S.V., and Demchenko, A.P., Resolution of Cys and Lys labeling of  $\alpha$ -crystallin with site-sensitive fluorescent 3-hydroxyflavone dye, *Anal.Biochem.* 329, 43-57, 2004.

## Statistical Power

The probability of detecting a true effect of a particular size; equal to 1-false negative rate. Power increases as the random error of a procedure decreases.

## Steroid Hormone Receptor (SHR)

Receptors for steroid hormones located in the nucleus. These are ligand-activated transcription factors. See Lavery, D.N. and McEwan, I.J., Structure and functions of steroid receptor AF1 transactivation domains: induction of active conformations, *Biochem. J.* 391, 449-464, 2005.

## Stochastic

Involving or containing random errors.

## Stochastic Process

A process consisting of a series of random variables ( $x_t$ ) where  $t$  assumes values in a certain range of  $T$ . *The Cambridge Dictionary of Statistics*, ed. B.S. Everitt, Cambridge University Press, Cambridge, United Kingdom, 1998.

## Structural Biology

Study of the secondary, tertiary, and higher structures of proteins in the proteome including but limited to the use of crystallography, nuclear magnetic resonance and electron microscopy. See Smith, C.U.M., *Molecular Biology: A Structural Approach*, MIT Press, Cambridge, MA, 1968; Devons, S., *Biology and the Physical Sciences*, Columbia University Press, New York, NY, 1969; Rhodes, D. and Schwabe, J.W., Structural biology. Complex behavior, *Nature* 352, 478-479, 1991; Riddihough, G., Structural biology. Picture an enzyme at work, *Nature* 362, 793, 1993; Diamond, R., *Molecular Structures in Biology*, Oxford University Press, Oxford, UK, 1993; *The Encyclopedia of Molecular Biology*, ed. J.C. Kendrew and E. Lawrence, Blackwell Science, Cambridge, MA, 1994; Waksman, G. and Caparon, M., *Structural Biology of Bacterial Pathogenesis*, ASM Press, Washington, DC, 2005; Weiner, S., Sagi, I., and Addadi, L., Structural biology. Choosing the crystallization path less traveled, *Science* 309, 1027-1028, 2005; Sundstrom, S. and Martin, N., *Structural Genomics and High Throughput Structural Biology*, Taylor & Francis, Boca Raton, FL, 2006; Chiu, W., Baker, M.L., and Almo, S.C., Structural biology of cellular machines, *Trends Cell Biol.* 16, 144-150, 2006; Aravind, L., Iyer, L.M., and Koonin, E.V., Comparative genomics and structural biology of the molecular innovations of eukaryotes, *Curr.Opin.Struct.Biol.* 16, 409-419, 2006.

## Structural Genomics

Focuses on the physical aspects of the genome through the construction and comparison of gene maps and sequences, as well as

gene discovery, localization, and characterization; determination of the three-dimensional structures of gene products using x-ray crystallography and NMR; known in a previous life as crystallography. See Bourne, P.E. and Weissig, H., *Structural Bioinformatics*, Wiley-Liss, Hoboken, NJ, 2003; Bernardi, G., *Structural and Evolutionary Genomics: Natural Selection in Genome Evolution*, Elsevier, Amsterdam, Netherland, 2004; Sundstrom, M. and Norin, M., *Structural Genomics and High Throughput Structural Biology*, Taylor & Francis, Boca Raton, FL, 2006. See also Kim, S.H., Shining a light on structural genomics, *Nat.Struct.Biol.* 5(Suppl), 643-645, 1998; Skolnick, J., Fetrow, J.S., and Kolinski, A., Structural genomics and its importance for gene function analysis, *Nat.Biotechnol.* 18, 283-287, 2000; Burley, S.K. and Bonnano, J.B., Structural genomics of proteins from conserved biochemical pathways and processes, *Curr.Opin.Struct.Biol.* 12, 383-391, 2002; Staunton, D., Owen, J., and Cambell, I.D., NMR and structural genomics, *Acc.Chem.Res.* 36, 207-214, 2003; Burley, S.K. and Bonanno, J.B., Structural genomics, *Methods Biochem.Anal.* 44, 591-612, 2003; Goldsmith-Fishman, S. and Honig, B., Structural genomics: computational methods for structure analysis, *Protein Sci.* 12, 1813-1821, 2003; Schmid, M.B., Seeing is believing: the impact of structural genomics on antimicrobial drug discovery, *Nat.Rev.Microbiol.* 2, 739-746, 2004; Lundstrom, K., Structural genomics of GPCRs, *Trends Biotechnol.* 12, 103-108, 2005; Chandonia, J.M. and Brenner, S.A., The impact of structural genomics: expectations and outcomes, *Science* 311, 347-351, 2006.

## Structural Proteomics

Study of the primary, secondary, and tertiary structure of the proteins in a proteome; functional predictions from primary structure. See Norin, M. and Sundstrom, M., Structural proteomics: developments in structure-to-function, predictions, *Trends Biotechnol.* 20, 79-84, 2002; Mylvagenam, S.E., Prahbakaran, M., Tudor, S.S., *et al.*, Structural proteomics: methods in deriving protein structural information and issues in data management, *Biotechniques March Suppl.*, 42-46, 2002; Sali, A., Glaseser, R., Earnest, T., and Baumeister, W., From words to literature in structural proteomics, *Nature* 422, 216-225, 2003; Lefkovits, I., Functional and structural proteomics: a critical appraisal, *J.Chromatog.B.Anal.Technol.Biomed.Life.Sci.* 787, 1-10, 2003; Smith, R.D., and Veenstra, T.D., *Proteome Characterization and Proteomics*, Academic Press, San Diego, CA, 2003; Kamp, R.M., and Calvete, J.J., *Methods in Proteome and Protein Analysis*, Springer, Berlin, 2004; Jung, J.W. and Lee, W., Structure-based functional discovery of proteins: structural proteomics, *J.Biochem.Mol.Biol.* 37, 28-34, 2004; Yakunin, A.F., Yee, A.A., Savchenko, A., *et al.*, Structural proteomics: a tool of genome annotation, *Curr.Opin.Chem.Biol.* 9, 42-48, 2004; Chan, K. and Fernandez, D., Patent prosecution in structural proteomics, *Assay Drug Dev.Technol.* 2, 313-319, 2004; Liu, H.L. and Hsu, J.P., Recent developments in structural proteomics for protein structure determination, *Proteomics* 5, 2056-2068, 2005; Vinarov, D.A. and Markley, J.L., High-throughput automated platform for nuclear magnetic resonance-based structural proteomics, *Expert Rev. Proteomics* 2, 49-55, 2005.

## SUMOylation

The modification of proteins with small ubiquitin-like modifier (SUMO). SUMO are ubiquitin-like proteins such as Rub1, Apg9, and Apg12 and are separate from ubiquitin domain proteins such as RAD23 and DSK2. Unlike modification with ubiquitin,

sumoylation does signal protein degradation but rather appears to enhance stability and/or specific transport. See Müller, S., Hoegge, C., Pyrowolakis, G., and Jenisch, S., SUMO, ubiquitin's mysterious cousin, *Nat.Rev.Molec.Cell Biol.* 2, 202-210, 2001; Watts, F.Z., SUMO modification of proteins other than transcription factors, *Semin.Cell Dev.Biol.* 15, 211-220, 2004; Gill, G., SUMO and ubiquitin in the nucleus: different functions, similar mechanisms?, *Genes Dev.* 18, 2046-2059, 2004; Navotchova, M., Budhiraja, R., Coupland, G., Eisenhaber, F. and Bachmair, A., SUMO conjugation in plants, *Planta* 220, 1-8, 2004; Bossis, G. and Melchior, F., Regulation of SUMOylation by reversible oxidation and SUMO conjugating enzymes, *Mol.Cell.* 21, 349-357, 2006.

## Surface Plasmon Resonance

A technique which uses affinity binding to measure analytes in solution. Conceptually surface plasmon resonance is related to other binding assays such as ELISA assays. In surface plasmon resonance, binding is measured by the increase in mass on a target probe which is bound to a surface. Frequently gold is the surface. Incident light is refracted from the surface and measured as reflectance (surface plasmon resonance). See also localized surface plasmon resonance. See Englebienne, P., Van Hoonacker, AS., and Verhas, M., Surface plasmon resonance: principles, methods and applications in biomedical sciences, *Spectroscopy* 17, 255-273, 2003; Smith, E.A. and Corn, R.M., Surface plasmon resonance imaging as a tool to monitor biomolecular interactions in an array based format, *Appl.Spectros.* 57, 320A-332A, 2003; Lee, J.H., Yan, Y., Marriott, G., and Corn, R.M., Quantitative functional analysis of protein complexes on surfaces, *J.Physiol.* 563, 61-71, 2005; Pehler, J., New methodologies for measuring protein interactions in vivo and in vitro, *Curr.Opin.Struct.Biol.* 15, 4-14, 2005; Buijs, J. and Franklin, G.C., SPR-MS in functional proteomics, *Brief Funct.Genomic Proteomic* 4, 39-47, 2005; Pattnaik, P., Surface plasmon resonance: applications in understanding receptor-ligand interaction, *Appl.Biochem. Biotechnol.* 126, 76-92, 2005; Homola, J., Vaisocherova, H., Dostalek, J., and Piliarik, M., Multi-analyte surface plasmon resonance biosensing, *Methods* 37, 26-36, 2005.

## Surface Tension

A phenomenon which occurs when two fluids are in contact with each other due to molecular attraction between molecules of the two liquids at the surface of separation.

## Surfactant

The term surfactant dates to the 1950's when it was developed as a shortened version of surface-active agent. Surfactants are amphipathic/amphiphilic molecules which tend to migrate to surfaces or interfaces in solutions (at equilibrium, the concentration of a surfactant is higher at the interface than the concentration in bulk solution). The term detergent is sometimes used interchangeably with surfactant; the purist might consider the term detergent to reflect on cleansing which is one of the several properties of surfactants. Surfactants can also be described as dispersing agents, emulsifiers, foaming agents, stabilizers, solubilizers or wetting agents depending on their performance activity and effect on final product. Surfactants can be divided into four broad chemical categories; anionic compounds such as soaps which are sodium salts of long-chain alkyl carboxylic acids (alkanoic acids); cationic compounds such as alkyl amine derivatives such as Triton™ RW;

amphoteric derivatives; and nonionic surfactants such as alkylphenol ethoxylates (Igepal™) and anhydrosorbitol esters (Tween derivatives). See *Kirk-Othmer Encyclopedia of Chemical Technology*, 3rd edn., Vol. 22, Wiley-Interscience, New York, NY, 1983. See also *Nonionic Surfactants*, ed. M.J. Schick, Marcel-Dekker, New York, New York, 1966; Attwood, D. and Florence, A.T., *Surfactant Systems: Their Chemistry, Pharmacy, and Biology*, Chapman and Hall, London, UK, 1983; Cross, J., *Anionic Surfactants Analytical Chemistry*, Marcel Dekker, New York, NY, 1998; van Oss, N.M., *Nonionic Surfactants Organic Chemistry*, Marcel Dekker, New York, NY, 1998; Holmberg, K., *Novel Surfactants Preparation, Applications, and Biodegradability*, Marcel Dekker, New York, NY, 1998; Kwak, J.C.T., *Polymer-Surfactant Systems*, Marcel Dekker, New York, NY, 1998; Hus, J.-P., *Interfacial Forces and Fields Theory and Applications*, Marcel Dekker, New York, NY, 1999; Pefferkorn, E., *Interfacial Phenomena in Chromatography*, Marcel Dekker, New York, NY, 1999; Myers, D., *Surfaces, Interfaces, and Colloid: Principles and Applications*, Wiley-VCH, New York, NY, 1999; Broze, G., *Handbook of Detergents*, Marcel Dekker, New York, NY, 1999; *Physical Properties of Lipids*, ed. A.G. Marangoni and S.S. Narine, Marcel-Dekker, New York, NY, 2002. Surfactants are used extensively in the solubilization of membranes and phospholipid (Lichtenberg, D., Robson, R. J., and Dennis, E.A., Solubilization of phospholipid by detergents. Structural and kinetic aspects, *Biochim.Biophys.Acta* 737, 285-304, 1983; Dennis, E.A., Micellization and solubilization of phospholipid by surfactants, *Adv.Colloid Interface Sci.* 26, 155-175, 1986; Silvius, J.R., Solubilization and functional reconstitution of biomembrane components, *Annu.Rev.Biophys. Biomol.Struct.* 21, 323-348, 1992; Henry, G.D. and Sykes, B.D., Methods to study membrane protein structure in solution, *Methods Enzymol.* 239, 515-535, 1994; Bowie, J.H., Stabilizing membrane proteins, *Curr.Opin.Struct. Biol.* 11, 397-402, 2001; Seddon, A.M., Curow, P., and Booth, B.J., Membrane proteins, lipids and detergents: not just a soap opera, *Biochim.Biophys. Acta* 1666, 105-117, 2004. Nonionic surfactants have an effect (drag reduction) on fluid flow at low concentrations (Jacobs, E.W., Anderson, G.W., Smith, C.A., et al., Drag reduction using high molecular weight fractions of poly-ethylene oxide, in *Drag Reduction in Fluid Flows. Techniques for Friction Control*, ed. R.H.J. Sellin and R.T. Moses, Ellis-Horwood, Chichester, NY, 1989; Drappier, J., Divoux, T., Amarouchene, Y., et al., Turbulent drag reduction by surfactants, *Europhysics Lett.* 74, 362-368, 2006).

## Surrogate Marker

A biomarker which can be used in place of a clinical indication for diagnosis or a clinical endpoint for prognosis; also referred to as surrogate endpoint. See Hilsenbeck, S.G. and Clark, G.M., Surrogate endpoints in chemoprevention of breast cancer: guidelines for evaluation of new biomarkers, *J.Cell.Biochem. Suppl.* 17G, 205-211, 1993; Morrish, P.K., How valid is dopamine transporter imaging as a surrogate marker in research trials on Parkinson's disease? *Mov.Disord.* 18, Suppl. 7, S63-70, 2003; Kluff, C., Principles of use of surrogate markers and endpoints, *Maturitas* 47, 293-298, 2004; Bowdish, M.E., Arcasoy, S.M., Wilt, J.S., et al., Surrogate markers and risk factors for chronic lung allograft dysfunction, *Am.J.Transplant.* 4, 1171-1178, 2004; Lieberman, R., Evidence-based medical perspectives: the evolving role of PSA for early detection, monitoring of treatment response, and as a surrogate end point of efficacy for intervention in men with different clinical risk states for the prevention and progression of prostate cancer, *Am.J.Ther.* 11, 501-506, 2004; Li, Z., Chines, A.A., and Meredith, M.P., Statistical validation of surrogate endpoints:

is bone density a valid surrogate for fracture? *J.Musculoskelet. Neuronal Interact.* 4, 64-74, 2004; Kantarci, K., and Jack, C.R., Jr., Quantitative magnetic resonance techniques as surrogate markers of Alzheimer's disease, *NeuroRx* 1, 196-205, 2004; Wier, C.J. and Walley, R.J., Statistical evaluation of biomarkers as surrogate endpoints: a literature review, *Stat.Med.* 25, 183-203, 2006.

## Synovial Fluid Synovial Proteome

The total protein content of synovial fluid; results obtained from the proteomic analysis of synovial fluid. See Dasuri, K., Antonovici, M., Chen, K., *et al.*, The synovial proteome: analysis of fibroblast-like synoviocytes, *Arthritis Res.Ther.* 6, R161-R168, 2004; Romeo, M.J., Espina, V., Lowenthal, M. *et al.*, CSF proteome: a protein repository for potential biomarker identification, *Expert. Rev.Proteomics* 2, 57-70, 2005; Hueber, W., Kidd, B.A., Tomooka, B.H., *et al.*, Antigen microarray profiling of autoantibodies in rheumatoid arthritis, *Arthritis Rheum.* 52, 2645-2655, 2005.

## Systems Biology

The integration of data at the genomic, transcriptomic, proteomic, and metabolomic levels including functional and structural data to understand biological function which can be described by a mathematical function. See Ideker, T., Galitski, T., and Hood, L., A new approach to decoding life: systems biology, *Annu.Rev.Genomics Hum.Genet.* 2, 343-372, 2001; Levesque, M.P. and Benfey, P.N., Systems biology, *Curr.Biol.* 14, R179-R189, 2004; Weston, A.D. and Hood, L.J., Systems biology, proteomics, and the future of health care: toward predictive, preventative, and personalized medicine, *J.Proteome Res.* 3, 179-196, 2004; Benner, S.A. and Ricardo, A., Planetary systems biology, *Mol.Cell.* 17, 471-472, 2005; Friboulet, A. and Thomas, D., Systems biology-an interdisciplinary approach, *Biosens.Bioelectron.* 20, 2404-2407, 2005; Aderem, A., Systems biology: its practices and challenges, *Cell* 121, 511-513, 2005; Theilgaard-Monch, K., Porse, B.T., and Borregaard, N., Systems biology of neutrophil differentiation and immune response, *Curr. Opin.Immunol.* 18, 54-60, 2006; Mustacchi, R., Hohmann, S., and Nielsen, J., Yeast systems biology to unravel the network of life, *Yeast* 23, 227-238, 2006; Baker, M.D., Wolanin, P.M., and Stock, J.B., Systems biology of bacterial chemotaxis, *Curr.Opin.Microbiol.* 9, 187-192, 2006; Philippi, S. and Kohler, J., Addressing the problems with life-science databases for traditional uses and systems biology, *Nat.Rev.Genet.* 7, 482-488, 2006; Palsson, B., *Systems Biology: Properties of Reconstructed Networks*, Cambridge University Press, Cambridge, UK, 2006; *Systems Biology: Definitions and Perspectives*, ed. L.Alberghina and H.V. Westerhoff, Springer, Berlin, 2005.

## Target of Rapomycin (TOR, mTOR)

A highly conserved serine/threonine kinase which is regulatory of cell growth which is target for immunosuppression in kidney transplantation with therapeutics such as sirolimus and everolimus. See Bestard, O., Cruzado, J.M., and Grinyo, J.M., Calcineurin-inhibitor-sparing immunosuppressive protocols, *Transplant Proc.* 37, 3729-3732, 2005; Mabasa, V.H. and Ensom, M.H., The role of therapeutic monitoring of everolimus in solid organ transplantation, *Ther.Drug.Monitor.* 27, 666-676, 2005; Dennis, P.B., Fumagalli, S., and Thomas, G., Target of rapamycin (TOR): balancing the opposing forces of protein synthesis and degradation, *Curr.Opin.Genet.Dev.* 9, 49-54, 1999; Hall, M.N., The TOR signaling pathway and growth control in yeast,

*Biochem.Soc.Trans.* 24, 234-239, 1996; Avruch, J., Lin, Y., Long, X., Murthy, S., and Ortiz-Vega, S., Recent advances in the regulation of the TOR pathway by insulin and nutrients, *Curr.Opin. Nutr.Metab.Care.* 8, 67-72, 2005; Abraham, R.T., TOR signaling: an odyssey from cellular stress to the cell growth machinery, *Curr.Biol.* 15, R139-R141, 2005; Cesareni, G., Ceol, A., Gavrilu, C., *et al.*, Comparative interactomics, *FEBS Lett.* 579, 1828-1833, 2005; Martin, D.E. and Hall, M.N., The expanding TOR signaling network, *Curr.Opin.Cell Biol.* 17, 158-166, 2005; Neuberger, J. and Jothimani, D., Long-term immunosuppression for prevention of nonviral disease recurrence, *Transplant.Proc.* 37, 1671-1674, 2005; dos Sarbassov, D., Ali, S.M., and Sabatini, D.M., Growing roles for the mTOR pathway, *Curr.Opin.Cell Biol.* 17, 596-603, 2005; Wullschlegel, S., Loewith, R., and Hall, M.N., TOR signaling in growth and metabolism, *Cell* 124, 471-484, 2006.

## Targeted Proteomics

Analysis of a defined portion of a proteome such as a glycoproteome, phosphoproteome, ribosomal proteins. See Knepper, M.A. and Masilamani, S., Targeted proteomics in the kidney using ensembles of antibodies, *Acta Physiol.Scand.* 173, 11-21, 2001; Warcheid, B. and Fenselau, C., A targeted proteomics approach to the rapid identification of bacterial cell mixtures by matrix-assisted laser desorption/ionization mass spectrometry, *Proteomics* 4, 2877-2892, 2004; Ecelbarger, C.A., Targeted proteomics using Immunoblotting technique for studying dysregulation of ion transporters in renal disorders, *Expert Rev. Proteomics* 1, 219-227, 2004; Immler, D., Greven, S., and Reinemer, P., Targeted proteomics in biomarker validation: detection and quantification of proteins using a multi-dimensional peptide separation strategy, *Proteomics* 6, 2947-2958, 2006.

## Telomerase

A ribonucleoprotein complex which catalyzes the synthesis of DNA at the ends of chromosomes and confers replicative immortality to cells. It is considered to be important in the growth of cancer cells and is a therapeutic target. See Blackburn, E.H., Greider, C.W., Henderson, E., *et al.*, Recognition and elongation of telomeres by telomerase, *Genome* 31, 553-560, 1989; Lamond, A.I., Tetrahymena telomerase contains an internal RNA template, *Trends Biochem.Sci.* 14, 202-204, 1989; Greider, C.W., Telomeres, telomerase and senescence, *Bioessays* 12, 363-369, 1990; Shippen-Lentz, D. and Blackburn, E.H., Functional evidence for an RNA template in telomerase, *Science* 247, 546-552, 1990; Romero, D.P. and Blackburn, E.H., A conserved secondary structure for telomerase RNA, *Cell* 67, 343-353, 1991; Greider, C.W., Telomerase and telomere-length regulation: lessons from small eukaryotes to mammals, *Cold Spring Harb.Symp.Quant.Biol.* 58, 719-723, 1993; Harley, C.B., Kim, N.W., Prowse, K.R., *et al.*, Telomerase, cell immortality, and cancer, *Cold Spring Harb.Symp.Quant. Biol.* 59, 307-315, 1994; Rhyu, M.S., Telomeres, telomerase, and immortality, *J.Natl.Cancer Inst.* 87, 884-894, 1995; Buchkovich, K.J., Telomeres, telomerase, and the cell cycle, *Prog.Cell Cycle Res.* 2, 187-195, 1996; Shay, J.W. and Wright, W.E., Use of telomerase to create bioengineered tissues, *Ann.N.Y.Acad.Sci.* 1057, 479-491, 2005; Flores, I., Benetti, R., and Blasco, M.A., Telomerase regulation and stem cell behavior, *Curr.Opin.Cell Biol.* 18, 254-260, 2006; Wirth, T., Kuhnel, F., and Kubicka, S., Telomerase-dependent gene therapy, *Curr.Mol.Med.* 5, 243-251, 2005; Hahn, W.C., Telomere and telomerase dynamics in human cells, *Curr. Mol.Med.* 5, 227-231, 2005; Blackburn, E.H., Telomeres and

telomerase: their mechanisms of action and the effects of altering their functions, *FEBS Lett.* 579, 859-862, 2005; Shin, J.S., Hong, A., Solomon, M.J., and Lee, C.S., The role of telomeres and telomerase in the pathology of human cancer and aging, *Pathology* 38, 103-113, 2006.

## Tetramer

Using a protein molecule containing four identical or non-identical subunits. In the case of non-identical subunits, the tetramer is frequently a dimer of dimers such as hemoglobin (Verzili, D., Rosato, N., Ascoli, F., and Chiancone, E., Aromatic amino acids and subunit assembly in the hemoglobins from *Scapharca inaequalis*; a fluorescence and Cd study of the apoproteins, *Biochim.Biophys.Acta.* 954, 108-113, 1988; Ackers, G.K. and Holt, J.M., Asymmetric cooperativity in a symmetric tetramer: human hemoglobin, *J.Biol.Chem.* 281,11441-11443, 2006) and MHC II receptors (Schafer, P.H., Pierce, S.K., and Jardetzky, T.S., The structure of MHC class II: a role for dimer of dimers, *Semin. Immunol.* 7, 389-398, 1995; Yadati, S., Nydam, T., Demian, D. *et al.*, Salt bridge residues between I-Ak dimer of dimers alpha-chains modulate antigen presentation, *Immunol.Lett.* 67, 47-55, 1999; Lindstedt, R., Monk, N., Lombardi, G., and Lechler, R., Amino acid substitutions in the putative MHC class II "dimer of dimers" interface inhibit CD4+ T cell activation, *J.Immunol.* 166, 800-808, 2001) although there are examples of tetrameric proteins such as lactose dehydrogenase where there can be varying subunit composition (Pesce, A., McKay, R.H., Stolzenbach, F., *et al.*, The comparative enzymology of lactic dehydrogenases. I Properties of the crystalline beef and chicken enzymes, *J.Biol. Chem.* 239, 1753-1761, 1964; Maekawa, M., Lactate dehydrogenase isoenzymes, *J.Chromatog.* 429, 373-398, 1988). See Kosaka, M., Iishi, Y., Okagawa, K., *et al.*, Tetramer Bence Jones protein in the immunoproliferative diseases. Angioimmunoblastic lymphadenopathy, primary amyloidosis, and multiple myeloma, *Am.J.Clin.Pathol.* 91, 639-646, 1989; Meissner, G., Ligand binding and cooperative interactions among the subunits of the tetrameric Ca<sup>2+</sup> release channel complex of sarcoplasmic reticulum, *Adv.Exp.Med.Biol.* 311, 277-287, 1992; Furey, W., Arjunan, P., Chen, L., *et al.*, Structure-function relationships and flexible tetramer assembly in pyruvate decarboxylase revealed by analysis of crystal structures, *Biochim.Biophys.Acta* 1385, 253-270, 1998; Grotzinger, J., Kerneback, T., Kallen, K.J., and Rose-John, S., IL-6 type cytokine receptor complexes: hexamer, tetramer or both? *Biol.Chem.* 380, 803-813, 1999; Kang, H.M., Choi, K.S., Kassam, G., *et al.*, Role of annexin II tetramer in plasminogen activation, *Trends Cardiovasc.Med.* 9, 92-102, 1999; Hamiche, A. and Richard-Foy, H., Characterization of specific nucleosomal states by use of selective substitution reagents in model octamer and tetramer structures, *Methods* 19, 457-464, 1999; Xu, X.N. and Sreaton, G.R., MHC/Peptide tetramer studies of T cell function, *J.Immunol.Methods* 268, 21-28, 2002; Zimmerman, A.L., Two B or not two B? ## Tetrose

A four-carbon monosaccharide including *meso*-erythritol (erythritol), *D*-erythrose, *L*-erythrulose, and *D*-threose. See Horecker, B.L., Smyrniotis, P.Z., Hiatt, H.H., and Marks, P.A., Tetrose phosphate and the formation of aldoheptulose diphosphate,

*J.Biol.Chem.* 212, 827-836, 1955; Batt, R.D., Dickens, F., and Williamson, D.H., Tetrose metabolism. 1. The preparation and degradation of specifically labelled [<sup>14</sup>C] tetroses and [<sup>14</sup>C] tetritols, *Biochem.J.* 77, 272-281, 1960; Taylor, G.A. and Ballou, C.E., *D*-Glycero-tetrol 1,4-diphosphate (*D*-erythrulose 1,4-diphosphate), *Biochemistry* 2, 553-555, 1963; Giudici, T.A. and Fluharty, A.L., A specific method for the determination of the aldotetroses, *Anal.Biochem.* 13, 448-457, 1965; Lai, C.Y., Martinez-de Dretz, G., Bacila, M., *et al.*, Labeling of the active site of aldolase with glyceraldehyde 3-phosphate and erythrose 4-phosphate, *Biochem.Biophys.Res.Comm.* 27, 665-672, 1968; Benov, L. and Fridovich, I., Superoxide dependence of the toxicity of short chain sugars, *J.Biol.Chem.* 273, 25741-25744, 1998; Lehman, T.D. and Ortwerth, B.J., Inhibition of advanced glycation end product-associated protein cross-linking, *Biochim.Biophys.Acta* 1535, 110-119, 2001; Chaput, J.C. and Szostak, J.W., TNA synthesis by DNA polymerases, *J.Am.Chem.Soc.* 125, 9274-9275, 2003; Kempeneers, V., Vastmans, K., Rozenski, J., and Herdewijn, P., Recognition of threosyl nucleotides by DNA and RNA polymerases, *Nucleic Acids Res.* 31, 6221-6226, 2003; Ichida, J.K., Zou, K., Horhota, A., *et al.*, An in vitro selection system for TNA, *J.Am.Chem.Soc.* 127, 2802-2803, 2005; Horhota, A., Zou, K., Ichida, J.K., *et al.*, Kinetic analysis of an efficient DNA-dependent TNA polymerase, *J.Am.Chem.Soc.* 127, 7427-7434, 2005; Wamelink, M.M., Struys, E.A., Huck, J.H., *et al.*, Quantification of sugar phosphate intermediates of the pentose phosphate pathway by LC-MS/MS: application to two new inherited defects of metabolism, *J.Chromatogr.B Analyt.Technol.Biomed.Life Sci.* 823, 18-25, 2005; Weber, A.L. and Pizzarello, S., The peptide-catalyzed stereospecific synthesis of tetroses: A possible model for prebiotic molecular evolution, *Proc.Natl.Acad.Sci.USA*, 103, 12713-12717, 2006.

## Theragnostic

As in theragnostic imaging described as the combined use of molecular and functional imaging to prescribe the distribution of radiations in three-dimensional space as a function of time in the process of radiation therapy. See Bentzen, S.M., Theragnostic imaging for radiation oncology: dose-painting by numbers, *Lancet Oncol.* 6, 112-117, 2005.

## Theranostics

The use of diagnostic laboratory tests to guide therapeutic outcomes. Current use has emphasized "real-time" PCR assays for the identification of pathogens. See Picard, F.J. and Bergeron, M.G., Rapid molecular theranostics in infectious disease, *Drug Discov.Today.* 7, 1092-1101, 2002.

## Therapeutic Equivalence (TE)

Drug products including biologics can be considered to be therapeutically equivalent if such products can be substituted for brand product/prescribed product/originator product with the full expectation that such substituted product will produce the same clinical effect and safety as the brand product/prescribed product/originator product. See Panhard, X. and Mentre, F., Evaluation by simulation of tests based on non-linear mixed-effects models in pharmacokinetic interaction and bioequivalence cross-over clinical trials, *Stat.Med.* 24, 1509-1524, 2005; Bolton, S., Bioequivalence studies for levothyroxine, *AAPS J.* 7, E47-E53, 2005; Meyer, M.C., United States Food and Drug Administration requirements for approval of generic drug products, *J.Clin.*

*Psychiatry* 62 Suppl 5, 4-9, 2001; Temple, R., Policy developments in regulatory approval, *Stat.Med.* 21, 2939-2048, 2002; Gould, A.L., Substantial evidence of effect, *J.Biopharm.Stat.* 12, 53-77, 2002; Chen, M.L., Patnaik, R., Hauck, W.W., *et al.*, An individual bioequivalence criterion: regulatory considerations, *Stat.Med.* 19, 2821-2842, 2000.

## Thermal Conductivity

Rate of heat transfer by conduction through unit thickness, across unit area for unit difference of temperature; measured as calories/second/cm<sup>2</sup>/cm (thickness) and a temperature difference of 1°C; unit is cal/cm sec °K or W/cm °K. See Harting, R. and Pfeiffenberger, U., Thermal conductivity of bovine and pig retina: an experimental study, *Grafes Arch.Clin.Exp.Ophthalmol.* 219, 290-291, 1982; Miller, J.H., Wilson, W.E., Swenberg, C.E. *et al.*, Stochastic model of free radical yields in oriented DNA exposed to densely ionizing radiation at 77K, *Int.J.Radiat.Biol.Relat.Stud.Phys. Chem.Med.* 53, 901-907, 1988; Arkin, H., Holmes, K.R., and Chen, M.M., A technique for measuring the thermal conductivity and evaluating the "apparent conductivity" concept in biomaterials, *J.Biomech.Eng.* 111, 276-282, 1989; Cheng, J., Shoffner, M.A., Mitchelson, K.R., *et al.*, Analysis of ligase chain reaction products amplified in a silicon-glass chip using capillary electrophoresis, *J.Chromatog.A* 732, 151-158, 1996; Bhattacharya, A. and Mahajan, R.L., Temperature dependence of thermal conductivity of biological tissues, *Physiol.Meas.* 24, 769-783, 2003; Rodriguez, I., Lesacherre, M., Tie, Y. *et al.*, Practical integration of polymerase chain reaction amplification and electrophoretic analysis in microfluidic devices for genetic analysis, *Electrophoresis* 24, 172-178, 2003.

## Thermophilic

Term used to describe an organism that grows at elevated temperatures which is described as thermophile. The most famous this bacteria (*Thermus aquaticus*) responsible for TAQ polymerase which is used in the PCR. See Friedman, S.M., Protein-synthesizing machinery of thermophilic bacteria, *Bacteriol.Rev.* 32, 27-38, 1968; Singleton, R., Jr. and Amelunxen, R.E., Protein from thermophilic microorganisms, *Bacteriol.Rev.* 37, 320-342, 1973; Lasa, I. and Berenguer, J., Thermophilic enzymes and their biotechnology potential, *Microbiologica* 9, 77-89, 1993; Kelly, R.M., Peeples, T.L., Halio, S.B., *et al.*, Extremely thermophilic microorganisms. Metabolic strategies, genetic characteristics, and biotechnological potential, *Ann.N.Y.Acad.Sci.* 745, 409-425, 1994; Russell, R.J. and Taylor, G.L., Engineering thermostability: lessons from the thermophilic proteins, *Curr.Opin.Biotechnol.* 6, 370-374, 1995; Kumar, S. and Nussinov, R., How do thermophilic proteins deal with heat? *Cell.Mol.Life.Sci.* 58, 1216-1233, 2001; Sambongi, Y., Uchiyama, S., Kobayashi, Y., *et al.*, Cytochrome c from a thermophilic bacterium has provided insights into the mechanisms of protein maturation, folding, and stability, *Eur.J.Biochem.* 269, 3355-3361, 2002; Radianingtyas, H. and Wright, P.C., Alcohol dehydrogenases from thermophilic and hyperthermophilic archae and bacteria, *FEMS Microbiol.Rev.* 27, 593-616, 2003; McMullen, G., Christie, J.M., Rahman, T.J., *et al.*, Habitat, applications and genomics of the aerobic, thermophilic genus *Geobacillus*, *Biochem.Soc.Trans.* 32, 214-217, 2004; Averhoff, B., DNA transport and natural transformation in mesophilic and thermophilic bacteria, *J.Bioenerg.Biomembr.* 36, 25-33, 2004; Pereira, M.M., Bandejas, T.M., Fernandes, A.S., *et al.*, Respiratory chains from aerobic thermophilic prokaryotes,

*J.Bioenerg.Biomembr.* 36, 93-105, 2004; Nishida, C.R. and Ortiz de Montellano, P.R., Thermophilic cytochrome P450 enzymes, *Biochem.Biophys.Res. Commun.* 338, 437-445, 2005; Egorova, K. and Antranikian, G., Industrial relevance of thermophilic Archaea, *Curr.Opin.Microbiol.* 8, 649-655, 2005.

## Thiolase Superfamily

A family of condensing enzymes with diverse functions such as the formation of carbon-carbon bonds in the synthesis of fatty acids and polyketides. The expression of peroxisome thiolases is regulated in the PPAR receptors. See Swartzman, E.E., Viswanathan, M.N., and Thorner, J., The PAL1 gene product is a peroxisomal ATP-binding cassette transporter in the yeast *Saccharomyces cerevisiae*, *J.Cell.Biol.* 132, 549-563, 1996; Aoyama, T., Peters, J.M., Iritani, N., *et al.*, Altered constitutive expression of fatty acid-metabolizing enzymes in mice lacking the peroxisome proliferator-activated receptor alpha (PPARalpha), *J.Biol.Chem.* 273, 5678-5684, 1998; Latruffe, N., Chekauoui, M.M., Nicholas-Frances, V., *et al.*, *Biochem.Pharmacol.* 60, 1027-1032, 2000; Rabus, R., Kube, M., Beck, A., Widdel, F., and Reinhardt, R., Genes involved in the anaerobic degradation of ethyl benzene in a denitrifying bacterium, strain EbN1, *Arch.Microbiol.* 178, 506-516, 2002; Kursula, P., Sikkila, H., Fukao, T., Kondo, N., and Wierenga, R.K., High resolution crystal structures of human cytosolic thiolase (CT): a comparison of the active sites of human CT, bacterial thiolase, and bacterial KAS I, *J.Mol.Biol.* 347, 189-201, 2005; Haapalainen, A.M., Merilainen, G., and Wierenga, R.K., The thiolase superfamily: condensing enzymes with diverse reaction specifications, *Trends Biochem.Sci.* 31, 64-71, 2006.

## Thioredoxin(s)

A small protein function as a hydrogen donor/reducing agent in biological systems; considered to be a major regulator of redox reactions in the cell. See Holmgren, A., Thioredoxin, *Annu.Rev.Biochem.* 54, 237-271, 1985; Brot, N. and Weissbach, H., Biochemistry of methionine sulfoxide residues in proteins, *Biofactors* 3, 91-96, 1991; Martin, J.L., Thioredoxin-a fold for all reasons, *Structure* 3, 245-250, 1995; Aslund, F. and Beckwith, J., The thioredoxin superfamily: redundancy, specificity, and gray-area genomics, *J.Bacteriol.* 181, 1375-1379, 1999; Arrigo, A.P., Gene expression and the thiol redox state, *Free Radic.Biol.Med.* 27, 936-944, 1999; Holmgren, A., Antioxidant function of thioredoxin and glutaredoxin systems, *Antioxid. Redox Signal.* 2, 811-820, 2000; Arner, E.S.J. and Holmgren, A., Physiological functions of thioredoxins and thioredoxin reductase, *Eur.J.Biochem.* 267, 6102-6109, 2000; Pearson, W.R., Phylogenies of glutathione transferase families, *Methods Enzymol.* 401, 186-204, 2005; Burke-Gaffney, A., Callister, M.E., and Nakamura, H., Thioredoxin: friend or foe in human disease? *Trends Pharmacol.Sci.* 26, 398-404, 2005; Stefankova, P., Kollarova, M., and Barak, I., Thioredoxin – structural and functional complexity, *Gen.Physiol.Biophys.* 24, 3-11, 2005; Koc, A., Mathews, C.K., Wheeler, L.J., Gross, M.K., and Merrill, G.F., Thioredoxin is required for deoxyribonucleotide pool maintenance during S phase, *J.Biol.Chem.* 281, 15058-15063.

## Thymosins

A group of peptide hormones (alpha, beta, and gamma) originally described in the thymus which have a broad range of functions including the modulation of actin polymerization and control of lymphoid tissue function in the development of T-cells and the

maturation of B-cell to form plasma cells. See Goldstein, A.L. and White, A., Role of thymosin and other thymic factors in the development, maturation, and functions of lymphoid tissue, *Curr.Top.Exp.Endocrinol.* 1, 121-149, 1971; Bach, J.F. and Carnaud, C., Thymic factors, *Prog.Allergy* 21, 342-408, 1976; Low, T.L., Thurman, G.B., Chincarini, C., *et al.*, Current status of thymosin research: evidence for the existence of a family of thymic factors that control T-cell maturation, *Ann.N.Y.Acad.Sci.* 332, 33-48, 1979; Ampe, C. and Vandekerchove, J., Actin-actin binding protein interfaces, *Semin.Cell Biol.* 5, 175-182, 1994; Chen, C., Li, M., Yang, H., *et al.*, Roles of thymosins in cancers and other organ systems, *World J.Surg.* 29, 264-270, 2005; Goldstein, A.L., Hannappel, E., and Kleinman, H.K., Thymosin beta4: actin-sequestering protein moonlights to repair injured tissues, *Trends Mol.Med.* 11, 421-429, 2005.

## Time-of-Flight

The term time-of-flight designates techniques and apparatus that depend on the time taken by particles to traverse a set distance, as, for example, the separation of ions according to their mass in mass spectrometry. Time-of-flight mass spectrometry (TOF-MS) measures flight time of ions; lighter ions travel a greater distance than heavier ions; mass proportional to time squared; converted to  $m/z$  by calibration with standards (Cotter, R.J., Time-of-flight mass spectrometry: an increasing role in the life sciences, *Biomed.Environ.Mass Spectrom.* 18, 513-532, 1989; Guilhaus, M., Selby, D., and Mlynski, V., Orthogonal acceleration time-of-flight mass spectrometry, *Mass Spectrom.Rev.* 19, 65-107, 2000; Belu, A.M., Graham, D.J., and Castner, D.G., Time-of-flight secondary ion mass spectrometry: techniques and applications for the characterization of biomaterial surfaces, *Biomaterials* 24, 3635-3653, 2003; Seibert, V., Wiesner, A., Buschmann, T., and Meuer, J., Surface-enhanced laser desorption/ionization time-of-flight mass spectrometry (SELDI TOF-MS) and ProteinChip technology in proteomics research, *Pathol.Res.Pract.* 200, 83-94, 2004; Vestal, M.L., and Campbell, J.M., Tandem time-of-flight mass spectrometry, *Methods Enzymol.* 402, 79-108, 2005). However, the technique is used in other applications such as measurement of blood flow (Kochar, R., Khandelwal, N., Singh, P., and Suri, S., Arterial contamination: a useful indirect sign of cerebral sinovenous thrombosis, *Acta Neurol.Scand.* 114, 139-142, 2006; Han, S., Granwehr, J., Garcia, S., *et al.*, Auxillary probe design adaptable to existing probes for remote detection NMR, MRI, and time-of-flight tracing, *J.Magn.Reson.*, 182, 260-272, 2006).

## Tissue Microarray

A microarray consisting of cores (0.6 mm in diameter for example) of tissue embedded in a paraffin block. Samples are taken from existing paraffin block sections. This technology allows multiple samples to be processed at the same time under the same conditions. See Moch, H., Schrami, P., Bubendorf, L., *et al.*, High-throughput tissue microarray analysis to evaluate genes uncovered by cDNA microarray screening in renal cell carcinoma, *Am.J.Pathol.* 154, 981-986, 1999; Kallioniemi, O.P., Wagner, U., Kononen, J., and Sauter, G., Tissue microarray technology for high-throughput molecular profiling of cancer, *Hum.Mol.Genet.* 10, 657-662, 2001; Rao, J., Seligson, D., and Hemstreet, G.P., Protein expression analysis using quantitative fluorescence image analysis on tissue microarray slides, *BioTechniques* 32, 928-930, 2002; Rubin, M.A., Dunn, R., Strawderman, M., and Pienta, K.J., Tissue microarray sampling strategy for prostate cancer

biomarker analysis, *Am.J.Surg.Pathol.* 26, 312-219, 2002; Hedvat, C.V., Hedge, A., Chaganti, R.S., *et al.*, Application of tissue microarray technology to the study of non-Hodgkin's and Hodgkin's lymphoma, *Hum.Pathol.* 33, 968-974, 2002; Kim, W.H., Rubin, M.A., and Dunn, R.L., High-density tissue microarray, *Am.J.Surg.Pathol.* 26, 1236-1238, 2002; Parker, R.L., Huntsman, D.G., Lesack, D.W., *et al.*, Assessment of interlaboratory variation in the immunohistochemical determination of estrogen receptor status using a breast cancer tissue microarray, *Am.J.Clin.Pathol.* 117, 723-728, 2002; Giltneane, J.M. and Rimm, D.L., Technology insight: Identification of biomarkers with tissue microarray technology, *Nat.Clin.Pract.Oncol.* 1, 104-111, 2004; Zimpfer, A., Schonberg, S., Lugli, A., *et al.*, Construction and validation of a bone marrow tissue microarray, *J.Clin.Pathol.*, 60, 57-61, 2006.

## Titin

A very large protein (mass of approximately 3 million daltons) which is the third-most abundant protein in vertebrate striated muscle and has a role in providing sarcomeric alignment and recoil. Titin is a single chain protein which extends from the M line to the Z line forming a thick filament. See Maruyama, K., Connectin, an elastic filamentous protein of striated muscle, *Int.Rev.Cytol.* 104, 81-114, 1986; Trinick, J., Elastic filaments and giant proteins in muscle, *Curr.Opin.Cell.Biol.* 3, 112-119, 1991; Fulton, A.B., and Isaacs, W.B., Titin, a huge, elastic sarcomeric protein with a probable role in morphogenesis, *Bioessays* 13, 157-161, 1991; Trinick, J., Understanding the functions of titin and nebulin, *FEBS Lett.* 307, 44-48, 1992; Kellermeyer, M.S. and Grama, L., Stretching and visualizing titin molecules: combining structure, dynamics and mechanics, *J.Muscle Res.Cell Motil.* 23, 499-511, 2002; Tskhovrebova, L. and Trinick, J., Titin: properties and family relationships, *Nat.Rev.Mol.Cell Biol.* 4, 679-689, 2003; Granzier, H.L. and Labeit, S., The giant protein titin: a major player in myocardial mechanics, signaling, and disease, *Circ.Res.* 94, 284-295, 2004; Tskhovrebova, L. and Trinick, J., Properties of titin immunoglobulin and fibronectin-3 domains, *J.Biol.Chem.* 279, 46351-46354, 2005; Samori, B., Zuccheri, G., and Baschieri, R., Protein unfolding and refolding under force: methodologies for nanomechanics, *Chemphyschem.* 6, 29-34, 2005; Lange, S., Ehler, E., and Gautel, M., From A to Z and back? Multicompartment proteins in the sarcomere, *Trends Cell Biol.* 16, 11-18, 2006; Ferrari, M.B., Podugu, S., and Eskew, J.D., Assembling the myofibril: coordinating contractile cable construction with calcium, *Cell.Biochem.Biophys.* 45, 317-337, 2006.

## Toll-like receptor

The term toll-like receptors is derived from the relationship of these proteins to the Toll receptor in *Drosophila* (Kuno, K. and Matsushima, K., The IL-1 receptor signaling pathway, *J.Leukoc.Biol.* 56, 542-547, 1994; Meister, M., Lemaître, B., and Hoffman, J.A., Antimicrobial peptide defense in *Drosophila*, *Bioessays* 19, 1019-1026, 1997; Dushay, M.S. and Eldon, E.D., *Drosophila* immune responses as models for human immunity, *Am.J.Hum.Genet.* 62, 10-14; O'Neill, L.A. and Greene, C., Signal transduction pathways activated by the IL-1 receptor family: ancient signaling machinery in mammals, insects, and plants, *J.Leukoc.Biol.* 63, 650-657, 1998). Toll-like receptors in mammals are immune cell receptors which recognize infectious agents and stimulate activation of the adaptive immune system. See Aderem, A. and Ulevitch, R.J., Toll-like receptors in the induction of the innate immune response, *Nature* 406, 782-77, 2000; Aderem, A.,

Role of the Toll-like receptors in inflammatory response in macrophages, *Crit.Care Med.* 29(7 Suppl), S16-S18, 2001; Beutler, B., Sepsis begins at the interface of pathogen and host, *Biochem.Soc. Trans.* 29, 853-859, 2001; Beutler, B. and Rietschel, E.T., Innate immune sensing and its roots: the story of endotoxin, *Nat.Rev. Immunol.* 3, 169-176, 2003; Philpott, D.J. and Girardin, S.E., The role of Toll-like receptors and Nod proteins in bacterial infection, *Mol.Immunol.* 41, 1099-1108, 2004; Jenner, R.G. and Young, R.A., Insights into host responses against pathogens from transcriptional profiling, *Nat.Rev.Microbiol.* 3, 281-294, 2005; Pasare, C. and Medzhitov, R., Toll-like receptors: linking innate and adaptive immunity, *Adv.Exp.Med.Biol.* 560, 11-18, 2005; O'Neill, L.A., How Toll-like receptors signal: what we know and what we don't know, *Curr.Opin.Immunol.* 18, 3-9, 2006; Kreig, A.M., Therapeutic potential of Toll-like receptor 9 activation, *Nat.RevDrug Discov.* 5, 471-484, 2006; Turvey, S.E., and Hawn, T.R., Towards subtlety: Understanding the role of Toll-like receptor signaling in susceptibility to human infections, *Clin.Immunol.* 120, 1-9, 2006.

## TonB

A membrane-spanning protein which functions in receptors. See Ferguson, A.D. and Deisenhofer, J., TonB-dependent receptors – structural perspectives, *Biochim.Biophys.Acta* 1565, 318-332, 2002; Koebnik, R., TonB-dependent trans-envelope signalling: the exception or the rule? *Trends in Microbiol.* 13, 343-347, 2005.

## Tonoplast

A membrane surrounding an intracellular structure or vacuole. See Barbeir-Brygoo, H. Renaudin, J.P., and Guern, J., The vacuolar membrane of plant cells: a newcomer in the field of biological membranes, *Biochimie* 68, 417-425, 1986; Bertl, A. and Slayman, C.L., Complex modulation of cation channels in the tonoplast and plasma membrane of *Saccharomyces cerevisiae*: single-channel studies, *J.Exp.Biol.* 172, 271-287, 1992; Neuhaus, J.M. and Rogers, J.C., Sorting of proteins to vacuoles in plant cells, *Plant Mol.Biol.* 38, 127-144, 1998; Lutge, U., The tonoplast functioning as the master switch for circadian regulation of crassulacean acid metabolism, *Planta* 211, 761-769, 2000.

## Top-down proteomics

Mass spectrometric analysis of intact proteins as opposed to bottom-up-proteomics where mass spectrometry is used to analysis peptides derived from the proteolytic enzyme digests of proteins. Successful top-down proteomics generally requires high sophisticated instrumental approaches such as Fourier Transform Ion Cyclotron Resonance (FITCR) mass spectrometry. See Ge, Y., Lawhorn, G., ElNagger, E., *et al.*, Top down characterization of larger proteins (45 kDa) by electron capture dissociation mass spectrometry, *J.Am.Chem.Soc.* 124, 672-678, 2002; Nemeth-Cawley, J.F., Tangarone, B.S., and Rouse, J.C., "Top Down" characterization is a complementary technique to peptide sequencing for identifying protein species in complex mixtures, *J.Proteome Res.* 2, 495-505, 2003; Hirano, H., Islam, N., and Kawasaki, H., Technical aspects of functional proteomics in plants, *Phytochemistry* 65, 1487-1498, 2004; Vaidyanathan, S., Kell, D.B., and Goodacre, R., Selective detection of proteins in mixtures using electrospray ionization mass spectrometry: influence of instrumental settings and implications for proteomics, *Anal.Chem.* 76, 5024-5032, 2004; Zhang, S. and van Pelt, C.K.,

Chip-based nanoelectrospray mass spectrometry for protein characterization, *Expert.Rev.Proteomics* 1, 449-468, 2004; Copper, H.J., Hakansson, K., Marshall, A.G., The role of electron capture dissociation in biomolecular analysis, *Mass Spectrom.Rev.* 24, 201-222, 2005; Godovac-Zimmerman, J., Kleiner, O., Brown, L.R., and Drukier, A.K., Perspectives in splicing up proteomics with splicing, *Proteomics* 5, 699-709, 2005; Kaiser, N.K., Anderson, G.A., and Bruce, J.E., Improved mass accuracy for tandem mass spectrometry, *J.Am.Soc.Mass Spectrom.* 16, 463-470, 2005; Williams, T.L., Monday, S.R., Edelson-Mammel, S., Buchanan, R., and Musser, S.M., A top-down proteomics approach for differentiating thermal resistant strains of *Enterobacter sakazakii*, *Proteomics* 5, 4161-4169, 2005; Demirev, P.A., Feldman, A.B., Kowalski, P., and Lin, J.S., Top-down proteomics for rapid identification of intact microorganisms, *Anal.Chem.* 77, 7455-7461, 2005; Du, Y., Parks, B.A., Sohn, S., Kwast, K.E., and Kelleher, N.L., Top-down approaches for measuring expression ratios of intact yeast proteins using fourier transform mass spectrometry, *Anal. Chem.* 78, 686-694, 2006.

## Topoisomerase

A family of enzymes which the topology of DNA by catalyzing relaxation and unknotting of the double-stranded DNA complex. This is accomplished through the alteration of the supercoiling of the DNA helix. Topoisomerase I cleaves one strand of DNA while Topoisomerase II cleaves both strands of the DNA helix and there are isoforms of human topoisomerase II (Kondapi, A.K., Satyanarayana, N., and Saikrishna, A.D., A study of the topoisomerase II activity in HIV-1 replication using the ferrocene derivatives as probes, *Archs.Biochem.Biophys.* 450, 123-132, 2006). This process is critical for the transcription of the DNA to yield messenger RNA and for the replication process. There are two other classes of topoisomerases; topoisomerase III which appears to be involved in recombination while topoisomerase IV appears to be involved in the separation of chromosomes. Topoisomerases are targets for cancer chemotherapy. See Glisson, B.S. and Ross, W.E., DNA topoisomerase II: a primer on the enzyme and its unique role as a multidrug target in cancer chemotherapy, *Pharmacol.Ther.* 32, 89-106, 1987; Osheroff, N., Biochemical basis for the interactions of type I and type II topoisomerases with DNA, *Pharmacol.Ther.* 41, 223-241, 1989; Gmeiner, W.H., Yu, S., Pon, R.T., Pourquier, P. and Pommier, Y., Structural basis for topoisomerase I inhibition by nucleoside analogs, *Nucleosides, Nucleotides, Nucleic Acids* 22, 653-658, 2003; Porter, A.C. and Farr, C.J., Topoisomerase II: untangling its contribution at the centromere, *Chromosome Res.* 12, 569-583, 2004; Pindur, U., Jansen, M., and Lemster, T., Advances in DNA-ligand with groove binding, intercalating and/or alkylating activity: chemistry, DNA-binding and biology, *Curr.Med.Chem.* 12, 2805-2847, 2005; Yangida, M., Basic mechanism of eukaryotic chromosome segregation, *Philos.Trans.Roy.Soc.London B Biol.Sci.* 360, 609-621, 2005; Martincic, D. and Hande, K.R., Topoisomerase II inhibitors, *Cancer Chemother.Biol.Response Modif.* 22, 101-121, 2005.

## Topological Proteomics

A technology which analyzes proteins and protein interactions on a single cell level (MELK technology); study of the toponome; analysis of protein networks; Owens, J., Topological proteomics: a new approach to drug discovery, *Drug Discov.Today* 6, 1081-1082, 2001; Shubert, W. Topological proteomics, toponomics, MELK-technology, *Adv.Biochem.Eng.Biotechnol.* 82, 189-209, 2003; Han,

J.D., Dupuy, D., Bertin, N., Cusick, M.E., and Vidal, M., Effect of sampling on topology predictions of protein-protein interaction networks, *Nat.Biotechnol.* 23, 839-44, 2005; Stelzl, U., Worm, U., Lalowski, M. *et al.*, A human protein-protein interaction network: a resource for annotating the proteome, *Cell* 122, 957-968, 2005.

### trans-activation

Enhancement of transcription (transcriptional activation) by a transcription factor binding to a *cis*-factor in DNA and influencing the activity of RNA polymerase. See Roizman, B., Kristie, T., McKnight, J.L. *et al.* The trans-activation of herpes simplex virus gene expression: comparison of two factors and their *cis* sites, *Biochimie* 70, 1031-1043, 1988; Nevins, J.R., Mechanisms of viral-mediated trans-activation of transcription, *Adv.Virus Res.* 37, 35-83, 1989; Green, N.M., Cellular and viral transcriptional activators, *Harvey Lect.* 88, 67-96, 1992-1993; de Folter, S. and Angenent, G.C., trans meets cis in MADS science, *Trends Plant Sci.* 11, 223-231, 2006; Gomez-Roman, N., Felteon-Edkins, Z.A., Kenneth, N.S., *et al.*, Activation by c-Myc or transcription by RNA polymerases I, II, and III, *Biochem.Soc.Symp.* (73), 141-154, 2006; Campbell, K.J. and Perkins, N.D., Regulation of NF- $\kappa$ B function, *Biochem.Soc.Symp.* (73), 165-180, 2006; Belakvadi, M. and Fondell, J.D., Role of the mediator complex in nuclear hormone receptor signaling, *Rev.Physiol.Biochem.Pharmacol.* 156, 23-43, 2006.

### trans-inactivation (transinactivation)

Gene or transgene silencing mediated by heterochromatin; gene inactivation by *trans*-inactivation is considered to be an epigenetic event; See Sabl, J.F. and Laird, C.D., Epigene conversion: a proposal with implications for gene mapping in humans, *Am.J.Hum. Genet.* 50, 1171-1177, 1992; Opsahl, M.L., Springbett, A., Lathe, R., Colman, A., McClenaghan, M., and Whitelaw, C.B., Mono-allelic expression of variegating transgene locus in the mouse, *Transgenic Res.* 12, 661-669, 2003; Sage, B.T., Jones, J.L., Holmes, A.L., Wu, M.D., and Csink, A.K., Sequence elements in *cis* influence heterochromatic silencing in trans, *Mol.Cell Biol.* 25, 377-388, 2005; also the suppression of the trans-phosphorylation of receptors and resulting signaling pathways. See Graness, A., Hanke, S., Boehmer, F.D., Pressek, P., and Liebmann, C., Protein-tyrosine-phosphatase-mediated epidermal growth factor (EGF) receptor transinactivation and EGF receptor-independent stimulation of mitogen-activated protein kinase by bradykinin in A431 cells, *Biochem.J.* 347, 441-447, 2000; Elbaz, N., Bedecs, K., Masson, M., Sutren, M., Strosberg, A.D., and Nahmias, C., Functional trans-inactivation of insulin receptor kinase by growth-inhibitory angiotensin II AT2 receptor, *Mol.Endocrinol.* 14, 795-804, 2000; Nouet, S., Amzallag, N., Li, J.M., *et al.*, Trans-inactivation of receptor tyrosine kinases by novel angiotensin II AT2 receptor-interacting protein, ATIP, *J.Biol.Chem.* 279, 28989-28997, 2004.

## Transcription

The process by which genetic information is transferred from DNA to RNA. See Hames, B.D. and Glover, D.M., *Transcription and Splicing*, IRL Press, Oxford, UK, 1988; Neidle, S., *DNA Structure and Recognition*, IRL Press, Oxford, UK, 1994; Singer, M. and Berg, P., *Exploring Genetic Mechanisms*, University Science Books, Sausalito, CA, 1997; Lewin, B., *Genes VII*, Oxford University Press, Oxford, UK, 2000; Lodish, H.F., *Molecular Cell Biology*, W.H.Freeman, New York, NY, 2000; Brown, W.M.,

and Brown, P.M., *Transcription*, Taylor & Francis, London, UK, 2002; Olson, M.O.J., *The Nucleolus*, Landes Bioscience, Georgetown, TX, 2004; Baumann, P., Qureshi, S.A., and Jackson, S.P., Transcription: new insights from studies on Archaea, *Trends Genet.* 11, 279-283, 1995; Alton, G., Schwanborn, K., Satoh, Y., and Westwick, J.K., Therapeutic modulation of inflammatory gene transcription by kinase inhibitors, *Expert.Opin.Biol.Ther.* 2, 621-632, 2002; Lee, D.K., Seol, W., and Kim, J.S., Custom DNA-binding proteins and artificial transcription factors, *Curr.Top.Med.Chem.* 3, 645-657, 2003; Mondal, N. and Parvin, J.D., Transcription from the perspective of the DNA: twists and bumps in the road, *Crit.Rev.Eukaryot.Gene Expr.* 13, 1-8, 2003; Sausville, E.A. and Holbeck, S.L., Transcription profiling of gene expression in drug discovery and development: the NCI experience, *Eur.J.Cancer* 40, 2544-2549, 2004; Uesugi, M., Synthetic molecules that modulate transcription and differentiation: hints for future drug discovery, *Comb.Chem.High Throughput Screen.* 7, 653-659, 2004.

## Transcription Factors

These are *trans* factors which are protein or protein complexes which bind to *cis* factors or regions which are intrinsic to the DNA sequence of the regulated gene and control the process of transcription. Transcription can be general transcription factors which are required for the basal transcription apparatus or regulatory transcription factors which may bind upstream or downstream from the transcription initiation site and either enhance or suppress the rate of transcription. See *Transcriptional Regulation*, ed. S.L. McKnight and K.R. Yamamoto, Cold Spring Harbor Press, Cold Spring Harbor, NY, 1992; Goodbourn, S., *Eukaryotic Gene Transcription*, IRL Press at Oxford, Oxford, UK, 1996; *Transcription Factor Protocols*, ed. M.J. Tymms, Humana, Totowa, NJ, 2000; *Transcription Factors*, ed. J.Locker, Academic Press(Bios), Oxford, United Kingdom, 2001; Michalik, L. and Wahli, W., Involvement of PPAR nuclear receptors in tissue injury and wound repair, *J.Clin.Invest.* 116, 598-606, 2006; Kikuchi, A., Kishida, S., and Yamamoto, H., Regulation of Wnt signaling by protein-protein interaction and post-translational modification, *Exp.Mol.Med.* 28, 1-10, 2006; Sharrocks, A.D., PIAS proteins and transcriptional regulation—more than just SUMO E3 ligases? *Genes Dev.* 20, 754-758, 2006; Campbell, K.J. and Perkins, N.D., Regulation of NF-kappaB function, *Biochem.Soc.Symp.*(73), 165-180, 2006; Russell, J. and Zomerdijk, J.C., The RNA polymerase I transcription machinery, *Biochem.Soc.Sym.*(73), 203-216, 2006; Gross, P. and Oelgeschlager, T., Core promoter-selective RNA polymerase II transcription, *Biochem.Soc.Symp.*(73), 225-236, 2006. See NF- $\kappa$ B; See promoter elements, RNA polymerase, general transcription factors, regulatory transcription factors.

## Transcriptional Silencing

Also known as transcription repression and results from the interaction of *cis*- and *trans*-components/sequences to inhibit the process of transcription of mRNA. Distinct from splicing silencing. See Nasmyth, K. and Shore, D., Transcriptional regulation in the yeast life cycle, *Science* 237, 1162-1170, 1987; Pannell, D. and Ellis, J., Silencing of gene expression: implications for design of retrovirus vectors, *Rev.Med.Virol.* 11, 205-217, 2001; Wanzel, M., Herold, S. and Eilers, M., Transcriptional repression by Myc, *Trends Cell Biol.* 13, 146-250, 2003; Ellis, J. and Yao, S., Retrovirus silencing and vector design: relevance to normal and cancer stem cells, *Curr.Gene.Ther.* 5, 367-373, 2005; Baniahmad, A., Nuclear

hormone receptor co-repressors, *J.Steroid Biochem.Mol.Biol.* 93, 89-97, 2005; Spellman, R. and Smith, C.W.J., Novel modes of splicing repression by PTB, *Trends Biochem.Sci.* 31, 73-76, 2006.

## Transcriptomics

The total RNA transcripts produced by a genome; the complete of RNA messages coded from the DNA within a cell. See Betts, J.C., Transcriptomics and proteomics: tools for the identification of novel drug targets and vaccine candidates for tuberculosis, *IUBMB Life* 53, 239-242, 2002; Hegde, P.S., White, I.R., and Delboubck, C., Interplay of transcriptomics and proteomics, *Curr. Opin.Biotechnol.* 14, 647-651, 2003; Jansen, B.J. and Schalkwijk, J., Transcriptomics and proteomics of human skin, *Brief Funct. Genomic Proteomic* 1, 326-341, 2003; Hu, Y.F., Kaplow, J., and He, Y., From traditional biomarkers to transcriptome analysis in drug development, *Curr.Mol.Med.* 5, 29-38, 2005; Viguerie, N., Poitou, C., Cancellato, R., *et al.*, Transcriptomics applied to obesity and caloric restriction, *Biochimie* 87, 117-123, 2005; Seda, O., Tremblay, J., Sedova, L., and Hamet, P., Integrating genomics and transcriptomics with geo-ethnicity and the environment for the resolution of complex cardiovascular disease, *Curr.Opin.Mol. Ther.* 7, 583-587, 2005.

## Transcytosis

Movement through a cell (usually an endothelial cell and vascular wall transport) as opposed to junctional transport (paracellular pathway). Involves a combination of endocytotic and exocytotic pathways. See Patel, H.M., Transcytosis of drug carriers carrying peptides across epithelial barriers, *Biochem.Soc. Trans.* 17, 940-942, 1989; Mostov, K., The polymeric immunoglobulin receptor, *Semin.Cell Biol.* 2, 411-418, 1991; Michel, C.C., Transport of macromolecules through microvascular walls, *Cardiovasc.Res.* 32, 644-653, 1996; Caplan, M.J. and Rodriguez-Boulan, E., Epithelial cell polarity: challenges and methodologies, in *Handbook of Physiology. Section 14, Cell Physiology*, ed. J.F. Hoffman and J.D. Jamieson, Oxford University Press (for the American Physiological Society), New York, NY, Chapter 17, 1997; Florence, A.T. and Hussain, N., Transcytosis of nanoparticles and dendrimer delivery systems: evolving vistas, *Adv.Drug Deliv.Rev.* 50(Suppl 1), S69-S89, 2001; Vogel, S.M. and Malik, A.B., Albumin transcytosis in mesothelium: further evidence of a transcellular pathway in polarized cells, *Am.J.Physiol.Lung Cell Mol.Physiol.* 282, L1-L2, 2002; Ghetie, V. and Ward, E.S., Transcytosis and catabolism of antibody, *Immunol.Res.* 25, 97-113, 2002; Kreuter, J., Influence of the surface properties on nanoparticle-mediated transport of drugs to the brain, *J.Nanosci.Nanotechnol.* 4, 484-488, 2004; Rot, A., Contribution of Duffy antigen to chemokine function, *Cytokine Growth Factor Rev.* 16, 687-694, 2005.

## Transformation

Cell changes manifested by escape from control mechanisms generally resulting in increased growth potential, alterations in the cell surface and karyotypic abnormalities. Cell transformation generally occurs as a result of the acquisition of genetic information as by a virus entering the cell. See Enders, J.F., Cell transformation by viruses as illustrated by the response of human and hamster renal cells to Simian virus 40, *Harvey Lect.* 59, 113-153, 1965; Dulbecco, R., Transformation of cells in vitro by DNA-containing viruses, *JAMA* 190, 721-726, 1964; Black, P.M., The oncogenic DNA viruses: a review of in vitro transformation

studies, *Annu.Rev.Microbiol.* 22, 391-426, 1968; Hanafusa, H., Replication of oncogenic viruses in virus-induced tumor cells-their persistence and interaction with other viruses, *Adv. Cancer Res.* 12, 137-165, 1969; Berk, A.J., Recent lessons in gene expression, cell cycle control, and cell biology from adenovirus, *Oncogene* 24, 7673-7685, 2005; Gius, D., Bradbury, C.M., Sun, L., Awwad, R.T., Huang, L., Smart, D.D., Bisht, K.S., Ho, A.S., and Nguyen, P., The epigenome as a molecular marker target, *Cancer* 104, 1789-1793, 2005; Adhikary, S. and Eilers, M., Transcriptional regulation and transformation by Myc proteins, *Nat.Rev.Mol.Cell Biol.* 6, 635-645, 2005.

## Transgene

A piece or segment of DNA, usually coding DNA, which is introduced into a cell or organism to modify the genome. Derivative animals are referred to as transgenic. See Grosveld, F.G. and Kollias, G.V., *Transgenic Animals*, Academic Press, San Diego CA, 1992; Hiatt, A., *Transgenic Plants: Fundamentals and Applications*, Marcel Dekker, New York, 1993; Gluethmann, H. and Ohashi, P.S., *Transgenesis and Targeted Mutagenesis in Immunology*, Academic Press, San Diego, 1994; Peña, L., *Transgenic Plants: Methods and Protocols*, Humana Press, Totowa, NJ, USA, 2005. Babinet, C., Morello, D., and Renard, J.P., Transgenic mice, *Genome* 31, 938-949, 1989; Dichek, D.A., Retroviral vector-mediated gene transfer into endothelial cells, *Mol.Biol.Med.* 8, 257-266, 1991; Janne, J., Hyttinen, J.M., Peura, T., *et al.*, Transgenic animals as bioproducers of therapeutic proteins, *Ann.Med.* 24, 273-280, 1992; Wright, D.C. and Wagner, T.E., Transgenic mice: a decade of progress in technology and research, *Mutat.Res.* 307, 429-440, 1994; Mittelstein, Scheid O., Transgene inactivation in *Aribidopsis thaliana*, *Curr.Top.Microbiol.Immunol.* 197, 29-42, 1995; Barry, M.A. and Johnston, S.A., Biological features of genetic immunization, *Vaccine* 15, 788-791, 1997; Patil, S.D., Rhodes, D.G., and Burgess, D.J., DNA-based therapeutics and DNA delivery systems: a comprehensive review, *AAPS J.* 7, E61-E77, 2005; Amsterdam, A. and Becker, T.S., Transgenes as screening tools to probe and manipulate the zebrafish genome, *Dev.Dyn.* 234, 255-268, 2005. Harrow, F. and Ortiz, B.D., The TCR $\alpha$  locus control region specifies thymic, but not peripheral patterns of TCR $\alpha$  gene expression, *J.Immunol.* 175, 6659-6667, 2005.

## Translation

The process by which information is transferred from RNA to protein structure. See Phelps, C.S. and Arnstein, H.R.V., *Messenger RNA and Ribosomes in Protein Synthesis*, Biochemical Society, London, UK, 1982; Arnstein, H.R.V. and Cox, R.A., *Protein Biosynthesis*, IRL Press, Oxford, UK, 1992; Belasco, J.G., and Brawerman, G., *Control of Messenger RNA Stability*, Academic Press, San Diego, CA, 1993; Ilan, J., *Translational Regulation of Gene Expression 2*, Plenum Press, New York, NY, 1993; Tymms, M.J., *In Vitro Transcription and Translation Protocols*, Humana Press, Totowa, NJ, 1995; Weissman, S.M., *cDNA Preparation and Characterization*, Academic Press, San Diego, CA, 1999; Lapointe, J. and Brakier-Gingras, L., *Translation Mechanisms*, Landes Bioscience, Georgetown, TX, 2003; Schoenberg, D.R., *mRNA Processing and Metabolism: Methods and Protocols*, Humana Press, Totowa, NJ, 2004; Ochoa, S., Translation of the genetic message, *Bull.Soc.Chim.Biol.* 27, 721-737, 1967; Lewin, B., Units of transcription and translation: the relationship between heterogeneous nuclear RNA and messenger RNA, *Cell* 4, 11-20, 1975; Buetow, D.E. and Wood, W.M., The mitochondrial

translation system, *Subcell.Biochem.* 5, 1-85, 1978; Kaufman, R.J., Control of gene expression at the level of translation initiation, *Curr.Opin.Biotechnol.* 5, 550-557, 1994; Yarus, M., On translation by RNAs alone, *Cold Spring Harb.Symp.Quant.Biol.* 66, 207-215, 2001; Frank, J., Towards an understanding of the structural basis of translation, *Genome Biol.* 4, 237, 2003; Huang, Y.S. and Richter, J.D., Regulation of local mRNA translation, *Curr.Opin.Cell Biol.* 16, 308-313, 2004; Kapp, L.D. and Lorsch, J.R., The molecular mechanics of eukaryotic translation, *Annu.Rev.Biochem.* 73, 657-704, 2004; Piper, M. and Holt, C., RNA translation in axons, *Annu.Rev. Cell Dev.Biol.* 20, 505-523, 2004; Noller, H.F., The driving of force for molecular evolution of translation, *RNA* 10, 1833-1837, 2004; Katz, L. and Ashley, G.W., Translation and protein synthesis: macrolides, *Chem.Rev.* 105, 499-528, 2005; Jackson, R.J., Alternative mechanisms of initiating translation of mammalian mRNAs, *Biochem.Soc.Trans.* 33, 1231-1241, 2005; Deana, A. and Belasco, J.G., Lost in translation: the influence of ribosomes on bacterial mRNA decay, *Genes Dev.* 19, 2526-2533, 2005; Pique, M., Lopez, J.M. and Mendez, R. Cytoplasmic mRNA polyadenylation and translation assays, *Methods Mol.Biol.* 322, 183-198, 2006; Schuman, E.M., Dynes, J.L., and Steward, O., Synaptic regulation of translation of dendritic mRNAs, *J.Neurosci.* 26, 7143-7146, 2006.

## Translocation

The movement of a ribosome along mRNA during protein synthesis: this process involved the participation of elongation factor (EF-G) and is accompanied by GTP hydrolysis. Translocation also refers to the process of protein transport across membranes which may be assisted by chaperone. Protein secretion from the cell also is described as translocation; type II secretion (the general secretory pathway) involves a multiprotein complex referred to as the translocon. See Egea, P.F., Stroud, P.W., and Walter, P., Targeting proteins to membranes: structure of the signal recognition particle, *Curr.Opin.Struct.Biol.* 15, 213-220, 2005; Collinson, I., The structure of the bacterial translocation complex, SecYEG, *Biochem.Soc.Trans.* 33, 1225-1230, 2005; Chavan, M. and Lennarz, W., The molecular basis of coupling of translocation and N-glycosylation, *Trends Biochem.Sci.* 31, 17-20, 2006.

Translocation also refers to the movement of water and solutes in a plant, in particular from the roots to the shoots. See Kutchan, T.M., A role for intra- and intercellular translocation in natural products, *Curr.Opin.Plant Biol.* 8, 292-300, 2005; Yang, X., Feng, Y., He, Z., and Stoffells, P.J., Molecular mechanisms of heavy metal hyperaccumulation and phytoremediation, *J.Trace Elem.Med.Biol.* 18, 339-353, 2005; Mackenzie, S.A., Plant organellar protein targeting: a traffic plan still under construction, *Trends Cell.Biol.* 15, 548-554, 2005; Thompson, M.V., Phloem: the long and the short of it, *Trends Plant Sci.* 11, 26-32, 2006; Takahashi, H., Yoshimoto, N., and Saito, K., Anionic nutrient transport in plants: the molecular basis of the sulfate transporter gene family, *Genet.Eng. (NY)* 27, 67-80, 2006.

## Translocon

A multiprotein complex (composed of several ER proteins) which mediates protein transport (cotranslational protein translocation) across membranes; interacts with single recognition particle (SRP). See Johnson, A.E. and van Waes, M.A., The translocon: a dynamic gateway at the ER membrane, *Annu.Rev.Cell Dev.Biol.* 15, 799-842, 1999; May, T. and Soll, J., Chloroplast precursor protein translocon, *FEBS Lett.* 452, 52-56, 1999; Johnson, A.E. and Haigh, N.G., The ER translocon and retrotranslocation: is the

shift into reverse manual or automatic? *Cell* 102, 709-712, 2000; White, S.H., Translocons, thermodynamics, and the folding of membrane proteins, *FEBS Lett.* 555, 116-221, 2003; Coombes, B.K. and Finlay, B.B., Insertion of the bacterial type III translocon: not your average needle stick, *Trends Microbiol.* 13, 92-95, 2006; Chavan, M. and Lennarz, W., The molecular basis of coupling of translocation and N-glycosylation, *Trends Biochem.Sci.* 31, 17-20, 2006.

## TRANSIL

Porous silica beads which can be coated with a single phospholipid bilayers and used to study protein-lipid interactions. See Schmitz, A.A., Schleiff, E., Rohrig, C. *et al.*, Interactions of myristoylated alanine-rich kinase substrates (MARCKS)-related protein with a novel solid-supported lipid membrane system (TRANSIL), *Anal.Biochem.* 268, 343-353, 1999; Loidl-Stahlhofen, A., Hartmann, T., Schottner, M., *et al.*, Multilamellar liposomes and solid-supported lipid membranes (TRANSIL): screening of lipid-water partitioning toward a high-throughput scale, *Pharm.Res.* 18, 1782-1788, 2001; Schuhmacher, J., Kohlsdorfer, C., Buhner, K., *et al.*, High-throughput determination of the free fraction of drugs strongly bound to plasma proteins, *J.Pharm.Sci.* 93, 816-830, 2004.

## Transportan

A 27 amino acid chimeric peptide with cell penetrating properties. See cell penetrating peptides. See Padiri, K. Säälük, P., Hansen, M., Koppel, K., Raid, R., Langel, U., and Pooga, M., Cell transduction pathways of transportans, *Bioconjugate Chem.* 16, 1399-1410, 2005; Pooga, M., Hällbrink, M., Zorko, M., and Langel, Ü., Cell penetration by transportan, *FASEB J.* 12, 67-77, 1998.

## Trans-splicing

A process that occurs with both nucleic acids and proteins. With nucleic acids, trans-splicing (transsplicing) occurs as part of pre-mRNA processing increasing messenger diversity. The trans-splicing of pre-mRNA is not related the removal of introns via cis-splicing. Trans-splicing transfers RNA segments from one RNA molecule to another while cis-splicing removes introns from the same RNA molecule. See Bonen, L., Trans-splicing of pre-mRNA in plants, animals, and protists, *FASEB J.* 7, 40-46, 1993; Nilsen, T.W., Trans-splicing: an update, *Mol.Biochem.Parasitol.* 73, 1-6, 1995; Adams, M.D., Rudner, D.Z., and Rio, D.C., Biochemistry and regulation of pre-mRNA splicing, *Curr.Opin.Cell Biol.* 8, 331-339, 1996; Frantz, C., Ebel, C., Paulus, F. and Imbault, P., Characterization of trans-splicing in Euglenoids, *Curr.Genet.* 37, 349-355, 2000; Garcia-Blanco, M.A., Messenger RNA reprogramming by spliceosome-mediated RNA trans-splicing, *J.Clin.Invest.* 112, 474-480, 2003; Kornblihtt, A.R., de la Maya, M., Fededa, J.P. *et al.*, Multiple links between transcription and splicing, *RNA* 10, 1489-1498, 2004; Mitchell, L.G. and McGarrity, G.J., Gene therapy progress and prospects: reprogramming gene expression by trans-splicing, *Gene Ther.* 12, 1477-1485, 2005; Yang, Y. and Walsh, C.E., Spliceosome-mediated RNA trans-splicing, *Mol.Ther.* 12, 1006-1012, 2005. Cheng, G., Cohen, L., Ndegwa, D., and Davis, R.E., The flatworm spliced leader 3'-terminal AUG as a translation initiator methionine, *J.Biol.Chem.* 281, 733-743, 2006.

SL (spliced leader) trans-splicing and alternative trans-splicing are special cases of trans-splicing for nucleic acids. Trans-splicing also occurs with proteins but is most often a technique

to use intein chemistry for ligation. See Shi, J. and Muir, T.W., Development of a tandem protein trans-splicing system based on native and engineered split inteins, *J.Am.Chem.Soc.* 127, 6198-6206, 2005; Khan, M.S., Khalid, A.M., and Malik, K.A., Intein-mediated protein trans-splicing and transgene containment in plastids, *Trends Biotechnol.* 23, 217-220, 2005; Kwon, Y., Coleman, M.A., and Camarero, J.A., Selective immobilization of proteiosn onto solid supports through split-intein-mediated protein trans-splicing, *Angew.Chem.Int.Ed. Engl.* 45, 1726-1729, 2006; Iwai, H., Zuger, S., Jin, J., and Tam, P.H., Highly efficient protein trans-splicing by a naturally split DnaE intein from *Nostoc punctiformis*, *FEBS Lett.* 580, 1853-1858, 2006; Muralidharan, V. and Muir, T.W., Protein ligation: an enabling technology for the biophysical analysis of proteins, *Nat.Methods* 3, 429-438, 2006. See inteins, alternative trans-splicing, spliced leader trans-splicing.

## Transvection

Literally to carry over or to carry across. In mathematics, a linear function. In biology, where gene expression is influence by *trans*-interactions between alleles depending on somatic pairing between homologous chromosome regions; it can result in partial complementation between mutant alleles. See Judd, B.H., Transvection: allelic cross talk, *Cell* 53, 841-843, 1988; Rassoulzadegan, M., Magliano, M., and Cuzin, F., Transvection effects involving DNA methylation during meiosis in the mouse, *EMBO J.* 21, 440-450, 2002; Duncan, I.W., Transvection effects in *Drosophila* 36, 521-556, 2002; Coulhard, A.B., Nolan, N., Bell, J.B., and Hilliker, A.J., Transvection at the vestigial locus of *Drosophila melanogaster* 170, 1711-1721, 2005.

## Triabody

An noncovalent trimer formed with scFv fragments engineered with no linker between the V<sub>H</sub> and V<sub>L</sub> domains. The normal linker engineered between the V<sub>H</sub> and V<sub>L</sub> domains is 15 residues (usually glycine and serine to promote maximum flexibility) which yields as monomer ; if the linker is reduced to 10 residues, a dimer (diabody) is formed while with no linker there is a trimer or higher order polymer. See Le Gall, E., Kipriyanov, S.M., Moldenhauer, G., and Little, M., Di-, tri- and tetrameric single chain Fv antibody fragments against human CD19: effect of valency on cell binding, *FEBS Lett.* 453, 164-168, 1999; Atwell, J.L., Breheney, K.A., Lawrence, L.J. *et al.*, scFv multimers of th anti-neuraminidase antibody NC10: length of the linker between V<sub>H</sub> and V<sub>L</sub> domains dictates precisely the transition between diabodies and triabodies, *Protein Eng.* 12, 597-604, 1999. Todorovska, A., Roovers, R.C., Dolezal, O., *et al.*, Design and application of diabodies, triabodies and tetrabodies for cancer targeting, *J.Immunol.Methods* 248, 47-66, 2001. See also tribody, diabody, single chain Fv. Note: It has been observed that if the order of the variable regions are switch in scFv construct (V<sub>L</sub>-V<sub>H</sub> instead of V<sub>H</sub>-V<sub>L</sub>), the engineered scFv with a zero-length linker formed a dimer (diabody) instead of the expected trimer – See Arndt, M.A.E., Krauss, J., and Rybak, S.M., Antigen binding and stability properties of non-covalently linked anti-CD22 single-chain Fv dimers, *FEBS Lett.* 578, 257-261, 2004.

## Tribody

A trivalent antibody construct with two scFv fragments attached to the C-terminal ends of an Fab fragment. See Schoonjans, R., Willems, A., Schoonoghe, S., Fiers, W., *et al.*, Fab chains as an efficient heterodimerization scaffold for the

production of recombinant bispecific and trispecific antibody derivatives, *J.Immunol.* 165, 7050-7057, 2000; Willems, A., Leonen, J., Schoonoghe, S., *et al.*, Optimizing expression and purification from cell culture of trispecific recombinant antibody derivatives, *J.Chromatog.B.Anal.Technol.Biomed.Life Sci.* 786, 161-176, 2003. See triabody and bibody.

## “tri-reagents”

See RNA Isolation

## Tris-lipidation

A process of linking a hydrophobic component to a peptide or protein to enhance membrane binding. The hydroxyl groups of Tris are esterified with fatty acids and subsequently coupled to a peptide or protein via the amino group. See Whittaker, R.G., Hayes, P.J., and Bender, V., A gentle method of linking Tris to amino acids and peptides, *Pept.Res.* 6, 125-128, 1993; Ali, M., Amon, M., Bender, V., and Manolis, N., Hydrophobic transmembrane-peptide lipid conjugation enhances membrane binding and functional activity in T-cells, *Bioconjugate Chem.* 16, 1556-1563, 2005.

## Troybody

Antibody with specificity for APC which has an antigenic sequence inserted into a constant domain region. See Lunde, E., Lauvrak, V., Rasmussen, I.B., *et al.*, Troybodies and pepbodies, *Biochem.Soc.Trans.* 30, 500-506, 2002; Lunde, E., Western, K.H., Rasmussen, I.B., Sandlie, I., and Bogen, B., Efficient delivery of T cell epitopes to APC by use of MHC class II-specific troybodies, *J.Immunol.* 168, 2154-2162, 2002; Tunheim, G., Schjetne, K.W., Fredrikson, A.B., Sandlie, I., and Bogen, G., Human CD14 is an efficient target for recombinant immunoglobulin vaccine constructs that delivers T cell epitopes, *J.Leuk.Biol.* 77, 303-310, 2005.

## Tubulin

A protein which polymerizes to form microtubules. Tubulin is target for anticancer therapy. See Feit, H., Slusarek, L., and Shelanski, M.L., Heterogeneity of tubulin subunits, *Proc.Natl.Acad.Sci.USA* 68, 2028-2031, 1971; Fine, R.E., Heterogeneity of tubulin, *Nat.New Biol.* 233, 283-284, 1971; Rappaport, L., Leterrier, J.F. and Nunez, J., Non phosphorylation in vitro of 6 S tubulin from brain and thyroid tissue, *FEBS Lett.* 26, 239-352, 1972; Berry, R.W. and Shelanski, M.L., Interactions of tubulin with vinblastine and guanosine triphosphate, *J.Mol.Biol.* 71, 71-80, 1972; Hemminki, K., Relative turnover of tubulin subunits in rat brain, *Biochim.Biophys.Acta* 310, 285-288, 1973; Timasheff, S.N., Frigon, R.P., and Lee, J.C., A solution physical-chemical examination of the self-association of tubulin, *Fed.Proc.* 35, 1886-1891, 1976; Mohri, H., The function of tubulin in motile systems, *Biochim.Biophys.Acta* 456, 85-127, 1976; Caplow, M. and Zeeberg, B., Stoichiometry for guanine nucleotide binding to tubulin under polymerizing and nonpolymerizing conditions, *Arch.Biochem.Biophys.* 203, 404-411, 1980; Zeeberg, B., Cheek, J., and Caplow, M., Exchange of tubulin dimer into rings in microtubule assembly-disassembly, *Biochemistry* 19, 5078-5086, 1980; Cleveland, D.W., Treadmilling of tubulin and actin, *Cell* 28, 689-691, 1982; Sternlicht, H., Yaffe, M.B., and Farr, G.W., A model of the nucleotide-binding site in tubulin, *FEBS Lett.* 214, 226-235, 1987; Oakley, B.R.,  $\gamma$ -Tubulin, *Curr.Top.Dev.Biol.* 49, 27-54, 2000; Dutcher, S.K., Motile organelles: the importance of specific tubulin

isoforms, *Curr.Biol.* 11, R419-R422, 2001; McKean, P.G., Vaughan, S., and Gull, K., The extended tubulin superfamily, *J.Cell Sci.* 114, 2723-2733, 2001; Cowan, N.J. and Lewis, S.A., Type II chaperonins, prefoldin, and the tubulin-specific chaperones, *Adv.Protein Chem.* 59, 73-104, 2001; Addinall, S.G. and Holland, B., The tubulin ancestor, FtsZ, draughtsman, designer, and driving force for bacterial cytokinesis, *J.Mol.Biol.* 318, 219-236, 2002; Szymanski, D., Tubulin folding cofactors: half a dozen for a dimer, *Curr.Biol.* 12, R767-R769, 2002; Dutcher, S.K., Long-lost relatives reappear: identification of new members of the tubulin superfamily, *Curr.Opin.Microbiol.* 6, 634-640, 2003; Caplow, M. and Fee, L., Concerning the chemical nature of tubulin subunits that cap and stabilize microtubules, *Biochemistry* 42, 2122-2126, 2003; Nogales, E., Wang, H.W., and Niederstrasser, H., Tubulin rings: which way do they curve?, *Curr.Opin.Struct.Biol.* 13, 256-261, 2003; Pellegrini, F. and Budman, D.R., Tubulin function, action of antitubulin drugs, and new drug development, *Cancer Invest.* 23, 264-273, 2005; Nogeles, E. and Wang, H.W., Structural mechanisms underlying nucleotide-dependent self-assembly of tubulin and its relatives, *Curr.Opin.Struct.Biol.* 16m, 221-229, 2006.

## Tumor Suppressor Gene

A gene responsible for the encoding of products which suppress the malignant phenotype. These gene were first identified in hybrid cells resulting from cell fusion. Loss of tumor suppressor genes result in cell cycle deregulation. p53 is one of the better known tumor suppressor genes. See Wynford-Thomas, D., Oncogenes and anti-oncogenes: the molecular basis of tumor behavior, *J.Pathol.* 165, 187-201, 1991; Carbone, D.P., Oncogenes and tumor suppressor genes, *Hosp.Pract.* 28, 145-148, 1993; Skapek, S.X. and Chui, C.H., Cytogenetics and the biologic basis of sarcomas, *Curr.Opin.Oncol.* 12, 315-322, 2000; Lee, M.P., Genome-wide analysis of epigenetics in cancer, *Ann.N.Y.Acad.Sci.* 983, 101-109, 2003; Bocchetta, M. and Carbone, M., Epidemiology and molecular pathology at crossroads to establish causation: molecular mechanisms of malignant transformation, *Oncogene* 23, 6484-6491, 2004; Seth, A. and Watson, D.K., ETS transcription factors and their emerging roles in human cancer, *Eur.J.Cancer* 41, 2462-2478, 2005.

## Turbidimetry

Turbidity is a measured of the light scattered from the direct path of the electromagnetic radiation; practically, it is the transmitted light. It represents electromagnetic radiation that is not absorbed as in spectroscopy but rather scattered. It is sometimes necessary to correct spectral measurements for turbidimetry or more commonly just as light scattering. The extent to which electromagnetic radiation is scattered and measured either by turbidimetry or nephelometry depends on the size of the particle and the wavelength of the incident radiation. Turbidimetry is used in clinical chemistry (Blirup-Jensen, S., Protein standardization III: Method optimization basic principles for quantitative determination of human serum proteins on automated instruments based on turbidimetry or nephelometry, *Clin.Chem.Lab.Med.* 39, 1098-1109, 2001; platelet aggregation (Cruz, W.O., Platelet determination by turbidimetry, *Blood* 9, 920-926, 1954; Jarvis, G.E., Platelet aggregation: turbidimetric measurements, *Methods Mol.Biol.* 272, 65-76, 2004) and for the assay of some enzymes (Rapport, M.M., Meyer, K., and Linker, A., Correlation of reductimetric and turbidimetric methods for hyaluronidase, *J.Biol.Chem.* 186, 615-623, 1950; Houck, J.C., The turbidimetric determination of deoxyribonuclease activity, *Arch.Biochem.Biophys.* 82, 135-144, 1959; Morsky, P., Turbidimetric

determination of lysozyme with *Micrococcus lysodeikticus* cells: reexamination of reaction conditions, *Anal.Biochem.* 128, 77-85, 1983; Jenzano, J.W. and Lundblad, R.L., Effects of amines and polyamines on turbidimetric and lysoplate assays for lysozyme, *J.Clin.Microbiol.* 26, 34-37, 1988; Walker, M.B., Retzinger, A.C., and Retzinger, G.S., A turbidimetric method for measuring the activity of trypsin and its inhibition, *Anal.Biochem.* 351, 114-121, 2006). See Zattoni, A., Loli Piccolomini, E., Torsi, G., and Rschiglian, P., Turbidimetric detection method in flow-assisted separation of dispersed samples, *Anal.Chem.* 75, 6469-6477, 2003; Mori, Y., Kitao, M., Tomita, N., and Natomi, T., Real-time turbidimetry of LAMP reaction for quantifying template DNA, *J.Biochem.Biophys.Methods* 31, 145-157, 2004; Hianik, T., Rybar, P., Andreev, S.Y. *et al.*, Detection of DNA hybridization on a liposome surface using ultrasound velocimetry and turbidimetry methods, *Bioorg.Med.Chem.Lett.* 14, 3897-3900, 2004; Gonzalez, V.D., Gugliotta, L.M., Vega, J.R., and Meira, G.R., Contamination by larger particles of two almost-uniform lattices: analysis by combined dynamic light scattering and turbidimetry, *J.Colloid Interface Sci.* 285, 581-589, 2005; Stano, P., Bufali, S., Damozou, A.S., and Luisi, P.L., Effect of tryptophan oligopeptides on the size distribution of POPC liposomes: a dynamic light scattering and turbidimetric study, *J.Liposome Res.* 15, 29-47, 2005; Mao, J., Kondu, S., Ji, H.F., and McShane, M.J., Study of the near-neutral pH-sensitivity of chitosan/gelatin hydrogels by turbidimetry and microcantilever deflection, *Biotechnol.Bioeng.* 95, 333-341, 2006.

## Tyrosine Kinase

A large group of enzymes involved in intracellular signal transduction which catalyze the phosphorylation of tyrosine residues in target proteins. See Hardle, D.G., *Protein Phosphorylation: A Practical Approach*, Oxford University Press, Oxford, United Kingdom, 1993; Woodgett, J.R., *Protein Kinases*, IRL Press at Oxford University Press, Oxford, United Kingdom, 1994; *The Protein Kinase Factsbooks*, ed. D.G. Hardle and S. Hanks, Academic Press, San Diego, CA, USA, 1995; *Protein Kinase Protocols*, ed. G. Krauss, Wiley-VCH, Weinheim, Germany, 2003.

## Tyrphostins

Inhibitors of protein tyrosine kinases. See Levitzki, A., Tyrphostins—potential antiproliferative agents and novel molecular tools, *Biochem.Pharmacol.* 40, 913-918, 1990; Lamb, D.J. and Shubhaba, S., Tyrphostins inhibit Sertoli cell-secreted growth factor stimulation of A431 cell growth, *Recent Prog.Homr.Res.* 48, 511-516, 1993; Wolbring, G., Hollenberg, M.D., and Schnetkamp, P.P., Inhibition of GTP-utilizing enzymes by tyrphostins, *J.Biol.Chem.* 269, 22470-22472, 1994; Holen, I., Stromhaug, P.E., Gordon, P.B., *et al.*, Inhibition of autophagy and multiple steps in asialoglycoprotein endocytosis by inhibitors of tyrosine protein kinases, (tyrphostins), *J.Biol.Chem.* 270, 12823-12831, 1995; Jaleel, M., Shenoy, A.R., and Visweswariah, S.S., Tyrphostins are inhibitors of guanylyl and adenylyl cyclases, *Biochemistry* 43, 8247-8255, 2004; Levitzki, A. and Mishani, E., Tyrphostins and other tyrosine kinase inhibitors, *Annu.Rev.Biochem.* 75, 93-109, 2006.

## Ubiquitin

Ubiquitin is a small intracellular protein that serves as marker for protein degradation by the proteasome. This is a process of controlled proteolysis which is an integral part of normal cell function. Some functions of the ubiquitin-proteasome system included the

degradation of misfolded proteins and the production of peptides during MHC class I antigen presentation (Michalek, M.T., Grant, E.P., Gramm, C., *et al.*, A role for the ubiquitin-dependent proteolytic pathway in MHC class I-restricted antigen presentation, *Nature* 363, 552-554, 1993). Ubiquitin is linked to a protein via an isopeptide bond in a process referred to as ubiquitinylation which is catalyzed by a ubiquitin ligase (Robinson, P.A. and Ardley, H.C., Ubiquitin-protein ligases, *J.Cell.Sci.* 5191-5194, 2004; Pavletich, N.P., Structural biology of ubiquitin-protein ligases, *Harvey Lect.* 98, 65-102, 2002-2003). Ubiquitin is initially "activated" by the ubiquity ligase to form a high-energy thioester bond between the enzyme and the C-terminal glycine residue of ubiquitin; the ubiquitin is then transferred to a lysine residue on the target protein forming the isopeptide peptide. While the discovery of ubiquitin was based on its ability to target proteins to degradation, it is clear that there are other functions (Welchman, R.L., Gordon, C., and Mayer, R.J., Ubiquitin and ubiquitin-like proteins as multifunctional signals, *Nat.Rev.Mol.Cell Biol.* 6, 599-609, 2005; Hicke, L., Schubert, H.L., and Hill, C.P., Ubiquitin-binding domain, *Nature Rev.Mol.Cell Biol.* 6, 610-621, 2005; Chen, Z.J., Ubiquitin signaling in the NF- $\kappa$ B pathway, *Nat. Cell Biol.* 7, 758-765, 2005; ). There is a ubiquitin family of proteins (Catic, A. and Ploegh, H.L., Ubiquitin – conserved protein or selfish gene? *Trends Biochem.Sci.* 30, 600-604, 2005); consisting of type I ubiquitin-like proteins and type II ubiquitin-like proteins (Pickart, C.M. and Eddins, M.J., Ubiquitin: structures, functions, mechanisms, *Biochim.Biophys.Acta* 1695, 755-72, 2004; Walters, K.J., Goh, A.M., Wang, Q., *et al.*, Ubiquitin family proteins and their relationship to the proteasome: a structural perspective, *Biochim.Biophys.Acta* 1695, 73-87, 2004). While there are few type 1 family members, they are well known with Nedd8 and SUMO (Kroetz, M.B., SUMO: a ubiquitin-like protein modifier, *Yale J.Biol.Med.* 78, 197-201, 2005. See Rechsteiner, M., Ubiquitin-mediated pathways for intracellular proteolysis, *Annu. Rev.Cell Biol.* 3, 1-30, 1987; Ciechanover, A., Gonen, H., Elias, S., and Mayer, A., Degradation of proteins by the ubiquitin-mediated proteolytic pathway, *New Biol.* 2, 227-234, 1990; Smalle, J. and Vierstra, R.D., The ubiquitin 26S proteasome proteolytic pathway, *Annu.Rev.Plant Biol.* 55, 555-590, 2004; Denison, C., Kirkpatrick, D.S., and Gygi, S.P., Proteomic insights into ubiquitin-like proteins, *Curr.Opin.Chem.Biol.* 9, 69-75, 2005; Miller, J. and Gordon, C., The regulation of proteasome degradation by multi-ubiquitin chain binding proteins, *FEBS Lett.* 579, 3224-3230, 2005; Ye, Y., The role of the ubiquitin-proteasome system in ER quality control, *Essays Biochem.* 41, 99-112, 2005; Salomens, F.A., Verhoef, L.G. and Dantuma, N.P., Fluorescent reporters of the ubiquitin-proteasome system, *Essays Biochem.* 41, 113-128, 2005; Nakayama, K.I. and Nakayama, K., Ubiquitin ligases: cell-cycle control and cancer, *Nat.Rev.Cancer* 6, 369-381, 2006.

## Ultraconserved Elements

A class of conserved elements in genomes between orthologous domains that share 100% identity over at least 200 bp in mammalian genomes. See Berjano, G., Pheasant, M., Makunin, I., *et al.*, Ultraconserved elements in the human genome, *Science* 304, 1321-1325, 2004.

## UHF Dielectrometry

Physical technique to study the state of protein-bound water see. Hackl, E.V., Gatash, S.V. and Nikalov, O.T., Using UHF-dielectrometry to study protein structural transitions, *J.Biochem. Biophys.Methods* 64, 127-148.

## Validity

External validity refers to the extent to which a specific finding from an investigation or analytical process can be generalized beyond the context of the specific investigation or analytical process. For regulatory purposes such as the manufacture of drugs and therapeutic biologicals, validity can be considered to be demonstration of the ability to reproducibly repeat the process and/or assay. The validation process is the process by which an organization can demonstrate that the process is reproducible and, therefore, their process valid.

## Variation

Literally, the state of discrete diversified coloration. In biology, this can refer to the discrete coloration patterns in leaves, or the occurrence within a tissue of sectors or clones of different phenotypes. In genetics, it is taken to mean a chromosome position effect when particular loci are contiguous with heterochromatin. See Baker, W.K., Position-effect variegation, *Adv.Genet.* 14, 133-169, 1968; Henikoff, S., Position-effect variegation after 60 years, *Trends Genet.* 6, 422-426, 1990; Cook, K.R. and Karpen, G.H., A rosy future for heterochromatin, *Proc.Natl.Acad.Sci.USA* 91, 5219-5221, 1994; Martin, D.I. and Whitelaw, E., The vagaries or variegating transgenes, *Bioessays* 18, 919-923, 1996; Klein, C.G. and Costa, M., DNA methylation, heterochromatin and epigenetic carcinogenesis, *Mutat. Res.* 386, 163-180, 1997; Zhimulev, I.F., Polytene chromosomes, heterochromatin, and position effect variegation, *Adv.Genet.* 37, 1-566, 1998; Hennig, W., Heterochromatin, *Chromosoma* 108, 1-9, 1999; Shotta, G., Ebert, A., Dorn, R., and Reuter, G., Position-effect variegation and the genetic dissection of chromatin regulation in *Drosophila*, *Semin.Cell Dev.Biol.* 14, 67-75, 2003.

## V(D)J Recombination

The process by which discontinuous regions of DNA become joined in lymphocytes resulting in rearrangement of the DNA germline; the process by which diversity is built into immunoglobulins. See Alt, F.W., Oltz, E.M., Young, F., Gorman, J., Taccioli, G., and Chen, J., VDJ recombination, *Immunol.Today* 13, 306-314, 1992; Jung, D. and Alt, F.W., Unraveling V(D)J recombination: insights into gene regulation, *Cell* 116, 299-311, 2004; Schatz, D.G., V(D)J recombination, *Immunol.Rev.* 200, 5-11, 2004; Jones, J.M. and Gellert, M., The taming of a transposon: V(D)J recombination and the immune system, *Immunol.Rev.* 200, 233-248, 2004; Dudley, D.D., Chaudhuri, J., Bassing, C.H., and Alt, F.W., Mechanism and control of V(D)J recombination versus class switch recombination: similarities and differences, *Adv.Immunol.* 86, 43-112, 2005; Aplon, P.D., Causes of oncogenic chromosomal translocation, *Trends Gene.* 22, 46-55, 2006.

## VGF

A neuronal protein involved in cell differentiation. See Salton, S.R.J., Fischber, D.J., and Don, K.-W., Structure of the gene encoding VGF, a nervous system-specific mRNA that is rapidly and selectively induced by nerve growth factor in PC12 cells, *Mol.Cell Biol.* 11, 2335-2349, 1991.

## VICKZ Proteins

A family of RNA-binding proteins recognizing specific *cis*-acting elements acting on a variety of transcriptional processes involved in cell polarity and migration. See Yisraeli, J.K., VICKZ proteins:

A multi-talented family of regulatory RNA-binding proteins, *Biol.Chem.* 97, 87-96, 2005.

## Virulence Factor(s)

A factor or factors elaborated by an organism, usually as bacteria, that are response for the pathogenicity of the organism. An example would be a bacterial exotoxin. See Evans, D.J., Jr. and Evans, D.G., Classification of pathogenic *Escherichia coli* according to serotype and the production of virulence factors, with special reference to colonization-factor antigens, *Rev.Infect.Dis.* 5(Suppl 4), S692-S701, 1983; Lubran, M.M., Bacterial toxins, *Ann.Clin.Lab.Sci.* 18, 58-71, 1988; Moxon, E.R. and Kroll, J.S., Type b capsular polysaccharide as a virulence factor of *Haemophilis influenzae*, *Vaccine* 6, 113-115, 1988; Pragman, A.A. and Schievert, P.M. Virulence regulation in *Staphylococcus aureus*: the need for in vivo analysis of virulence factor regulation, *FEMS Immuno.Med.Microbiol.* 42, 147-154, 2004; Walker, M.J., McArthur, J.D., McKay, F., and Ranson, M., Is plasminogen deployed as a *Streptococcus pyogenes* virulence factor? *Trends Microbiol.* 13, 308-313, 2005; Lu, H., Yamaoka, Y., and Graham, D.Y., *Helicobacter pylori* virulence factors: fact and fantasies, *Curr.Opin.Gastroenterol.* 21, 653-659, 2005; Zaas, D.W., Duncan, M., Rae Wright, J., and Abraham, S.N., The role of lipid rafts in the pathogenesis of bacterial infections, *Biochim.Biophys. Acta* 1746, 305-313, 2005; Kazmierczak, M.J., Wiedmann, M., and Boor, K.J., Alternative sigma factors and their roles in bacterial virulence, *Microbiol.Mol.Biol.Rev.* 69, 527-543, 2005; Yates, S.P., Jørgensen, R., Andersen, G.R., *et al.*, Stealth and mimicry by deadly bacterial toxins, *Trends Biochem.Sci.* 31, 123-133, 2006.

## Viscosity

The property of a fluid indicating resistance to change in form or resistance to flow. There is considerable interest in the viscosity of blood as its related to cardiovascular disease (Somer, T. and Meiselman, H.J., Disorders of blood viscosity, *Ann.Med.* 25, 31-39, 1993). See Kupke, D.W. and Crouch, T.H., Magnetic suspension: density-volume, viscosity, and osmotic pressure, *Methods Enzymol.* 48, 29-68, 1978; Ahmad, F. and McPhie, P., The intrinsic viscosity of glycoproteins, *Int.J.Biochem.* 11, 91-96, 1980; Harding, S.E., The intrinsic viscosity of biological macromolecules. Progress in measurement, interpretation and application to structure in dilute solution, *Prog.Biophys.Mol.Biol.* 68, 207-262, 1997; Ulker, P., Alexy, T., Meiselman, H.J., and Baskurt, O.K., Estimation of infused dextran plasma concentration via measurement of plasma viscosity, *Biorheology* 43, 161-166, 2006; Chopra, S., Lynch, R., Kim, S.H., *et al.*, Effects of temperature and viscosity on R67 dihydrofolate reductase catalysis, *Biochemistry* 45, 6596-6505, 2006; Laghaei, R., Nasrabad, A.E., and Eu, B.C., Generic van der Waals equation of state, modified free volume theory of diffusion, and viscosity of simple liquids, *J.Phys.Chem.B Condens.Matter Mater.Surf. Interfaces Biophys.* 109, 5873-5883, 2005; Brookes, R., Davies, A., Ketwaroo, G., and Madden, P.A., Diffusion coefficients in ionic liquids: relationship to the viscosity, *J.Phys.Chem.B Condens.Matter Mater.Surf. *Pharm. Dev Technol.* 11, 389-397, 2006; Haidekker, M.A., Akers, W.J., Fischer, D., and Theodorakis, E.A., Optical fiber-based fluorescent viscosity sensor, *Opt.Lett.* 31, 2529-2531, 2006.

## Vitamers

Different chemical structural forms of a vitamin which have the same biological activity. See Bender, D.A., *Nutritional Biochemistry of the Vitamins*, 2nd Edn., Cambridge University Press, Cambridge, United Kingdom, 2003; Voziyan, P.A. and Hudson, B.G., Pyridoxamine. The many virtues of a Maillard reaction inhibitor, *Ann.N.Y.Acad.Sci.* 1043, 807-816, 2005.

## Ealker A Motif

A motif described in SKN-1, a transcription factor in *Caenorhabditis elegans*. See Walker, A.K., See, R., Batchelder, C., Kophengnavong, T., Gronniger, J.T., Shi, Y., and Blackwell, T.K., A conserved transcription motif suggesting functional parallels between *Caenorhabditis elegans* SKN-1 and Cap'n'Collar-related basic leucine zipper proteins, *J.Biol.Chem.* 275, 22166-22171, 2000.

## Western Blotting

A method for identifying proteins after electrophoretic separation involving a specific probe, usually an antibody. It was derived from the earlier development of Southern Blotting and Northern Blotting. See also Southwestern Blotting and Northwestern Blotting. See Radka, S.F., Monoclonal antibodies to human major histocompatibility complex class II antigens, *Crit.Rev.Immunol.* 8, 23-48, 1987; Heerman, K.H., Gultekin, H., and Gerlich, W.H., Protein blotting: techniques and application in virus hepatitis research, *Ric.Clin.Lab.* 18, 193-221, 1988; Hayes, P.C., Wolf, C.R., and Hayes, J.D., Blotting techniques for the study of DNA, RNA, and proteins, *BMJ* 299, 965-968, 1989; Harper, D.R., Kit, M.L., and Kangrok H.O., Protein blotting: ten years on, *J.Virol. Methods* 30, 25-39, 1990; Dunn, M.J., Detection of proteins on blots using the avidin-biotin system, *Methods Mol.Biol.* 32, 227-232, 1994; Westermeier, R. and Marouga, R., Protein detection methods in proteomics research, *Biosci.Rep.* 25, 19-32, 2005; Dunbar, B.S., *Protein Blotting: A Practical Approach*, IRL Press at Oxford, Oxford, UK, 1994; Baldo, B.A. and Tovey, E.R., *Protein Blotting: Methodology, Research, and Diagnostic Applications*, Karger, Basel, 1989.

## Wormbase

A public database for the genomics biology of *Caenorhabditis elegans* (a soil-dwelling nematode used extensively in biological research). See Chen, N., Harris, T.W., Antoschechkin, I., *et al.*, WormBase: a comprehensive data resource for *Caenorhabditis* biology and genomics, *Nucleic Acids Res.* 33, D383-D389, 2005; O'Connell, K., There's no place like WormBase: an indispensable resource for *Caenorhabditis elegans* researchers, *Biol.Cell.* 97, 867-872, 2005; Schwarz, E.M., Antoschechkin, I., Bastiani, C. *et al.*, WormBase: better software, richer content, *Nucleic Acids Res.* 34, D475-D478, 2006.

## Wormgate

A cloning system for the expression RNAai (hairpin RNA constructs) from the *C. elegans* ORFeome library. See Johnson, N.M., Behm, C.A., and Trowell, S.C., Heritable and inducible gene

knockdown in *C. elegans* using Wormgate and the ORFeome, *Gene* 359, 26-34, 2005. See also Lamesch, P., Milstein, S., Hao, T., *et al.*, *C. elegans* ORFeome version 3.1: increasing the coverage of ORFeome resource with improved gene prediction, *Genome Res.* 14, 2064-2069, 2004 (Wormbase).

## Xenobiotic

A chemical found in the body of an organism which is not the biosynthetic product of said organism and is therefore from an exogenous source. Benzene is an example of a xenobiotic compound. Organisms have utilized unique metabolic pathways for the metabolism/detoxification of xenobiotic compounds. See Paulson, G.D., Lamoureux, G.L., and Feil, V.J., Advances in methods and techniques for the identification of xenobiotic conjugates, *J.Toxicol.Clin.Toxicol.* 19, 571-608, 1982; Garattini, S., Notes on xenobiotic metabolism, *Ann.N.Y.Acad.Sci.* 407, 1-25, 1983; Glatt, H., Gemperlein, I., Turchi, G., *et al.*, Search for cell culture systems with diverse xenobiotic-metabolizing activities and their use in toxicological studies, *Mol.Toxicol.* 1, 313-334, 1987-1988; Copley, S.D., Microbial dehalogenases: enzymes recruited to convert xenobiotic substrates, *Curr.Opin.Chem.Biol.* 2, 613-617, 1998; Gil, F. and Pla, A., Biomarkers as biological indicators of xenobiotic exposure, *J.Appl.Toxic.* 21, 245-255, 2001; Snyder, R., Xenobiotic metabolism and the mechanism(s) of benzene toxicity, *Drug.Metab.Rev.* 36, 531-547, 2004; Pritchard, J.B. and Miller, D.S., *Toxicol.Appl.Pharmacol.* 204, 256-262, 2005; Dai, G. and Wan, Y.J., Animal models of xenobiotic receptors, *Curr.Drug Metab.* 6, 341-355, 2005; Cribb, A.E., Peyrou, M., Muruganandan, S., and Schneider, L., The endoplasmic reticulum in xenobiotic toxicity, *Drug Metab.Rev.* 37, 405-442, 2005; Janssen, D.B., Dinkla, I.J., Peolarends, G.J., and Terpstra, P., Bacterial degradation of xenobiotic compounds: evolution and distribution of novel enzyme activities, *Environ.Microbiol.* 7, 1868-1882, 2005; Gong, H., Sinz, M.W., Feng, Y., *et al.*, Animal models of xenobiotic receptors in drug metabolism and diseases, *Methods Enzymol.* 400, 598-618, 2005; Matsunaga, T., Shitani, S., and Hara, A., Multiplicity of mammalian reductases for xenobiotic carbonyl compounds, *Drug Metab.Pharmacokinet.* 21, 1-18, 2006.

## Xerogel

Not a gel but rather a term used in reference to a dried, possibly open gel; a gel in which the dispersing agent has been removed as opposed to a lyogel where the dispersing agent is still present as, for example, with a hydrogel which contains a substantial amount of water. There has been interest in xerogels a drug delivery vehicles. See Kortesuso, P., Ahola, M., Karlsson, S., *et al.*, Sol-gel-processed sintered silica xerogel as a carrier in controlled drug delivery, *J.Biomed.Mat.Res.* 44, 162-167, 1999; Kortesuso, P., Ahola, M., Karlsson, S., *et al.*, Silica xerogel as an implantable carrier for controlled drug delivery—evaluation of drug distribution and tissue effects after implantation, *Biomaterials* 21, 193-198, 2000; Shamansky, L.M., Luong, K.M., Han, D., and Chronister, E.L., Photoinduced kinetics of bacteriorhodopsin in a dried xerogel glass, *Biosens.Bioelectron.* 17, 227-231, 2002; Weng, K.C., Stalgren, J.J., Duval, D.J., *et al.*, Fluid biomembranes supported on nanoporous aerogel/xerogel substrates, *Langmuir* 20, 7232-7239, 2004; Clifford, J.S. and Legge, R.L., Use of water to evaluate hydrophobicity of organically-modified xerogel enzyme supports, *Biotechnol.Bioeng.* 92, 231-237, 2005; Oh, B.K., Robbins, M.E., Nablo, B.J., and Schoenfish, M.H., Minaturized glucose biosensor modified with a nitric oxide-releasing xerogel microarray,

*Biosens.Bioelectron.* 21, 749-757, 2005; Copello, G.J., Teves, S., Degrossi, J., *et al.*, Antimicrobial activity on glass materials subject to disinfectant xerogel coating, *J.Ind.Microbiol.* 33, 343-348, 2006; Xue, J.M., Tan, C.H., and Lukito, D., Biodegradable polymer-silica xerogel composite microspheres for controlled release of gentamicin, *J.Biomed.Mater.Res.B Appl.Biomater.* 78, 417-422, 2006.

## Yeast Artificial Chromosomes

Yeast artificial chromosomes (YAC) are yeast DNA sequences which contain large segments of foreign recombinant DNA introduced by transformation. Yeast artificial chromosomes permit the cloning of large DNA fragments such a genes with flanking regulatory regions. See Schlessinger, D. Yeast artificial chromosomes: tools for mapping and analysis of complex genomes, *Trends Genet.* 6, 255-258, 1990; Huxley, C. and Gnirke, A., Transfer of yeast artificial chromosomes from yeast to mammalian cells, *Bioessays* 13, 545-550, 1991; Anand, R., Yeast artificial chromosomes (YACs) and the analysis of complex genomes, *Trends Biotechnol.* 10, 35-40, 1992; Huxley, C., Transfer of YACs to mammalian cells and transgenic mice, *Genet. Eng.* 16, 65-91, 1994; Schalkwyk, L.C., Francis, E., and Lehrach, H., Techniques in mammalian genome mapping, *Curr.Opin.Biotechnol.* 6, 37-43, 1995; Kouprina, N. and Larionov, V., Exploiting the yeast *Saccharomyces cerevisiae* for the study of the organization and evolution of complex genomes, *FEMS Microbiol. Rev.* 27, 629-649, 2003; Sasaki, T., Matsumoto, T., Antonio, B.A., and Nagamura, Y., From mapping to sequencing, post-sequencing and beyond, *Plant Cell Physiol.* 46, 3-13, 2005.

## Zebrafish

Zebrafish (*Danio rerio*) is a freshwater fish used for research in developmental biology. see <http://zfin.org>; <http://www.neuro.uoregon.edu/k12/FAQs.html>; <http://www.ncbi.nlm.nih.gov/genome/guide/zebrafish/> See also Stemple, D.L. and Driever, W., Zebrafish: tools for investigating cellular differentiation, *Curr.Opin.Cell.Biol.* 8, 858-864, 1996; Driever, W., Stemple, D., Schier, A., and Solnica-Krezel, L., Zebrafish: genetic tools for studying vertebrate development, *Trends Genet.* 10, 152-159, 1994; Kimmel, C.B., Genetics and early development of zebrafish, *Trends Genet.* 5, 283-288, 1989; Fulwiler, C. and Gilbert, W., Zebrafish embryology and neural development, *Curr.Opin.Cell Biol.* 3, 989-991, 1991; Ingham, P.W. and Kim, H.R., Hedgehog signaling and the specification of muscle cell identity in the zebrafish embryo, *Exp. Cell Res.* 306, 336-342, 2005; Teh, C., Parinov, S. and Korzh, V., New ways to admire zebrafish: progress in functional genomics research methodology, *Biotechniques* 38, 897-906, 2005; Amsterdam, A. and Becker, T.S., Transgenes as screening tools to probe and manipulate the zebrafish genome, *Dev.Dyn.* 234, 255-268, 2005; Hsia, N. and Zon, L.I., Transcriptional regulation of hematopoietic stem cell development in zebrafish, *Exp.Hematol.* 33, 1007-1014, 2005; de Jong, J.L., and Zon, L.I., Use of the zebrafish to study primitive and definitive hematopoiesis, *Annu.Rev. Genet.* 39, 481-501, 2005; Alestrom, P., Holter, J.L., Nourizadeh-Lillabadi, R., Zebrafish in functional genomics and aquatic biomedicine, *Trends Biotechnol.* 24, 15-21, 2006.

## Zeolites

An aluminum silicate cage-like compound with a negative charge which "captures" cations in the cavity. Zeolites are used as molecular sieves for drying solvents and gases (Mumpton, F.A., La roca magica: uses of natural zeolites in agriculture and

industry, *Proc.Natl.Acad.Sci.USA*. 96, 3463-3470, 1999; Kaiser, L.G., Meersmann, T., Logan, J.W., and Pines, A., Visualization of gas flow and diffusion in porous media, *Proc.Nat.Acad.Sci.USA* 97, 2414-2418, 2000; Kuznicki, S.M., Bell, V.A., Nair, S., *et al.*, A titanosilicate molecular sieve with adjustable pores for size-selective adsorption of molecules, *Nature* 412, 720-724, 2001; Yan, A.X., Li, X.W., and Ye, Y.H., Recent progress on immobilization of enzymes on molecular sieves for reactions in organic solvents, *Appl.Biochem.Biotechnol.* 101, 113-129, 2002). There has been some interest in the specific adsorption on biopolymers such as proteins on zeolites (Matsui, M., Kiyozumi, Y., Yamamoto, T., Selective adsorption of biopolymers on zeolites, *Chemistry* 7, 1555-1560, 2001; Chiku, H., Matsui, M., Murakami, S., *et al.*, Zeolites as new chromatographic carriers for proteins—easy recovery of proteins adsorbed on zeolites by polyethylene glycol, *Anal.Biochem.* 318, 80-85, 2003; Sakaguchi, K., Matsui, M., and Mizukami, F., Applications of zeolite inorganic composites in biotechnology: current status and perspectives, *Appl.Microbiol. Biotechnol.* 67, 306-311, 2005). There are suggestions for the use of zeolites in health (Pavelic, K., Hadzija, M., Bedrica, L., Natural zeolite clinoptilolite: new adjuvant in anticancer therapy, *J.Mol. Med.* 78, 708-720, 2001; Zarkovic, N., Zarkovic, K., Kralj, M., *et al.*, Anticancer and antioxidative effects of micronized zeolite clinoptilolite, *Anticancer Res.* 23, 159-1595, 2003).

## Zinc Finger Motifs

Motifs in DNA- and RNA-binding proteins whose amino acids are folded into a single structural unit around a zinc atom. In the classic zinc finger, one zinc atom is bound to two cysteines and two histidines. In between the cysteines and histidines are 12 residues which form a DNA binding fingertip. By variations in the composition of the sequences in the fingertip and the number and spacing of tandem repeats of the motif, zinc fingers can form a large number of different sequence specific binding sites. Specificity of binding to the nucleic acid is achieved by recognition of an 18 bp sequence. See Gommans, W.M., Haisma, H.J., and Rots, M.G., Engineering zinc finger protein transcription factors: the therapeutic relevance of switching endogenous gene expression on or off at command, *J.Mol.Biol.* 354, 507-519, 2005; Struhl, K., Helix-turn-helix, zinc-finger, and leucine-zipper motifs for eukaryotic transcriptional regulatory proteins, *Trends Biochem. Sci.* 14, 137-140, 1989; Schleif, R., DNA binding by proteins, *Science* 241, 1182-1187, 1988; Durai, S., Mani, M., Kandavelou, K., Wu, J., Porteus, M.H., and Chandrasegaran, S., Zinc finger nucleases: custom-designed molecular scissors for genome engineering of plant and mammalian cells, *Nucl.Acids Res.* 26, 5978-5990, 2005; Chen, Y. and Varani, G., Protein families and RNA recognition, *FEBS J.* 272, 2088-2097, 2005.

## Zinc Finger Nuclease

Zinc finger nucleases are engineered nucleases which consist of a zinc finger domain or domains fused to the nuclease domain from FokI restriction endonuclease. This nuclease domain is non-specific such that the sequence specificity cleavage

of the zinc finger nucleases is provided from the zinc finger domain(s). See Urnov, F.D., Miller, J.C., Lee, Y.L., *et al.*, Highly efficient endogenous 45-52, 2006; human gene correction using zinc-finger nucleases, *Nature* 435, 646-651, 2005; Mani, M., Smith, J., Kandavelou, K., Berg, J.M., and Chandrasegaran, S., Binding of two zinc finger nuclease monomers to two specific sites is required for effective double-strand DNA cleavage, *Biochem.Biophys.Res.Communic.* 334, 1191-1197, 2005; Mani, M., Kandavelou, K., Dy, F.J., Durai, S., and Chandrasegaran, S., Design, engineering, and characterization of zinc finger nucleases, *Biochem.Biophys.Res.Communic.* 335, 447-457, 2005; Porteus, M.H., Mammalian gene targeting with designed zinc finger nucleases, *Mol.Ther.* 13, 438-446, 2006; Dhanasekaran, M., Negi, S., and Sugiura, Y., Designer zinc finger proteins: tools for creating artificial DNA-binding proteins, *Acc.Chem.Res.* 39, 45-2, 2006.

## Zymography

A method for detecting enzyme activity on a matrix, usually a polyacrylamide gel or agarose gel after electrophoretic separation; See Lombard, C., Saulnier, J., and Wallach, J., Assays of matrix metalloproteinases (MMPs) activities: a review, *Biochimie* 87, 265-272, 2005; Frederiks, W.M., and Mook, O.R., Metabolic mapping of proteinase activity with emphasis on in situ zymography of gelatinases: review and protocols, *J.Histochem.Cytochem.* 52, 711-722, 2004.

## Zymosan

An insoluble polysaccharide derived from the cell wall of fungi. More specifically, the term zymosan is used to refer to a specific preparation from yeast which is used in models of inflammatory disease and multi-organ dysfunction. There is evidence for specific interaction with Toll receptors on macrophages. See Fitzpatrick, F.W. and DiCarlo, F.J., Zymosan, *Ann.N.Y.Acad.Sci.* 118, 233-262, 1964; Czop, J.K. Phagocytosis of particular activators of the alternative complement pathway: effects of fibronectin, *Adv.Immunol.* 38, 361-398, 1986; Stewart, J. and Weir, D.M., Carbohydrates as recognition molecules in macrophage activities, *J.Clin.Lab. Immunol.* 28, 103-108, 1989; Takeuchi, O. and Akira, S., Toll-like receptors: their physiological role and signal transduction system, *Int.Immunopharmacol.* 1, 625-635, 2001; Levitz, S.M., Interactions of toll-like receptors with fungi, *Microbes Infect.* 6, 1351-1355, 2004; Volman, T.J., Hendriks, T., and Goris, R.J., Zymosan-induced generalized inflammation: experimental studies into mechanisms leading to multiple organ dysfunction syndrome, *Shock* 23, 291-297, 2005; Ikeda, Y., Adachi, Y., Ishibashi, K., Miura, N., and Ohno, N., Activation of toll-like receptor-mediated NF-kappa beta by zymosan-derived water-soluble fraction: possible contribution of endotoxin-like substances, *Immunopharmacol.Immunotoxicol.* 27, 285-298, 2005.

<sup>a</sup> the distinction between peptide and protein can be arbitrary.
