About the Authors	xliv
How to Use This Text	xlvi

UNIT I: NURSING'S PERSPECTIVE: PAST, PRESENT, AND FUTURE

CHAPTER 1: Evolution of Nursing and Health Care 3

Historical Overview	4
Evolution of Nursing	5
Religious Influences	5
Florence Nightingale	9
Research Focus	9
Nursing and the Civil War	10
The Women's Movement	11
Nursing Pioneers	11
Nursing Leaders	13
Nursing in the 20th Century	15
Flexner Report	15
Early Insurance Plans	16
Landmark Reports in Nursing Education	16
Other Health Care Initiatives	17
Selected Legislation	17
Education and Practice: Contemporary Reports	17
Social Forces Affecting Nursing	18
Healthy People Initiatives	19
Alternative Methods of Health Care Delivery	19
Costs and Quality Controls	19
Health Care Reform	20
The Future of Nursing	20

CHAPTER 2: Theoretical Foundations of Nursing **23**

Components of the Theoretical Foundation	.24
What Is a Concept?	.24
What Is a Proposition?	.24
What Is a Theory?	.24
Use of Theories from Other Disciplines	.25
Importance of Nursing Theories	.25
Scope of Theories	.26
Research Focus	.26
Grand Theory	.27
Middle-Range Theory	.27
Micro-Range Theory	.27
The Evolution of Nursing Theory	.27
Knowledge Development in Nursing	.27
The Metaparadigm of Nursing	.27
Paradigms in Nursing	.30
Selected Nursing Theories	.31
Florence Nightingale	.31
Early Nursing Theories	.32
Contemporary Nursing Theories	.33
Theories for the New Worldview of Nursing	.36
Continuing Evolution of Nursing Theory	.37

CHAPTER 3: Nursing Education and Research **39**

Nursing Education	.40
Types of Programs	.40
Education Reform Mandates	.43
Trends in Nursing Education	.44
Research Focus	.46
Research: Substantiating the Science of Nursing	.49
Historical Development	.49
Framework	.50
Application	.52
Organizational Structure	.53
Research Focus	.53
Trends in Nursing Research	.54

CHAPTER 4: The Health Care Delivery System **57**

Types of Health Care Services	.58
Primary: Health Promotion and Illness Prevention	.58
Secondary: Diagnosis and Treatment	.59
Tertiary: Rehabilitation	.59
Health Care Settings	.59
Public Sector	.59
Private Sector	.60
Health Care Team	.62
Nurse	.62

VIII Contents

Economics of Health Care	.63
Private Insurance	.63
Managed Care	.63
Federal Government Insurance Plans	.65
Canadian Health Insurance	.65
Research Focus	.65
Factors Influencing the Delivery of Health Care	.66
Cost	.66
Access	.67
Quality	.67
Challenges within the Health Care System	.67
Disillusionment with Professionals	.68
Loss of Control	.68
Decreased Hospital Use	.68
Changing Practice Settings	.69
Ethical Issues	.69
Vulnerable Populations	.69
Nursing's Response to Health Care Challenges	.70
Nursing's Agenda for Health Care Reform	.70
Standards of Care	.71
Advanced Practice	.71
Public versus Private Programs	.72
Public Health	.72
Community Health	.72
Long-Term Care	.73
Trends and Issues	.74

UNIT II: NURSING PROCESS: THE STANDARD OF CARE

CHAPTER 5: Critical Thinking and the Nursing Process 79

Critical Thinking	.80
Components of Critical Thinking	.80
Phases of Critical Thinking	.81
Development of Critical Thinking Skills	.81
Critical Thinking and Creativity	.81
Critical Thinking and Problem Solving	.82
Critical Thinking and Decision Making	.83
The Nursing Process	.83
Historical Perspective	.83
Overview of the Nursing Process	.83
Assessment	.84
Diagnosis	.85
Outcome Identification and Planning	.87
Implementation	.88
Evaluation	.88
Research Focus	.88
Critical Thinking Applied in Nursing	.89

CHAPTER 6: Assessment **93**

Purpose of Assessment	.94
Types of Assessment	.94
Comprehensive Assessment	.95
Focused Assessment	.95
Ongoing Assessment	.95
Data Collection	.95
Types of Data	.96
Sources of Data	.96
Methods of Data Collection	.96
Data Verification	.101
Data Organization	.102
Assessment Models	.102
Research Focus	.103
Data Interpretation	.104
Data Documentation	.104
Types of Assessment Formats	.104

CHAPTER 7: Nursing Diagnosis **113**

What Is a Nursing Diagnosis?	.114
Comparison of Nursing and Medical Diagnoses	.114
Historical Perspective	.115
Research	.116
Research Focus	.116
Purposes of Nursing Diagnosis	.117
Nursing Diagnoses and Diagnostic-Related Groups	.118
Components of a Nursing Diagnosis	.118
The Two-Part Statement	.118
The Three-Part Statement	.122
Categories of Nursing Diagnoses	.122
Taxonomy of Nursing Diagnosis	.123
Developing a Nursing Diagnosis	.124
Assessing Database	.124
Validating Cues	.124
Interpreting Cues	.124
Clustering Cues	.125
Consulting NANDA List of Nursing Diagnoses	.125
Writing the Nursing Diagnosis Statement	.125
Avoiding Errors in Developing a Nursing Diagnosis	.126
Problem with Assessment Data	.126
Incomplete Collection of Assessment Data	.126
Restricted Data Collection	.126
Failure to Validate Data	.126
Misinterpretation of Data	.126
Inappropriate Data Clustering Associated with Lack of Clinical Knowledge	.126
Incorrect Writing of the Nursing Diagnosis Statement	.126

Limitations of Nursing Diagnosis127
Overcoming Barriers to Nursing Diagnosis127

CHAPTER 8: Outcome Identification and Planning 131

Purposes of Outcome Identification and Planning132
Process of Outcome Identification and Planning132
 Critical Thinking133
 Establishing Priorities133
 Establishing Goals and Expected Outcomes134
 Writing Goals135
 Problems Frequently Encountered in Planning137
 Planning Nursing Interventions138
 Evaluating Care140
Nursing Outcomes Classification (NOC)140
Plan of Care141
Strategies for Effective Care Planning142
Research Focus143

CHAPTER 9: Implementation 147

Purposes of Implementation148
Requirements for Effective Implementation148
Implementation Activities148
 Ongoing Assessment149
 Establishment of Priorities149
 Allocation of Resources150
 Nursing Interventions153
 Evaluating Interventions157
 Documentation of Interventions157
Research Focus157

CHAPTER 10: Evaluation 161

Evaluation of Client Care162
Components of Evaluation162
 Techniques163
 Sources of Data163
 Goals and Expected Outcomes164
Methods of Evaluation164
 Establishing Standards164
 Collecting Data164
 Determining Goal Achievement164
 Relating Nursing Actions to Client Status164
 Judging the Value of Nursing Interventions164
 Reassessing the Client's Status164
 Modifying the Plan of Care165
 Critical Thinking and Evaluation165
Evaluation and Quality of Care165
 Elements in Evaluating the Quality of Care165

Research Focus	166
Nursing Audit	167
Peer Evaluation	167
Evaluation and Accountability	168
Multidisciplinary Collaboration in Evaluation	170

UNIT III: THE THERAPEUTIC NATURE OF NURSING

CHAPTER 11: Nursing, Healing, and Caring **175**

Nursing's Therapeutic Value	176
Definition of Nursing	176
Nursing: A Blend of Art and Science	176
Purposes of Nursing	176
Nursing: A Healing Modality	177
Caring: An Integral Component of Nursing	177
Care in the High-Tech Environment	178
Nurse-Client Relationship	179
Phases of Therapeutic Relationship	179
Therapeutic Use of Self	181
Characteristics of Therapeutic Relationships	182
Warmth	182
Hope	182
Rapport	182
Trust	183
Empathy	183
Acceptance	183
Research Focus	183
Active Listening	184
Humor	184
Compassion	184
Self-Awareness	185
Nonjudgmental Approach	185
Flexibility	185
Risk-Taking	186
Therapeutic Value of the Nursing Process	186
Nursing Roles	186
Caregiver	186
Counselor	186
Teacher	186
Client Advocate	186
Change Agent	187
Team Member	187
Resource Person	187

CHAPTER 12: Therapeutic Communication **189**

The Communication Process	190
Components of the Communication Process	190

Factors Influencing Communication	.191
Levels of Communication	.193
Modes of Communication	.194
Verbal Messages	.194
Nonverbal Messages	.194
Metacommunication	.196
Types of Communication	.196
Interdisciplinary Communication	.196
Therapeutic Communication	.196
Research Focus	.197
Therapeutic Approaches with Clients	.199
Barriers to Therapeutic Interaction	.199
Language Differences	.199
Cultural Differences	.199
Gender	.201
Health Status	.201
Developmental Level	.202
Knowledge Differences	.202
Emotional Distance	.202
Emotions	.202
Daydreaming	.202
Communication Blocks	.202
Communication, Critical Thinking, and Nursing Process	.202
Assessment	.202
Nursing Diagnosis	.204
Outcome Identification and Planning	.205
Implementation	.205

CHAPTER 13: Client Education **209**

The Teaching-Learning Process	.210
Purposes of Client Teaching	.210
Facilitators of Learning	.211
Barriers to Learning	.212
Domains of Learning	.212
Professional Responsibilities Related to Teaching	.213
Legal Aspects	.213
Documentation	.213
Learning Throughout the Life Cycle	.216
Children	.216
Adolescents	.216
Older Adults	.219
Teaching-Learning and the Nursing Process	.219
Assessment	.219
Learning Styles	.219
Research Focus	.219
Learning Needs	.220
Potential Learning Needs	.221
Ability to Learn	.221

Readiness to Learn221
Client Strengths221
Previous Experience and Knowledge Base222
Nursing Diagnosis222
Outcome Identification and Planning222
Implementation224
Evaluation225

CHAPTER 14: Nursing and Complementary/Alternative Treatment Modalities 229

Historical Influences on Contemporary Practices230
From Ancient Tradition to Early Science230
Shamanistic Tradition231
Allopathic Medicine232
Contemporary Trends232
Mind-Body Medicine and Research233
Holism and Nursing Practice233
The Nature of Healing233
Complementary/Alternative Interventions234
Mind-Body: Self-Regulatory Techniques234
Body-Movement: Manipulation Strategies236
Energetic-Touch Healing237
Spiritual Therapies245
Nutritional Therapies245
Other CAM Methodologies249
Research Focus251
Nursing and Complementary/Alternative Approaches252
Nurse as Instrument of Healing253

UNIT IV: THE INDIVIDUAL AND HEALTH

CHAPTER 15: Health, Holism, and the Individual 259

Health, Illness, and Wellness260
Models of Health260
Illness Perspectives262
Wellness Perspectives262
Health Behaviors262
Variables Influencing Health Behaviors263
Health Promotion264
Health Promotion Activities265
Health Protection Activities266
Disease Prevention Activities266
Nurse’s Role in Health Promotion, Health Protection, and Disease Prevention266
Health Promotion and Vulnerable Populations267
The Individual as a Holistic Being267
Needs and Health268

Physiological Dimension	.269
Psychological Dimension	.269
Sociocultural Dimension	.269
Intellectual Dimension	.269
Spiritual Dimension	.269
Research Focus	.276
Sexual Dimension	.276

CHAPTER 16: Cultural Diversity **283**

Concepts of Culture	.284
Culture	.284
Ethnicity and Race	.285
Labeling and Stereotyping	.285
Dominant Values in the United States	.285
Multiculturalism in the United States	.286
Value of Diversity	.286
Organizing Phenomena of Culture	.286
Communication	.286
Space	.291
Orientation to Time	.291
Social Organization	.291
Cultural Disparities in Health and Health Care Delivery	.294
Vulnerable Populations	.294
Environmental Control	.296
Folk Medicine	.296
Biologic Variations	.296
Transcultural Nursing	.296
Cultural Competence	.299
Cultural Competence and Nursing Process	.299
Assessment	.300
Nursing Diagnosis	.300
Research Focus	.300
Outcome Identification and Planning	.302
Implementation	.302
Evaluation	.303

CHAPTER 17: The Life Cycle **305**

Fundamental Concepts of Growth and Development	.306
Principles of Growth and Development	.306
Factors Influencing Growth and Development	.306
Theoretical Perspectives of Human Development	.308
Physiological Dimension	.308
Psychosocial Dimension	.308
Cognitive Dimension	.309
Moral Dimension	.312
Spiritual Dimension	.313
Holistic Framework for Nursing	.315
Stages of the Life Cycle	.315

Prenatal Period	.315
Safety Considerations	.317
Neonate	.317
Infant	.320
Toddler	.323
Preschooler	.326
School-Aged Child	.328
Preadolescent	.328
Adolescent	.334
Young Adult	.339
Research Focus	.339
Middle Adult	.341
Older Adult	.342

CHAPTER 18: The Older Client **351**

Defining Old Age	.352
Theories of Aging	.352
Myths and Stereotypes of Aging	.353
Quality of Life among the Elderly	.353
Changes Associated with Aging	.354
Developmental Changes	.354
Physiological Changes	.354
Research Focus	.356
Psychosocial Changes	.361
Medications and the Older Adult	.363
Adverse Drug Reaction	.363
Compliance	.364
Mistreatment of the Older Adult	.364
Nursing Process and the Older Adult	.365
Assessment	.365
Nursing Diagnosis	.366
Outcome Identification and Planning	.367
Implementation	.367
Evaluation	.372

CHAPTER 19: Self-Concept **375**

Components of Self-Concept	.376
Identity	.376
Body Image	.376
Self-Esteem	.377
Role Performance	.377
Development of Self-Concept	.378
Childhood	.378
Adolescence	.378
Adulthood	.379
Factors Affecting Self-Concept	.379
Altered Health Status	.379
Research Focus	.380

Developmental Transitions381
Experience381
Assessment381
Diagnosis382
Outcome Identification and Planning383
Implementation383
Initiate Therapeutic Interaction383
Support Healthy Defense Mechanisms383
Ensure Satisfaction of Needs384
Promote Positive Self-Esteem Across the Life Span384
Evaluation385

CHAPTER 20: Stress, Anxiety, and Adaptation **389**

Stress, Anxiety, and Adaptation390
Sources of Stress390
Responses to Stress390
Physiological Response to Stress390
Manifestations of Stress391
Outcomes of Stress391
Stress and Illness395
Impact of Illness and Treatment396
Stress and Change396
Types of Change397
Theories of Change397
Resistance to Change398
Changing Paradigms398
Nurse As Change Agent399
Assessment399
Nursing Diagnosis400
Outcome Identification and Planning400
Implementation400
Meeting Basic Needs400
Environmental Strategies400
Verbalization400
Involvement of Family and Significant Others402
Stress Management Techniques402
Crisis Intervention405
Evaluation406
Personal Stress Management Approaches for the Nurse406
Burnout and Nurses406
Research Focus409

CHAPTER 21: Loss and Grief **413**

Loss414
Loss as Crisis414
Types of Loss414
Grief415
Theories of the Grieving Process415

Types of Grief	416
Factors Affecting Grief	418
Research Focus	421
Assessment	422
Diagnosis	422
Outcome Identification and Planning	422
Implementation	423
Evaluation	424
Death	424
End-Of-Life (EOL) Care	424
Stages of Death and Dying	424
Ethical Implications	426
Assessment	426
Diagnosis	426
Outcome Identification and Planning	426
Implementation	426
Care After Death	430
Care of the Body	431
Legal Aspects	431
Care of the Family	431
Nurse's Self-Care	432

UNIT V: PROFESSIONAL ACCOUNTABILITY

CHAPTER 22: Professional Accountability and Leadership 437

Professional Nursing Practice	438
Criteria of a Profession	438
Professional Accountability	441
Elements of Professional Accountability	441
Legislative Accountability	443
Advanced Practice Nursing	448
Leadership in Nursing	449
Managerial Functions	449
Leadership Styles	450
Leadership Characteristics	452
Power	453
Networking	455
Empowerment	456
Politics of Nursing	456
Research Focus	457

CHAPTER 23: Legal Accountability and Responsibilities 459

Legal Foundations of Nursing	460
Sources of Law	460
Legal Liability in Nursing	462
Negligence and Malpractice	462
Informed Consent	463

Assault and Battery	.465
False Imprisonment	.465
Restraints or Seclusion	.465
Privacy and Confidentiality	.465
Defamation	.466
Fraud	.466
Unprofessional Conduct	.466
Controlled Substances	.466
Safety	.467
Understaffing	.467
Executing Prescribed Orders	.467
Legal Responsibilities and Roles of Professional Nurses	.467
Provider of Service	.467
Expert Witness	.468
Forensic Specialist	.468
Reporting Responsibilities	.468
Legal Responsibilities of Students	.468
Legal Safeguards for Nursing Practice	.468
Institutional Policies	.468
Professional Liability Insurance	.468
Risk Management Programs	.468
Incident Reports	.469
Client Education	.469
Legislation Affecting Nursing	.469
Advance Directives	.469
Abortion	.470
The Americans with Disabilities Act	.470
Good Samaritan Acts	.471
Research Focus	.471
National Practitioner Data Bank	.472
Occupational Safety and Health Act	.472
Legal Issues Related to Death	.472
Do Not Resuscitate Orders	.472
Euthanasia	.472
Wills	.472
Pronouncement of Death	.472
Care of the Deceased	.472
Organ Donation	.473
Autopsies	.473

CHAPTER 24: Ethical Obligations and Accountability **475**

Concept of Ethics	.476
Relationship Between Legal and Ethical Concepts	.476
Ethics in Health Care	.477
Ethical Theories	.477
Teleology	.477
Deontology	.477
Ethical Principles	.478

Autonomy	478
Nonmaleficence	478
Beneficence	479
Justice	479
Veracity	479
Fidelity	480
Values and Ethics	480
Values Clarification	480
Ethical Codes	480
Clients' Rights	482
Ethical Dilemmas	482
Ethical Decision Making	482
Framework for Ethical Decision Making	482
Euthanasia	483
Refusal of Treatment	484
Research Focus	484
Scarce Resources	485
Ethics and Nursing	485
Ethics Committees	485
Nurse As Client Advocate	485
Nurse As Whistle-Blower	486

CHAPTER 25: The Role of Quality Management in Accountability **489**

The Quality Movement in Health Care	490
Evolution	490
Role of the JCAHO in the Quality Movement	490
Defining Quality	490
Factors Influencing the Quality Movement in Health Care	491
Legal and Ethical Implications	492
Quality and Cost	494
Quality Improvement	494
Principles	494
Customer Perspective	495
Organizational Structure for Quality Management	495
Organizational Culture	496
Work Force Diversity	496
Research Focus	496
Empowerment	498
Leadership	498
Teamwork	498
Process Improvement	499
Prioritization	499
Scientific Approach	499
Tools	499
Nursing's Role in Quality Management	500

CHAPTER 26: Accountability: Documentation and Reporting **503**

Documentation as Communication	.504
Documentation Defined	.504
Purposes of Health Care Documentation	.505
Principles of Effective Documentation	.509
Elements of Effective Documentation	.510
Methods of Documentation	.512
Narrative Charting	.512
Source-Oriented Charting	.513
Problem-Oriented Charting	.513
PIE Charting	.513
Focus Charting	.513
Charting by Exception	.514
Computerized Documentation	.515
Case Management Process	.516
Forms for Recording Data	.517
Kardex	.517
Flow Sheets	.517
Nurses' Progress Notes	.517
Discharge Summary	.522
Trends in Documentation	.522
Nursing Minimum Data Set (NMDS)	.522
Nursing Diagnoses	.522
Nursing Intervention Classification (NIC)	.522
Nursing Outcomes	.524
Reporting	.524
Summary Reports	.524
Walking Rounds	.525
Telephone Reports and Orders	.525
Incident Reports	.526
Research Focus	.526

UNIT VI: DIAGNOSTIC AND THERAPEUTIC INTERVENTIONS

CHAPTER 27: Vital Signs and Physical Assessment **533**

Vital Signs	.534
Physiological Function	.535
Factors Influencing Vital Signs	.538
Age	.538
Gender	.539
Heredity	.539
Race	.539
Lifestyle	.539
Environment	.539
Medications	.540
Pain	.540

Other Factors	.540
Measuring Vital Signs	.541
Equipment	.541
Measurement of Height and Weight	.541
Body Temperature	.546
Pulse	.553
Respirations	.558
Blood Pressure	.559
Physical Examination	.566
Preparation	.566
General Survey	.570
Techniques	.571
Integument	.572
Head and Neck	.578
Thorax and Lungs	.592
Heart and Vascular System	.594
Breasts and Axillae	.603
Abdomen	.608
Female Genitalia and Anus	.609
Male Genitalia, Anus, and Rectum	.609
Research Focus	.612
Musculoskeletal System	.614
Neurologic System	.615
Care of the Client after the Examination	.623
Data Documentation	.624

CHAPTER 28: Diagnostic Testing **627**

Understanding Diagnostic Testing	.628
Noninvasive and Invasive Diagnostic Testing	.629
Nursing Care of the Client	.629
Laboratory Tests	.633
Specimen Collection	.633
Blood Chemistry	.651
Research Focus	.652
Urine Tests	.656
Stool Tests	.658
Papanicolaou Test	.660
Radiologic Studies	.660
Chest X-Ray	.660
Research Focus	.661
Kidney-Ureter-Bladder	.662
Mammography	.662
Skeletal X-Rays	.662
Computed Tomography	.662
Barium Studies	.662
Angiography	.663
Arteriography	.663
Dye Injection Studies	.664
Ultrasonography	.665

Echocardiograms665
Doppler Ultrasonography665
Magnetic Resonance Imaging666
Radioactive Studies666
Electrodiagnostic Studies666
Electrocardiography666
Electroencephalography666
Endoscopy667
Aspiration/Biopsy669
Amniocentesis669
Bone Marrow Aspiration/Biopsy669
Paracentesis669
Thoracentesis669
Cerebrospinal Fluid Aspiration670

CHAPTER 29: Medication Administration **673**

Drug Standards and Legislation674
Standards674
Federal Legislation674
State and Local Legislation675
Health Care Institution Regulations675
Pharmacokinetics675
Absorption675
Distribution676
Metabolism677
Excretion677
Drug Nomenclature677
Drug Action677
Pharmacology677
Drug Interaction680
Side Effects and Adverse Reactions680
Food and Drug Interactions680
Factors Influencing Drug Action681
Professional Roles in Medication Administration681
Types of Medication Orders683
Parts of the Drug Order684
Systems of Weight and Measure684
Metric System684
Apothecary System684
Household System684
Approximate Dose Equivalents684
Converting Units of Weight and Volume685
Drug Dose Calculations686
Safe Drug Administration686
Guidelines for Medication Administration687
Documentation of Drug Administration689
Drug Supply and Storage690
Drug Abuse690
Medication Compliance692

Legal Aspects of Administering Medications	692
Medication Errors	692
Assessment	693
Medical History	693
Drug History	693
Physical Examination	694
Diagnostic and Laboratory Data	694
Nursing Diagnosis	694
Planning	695
Outcome Identification	695
Implementation	695
Administer Oral Drugs	696
Administer Parenteral Drugs	700
Administer Topical Medications	721
Complementary Therapy	734
Evaluation	738

CHAPTER 30: Responding to the Needs of the Perioperative Client

741

Surgical Interventions	742
Setting	743
Perioperative Management of Care	743
Surgeon Responsibilities	743
Anesthesia Provider Responsibilities	743
Nurse Responsibilities	744
Anesthesia	744
General Anesthesia	744
Regional Anesthesia	746
Local Anesthesia	746
Preoperative Phase	746
Assessment	746
Diagnosis	749
Outcome Identification and Planning	750
Implementation	750
Evaluation	763
Intraoperative Phase	764
Surgical Environment	764
Surgical Team	764
Research Focus	764
Assessment	765
Nursing Diagnoses	765
Outcome Identification and Planning	765
Interventions	766
Evaluation	768
Transfer to Postanesthesia Care Unit	769
Postoperative Phase	769
Assessment	769
Nursing Diagnosis	769
Outcome Identification and Planning	770

Interventions771
Evaluation and Discharge from the PACU774
Ongoing Postoperative Care774
Evaluation776

UNIT VII: NURSING MANAGEMENT OF BASIC NEEDS

CHAPTER 31: Safety, Infection Control, and Hygiene 779

Safe Environment780
Factors Affecting Safety780
Age780
Lifestyle781
Sensory and Perceptual Alterations782
Mobility782
Emotional State782
Types of Accidents782
Potential Occupational Hazards783
Infection Control Principles784
Pathogens, Infection, and Colonization784
Chain of Infection784
Normal Defense Mechanisms786
Stages of the Infectious Process788
Nosocomial Infections788
Blood-Borne Pathogens789
Hygiene789
Factors Influencing Hygienic Practice789
Assessment790
Physical Examination791
Diagnostic and Laboratory Data793
Nursing Diagnosis794
Risk for Injury794
Risk for Infection795
Self-Care Deficits795
Other Nursing Diagnoses795
Outcome Identification and Planning796
Implementation796
Raise Safety Awareness and Knowledge797
Prevent Falls799
Research Focus800
Reduce Bathroom Hazards804
Prevent Fire805
Ensure Safe Operation of Electrical Equipment805
Reduce Exposure to Radiation805
Prevent Poisoning806
Reduce Noise Pollution806
Ensure Asepsis806

Reduce or Eliminate Infectious Agents820
Practice Standard and Isolation Precautions822
Alternative Therapies832
Provide for Client Bathing Needs833
Provide Clean Bed Linen838
Provide Skin Care841
Offer Back Rubs845
Provide Foot and Nail Care848
Provide Oral Care848
Fluoride848
Provide Hair Care854
Provide Eye, Ear, and Nose Care856
Evaluation863

CHAPTER 32: Oxygenation **867**

Physiology of Oxygenation868
Ventilation868
Alveolar Gas Exchange869
Oxygen Transport and Delivery870
Cellular Respiration873
Factors Affecting Oxygenation873
Age873
Environmental and Lifestyle Factors873
Disease Processes874
Physiological Responses to Reduced Oxygenation877
Assessment878
Health History878
Physical Examination878
Diagnostic and Laboratory Data880
Nursing Diagnosis881
Ineffective Airway Clearance882
Ineffective Breathing Patterns882
Impaired Gas Exchange882
Decreased Cardiac Output882
Ineffective Tissue Perfusion882
Other Nursing Diagnoses883
Outcome Identification and Planning884
Implementation884
Interventions to Promote Airway Clearance884
Interventions to Improve Breathing Patterns895
Interventions to Improve Oxygen Uptake and Delivery899
Interventions to Increase Cardiac Output and Tissue Perfusion903
Emergency Interventions904
Interventions to Address Associated Nursing Diagnoses904
Research Focus909
Complementary Therapies911
Evaluation912

CHAPTER 33: Comfort and Sleep **915**

Pain	.916
Nature of Pain	.916
Physiology of Pain	.918
Factors Affecting the Pain Experience	.921
Assessment	.923
Nursing Diagnosis	.927
Outcome Identification and Planning	.927
Implementation	.928
Evaluation	.941
Rest and Sleep	.942
Physiology of Rest and Sleep	.942
Biological Clock	.944
Factors Affecting Rest and Sleep	.945
Illness or Hospitalization	.946
Alteration in Sleep Patterns	.947
Hypersomnia or Narcolepsy	.947
Assessment	.948
Nursing Diagnosis	.948
Outcome Identification and Planning	.948
Implementation	.948
Evaluation	.950

CHAPTER 34: Mobility **953**

Overview of Mobility	.954
Body Alignment	.954
Body Mechanics	.956
Physiology of Mobility	.956
The Musculoskeletal System	.956
Nervous System	.956
Exercise	.957
Types of Exercise	.958
Physical Fitness	.958
Factors Affecting Mobility	.959
Health Status	.959
Developmental Stage	.959
Environment	.965
Attitudes and Beliefs	.965
Lifestyle	.966
Physiological Effects of Mobility and Immobility	.966
Neurological Effects/Mental Status	.966
Cardiovascular Effects	.966
Respiratory Effects	.967
Musculoskeletal Effects	.967
Digestive Effects	.967
Elimination Effects	.967
Integumentary Effects	.968

Assessment	.968
Health History	.968
Physical Examination	.968
Nursing Diagnosis	.973
Outcome Identification and Planning	.974
Bed Rest	.975
Restorative Nursing Care	.975
Health Promotion and Fitness	.975
Implementation	.976
Meeting Psychosocial Needs	.976
Applying Principles of Body Mechanics	.976
Maintaining Body Alignment: Positioning	.977
Performing Range-of-Motion Exercises	.984
Transfer Techniques	.984
Assisting with Ambulation	.998
Wellness Promotion	.1006
Complementary Treatment Modalities	.1006
Evaluation	.1007
Research Focus	.1007

CHAPTER 35: Skin Integrity and Wound Healing **1011**

Wounds	.1011
Physiology of Wound Healing	.1011
Factors Affecting Wound Healing	.1014
Wound Classification	.1015
Assessment	.1018
Nursing Diagnoses	.1020
Outcome Identification and Planning	.1020
Implementation	.1022
Research Focus	.1029
Administer Heat and Cold Therapy	.1034
Evaluation	.1038
Pressure Ulcers	.1038
Physiology of Pressure Ulcers	.1039
Risk Factors for Pressure Ulcers	.1039
Assessment	.1039
Nursing Diagnoses	.1039
Outcome Identification and Planning	.1039
Implementation	.1039
Complementary Therapies	.1043
Evaluation	.1047

CHAPTER 36: Sensation, Perception, and Cognition **1049**

Physiology of Sensation, Perception, and Cognition	.1050
Components of Sensation and Perception	.1050
Components of Cognition	.1053
Factors Affecting Sensation, Perception, and Cognition	.1054
Age	.1054

Environment	.1055
Lifestyle	.1055
Stress	.1055
Illness	.1056
Medications	.1056
Sensory, Perceptual, and Cognitive Alterations	.1056
Sensory Deficits	.1056
Sensory Deprivation	.1056
Sensory Overload	.1057
Assessment	.1057
Health History	.1058
Physical Examination	.1058
Mental-Status Assessment	.1059
Functional Abilities	.1060
Environment	.1060
Diagnosis	.1062
Outcome Identification and Planning	.1062
Implementation	.1064
Managing Sensory Deficits	.1064
Managing Sensory Deprivation	.1065
Managing Sensory Overload	.1065
Caring for the Unconscious Client	.1066
Use of Restraints	.1067
Complementary/Alternative Therapies	.1067
Research Focus	.1067
Evaluation	.1068

CHAPTER 37: Fluid, Electrolyte, and Acid-Base Balance 1073

Physiology of Fluid and Acid-Base Balance	.1074
Fluid Compartments	.1074
Body Water Distribution	.1075
Electrolytes	.1075
Movement of Body Fluids	.1075
Regulators of Fluid Balance	.1078
Acid-Base Balance	.1079
Regulators of Acid-Base Balance	.1079
Factors Affecting Fluid and Electrolyte Balance	.1080
Age	.1080
Lifestyle	.1080
Disturbances in Electrolyte and Acid-Base Balance	.1080
Electrolyte Disturbances	.1080
Acid-Base Disturbances	.1088
Assessment	.1092
Health History	.1092
Physical Examination	.1092
Diagnostic and Laboratory Data	.1094
Nursing Diagnosis	.1096
Excess Fluid Volume	.1096
Deficient Fluid Volume	.1096

Risk for Deficient Fluid Volume	1097
Other Nursing Diagnoses	1097
Outcome Identification and Planning	1098
Implementation	1098
Monitor Daily Weight	1098
Measure Vital Signs	1098
Measure Intake and Output	1098
Provide Oral Hygiene	1100
Initiate Oral Fluid Therapy	1100
Maintain Tube Feeding	1101
Monitor Intravenous Therapy	1101
Research Focus	1119
Complementary Therapy	1135
Evaluation	1136

CHAPTER 38: Nutrition **1141**

Physiology of Nutrition	1142
Digestion	1142
Absorption	1143
Metabolism	1144
Energy	1145
Excretion	1145
Nutrients	1145
Water	1145
Vitamins	1145
Minerals	1148
Carbohydrates	1148
Proteins	1150
Lipids	1151
Promoting Proper Nutrition	1152
Dietary Reference Intakes and Recommended Daily Allowances ...	1152
The Food Guide Pyramid	1153
Societal Concerns	1153
Weight Management	1154
Factors Affecting Nutrition	1155
Age	1155
Lifestyle	1156
Ethnicity, Culture, and Religious Practices	1156
Other Factors	1157
Assessment	1158
Nutritional History	1158
Physical Examination	1158
Diagnostic and Laboratory Data	1160
Nursing Diagnosis	1163
Imbalanced Nutrition: Less Than Body Requirements	1163
Imbalanced Nutrition: More Than Body Requirements or Risk for More Than Body Requirements	1164
Other Nursing Diagnoses	1164
Outcome Identification and Planning	1164

Implementation	.1165
Monitoring Weight and Intake	.1165
Initiating Diet Therapy	.1165
Assistance with Feeding	.1166
Research Focus	.1166
Providing Nutrition Support	.1167
Providing Enteral Nutrition	.1169
Research Focus	.1178
Providing Parenteral Nutrition	.1179
Administering Medication through a Feeding Tube	.1182
Evaluation	.1186

CHAPTER 39: Elimination **1189**

Physiology of Elimination	.1190
Urinary Elimination	.1190
Bowel Elimination	.1192
Factors Affecting Elimination	.1193
Age	.1193
Diet	.1194
Exercise	.1194
Medications	.1194
Common Alterations in Elimination	.1194
Urinary Elimination	.1194
Bowel Elimination	.1196
Assessment	.1198
Research Focus	.1198
Physical Examination	.1199
Diagnostic and Laboratory Data	.1202
Nursing Diagnosis	.1202
Impaired Urinary Elimination	.1202
Stress Urinary Incontinence	.1202
Reflex Urinary Incontinence	.1202
Urge Urinary Incontinence	.1202
Functional Urinary Incontinence	.1203
Total Urinary Incontinence	.1203
Urinary Retention	.1203
Constipation	.1203
Perceived Constipation	.1203
Diarrhea	.1203
Bowel Incontinence	.1203
Other Diagnoses	.1203
Outcome Identification and Planning	.1204
Implementation	.1204
Maintain Elimination Health	.1204
Initiate Exercise Regimen	.1206
Suggest Environmental Modifications	.1208
Initiate Behavioral Interventions	.1208
Monitor Skin Integrity	.1209
Apply a Containment Device	.1209

Initiate Diet and Fluid Therapy	1210
Administer Medications	1212
Perform Catheterization	1213
Administer Enemas	1216
Initiate Rectal Stimulation	1220
Monitor Elimination Diversions	1223
Monitor Surgical Management	1226
Complementary Therapies	1226
Evaluation	1228
Appendix A NANDA Nursing Diagnoses 2001–2002	1231
Appendix B Symbols and Abbreviations	1233
Appendix C Recommended Dietary Allowances	1237
Appendix D Educational Resources for Caregivers	1239
Appendix E Your Guide to Gloves	1241
Appendix F Standard Precautions	1243
Appendix G Clinical Pathways	1244
Appendix H Answers to Review Questions	1248
Glossary	1269
References	1297
Index	1331

Procedures

Procedure 14-1	Administering Therapeutic Massage	240
Procedure 27-1	Measuring Body Temperature	547
Procedure 27-2	Assessing Pulse Rate	555
Procedure 27-3	Assessing Respirations	559
Procedure 27-4	Assessing Blood Pressure	560
Procedure 28-1	Venipuncture	636
Procedure 28-2	Skin Puncture	640
Procedure 28-3	Urine Collection—Closed Drainage System	643
Procedure 28-4	Urine Collection—Clean Catch, Female	644
Procedure 29-1	Administering an Oral Medication	696
Procedure 29-2	Withdrawing Medication from an Ampule	702
Procedure 29-3	Withdrawing Medication from a Vial	705
Procedure 29-4	Mixing Insulins in One Syringe	706
Procedure 29-5	Administering an Intradermal Injection	708
Procedure 29-6	Administering a Subcutaneous Injection	710
Procedure 29-7	Administering an Intramuscular Injection	713
Procedure 29-8	Administering Medications by IV Piggyback to an Existing IV	718
Procedure 29-9	Administering an Eye Medication	723
Procedure 29-10	Instilling an Ear Medication	727
Procedure 29-11	Instilling Nose Drops	729
Procedure 29-12	Teaching Self-administration with a Metered-dose Inhaler	730
Procedure 29-13	Administering a Rectal Suppository	733
Procedure 29-14	Administering a Vaginal Suppository	735
Procedure 30-1	Postoperative Exercise Instruction	755
Procedure 31-1	Application of Restraints	803
Procedure 31-2	Handwashing	807
Procedure 31-3	Surgical Asepsis: Preparing and Maintaining a Sterile Field	809
Procedure 31-4	Performing Open Gloving and Removing of Soiled Gloves	814
Procedure 31-5	Applying a Surgical Mask	817
Procedure 31-6	Surgical Handwashing	817
Procedure 31-7	Performing Gowning and Closed Gloving	819
Procedure 31-8	Initiating Strict Isolation Precautions	827

Procedure 31-9	Adult Bath	834
Procedure 31-10	Bedmaking: Unoccupied Bed	838
Procedure 31-11	Bedmaking: Occupied Bed	842
Procedure 31-12	Perineal Care	845
Procedure 31-13	Oral Hygiene	849
Procedure 31-14	Eye Care: Artificial Eye and Contact Lens Removal	857
Procedure 32-1	Performing Tracheostomy Care	888
Procedure 32-2	Performing Nasopharyngeal and Oropharyngeal Suctioning	892
Procedure 32-3	Performing Tracheostomy Suctioning	896
Procedure 32-4	Administering Oxygen	901
Procedure 32-5	Clearing an Obstructed Airway	905
Procedure 32-6	Performing Adult Cardiopulmonary Resuscitation (CPR).	907
Procedure 34-1	Practicing Proper Body Mechanics	978
Procedure 34-2	Positioning a Client in Bed.	982
Procedure 34-3	Performing Range-of-Motion (ROM) Exercises	985
Procedure 34-4	Moving a Client in Bed.	989
Procedure 34-5	Logrolling a Client	990
Procedure 34-6	Transferring a Client from Bed to Chair.	991
Procedure 34-7	Transferring a Client from Bed to Stretcher with Minimum Assistance	993
Procedure 34-8	Transferring a Client from Bed to Stretcher with Maximum Assistance	993
Procedure 34-9	Using a Hydraulic (Mechanical) Lift	995
Procedure 34-10	Assisting a Client with Ambulation	999
Procedure 34-11	Assisting a Client with Crutch Walking.	1004
Procedure 35-1	Culturing a Wound.	1020
Procedure 35-2	Irrigating a Wound.	1024
Procedure 35-3	Applying a Dry Sterile Dressing	1030
Procedure 35-4	Applying a Wet to Dry Dressing	1033
Procedure 37-1	Measuring Intake and Output	1099
Procedure 37-2	Preparing an Intravenous Solution	1108
Procedure 37-3	Administering an IV Solution.	1113
Procedure 37-4	Managing IV Therapy and Dressing Change	1121
Procedure 37-5	Administering a Blood Transfusion Procedure	1130
Procedure 38-1	Inserting a Nasogastric or Nasointestinal Tube for Suction and Enteral Feeding	1170
Procedure 38-2	Administering Enteral Tube Feedings	1174
Procedure 39-1	Positioning and Removing a Bedpan.	1206
Procedure 39-2	Applying a Condom Catheter.	1211
Procedure 39-3	Performing Urinary Catheterization: Male Client	1214
Procedure 39-4	Performing Urinary Catheterization: Female Client	1216
Procedure 39-5	Irrigating an Open Catheter.	1218
Procedure 39-6	Irrigating a Closed Catheter.	1219
Procedure 39-7	Administering a Large Enema	1221
Procedure 39-8	Administering a Small (Mini-) Enema.	1222
Procedure 39-9	Changing a Colostomy Pouch	1225

Preface

*H*ealth care is changing like never before. Every day there are new technologies, new treatments, and new pressures. Changes in response to social, political, and economic factors are challenging and changing everything—including nursing. This text addresses these changes by recognizing that students, now and in the future, will have less clinical experience in acute care settings and more exposure to alternate settings, such as skilled nursing units, home health, and outpatient clinics, for clinical learning experiences.

A holistic concept of people, health, wellness, and healing is used to avoid the fragmentation that may occur in some health care settings. A holistic perspective focuses on all dimensions of an individual, including physiological, psychological, social, cultural, cognitive, and spiritual. An individual cannot be divided into separate entities and still be viewed as a unique being. In keeping with the holistic perspective, many concepts (such as sexuality, spirituality) have been integrated throughout the text.

Special attention has been given to provide a clear, concise presentation of content that is realistic for the beginning nursing student. This text is timely in its approach to content, recognizing the inherent changes affecting the health care delivery system and the nursing curriculum. The authors recognize the student as an active participant who assumes a collaborative role in the learning process. Content is presented to challenge the student to develop critical thinking skills.

ORGANIZATION

Unit I, *Nursing's Perspective: Past, Present and Future*, explores many aspects that are essential to nursing. A historical overview of early leaders and social forces that have influenced the development of nursing practice is provided. The theoretical frame-

works for guiding professional practice and the significance of incorporating research into nursing practice are emphasized. The evolution of our current health care delivery system is discussed with attention given to proposals for change.

Unit II, *Nursing Process, The Standard of Care*, explains each component of the nursing process. The nursing process is the framework for delivering holistic care in an organized scientific manner. A chapter on critical thinking leads the unit discussion of the five phases of the nursing process.

Unit III, *The Therapeutic Nature of Nursing*, discusses the caring nature of nursing as demonstrated through therapeutic communication and actions. Nursing, by definition and purpose, is a therapeutic process. Improving interpersonal and therapeutic effectiveness through knowledge and skills are key to this unit presentation. Nurses' roles in client education are addressed. Complementary and alternative treatment modalities are presented here.

Unit IV, *The Individual and Health*, focuses on the holistic nature of individuals and nursing as a holistic discipline. The impact on an individual's health related behaviors are discussed in relation to the life cycle, aging, stress, culture, self-concept and reaction to loss.

Unit V, *Professional Accountability*, addresses accountability from the professional, legal and ethical perspectives. Documentation and quality management are discussed in detail in this unit.

Unit VI, *Diagnostic and Therapeutic Interventions*, present many of the fundamental skills and tools for providing nursing care. Step-by-step instruction and rationale are provided for each of the skills presented.

Unit VII, *Nursing Management of Basic Needs*, discusses areas of nursing care that are common to every area of practice. Concepts such as safety and infection control, mobility, fluid and electrolyte balance, skin integrity, and nutrition are described. Step-by-step skill presentation with rationale is also presented for each chapter.

CONCEPTUAL APPROACH

The concept for *Fundamentals of Nursing* arose from a need identified by the authors for a straightforward, well-organized, and easily read and assimilated text. Content is designed to challenge students to view nursing as a holistic and caring practice based on theory and research. Similar concepts have been grouped together to encourage students to learn through association; this method of presentation also prevented duplication of content, which allowed the authors to create several unique chapters.

Chapter 11

Nursing is an art and science of caring and healing that promotes health. The art of caring is implemented through the nursing process. Healing is a process that empowers both the health care recipient and provider. Health is a relative concept focusing on the client's abilities and assets, regardless of the presence or absence of "disease." The caring aspect of nursing is highlighted in this chapter.

Chapter 14

Due to the phenomenal increase in consumer use of complementary and alternative treatment approaches, the authors decided it was imperative that students understand some of the complementary and alternative approaches to healing.

Chapter 17

To present the dynamic, flowing concepts of growth and development, the life cycle is presented in one comprehensive chapter.

Chapter 22

Professionalism and accountability is inherent in nursing practice. Even though beginning students assume no formalized managerial role, it is important for them to understand such leadership skills as delegating and collaborating.

Chapter 25

With emphasis on quality in health care organizations, this chapter was designed to encourage students to start implementing quality initiatives at the beginning of their student careers rather than just before graduation.

CHANGES TO THE NEW EDITION

- Coverage of the nursing process has been moved forward, opening with expanded discussion of critical thinking and the nursing process. This lays the foundation for the content presented in later chapters.
- Content related to spirituality and sexuality is emphasized throughout as appropriate so that students may see how these vital aspects affect clients in vital ways. Tables in Chapter 13 emphasize the sexual dimension.
- Increased coverage of family and community health concepts—especially in Chapter 11 on the legal framework. Home health care content is also emphasized throughout in order to highlight the many arenas of contemporary client care.
- Coverage of Complementary/Alternative Treatments is covered in Chapter 14 and is highlighted in each chapter, as appropriate, reflecting the author's holistic philosophy.
- New unit on "Diagnostic and Therapeutic Interventions," which includes vital signs and physical assessment, diagnostic testing, care of perioperative clients, and medication administration.
- Discussion of quality has been integrated with that of accountability to highlight the importance of keeping the "care" in nursing care in an age of a cost-conscious, business-oriented health care system.
- The chapter on mobility has been totally revised, now emphasizing the impact of immobility on health status. It also presents information on the functional aspects of mobility.
- The overall number of boxed items was reduced to enhance clarity of presentation.
- A clinical companion is available that contains many valuable reference tools as well as every skill presented in the book—perfect for use in a clinical setting.
- Free CD-ROM at back of book contains flashcard software that reviews concepts on a chapter-by-chapter basis.
- DeLaune home page (<http://delaune.Delmar-Nursing.com>) contains free student resources: chapter summaries, frequently asked questions, course notes and more. Instructor resources include downloadable supplements and a library of over 100 nursing case studies.

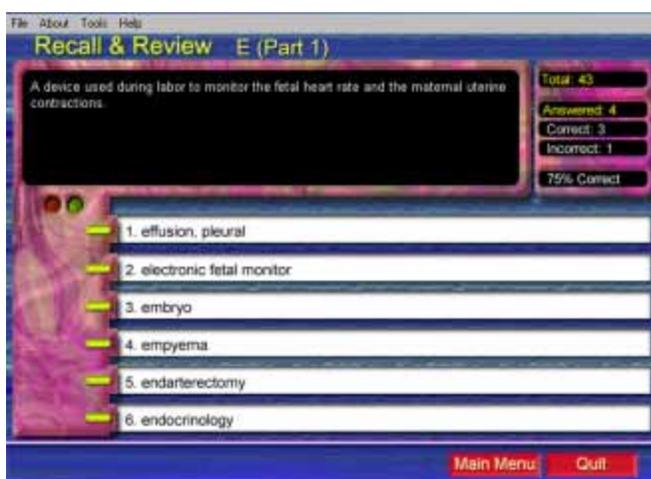

EXTENSIVE TEACHING/LEARNING PACKAGE

The complete Supplements Package was developed to achieve two goals:

1. To assist students in learning the essential skills and competencies needed to secure a career in the area of nursing
2. To assist instructors in planning and implementing their programs for the most efficient use of time and other resources

Student Tutorial CD-ROM

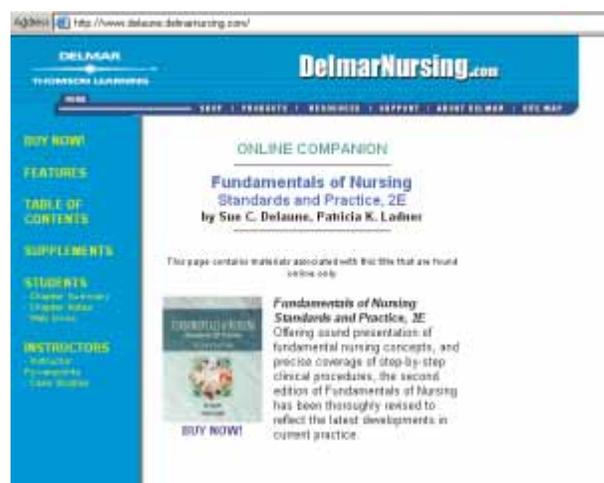

A free student tutorial CD-ROM is packaged with each text. It is a computerized flashcard question-and-answer program designed to help users learn and retain large amounts of information quickly and easily. This CD-ROM contains terms and definitions in a question-and-answer format to aid in overall understanding of the complexity of human illness. This unique program provides a fun, self-paced environment for anyone learning or brushing up on nursing concepts. User-defined preferences control how information is presented—in what order, pause length between questions, and more. FLASH! Displays the question with the answer automatically or manually. System requirements: 100 MHz Pentium, 24 MB RAM, Microsoft Windows 95 or newer SVGA 24-bit color display, 8 MB free disk space.

Online Companion

Delmar offers a series of Online Companions™. Through the Delmar site on the World Wide Web, the DeLaune Online Companion™ allows users of *Fundamentals of Nursing: Standards and Practice*, 2nd edition, to access a wealth of information designed to enhance the book.

- Student resources such as Power Notes (an online PowerPoint presentation that supplements the text's coverage) and chapter summaries that students may access anyplace, anytime.
- Instructor resources such as additional case studies and downloadable supplements.

To access the site for *Fundamentals of Nursing: Standards and Practice*, 2nd edition, simply point your browser to <http://DeLaune.DelmarNursing.com>.

Clinical Companion

ISBN 0-7668-2455-1

The *Clinical Companion* is an invaluable resource for any student nurse. A convenient, portable sized volume, the *Companion* includes many useful tools and resources—including every skill presented in the book, many lab findings, and much more.

Student Study Guide

ISBN 0-7668-2453-5

Containing over 500 questions in an easy-to-use format, this study aid builds on and reinforces the content that is presented in the text. Students have an avenue to learn key concepts at a pace that is comfortable for them.

Features:

- Multiple question types—true/false, matching, sequencing, multiple choice, short answer, and essay.
- Various levels of difficulty.
- Questions built upon the key concepts on a chapter-by-chapter basis.

Skills Checklist to Accompany *Fundamentals of Nursing: Standards & Practice, Second Edition*

ISBN 0-7668-2454-3

This teaching/learning tool contains key steps for every procedure in *Fundamentals of Nursing: Standards & Practice*, Second Edition by Sue C. DeLaune and Patricia K. Ladner. These checklists may be used to help students evaluate their comprehension and execution of the procedures.

Key Features:

- Three categories to document performance: able to perform, able to perform with assistance, and unable to perform
- Comments section at each step for constructive feedback
- Easy-to-follow format

Classroom Manager

ISBN # 0-7668-2457-8

A must have for all instructors, this comprehensive and resource packed three-ring binder includes:

Instructor's Guide

- **Key Terms**—The key terms for each chapter are listed alphabetically with corresponding definitions.
- **Instructional Strategies**—Centered around the competencies at the beginning of each chapter, Critical Thinking questions, followed by a student activity (group and/or individual), are provided to enhance student comprehension and critical thinking skills.
- **Additional Resource Aids**—Additional audiovisual, computer programs/software, and web sites are included to increase student awareness of current issues, trends, and skills.
- **Evaluation Strategies**—Five additional discussion questions are provided for each chapter to enhance student writing and thinking skills.

Computerized and Printed Testbank with Electronic Gradebook

- **Testbank**—Computerized testbank includes over 1000 multiple choice questions.
- **PowerPoint Presentation**—A vital resource for instructors, this PowerPoint presentation parallels the content found in the book, serving as a foundation on which instructors may customize their own unique presentations.

CD-ROM Image Library

The Image Library is a software tool that includes an organized digital library of approximately 600 illustrations and photographs from the text. A Microsoft Windows 3.1 and Windows 95 application, it can be used with the most common graphics file formats (BMP, TIFF, GIF). This allows the instructor and student to add new images.

With the Image Library you can:

- Create additional libraries.
- Set up electronic pointers to actual image files or collections.
- Sort art by desired categories.
- Print selected pieces.

The Image Library will work in combination with:

- Microsoft PowerPoint for Windows 95, version 7.0 and higher.
- Other Delmar Image Collections.

Color Transparencies

Includes approximately 50 images from the text that provide the instructor with yet another means of promoting student understanding of skills and concepts.

LEARNING ENHANCEMENTS

Also available are several unique CD-ROMSs.

Delmar's Anatomy and Physiology CD-ROM

ISBN 0-7668-2415-2

Intended for any course where a brief review of anatomy and physiology is desired, *Delmar's Anatomy and Physiology CD-ROM* presents anatomy and physiology in an accessible and engaging manner. Organized by body system, the CD-ROM is perfect for self-guided learning or review. Features include:

- Organization by body system.
- Separate quiz and tutorial modes.

Delmar's Heart and Lung Sounds for Nurses CD-ROM

Single User Version: ISBN 0-7668-2416-0

Institutional Version: ISBN 0-7668-4257-6

Auscultation is one of the most difficult skills for student nurses to master. *Delmar's Heart and Lung Sounds for Nurses CD-ROM* is an excellent learning tool that helps nurses identify and interpret normal and abnormal heart and lung sounds. Features include:

- An extensive library of normal and abnormal heart and lung sounds for students to reference.
- A three-part heart sounds module.
- A skill review section includes Overview, Step-by-Step (with actions and rationales), Variations, and Tips and Errors.

Delmar's Nursing Fundamentals Critical Thinking CD-ROM

Single User version: ISBN 0-7668-2456-X

This CD-ROM is an invaluable resource for any nursing fundamentals course. Containing a content-rich library of 20 nursing cases that emphasize clinical decision-making and a dynamic review of anatomy and physiology, *Delmar's Nursing Fundamentals Critical Thinking CD-ROM* will help users both learn valuable concepts and think like a nurse.

Acknowledgments

This textbook is the product of many dedicated, knowledgeable, and conscientious individuals. First, we would like to thank Carol Kneisl for initiating our work on this text. We would like to thank all the contributors who persevered to produce an outstanding contribution to the nursing literature. The content for nursing fundamentals has changed greatly over the past 20 years in an effort to incorporate the advances in nursing theory and research and technology. Your clinical expertise is evident in this final product.

Likewise, we need to thank all the reviewers who critically read and commented on the manuscript. Your clinical and academic expertise provided valuable suggestions that strengthened the text.

Our friends and professional colleagues provided encouragement throughout the development of this manuscript. Thank you for sharing so many of your resources and support with us.

Our families deserve recognition for their daily queries relative to the book, which often stimulated humor, easing a sometimes tedious task. Special thanks to Jay, Jennifer, Katie, and Sarabeth and Wayne, Kelly, Wayne Jr., Gretchen, and Michael for demonstrating daily understanding and support when the book had to be given priority.

About the Authors

Sue DeLaune

Sue Carter DeLaune earned a Bachelor of Science in Nursing from Northwestern State University, Natchitoches, Louisiana and a Master's degree in Nursing from Louisiana State University Medical Center, New Orleans. She has taught nursing in diploma, associate degree, and baccalaureate schools of nursing, as well as in RN degree-completion programs. With over 30 years experience as an educator, clinician, and administrator, Sue has taught fundamentals of nursing, psychiatric/mental health nursing, and nursing leadership in a variety of programs. She also presents seminars and workshops across the country that assist nurses to

maintain competency in areas of communication, leadership skills, client education, and stress management.

Sue is a member of the American Holistic Nurses Association, Sigma Theta Tau, and the American Nurses Association. She has been recognized as one of the "Great 100 Nurses" by the New Orleans District Nurses Association.

Currently, Sue is the Health Education Consultant at New Orleans Adolescent Hospital, New Orleans, Louisiana and is adjunct faculty at William Carey College School of Nursing, New Orleans. She also is President of SDeLaune Consulting, an independent education consulting business based in Mandeville, Louisiana.

Patricia Ladner

Patricia Ann Kelly Ladner obtained an Associate degree in Science from Mercy Junior College, St. Louis, Missouri, a Bachelor of Science in Nursing from Marillac College, St. Louis, Missouri, a Master of Science in Counseling and Guidance from Troy State University, Troy, Alabama, and a Master's degree in Nursing from Louisiana State Medical Center, New Orleans, Louisiana.

She has taught at George C. Wallace Junior Community College, Dothan, Alabama; Sampson Technical Institute, Clinton, North Carolina; Touro Infirmary School of Nursing and Charity/Delgado School of Nursing in New Orleans, Louisiana. She has also been the Director of Touro Infirmary School of Nursing and a Director of Nursing, Tulane University Medical Center in New Orleans. With 35 years as a clinician and academician, Mrs. Ladner has taught fundamentals of nursing, medical/surgical nursing, and nursing seminars while maintaining clinical compe-

tency in various critical care and medical/surgical settings. Her professional career has provided her with the necessary knowledge and skills to be an effective lecturer and community leader.

Mrs. Ladner received a Governor's appointment to serve on an Advisory Committee of the Louisiana State Board of Medical Examiners and she also served on an Advisory Committee for Loyola University in New Orleans. She maintains membership in Sigma Theta Tau, American Nurses Association, and the Louisiana Organization of Nurse Executives. She served for over 10 years on the Louisiana State Nurses Association's Continuing Education Committee. She is the recipient of the New Orleans District Nurses Association Community Service Award and has been recognized as one of the "Great 100" nurses by the New Orleans District Nurses Association.

Mrs. Ladner has been listed in *Who's Who in American Nursing*. She is currently the Nursing Practice Consultant for the Louisiana State Board of Nursing.

How to Use This Text

The following suggests how you can use the features of this text to gain competence and confidence in your assessment and nursing skills.

PROCEDURE 29-3

Withdrawing Medication from a Vial

Equipment

- Medication administration record (MAR)
- Sterile syringe and needle
- Alcohol swab
- Vial of medication
- Sterile needle

Action

- Wash your hands.
- Prepare the vial.
 - Open the alcohol wipe.
 - New vial, remove metal cap from vial of medicine and cleanse the rubber top of the vial.
 - Used vial, cleanse the rubber top of the vial.
- Prepare syringe.
 - Choose a syringe of appropriate size to accommodate the volume of medication to be withdrawn.
 - Grasp needle and turn barrel of syringe to the right.
 - Remove the needle cap and pull back on plunger to fill syringe with an amount of air equal to amount of solution to be withdrawn from the vial.
- Insert the needle into the center of the upright vial and inject air into the vial.
- Invert vial; keep the vial at eye level and the needle's bevel below the fluid level, and remove the exact amount of medicine while touching only the syringe barrel and plunger tip (Figure 29-17).

Rationale

- Reduces transmission of microorganisms.
- Provides access to vial. Removes surface contamination. (*Note:* Manufacturers do not ensure sterility of rubber top.)
- Ensures a closed system.
 - Ensures withdrawing all the medication at one time.
 - Displaces the solution with air to prevent the formation of a vacuum in the sealed vial.
- Creates positive pressure inside vial to allow accurate withdrawal of medicine.
- Prevents contamination of the plunger, barrel, and medicine.

Figure 29-17 Invert the vial, and keep the needle below the fluid level.

(continues)

Procedures

Procedure boxes are step-by-step guides to performing basic clinical nursing skills. This feature will help you gain competence in nursing skills. Use this feature as a study tool to help you understand the rationale behind the nursing interventions, as a guide for mastery of procedures, and as a review aid for future reference.

RESEARCH FOCUS

Title of Study

“Clinical Decision-Making Process in Perioperative Nursing”

Authors

Parker, C., Minick, P., & Kee, C.

Purpose

The purpose of this phenomenological study was to reveal the processes of clinical decision-making by expert perioperative nurses.

Methods

Six expert nurses from five different hospitals in a large southern metropolitan area participated in the study. Expert nurses were defined as having worked a minimum of 5 years and considered themselves to be expert circulating nurses in the OR. Based on a pre-developed interview guide, the participants were asked to describe any perioperative clinical situation in which they intervened on the patient's behalf and affected the patient's outcome by doing so. The interviews were transcribed verbatim; data were loaded into a software program to categorize, sort, and manage the data.

Findings

The predominant pattern contributing to the clinical decision-making process among the expert nurses was “seeing the big picture: engendered through caring.” Multiple decisions were identified within each nurse's practice, and within each decision, certain characteristics were identified and categorized into themes. Data analysis identified three themes as requisite for expert clinical decision-making: connecting with patients; advocating for patients; and embodied knowing.

Implications

This study demonstrates that positive patient outcomes depend on the ability of the perioperative nurse to integrate all nursing knowledge, make rapid decisions, and constantly advocate for the patient. These data also suggest that nurses and nursing students would both benefit if personal care experiences were shared so that the taken-for-granted knowledge of clinical practice could be examined and caring practices could be made explicit.

Parker, C., Minick, P., & Kee, C. (1999). Clinical decision-making process in perioperative nursing. *AORN Journal*, 70(1), 45–62.

Research Focus

The Research Focus box emphasizes the importance of clinical research in nursing by linking theory to practice. A useful learning tool, the box focuses attention on current issues and trends in nursing, as well as illustrates the correct way to write an abstract for a nursing research paper.

Nursing Process Highlight

Implementation: Client Teaching

The American Nurses Association and various governing bodies support written medication information for clients that is “scientifically accurate, unbiased in content and tone, sufficiently specific and comprehensive, presented in an understandable and legible format, timely, up to date, and useful.” Written medication information should:

- Be appropriate to client literacy levels
- Reflect print size appropriate to client's visual abilities
- Give straightforward instructions
- Include brand and trade names
- Prominently display drug warnings
- Outline indications for use, contraindications, and precautions
- List possible adverse reactions and risks, storage, and use

(From American Nurses Association. [1997, March/April]. *The American Nurse*, 29 [2], 11)

Nursing Process Highlights

These boxes offer a detailed snapshot of a given step of the nursing process and allow you to refer back to the material as needed until you have mastered the step and incorporated the information into your repertoire of clinical nursing skills.

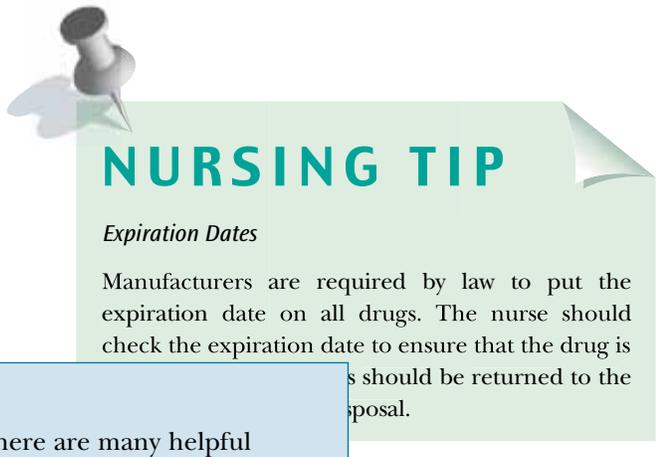

Think About It

This feature helps you to develop sensitivity to ethical and moral issues, and guides you to think critically in clinical situations and be active in problem solving. You may choose to read through each one and explore the issues *before* reading the chapter. Then as you read through the chapter, readdress each Think About It and reevaluate your original thoughts. If you choose to read them as you go through the chapter, perhaps write your thoughts down, then go back and look at them at a later date.

THINK ABOUT IT

Medication Error

While monitoring a client who has an order for Solu-Cortef (anti-inflammatory drug) intravenously, you notice that Solu-Medrol (anti-inflammatory drug) is in the client's room. You recheck the order to make sure that the original order was for Solu-Cortef and that the order was not changed. What should your next action be? How do you feel about the nurse who made the medication error but did not recognize it?

NURSING TIP

Expiration Dates

Manufacturers are required by law to put the expiration date on all drugs. The nurse should check the expiration date to ensure that the drug is safe to use. Expired drugs should be returned to the manufacturer for disposal.

Nursing Tips

In any profession there are many helpful hints that assist you in performing more efficiently. In nursing, you need to be able to practice sensitivity in the process. The wide variety of hints, tips, and strategies presented here will help you as you work toward professional advancement. Study, share, and discuss them with your colleagues.

CLIENT TEACHING CHECKLIST

Safety Measures to Prevent Accidental Poisonings

- Store medications in child-resistant containers (Figure 31-10).
- Do not take medications in front of children.
- Never call medicine candy.
- Limit the number of tablets in a medicine container.
- Place toxic substances in a locked cabinet out of reach of children.

Client Teaching Checklist

As a nurse, you will often be a client's main link to health care. The Client Teaching Checklist is a great resource for ensuring success in teaching exercises and procedures, and in relaying critical information to clients.

- Remove labels from containers.
- Do not place poisonous substances in food or medicine containers.
- Place poison stickers on toxic substances.
- Post poison control center phone numbers in prominent places.
- Post poison control center phone numbers in prominent places.

NURSING CARE PLAN Client at Risk for Injury

Case Presentation

Mr. Simon, age 75, is admitted to the hospital with coronary heart disease (CHD). CHD. He smokes two packs of cigarettes per day, has diabetes mellitus, and is obese.

Assessment

- Weight gain of 7 pounds in past month
- Blood cholesterol 320 mg/dl
- High-density lipoproteins (HDL) 28 mg/dl
- Blood pressure 186/116
- Diminished visual acuity
- Decreased bladder tone
- Weakness and syncope
- Glasgow Coma Scale (GCS) score of 12

Nursing Diagnosis #1

Risk for injury related to sensory dysfunction and altered level of consciousness .

Expected Outcomes

The client will be protected from injury during the hospitalization.

Intervention/Rationale

1. Initiate the fall prevention protocol.
Identifies and reduces risk for injury.
2. Reassess the client's injury status every 4 hours.
Identifies changes and highlights need to modify plan of care.
3. Place the client in a room as close as possible to the nurses station.
Facilitates faster response time to client's needs.
4. Place fall alert signs on the client's door and head of bed.
Alerts other health care workers to client's risk status.
5. Put the bed alarm on.
Helps monitor client status and facilitates prompt response.
6. Monitor the client and the environment every 2 hours.
Provides information on status, progress, and needs of client.
7. Instruct all caregivers to respond promptly to call light.
Ensures rapid response to client's needs.
8. Teach the client to use the call light; reinforce teaching.
Ensures that client has means and knowledge to call for assistance.

Evaluation

Fall prevention protocol implemented; client discharged on third day of hospitalization.

Nursing Care Plan

The Nursing Care Plan walks you through the process of planning care, performing interventions, and evaluating the success of your course of care. These are very helpful in strengthening your understanding of the nursing process in "live" nursing situations, in exercising your critical thinking skills, and for use as a blueprint from which to develop your own complete plans of care.

NURSING ALERT

Systemic Effects of Eyedrops

The nurse should apply pressure to the inner canthus when instilling eyedrops that have potential systemic effects such as atropine (Atropine). Gentle pressure over the inner canthus prevents the medication from flowing into the systemic circulation, decreasing the absorption.

Nursing Alert

As a professional, you will need to be able to react immediately in some situations in order to ensure the health and safety of your patients. Pay careful attention to this feature as it will help you to begin to identify and respond to critical situations on your own, both efficiently and effectively.

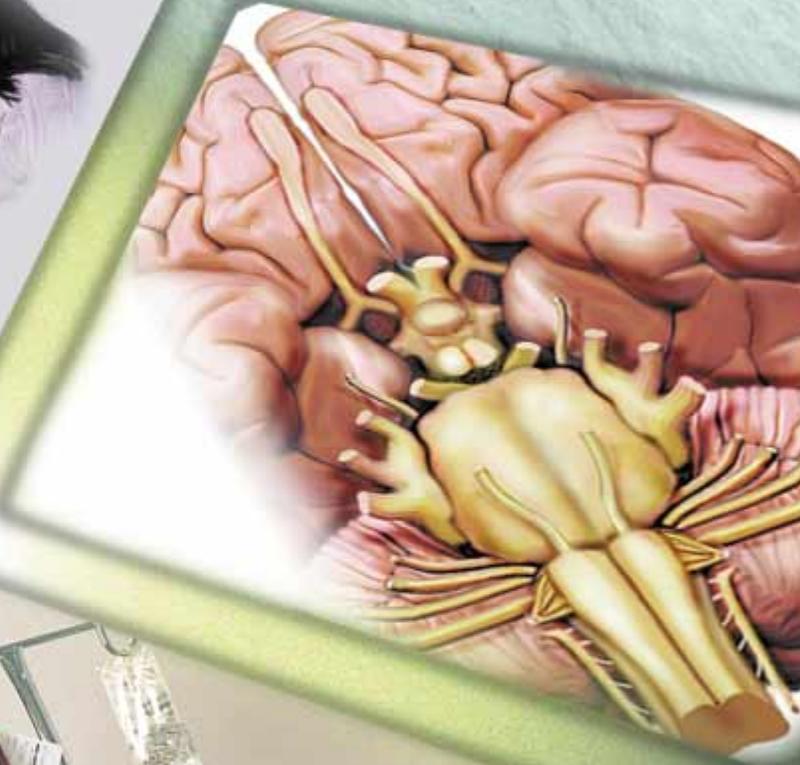

NURSING CHECKLIST

Eye Care for the Comatose Client

- Cleanse eyelids, eyelashes, and eyebrows with warm washcloth at least every 4 hours. Clean from inner to outer canthus.
- If eyes remain open and blink reflex is absent, liquid tear solutions should be applied to prevent corneal drying and ulcerations.
- Eyes can be closed and covered with an eye patch or protective shield. The eye patch or protective shield should be removed at least every 4 hours to assess eyes and provide care.

Nursing Checklist

Nursing Checklist boxes outline important points for you to consider before, during, and after utilizing the nursing process. Checklists are your reference guide to using critical thinking in nursing and to understanding the steps in the nursing process.

Unit

Nursing's Perspective: Past, Present, and Future

- 1 Evolution of Nursing and Health Care
- 2 Theoretical Foundations of Nursing
- 3 Nursing Education and Research
- 4 The Health Care Delivery System

Evolution of Nursing and Health Care

All history is modern history.

—Wallace Stevens,
American poet and author (1879–1955)

COMPETENCIES

1. Define nursing as an art and a science.
2. Identify major historical and social events that have shaped current nursing practice.
3. Describe Florence Nightingale's impact on current nursing practice.
4. Discuss the contributions of early leaders in American nursing.
5. Discuss the impact of selected landmark reports on nursing education and practice.
6. Relate the social forces of nursing's evolution to the current status of advanced practitioners.

KEY
TERMS

autonomy
empowerment
evidence-based practice
health maintenance organization
history
nursing
primary health care

Figure 1-1 Graduating Class (1900) of Touro Infirmary Training School for Nurses (Photo courtesy of Touro Infirmary Archives, New Orleans, LA)

Nursing is an art and a science by which people are assisted in learning to care for themselves whenever possible and cared for by others when they are unable to meet their own needs.

Nursing has evolved from an unstructured method of caring for the ill to a scientific profession. The result has been movement from the mystical beliefs of primitive times to a “high-tech, high-touch” era. Nursing combines art and science. Using scientific knowledge in a humane manner, nursing combines critical thinking skills with caring behaviors.

Nursing requires a delicate balance of promoting clients’ independence and dependence. Nursing focuses not on illness but rather on the client’s *response* to illness.

Nursing promotes health and helps clients move to a higher level of wellness. This aspect of nursing also includes assisting a client with a terminal illness to maintain comfort and dignity in the final stage of life.

This chapter traces the evolution of nursing by exploring its rich heritage. Social forces that have affected the development of nursing are examined.

HISTORICAL OVERVIEW

To understand the present status of nursing, it is necessary to have a base of historical knowledge about the profession. By studying nursing history, the nurse is better able to understand such issues as **autonomy** (being self-directed), unity within the profession, supply and demand, salary, education, and current practice. **History** is a study of the past that includes events, situations, and individuals (Figure 1-1). By learning from historical role models, nurses can enhance their abilities to create positive change in the present and set a course for the future.

The study of nursing history offers another advantage—learning where the profession has been and its advancements. **Empowerment** is the process of enabling others to do for themselves. Only when nurses are empowered are they truly autonomous. Autonomy has

THINK ABOUT IT

Lessons from History

Think of some lessons you have learned from the past. Can you identify some life experiences that have been excellent teachers? List two lessons gained from these experiences or situations.

historically been difficult for nurses to achieve. Empowerment and autonomy go together and are necessary for nursing to bring about positive changes in health care today (Figure 1-2). Power is not authority—authority is power. See Chapter 10 for further discussion of this topic.

Learning from the past is the major reason for studying history. Ignoring nursing’s history can be detrimental to the future of the profession. By applying the

Figure 1-2 Through consultation and exchange of information, nurses demonstrate their roles as autonomous professionals. How important are the qualities of autonomy and empowerment to your career goals?

lessons gained from a historical review, nurses will indeed be a vital force in the new millennium.

Evolution of Nursing

Nursing has evolved with the development of civilization of mankind. Refer to Table 1-1 and the following for a discussion of nursing from early civilizations to the present era of advanced nursing practice and health care reform.

THINK ABOUT IT

Attributes of Nursing Leaders

Personal power comes to individuals who are clear about what they want from life and who see their work as essential to the contributions they wish to make. As you read about nursing leaders, reflect on the personal traits that empowered them to direct change and shape nursing's future in health care.

Early Civilizations

The evolution of nursing dates back to 4000 BC, to primitive societies in which mother-nurses worked with priests. In 2000 BC, the use of wet nurses is recorded in Babylonia and Assyria.

Ancient Greece

The ancient Greeks built temples to honor Hygiea, the goddess of health. These temples were more like health spas rather than hospitals in that they were religious institutions governed by priests. Priestesses (who were not nurses) attended to those housed in the temples. The nursing that was done by women was performed in the home.

Roman Empire

Hospitals were first established in the Eastern Roman Empire (Byzantine Empire). St. Jerome was responsible, through one of his disciples, Fabiola, for introducing hospitals in the West. Western hospitals were primarily religious and charitable institutions housed in monasteries and convents. The caregivers had no formal training in therapeutic modalities and volunteered their time to nurse the sick.

Middle Ages

Hospitals in large Byzantine cities were staffed primarily by paid male assistants and male nurses. During the

medieval era, these hospitals were established primarily as almshouses, with care of the sick being secondary.

Medical practices in Western Europe remained basically unchanged until the 11th and 12th centuries, when formal medical education for physicians was required in a university setting. Although there were not enough physicians to care for all the sick, other caregivers were not required to receive any formal training. The dominant caregivers in the Byzantine setting were men; however, this was not true in the rural parts of the Eastern Roman Empire and in the West. In these societies, nursing was viewed as a natural nurturing job for women.

Renaissance

During the Renaissance (AD 1400–1550), interest in the arts and sciences emerged. This was also the time of many geographic explorations by Europeans. As a result, the world literally expanded.

Because of renewed interest in science, universities were established, but no formal nursing schools were founded. Because of social status and customs, women were not encouraged to leave their homes; they continued to fulfill the traditional role of nurturer/caregiver in the home.

Enlightenment and Industrial Revolution

The Industrial Revolution introduced technology that led to a proliferation of factories. Conditions for the factory workers were deplorable. Long hours, grueling work, and unsafe conditions prevailed in the workplace. The health status of laborers received little, if any, attention.

Medical schools were founded, including the Royal College of Surgeons in London in 1800. In France, men who were barbers also functioned as surgeons by performing procedures such as leeching, giving enemas, and extracting teeth.

At the end of the 18th century, there were no standards for nurses who worked in hospitals. In the early to mid-1800s, nursing was considered unseemly for women even though some hospitals (almshouses) relied on women to make beds, scrub floors, and bathe the poor. Most nursing care was still performed in the home by female relatives of the ill.

Religious Influences

The strong influence of religions on the development of nursing started in India (800–600 BC) and flourished in Greece and Ireland in 3 BC with male nurse-priests.

In 1836, Theodor Fleidner revived the Church Order of Deaconesses to care for those in a hospital he had founded. These deaconesses of Kaiserwerth became famous because they were the only ones formally

trained in nursing. Pastor Fleidner had a profound influence on nursing because Florence Nightingale received her nurse's training at the Kaiserwerth Institute.

The Nursing Sisters of the Holy Cross was founded in LeMans, France by Father Bassil Moreau in 1841. Father Sorin brought four sisters to Notre Dame in South Bend, Indiana in 1841. In 1844, these sisters established St. Mary's Academy in Bertrand, Michigan. In 1855, the school was moved to Notre Dame and became known as Saint Mary's College, which became influential on the emerging role of women.

Florence Nightingale

Florence Nightingale is considered the founder of modern nursing. She grew up in a wealthy upper-class family in England during the mid-1800s. Unlike other young women of her era, Nightingale received a thorough education including Greek, Latin, history, mathematics, and philosophy. She had always been interested in relieving suffering and caring for the sick. Social mores of the time made it impossible for her to consider caring for others because she was not a member of a religious order. She became a nurse over the objections of society and her family.

Title of Study

"Religion, Gender, and Autonomy: A Comparison of Two Religious Women's Groups in Nursing and Hospitals in the Late Nineteenth and Early Twentieth Centuries"

Authors

Marshall, E. S., & Wall, B. M.

Purpose

This comparative study examines cases of Catholic nuns and Mormon women, and their effect on nursing in the American frontier in the 1800s and 1900s. The purpose of the study was to show how beliefs about religion and gender translated into power that women used to effectively administer health care services.

Method

A comparative study of selected case studies was done to analyze the effect of Catholic nuns and Mormon women on the delivery of nursing care in the pioneer American West.

Findings

The two groups studied, Catholic nuns and Mormon women, lived in separate cultures on the frontier together. However, there are remarkable parallels in religious devotion, unique gender initiatives, autonomy, and the use of power. The numerous parallels include the following:

- The women in both groups were strong and capable in a society that promoted modesty and self-effacement of women.
- Women of both groups had a compelling sense of purpose ("mission") that empowered them to provide health care services.
- They received trust and support from male leaders because of their religious beliefs that broadened their roles in the community.
- The religious calling or mission did not interfere with or compromise professional competence of the women.
- Both groups of women had a privileged status and authority within their communities.

Implications

The role of religious groups in the American frontier has been largely ignored by modern historical research. This study is the beginning effort to focus importance on the experience of women as nurses and administrators of health care institutions.

Marshall, E. S., & Wall, B. M. (1999). Religion, gender, and autonomy: A comparison of two religious women's groups in nursing and hospitals in the late nineteenth and early twentieth centuries. *Advances in Nursing Science*, 22(1), 1–22.

After completing the 3-month course of study at Kaiserwerth Institute, Nightingale became active in reforming health care. The advent of Britain's war in the Crimea presented the stage for Nightingale to further develop the public's awareness of the need for educated nurses (Figure 1-3). The implementation of her principles in the areas of nursing practice and environmental modifications resulted in reduced morbidity and mortality rates during the war.

Nightingale forged the future of nursing education as a result of her experiences in training nurses to care for British soldiers. She established the Nightingale Training School of Nurses at St. Thomas' Hospital in London. This was the first school for nurses that provided both theory-based knowledge and clinical skill building. She revolutionized not only the public's perception of nursing but also the method for educating nurses. Some of Nightingale's novel beliefs about nursing education were:

- A holistic framework inclusive of illness and health
- The need for a theoretical basis for nursing practice
- A liberal education as a foundation for nursing practice
- The importance of creating an environment that promotes healing
- The need for a body of nursing knowledge that was distinct from medical knowledge (Nightingale, 1969)

Nightingale introduced many other concepts that, though unique in her time, are still used today. She advocated: (1) having a systematic method of assessing clients; (2) individualizing care on the basis of the client's needs and preferences; and (3) maintaining confidentiality.

Nightingale also recognized the influence of environmental factors on health. She advocated that nurses provide clean surroundings with fresh air and light to improve the quality of care (Nightingale, 1969). Nightingale believed that nurses should be formally educated and should function as client advocates.

Nursing and the Civil War

America's need for nurses increased dramatically during the Civil War (1861–1865). The sisters of the

Figure 1-3 Florence Nightingale in the Crimea (Photo courtesy of Parke-Davis, a division of Warner-Lambert Company)

Holy Cross were the first to respond to the need for nurses during the Civil War. Answering a request of Indiana's governor, 12 sisters started caring for wounded soldiers. By the end of the war, 80 sisters had cared for soldiers in Illinois, Missouri, Kentucky, and Tennessee.

During the Civil War, nursing care was provided by the Sisters of Mercy, Daughters of Charity, Dominican Sisters, and the Franciscan Sisters of the Poor. The sisters were influenced by the roles assigned to women during the 19th century. Although they were submissive to authority, they were willing to take risks when human rights were threatened. Women volunteered to care for the soldiers of both the Union and Confederate armies (Figure 1-4). These women performed various duties, including the implementation of sanitary conditions in field hospitals.

Dorothea Dix, a New England schoolteacher, was appointed Superintendent of the Female Nurses of the Army in 1861; no woman had ever before been appointed to an administrative position by the federal government. As a result of her recruitment efforts, more than 2000 women cared for the sick in the Union Army. After the Civil War, Dix concentrated her energies on reforming treatment of the mentally ill.

Clara Barton volunteered her nursing services during the Civil War and, in 1881, organized the Red Cross in the United States.

Realizing that "women played a special role in providing aid during times of crisis" (Frantz, 1998), Clara Barton began her efforts to establish an organization after the Civil War. Although nursing in America was not recognized as an acceptable career for women, Barton lobbied presidents and senators to allow nurses

THINK ABOUT IT

Nightingale as a Role Model

Nightingale has been described as being strong minded and assertive. In what ways would it be helpful for you to develop such characteristics? How can these traits be cultivated in nurses today?

Figure 1-4 During the Civil War, women were instrumental in the effort to minimize the risk of spreading contagious diseases among wounded soldiers. (Photo courtesy of Corbis-Bettmann)

to form an organization to provide war relief. Determined to provide aid in times of crisis, Barton, who was unsuccessful in her lobbying efforts to sponsor war relief, established the American Red Cross in 1881 to provide disaster relief. States rallied with support by creating their own branches of the American Red Cross. In 1898, Barton's knowledge from the Civil War allowed her and the State of Texas to effectively provide war relief to the Cuban citizens, and eventually to the American army during the Spanish-American War in Cuba (Frantz, 1998).

The Women's Movement

In 1848, the Women's Rights Convention in Seneca Falls, New York, signaled the beginnings of social unrest. Women were not considered equal to men, society did not value education for women, and women did not have the right to vote. With suffrage, not only were the rights of women advocated but also the nursing profession itself advanced. By the mid-1900s, more women were being accepted into colleges and universities, even though only limited numbers of university-based nursing programs were available.

Nursing Pioneers

Modern nursing was forged by the contributions of many outstanding nurses through the years. The establishment of public health nursing, the provision of rural health care services, and the advancement of nursing education occurred as a result of the works of nurse pioneers, who are discussed below. Note that the term *trained nurse* was used historically as the predecessor of *registered nurse*.

Lillian Wald

Lillian Wald (Figure 1-5) spent her life providing nursing care to the indigent population. In 1893, as the first community health nurse, she founded public health nursing with the establishment of the Henry Street Settlement Service (Figure 1-6) in New York City. Wald was a tireless reformer who:

- Improved housing conditions in tenement districts
- Supported education for the mentally challenged
- Advocated passage of more lenient immigration regulations
- Initiated change of child labor laws and founded the Children's Bureau of the U.S. Department of Labor

In addition to initiating public health nursing, Wald also established a school of nursing.

Isabel Hampton Robb

Isabel Hampton Robb (Figure 1-7) was responsible for founding several nursing organizations, namely the Superintendents' Society in 1893 and the Nurses' Associated Alumnae of the United States and Canada in 1896. She recognized the necessity of nurses' participating in professional organizations to establish unity throughout nursing on positions and issues. She was instrumental in establishing both the American Nurses Association and the National League of Nursing Education. Robb was also an early supporter of the rights of nursing students. She called for shorter working hours and emphasized the role of the nursing student as learner instead of employee.

Figure 1-5 Lillian Wald (Photo courtesy of the American Nurses Association)

THINK ABOUT IT

Robb's View of Nursing Students

What is the impact of Robb's view of nursing students as learner versus employee on the role of nursing students today?

Jane Delano

During World War I, Jane Delano, a graduate of Bellevue School of Nursing and former American Nurses Association president, took one of the first stances that created a division among nursing leaders (Figure 1-8). In 1912, physicians wanted the Red Cross to put untrained nursing aides at their sides to assist with war casualties. Physicians, not nurses, would train the aides in caring for the sick.

Delano was opposed to the aide education plan because it violated the educational standards already established by nursing. This position pitted Delano against Annie Goodrich and Adelaide Nutting. The Red Cross recognized Delano's leadership abilities and dropped the aide plan. Delano was active in the Army Nurse Corps until she resigned her Army position in 1912 to work full time with the Red Cross. She died during wartime service in Europe.

Figure 1-7 Isabel Hampton Robb (Photo courtesy of the American Nurses Association)

Figure 1-8 Jane Delano (Photo courtesy of the American Nurses Association)

Annie Goodrich

Annie Goodrich (Figure 1-9) was influential in national and international nursing issues. During World War I, the supply of civilian nurses was greatly depleted because of the Army's need for trained nurses. Goodrich pushed for the establishment of an Army training school for nurses, which she envisioned as a model for other schools of nursing. She then was appointed dean of the Army School of Nursing. As an advocate of college-based educational nursing programs, Goodrich became the first dean of Yale University School of Nursing.

Adelaide Nutting

Adelaide Nutting was a nursing educator, historian, and scholar. She actively campaigned for nurses being educated in university settings and was the first nurse to be appointed to a university professorship. In 1910, Nutting was appointed to direct the newly established department of nursing and health at Teachers College, Columbia University in New York City. This department was established to prepare nurses for teaching and supervision in nurse training schools, for administration in hospitals, and for work in preventive and social aspects of nursing.

Lavinia Dock

An influential leader in American nursing education was Lavinia Dock, who graduated from Bellevue Training School for Nurses in 1886. In her early nursing practice, she worked at the Henry Street Settlement House in New York City providing visiting nursing services to the indigent. She wrote one of the first nursing textbooks, *Materia Medica for Nurses*. Dock wrote many other books

Figure 1-9 Annie Goodrich (Photo courtesy of the American Nurses Association)

and was the first editor of the *American Journal of Nursing* (*AJN*). Dock was a political activist who in 1914 encouraged nurses to unite when physicians objected to reforming labor laws to include nursing students.

Nursing Leaders

American nursing's history is rich with many outstanding leaders. Following is a discussion of some other nursing pioneers in America. Information is presented in alphabetical, not chronological, order.

Mary Breckinridge

In 1925, Mary Breckinridge introduced a system for delivering health care to rural America. She created a decentralized system for primary nursing care services in the Kentucky Appalachian Mountains. This system, the Frontier Nursing Service, lowered the childbirth mortality rate in Leslie County, Kentucky, from the highest in the nation to below the national average.

Martha Franklin

Martha Franklin was one of the first people to advocate racial equality in nursing. She was the only African American graduate of her class at Women's Hospital Training School for Nurses in Philadelphia. In 1908, Franklin organized the National Association of Colored Graduate Nurses (NACGN), which advocated that black nurses meet the same standards required of other nurses to prevent a double standard based on race. In 1951, the NACGN merged with the American Nurses Association (ANA).

Amelia Greenwald

Amelia Greenwald was a pioneer in public health nursing on the international scene. In 1908, she entered the Touro Infirmiry Training School for Nurses in New Orleans, Louisiana. After graduation, Greenwald studied psychiatric and public health nursing. She served as Chief Nurse in several field hospitals during World War I. In 1923, she accepted the challenge of establishing a school of nursing in Poland. She received the Polish Golden Cross of Merit for her contributions to the welfare of the people. Greenwald was a catalyst for international public health nursing.

Mamie Hale

In 1942, Mamie Hale was hired by the Arkansas Health Department to upgrade the educational programs for midwives (Figure 1-10). Hale, a graduate of Tuskegee School of Nurse-Midwifery, gained the support of granny midwives, public health nurses, and obstetricians. Through education, Hale decreased superstition and illiteracy of those functioning as midwives. Hale's

Figure 1-10 Mamie Hale (Photo courtesy of Historical Research Center, University of Arkansas for Medical Sciences Library, Little Rock, RG 515, Box 47)

efforts resulted in improved mortality rates for both mothers and infants.

Mary Mahoney

America's first African American professional nurse, Mary Mahoney (Figure 1-11), was a noted nursing leader who encouraged a respect for cultural diversity. Today, the ANA bestows the Mary Mahoney Award in recognition of individuals who make significant contributions toward improving relationships among multicultural groups.

Harriet Neuton Phillips

Harriet Neuton Phillips was the first known graduate of the Women's Hospital of Philadelphia. A 6-month training course for nurses had been established by Dr. Ann Preston in 1861. Although no formal diplomas were awarded, the graduate nurses worked in the hospital and did private duty nursing in homes. Thus, Harriet Phillips can claim the title of the first American nurse to receive a training certificate. As a pioneer in community

nursing, she worked with Chinese immigrants in San Francisco and with Native Americans in Wisconsin.

Linda Richards

In 1873, the first diploma from an American training school for nurses was awarded to Linda Richards. Richards founded or reorganized 10 hospital-based training schools for nurses. She introduced the practice of keeping nurses' notes and physicians' orders as part of medical records. Also, Richards began the practice of nurses wearing uniforms. As the first Superintendent of Nurses at Massachusetts General Hospital, she demonstrated that trained nurses gave better care than those without formal nursing education.

Margaret Sanger

In 1912, Margaret Sanger, a nurse living in New York City, became concerned with women who had too many children to support. She coined the phrase "birth control" and began writing about contraceptive measures (Figure 1-12). Sanger fought to revise legislation that prohibited dissemination of information about contraception.

Sanger was not afraid of controversy and spent one month in jail for distributing information on birth control. As a true activist, Sanger made birth control an issue and fought for the rights of poor women. She understood the relationship between poverty, overpopulation, and high infant and maternal mortality rates. Sanger founded the American Birth Control League and was the first president of the International Planned Parenthood Federation.

Figure 1-11 Mary Mahoney (Photo courtesy of the American Nurses Association)

Figure 1-12 Margaret Sanger (Photo courtesy of the American Nurses Association)

THINK ABOUT IT

Nursing's Influence on Reproductive Issues

Nursing did not have sleeping giants but rather leaders who embraced the social issues of their times to challenge America's Constitution, promoting equal rights for all citizens.

Margaret Sanger saw the need for birth control and legislation to protect children from the abuses of poverty and cruel child labor practices. She viewed birth control as the major solution to social problems affecting children.

How would history have been written if Sanger had succeeded at making birth control widely available in 1912? If birth control had been in practice before the 1960s, what impact would it have had on women's reproductive health issues (such as abortion) today?

Shirley Titus

Shirley Titus received a diploma from St. Luke's Hospital School of Nursing in San Francisco in 1915. During her career, Titus served as dean of the School of Nursing at Vanderbilt University and in 1940 was the executive director of the California State Nurses' Association. She advocated improved economic security for nurses. Some of the many approaches to economic security for which she campaigned were malpractice insurance coverage, improved salaries and benefits, and collective bargaining.

Adah Belle Thoms

Adah Belle Thoms was a crusader for improved relationships among persons of all races. In the early 1900s, she

THINK ABOUT IT

Employment Issues

In the current health care environment, how do you feel about nurses going on strike? Do you think it is ethical for nurses to take a job action regarding client care issues, safety of the work environment, or salary and benefits? Does your answer vary depending on the reason for the job action or does it remain the same regardless of the underlying issue?

became acting director of nursing of the Lincoln School for Nurses in New York when African Americans rarely held high level positions (Chinn, 1994). Thoms was one of the first to recognize public health as a field of nursing. She campaigned for equal rights for black nurses in the American Red Cross and the Army Nurse Corps.

NURSING IN THE 20TH CENTURY

The beginning of the 20th century brought about changes that have influenced contemporary nursing. Several landmark reports about medical and nursing education, as well as some contemporary reports, are discussed below. The establishment of visiting nurse associations and their use of protocols are discussed.

Flexner Report

In 1910, supported by a Carnegie grant, Abraham Flexner visited the 155 medical schools in the United States and Canada. The Flexner report was based on these findings, and its goal was to increase accountability in medical education. The results of the study brought about the following changes: closure of inadequate medical schools, consolidation of schools with limited resources, creation of nonprofit status for remaining schools, and establishment of medical education in university settings based on standards and strong economic resources.

Adelaide Nutting saw the value and impact of the Flexner report on medical education, and, in 1911, together with other colleagues of the Superintendents' Society, presented a proposal to the Carnegie Foundation to study nursing education. This foundation never allocated monies to study nursing education, but it supported educational studies in other disciplines such as law, dentistry, and teaching.

Although the efforts of Nutting and other nursing leaders went unheeded, in 1906 Richard Olding Beard successfully established a 3-year diploma school of nursing at the University of Minnesota under the College of Medicine.

Early Insurance Plans

At the turn of the 20th century, there were more than 4000 hospitals and 1000 schools of nursing. During this time, the concepts of third-party payments and prepaid health insurance were instituted. Third-party payments refer to situations in which someone other than the recipient of health care (usually an insurance company) pays for the health care services provided. Prepaid medical plans were started in Pacific Northwest lumber and mining camps where employers contracted for and paid a monthly fee for medical services. This led to the establishment of the Bureau of Medical Services, where the employer contracted for medical services and the subscriber selected one of the physicians in the bureau.

Lillian Wald suggested the establishment of a national health insurance plan when she was the first president of the National Organization for Public Health Nursing.

Blue Cross and Blue Shield

The Depression provided the main impetus for the growth of insurance plans. In addition, the American philosophy of health care for all contributed to the growth of insurance plans. In 1920, American hospitals offered a prepaid hospital plan that led to the “Baylor Plan,” which eventually became the prototype of Blue Cross.

Blue Cross was the result of a joint venture between hospitals, physicians, and the general public. The American Hospital Association pioneered the development of an insurance company to provide benefits to subscribers who were hospitalized. Blue Shield was developed by the American Medical Association to provide reimbursement for medical services provided to subscribers. In 1933, the American Hospital Association endorsed Blue Cross, and in 1938 the American Medical Association endorsed Blue Shield.

The federal government became more involved in health care delivery in 1935 with the passage of the Social Security Act, which provided for (among other things) benefits for the elderly, child welfare, and federal funding for training of health care personnel. During World War II, the U.S. government extended the benefits for military services to include health care for veterans and their dependents.

Visiting Nurses Associations

In 1901, at the suggestion of Lillian Wald, the Metropolitan Life Insurance Company, which provided visiting nursing services to its policyholders, entered into an agreement with the Henry Street Settlement. Wald worked with Metropolitan to expand the services of the Henry Street Settlement to other cities; thus, one form of managed care began.

Nurses providing care in the home environment experienced greater autonomy of practice than hospital-based nurses (Figure 1-13). This led to conflicts with

some physicians about the scope of medical practice versus nursing practice parameters. Some physicians thought nurses were taking over their practice, whereas other physicians encouraged nurses to do whatever was necessary to care for the sick at home.

In 1912, in an effort to provide direction to home health staff nurses, the Chicago Visiting Nurse Association developed a list of standing orders for nurses to follow in providing home care. These orders were to direct the nursing care of clients when the nurse did not have specific orders from a physician. Thus, the groundwork for nursing protocols was established.

Landmark Reports in Nursing Education

During the first half of the 20th century, a number of reports were issued concerning nursing education and practice. Three of them, the Goldmark, the Brown, and the Institute of Research and Service in Nursing Education reports, are discussed below.

Goldmark Report

In 1918, Adelaide Nutting (relentless in her efforts to document the need for nursing education reform) approached the Rockefeller Foundation for support. Funding was provided, and, in 1919, the Committee for the Study of Nursing Education was established to investigate the training of public health nurses. E. A. Winslow, professor of public health, Yale University, chaired the committee, composed of ten physicians, two lay persons, and six nurses: Adelaide Nutting, Mary Beard, Lillian Clay, Annie Goodrich, Lillian Wald, and Helen Wood. Josephine Goldmark, a social worker, served as the secretary to the committee.

As secretary, Goldmark developed the methodology of data collection and analysis for a small sampling of

Figure 1-13 A baby being weighed by a student nurse and a Junior League volunteer in 1929. (Photo courtesy of Touro Infirmary Archives, New Orleans, LA)

the 1800 schools of nursing in existence. The study of 23 of the best nursing schools across the nation represented a cross-sample of schools—small and large, public and private.

The Goldmark report, entitled *Nursing and Nursing Education in the United States*, was published in 1923. Goldmark identified the major weakness of the hospital-based training programs as that of putting the needs of the institution (service delivery) before the needs of the student (education). Nursing tradition and the apprenticeship form of education reinforced putting the needs of the client before the learning needs of the student.

Some major inadequacies identified in nursing education by the study were limited resources, low admission standards, lack of supervision, poorly trained instructors, and failure to correlate clinical practice with theory. The report concluded that for nursing to be on equal footing with other disciplines, nursing education should occur in the university setting.

Brown Report

In 1948, Esther Lucille Brown, a social anthropologist, published *Nursing for the Future and Nursing Reconsidered: A Study for Change*. Several recommendations were put forth in this study, including the need for nurses to demonstrate greater professional competence by moving nursing education from the hospital to the university setting.

Although published 20 years after the Goldmark report, the Brown report identified many of the same problems in diploma education—nursing students were still being used for service by the hospitals and inadequate resources and authoritarianism in hospitals still prevailed in nursing education.

Brown recognized that nursing education in the university setting would provide the proper intellectual climate for the professional. Visionary nurse educators were securing necessary learning resources: libraries, laboratories, and clinical facilities. Professional endeavors such as research and publication were being implemented by nurse leaders.

Institute of Research and Service in Nursing Education Report

During the 1950s, there was a deficit in the supply of nurses as the post-World War II demand for nursing services increased. Some contributing factors to the dearth of nurses were the low esteem of nursing as a profession, long hours with a heavy workload, and low salaries.

The Institute of Research and Service in Nursing Education report resulted in the establishment of practical nursing under Title III of the Health Amendment Act of 1955. There was a proliferation of practical nursing schools in the United States to increase the supply of nurses.

Other Health Care Initiatives

In the 1960s, health care services were provided to the elderly and the indigent with the federal government's inception of Medicare and Medicaid.

This era also saw passage of the Nurse Training Act (1964), which provided federal funds to expand enrollments in schools of nursing. Federal funds were used to construct nursing schools, and student loans and scholarships were made available to nursing students.

Selected Legislation

The Health Maintenance Organization Act of 1973 provided an alternative to the private health insurance industry. **Health maintenance organizations** (HMOs) are prepaid health plans that provide primary health care services for a predetermined fee. (See Chapter 7 for further discussion.) Because the fee is set in advance of services being rendered, HMOs provide cost-effective services. **Primary health care** refers to the client's point of entry into the health care system and includes assessment, diagnosis, treatment, coordination of care, preventive services, and education. (See Chapter 3 for further discussion.)

The National Commission for Manpower study, released in 1977, resulted in amendments to the House of Representatives 2504 of Title XVIII of the Social Security Act that provided payment for rural health clinic services. Through the efforts of Anne Zimmerman, former President of the ANA, the bill was amended to substitute the term *primary care providers* for *physician extenders* and, therefore, allowed nurse practitioners to be paid directly for their services. This was a major success for nursing.

The Rural Health Clinic Service Act of 1977 covered services rendered by nurse practitioners and nurse-midwives. The Omnibus Budget Reconciliation Act of 1980 mandated payment for nurse-midwife services to needy recipients. (See Chapter 7 for further discussion.) Nursing became an integral part in meeting the needs of vulnerable populations.

Education and Practice: Contemporary Reports

During the 1980s, several important studies were commissioned to examine the areas of nursing education and practice. Some of these reports are discussed on page 20.

National Commission on Nursing

The National Commission on Nursing was created in 1980 by the American Hospital Association (AHA), the Hospital Research and Education Trust, and the American Hospital Supply Corporation to study nursing education and related issues in hospital

management, nursing practice, and nursing education. The commission's conclusions addressed the need for:

- Adequate clinical education for students
- Baccalaureate education and educational mobility
- Involvement of nurses in collaborative institutional and clinical decision making
- Improved working conditions, specifically, salaries, flexible scheduling, and differentiated practice

As a result of the commission's study, attention was given to the need for physicians and nurses to enter into collaborative practice.

Institute of Medicine

Concurrent with the National Commission on Nursing study, another study was initiated by Congress in 1979 and conducted by the Institute of Medicine (IOM). The study, *Nursing and Nursing Education: Public Policies and Private Actions*, focused on the need for continued federal funding to nursing education. The findings indicated that there was not a shortage of the general supply of nurses, but there was a serious shortage of nurses in research, teaching, administration, and advanced clinical practice. A significant nursing shortage existed in preventive and primary care for the disadvantaged and elderly in inner cities and rural areas.

Secretary's Commission on Nursing

Although the IOM study indicated that there were sufficient numbers of staff nurses, based on supply and demand, hospitals continued to report severe shortages. As a response to hospitals' recruitment and retention challenges, Health and Human Services Secretary Otis R. Brown, MD, established the Secretary's Commission on Nursing, which made the following recommendations related to nursing practice:

- Nurse compensation
- Health care financing
- Nurse decision making
- Development, use, and maintenance of nursing resources (Secretary's Commission on Nursing, 1988)

This commission recognized that the federal government alone could not correct the problems facing nursing and health care but rather that the concerted efforts of health care organizations were needed for the implementation of the report's recommendations.

SOCIAL FORCES AFFECTING NURSING

From the earliest recordings of nursing, 4000 BC through the Christian era, women were allowed to per-

form the nurse role only in the home. Nursing's links with the church caused nursing to be viewed as a "service," not a profession such as medicine. The Crimean and Civil Wars had a significant impact on nursing's future by focusing on women as nurse providers and on the need for nurse training.

During the 20th century, the evolution of medical education as an established profession had far advanced that of nursing. The Flexner report carved the destiny for physicians. The Goldmark and Brown reports created havoc for nurses as they debated the issue of nursing education in the university setting.

The Depression and World War II brought social reform and created health and medical insurance that strengthened the organized power base of both physician and hospital. Nursing—almost exclusively a female profession—had little power and, therefore, did not exert much influence on the social forces at play. The greatest advances for nurses were seen in the realm of public health and preventive health care.

As physicians were released from military service after World War II, the era of specialized medicine began. Physicians used their veterans' educational entitlement benefits to take residency training in one or more specialty areas. By 1966, more than 70% of the physicians in practice were specialists.

The 1960s was a decade of growth and change. As technologic advances increased the scope of practice of medicine and nursing, other social forces were at play: access to health care services enhanced by Medicare and Medicaid; physician and nurse shortages; the feminist movement; the inception of nurse practitioners; and a focus on health maintenance.

The economic recession of the 1970s saw health care costs escalating along with unemployment. Professional autonomy was being debated, nursing theories were being developed, and nursing education was being integrated into the university setting. Nurses were becoming more politically astute in that they were working through professional organizations to affect health care legislation.

During the 1980s, nursing became more specialized and autonomous. The rapid technologic advances in medicine required more specialization in nursing. Nurse practitioners were being more widely accepted by the general public and other health care providers. Expanded roles of nurses were developing in response to greater demands for nursing services. One factor that led to an increased need for nursing was the proliferation of HMOs in early 1980s.

During the 1990s, nurses were actively assuming more responsibilities for the delivery of health care. Evolving technology mandated nurses to continue to advance their knowledge base and skills. The aging of the population called for more nursing involvement with the elderly. Nurses, as individuals and as members of professional organizations, were involved in shaping policies for health care reform. Nursing was a stronger advocate for vulnerable populations: the elderly; those

living in poverty; the homeless; and those with human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS).

Healthy People Initiatives

Healthy People initiatives has become the nation's health agenda. This initiative began with a report entitled *Healthy People: The Surgeon General's Report on Health Promotion and Disease Prevention in 1979*. The report described the Healthy People as the nation's health agenda to guide policy on public health initiatives for health promotion and disease prevention activities during the decade 1980–1990. Five goals were identified to decrease the mortality rates for four distinct age groups (infants, children ages 1–14 years, adolescents and young adults up to age 34, adults ages 25–65) and to reduce the average number of days of illness among those over age 65 (U.S. Public Health Service, 1979). Also identified in the report were 15 strategies to achieve the goals; these strategies were studied by panels of experts and resulted in quantifiable objectives to implement the 15 strategies by governmental bodies and private sector agencies at the national, state, local, and community levels (U.S. Public Health Service, 1979). Achievement of the 226 objectives was measured and reported at 2-year increments by the National Center for Health Statistics. While positive changes were achieved for infants, children and adults, the goals for adolescents and the elderly were not achieved by 1990 (“Results of the 1990 Objectives,” 1992).

The outcomes from the 1979 Healthy People initiative led to the development of the Healthy People 2000 Objectives. Coordinated by the U.S. Public Health Service, this program identified the following goals to be achieved from 1990 to 2000: increase the span of healthy life; reduce health disparities; and promote access to preventive services for all Americans (U.S. Department of Health and Human Services, 1991). The original 15 strategies were expanded to include 22 priority areas, and the total number of objectives was increased to 319. The objectives were classified into three major categories: health promotion; health protection; and preventive services. Wilson (1999) described the Healthy People 2000 Objectives as a challenge to the nation to move beyond merely saving lives, to decrease unnecessary suffering, illness, and disability, and to improve the quality of life. Although methodologies were similar to the first study regarding data collection and analysis, it is difficult to measure this program's success since many of the surveillance systems needed to measure outcomes were not in place at the onset of the study (Wilson, 1999).

The first draft of Healthy People 2010 initiatives appeared in the September 1997 issue of the *Federal Register*. Early work focused on identifying the 2000 objectives to be continued into the 2010 agenda. The Healthy People Consortium, an alliance that includes more than 350 national organizations and 270 state pub-

lic health, mental health, substance abuse, and environmental agencies, launched in January 2000 the following Healthy People 2010 goals and objectives.

- Major goals
 1. Increase quality and years of healthy life.
 2. Eliminate health disparities.
- Enabling goals
 1. Promote healthy behaviors.
 2. Promote healthy and safe communities.
 3. Improve systems for personal and public health.
 4. Prevent and reduce diseases and disorders.

An additional 26 focus areas, objectives, and developmental objectives were identified to support the achievement of the major and enabling goals.

Success of the Healthy People program requires the cooperative efforts of all health care disciplines to pool their resources and services in order to provide accessible, quality health care and preventive services for all Americans regardless of nationality, ethnicity, and economic status (Wilson, 1999). Refer to Chapter 15 for a complete discussion of the three generations of the Healthy People initiatives.

Alternative Methods of Health Care Delivery

As it has evolved over time, nursing is still focused on caring. Rapid technologic advances, the changing climate of financing health care, and the explosion of alternative delivery methods present challenges to nurses. How are nurses responding to these challenges?

- By shaping health care policies
- By collaborating with other health care providers
- By continuing to advance nursing education

Nursing in the new millennium will be vastly different from what it has been. Collaborative health care services and innovative settings for the delivery of health care are currently being developed by nurses.

Costs and Quality Controls

During the 1970s, the cost-control systems of various federal government health programs were inadequate because of the rapid escalation of health care expenditures. Consequently, the Tax Equity Fiscal Responsibility Act (TEFRA) of 1982 was created in response to the \$287 billion spent on health care in 1981. While the federal government, with TEFRA and prospective payment legislation, tried to control costs, there was also a heightened concern with the quality of health care.

Business and industry embraced quality control systems in the 1940s and 1950s. However, the health care

industry failed to see the need for these types of controls until the 1980s. The Joint Commission on the Accreditation of Healthcare Organizations' (JCAHO) agenda for change in the late 1980s emphasized monitoring quality for outcomes rather than process, thus advocating change from a static quality assurance system to dynamic quality improvement. The JCAHO (1996) views quality of care as an ongoing process that continuously looks for ways to improve the care provided. See Chapter 25 for a discussion of the issue of quality management in nursing and health care.

Health Care Reform

Health care access and costs were the focus of attention in the 1990s with an ever-increasing number (over 60 million) of Americans being uninsured or underinsured. Children remain at risk for having their health care neglected; one in five American children is not insured.

Nursing as a profession has made great strides in effecting federal and state health care legislation (Figure 1-14). The 1990s were filled with challenges as nurses were held accountable for quality nursing care amidst cutbacks in staffing patterns. Some of these challenges were settled by legislative outcomes such as determining nurse client ratios in skilled nursing facilities and prohibiting acute care hospitals from assigning unlicensed personnel to perform nursing functions, in lieu of a registered nurse. Nurses worked in collaboration with other health care professionals in providing community-based services and in developing **evidence-based practice** among diverse health care settings. "Evidence-based practice is the application of the best available empirical evidence, including recent research findings to clinical practice in order to aid clinical decision-making" (Taylor-Piliae, p. 30, 1998).

Figure 1-14 Nurses making a presentation before a state legislature. Considering the issues for which historic nursing leaders worked, what challenges do you think merit your participation in the health care debate? (Photo courtesy of the New York State Nurses Association)

THE FUTURE OF NURSING

History is being made daily for nurses and other health care providers as the citizens of this country decide which way to move with health care reform initiatives. Pressing issues for nursing include developing evidence-based practice that can be uniformly adopted in diverse nursing care settings; monitoring safe practice in a restructured health care environment; and designing systems that will enhance collaborative planning, and implement actions and policies to address the changes occurring in the nursing labor market. Nurses can make the most of this time of transformation, which is driven by societal needs. Nurses and nursing students need to stay abreast of current issues and be active with local nursing leaders to communicate nursing's position(s) on health care reform and alternative health care delivery models.

Nurses are being recognized as autonomous professionals and are involved in administrative and clinical decision making (Figure 1-15). Only when nurses are empowered are they truly autonomous.

KEY CONCEPTS

- Nursing is an art and a science in which people are assisted in learning to care for themselves whenever possible and cared for when they are unable to meet their own needs.
- Nurses will understand such issues as autonomy, unity within the profession, supply and demand, salary, education, and current practice and the empowerment of the profession by studying nursing's history.
- Nursing's early history was heavily influenced by religious organizations and the need for nurses to care for soldiers during wartime.

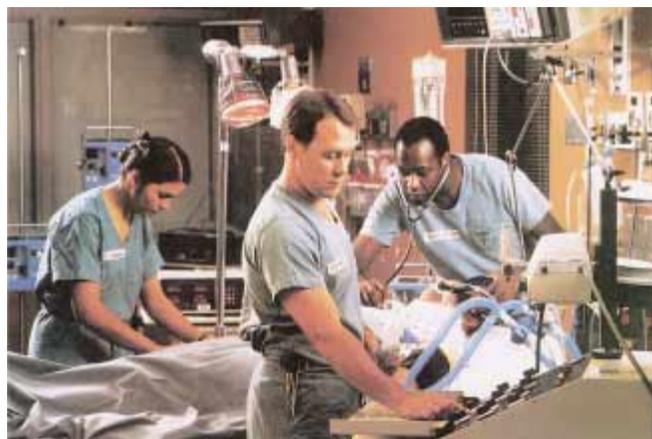

Figure 1-15 A component of the professional role of nurses is the delivery of highly skilled care to clients. In what ways can nurses build on these skills so as to achieve full autonomy and empowerment as members of the health care team? ("Be All You Can Be," Courtesy of the U.S. Government, as represented by the Secretary of the Army)

- Florence Nightingale forged the future of nursing practice and education as a result of her experiences in training nurses to care for soldiers.
- Nursing's early American leaders, professional organizations, and landmark reports have influenced the infrastructure of current nursing practice.
- Influential nursing leaders, such as Lillian Wald, Jane Delano, Isabel Hampton Robb, Annie Goodrich, Adelaide Nutting, and Lavinia Dock, were instrumental in the advancement of nursing education and practice.
- Other nursing pioneers, such as Amelia Greenwald, Mary Breckenridge, Mamie Hale, Mary Mahoney, Linda Richards, and Margaret Sanger, made important contributions to both nursing education and the fields of rural, public health, maternity, and multicultural nursing.
- In 1923, the Goldmark report concluded that, for nursing to be on equal footing with other disciplines, nursing education should occur in the university setting.
- The Brown report (1948) addressed the need for nurses to demonstrate greater professional competence by moving nursing education to the university setting.
- The Health Maintenance Organization Act of 1973 provided an alternative to the private health insurance industry.
- Contemporary reports issued by the National Commission on Nursing, the Institute of Medicine, and the Secretary's Commission on Nursing focused on the areas of nursing education, practice, and nursing's role in health care financing policies.
- Developments such as alternative methods of health care delivery, evidence-based practice, and the efforts devoted to health care reform have led to diversified nursing roles.
- As the nursing profession continues to evolve and respond to the challenges within the health care system, nurses will remain responsive to societal needs.

CRITICAL THINKING ACTIVITIES

1. What does the phrase "using their own history" mean to nurses? After studying this chapter, list some major lessons nurses can derive from history.
2. Examine the history of your nursing school. Are the early leaders honored for their contributions?
3. Identify some contemporary nursing leaders. What are their contributions to the nursing profession?
4. Choose the correct answer. The major recommendation of both the Goldmark and Brown reports was to:
 - a. recruit more people into the nursing profession.
 - b. compensate nurses with higher salaries and more comprehensive benefits.
 - c. place nursing education within institutions of higher learning.
 - d. increase the amount of clinical practice in nursing education programs.
5. List some key legislative measures that have affected nurse's role in the delivery of health care in the United States.

Theoretical Foundations of Nursing

Theory is the poetry of Science.

—Levine (1995)

COMPETENCIES

1. Explain the relationships of concepts and propositions to theory.
2. Discuss the purpose of theory.
3. Describe the link between nursing theory and the continuing development of the nursing profession.
4. Explain the interdependent roles of nursing practice, nursing theory, and nursing research.
5. Identify the three categories relating to the scope of theories.
6. Describe the metaparadigm concepts in nursing and how they differ from the metaparadigm concepts in medicine.
7. Discuss the process of paradigm revolution and paradigm shift in nursing and relate it to the current paradigms in nursing.
8. Apply the principles of selected nursing theories, such as the Conservation Theory, the Self-Care Deficit Theory of Nursing, the Roy Adaptation Model, the Theory of Human Caring, the Science of Unitary Human Beings, and Man-Living-Health, to nursing practice.

KEY
TERMS

concept	micro-range theory	phenomenon
conceptual framework	middle-range theory	proposition
discipline	nursing research	self-care
existentialism	paradigm	Simultaneity Paradigm
grand theory	paradigm revolution	theory
metaparadigm	paradigm shift	Totality Paradigm

This chapter explores the theoretical foundation on which the knowledge base of the nursing profession has been and is being built. Nursing theory provides a perspective from which to define the *what* of nursing, to describe the *who* of nursing (who is the client) and *when* nursing is needed, and to identify the boundaries and goals of nursing's therapeutic activities. Theory is fundamental to effective nursing practice and research. The professionalization of nursing has been and is being brought about through the development and use of nursing theory.

This chapter first addresses basic ideas about the meaning of nursing theory and its relevance to professional nursing. Issues related to the purpose, use, and diversity of nursing theories are discussed. It then presents a broad overview of selected nursing theories. The major ideas of selected nursing theories are explained and examples of their use in nursing situations are provided.

COMPONENTS OF THE THEORETICAL FOUNDATION

The basic elements that structure a nursing theory are concepts and propositions. In a theory, propositions represent how concepts affect each other.

What Is a Concept?

A concept is the basic building block of a theory. A **concept** is a vehicle of thought. According to Chinn and Kramer (1995, p. 78), the term *concept* refers to a “complex mental formulation of . . . [our] perceptions of the world.” A concept labels or names a **phenomenon**, an observable fact that can be perceived through the senses and explained. A concept assists us in formulating a mental image about an object or situation. Concepts help us to name things and occurrences in the world around us and assist us in communicating with each other about the world. Independence, self-care, and caring are just a few examples of concepts frequently encountered in health care. Theories are formulated by linking concepts together. A **conceptual framework** is a structure that links global concepts together and represents the unified whole of a larger reality. The specifics about phenomena within the global whole are better explained by theory.

By its nature, a concept is a socially constructed label that may represent more than a single phenomenon. For example, when you hear the word *chair*, a mental image that probably comes to mind is an item of furniture used for sitting. The word *chair* could represent many different kinds of furniture for sitting, such as a desk chair, a high chair, or an easy chair. Further, the word *chair* could also represent the leader of a committee or the head of a corporation. The meaning of the word *chair* depends on the context in which it is used.

In health care, the concept of *wandering* may be represented by words such as aimless and random movement, disorganized thought processes, and conversation that is difficult to follow. To be useful, the multiple meanings that often underlie a concept must be thoroughly understood and clearly defined within the context in which it is used.

It is important to remember that the same concept may be used differently in various theories. For example, one nursing theory may use the concept of *environment* to mean all that surrounds a human being (the external environment), whereas another theory may use this concept to mean the external environment *and* all the biological and psychological components of the person (the internal environment).

What Is a Proposition?

A **proposition** (another structural element of a theory) is a statement that proposes a relationship between concepts. An example of a nonnursing proposition might be the statement “people seem to be happier in the springtime.” This proposition establishes a relationship between the concept of happiness and the time of the year. A nursing propositional statement linking the concept of helplessness and the concept of loss might be stated as “multiple and rapid losses predispose one to feelings of helplessness.” Propositional statements in a theory represent the theorist's particular view of which concepts fit together and, in most theories, establish how concepts affect one another.

What Is a Theory?

A **theory** is a set of concepts and propositions that provide an orderly way to view phenomena. In the scientific literature, *theory* may be defined in many different ways,

with subtle nuances specific to the particular author's viewpoint. These various explanations share a common notion of the purpose of the theory, that being description, explanation, and prediction. "The purpose of a theory in scientific disciplines is to guide research to enhance the science by supporting existing knowledge or generating new knowledge" (Parse, 1987 p. 3). A theory not only helps us to organize our thoughts and ideas, but it may also help direct us in what to do and when and how to do it.

The use of the term *theory* is not restricted to the scientific world, however. It is often used in daily life and conversation. For example, when telling a friend about a mystery novel you are reading, you may have said, "I have a theory about who committed the crime." Or you may have heard a Little League coach saying to his players, "I have a theory about how to improve our performance." The way in which this term is used in these statements is a useful way to think about the meaning of theory.

USE OF THEORIES FROM OTHER DISCIPLINES

In addition to using theories specifically constructed to describe, explain, and predict the phenomena of concern to nursing, the nursing profession has long used theories from other disciplines. A **discipline** is a field of study. Theories from biological, physical, and behavioral sciences are commonly used in the practice of nursing. For example, nonnursing theories such as Maslow's Hierarchy of Basic Human Needs, Erikson's Theory of Human Development, and Selye's General Adaptation Syndrome have been and continue to be useful in nursing practice.

These nonnursing theories are often incorporated into nursing practice together with specific nursing theories. When used in conjunction with a nursing theory, a non-nursing theory is transformed by the unique approach of the nursing perspective. This perspective provides the specific framework or viewpoint within which to use theories and knowledge from other disciplines.

IMPORTANCE OF NURSING THEORIES

Why do we have nursing theories? In the early part of nursing's history, knowledge was extremely limited and almost entirely task oriented. The knowledge explosion that occurred in health care in the 1950s produced the need to systematically organize the tremendous volume of new information being generated. From the very beginnings of nursing education, there was a need to categorize knowledge and to analyze client care situations in order to communicate in coherent and meaningful ways.

The literature about the relationship between theory and nursing care yields many interpretations in terms of

the role each component plays in the health care environment. According to Barnum (1994, p. 1), "a theory is a construct that accounts for or organizes some phenomenon." Chinn and Kramer (1995, p. 20) viewed theory as a "systematic abstraction of reality that serves some purpose." Meleis (1991, p. 13) stated that a theory is "a symbolic depiction of aspects of reality that are discovered or invented for the purpose of describing, explaining, predicting, or prescribing responses, events, situations, conditions, or relationships." Similarly, Parse (1987, p. 2) defined a theory as a "set of interrelated concepts at the same level of discourse that explains, describes, or makes predictions about the phenomena of the discipline."

Nursing theories provide a framework for thought in which to examine situations. As new situations are encountered, this framework provides a structure for organization, analysis, and decision making. In addition, nursing theories provide a structure for communicating with other nurses and with other members of the health care team. Nursing theories assist the discipline of nursing in clarifying beliefs, values, and goals, and they help to define the unique contribution of nursing in the care of clients. When the focus of nursing's contribution is clear, then greater professional autonomy and, ultimately, control of certain aspects of practice are achieved.

In the broadest sense, nursing theory is necessary for the continued development and evolution of the discipline of nursing. Because the world of health care changes virtually on a daily basis, nursing needs to continue to expand its knowledge base to proactively respond to changes in societal needs. Knowledge for nursing practice is developed through nursing research that, in turn, is used to either test existing theories or generate new theories. **Nursing research** is the systematic application of formalized methods for generating valid and dependable information about the phenomena of concern to the discipline of nursing (Chinn & Kramer, 1995).

The relationship between nursing practice, theory, and research is depicted in Figure 2-1. These processes are so closely related that to consider one aspect without

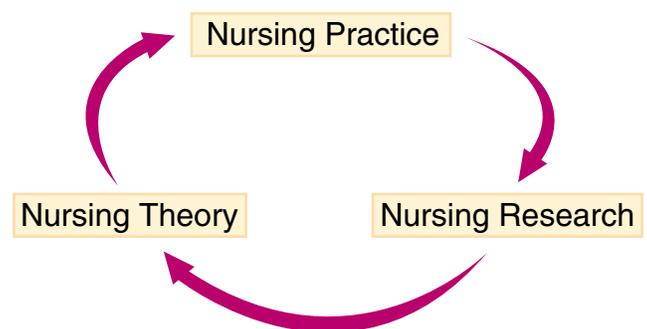

Figure 2-1 Process of knowledge development. Nursing practice, theory, and research are interdependent. Nursing theory development and nursing research activities are directed toward developing nursing practice standards.

considering the other two aspects would be the same as seeing only a part of the whole. Nursing practice is the focal point of the relationship between practice, theory, and research. It provides the raw material for the ideas that are systematically developed and organized in the form of nursing theory. The ideas proposed by nursing theory must be tested and validated through nursing research. In turn, new knowledge that results from nursing research is used to transform and inform nursing practice. Alternatively, nursing practice generates questions that serve as the basis for nursing research. Nursing research, then, influences the development of nursing theory that, in turn, transforms nursing practice.

Levine stated that “exploring a variety of nursing theories ought to provide nurses with new insights into patient care, opening nursing options otherwise hidden, and stimulating innovative interventions” (1995, p. 13). Theoretical thinking enhances and strengthens the nurse’s role and helps one to actually *think* nursing. As nurses learn more about specific nursing theories, it may be discovered that they can relate more to one theory than another or that they can appreciate the ideas

contained in several different theories. Nurses may use a specific nursing theory to help guide their practice or may choose a more eclectic approach and adopt ideas from several theories. Both of these approaches are valid. Furthermore, nurses may find some theories more appropriate for certain situations. In that case, one theory can be used with a client in a home health care setting, whereas another theory may be more applicable to a client in an acute care environment. Regardless of the approach chosen, nurses will recognize the value and usefulness of nursing theory as a tool for effective nursing practice.

SCOPE OF THEORIES

“Although theories address relatively specific and concrete phenomena, they vary in scope. Scope refers to the relative level of substantive specificity of a theory and the concreteness of its concepts and propositions” (Fawcett, 1993, p. 19). Essentially, three different cate-

Title of Study

“Nurse-Expressed Empathy, Client Outcomes, and Development of a Middle-Range Theory”

Authors

Olson, J., & Hanchett, E.

Purpose

To demonstrate how a middle-range theory was developed and tested through research that examined relationships between nurse-expressed empathy and two client outcomes: client-perceived empathy and client distress.

Methods

A sample of 140 subjects, 70 staff RNs, and 70 clients from hospital medical-surgical acute care units were used to test Orlando’s model. Each nurse-subject completed two measures of nurse-expressed empathy and each client-subject completed a measure of perceived empathy and two measures of distress.

Findings

Negative relationships were found between nurse-expressed empathy and client distress, and between client-perceived empathy and client distress. A moderate positive relationship was found between nurse-expressed empathy and client-perceived empathy.

Implications

The results of the study demonstrated support for relationships proposed in Orlando’s model and also demonstrated that a model can be tested when propositions theoretically linked to the model are empirically tested. Ongoing research is needed to determine the client outcomes that are related to the empathy of nurses.

Olson, J., & Hanchett, E. (1997). Nurse-expressed empathy, patient outcomes, and development of a middle-range theory. *Image: Journal of Nursing Scholarship*, 29(1), 71–76.

gories relate to the scope of theories: grand theories, middle-range theories, and micro-range theories. This classification is applicable to both nursing and non-nursing theories.

Grand Theory

A **grand theory** is composed of concepts representing global and extremely complex phenomena. It is the broadest in scope, represents the most abstract level of development, and addresses the broad phenomena of concern within the discipline. Typically, a grand theory is not intended to provide guidance for the formation of specific nursing interventions, but rather provides an overall framework for structuring broad, abstract ideas (Fawcett, 1993). An example of a grand theory is Orem's Self-Care Deficit Theory of Nursing.

Middle-Range Theory

A theory that addresses more concrete and more narrowly defined phenomena than a grand theory is known as a **middle-range theory**. Descriptions, explanations, and predictions put forth in a middle-range theory are intended to answer questions about nursing phenomena, yet they do not cover the full range of phenomena of concern to the discipline. A middle-range theory provides a perspective from which to view complex situations and a direction for interventions (Fawcett, 1993). An example of a middle-range theory is Peplau's Theory of Interpersonal Relations.

Micro-Range Theory

A micro-range theory is the most concrete and narrow in scope. A **micro-range theory** explains a specific phenomenon of concern to the discipline (Fawcett, 1993), such as the effect of social supports on grieving and would establish nursing care guidelines to address the problem.

THE EVOLUTION OF NURSING THEORY

The work of early nursing theorists in the 1950s focused on the tasks of nursing practice from a somewhat mechanistic viewpoint. Because of this emphasis, much of the art of nursing—the value of caring, the relationship aspects of nursing, and the esthetics of practice—was diminished. During the decades of the 1960s, 1970s, and 1980s, many nursing theorists struggled with making nursing practice, theory, and research fit into the then prevailing view of science. Table 2-1 provides a chronological summary of the development of nursing's theory base through the contributions of noted theorists and influential leaders in nursing.

Reflecting changes in global awareness of health care needs, several contemporary nursing theorists have projected a new perspective for nursing that truly unifies the notion of nursing as both an art and a science. Noted nursing theorists such as Leininger, Watson, Rogers, Parse, and Newman have been urging the discipline of nursing to embrace this new emerging view that is seen as more holistic, humanistic, client focused, and grounded in the notion of caring as the core of nursing.

Since the early 1950s, many nursing theories have been systematically developed to help describe, explain, and predict the phenomena of concern to nursing. Each of these established theories provides a unique perspective and each is distinct and separate from other nursing theories in its particular view of nursing phenomena. An overview of several nursing theories is presented later in the chapter.

KNOWLEDGE DEVELOPMENT IN NURSING

The knowledge in a particular discipline can be arranged in a hierarchical structure that ranges from abstract to concrete. Theories represent the most concrete component of a discipline. Several theories that share a common view of the world can be grouped together to form a paradigm. A **paradigm** is a particular viewpoint or perspective. Each discipline has a defined metaparadigm, which is the most abstract component of knowledge and which can consist of more than one paradigm (Fawcett, 1989). A **metaparadigm** is the unifying force in a discipline that names the phenomena of concern to that discipline.

The Metaparadigm of Nursing

What is it that distinguishes nursing from any other discipline such as biology, sociology, or psychology? Each of these other disciplines—biology, sociology, and psychology—is concerned with specific aspects of the

THINK ABOUT IT

Metaparadigm Concepts in Nursing

Some of the more contemporary theories in nursing are creating new views of person, environment, health, and nursing. What are your beliefs about the nature of the person? Do you view the person as a holistic being or parts that make up a whole? Is your concept of environment centered more on external or internal conditions? Can the person be considered in isolation of the environment? How do you define health? Is illness the opposite of health? What is the purpose of nursing? How does nursing accomplish its goals?

TABLE 2-1
Chronology of Nursing Theory Development

Date	Theorist	Theory/Publications
1859	Florence Nightingale	<i>Notes on Nursing: What It Is and What It Is Not</i>

human being. "Each discipline singles out certain phenomena with which it will deal in a unique manner" (Fawcett, 1989, p. 5). The field of biology (the study of living organisms) has defined limits and boundaries that do not extend into psychology. Similarly, psychology (which is concerned with the behavior of individuals) does not extend its concerns into the domain of sociology, which has as its main focus the social behavior of human beings.

The broadly identified concerns of a discipline are defined in its metaparadigm. The metaparadigm concepts provide the boundaries and limitations of a discipline, identify the common viewpoint that all members of a discipline share, and help to focus the activities of the members of that discipline. Disciplines are distinguished from each other by differing metaparadigm concepts. Most metaparadigms consist of several major concepts.

Initial consensus on the metaparadigm concepts in nursing was achieved in 1984. According to Fawcett (1984), the major concepts that provide structure to the domain of nursing are *person, environment, health, and nursing*. These metaparadigm elements name the overall areas of concern for the nursing discipline. Each nursing theory presents a slightly different view of the metaparadigm concepts. Refer to the section entitled

"Selected Nursing Theories" for a discussion of how various theorists address and link the metaparadigm concepts.

Consider for a moment the practice of nursing by a school nurse, an emergency room nurse, and a psychiatric nurse. What is the unifying thread among these various nurses? Although each nurse's practice is obviously different, they all consider their work as part of the profession of nursing because all share the same major concerns. Regardless of the setting or the type of client involved, each nurse is concerned with person, environment, health, and nursing. Nursing's metaparadigm is shared by all nurses despite differences in their individual practices.

How is nursing's metaparadigm different from that of other helping professions? The metaparadigm of medicine focuses on pathophysiology and the curing of disease. Nursing's metaparadigm is broader and focuses on the person, health, and the environment. Consider a physician's and a nurse's view of a client who is newly diagnosed with diabetes. The physician is concerned with reducing the client's abnormal blood glucose values to normal levels, if possible. The physician prescribes medications, an exercise regime, and nutritional counseling in an effort to control blood sugar levels. In dealing with the same client situation, the nurse is

concerned with such issues as the client's ability to cope with a chronic condition, the effect of the diagnosis on the client's family, and teaching about the need for changes in the client's daily living patterns. The nurse is concerned with the impact of the diagnosis on all aspects of the client's life. Although both health care providers are viewing the same client situation, each has a different perspective or focus. Each discipline's metaparadigm provides a viewpoint that leads to the development of knowledge as seen within that viewpoint.

Despite the fact that person, health, environment, and nursing are the generally accepted metaparadigm elements in nursing, there is growing discontent with the limitation of these elements. As dialogue continues and as clarity emerges, the metaparadigm elements will change to reflect contemporary thought and practice.

One example of this evolution in the discipline of nursing is the inclusion of caring as a basic core concept, central to the practice of nursing. Nurse scholars have urged a reconsideration of the identified metaparadigm elements. Watson (1985, p. 35) stated that "care is the essence of nursing and the most central and unifying focus for nursing practice." According to Watson (1990, p. 21), "human caring needs to be explicitly incorporated into nursing's metaparadigm."

Paradigms in Nursing

The metaparadigm of a discipline identifies common areas of concern. A paradigm is a particular way of viewing the phenomena of concern that have been delineated by the metaparadigm of the discipline. The term *paradigm* stems from the work of Kuhn (1970), who referred to a paradigm as "worldview" about the phenomena of concern in a discipline.

Two individuals with different paradigmatic views can look at precisely the same phenomenon and each will "see" or view the phenomenon differently. For example, consider the viewpoints of a mother and father who are watching their daughter at T-ball practice. The mother looks at her daughter and "sees" a graceful, yet somewhat shy child who has shown improvement in her ability to make new friends. On the other hand, the father "sees" a strong runner who needs help with batting drills. Each parent is looking at the same phenomenon (their daughter), but each is "seeing" the phenomenon from a completely different perspective. Each parent is operating from a different paradigm.

The prevailing paradigm in a discipline represents the dominant viewpoint of particular concepts. This viewpoint is supported by theories and research that for the time being adequately address the concerns of the discipline. By consensus, the community of scholars in a discipline accepts and agrees on a particular viewpoint or worldview. When new theories and research surface that challenge the prevailing paradigm, a new paradigm emerges to compete with the prevailing worldview. The competition between the paradigms results in what

Kuhn (1970) refers to as a paradigm revolution. A **paradigm revolution** is the turmoil and conflict that occur in a discipline when a competing paradigm gains acceptance over the dominant paradigm. If the competing paradigm answers more questions and solves more problems for the discipline than the prevailing paradigm, then a paradigm shift occurs. A **paradigm shift** refers to the acceptance of the competing paradigm over the prevailing paradigm or a shifting away from one worldview toward another worldview. Again, by consensus the competing paradigm becomes the dominant paradigm and the process begins again (Kuhn, 1970).

The notion of paradigm revolution can be likened to the revolution that might occur in a country where the ruling government is overthrown by a competing group who proposed to have more and better solutions to the country's problems. In this situation, power shifts from one ruling body to another. In another example, a paradigm shift occurred when people began to view the world as round rather than flat. Once it was agreed on by the community of scholars that the world was round (now the prevailing paradigm), all other views about the world also changed. Paradigms can be mutually exclusive. Members of a discipline cannot subscribe to two competing paradigms at the same time. One cannot believe at the same time that the world is flat *and* that the world is round.

Several nursing scholars have proposed that the discipline of nursing is in the midst of a paradigm revolution. The implication is that there are at least two paradigms in competition with each other. Although the scholarly literature in nursing reflects the views of several authors who present and name different paradigms in nursing, the work of Parse is highlighted here. According to Parse (1987), there are currently two paradigms in nursing: the *Totality Paradigm* and the *Simultaneity Paradigm* (Figure 2-2). Each of these paradigms is composed of various nursing theories that are similar in their worldview of the metaparadigm concepts. However, each theory, which is grouped within a particular paradigm, has different definitions of concepts and propositions that state how these concepts are related.

In the **Totality Paradigm**, the person, who is a combination of biological, psychological, social, and spiritual features, is in constant interaction with the environment to accomplish goals and maintain balance. "The goals of nursing in the totality paradigm focus on health promotion, care and cure of the sick, and prevention of illness. Those receiving nursing care are persons designated as ill by societal norms" (Parse, 1987, p. 32). Identification with the Totality Paradigm is understandable because it has been and is the prevailing paradigm in nursing. Many of the nursing theories developed to date have a view of the discipline of nursing that fits the Totality Paradigm.

In the competing paradigm, the Simultaneity Paradigm, the person-environment interaction is viewed very differently. In the **Simultaneity Paradigm**,

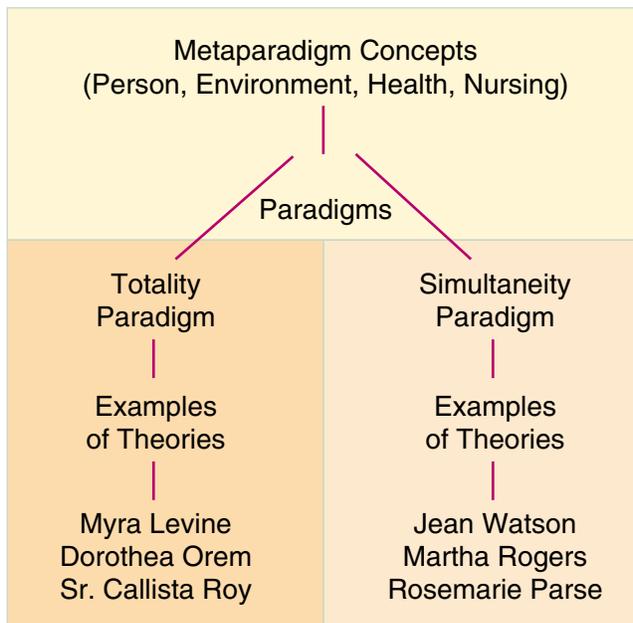

Figure 2-2 Hierarchy of knowledge development in nursing. In the hierarchical arrangement of knowledge development in a discipline, the metaparadigm concepts are the most abstract. Theories represent the most concrete level in this hierarchy.

the person is seen as “more than and different from the sum of the parts, changing mutually and simultaneously with the environment . . . as a freely choosing being cocreating health through mutual interchange with the environment” (Parse, 1987, p. 4). “The goals of nursing in the simultaneity paradigm focus on the quality of life from the person’s perspective. Designation of illness by societal norms is not a significant factor. The authority and prime decision maker in regard to nursing is the person not the nurse” (Parse, 1987, pp. 136–137).

Clearly, these two paradigms represent very different viewpoints. Each paradigm has several nursing theories that are congruent with the worldview proposed by that paradigm.

Debate, dialogue, discussion, theory development, and research continue within the discipline of nursing. Some nursing scholars argue about the structural elements of the discipline; some debate the value of competing paradigms; and some present alternative metaparadigm elements. Yet, with all the uncertainty that is created by these questions and alternative ideas, the ongoing dialogue is a healthy sign of the development of the nursing profession.

SELECTED NURSING THEORIES

Although there are many nursing theories, frameworks, and models in nursing, this chapter addresses only selected ones. The theories discussed have been selected

because they represent the development of nursing’s scientific thought.

Florence Nightingale

Nightingale did not develop a theory of nursing as theory is defined today, but rather she provided the nursing profession with the philosophical basis from which other theories have emerged and developed. Nightingale’s ideas about nursing have guided both theoretical thought and actual nursing practice throughout the history of modern nursing.

Nightingale considered nursing similar to a religious calling to be answered only by women with an all-consuming and passionate response. She considered nursing to be both an art and a science and believed that nurses should be formally educated.

Her writings did not focus on the nature of the person but did stress the importance of caring for the ill person rather than caring for the illness. In Nightingale’s view, the person was a passive recipient of care, and nursing’s primary focus was on the manipulation of the person’s environment to maintain or achieve a state of health.

Despite the fact that she did not believe in the germ theory, her experiences in the Crimean War magnified her interest in the principles of sanitation and the relationship between environment and health. A person’s health was the direct result of environmental influences, specifically cleanliness, light, pure air, pure water, and efficient drainage. Through manipulating the environment, nursing “aims to discover the laws of nature that would assist in putting the patient in the best possible condition so that nature can effect a cure” (Nightingale, 1859, p. 6). Nursing’s main focus was health, and health was closely related to nursing. Nursing was concerned with the healthy, as well as the sick (Nightingale, 1859).

Nightingale’s principles regarding environment-health-nursing were implemented in America at the turn of the 20th century. With the development of hospital-based schools of nursing, Nightingale’s principles of sanitation were used to clean up the rat-infested, dirty hospitals of the day. With the use of Nightingale’s ideas, hospitals became a place for people to recover rather than a place to die. When, for a variety of reasons, hospitals did not hire their own nursing graduates, nurses applied Nightingale’s principles in the community in the development of public health nursing. The Henry Street Settlement founded by Lillian Wald is an excellent example of Nightingale’s theory in practice.

Private duty nursing and public health nursing remained the primary focus of nursing practice until World War II. At this time, there was a tremendous increase in scientific knowledge and technology affecting health care. As the practice of medicine became more scientifically based, more clients were cared for in hospital settings. Nursing practice likewise became

centered in the hospital rather than the home. With this development, it became clear that nursing did not have an adequate theory base to organize new knowledge and guide nursing practice. Nursing began to further develop its knowledge base by incorporating the principles of Nightingale into modern nursing theory.

Early Nursing Theories

By its very nature, the development of nursing's theoretical base has progressed in a methodical and systematic, albeit slow, fashion. Knowledge development is an ongoing process that is often influenced by driving forces outside the discipline of nursing. The early nurse theorists were not attempting to address the metaparadigm concepts because initial consensus on these had not yet been achieved. Rather, these theories were attempting to answer the question, "What is nursing?"

Hildegard Peplau

Hildegard Peplau, a psychiatric nurse, combined her research and experience in the development of a theory of psychodynamic nursing, published in *Interpersonal Relations in Nursing* (1952). Drawing from her own knowledge and that from other disciplines, Peplau defined the concepts and stages involved in the development of the nurse-client relationship. From that relationship, she identified the roles of the nurse as stranger, resource person, teacher, leader, surrogate, and counselor. Peplau developed a middle-range theory with a focus on both nursing and the person and did not incorporate all aspects of the metaparadigm into her theory. Although other theories may view the nurse-client relationship differently, the primacy of this relationship in nursing has remained.

Virginia Henderson

Virginia Henderson's definition of nursing, considered to be a classic, first appeared in 1955.

The unique function of the nurse is to assist the individual, sick or well, in the performance of those activities contributing to health or its recovery (or to a peaceful death) that he would perform unaided if he has the necessary strength, will, or knowledge. And to do this in such a way as to help him gain independence as rapidly as possible. (Henderson, 1966, p. 15)

Together with Bertha Harmer, Henderson attempted to identify those basic human needs viewed as the basis of nursing care. These needs include the need to maintain physiologic balance, to adjust to the environment, to communicate and participate in social interaction, and to worship according to one's faith. Her 14 basic needs were published in the *Textbook of the Principles and Practice*

of Nursing, one of the first nursing textbooks. Henderson viewed the nursing role as helping the client from dependence to independence. As an early nursing theorist, Henderson did not intend to develop a theory of nursing, but rather she attempted to define the unique focus of nursing. Henderson's emphasis on basic human needs as the central focus of nursing practice has led to further theory development regarding the needs of the person and how nursing can assist in meeting those needs.

Faye Abdellah

Faye Abdellah, acknowledging the influence of Henderson, expanded Henderson's 14 needs into 21 problems that she believed would serve as a knowledge base for nursing. Throughout her career, she strongly supported the idea that nursing research would be the key factor in helping nursing to emerge as a true profession. The research that was done regarding these common needs/problems has served as a foundation for the development of what we now know as nursing diagnoses.

Joyce Travelbee

Joyce Travelbee, an educator and psychiatric nurse, was influenced by the philosophy of **existentialism**, a movement that is centered on individual existence in an incomprehensible world and the role that free will plays in it, and searched to find meaning in life's experiences. She extensively developed the ideas of sympathy, empathy, and rapport in which the nurse could begin to comprehend and relate to the uniqueness of others. Her work focused on the human-to-human relationship and on finding meaning in experiences such as pain, illness, and distress. Travelbee based most of her theory on her own experiences and readings and first published her work in *Interpersonal Aspects of Nursing* in 1966.

Josephine Paterson and Loretta Zderad

The work of Josephine Paterson and Loretta Zderad was similar to that of Travelbee in that it emphasized the humanistic and existential basis of nursing practice. According to Paterson and Zderad, theory developed from the practice of nursing. Although the models proposed by Travelbee and Paterson and Zderad had some impact at the time of their initial introduction, they did not gain wide popularity and application in nursing. The work of Travelbee and Paterson and Zderad most appropriately fit the Simultaneity Paradigm. Current theorists—such as Watson, Rogers, Parse, Fitzpatrick, and Newman—who have an existential orientation, are rediscovering the merits of Travelbee and Paterson and Zderad.

Contemporary Nursing Theories

Although early nursing theorists attempted to answer the question “What is nursing?,” contemporary theorists addressed the metaparadigm concepts in more depth, focused more specifically on nursing actions, and tried to answer the question “When is nursing needed?” The work of contemporary theorists such as Levine, Orem, and Roy form the theoretical basis for many interventions in current nursing practice.

Myra Levine

Myra Levine’s Conservation Theory is directly grounded in nursing practice. In her attempt to describe, explain, and predict the phenomena of concern to nursing, Levine published the four conservation principles in 1969 in *Introduction to Clinical Nursing*. Conservation is derived from the Latin word “to keep together.” Levine believed in the wholeness of the human being and the primary focus of conservation is to maintain that wholeness. Levine viewed nursing as assisting clients with the conservation of their uniqueness by helping clients to adapt appropriately. Conservation principles are universal principles designed to link concepts into a cohesive framework within which nursing practice in different environments can be performed (Levine, 1990).

According to Levine, the four principles of conservation are:

1. *Conservation of Energy*: “The individual requires a balance of energy and a constant renewal of energy to maintain life activities” (Levine, 1990, p. 197).
2. *Conservation of Structural Integrity*: “Structural integrity is concerned with the processes of healing . . . to restore wholeness and continuity after injury or illness” (Levine, 1989, p. 333).
3. *Conservation of Personal Integrity*: “Everyone seeks to defend his or her identity as a self, in both that hidden, intensely private person that dwells within and in the public faces assumed as individuals move through their relationships with others” (Levine, 1989, p. 334).
4. *Conservation of Social Integrity*: “No diagnosis should be made that does not include the other persons whose lives are entwined with that of the individual” (Levine, 1989, p. 336).

According to Levine, the *person* is who the person knows himself or herself to be and the *environment* is the context in which the person lives his or her life. In Levine’s view, health is socially defined and the goal of nursing is based on the four conservation principles. Levine did not operationally define and relate the metaparadigm concepts in her theory because her original work was initially intended to be a medical-surgical nursing textbook and not a developed nursing theory. In reevaluating her theory 20 years later, Levine stated

that she has “grown in [her] conviction that they [the conservation principles] continue to offer an approach to nursing that is scientific, research oriented, and above all suitable in daily practice in many environments” (Levine, 1989, p. 331).

A nurse who is involved in acute care situations such as an emergency room or intensive care unit often deals with clients who are exposed to severe threats to physiological integrity. The conservation of structural integrity is often the immediate priority in these acute care situations. For example, when a nurse in an emergency room is dealing with a client who has been in a severe motor vehicle accident, the client’s structural integrity is at risk. When the client’s structural integrity has been damaged, the client must put all available energy into healing the self. The nurse tries to provide care for that client so that energy can be conserved for the processes of healing. In addition to experiencing a threat to structural integrity, this client has other needs as well. The client has social relationships and these relationships are also disrupted by the accident. The nurse is concerned with the client’s spouse and family who are part of the social unit. Even in this time of crisis in the emergency room, the client’s social integrity is of concern. Finally, the nurse is also concerned about the client’s personal integrity because the traumatic experience and necessary treatment can be frightening and dehumanizing. As the nurse strives to maintain the client’s structural, social, and personal integrity, the nurse recognizes that the client is a person who is a unique individual.

Levine’s four conservation principles can also be useful in a home setting in which the family rather than a single individual is the client. The nurse recognizes that energy within the family needs to be maintained to keep the family whole. In caring for the family, the nurse needs to maintain the structural, social, and personal integrity of the family and of each individual while dealing with the illness of a specific family member. Consider, for example, the nurse who makes a home health visit to see a child with cystic fibrosis. In this situation, the nurse’s attention needs to be directed toward conservation of energy for the child. To help conserve the child’s energy for breathing, exercises must be taught to and done by others. The nurse directs strategies toward conserving the child’s structural integrity while recognizing that the

THINK ABOUT IT

Levine’s Conservation Principles

Undoubtedly, as a new student in nursing, you have had to make major adjustments in your life. Using Levine’s four conservation principles, design strategies for yourself that will conserve your own energy, structural integrity, personal integrity, and social integrity.

child is a unique individual and is a member of a social group, the family. Conservation of social integrity would be accomplished through maintaining interest in and monitoring the family dynamics.

Levine is pragmatic, and the conservation principles can be applied to most nursing situations. Her theory is appropriate for use in situations in which the nurse has had a long-term relationship with the client, yet is also useful for short-term relationships. Levine's theory is congruent with the characteristics of the Totality Paradigm.

Dorothea Orem

In attempting to plan a nursing curriculum for licensed practical nurses, Dorothea Orem was searching for a pragmatic framework to organize nursing knowledge. She focused on the questions "What is nursing?" and "When do people need nursing care?" and from this she derived that people need nursing when they are unable to care for themselves. In 1971, she presented the Self-Care Deficit Theory of Nursing (S-CDTN) in the book *Nursing Concepts of Practice* and has continually revised and updated her theory.

Orem's theory incorporates the medical model rather than rejects it, centers on the individual, is problem oriented, and is easily adaptable in varied clinical situations. These attributes create its wide appeal for application in nursing practice. Meleis (1991, p. 401) stated that it has "the widest circle of all theories in practice." As a grand theory, the S-CDTN has three interconnecting theories: Theory of Self-Care, Theory of Self-Care Deficit, and Theory of Nursing Systems. Each one is discussed below.

Theory of Self-Care

According to this theory, **self-care** is a learned behavior and a deliberate action in response to a need. Orem identified three categories of self-care requisites: universal self-care requisites, developmental self-care requisites, and health-deviation self-care requisites. Universal self-care requisites are common to all human beings and include both physiological and social interaction needs. Developmental self-care requisites are the needs that arise as the individual grows and develops. Health-deviation self-care requisites result from the needs produced by disease or illness states. Self-care is performed by mature and maturing individuals. When someone else must perform a self-care need, it is termed dependent care.

Theory of Self-Care Deficit

This theory purports that nursing care is needed when people are affected by limitations that do not allow them to meet their self-care needs. The relationship between the nurse and the client is established when a self-care deficit is present. Self-care deficits, not medical diagnosis, determine the need for nursing care.

According to Orem, the only legitimate need for nursing care is when a self-care deficit exists.

Theory of Nursing Systems

This is the unifying theory that "subsumes the theory of self-care deficit which subsumes the theory of self-care" (Orem, 1991, p. 66). The Theory of Nursing Systems attempts to answer the question "What do nurses do?" This was the original question that prompted the development of Orem's theory.

The nurse determines whether or not there is a legitimate need for nursing care. Is a person able to meet self-care needs? Does a deficit exist? If a deficit exists, then the nurse plans care that identifies what is to be done by whom: the nurse, the client, or other (family or significant other). Collectively, the actions of all these people are called the nursing system. Orem identified three types of nursing systems: wholly compensatory, partly compensatory, and supportive-educative.

In the wholly compensatory nursing system, the nurse supports and protects the client, compensates for the client's inability to care for self, and attempts to provide care for the client. The nurse would use the wholly compensatory nursing system when caring for a newborn or with a client in a postanesthesia care unit who is recovering from surgery. Both of these clients are completely unable to provide self-care.

THINK ABOUT IT

Types of Nursing Systems

When caring for clients who require the wholly compensatory nursing system, how would you feel about giving complete personal care to a client who has experienced a stroke and is unable to bathe or toilet himself or herself? How would you approach such a situation?

In the partly compensatory nursing system, both the nurse and client perform care measures. For example, the nurse can assist the postoperative client to ambulate. The nurse may bring in a meal tray for the client who is able to feed self. The nurse compensates for what the client cannot do. The client is able to perform selected self-care activities but also accepts care performed by the nurse for needs the client is unable to meet independently.

In the supportive-educative nursing system, the nurse's actions are to help clients develop their own self-care abilities through knowledge, support, and encouragement. Clients must learn and perform their own self-care activities. The supportive-educative nursing system is being used when a nurse guides a new mother to breastfeed her baby. Counseling a psychiatric client on more adaptive coping strategies is

another example of the use of the supportive-educative nursing system.

Orem focused primarily on the needs of the person and the action of nursing to meet those needs. Lesser emphasis was given to defining health and the environment. The S-CDTN is useful in determining the kind of nursing assistance needed by the client and, therefore, has merit as a theory that guides nursing practice. Orem's theory is consistent with the characteristics of the Totality Paradigm.

Sister Callista Roy

Sister Callista Roy combined general systems theory with adaptation theory to produce the Roy Adaptation Model. Roy was greatly influenced by her teacher and mentor, Dorothy E. Johnson, a nursing theorist who developed the Behavioral Systems Model. Roy first published her model in the 1970s and has continued to further refine and develop the theory. As a contemporary theorist, Roy worked with the metaparadigm concepts to define and relate these concepts.

Roy defines a person as “an adaptive system . . . a whole comprised of parts that function as a unity for some purpose” (Andrews & Roy, 1991, p. 4). The person is a biopsychosocial being in constant interaction with a changing internal and external environment. Nursing attempts to alter the environment when the person is not adapting well or has ineffective coping responses.

“The world around and within (the person as an adaptive system) is called the environment” and “includes all conditions, circumstances, and influences that surround and affect the development and behavior of the person” (Andrews & Roy, 1991, p. 18). The environmental stimuli can be classified as either focal, residual, or contextual. Focal stimuli are those that are immediately present in the person's environment. Focal stimuli are the objects or events that most attract one's attention. Most stimuli never become focal. Residual stimuli are those attitudes that are developed during previous experiences in one's life whose effects on the current situation are unclear. Contextual stimuli are “all the other stimuli present in the situation that contribute to the effect of the focal stimulus” (Andrews & Roy, 1991, p. 9). Because stimuli are constantly changing, that which is a focal stimulus one minute can become a residual stimulus the next.

According to the Roy Adaptation Model, the person has coping mechanisms that are broadly categorized in either the regulator or cognator subsystem. Adaptation is accomplished through these coping mechanisms that are innate, “genetically determined . . . and automatic processes” (Andrews & Roy, 1991, p. 13). The regulator subsystem functions through the autonomic nervous system, which “responds automatically through neural, chemical, and endocrine coping processes” (Andrews & Roy, 1991, p. 14). The cognator subsystem enables the person to respond to stimuli through processing stim-

uli, learning, judgment, and emotion. All input into the system (the person) is channeled through the regulator and cognator subsystems. If the regulator or cognator subsystem fails, there is ineffective adaptation.

Neither the regulator nor the cognator subsystem can be observed directly. Only the responses that each produces are observable. Roy categorized these responses into four adaptive modes: physiologic, self-concept, role function, and interdependence. The physiologic mode allows individuals to respond physiologically to their environment. The self-concept mode “focuses on psychologic and spiritual aspects of the person” (Andrews & Roy, 1991, p. 16). The basic underlying need of the self-concept mode is psychologic integrity. The role function mode focuses on the need to know who one is. The emphasis of the interdependence mode is affectional adequacy or the feeling of security in nurturing relationships (Andrews & Roy, 1991).

The purposes of adaptation are survival, growth, reproduction, and mastery. Adaptive responses contribute to these goals, whereas ineffective responses may threaten the person's survival, growth, reproduction, or mastery (Andrews & Roy, 1991).

The goal of nursing is “the promotion of adaptation in each of the four modes, thereby contributing to the person's health, quality of life, and dying with dignity” (Andrews & Roy, 1991, p. 20). Nursing care needs to be provided when a person has unusual stressors or when usual coping mechanisms are ineffective. See Chapter 23 for a discussion of the nature of and management of stress. Basically, the nurse attempts to manipulate stimuli in such a way as to allow the client to cope effectively. Roy defines health as “a state and a process of being and becoming an integrated and whole person” and a “lack of integration represents lack of health” (Andrews & Roy, 1991, p. 419).

In Roy's view, the nurse must first assess how the client behaves in each adaptive mode and then determine what can be altered in that mode to produce more efficient and effective adaptive responses. The nurse then either alters the environment directly or helps the person to alter the environment for better adaptive responses.

In the physiological mode, problems may arise in areas such as exercise, nutrition, elimination, fluid and electrolytes, temperature regulation, and oxygenation. For example, in caring for a client with a fever, the nurse helps the client to adapt by administering medications to lower the temperature, administering cool baths, and providing adequate fluids. Through these interventions, the nurse is attempting to alter both the internal and external environments of the person.

In the self-concept mode, the term *self-concept* refers to both the physical and the personal self. The physical self is affected or threatened during invasive procedures such as surgery. Anxiety, guilt, and distress are responses within the personal self to physical or emotional stressors. For example, in caring for an obese person who feels guilty

about developing diabetes at an early age, a nurse can help reframe the client's thinking to work through the guilt and anxiety. Through the use of counseling techniques, the nurse can teach the client how to adapt to the present situation and learn how to cope with it in the future.

Within the framework of the role function mode, the nurse would help a woman disabled with arthritis to identify adaptive approaches to maintain the roles of wife and homemaker. Nursing actions might include referral to occupational therapy for needed adaptive devices that could assist the client in maintenance of roles.

In the interdependence mode, problems may include feelings of alienation, disengagement, loneliness, or disenfranchisement that are experienced in various relationships. Examples of clients with problems in interdependence may include a grieving widow or a person with an abusive spouse.

The Roy Adaptation Model has gained wide acceptance in nursing practice, research, and education and is part of the dominant worldview of nursing. Roy's views of the person and the person-environment interaction clearly represent characteristics of the Totality Paradigm.

Theories for the New Worldview of Nursing

Theories for the new worldview of nursing describe, explain, and predict the phenomena of concern to nursing from a unique, more holistic perspective. In this new worldview, the client has primacy and the client-environment interaction is of utmost importance. Theories by Jean Watson, Martha Rogers, and Rosemarie Parse exemplify the new worldview.

Jean Watson

In the 1980s, Jean Watson developed the Theory of Human Caring, which focuses on the art and science of human caring. According to Watson (1985, p. 33), "caring is the essence of nursing and the most central and unifying focus of nursing practice." This theory offers a new way of conceptualizing and maximizing human-to-human transactions that occur daily in nursing practice. Watson's theory is influenced by Eastern philosophy and is "based on a metaphysical, spiritual-existential, and phenomenological orientation" (Fawcett, 1993, p. 220). These influences link Watson's theory to the work of early theorists such as Travelbee and Paterson and Zderad.

The Theory of Human Caring evolved from Watson's beliefs, values, and assumptions about caring. In Watson's view (1985), care and love comprise the primal universal psychic energy and are the basis for our humanity. Watson noted that, throughout its history, nursing has been involved in caring and has actually evolved out of caring. Furthermore, she stated that

caring will determine nursing's contribution to the humanizing of the world.

Watson's theory is composed of 10 carative factors, which are classified as nursing actions or caring processes. Watson's carative factors are:

1. Formation of a humanistic-altruistic system of values
2. Nurturing of faith-hope
3. Cultivation of sensitivity to one's self and to others
4. Developing a helping-trusting, human caring relationship
5. Promotion and acceptance of the expression of positive and negative feelings
6. Use of creative problem-solving method processes
7. Promotion of transpersonal teaching and learning
8. Provision for a supportive, protective, or corrective mental, physical, sociocultural, and spiritual environment
9. Assistance with gratification of human needs
10. Allowance for existential-phenomenological forces (Watson, 1989)

The first three carative factors serve as the philosophical foundation for the science of caring. The remaining seven provide more specific direction for nursing actions.

Watson stated that "health refers to unity and harmony within the mind, body, and soul. Health is also associated with the degree of congruence between the self as perceived and the self as experienced" (Watson, 1985, p. 48). In Watson's (1985, p. 49) view, the goal of nursing "is to help persons gain a higher degree of harmony with the mind, body, and soul." The nurse uses the above carative factors to accomplish the goal of nursing. Watson's theory clearly fits within the principles of the Simultaneity Paradigm.

Although the concept of caring is being deemphasized in today's health care environment because of exploding technology and cost-containment strategies, nursing must persevere in delivering care to clients. The challenge of nursing is to create moments of caring through human-to-human interaction in the face of the fast-paced world of health care.

Martha Rogers

Martha Rogers, a visionary leader and pioneer in the development of nursing's unique knowledge base, developed the highly abstract theory of the Science of Unitary Human Beings. According to Rogers, "nursing is a learned profession: a science and an art. A science is an organized body of abstract knowledge. The art involved in nursing is the creative use of science for human betterment" (Rogers, 1990, p. 198). Rogers' contribution to the discipline of nursing was revolutionary and provided new directions for the practice of nursing. Rogers first presented her ideas in the book *An*

THINK ABOUT IT

Theory of Human Caring

Recall the last time that you were sick with the flu. Reflect on what it means to you “to be cared about,” “to be cared for,” and “to be taken care of.” How are these the same? How are these different? As the recipient of care, what kinds of behaviors did you identify as “caring behaviors”? How could these behaviors be different for another person who grew up in a different family? A different culture?

Introduction to the Theoretical Basis of Nursing (1970). Her ideas regarding the person and the environment as energy fields were not considered to be consistent with the dominant paradigm of the 1970s but are more applicable with the principles of the Simultaneity Paradigm of the late 1980s.

According to Rogers (1990, p. 108), “the uniqueness of nursing is identified in the phenomena of concern. Nursing is the study of unitary, irreducible human beings and their respective environments.” Unitary person is an irreducible pandimensional energy field characterized by pattern and expressing qualities that are unique to the whole and cannot be foreseen from knowledge of the parts (Rogers, 1990). Environment is defined as “an irreducible pandimensional energy field identified by pattern and integral with a given human field” (Rogers, 1990, p. 109).

Within the viewpoint of the Science of Unitary Human Beings, the person is a unified whole and seen as greater than and different from the sum of the parts. The whole person cannot be known by examining any particular aspect or dimension of the person because all aspects together combine to form an entity different from the collection of parts. It is the characterization of the person as a human energy field that unites all aspects of the person into a unified whole. The whole of the person’s energy field interacts with the whole of the environmental energy field, which results in the process of life. There is a constant exchange of matter and energy between the person-environment unit, yet the uniqueness of each person is maintained through rhythmical patterns and relationships. “In a worldview where person and environment are in a constant, dynamic simultaneous process of change the concept of homeostasis is obsolete” (Joseph, 1990, pp. 116–117).

Nursing identifies the patterns and organization of the person-environment unit and aims to repattern the rhythm and organization of these energy fields so that the person’s integrity is heightened. “Maintenance and promotion of health, prevention of disease, nursing diagnosis, intervention, and rehabilitation encompass the scope of nursing’s goals” (Rogers, 1970, p. 86).

Rosemarie Parse

Rosemarie Parse synthesized Rogers’ Science of Unitary Human Beings with existential-phenomenological philosophy and added emphasis on the meaning and values that influence a person’s behavioral choices. Parse differs from Rogers in that she “does not view Man as an energy field, but rather as an open being who cocreates personal health” (Parse, 1987, p. 159). According to Leddy and Pepper (1993, p. 170), health is a “constantly changing process of becoming that incorporates values. Because it is not a state, health cannot be contrasted with disease.” Parse (1987, p. 169) states that “the practice of nursing . . . is a subject-to-subject interrelationship, a loving, true presence with the other to promote health and quality of life.” Parse provides a practice methodology in which the nurse helps clients to understand their own feelings and situation, find meaning within themselves and the situation, and plan for changes in the lived health patterns. In Parse’s perspective, the nurse does things *with* people as opposed to *for* them or *to* them. Clearly, Parse’s theory is consistent with the principles of the Simultaneity Paradigm.

Similar to the work of Parse, Joyce Fitzpatrick’s Life Perspective Rhythm Model (1989) and Margaret Newman’s Model of Health (1986) are current developing theories within the Simultaneity Paradigm.

CONTINUING EVOLUTION OF NURSING THEORY

Current theorists are continually expanding and refining the work of theorists before them, and they are developing new ways of looking at the metaparadigm concepts of person, environment, health, and nursing. Our understanding of the nature of nursing is, and always has been, in a state of change. Although change is healthy and leads to growth, it is not always easy. Knowledge is not static, and what one learns today may be challenged by different thoughts tomorrow.

The world of health care changes on a daily basis. Client needs and problems often change on a minute-by-minute basis. Knowledge, information, and technology in both health care and nursing are growing at unprecedented rates. In the face of these advances, nursing strives to preserve *the notion of caring* in health care. Theories are needed to organize knowledge and to guide nursing practice and nursing research. More nursing research is needed to confirm or refute theories. A strong theoretical foundation on which to base the practice of nursing is essential.

Nurses encounter a variety of clinical situations in which application of nursing theory is needed. In these occurrences, nurses may discover that specific theories will be more appropriate for certain clinical situations than others. Knowledge of specific theories should expand as nurses gain experience in nursing practice. In

all cases, theories that are selected for application in practice should be congruent with the nurse's own beliefs and values.

KEY CONCEPTS

- Concepts are abstract vehicles of thought and are the building blocks of theory.
- Propositions are relational statements that link concepts together.
- Theories help to show how things fit together. The function of theory is to provide a framework for explaining, predicting, and sometimes controlling situations.
- Nursing uses theories from other disciplines in conjunction with nursing theory.
- The development, use, and testing of nursing theory are necessary for the professionalization of the discipline of nursing.
- The relationship between nursing theory, practice, and research is an interdependent one. As a practice-oriented discipline, nursing theory and research inform and transform nursing practice.
- Theories range in scope from grand theories to middle-range theories to micro-range theories.
- The metaparadigm names the phenomena of concern to a discipline and distinguishes one discipline from another.
- The currently accepted metaparadigm concepts in nursing are person, environment, health, and nursing.
- The metaparadigm may be composed of more than one paradigm. Parse purports that there are two paradigms in nursing: the Totality Paradigm and the Simultaneity Paradigm.
- Early nursing theorists were attempting to answer questions related to the “what” and “how” of nursing.
- The theories developed by Levine, Orem, and Roy are useful in guiding nursing practice.
- A new worldview of nursing is emerging in the work of such theorists as Watson, Rogers, and Parse.

CRITICAL THINKING ACTIVITIES

1. Explain the relationship between concepts and propositions. How are concepts and propositions related to theory?
2. Define the term *theory*. What is the purpose of theory?
3. Explain the relationship between nursing theory, practice, and research.
4. Identify the main features of a metaparadigm. What are the metaparadigm concepts in nursing? How is nursing's metaparadigm different from medicine's metaparadigm?
5. What is a paradigm? What is the purpose of a paradigm?
6. Name the two paradigms in nursing identified by Parse and identify the principal philosophical underpinnings of each.
7. Discuss Nightingale's influence on modern nursing.
8. True or false: The early nursing theorists were attempting to address all of the metaparadigm concepts. Justify your answer.
9. Discuss the features of the following theories:
Levine
Roy
Orem
Watson
Rogers
10. Discuss how you plan to use nursing theory in your practice.

Nursing Education and Research

By changing nothing, we hang on to what we understand, even if it is the bars of our own jail.

(John LeCarre, 1990)

COMPETENCIES

1. Describe the characteristics of each of the educational programs for entry level nursing practice.
2. Discuss the Health Care Professionals' Competencies document and the strategies proposed by the PEW Health Professions Commission for nursing education reform.
3. Describe the trends in nursing education that specifically relate to the issues of competency development and delivery of care.
4. Explain the basis for research and knowledge development in nursing.
5. Describe the steps in the research process.
6. Explain the responsibilities of the researcher in guarding the rights of research participants and others who assist in the research study.
7. Identify the various applications of nursing research in nursing practice.
8. Discuss the trends occurring in health care that will influence the priorities for nursing research.

KEY
TERMS

abstract	organizations	primary source
client-focused care	hypothesis	qualitative analysis
competencies	independent variable	qualitative research
concepts	informed consent	quantitative research
conceptual framework	magnet hospitals	research
conceptualization	managed care	research design
construct	phenomena	secondary source
dependent variable	preferred-provider organizations	theory
full disclosure	primary care providers	value
health maintenance		variable

Trends in nursing education and research cannot be isolated from the dynamics of nursing practice. Likewise, nursing trends are responsive to the projected changes in the delivery, organization, and financing of health care. The health care revolution occurring in the United States is spurred by the questionable effectiveness of the current system to provide access to basic health services in an efficient and cost-effective manner. Because of the lack of a unified federal and state health care policy that directs, monitors, and ensures the basic value of health, discussion about appropriate practice roles and an adequate supply of professionals is central in the health care industry. To address these concerns, immediate shifts in traditional activities may offer solutions by developing guidelines for the optimal size of the health care work force, thus providing the nature and structure of care that guarantees access to health care for all U.S. citizens.

This chapter discusses the interrelatedness of nursing education, research, and practice. The various educational programs of the United States and Canada are presented in terms of their characteristics and the graduate's nursing role in health care delivery. Research studies are described within the context of methodology and relationship to practice. This chapter also discusses trends that question nursing's contribution to health care delivery from an educational or research perspective.

Nursing as a scientific discipline and as a profession is an essential component of any delivery system that influences improved health outcomes. According to the American Nurses Association (ANA, 1995a):

Nursing has a single scope of practice that is dynamic and evolves with changes in the phenomenon of concern, knowledge about the effects of various interventions on patient or group outcomes, the political environment, legal conditions and demographic patterns in society. . . . Individual nurses engage in the total scope of nursing practice . . . dependent on their educational preparation, experience, role and the nature of the patient populations they serve. (p. 5)

To produce beneficial results for the client (individual, family, group, or community), nurses must use sci-

entific methods and other ways of knowing to measure the efficacy of interventions. Theoretical and research-based understanding of **phenomena** (observable facts or events that can be perceived through the senses and are susceptible to description and explanation) will influence the quality of clinical decisions made by the nurse. It is within the framework of formal and accountable academic postsecondary education that these cognitive, attitudinal, and psychomotor skills are initially mastered.

NURSING EDUCATION

Educational programs that prepare graduates to write a licensing examination must be approved by a state or provincial (Canada) Board of Nursing. Boards approve entry level programs to ensure the safe practice of nursing by setting minimum educational requirements and guaranteeing the graduate of the program is an eligible candidate to write a licensing examination. In the United States, candidates must pass the National Council Licensing Examination (NCLEX) to obtain a license to practice nursing. In Canada, the licensing examination is administered by the Canadian Nurses Association Testing Service (CNATS).

Types of Programs

Two types of entry level nursing programs are available in the United States: licensed practical or vocational nurse (LPN or LVN) and registered nurse (RN). An *entry level educational program* means that the program prepares graduates to write a licensing examination. Graduates of the licensed practical/vocational programs write the NCLEX for practical nurses (NCLEX-PN), and graduates of registered nurse programs write the NCLEX for registered nurses (NCLEX-RN).

Postgraduate programs prepare nurses to practice in various roles as advanced practice registered nurses (APRNs). Individual states have varying statutory provisions for APRNs. For instance, some states recognize the APRN's credentials to practice, whereas others require licensure.

Licensed Practical Nursing

An LPN or LVN is trained in basic nursing skills to provide client care under the guidance of an RN or other licensed provider, for example, a physician or dentist. In the United States, these programs are 9 to 12 months in length and exist in a variety of settings: high schools, community colleges, vocational schools, hospitals, and other health care agencies. The Canadian equivalent to the LPN is a registered nurse's assistant (RNA). RNAs usually receive 12 months of education in a community college or hospital setting.

Practical nursing programs provide the graduate with didactic learning and clinical skills to perform selected nursing skills. Once licensed, practical nurses are prepared to work in structured settings, such as hospital and long-term care facilities, under RN supervision.

Registered Nursing

Registered nurse candidates are graduates from programs that are state approved and, in many cases, accredited by national accrediting organizations. In the United States, the National League for Nursing Accrediting Commission (NLNAC) accredits nursing programs; the Canadian Association of University Schools of Nursing (CAUSN) accredits baccalaureate programs. The Commission on Collegiate Nursing Education (CCNE) was established in 1996 as an accrediting agency of the American Association of Colleges of Nursing (AACN) to evaluate the quality and integrity of baccalaureate and graduate degree nursing education programs. RNs are prepared for entry into practice typically in three ways: associate degree nursing programs, hospital diploma programs, or baccalaureate degree nursing programs. Educational preparation for entry into practice has been an ongoing debate in nursing since the 1930s and 1940s, when the Brown and Goldmark reports recommended two levels of educational preparation for nurses. ANA's 1965 Position Statement identified two entry levels of educational preparation: minimum preparation for professional practice, baccalaureate degree; and minimum preparation for technical practice, associate degree. Again in 1985, the ANA adopted a resolution regarding titles: professional nurse, a nurse possessing the baccalaureate degree in nursing; and associate nurse, a nurse prepared in an associate degree program. Although AACN, CAUSN, and the professional nursing organizations in the United States (American Nurses Association) and Canada (Canadian Nurses Association) have supported the baccalaureate degree to be the minimum entry level for professional practice, the authority to enforce this requirement rests with the individual states and provinces.

CAUSN's mission is to promote health and wellness by advancing nursing education and nursing research. Although CAUSN supports baccalaureate education as the required educational preparation for beginning practitioners, the association established a Task Force

for Collaborative Nursing Education Models to foster collaboration between diploma and university schools in Canada (CAUSN Position Statement on Education, November 1998).

Associate Degree In the 1950s, Mildred L. Montag introduced the blueprint for associate degree nursing programs in response to the nursing shortage that followed World War II. Montag envisioned the associate degree graduate as a technical nurse who would work under the supervision of a professional nurse.

Associate degree programs are typically 2 years in length and are located in community colleges but may be found as options at 4-year degree granting universities. Program content in associate degree programs has reflected basic skill preparation and has traditionally emphasized clinical practice in a hospital setting. However, because of the decreasing demand for hospital beds, these students are likely to spend more clinical education hours in community-based institutions (ambulatory settings, schools, and clinics).

Diploma Programs Nursing education began in hospital-based diploma programs established by Florence Nightingale. The first program to train women in nursing was established in 1860 at St. Thomas' Hospital, England. Today's hospital-based educational programs vary from 2 to 3 years in length and are often affiliated with colleges or universities. Diploma education has always been associated with providing nursing students with strong hospital-based clinical experience. With the decline in hospitalized clients, diploma programs have expanded their practice sites to include community-based services (NLN, 1996).

Baccalaureate Degree In the early 1900s, baccalaureate nursing programs were established in university settings in the United States and Canada to provide the students with a liberal arts education. The typical 4 year educational preparation provides the student with a Bachelor of Science degree in nursing (BSN). The equivalent degree in Canada is a Bachelor of Science in Nursing (BScN) or a Bachelor in Nursing (BN). Most baccalaureate programs have special curricula to accommodate RNs of associate degree and diploma programs to articulate to a BSN. The major components of baccalaureate nursing education are liberal education, professional values, core competencies (critical thinking, communication, assessment, and technical skills), core knowledge and role development (AACN 1998).

Enrollment Trends in Nursing Programs According to the NLN (2000) enrollments in all entry level nursing programs have decreased between 1995 and 1999. The AACN (2000) reported a fifth consecutive year decline for entry level enrollment in baccalaureate

nursing programs, with a decrease of 4.6% in 1999. AACN attributes the decline in enrollments to several resource constraints: faculty shortages and a limited supply of clinical training sites. Other factors causing lower enrollments in entry level nursing programs are the proliferation of new career opportunities for women and a lingering belief that nursing is not a secure job (AACN Issue Bulletin, 2000).

Nontraditional Entry Level Programs

Nontraditional programs provide the student with an alternative method for entry into professional nursing. Second degree programs are examples of nontraditional programs. Second degree programs build on the student's prior education and/or experience, and provide the student with several years of accelerated nursing education. According to the AACN, "these innovative models provide us with a variety of graduate education approaches for professional entry, and they need to be carefully examined and evaluated" (AACN, 1998, p. 20).

Postgraduate Programs

During the 1970s and 1980s, nurses wanting to expand their *clinical practice* in certain areas of specialization enrolled in postgraduate, nondegree-granting programs. These programs, usually 9 to 12 months in length, include a formal course of study (didactic and clinical practice) and award a diploma or certificate on completion. The graduate, on successful completion of the program and national certification in the area of specialization (for example, midwife, neonatal nurse practitioner, and certified nurse anesthetist), can apply for recognition or licensure as an advanced practitioner with the state Board of Nursing.

Graduate Nursing Education

The master's degree in nursing allows nurses to expand their roles: educator, administrator, or advanced practitioner. Various master's degrees in nursing are offered by educational institutions of higher learning: Master of Arts (MA), Master in Nursing (MN), and Master of Science in Nursing (MSN). The program of studies exposes the student to advanced knowledge in the humanities, sciences, nursing theory, and specialization in an area of clinical practice.

Doctorate programs in nursing build on the master's preparation with emphasis on the application of research findings to clinical nursing. Doctoral programs confer a Doctorate of Science in Nursing (DSN) or Doctorate of Nursing in Science (DNSc) degree. Although many of the first doctorates in nursing were DSN or DSNc, the majority of current nursing doctorates are PhD degrees (McBride, 1999).

Advanced Practice

Advanced practice RNs have acquired and demonstrated a knowledge base and the practical experiences to prepare them for specialization, expansion, and advancement in practice. Nursing organizations and regulatory agencies now recommend or require graduate education (master's degree) as preparation for advanced practice roles such as clinical nurse specialists, nurse anesthetists, and nurse midwives.

In 1986, Lehman College of the City University of New York, in response to the need for nurses with advanced degrees, instituted a special pathway to graduate education for RNs with baccalaureate degrees in other disciplines. Frik, Speed, and Pollock (1996) studied the 65 graduates from Lehman College to determine the viability of this program in preparing non-BSN RNs for advanced practice. The study did not reveal any differences in retention and successful completion of the master's programs and professional socialization between nurses who enter the program with a BSN and those with a baccalaureate degree in another discipline.

Enrollment Trends in Graduate Nursing Programs

Nursing enrollments and graduations have increased significantly for master's programs as well as programs combining a nursing master's degree with another degree (American Association of Colleges of Nursing, 1999). One notable surge in master's degree education is the rapid increase of nurse practitioner programs.

Between 1970–1972 and 1994–1996, the number of masters degree graduates increased from 1,988 to 9,261; likewise, the number of doctoral graduates increased from 27 to 425 for the same time frame (McBride, 1999). AACN's survey showed a steady increase in the enrollment of full-time master's degree nursing students, and the number of nursing graduates from these programs rose 3.3% over the fall of 1997, while the number of these graduates grew by 4.3% between August 1997 and 1998 (AACN, 1999).

Staff Development and Continuing Education

Once nurses are in practice, both staff development and continuing education are used to maintain the requisite knowledge and skill needed for contemporary practice in addition to a formal academic degree. Staff development typically occurs in the setting of employment and is described as the delivery of instruction to assist the nurse to achieve the goals of the employer. According to the ANA (1990):

. . . nursing staff development is a process of orientation, in-service education and continuing education for the purpose of promoting the development of personnel within any employment setting, consistent with the goals and responsibilities of the employer. (p. 3)

Orientation is an important organizational tool for recruitment and retention. Orientation sessions typically occur at the initiation of employment and whenever positions and roles change. Content in orientation education unique to the institution of employment includes philosophy, goals, policies and procedures, role expectations, facilities, resources and special services, and assessment and development of competency with equipment and supplies used in the work setting (ANA, 1990).

In-service education is that phase of the staff development process that occurs after orientation and supports the nurse in acquiring, maintaining, and increasing skills to fulfill assigned responsibilities. Challenging learning opportunities in the employment setting include:

- Technology development
- Changing nature of health care and nursing science
- Interdisciplinary practice
- Changing delivery systems
- New equipment and supplies
- Enlarging roles of nursing related to leadership, management, delegation, supervision, and legal and ethical demands on practice

Active orientation and in-service development for nurses is a critical element of a delivery system that holds high standards for quality of care delivery in a cost-effective manner. Staff development is guided by the accreditation standards of the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) and ANA's *Standards for Nursing Staff Development* (ANA, 1990).

Professional nurses are responsible for their own continuing education. Continuing education offers both personal and professional growth to the nurse and may serve as an incentive to pursue an academic degree. Continuing education builds on acquired knowledge, attitudes, and skills and constitutes an essential dimension of lifelong learning.

Although half the boards of nursing require continuing education units (CEUs) as part of the licensure renewal process to document the registered nurse's competency, increasing evidence supports the assertion that "CE [continuing education] requirements do not guarantee continuing competence" (PEW Health Professions Commission, 1995, p. 1). With the release of the full PEW Health Professions Commission report and the repeal of Colorado's mandatory continuing education legislation, the debate over the value of mandating continuing education is certain to escalate (Hewlett & Eichelberger, 1996).

Lifelong learning is essential to career development and competency achievement in nursing practice. Technology has expanded the delivery and scheduling flexibility of continuing education for nurses in different geographic sites. Accessibility to continuing education will continue to improve the ability of the nurse to be flexible, factual, futuristic, and functional. The nurse

of the future will be the professional who knows how to obtain and use the relevant scientific base of nursing and health care delivery to achieve quality outcomes for health care.

Education Reform Mandates

The scientific base for nursing practice demands **competencies** (the ability to function in a particular way) from multiple sources: philosophy and ethics; physical, economic, behavioral, and social sciences; nursing science; and biomedicine. Additional competencies in collaboration, coordination, and the interdisciplinary practice activities of exchanging knowledge and techniques are critical to nursing practice and health care delivery. These competencies raise questions about the single, discipline-specific method of educating the nursing work force and offer alternative scenarios for nursing education.

The PEW Health Professions Commission (O'Neil, 1993; PEW Health Professions Commission, 1995; Shugars, O'Neil, & Bader, 1991), in its widely referenced and distributed reports, has recommended that academic institutions investigate whether the providers of educational experiences in health care are addressing the needs of clients. The *competencies* of practitioners in health care professions (physicians, nurses, dentists,

HEALTH CARE PROFESSIONALS' COMPETENCIES FOR THE YEAR 2005

- Care for the community's health
- Expand access to effective care
- Provide contemporary clinical care
- Emphasize primary care
- Participate in coordinated care
- Ensure cost-effective, appropriate care
- Practice prevention
- Involve patients and families in the decision-making process
- Promote healthy lifestyles
- Assess and use technology appropriately
- Improve the health care system
- Manage information
- Understand the role of the environment in mitigating the impact of environmental hazards on health
- Provide counseling on ethical issues
- Accommodate expanded accountability
- Participate in a racially and culturally diverse society
- Continue to learn

(From Shugars, D. A., O'Neil, E. H., & Bader, J. D. [1991]. *Healthy America: Practitioners for 2005: An agenda for action for U.S. health professional schools* [pp. 18–20]. Durham, NC: The PEW Health Professions Commission.)

pharmacists, and veterinarians) are targeted for implementation in the year 2005, and strategies for achieving these competencies are fully discussed in the PEW Health Professions Commission's report entitled *Healthy America* (Shugars et al., 1991). The accompanying display lists the PEW Health Professions Commission competencies.

Nursing leaders have embraced these competencies as consistent with the values and issues raised in *Nursing's Agenda for Health Care Reform* (ANA, 1991). To ensure that the nursing work force is educated sufficiently to demonstrate these competencies, schools are being challenged to redefine their educational core. To accomplish this goal, schools of nursing, health science centers, and institutions of higher education are refining mission statements, developing strategic plans and implementation activities, and examining curriculum activities, faculty competencies, educational methods and technologies, and sites/populations for clinical experiences.

To assist academic programs in achieving the changes needed in health care education, six strategies specifically designed for nursing education are proposed by the PEW Health Professions Commission (Shugars et al., 1991). The strategies for change are discussed in the accompanying display.

THINK ABOUT IT

Development of Competencies

After reviewing the PEW Health Care Professionals' Competencies for the year 2005, describe the basic science, liberal arts, or nursing courses you have taken or are currently taking that will assist you in developing these competencies. Discuss these with your peers and faculty.

The strategies recommended by the PEW Health Professions Commission for change in nursing education are parallel to the education strategies of all professional health care providers. Clearly, the demographics of the United States and the epidemiologic trends of health and disease patterns in the future are influencing the changing nature of nursing to provide core, competency-based educational experiences in all nursing programs.

Implications for the education of entry level nurses are clear: regardless of the type of educational program, entry level nurse generalists will be best prepared to demonstrate the PEW competencies to meet clients' needs in the year 2005 through educational reform efforts initiated now in nursing education. The trends in education (discussed below) reflect these reform initiatives.

Trends in Nursing Education

Four clusters of trends in nursing education are apparent from the issues and data presented by the PEW commission fourth and final major report. Each is discussed

STRATEGIES FOR CHANGE

- Refine the educational core by examining the disciplines represented in the nursing care setting of clinical education; teaching-learning strategies; educational teaming of students with those in other disciplines; process and outcome evaluation of curriculum; and earlier and greater access to professional, interprofessional, and multicompetency education.
- Restructure education and delivery of services to be responsible for the health care needs of a particular community; to provide for new, flexible program development; to provide for continued professional career competency; and to provide cost-effective education with faculty role models demonstrating the newest competencies.
- Obtain support by the university for innovative leadership to bring nursing education in tandem with diverse multicultural needs for health care. Programming will require strategic resource support for faculty, compensation systems, student recruitment and progression, and development of community clinical practicums.
- Health professions associations such as PEW, ANA, NLN, American Association of Colleges of Nursing, and Association of Nurse Executives should support a professional nursing redefinition consistent with the changing health care needs of clients and systems. Licensure and accreditation bodies should work closely with educational programs to support educational reform. See Chapter 10 for a discussion of professional licensure.
- Government (federal and state) should support changes in education through incentives for innovative educational programs; financing of practitioner education consistent with the PEW competencies; work force preparation policies (numbers, distribution, and specialty mix needed); and encouragement of regulatory and accreditation bodies to support innovation.
- The public (client) should participate in redefining the role of professionals in delivering health care. Schools of nursing can benefit from working with consumer advocacy groups and inviting participation in educational planning and evaluation by community representatives.

(From Shugars, D. A., O'Neil, E. H., & Bader, J. D. [1991]. *Healthy America: Practitioners for 2005: An agenda for action for U.S. health professional schools* [p. xi]. San Francisco: PEW Health Professions Commission.)

THINK ABOUT IT

Reforming Nursing Education

If you were to survey the public, what ideas would they share to reform nursing education? Interview some of your acquaintances who are not health care providers to determine their perceptions of needed changes and competencies in the nursing profession. Do you agree? State the rationale for your answer.

relative to the predicted and preferred future of nursing, nursing education, and the public's health.

Enrollment Strategies

Enrollment in entry level programs should be determined by the numbers and types of nurses appropriate to local or regional demand, rather than institutional and political needs. Schools of nursing are implementing aggressive recruitment efforts to increase enrollment by targeting high school and early college level students. AACN (AACN Issue Bulletin, 2000) reported that deans of nursing programs were utilizing media and promotional outlets to advertise their particular academic programs and the rewards of a nursing career. For example, one school used radio and newspaper ads, and a year-long run of still slides shown at local movie theaters before the start of the films to portray a positive image of nursing. Other schools of nursing offer college credit courses such as medical terminology and introduction to health careers on their campus to high school students to stimulate interest in nursing as a career.

Competency Development and Differentiated Practice

Debate concerning multiple educational levels for entry level nursing practice will continue to be active. The focus on basic competency demonstration by *all entry level* graduates regardless of educational level is likely to gain much greater support from professional nursing because it allows for both consensus about the outcome (competency) and diversity (innovation) about the process of achieving the competency.

Competency development in nursing education, which is consistent with the PEW Health Professions Commission's report (1998) and with *Nursing's Agenda for Health Care Reform* (ANA, 1991), is stimulating the following changes in nursing education:

- Revise the content and learning experiences in the nursing curriculum to produce graduates with the competencies needed for differentiated practice
- Clinical practicum experiences in community-based health care delivery sites for all courses in a curriculum

- Strengthen existing career mobility programs that facilitate educational advancement for associate degree and diploma graduates
- The use of nursing, medicine, and allied health student course work and practicum experiences to foster interdisciplinary communication and clinical care planning, intervention, and evaluation; to promote interdisciplinary role expectations for practice; and to demonstrate a holistic and coordinated approach to the client's health-illness continuum
- Additional depth in basic science course work that expands the environmental science interrelationships of health and disease patterns

As work redesign approaches (such as cross-training and unlicensed assistive personnel) continue to be implemented and evaluated for cost, quality, and safety in the delivery system, nursing education will need to support competency development in human and information resource management, delegation, supervision, leadership, and accountability. These indirect areas of nursing practice are expected to demand more guided practice and development in the academic programs. Even for entry level RNs, skills in planning, outcomes measurement, and evaluation will be demanded of new graduates.

Research

The need to further nursing's professional and practical goals requires that schools of nursing integrate research, teaching, and practice into the curriculum. The PEW report encourages that:

- Diploma and associate degree programs employ nurses to teach with extensive clinical practice experience, particularly in integrated systems of care
- Baccalaureate and higher degree nursing programs expand the opportunities for faculty to participate in clinical research, and to reward the faculty for such activity
- The increase in clinical research has prepared the way for nursing students to learn clinical decision-making skills based on the evidence relating to support specific interventions such as wound care and urinary catheterization. Evidenced-based practice is discussed later in this chapter.

Enrollments

Enrollments in schools of nursing have continued to decrease since 1995. As a result of the growing diversity of the American population, nursing students have become more diverse in terms of age, race, gender, and learning style, and nurse educators have begun to place greater emphasis on the value of diversity and cultural competence (McBride, 1999). Even with these changes in student diversity, the homogeneity of nursing remains one of the most salient features of the profession in that 86% are white women (McBride, 1999).

According to the projections of AACN (AACN Issue Bulletin, 1998), if current enrollment trends continue, by 2015, 114,000 full-time jobs for registered nurses are expected to be unfilled nationwide. The estimated predicted shortage is greatest for bachelor's and graduate degree nurses as the job market seeks nurses with management skills, clinical management skills, technological capabilities, critical thinking, and professional judgment (PEW, 1998).

While BSN enrollments are declining, increasing evidence shows an association between health care quality and the educational level of nursing staff, the number of RNs in the clinical setting, and the perceived value placed on nursing staff by the practice setting (Bednash, 2000). These findings have been documented in **magnet hospitals** that have been identified as good places to practice nursing and are recognized for their ability to attract and retain RNs in times of shortage. Magnet hospitals also have a higher proportion of nursing staff prepared at the BSN level, an average of 59% compared to 34% for all hospitals (Aikens, Havens, & Sloane, 2000).

Instructional Strategies

Diversity in instructional strategies and technology will encourage critical thinking, problem solving, and information management. Virtual reality technology, small group participant learning, and distance technology will offer greater consistency in knowledge acquisition that is independent of faculty expertise or location. The developing instructional strategies will provide greater access and flexibility for students and staff pursuing health care professions education and continued career competency development regardless of setting, location, or schedule.

Nursing Faculty

Demographic trends indicate that two-thirds of the current faculty in higher education will retire by 2005 (American Association of Colleges of Nursing, 1996). This trend is likely to escalate the competition for qualified faculty and increase faculty compensation, faculty turnover, the use of teaching assistants, and the use of part-time faculty. Graduate programs will need to prepare sufficient numbers of faculty to replace a gap created by the demographic trends of retirement.

Although there is a documented shortage of nurse faculty, their ability to provide cost-effective quality education is also being studied. McBride (1999) cites that schools of nursing will operate in the future, based on principles of responsibility-centered management and that this trend will mean that faculty will have to have more knowledge regarding the financing of their programs and take personal responsibility for expanding resources. Oermann questions "how faculty beginning their teaching career develop a knowledge base for clinical teaching and awareness of behaviors which facilitate learning in clinical practice" (1998, p. 201). Oermann's research findings on the

Title of Study

"Differences in Clinical Experiences of ADN and BSN Students"

Author

Oermann, M. H.

Purpose

The purposes of this study were to compare the clinical experiences of ADN and BSN students at different levels in the programs and describe these experiences from the student's perspectives.

Methods

A descriptive exploratory design was used for the research. Both quantitative and qualitative data were collected from 415 ADN and BSN students from 10 randomly selected NLN accredited ADN and BSN programs in the Midwest. The independent variables were type of nursing student and level in the nursing program. Dependent variables were the degrees of stress, challenge, and threat associated with the clinical experience.

Findings

The stress experienced by both ADN and BSN students in clinical practice increased as they progressed through the programs. The most stressful time in terms of clinical practice for both ADN and BSN students was the semester prior to graduation. The predominant stressor reported by students in ADN programs across all levels of the curriculum was the instructor. The most prevalent stressors among BSN students were coping with demands associated with client care and the clinical instructor. The findings highlight the important role of the clinical faculty in both types of nursing programs.

Implications

The need for graduate education to prepare faculty for clinical teaching is exemplified by the findings of this study.

Oermann, M. H. (1998). Differences in clinical experiences of ADN and BSN students. *Journal of Nursing Education*, 37(5), 197–201.

differences in clinical experiences in ADN and BSN students identified that the instructor was the predominant stressor reported by ADN students and was a prevalent stressor among BSN students.

Advanced Educational Preparation

A master's degree has become the standard requirement for APRNs. Additional credentials besides RN licensure, in the form of either a second license or certification credential, will be required to practice as an APRN within individual states.

The number of nurses graduating from doctoral programs will grow to meet the demand for more advanced nurse practice roles. Innovative "entry to doctoral" paths will be implemented that will assist in the timely and cost-effective production of the doctorally educated nursing work force. Case Western Reserve University is an example of a nursing program that offers the nursing doctorate as the first professional degree in nursing.

Licensure

Differential licensure and practice realities will shape the future of nursing education. Supplemental licensure for baccalaureate students is a licensure alternative that may prove useful for nursing programs, the public, and employers of graduates. Professional nursing organizations, such as the American Association of Colleges of Nursing, NLNAC, ANA, and Association of Nurse Executives, will participate in documentation to substantiate their positions in support of differentiation. As an example, the Maine State Board of Nursing has reported that a distinct set of skills possessed by BSN-prepared nurses have begun to be specified in job descriptions.

The National Council of State Boards of Nursing (NCSBN) has endorsed mutual recognition (multi-state licensure). Mutual recognition will legalize the practice of nursing beyond state borders. Several states have successfully passed legislation regarding mutual recognition. Under the leadership of the NCBSN, some states have embraced mutual recognition. Although mutual recognition facilitates mobility of licensed nurses, an area of concern regarding mutual recognition is the lack of uniform core licensure requirements. The lack of core licensure requirements may limit the authority of individual boards of nursing to regulate nursing, thereby threatening the board's mission to protect the public health, safety, and welfare of its citizens. See chapter 22 for a complete discussion of mutual recognition.

Size of Work Force

The demand for RNs in all practice settings continues to decrease the supply of experienced RNs, especially in critical care areas and the operating room. Schools of nursing will be forced to increase enrollment as health care requires more RNs to provide primary and preventive care services throughout the community. Couple these factors with an aging workforce of RNs, and a real nursing shortage will become a reality as we enter the 21st century.

The primary factor that has led to the aging of the RN workforce appears to be the decline in younger women choosing nursing as a career during the last 2 decades. Unless this trend is reversed, the RN workforce will continue to age, and eventually shrink, and will not meet projected long-term workforce requirements. (Buerhaus, Staiger, & Auerback, 2000, p. 2949)

According to the U.S. Department of Health and Human Services, by 2010 there will be only 635,000 registered nurses to fill nearly 1.8 million positions. The reasons for the shortage include the following:

- Aging nursing work force
- Nonhospital jobs available for nurses
- Stress of hospital workload
- Working conditions

Other reasons for the shortage include expanded career opportunities for women, who make up 94% of all RNs and the fact that nursing is not often chosen as a career because of increased pressure to provide care for more people with fewer resources.

Delivery of Care

The demand for nursing care will continue to be driven by aging populations, long-term care, home health care services, expansion of primary and preventive care, increased use of ambulatory care services, increased complexity of health care delivery, and increased demand to provide health services to underserved populations (such as inner city residents or those in rural areas).

Due to the increasing demands for **primary care providers** (health care providers whom a client sees first for health care), master's programs in nursing education will produce more advanced practice nursing graduates to answer the demand unmet by physicians pursuing specialty practice.

Clinical experiences in nursing education will parallel the nursing health care delivery sites burgeoning outside the hospital setting.

Managed care arrangements will continue as the primary delivery systems of the future. Almost 20% of the U.S. population is enrolled in **health maintenance organizations (HMOs)** (health plans that offer a full package of basic services in exchange for a set fee), and the number of subscribers enrolled in **preferred-provider organizations** (type of managed care model in which member choice is limited to providers within the system) is growing (Bartling, 1995). These types of health care plans are expected to increase in the years ahead.

Managed care emphasizes wellness, disease prevention, and health promotion. What a natural fit for nursing practice! Nursing has long been aware that health behaviors, genetics, the environment, and biologic factors contribute to health. The 10 leading causes of death actually result from a combination of genetic/biologic

HEALTHY PEOPLE 2010 AGENDA

GOALS

- Increase quality and years of healthy life
- Eliminate health disparities

INDICATORS

- Physical activity
- Overweight and obesity
- Tobacco use
- Substance abuse
- Responsible sexual behavior
- Mental health
- Injury and violence
- Environmental quality
- Immunization
- Access to health care

FOCUS AREAS

- Access to quality health services
- Arthritis, osteoporosis, and chronic back conditions
- Cancer
- Chronic kidney disease
- Diabetes
- Disability and secondary conditions
- Educational and community-based programs
- Environmental health
- Family planning
- Food safety
- Health communication
- Heart disease and stroke
- HIV
- Immunization and infectious disease
- Injury and violence prevention
- Maternal, infant, and child health
- Medical product safety
- Mental health and mental disorders
- Nutrition and overweight
- Occupational safety and health
- Oral health
- Physical activity and fitness
- Public health infrastructure
- Respiratory disease
- Sexually transmitted diseases
- Substance abuse
- Tobacco use
- Vision and hearing

(From Institute of Medicine, Office of Disease Prevention and Health Promotion, U.S. Department of Health and Human Services. [1999]. *Leading health indicators for healthy people 2010. Final report*. Washington, DC: National Academy Press.)

choices clients make and are amenable to knowledge, a supportive social environment, and availability of facilitative services (McGinnis & Foege, 1993). These are interventions that nurses have traditionally used in addition to highly technologically driven activities.

As additional contributing factors of disease point to health behaviors and preventive interventions, nursing education must provide a strong scientific base in health-seeking and health behavior frameworks that can prevent premature morbidity and mortality. The *Healthy People 2010* objectives will be accomplished only through the intervention of nursing in collaboration with other disciplines. Refer to the accompanying display for a listing of *Healthy People 2010* agenda.

Nursing education must instill in nursing graduates an appreciation for the complexity of human behaviors that have an impact on health outcomes. In the interaction with clients, entry level graduates must demonstrate competency with methods to support healthy lifestyle behaviors and changes in destructive behavior.

The trends in demographics, indicators of health status in the U.S. population, the influence of global factors, and the shifts in financing and organization of health care services will all have an impact on educational structures and programs for the nursing work force. If health policy initiatives solidly emphasize health and prevention dramatically beyond the current level of 3% to 5% of the total federal budget, the changing skill development achieved in nursing education will establish a firm leadership position for nurses among health care team members. Clearly, these skills and the PEW Health Professions Commission competencies must be standardized for all entry level nurses and amplified, researched, and evaluated for clinical and population outcomes by nurses educated at the master's and doctoral levels.

Education is an essential factor in the ability to fully practice the legal and professional scope of nursing practice. Addressing the issues of quality, cost, and access for education is as important to the preparation of a competent nurse work force as these three values are to the successes in health care delivery and for the health status of the public.

THINK ABOUT IT

Implementing Healthy People 2000 Objectives

Select and review one objective within each of the four areas (health promotion, health protection, prevention services, and surveillance and data systems) from the Healthy People 2000 objectives. How can your interventions as a nurse support the achievement of that objective? What knowledge and skills will you need to provide effective nursing care to your clients so each objective can be met?

and external factors. *External factors* (such as tobacco, diet and activity patterns, and alcohol) influencing the three leading causes of death (heart disease, cancer, and cerebrovascular diseases) are rooted in behavioral

Evidence-Based Practice

Nursing as a profession has always recognized the importance of research as an essential basis for its development. The identification of the knowledge base for nursing practice contributes to achieving client outcomes and making nursing practice credible (McPheeters & Lohr, 1999). During the past decade, nursing has witnessed increasing emphasis on the integration of research and clinical care with the evolution of evidence-based practice and best practices.

Taylor-Piliae (1998) describes evidence-based practice as the application of the best available empirical evidence that applies recent research findings to clinical practice in order to assist the provider's clinical decision-making. "Evidence-based practices are proven ways to diagnose and treat patients based on rigorous scientific evidence and clinical effectiveness studies" (Ling, 2000, p. 81).

Although the terms best practices and evidence-based practice are often used interchangeably, these terms have different meanings. Evidence-based practice can be a best practice, but a best practice is not necessarily evidence-based; best practices are simply ideas/strategies that work, such as programs, services, or interventions that produce positive client outcomes or reduce costs (Ling, 2000). Nurses need to base their clinical practice on empirical evidence to optimize client outcomes, to provide cost-effective safe practice and to enhance the credibility of nursing care.

Taylor-Piliae (1998) recognizes that a gap still exists between research findings and their implementation in practice. Nurses continue to have difficulty synthesizing empirical and contextual evidence and integrating evidence-based changes into practice (Rosswurm & Larrabee, 1999).

Although nurses are well placed to contribute towards more clinically effective and cost-effective client care, nurses need skills and resources to appraise, synthesize, and implement the best evidence into practice. Gross (2000) contends that efforts to promote the implementation of evidence-based practice should focus on designing organizational systems that will facilitate change as opposed to those trying to change the behavior of the health care provider.

RESEARCH: SUBSTANTIATING THE SCIENCE OF NURSING

Nursing is a profession characterized by educational standards, autonomy, socialization, an established knowledge base, licensure, formal entry examinations, code of ethics, technical expertise, professional standards, altruistic service, and public trust. The main characteristics of a profession are established, specialized training in a body of abstract knowledge and a collectivity of service orientation.

The science of nursing knowledge is established by the same systematic, investigative process used by all science-based disciplines, the research process. **Research** is a systematic method of exploring, describing, explaining, relating, or establishing the existence of a phenomenon, the factors that cause changes in the phenomenon, and how the phenomenon influences other phenomena. Nursing practice activities are substantiated as predicting valid and reliable outcomes for clients (the individual, family, group, or community) only after a body of knowledge has been established and confirmed by numerous research efforts.

Historical Development

Nursing research is aligned with the founder of modern nursing, Florence Nightingale. Nightingale combined dedicated client care with vigorous research to show the "impact of disease and the effects of improved sanitary conditions" (Oermann, 1991, p. 233). The groundwork established by Nightingale for using research to direct client care was not sustained by subsequent nursing leaders because of two forces that had a direct impact on nursing's future. First, societal norms basically excluded women from becoming scientists; therefore, initiating or participating in scientific discovery (research) was not an option for women. The second force dealt with the "training" as opposed to the "education" of nurses. It was not until 1899, with the inception of a graduate course and later undergraduate programs for nurses at Teachers College, Columbia University, that nursing was able to capitalize on building a scientific foundation. With the integration of nursing into higher education, the role of researcher became a natural acquisition for nurses.

Nursing research from 1940 to 1965 focused on educational curriculum questions and the roles and characteristics of nurses rather than developing a scientific base for clinical practice. Nursing during this era was still basically a female profession striving to define the autonomy of nurses and implement societal and educational reforms as recommended by studies and reports.

The *Journal of Nursing Research* was established in 1952 to inform nurses about clinical, knowledge-based research. Regrettably, this goal was not attained until the mid-1970s, through the combined commitment of several organizations, when research outcomes became applicable to clinical practice (Hinshaw, 1999)

In 1974, the ANA House of Delegates passed a resolution calling for more clinical research findings to support practice. ANA's standards for research were disseminated in 1981 as guidelines for investigative functions of nurses at various educational levels; for instance, nurses with a baccalaureate in nursing apply established findings of nursing and other related research findings to nursing practice. The majority of baccalaureate programs include nursing research content in their curricula.

Sigma Theta Tau, nursing's professional honor society, has taken a leadership role in supporting the use of

research in practice. Their goals address the development and dissemination of clinical databases to bridge the gap between nursing research and practice.

The National Institute of Nursing Research and the Agency for Health Care Research, and Quality, have provided resources to promote scientific knowledge to direct clinical practice. The contributions of these agencies are discussed later in this chapter.

Framework

Knowledge gained from both nursing research and practice is necessary to support the predictable outcomes of nursing care. Research used in nursing comes from nursing as well as other disciplines such as psychology, education, sociology, biology, and anthropology. Nursing research explores the many pathways through which scientific and practical knowledge regarding nursing care are established.

Research Process

The person conducting the research is called *researcher*, *investigator*, or *scientist*. When a researcher poses a problem or answers a question using the *scientific approach*, it is called a study, an investigation, or a research project. The people who are being studied are called *subjects* or *study participants*.

Scientific research is mainly concerned with vehicles of thought defined as **concepts**. The process of developing and refining concepts is referred to as **conceptual-**

ization. A **construct** is an abstraction or mental representation inferred from situations, events, or behaviors. Constructs are different from concepts in that the constructs are deliberately invented (or constructed) by researchers for a specific scientific purpose. These concepts or constructs are ideas that formulate a **theory** (a set of concepts and propositions that provide an orderly way to view phenomena). “In a theory, concepts (or constructs) are knitted together into an orderly system to explain the way in which our world and the people in it function” (Polit & Hungler, 1998, p. 22).

Nurse researchers can use one of two broad approaches to gather and analyze scientific information:

Quantitative research involves the systematic collection of numerical information, often under conditions of considerable control, and the analysis of the information using statistical procedures; **qualitative research** involves the systematic collection and analysis of more subjective narrative materials, using procedures in which there tends to be a minimum of researcher-imposed control. (Polit & Hungler, 1998, p. 15)

See the accompanying display for a comparison of the major characteristics of quantitative and qualitative research.

The scientific method requires an exact, orderly, and objective approach of acquiring knowledge. Controlled methods are used to study problems and test the **hypothesis** (statement of an asserted relationship between two or more variables). A **variable** is anything that may dif-

MAJOR CHARACTERISTICS: QUANTITATIVE AND QUALITATIVE RESEARCH

Quantitative Research

Hard science

Purpose: test theory

Focus: concise and narrow

Reasoning: deductive

Design: reductionist

Data collection: control, instruments

Basic element of analysis: numbers; statistical analysis

Reporting of findings: generalization; objective; formal style

Qualitative Research

Soft science

Purpose: develop sensitizing concepts, create theory

Focus: complete and broad

Reasoning: inductive

Design: holistic

Data collection: shared interpretation; communication and observation

Basic element of analysis: words; individual interpretation

Reporting of findings: uniqueness; subjective; rich narrative; expressive language

(Adapted from Burns, N., & Grove, S. [2000]. *The practice of nursing research* [4th ed.]. Philadelphia: W. B. Saunders Company; and Dempsey, P., & Dempsey A. [2000]. *Using nursing research: Process, critical evaluation & utilization* [5th ed.]. Philadelphia: Lippincott.)

fer from the norm. The two types of variables are independent and dependent.

The **independent variable** (criterion variable) is that variable that is believed to cause or influence the **dependent variable**, which is the outcome variable of interest and is the variable that is hypothesized to depend on or be caused by or predicted by the independent variable (Polit & Hungler, 1998). For example, if the question reads *to what extent does age predict recovery from surgical anesthesia relative to when perioperative instructions were first given*, the independent variable is age and the dependent variable is recovery from surgical anesthesia relative to when perioperative instructions were first given. **Value** is the variation of the variable. The values of the independent variable are actual ages of surgical clients, and the values of the dependent variable are when instructions were first given.

There are multiple ways in which nurses establish the sources and the realm of knowledge about nursing, human responses, diagnoses, and treatments. Holm and Llewellyn (1986) describe the establishment of nursing knowledge through multiple ways: logical reasoning, trial and error, experience, tradition, customs and habits, authority, precedent, and basic and applied research. There is also the belief that men and women use different ways of knowing (Belenky, Clinchy, Goldberger & Tarule, 1986). Carper (1978, 1992) describes four fundamental patterns of knowing:

- *Empirical*: using research to explain, describe and predict
- *Ethical*: extending knowledge of valuing, clarifying, and advocating
- *Personal*: encountering and focusing on self and others
- *Esthetics*: interpreting, engaging, and envisioning clues to knowledge

STEPS IN THE RESEARCH PROCESS

- Formulating a research question or problem
- Defining the purpose of the study
- Reviewing relevant literature
- Developing a **conceptual framework** (structure that links global concepts together to form a unified whole)
- Developing research objectives, questions, and hypotheses
- Defining research variables
- Selecting a **research design** (overall plan used to conduct the research); see the accompanying display for types of research design
- Defining the population, sample, and setting
- Conducting a pilot study
- Collecting data
- Analyzing data
- Communicating research findings, their implications, and the limitations of the study

TYPES OF RESEARCH DESIGN

Historical: Systematic investigation of a past event using relevant sources to describe or explain the event

Exploratory: Preliminary investigation designed to develop or refine hypotheses or to test the data collection methods

Evaluative: Systematic investigation of how well a program, practice, or policy is working

Descriptive: Investigations that have as their main objective the accurate portrayal of the characteristics of persons, groups, or situations and the frequency with which certain phenomena occur

Experimental: Research studies in which the investigator controls (manipulates) the independent variable and randomly assigns subjects to different conditions

Quasi-experimental: Studies that deviate from the methods of the experimental component in that subjects cannot be randomly assigned to treatment conditions even though the researcher manipulates the independent variable and exercises certain controls to enhance the internal validity of the results

(Adapted from Polit, D. F., & Hungler, B. P. [1998]. *Nursing research: Principles and methods* [6th ed.]. Philadelphia: Lippincott.)

The research process is based on sequential, interrelated steps; see the accompanying display.

Once the researcher has developed the conceptual framework, the research literature is reviewed to provide a foundation on which to base new knowledge. In selecting a research design, the researcher determines the methods to be used to address the research question and test the hypothesis, the specific population to be studied, and how the data will be collected.

Clearly, the contemporary thought on knowledge generation incorporates a variety of sources of data collection, each with its own strengths and weaknesses. However, knowledge in nursing is developed and used most effectively through the combination of nursing theory, research, and practice.

Following data collection, the researcher subjects the data to analysis in an orderly fashion so that patterns and relationships can be discerned. **Qualitative analysis** involves the “integration and synthesis of narrative, non-numerical data” (Polit & Hungler, 1998, p. 36), whereas quantitative information is usually analyzed through statistical procedures. If the data support the research hypothesis, the findings are reported in a straightforward fashion; however, if the results fail to support the hypothesis, the researcher must explain the possible reasons for this failure, for example, problems with the research method (use of inappropriate tools for data collection). The research findings can be communicated in various forms such as dissertations and journal

articles. Usually, research reports discuss how the findings can be incorporated into the practice of nursing.

Roles

Becoming a nurse researcher requires education and experience in the process of scientific inquiry. That process is then combined with the nurse's already established clinical experience and expertise. A nurse scientist is an RN with a strong clinical background who has also been educated at the doctoral level to conduct research (Hinshaw, 1999). However, nurses participate as consumers and critics of research by conducting the important work of translating, applying, and evaluating the new knowledge with clients and systems. Nurses also participate on research teams or with research protocols to plan, apply, collect data, and evaluate the process.

Each of these roles (nurse scientist, principal investigator, research team member, research consumer, and advocate for research clients) offers a substantial contribution to the process of scientific knowledge development in nursing and health care. Interdisciplinary experiences can further enrich the nurse's understanding of the concept or phenomenon and add to the research team's perspective of the research project.

Rights

During the research design phase of the process, the researcher must determine how to safeguard the rights of the research participants. An important role of the nurse researcher is that of advocate for the client's rights during the process; see the accompanying display regarding the human rights that require protection during research.

Obtaining **informed consent** requires that the researcher provide **full disclosure** (communication of complete information to potential research subjects regarding the nature of the study, the subject's right to refuse participation, and the likely risks and benefits that would be incurred) (Polit & Hungler, 1998). The nature, seriousness, and likelihood of risks (physical, psychological, social, and legal) are explained to the participants. The researcher must also identify what precautions will be taken to minimize the risks. Protection of subjects requires that the potential benefits outweigh potential risks.

Nurses have an obligation to collaborate in the research, provided the researcher has followed proper protocols. The researcher must obtain permission from the agency to use its facility as part of the research setting. Staff nurses who are expected to participate in the research process must have an adequate understanding of the nature of the study. Likewise, the staff nurse has the right to refuse to participate in the study.

Application

Accessing nursing research can be a challenge to students. "Nursing students are often intimidated by the research

PROTECTING HUMAN RIGHTS IN RESEARCH

- **Self-determination:** The person has the right to control his or her own destiny
- **Privacy:** The person has to determine the time, extent, and general circumstances under which private information will be shared with or withheld from others.
- **Anonymity:** Data collected will be kept confidential.
- **Fair treatment:** The person should be treated fairly and should receive what he or she is due or owed.
- **Protection from discomfort and harm:** Based on the principle of beneficence (one should do good and, above all, do no harm) the person should be protected from physical, emotional, social, and economic discomfort and harm.
- **Informed consent:** The person understands the reason for the proposed intervention and its benefits and risks, and agrees to the treatment by signing a consent form.

(Adapted from Burns, N., & Grove, S. [2000]. *The practice of nursing research* [4th ed.]. Philadelphia: W. B. Saunders Company.)

process" (Morse, Oleson, Duffy, Patek, & Sohr, 1996, p. 148). Nursing students are exposed to research in varying degrees as determined by the program's curriculum.

Nursing students need to familiarize themselves with a few general terms before they read and analyze research studies. When an article is written by one or more researchers, it is called a **primary source**. When an author addresses the research of someone else, it is referred to as a **secondary source**.

Research articles usually begin with an **abstract**, a summary statement that identifies the purpose, methodology (inclusive of subject population), findings, and

THINK ABOUT IT

Responsibility in Nursing Research

What should a nurse do when a risk factor has not been fully explained to a client who has agreed to participate in a study? You are a staff nurse working at a medical center where it is common practice for the nurses to participate in research studies that use investigational drugs. In reading the accompanying literature on the investigational drug being used in this particular study, you discover that the risk for infertility has not been addressed in the informed consent. Although you realize that you do not have to participate in the research, what should you do to protect the client's rights?

ABSTRACT CONTENTS

Title of the Study

Introduction of the Scientific Problem

- Statement of the problem and purpose
- Identification of the framework

Methodology

- Design
- Sample size
- Identification of data analysis methods

Results

- Major findings
- Conclusions
- Implications for nursing
- Recommendations for further research

conclusions. Some authors also include implications for further study within the context of the abstract; see the accompanying display for the major elements of an abstract.

During the career of a nurse, many clinical and practice questions will be raised that will require research methods to answer confidently. By pursuing and applying research in the area of choice, nurses acquire valid and reliable information that enables them to provide quality care.

Organizational Structure

The National Institute of Nursing Research (NINR) was initially established as the National Center for Nursing Research (NCNR) as a part of the National Institutes of Health (NIH) to build a strong scientific foundation for nursing practice. The name of the NCNR was changed to

THINK ABOUT IT

Nursing Research

Research in community health practice is challenging. The variables can be difficult to identify and measure. Consider ways that you might structure your research to answer the following.

- How might you measure the “health” or “wellness” of your community?
- You have decided to implement a teaching project on stress management to a group of well elders. What criteria might you use to measure the effectiveness of your nursing interventions?
- You are a new occupational health nurse at a local plastics factory. What questions might you ask the employees to better understand their need for and interest in health-promotion topics?

Title of Study

“Strategic Planning for Research Use in Nursing Practice”

Author

Mullem, C. V., Burke, L. J., and Dobbmeyer, K.

Purpose

The purposes of this study were to assess RN’s knowledge, attitudes, and practices of nursing research activities, assess factors that support a research environment, and determine facilitating and challenging factors related to conducting regional nursing research.

Methods

A descriptive 33-item survey based on the Iowa Model for Evidence-Based Practice was developed, validated, and determined to be reliable. Site coordinators collected the data from 2,736 RNs who worked in six hospitals, 65 affiliated clinics, and three business units.

Findings

Self-reported research activity patterns differed by roles and education: nurses prepared at the masters level, specifically clinical nurse specialists, reported having more knowledge, willingness, and ability to participate in research than did staff members or managers. Nurses with bachelors degrees self-reported more moderate and high knowledge and ability to perform research activities than did those at the diploma or associate degree level; however, there were no differences in willingness to engage in research activities among these three groups.

Implications

While exposure to research during nursing school increases the nurse’s knowledge of research activities, results suggest that it is the expectations of the health care systems that are gradually creating change. Health care systems are recognizing that research utilization is essential to defining nursing’s role in meeting the emerging health care needs of the population through cost-effective approaches.

Mullem, C. V., Burke, L.J., and Dobbmeyer, K. (1999). Strategic planning for research use in nursing practice. *The Journal of Nursing Administration*, 29(12) 38–49.

THINK ABOUT IT

Ways of Knowing

Nurses use scientific and “other ways of knowing” to measure the effectiveness of nursing interventions.

- Name and describe three “other ways of knowing” that you use in your personal life to solve problems.
- What are the advantages and disadvantages of each method you use?
- How can “other ways of knowing” be used by nurses to measure the client’s situation or the outcome of the nursing activity applied to the situation?

the NINR in 1993. NINR promotes research and the training of researchers in universities, hospitals, and research centers and with other scientific disciplines at NIH.

The NINR develops nursing research priorities to establish funding preferences (research and training grants) based on collaboration and communication with the academic and practice communities. Currently, the three major areas are *Health Promotion/Disease Prevention, Acute and Chronic Illness, and Nursing System*. In addition to investigator-initiated applications for research funding, a National Nursing Research Agenda has guided the priorities and future nursing research concerns since NINR’s inception.

The Agency for Health Care Research and Quality (AHCRO), founded in 1987 as the Agency for Health Care Policy and Research, is a part of the U.S. Department of Health and Human Services. AHCRO’s purpose is to support research designed to improve the quality of health care, reduce costs, and broaden access to essential health care services. The agency has developed and published clinical practice guidelines, ranging from acute pain to urinary incontinence. These guidelines are based on evidence, provide the consumer with information directly related to the clinical practice guidelines, and are available online (refer to the Web Resources at the end of this chapter for AHCRO’s website address). AHCRO’s website has links to 12 U.S. evidence-based practice centers.

Trends in Nursing Research

The following trends in health care will have a definite impact on future nursing research.

1. Increasing numbers of doctorally prepared nurses will contribute to building and evaluating the science of nursing practice.
2. Nurse scientists will build international collaboration teams with scientists from other disciplines.
3. National research priorities will establish a strong scientific base for nursing within the priorities.

4. Nurse scientists will increasingly be educated and funded in health services research as related to clinical practice guidelines for nursing care services to reduce variance in nursing practice activities.
5. Nurses working with clients on research protocols will continue to confront ethical dilemmas that balance the goals of research with those of the client and client care. The client advocacy and empowerment role will consume a larger component of nursing practice.
6. The collaborative efforts by national organizations to develop innovative systems strategies to identify the barriers and bridge the gaps around the process of adopting evidence-based practice.

“Nursing research has much to celebrate and much to accomplish as we stand at the beginning of a new millennium” (Grady, 2000, p. 33).

With the identification of clear, significant priorities for study, striving for excellence in the evolving knowledge base, and confirming study findings, nursing researchers are providing a creditable scientific position from which to address societal health care issues and guide nursing practice.

KEY CONCEPTS

- The three types of programs that currently prepare nurses for entry level practice are diploma, associate degree, and baccalaureate degree nursing programs.
- To achieve the competencies established for health care professionals, several strategies for nursing education reform have been proposed in the areas of institutional, governmental, and federal involvement with the nursing profession.
- Trends in nursing education have been identified in the areas of competency development, enrollments, instructional strategies, nursing faculty, advanced educational preparation, licensure, size of the work force, and delivery of care.
- The science of nursing is established by the same systematic, investigative process used by all science-based disciplines, the research process.
- Knowledge and nursing science are predicated on many ways of knowing such as tradition, systematic inquiry, esthetics, and empiricism and are influenced by gender perspectives.
- The five steps of the research process are statement of the research problem, delineation of a conceptual framework and review of the literature, selection of a research design, analysis and interpretation of the findings, and communication of the results of the research study.
- Research, education, and practice constitute the required integrated approach to the daily practice of all nurses.

- Obtaining informed consent for clients participating in the research process requires that the researcher provides full disclosure of the nature of the study, the subject's right to refuse participation, and the likely risks and benefits that would be incurred by the study.
- The various applications of nursing research to education and practice can significantly influence the quality and delivery of nursing care.
- The importance of nursing research will increase as the result of trends occurring in educational programs, interdisciplinary collaboration, interrelationships between nursing practice and research, and nurse-client involvement in research activities.

CRITICAL THINKING ACTIVITIES

1. Debate these statements:
 - a. One licensure examination for RNs demands only one type of educational program.
 - b. Different licensure examinations should be administered to graduates from different types of entry and advanced levels of educational programs.
2. Describe how nursing education will be different in the next 10 years to graduate nurses who demonstrate the competencies issued from the PEW Health Professions Commission.
3. Name a phenomenon you may see in nursing or in clients that raises a question for you. Discuss the steps you would take to answer the question using a systematic investigation method.
4. Which type of research design is used in the Research Focus feature that is relative to early hospital discharge and home follow-up of women having cesarean birth?
 - a. Exploratory
 - b. Descriptive
 - c. Experimental
 - d. Quasi-experimental

5. Why must the researcher secure an informed consent from research participants?
6. How do the nursing research priorities established by NINR match with the *Healthy People 2000* goals and objectives?

The Health Care Delivery System

*The future is not some place we are going to,
But one we are creating.
The paths to it are not found, but made.
And the activity of making them
Changes both the maker and the destiny.*

—Anonymous (in Zerwekh & Claborn, 1994)

COMPETENCIES

1. Describe the types of services of the U.S. health care delivery system.
2. Discuss the various health care settings through which health care services are delivered.
3. Identify the members of the health care team and their respective roles.
4. Describe the differences between the various financial programs for health care services and reimbursement.
5. Explain the factors that influence health care delivery.
6. Explore the challenges that exist within the health care system.
7. Discuss nursing's role in meeting the challenges within the health care system.
8. Describe the emerging trends and issues for the health care delivery system.

A **health care delivery system** is a mechanism for providing services that meet the health-related needs of individuals. The U.S. health care delivery system is currently experiencing dramatic change. Health care institutions that once flourished economically are now searching for ways to survive. Health care providers are seeking cost-effective ways to deliver an ever-increasing range of services to consumers. Consumers are demanding greater accessibility to quality health care services that are affordable.

Nursing is a major component of the U.S. health care delivery system. Consequently, nurses must understand the changes occurring within this system, as well as their role in shaping the changes. This chapter discusses the types of health care services available, various settings in which these services are provided, and the members of the health care team. The economics of health care and the challenges within the health care delivery system are also discussed. Nursing's role in meeting these challenges is described.

Americans are becoming increasingly confused about the services and coverage offered by the health care system. This chapter examines some of the problems and possible solutions in health care delivery.

TYPES OF HEALTH CARE SERVICES

Basically, health care services can be categorized into three levels: primary, secondary, and tertiary (Figure 4-1). The complexity of care varies according to the individual's need, provider's expertise, and delivery setting. Table 4-1 provides an overview of the types of care.

Primary: Health Promotion and Illness Prevention

The major purposes of health care are to promote wellness and prevent illness or disability. Traditionally, the U.S. health care system focused on disease prevention rather than health promotion. However, within the past decade, society has begun to engage in health-promoting behaviors. Illness prevention activities are directed at the individual, the family, and/or the community.

Unfortunately, our entire system of health care delivery is not a *health* care system but rather an *illness* care system. Services are directed to caring for an individual after disease or disability has developed rather than

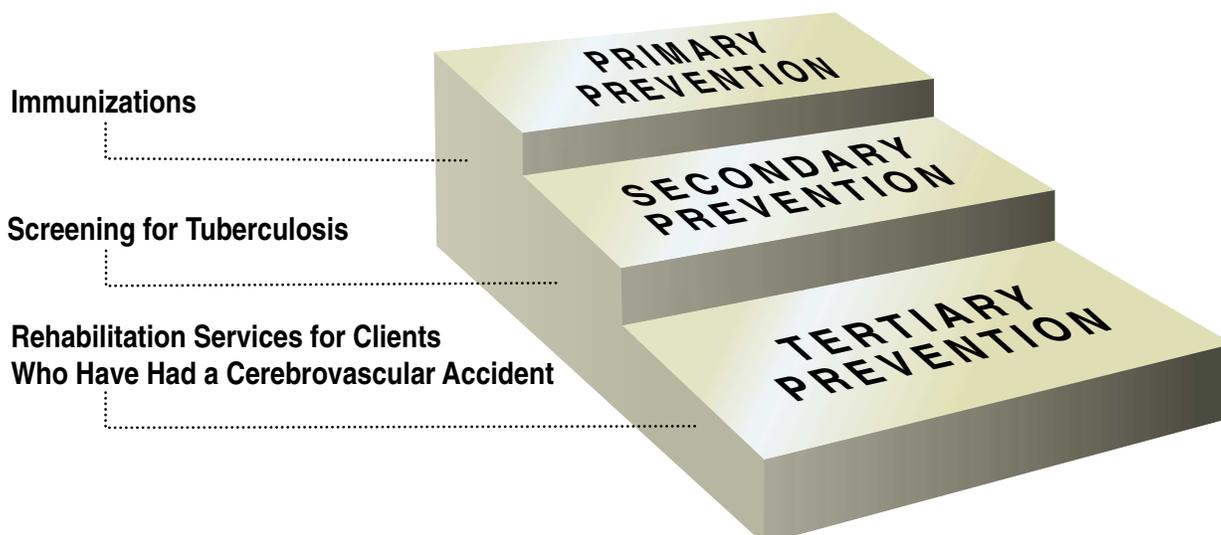

Figure 4-1 Three Levels of Prevention: Examples

TABLE 4-1
Types of Health Care Services

Type of Care	Description	Examples
<i>Primary</i>	<p><i>Goal:</i> To decrease the risk to a client (individual or community) for disease or dysfunction</p> <p><i>Explanation:</i> General health promotion Protection against specific illnesses</p>	<p>Teaching Lifestyle modification for health (e.g., smoking cessation, nutritional counseling)</p> <p>Referrals Immunization Promotion of a safe environment (e.g., sanitation, protection from toxic agents)</p>
<i>Secondary</i>	<p><i>Goal:</i> Early intervention to alleviate disease and prevent further disability</p> <p><i>Explanation:</i> Early detection and intervention</p>	<p>Screenings/diagnosis Acute care Surgery</p>
<i>Tertiary</i>	<p><i>Goal:</i> To minimize effects and permanent disability of chronic or irreversible condition</p> <p><i>Explanation:</i> Restorative and rehabilitative activities to obtain optimal level of functioning</p>	<p>Education and retraining Provision of direct care Environmental modifications (e.g., advising on necessity of wheelchair accessibility for a person who has experienced a cardiovascular accident [stroke])</p>

THINK ABOUT IT

Is the Health Care System in Crisis?

Before focusing on the problems within the current health care delivery system, stop and think! The American health care system is first in technologic advances, biomedical research, and state-of-the-art clinical equipment and facilities. Yet, even with these advantages, many consider that this system is in crisis. From your perspective, is the health care system in a position of strength or weakness?

emphasizing preventive aspects of care (Pruitt & Campbell, 1994). Ideally, preventive care occurs in the community (e.g., homes, workplaces, schools) and emphasizes the development of healthy lifestyles.

Secondary: Diagnosis and Treatment

Most services occur within this secondary type of health care. Acute treatment centers (hospitals) are still the predominant site of delivery of health care services. There is a growing movement to have diagnostic and therapeutic services provided in locations that are more easily accessed by individuals. This trend is discussed later in this chapter.

Tertiary: Rehabilitation

Restoring an individual to the state that existed before the development of an illness is the purpose of rehabilitative (or restorative) care. In situations in which the person is unable to regain previous functional abilities, the goal of rehabilitation is to help the client reach the optimal level of self-care. Restorative care is holistic, in that the entire person is cared for—physiological, psychological, social, and spiritual aspects.

HEALTH CARE SETTINGS

The U.S. health care delivery system is complex, involving myriad providers, consumers, and settings. Health care services in this country are delivered by both the public (including official and voluntary) and private sectors.

Public Sector

Public agencies are financed with tax monies; thus, these agencies are accountable to the public. The public sector includes official (or governmental) agencies, voluntary agencies, and nonprofit agencies. Figure 4-2 shows the hierarchy of the public sector of health care delivery.

At the local level, services provided include immunizations, maternal-child care, and activities directed at control of chronic diseases. Each state varies in the

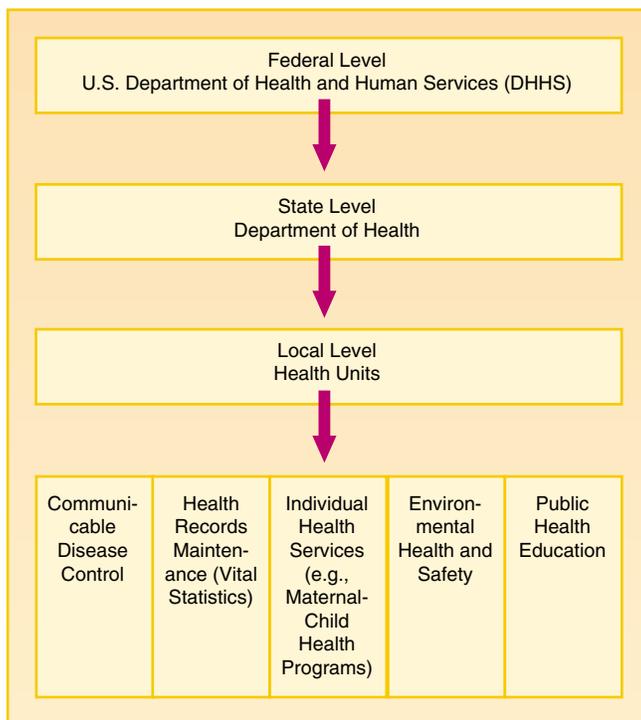

Figure 4-2 The Public Sector of Health Care Delivery

provision of public health services. Generally, a state department of health coordinates the activities of local health units.

At the national level, the U.S. Department of Health and Human Services (DHHS) is administratively responsible for health care services delivered to the public. The Surgeon General is the chief officer of the U.S. Public Health Service (USPHS), the major agency that oversees the actual delivery of care services. Table 4-2 lists the USPHS agencies and their purposes.

An important part of the public sector of the health care delivery system is voluntary agencies. These not-for-profit agencies exert significant legislative influence (e.g., the American Nurses Association [ANA] and the American Medical Association). Other voluntary agencies, such as the American Cancer Society and the American Heart Association, provide educational resources to the general public and to health care providers. Voluntary agencies are funded in a variety of ways, including individual contributions, corporate philanthropy, and membership dues.

Private Sector

The private sector of the health care delivery system primarily comprises independent providers who are reimbursed on a **fee-for-service** basis (the recipient directly pays the provider for services as they are provided). The variety of settings in which health care is delivered and the roles of nurses in these settings are presented in Table 4-3. These practices settings are directly influenced by social and economic factors.

TABLE 4-2
Agencies of the U.S. Public Health Service

Agency	Purpose
Health Resources and Services Administration (HRSA)	Provide health-related information Administer programs concerned with health care for the homeless, people with human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS), organ transplants, rural health care, and employee occupational health
Food and Drug Administration (FDA)	Protect the public from unsafe drugs, food, and cosmetics
Centers for Disease Control and Prevention (CDC)	Prevent the transmission of communicable diseases
National Institutes of Health (NIH)	Conduct research and education related to specific illnesses
Alcohol, Drug Abuse, and Mental Health Administration (ADAMHA)	Serve as clearinghouse for information on substance abuse and mental health issues
Agency for Toxic Substances and Disease Registry (ATSDR)	Maintain registry of certain diseases Provide information on toxic agents Conduct mortality and morbidity studies on defined population groups
Indian Health Service (IHS)	Provide health care services to Native Americans, including: health promotion, disease prevention, alcoholism prevention, substance abuse prevention, suicide prevention, nutrition, maternal-child health
Agency for Healthcare Research and Quality (AHRQ)	Primary source of federal support for research related to quality of health care delivery

TABLE 4-3
Health Care Settings

Setting	Services Provided	Nurse's Role
Hospitals	Diagnosis and treatment of illnesses (acute and chronic) Acute inpatient services Emergency care Ambulatory care services Critical (intensive) care Rehabilitative care Surgical interventions Diagnostic procedures	Caregiver Client educator Provides ongoing assessment Coordinates care and collaborates with other health care providers Maintains client safety Initiates discharge planning Has a variety of areas in which to specialize: Cardiology Critical care Dialysis Emergency Geriatrics Infection control Neurology Oncology Orthopedics Pediatrics Psychiatry Rehabilitation Surgery
Extended care (long-term care) facilities (e.g., nursing homes, skilled nursing facilities)	Intermediate and long-term care for people with chronic illnesses or those who are unable to care for themselves Restorative care until client is ready for discharge to home	Provides care directed at meeting basic needs (e.g., nutrition, hydration, comfort, elimination) Provides teaching and counseling Plans and coordinates care Administers medications, treatments, and other therapeutic modalities
Home health agencies	Wide range of services, including curative and rehabilitative	Provides skilled nursing care Coordinates health promotion activities (e.g., education)
Hospices	Care of individuals with terminal illnesses Improving the quality of life until death	Promotes comfort measures Provides pain control Supports grieving families
Outpatient settings (clinics, health care practitioners' offices, ambulatory treatment centers)	Treatment of illness (acute and chronic) Diagnostic testing Simple surgical procedures	<i>Traditional Role:</i> Checks vital signs Assists with diagnostic tests Prepares client for examination <i>Expanded Role:</i> Provides teaching and counseling Performs physical (or mental status) examination In some settings, advanced practice registered nurses (APRNs) are the primary care providers
Schools	School-based clinics (SCBs) are federally funded providers of physical and mental health services in middle and high schools.	Coordinates health promotion and disease prevention activities Treats minor illnesses Provides health education
Industrial clinics	Maintain health and safety of workers	Coordinates health promotion activities Provides education for safety Provides urgent care as needed Maintains health records Conducts ongoing screenings Provides preventive services (e.g., tuberculosis testing)
Managed care organizations	Reimbursement for health care services	Serves as case manager Uses triage to determine the most appropriate intervention for clients
Community nursing centers	Direct access to professional nursing services	Treats client's responses to health problems Promotes health and wellness
Rural primary care hospitals (RPCs)	Stabilize clients until they are physiologically able to be transferred to more skilled facilities	Performs assessments and provides emergency care

HEALTH CARE TEAM

Health care services are delivered by a multidisciplinary team. Table 4-4 provides a list of health care providers. Because nurses work with other care providers on an ongoing basis, it is necessary to understand the role of each provider. Nurses coordinate the care provided by other personnel.

Nurse

What do nurses do? Nurses fulfill a variety of roles while assisting clients to meet their needs. Table 4-5 defines the most common roles of nurses. These roles are affected by changes in the health care environment. Nurses function in dependent, independent, and interdependent roles. The degree of autonomy nurses experience is related to client needs, expertise of the nurse, and practice setting.

TABLE 4-4
Health Care Providers

Professional	Function/Role
Nurse (RN)	Provides care to individuals who are unable to care for themselves; with a holistic approach, nurses assist clients to cope with illness or disability Addresses the needs of the client (individual, family, community) Emphasizes health promotion
Physician (MD)	Makes medical diagnoses and prescribes therapeutic modalities Performs medical procedures (e.g., surgery) May specialize in a variety of areas (e.g., gynecology/obstetrics, oncology, surgery)
Physician Assistant (PA)	Provides medical services under the supervision of a health care practitioner
Pharmacist (RPh)	Prepares and dispenses drugs for therapeutic use Often involved in client education
Dentist (DDS)	Diagnoses and treats conditions affecting mouth, teeth, and gums Performs preventive measures to promote dental health
Dietitian (RD)	Plans diets to meet special needs of clients Promotes health and prevents disease through education and counseling May supervise preparation of meals
Social worker (SW)	Assists clients with psychosocial problems (e.g., financial, marital) Conducts discharge planning Makes referrals for placement
Respiratory therapist (RT)	Administers pulmonary function tests Performs therapeutic measures to assist with respiration (e.g., oxygen administration, ventilators)
Physical therapist (PT)	Works with clients experiencing musculoskeletal problems Assesses person's strength and mobility Performs therapeutic measures (e.g., range of motion, massage, application of heat and cold) Teaches new skills (e.g., walking with crutches)
Occupational therapist (OT)	Works with clients with functional impairment to learn skills for activities of daily living
Chaplain	Assists in helping clients meet spiritual needs Provides individual counseling Provides support to families Conducts religious services
Unlicensed assistive personnel (UAP)	Assists in provision of client care activities under the direction of the RN May include certified nurses aide, personal care assistant, nursing assistant, orderly, and certified phlebotomist

TABLE 4-5
Nursing Roles

Role	Description
Caregiver	Traditional and most essential role Functions as nurturer Provides direct care Is supportive Demonstrates clinical proficiency Promotes comfort of client
Teacher	Provides information Serves as counselor Seeks to empower clients for self-care Encourages compliance with prescribed therapy Promotes healthy lifestyles Interprets information
Advocate	Protects the client Provides explanations in client's language Acts as change agent Supports client's decisions
Manager	Makes decisions Coordinates activities of others Allocates resources Evaluates care and personnel Serves as a leader Takes initiative
Expert	Advanced practice clinician Conducts research Teaches in schools of nursing Develops theory Contributes to professional literature Provides testimony at governmental hearings and in courts
Case manager	Tracks client's progress through the health care system Coordinates care to ensure continuity
Team member	Collaborates with others Possesses highly skilled communication methods Performs therapeutic measures to assist with respiration (e.g., oxygen administration, ventilators)

ECONOMICS OF HEALTH CARE

The reform movement in health care has been motivated primarily by health care costs. Control of costs has shifted from the health care providers to the insurers. As a result, there are increasing constraints on reim-

bursement. For years, the predominant method of covering health care costs was the fee-for-service method. There was little, if any, incentive for cost-effective delivery of care (Chamberlain, Chen, Osuna, & Yamamoto, 1995). All that is changing.

The United States health care system has a diverse financial base, composed of both private and public funding. As a result, administrative costs for health care reimbursement are higher in this country than in countries with a **single-payer system** (a model in which the government is the only entity to reimburse health care costs: e.g., Canada). The level of U.S. health care expenditures is higher than in any other nation, and previous cost-containment measures have been ineffective in slowing the growth of expenditures (Schieber, Poullier, & Greenwald, 1994). Despite the enormous expenditures of public funds, the United States has not found a way to provide adequate health care coverage for all citizens.

Private Insurance

The system for financing health care services in the United States is based on the private insurance model. One of the largest sectors of the health care system is private insurance companies. Currently, more than 1000 private insurance companies exist (Schieber et al., 1994). Payment rates to health care providers vary among insurance companies.

Insured individuals are paying substantial monthly premiums and deductibles for health care services. These costs limit access for many Americans. In addition, insurers will no longer pay for services that they deem unnecessary. The quality of care provided is being monitored by providers, third-party payers, and, ever-increasingly, by consumers.

Managed Care

Managed care is a system of providing and monitoring care in which access, cost, and quality are controlled before or during delivery of services. The goal of managed care is the delivery of services in the most cost-efficient manner possible. Managed care seeks to control costs by monitoring delivery of services and restricting access to expensive procedures and providers.

Managed care was designed to provide coordinated services with an emphasis on prevention and primary care (ANA, 1995). The rationale for managed care is to give consumers preventive services delivered by a **primary care provider** (a health care provider whom a client sees first for health care) that, in turn, results in less expensive interventions.

Managed care has been in existence for years; however, it is only within the past few decades that it has received national prominence (Society for Ambulatory Care Professionals, 1994). The Health Maintenance Organization Act (passed in 1973) implemented two

mandates. First, federal grants and loans were made available to **health maintenance organizations (HMOs)** (prepaid health plans that provide primary health care services for a preset fee and focus on cost-effective treatment measures) that complied with strict federal regulations as opposed to the less restrictive state requirements. Second, the act required large employers to provide an HMO as an option for employees for health care coverage (Society for Ambulatory Care Professionals, 1994). From their inception, HMOs have been a viable alternative to the traditional fee-for-service system.

Managed care is not a place but rather an organizational structure with a few variations. One is represented by HMOs, which are both providers and insurers. Other variations are represented by **preferred provider organizations (PPOs)** (a type of managed care model in which member choice is limited to providers within the system) and **exclusive provider organizations (EPOs)** (organizations in which care must be delivered by the plan for clients to receive reimbursement). The latter creates a network of providers (such as physicians and hospitals) and offers the incentive of consumer services with little or no copayment if these providers are used exclusively. Table 4-6 provides a comparison of independent practice and managed care organizational structures.

The impact of managed care is that caregivers and institutions must change from providing as many ser-

vices as possible under a fee-for-service payment approach to keeping the client well and providing fewer services so as to protect their financial interests. “In a fee-for-service system, the concern is that a client might receive too many or unnecessary services; in a prepaid system, the concern is that too few services might be given in order to save the provider and the managed care plan money” (Hitchcock, Schubert, & Thomas, 1999, p. 46).

Health Maintenance Organizations

The HMOs often maintain primary health care sites and commonly employ provider professionals. They use **capitated rates** (a preset flat fee that is based on membership in, not services provided by, the HMO), assume the risk of clients who are heavy users, and exert control on the use of services. HMOs have been noted for their use of advanced practice registered nurses (APRNs) as primary care providers, precertification programs to limit unnecessary hospitalization, and an emphasis on client education for health promotion and self-care.

Another common feature of HMOs is the practice of **single point of entry** (entry into the health care system is required through a point designated by the plan) through which primary care is delivered. **Primary health care** is the client's point of entry into the health care system and includes assessment, diagnosis, treatment, coordination of care, education, preventive services, and surveillance. It consists of the spectrum of services provided by a family practitioner (nurse or physician) in an ambulatory setting. Primary care providers (PCPs) serve as “gatekeepers” to the health care system in that they determine which, if any, referrals to specialists are needed by the client. To reduce costs, direct access to specialists is limited. Extensive data collection proves that APRNs are exceptionally suited to these primary provider/gatekeeper roles (ANA, 1993a). Managed care plans assume a significant portion of the risk of providing health care and, consequently, encourage both prudent use by consumers and prescription by providers.

Preferred Provider Organizations

The most common managed care systems are preferred provider organizations (PPOs). A PPO is a contractual relationship between hospitals, providers, employers, and third-party payers to form a network in which providers negotiate with group purchasers to provide health services for a defined population at a predetermined price (Society for Ambulatory Care Professionals, 1994). Even though PPOs have been very popular with the American public, it appears that HMOs are gaining in market share among the American public (Kelly & Joel, 1995). Currently, managed care is emerging as the preferred model for delivery of services.

TABLE 4-6
Comparison of Independent Practice
with Managed Care

Type	Description
Independent practice	Fee-for-service Functions within socially prescribed boundaries (professional ethics) Consumer choice of provider Disease-oriented philosophy
Health maintenance organizations (HMOs)	Provide services to a group of enrolled persons Fee is preset and prepaid Service provision is limited
Preferred provider organizations (PPOs)	Networks of providers that give discounts to sponsoring organization Members are not mandated to select a primary care health care practitioner but must use a health care practitioner in the network
Exclusive provider organizations (EPOs)	Plan pays no benefit if member is treated outside the network Are usually regulated by state insurance laws

Title of Study

“Primary Care Outcomes in Patients Treated by Nurse Practitioners or Physicians: A Randomized Trial”

Author

Mundinger, M. O., Kane, R. L., Lenz, E. R., Totten, A. M., Tsai, W., Cleary, P. D., Friedewald, W. T., Siu, A. L., & Shelanski, M. L.

Purpose

To compare outcomes for clients treated by nurse practitioners or health care practitioners for primary care follow-up and ongoing care after an urgent care visit or emergency department visit. This study provided direct comparison of outcomes for clients with services provided by nurse practitioners and by health care practitioners.

Methods

A randomized trial was conducted from August 1995 to October 1997, with client interviews 6 months and 1 year following an initial appointment. The study occurred at four community-based primary clinics (17 health care practitioners) and one primary care clinic (seven nurse practitioners) at an urban academic medical center.

Findings

No significant differences were found in clients' health status at 6 months following the appointment. No significant differences were found in health services utilization after 6 months or 1 year. Clients reported no differences in satisfaction ratings following the initial appointment. In an ambulatory care setting in which clients were randomly assigned to nurse practitioners or health care practitioners, client outcomes were comparable.

Implications

This was a groundbreaking study in that it was published in a premiere medical journal and showed no statistical advantages for clients to be treated by health care practitioners instead of nurse practitioners in an ambulatory treatment setting. This study can be useful in documenting the efficacy of nurse practitioners.

Mundinger, M. O., Kane, R. L., Lenz, E. R., Totten, A. M., Tsai, W., Cleary, P. D., Friedewald, W. T., Siu, A. L., & Shelanski, M. L. (2000). Primary care outcomes in patients treated by nurse practitioners or physicians: A randomized trial. *Journal of the American Medical Association* 283(1), 59.

Federal Government Insurance Plans

The federal government became a third-party payer for health care services with the advent of Medicare and Medicaid in 1965. The Health Care Financing Administration (HCFA) is a federal agency that regulates Medicare and Medicaid expenditures. Public funding is used for about 42% of total health expenditures (Schieber et al., 1994). There are myriad public programs for financing health care, with Medicare and Medicaid being the predominant ones. Medicare is the federally funded program that provides health care coverage for the elderly and the disabled. Medicaid is a jointly administered program between the federal and state governments that provides health care coverage for the economically disadvantaged.

The federal government created diagnosis-related groups (DRGs) to curtail spending for hospitalized Medicare recipients and to ensure that health care dollars would get to those who most need them. Through this system, an inclusive rate is established for each episode of hospitalization based on the client's age, principal diagnosis, and the presence or absence of surgery and **comorbidity** (existence of simultaneous disease processes within an individual). Hospitals are now reimbursed only for services that are determined to be medically necessary. An accelerating trend for the federal government is to give recipients of public monies the personal right to choose, through the use of vouchers, a managed care program in the private sector.

Medicare

When Medicare was established in 1965, it was intended to protect individuals over the age of 65 from exorbitant costs of health care by providing public funds to cover the majority of health care services.

In 1972, Medicare was modified to include permanently disabled individuals and those with end-stage renal disease.

Medicaid

Medicaid is a shared venture between the federal and state governments. Each state has latitude in determining who is “medically indigent,” and thus qualifies for public monies. Minimal services covered by Medicaid are defined by the federal government and include inpatient and outpatient hospital services, physician services, laboratory services (including x-rays), and rural health clinic services. States may elect to cover other services, such as dental, vision, and prescription drugs.

Canadian Health Insurance

Canada has a national health insurance program that covers each citizen for short- and long-term care. This mandatory program is financed with tax dollars. Each

province runs its own health system in accordance with federal rules and with a fixed federal monetary contribution. Physicians are reimbursed on a prenegotiated fee-for-service basis (Schieber et al., 1994). Table 4-7 describes the characteristics of the Canadian health care system.

Although some disagreement persists in the nursing community, the Canadian (or single-payer) model is not generally seen as the best choice for the United States. The Canadian system is more suited to a highly homogeneous population and the ethos of “the greatest good for the most people.” The latter sounds like an incontestable truth, but it is a questionable fit with the American spirit, which is more aligned with the idea of equal opportunity for all plus the availability of extra services for those who can afford them.

It is also appropriate to challenge the illusion of the Canadian health care system as a panacea. Further, increasing costs are prompting a debate in Canada about which services are really affordable and whether copayment and deductibles will eventually be necessary. The Canadian Government is implementing a plan that responds to the need for more nurses in all sectors of health care. In 1988, \$20 million per year were allocated to increase the number of nurses in long-term care facilities (Hirsch, 1999). In Canadian provinces that have additionally chosen to enrich the basic standard established at the national level, there is the possibility of cutbacks.

THINK ABOUT IT

U.S. versus Canadian Health Care Systems

What is your response to the difference in philosophical frameworks of Canada and the United States regarding delivery of health care services?

TABLE 4-7
Characteristics of the Canadian Health Care System

Principle	Description
Comprehensive scope	All medically necessary services are covered.
Universality	All citizens have coverage.
Public administration	Health care is accountable to the public because it is financed entirely with public funds.
Accessibility	Health care providers and services are available to all citizens.
Portability	Coverage remains uninterrupted as individuals change jobs or move to different provinces.

FACTORS INFLUENCING THE DELIVERY OF HEALTH CARE

Despite cost-containment efforts (such as DRGs established by the federal government and managed care by the insurers), the U.S. health care system still has problems with issues of cost, access, and quality.

Cost

Why is consideration of cost so important? The very existence of the health care system depends on fiscal issues (O’Neil, 1993). Cost has been a driving force for change in the health care system as evidenced by the strength and numbers of managed care plans, increased use of outpatient treatment, and shortened hospital stays. These market forces (to maximize profits by minimizing costs) are dominating the current changes in the health care system.

The U.S. government spends more on health care per person than any other country (O’Neil, 1993). The increasing consumption of federal funds for health care means that resources are being moved from other areas of need, such as education, housing, and social services (Grace, 1994).

The cost of providing health care has risen dramatically during the past 20 years. Health care costs are expected to consume 16.2% of the Gross Domestic Product (GDP) by the year 2008 (Health Care Financing Administration, 1997).

The health care bureaucracy has become mammoth. The most cost-efficient programs in terms of administration are Medicare and Medicaid because of the number of people eligible for these benefits. In contrast, some private plans, particularly small business plans, use over 40 cents of each dollar for administration. The cost of health care is seriously compromising American business and industry. For example, the chief executive officer of Ford Motor Company stated that the costs for health care coverage of employees exceeded the total expenditures on steel used in building cars (Grace & Brock, 1994). This policy may lead businesses to invest less money in growth and development, a decision that places the United States at risk in global markets. Over the last generation, the United States has moved rapidly toward becoming a service-dominated economy. Yet, a society’s economic strength depends on its manufacturing and industry. This imbalance leaves few resources to return our industries to a position of world prominence. The cost of employee health care benefits is an expensive commitment for small businesses and is a serious factor when one considers that the economy of this country has survived—if not thrived—because of the contributions of small businesses.

Four major factors increase the cost of health care: (1) an oversupply of specialized providers, (2) a surplus of hospital beds, (3) the passive role assumed by most consumers, and (4) inequitable financing of services

(Grace, 1994). Other factors that contribute to the high cost of health care are the aging of the population, the increased number of people with chronic illnesses, the increase in health-related lawsuits that has resulted in the unnecessary use of services, and advanced technology that has allowed more people to survive disabling illnesses.

Access

In addition to the issue of cost, access to health care services has a serious impact on the functioning of the health care system. As a result of the cost, health care for many people is crisis-oriented and fragmented. A large number of Americans are unable to gain access to health care services owing to low income or lack of insurance, and, therefore, their illnesses progress to an acute stage before they seek intervention. Poverty often adversely affects an individual's access to health care services. For example, limited transportation (lack of an automobile or funding for public transit) interferes with the ability to travel to health care facilities. Services used by individuals during acute illnesses are typically those provided by emergency departments. Emergency room and acute care services are expensive when compared with early intervention and preventive measures.

Approximately 43 million Americans are uninsured (Falter 1999). Only a small portion of the medically indigent are covered by Medicare. In addition, many individuals are underinsured. These people are neither poor nor old, but middle-class unemployed Americans or those in jobs without adequate health care benefits.

In addition to poverty and unemployment, other factors impede a person's ability to obtain insurance. Refer to the accompanying display that lists factors affecting access to health care services.

FACTORS LIMITING ACCESS TO HEALTH CARE SERVICES

- No provision for insurance by an employer due to prohibitive costs
- Inability to obtain individual insurance due to high costs
- Difficulty for people with certain medical problems (preexisting conditions) to obtain insurance
- Cultural barriers
- Shortages of health care providers in some geographic areas (especially rural or inner city areas)
- Limited access to ancillary services (e.g., child care, transportation)

Other variables affecting access are the increase in the number of women employed outside the home and the number of single-parent families. These factors

impair access to health care services because it is often difficult for parents to take time off from work to transport children to health care providers (Uphold & Graham, 1993).

Quality

It is estimated that 30% to 40% of diagnostic and medical procedures performed in this country are unnecessary (Lee, Soffel, & Luft, 1994). This inappropriate use of resources can be traced to several causative factors, including:

- The litigious environment that creates the tendency toward defensive practice
- Resource consumption is highly influenced by the widely held American belief that more is better
- Lack of access to and continuity of services with subsequent misuse of acute care services

In an attempt to provide universal access to services in a cost-effective manner, quality does not have to be sacrificed. For example, hospitals that are reducing the numbers of registered nurses ("downsizing") risk endangering quality. Safety and quality are frequently compromised by inappropriate substitution of unqualified personnel for registered nurses in direct care of clients. The Economic Policy Institute (1999) released a study that indicates that, as more tasks are delegated to unlicensed assistive personnel (UAP), the quality of data used in decision-making diminishes.

A study conducted in 1998 revealed that 72% of nurses surveyed stated that the quality of care provided at their hospitals had deteriorated because of cost-containment measures. This reflects a 12% increase from 1988 similar survey results (Wolfe, 1999). Cross-training of staff, increased use of unlicensed personnel, and reductions in full-time positions for nurses are affecting the type of care delivered in hospitals. In an attempt to be cost-effective, some hospitals have decreased the number of registered nurses, thereby creating unsafe situations for clients (American Nurses Association, 1995). Any movement toward reform must focus on providing quality nursing care to all consumers.

CHALLENGES WITHIN THE HEALTH CARE SYSTEM

The major challenges facing the U.S. health care delivery system include the public's disillusionment with providers, loss of control over health care decisions, decreased use of hospitals and the impact on quality of care, changing practice settings, ethical issues, and vulnerable populations.

Disillusionment with Professionals

Americans believe the major problem of the health care system is greed and waste (Maraldo, 1994). Whether this problem is caused by defensive practice, consumer demand, or professional economics is irrelevant to the public. Success in reform depends on starting where the public expects it should begin—by eliminating greed and waste. Further, Americans are suspicious of medical professionals. The high level of esteem with which medicine has traditionally been held has diminished over the past few years. Consumers are becoming increasingly tired of paying the high cost of care and question medical practices and fees (Zerwekh & Claborn, 1994). However, the public is not suspicious of nurses (Kellogg Foundation, 1994). This positive perception of nurses will be important as reform initiatives are established.

THINK ABOUT IT

Perception of Nurses

What factors do you think have contributed to a positive perception of nurses? On the other hand, what factors have led to the development of negative images? What can you do specifically to promote positive images of nurses to the public?

Positive Perception of Nurses

Several studies (ANA, 1993a; Kellogg Foundation, 1994) verify the public's trust in nurses. The public sees nurses as part of the solution, not the problem, and believes that, if nurses were allowed to use their skills, they would significantly enhance quality and reduce cost. One survey (ANA, 1993a) inquired about consumer receptivity to nurses' assuming expanded responsibilities. Respondents supported **prescriptive authority** (legal recognition of the ability to prescribe medications) for nurses and endorsed their role in performing physical examinations and managing minor acute illnesses. Nurses have limited their own vision of their roles owing to the roots of their education in the **medical model** (traditional approach to health care in which the focus is on treatment and cure of disease) and their socialization into the hierarchy that this model assumes.

Loss of Control

Consumers express the sentiment of feeling terrorized by the health care delivery system. They feel they have lost personal control, and they do not trust the people who represent them. Many Americans stay in unsatisfying jobs because of their health care benefits and relinquish

employment mobility due to a fear of being denied a new policy because of preexisting conditions. Many American workers state that their greatest concern is the possible loss of health care coverage (Grace & Brock, 1994).

Decreased Hospital Use

In the early 20th century, hospitals focused on providing care to those who had no caregivers in the family or community. The focus of these early institutions was care not cure (Grace, 1994). The focus of hospitals changed in the mid-1940s as a result of technologic changes and the passage of the Hill-Burton Act by Congress in 1946, which provided funding for renovation and construction of hospitals. One unanticipated outcome of this act was a substantial oversupply of hospital beds. Health care costs escalated with the need to keep the hospital beds occupied.

From 1945 to 1982, the demand for hospital beds steadily increased. After 1982, a steady decline in the number of hospital admissions and the length of stay occurred (Grace, 1994). "As patient care services continue to move to outpatient settings, HCFA says that hospitals can expect to get only 30% of the nation's total expenditures by 2007—that's 5% less than in 1997" (Ventura, 1999, p. 14).

Currently, hospitals continue to be the nucleus of the health care delivery system in the United States. Hospitals account for the largest proportion of expenditures and employ the majority of health care workers. Hospitals have fewer clients today because of the trend toward rapid discharge and more procedures being performed in outpatient settings. The clients who are hospitalized require more nursing care because of the greater complexity of needs and severity of illness. The accompanying display lists factors that have contributed to the decreased hospital population.

FACTORS INFLUENCING DECREASED HOSPITAL POPULATION

- Shorter lengths of stay
- Technologic advances
- Greater availability of outpatient facilities
- More services available in outpatient settings
- Expectations/demands of third-party payers

As a result of the changes in reimbursement practices, hospitals are restructuring (also referred to as redesigning and re-engineering). Examples of restructuring activities include mergers with larger institutions; development of integrated systems that provide a full range of services focusing on continuity of care such as preadmission, outpatient, acute inpatient, long-term inpatient, and home care; and the substitution of multiskilled workers for nurses. Approximately 67% of registered nurses are employed by hospitals (McCloskey & Grace, 1994).

The majority of these nursing positions are direct care providers (staff nurses). In some institutions, restructuring includes replacing registered nurses with unlicensed personnel, which may lead to decreased quality of care. Nurses must ensure that cost-cutting efforts do not threaten client safety.

As the average lengths of stay in hospitals decline, the acuity level of clients increases. The presence of increasingly ill clients requires nurses who possess technical expertise, critical thinking skills, and interpersonal competence. Community based services, such as home health, will need to continue to expand to meet the increased needs of the steadily growing elderly population (Hull, 1994).

Changing Practice Settings

Most nurses currently practice in hospitals and will continue to do so in the future (Aiken, 1995). However, there is an ever-increasing need for nurses in different areas of practice. Social and political changes are affecting nurses by creating the need for expanded services and settings. Because of these changes, demand for nursing care fluctuates. For example, nursing employment outside the hospital continues to increase rapidly. Health care expenditures for home care are rapidly increasing. It is predicted that 70%–80% of care will be delivered in the home by the year 2010 (Conger et al., 1999). Since the advent of Medicare and Medicaid, home health care has grown rapidly.

More nurses will be needed in the future due to:

- The growing elderly population will require more health care services.
- The number of people admitted to nursing homes is steadily growing.
- The number of homeless individuals, who are most often denied access to health care, is increasing.

As health care reform occurs, some nurses may be displaced from their current jobs. But overall, many more jobs will be created by the demand for greater access to health care services. Some examples of areas in which larger numbers of nurses will be required are primary care, public health, extended care facilities, and the home setting.

THINK ABOUT IT

Preparing for the Future

Consider the following anonymous quote: “The future belongs to those who prepare for it.” As the number of hospital closings continues to increase across the country, fewer numbers of registered nurses are needed to function in the “traditional” setting. How do you see yourself functioning in a professional role? How are you positioning yourself for the future?

Ethical Issues

The United States is struggling with a major ethical conflict of cost containment versus compassionate quality care. According to Hicks and Boles (1994), no country, regardless of how wealthy it is, can provide all citizens with every health care service they desire or need. Today, the U.S. health care delivery system is faced with the dilemma of citizens’ needs being greater than available resources. Thus, some difficult choices must be made to determine which needs will be met and which will remain unmet.

The expectation that “everything must be done to save” a dying person has created an enormous drain on the health care resources of this country. As decisions are made about allocating scarce resources, there will be much debate about the ethics involved. The appropriateness of futile life-sustaining measures must be addressed (Rowe, 1996). Nurses must continue to strongly advocate for just and ethical distribution of resources as health care reform progresses.

THINK ABOUT IT

Rationing Health Care

Think about the ethical ramifications of determining medically necessary therapeutics. Is rationing of scarce resources the answer to our health care dilemma?

Vulnerable Populations

Meeting the health care needs of underserved populations is especially challenging. Groups that may be unable to gain access to health care services include: children, the elderly, people with AIDS, the homeless, and others living in poverty. Approximately 43 million people in America had no health insurance in 1997. (US Census Bureau, 1998) Medicaid is no longer adequate to meet the needs of the medically indigent.

Our current health care system neglects the overall needs of children. Children are more likely than adults to be uninsured. One in 5 children lives in families with income below the poverty level; only half of those children living in poverty are covered by Medicaid (Uphold & Graham, 1993). As the federal and state governments continue to curb expenditures for health care, more children will be declared ineligible for Medicaid. Children who are covered by health insurance have a greater degree of well-being. Approximately 1 in 5 children in the United States is uninsured (Baker, 1994).

Over 35% of preschool children in this country are not immunized. Many parents do not begin having their children immunized until the children are ready to start school (Kyle & Coulter, 1995). Preventive health care should be available to children of all ages, with an emphasis on early immunization. In addition, maternal-child

health among select ethnic and racial minorities in certain geographic areas of this country is poorer than that in developing countries. The health of a country is often judged by its maternal-child health indicators (Kelly & Joel, 1995). The ANA and a coalition of allied nursing associations are working together in an attempt to immunize all children in the United States.

Over 230,000 Americans have been diagnosed with AIDS and approximately 1 million Americans are infected with HIV (Hull, 1994). The most rapid spread of the disease is occurring among women, children, and intravenous drug users and their sexual partners. Women who have AIDS have a higher mortality rate than men, and decreased access to health care may be one contributing factor to this higher mortality rate (Tlusty, 1994). Although the cost of the AIDS epidemic is unmeasurable in terms of human suffering, approximately \$10.5 billion dollars was spent on care of people with AIDS in 1994 alone (Hull, 1994). Not only will additional funding be necessary, but also outpatient care settings (such as hospices, home care, and clinics) must be expanded to care for those affected by this epidemic.

Traditionally, rural areas have always had few health care providers and facilities that were easily accessible. A large number of elderly people (approximately 45% of those over the age 65) live in rural areas (Vrabec, 1995). Because people in rural areas tend to work for small businesses or are self-employed, many of them have no health insurance. Also, many hospitals in rural areas have been closed due to economic pressures.

Usually, adults in the United States who receive little assistance in health promotion maintain unhealthy lifestyles, which lead to the development of chronic illnesses. Older adults who have accumulated problems that could have been prevented are admitted to nursing homes, which are very costly (Grace & Brock, 1994).

It is in the best interests of society to see that those who cannot afford the basic health services are not denied such services. The entire society's health is threatened when some sectors are denied basic care. As a group, nurses are concerned with the availability of health care services to everyone, regardless of their ability to pay (Hicks & Boles, 1994).

NURSING'S RESPONSE TO HEALTH CARE CHALLENGES

As the United States continues to look for ways to address the issue of health care reform, the implications for nursing will continue to increase. Some nurses feel threatened by impending changes, whereas others are excited about the possibility of transforming the health care system into something better. The nursing profession has responded to the myriad challenges in health care delivery by proposing a plan for reform.

Nursing's Agenda for Health Care Reform

In 1991, in response to the problems of high cost, limited access, and eroding quality that were affecting the U.S. health care system, the nursing community created a public policy agenda that is currently endorsed by more than 70 organizations. *Nursing's Agenda for Health Care Reform* (ANA, 1991) provides a valid framework for change in health care policies. The accompanying display lists the major tenets of this agenda. A cornerstone of nursing's proposal is the delivery of health care services in environments that are easily accessible, familiar, and consumer friendly. Another essential part of nursing's agenda is the empowerment of consumers for self-care. This goal has enormous implications for nurses as

NURSING'S AGENDA FOR HEALTH CARE REFORM

Nursing's agenda for health care reform includes several basic premises, including the following:

- All citizens and residents of the United States must have equitable access to essential health care services.
- Primary health care services must play a very basic and prominent role in service delivery.
- Consumers must be the central focus of the health care system. Assessment of health care needs must be the determining factor in the ultimate structuring and delivery of programs and services.
- Consumers must be guaranteed direct access to a full range of qualified health care providers who offer their services in a variety of delivery arrangements at sites that are accessible, convenient, and familiar to the consumer.
- Consumers must assume more responsibility for their own care and become better informed about the range of providers and potential options for services.
- Health care services must be restructured to create a better balance between the prevailing orientation toward illness and cure and a new commitment to wellness and care.
- The health care system must assure that appropriate, effective care is delivered through efficient use of resources.
- A standardized package of essential health care services must be provided and financed through an integration of public and private sources.
- Mechanisms must be implemented to protect against catastrophic costs and impoverishment.

(From American Nurses Association. [1991]. *Nursing's agenda for health care reform*. Kansas City, MO: Author.)

health educators and for the use of incentives for increasing personal accountability for one's own health status.

Standards of Care

Another approach to the challenges experienced by the health care delivery system has been the move toward standardization of care. In December 1990, the Agency for Health Care Research and Quality (AHRQ), formerly known as the Agency for Health Care Policy and Research (AHCPR), was established with the specific charge of achieving consensus within the medical/health care community on the usual treatment of high-volume and expensive disease conditions that differ in their therapeutic management despite substantial research. More simply put, there is significant variation in the diagnosis and treatment of certain illnesses and diseases. The medical justification for such variance has been that every client is an individual and the choice of treatment is a private decision involving client and physician. AHRQ aims to identify the standards of treatment for which the health care community can be held accountable.

THINK ABOUT IT

Standards of Treatment

How do you feel about AHRQ's development of treatment standards for medical/health care practice? What potential outcomes can you envision as a result of standardization?

When AHRQ was created, the ANA recognized the need to strengthen nursing practice standards. Three interdisciplinary panels chaired by nurses were created to propose standards for conditions that are highly responsive to nursing interventions. Currently, AHRQ published guidelines are available to the public and should be integral to nursing practice.

Advanced Practice

The advanced practice of nursing has evolved as nursing has become more complex and specialized. Since the late 1960s, nurse practitioners (NPs), clinical nurse specialists (CNS), certified nurse midwives (CNMs), and other advanced practice registered nurses (APRNs) have provided primary health care services to individuals, many of whom would have had inadequate or no access to services. (APRNs) possess advanced skills and in-depth knowledge in specific areas of practice. Even though there are differences in various advanced practice roles, all APRNs are experts who work with clients to prevent disease and to promote health.

There are currently more than 100,000 APRNs in the United States (ANA, 1995). It is predicted that there will be a 50% to 75% increase in the demand for APRNs in the next 10 years, with an accompanying decrease in demand for RNs without APRN preparation (Peterson, 1999). Nurses in advanced practice are also moving toward independent practice. Data suggest that APRNs can independently diagnose and resolve over 80% of the primary health care problems of the American public (ANA, 1993a). Nurses are preferable to other providers in terms of client compliance with a therapeutic regimen, consumer satisfaction, and client gains in functional ability and self-care. NPs facilitate access to and continuity of care and provide high-quality care (Brown & Grimes, 1993). APRNs prescribe less-expensive diagnostic tests, the length of their visits is comparable to that of physicians, and they charge less for services because of the low cost of professional liability insurance (ANA, 1993b). Despite repeated proof of the cost efficiency and therapeutic effectiveness of APRNs, obstacles to this role for nurses persist. In a recent Division of Nursing report on APRNs, the singular most formidable obstacle to practice is the fact that most people are unaware of what APRNs offer (Washington Consulting Group, 1994).

For APRNs, direct access to clients is a necessity and requires direct reimbursement, prescriptive authority, sufficient professional liability insurance, autonomy in managed care plans, professional staff privileges in service systems, and adequate practice acts. As the social and economic barriers to advanced practice are removed, utilization of these nurse specialists will increase.

THINK ABOUT IT

Advanced Practice

Read the nurse practice act for your state. Do nurses in your state have prescriptive authority? Are they eligible for reimbursement from third-party payers? What about staff privileges in local health care institutions? How does your state measure up in promoting advanced practice nursing?

Recently, progress has been made on the access issues that constrain APRNs. Reimbursement is now available to some segments of the advanced practice community in every federal entitlement program. Although insurance providers in the private sector are governed by state law and vary to the extent that they recognize advanced practice, APRNs report some form of reimbursement (in addition to that which is federally mandated) in every state and the District of Columbia (Pearson, 1996).

Currently, every state and the District of Columbia award APRNs some type of prescriptive authority (Pearson, 1996).

The ANA (through the Joint Commission on the Accreditation of Healthcare Organizations [JCAHO])

and HCFA) began the groundwork for professional staff privileges for APRNs in its revision of the official definitions of professional staff that include a broad range of providers. The issue of institutional privileges is complicated given the fact that a facility may impose additional requirements on these privileges, including joint or collaborative practice with a physician (ANA, 1993b).

THINK ABOUT IT

Universal Health Care Guarantee

If you were to develop a core of basic health care services to which all Americans would have access, what would be included?

Public versus Private Programs

The combination of public and private sector resources for health care seems to be comfortable for Americans. The competition between the two types of settings has encouraged quality and progress. Each setting provides benefits as well as drawbacks to health care recipients.

The nursing profession supports an integration of public and private sector programs and resources. Public dollars are required to help the poor and those who do not receive health care benefits through the workplace. Actual services should be available through a variety of public and private sources. To safeguard the health care system from becoming a two-tiered process based on personal resources, both the poor and non-poor and the privileged and nonprivileged must be enrolled in the same programs.

Finally, the basic required package of services must be defined in the same way in each state and required as the minimum for both public and private sector programs. The persistence for national standards must be tempered with a respect for local needs and differences. In other words, set minimal national standards, but promote local planning and implementation. Local insights are particularly critical to the public health, meaning the health of a community as an aggregate of people, and not personal health services delivered in the community.

The states' rights philosophy prevailing in the United States creates an obstacle to national standards, which are necessary for several areas of assurance. Some coast-to-coast consistency in the cost of services is needed with local area adjustments. Further, a national standard to qualify for public entitlement is long overdue.

Public Health

Public health includes services such as immunizations, prenatal care, environmental concerns, and analysis of the prevailing disease patterns in a community. Current public health problems include:

- Increase of sexually transmitted diseases that were once nearly eradicated (e.g., syphilis and gonorrhea)
- Appearance of new fatal diseases (e.g., AIDS and the Ebola virus)
- Emergence of drug-resistant strains of tuberculosis
- Underimmunization of infants and children
- Prevalence of overweight and inadequately nourished young people
- Presence of toxic environmental conditions

For today's needs, the medical model is insufficient. Table 4-8 presents a comparison of the medical model and the nursing model. In most instances, the nursing profession's approach to these issues transcends a health model and looks to a social model for response and assistance. Social models view areas of health, housing, education, and employment, in fact all social welfare concerns and programs, as an integrated whole. Education for healthy living is a good example. Healthy personal behaviors from adults are possible only if they have filtered down into the schools for the purposes of educating for health and influencing the peer systems that reinforce behaviors.

Nursing's strategic plan, as described in *Nursing's Agenda for Health Care Reform* (ANA, 1991), for achieving a better balance between illness and cure and wellness and care is only an interim step. Nursing must document its effectiveness in providing quality, cost-efficient services. Establishing joint ventures, procuring grant monies and other funding sources, and conducting research are avenues that nursing must pursue to achieve these objectives.

Community Health

Parris and Hines (1995) recommend a commitment to a community-based approach to reform the system of health care delivery. Community-based care focuses on prevention and primary care. Community health nurses work in a variety of settings, including homes, clinics, workplaces, schools, church parishes, and organizations. They are skilled at providing services to populations at high risk for illness, homeless persons, aging populations, and those experiencing chronic illness. Regardless of the setting, fundamental principles of community care include the following (Hunt, 1998):

TABLE 4-8
Medical Model versus Nursing Model

Medical Model	Nursing Model
Focuses on disease and illness	Focuses on wellness
Cure oriented	Care oriented
Fragmented cases	Holistic perspective

- Focusing on prevention
- Advocating client self-care
- Interactive nature between family, culture, and community
- Continuity of care
- Collaborative care

School Nursing

The advent of school nursing was an extension of public health nursing in the early 1900s. Los Angeles became the first city to hire school nurses. The emphasis was on preventing the spread of communicable diseases. Early school nurses also provided health education to students and their families, performed physical assessments, and treated minor infections (Hitchcock, Schubert, & Thomas, 1999). Currently, services provided by school nurses have expanded to include maintaining a safe, healthy school environment, case finding, referral, and teaching other personnel how to care for children with special health care needs. Nursing has a rich heritage of providing community services. Thus, as nursing reclaims community-based practice as an integral part of its role, it is returning to its professional roots.

An ANA/American Association of Occupational Health Nurses (AAOHN) partnership published a proposal that describes how occupational health settings can be expanded into family health centers (ANA & AAOHN, 1993). Industry-based primary care programs in which employee health services are self-insured are particularly popular. The ANA has written a similar model with school health nursing organizations (Igoe & Giordano, 1992). This model proposes that occupational and school health sites offer families a full range of primary care services, such as disease prevention, health promotion, diagnosis and treatment of minor acute illness, and monitoring and management of chronic disease.

This scope and immediacy of health care services is extremely significant to school children. A generation ago, programs funded by the Robert Wood Johnson Foundation demonstrated that school nurse practitioners can identify over 90% of the health problems of school-age children and independently resolve over 80% of those problems (Igoe & Giordano, 1992). Despite these data, such services continue to be inaccessible to many children.

In 1992, HCFA funded Community Nursing Organizations (CNOs) to help meet the needs of elderly people in the community. The goal of CNOs is to provide quality health care services in a cost-effective manner. The four pilot projects (Carondelet Health Services, Tucson, AZ; Carle Clinic Association, Urbana, IL; Living at Home/Block Nurse Program, St. Paul, MN; and Visiting Nurse Service of New York, New York City) have demonstrated the following results:

- A high degree of client satisfaction
- Decreased Medicare expenditures in home care costs

- Use of less expensive equipment
- An expected decrease in emergency department costs (ANA, 1995)

Naylor and Buhler-Wilkerson (1999) call for nursing to “emphasize knowledge development related to care of vulnerable populations and the testing of innovative models of community based care,” (pp. 126–127). Examples of innovative models that meet community health care needs include:

- *Columbia Advanced Practice Nurse Associates (CAPNA)*—This practice, established in 1997, collaborates with Columbia University’s medical faculty to provide comprehensive services to clients in midtown Manhattan (Bocuzzi, 1998).
- *North Carolina Maternal and Child Health Migrant Project*—Nurses train women in migrant camps to provide health teaching and first aid (Sandhaus, 1998).
- *University of Pennsylvania School of Nursing*—This school has established a community-based practice that focuses on meeting the needs of frail elderly clients (Naylor & Buhler-Wilkerson, 1999).
- *Alberta Children’s Hospital in Canada*—Nurses here, in 1982, assumed the role of providing health care advice via a telephone triage services (Vollmerhaus, 1999). There are several similar triage services managed by nurses throughout the United States.

THINK ABOUT IT

Nursing’s Response to Health Care Challenges

Are there programs in your community in which nurses are delivering health services to vulnerable populations? What is the need for such services, taking into consideration populations such as children, the elderly, people with AIDS, the indigent, and the homeless?

Long-Term Care

Nurses propose a community-personal partnership in addressing long-term care and support various financial plans that enable individuals to anticipate their long-term care needs; for example, long-term care insurance, long-term care individual retirement accounts (IRAs), and accessing the equity in property and life insurance policies to use for health care costs. Nurses are also aware that need will exceed resources for many chronically ill, frail, and disabled Americans. In those cases where there is catastrophic need, government dollars must be available.

Nurses also support the concept of **subacute care** (short-term aggressive care that emphasizes restorative interventions before the client’s reentry into the community). The idea is not new but dates back to the Loeb Center of Montefiore Hospital in New York City in the 1960s (Kelly & Joel, 1995).

TRENDS AFFECTING DELIVERY OF HEALTH CARE SERVICES

- The aging of the U.S. population
- Increasing diversity in the U.S. population
- Increased number of single-parent families, with more children living in poverty
- Continued growth in outpatient settings with a greater demand for primary care providers
- Advances in technology with a resultant ability to perform more services in outpatient settings (including the home)
- More states using managed care models to deliver services to the medically indigent
- More emphasis on disease prevention and health promotion at the workplace
- Expectations of third-party payers and providers for clients to assume more personal responsibility for care
- Incentives for individuals who participate in preventive activities
- Federal funding of health care provider education focusing on service to underserved populations and areas
- The system as a union of both public and private sector resources and services
- Managed care dominating as the context for service delivery
- The right for individuals to enhance a basic package or expand their choices if they care to purchase that privilege
- Continuing focus on quality improvement

TRENDS AND ISSUES

As current trends continue into the millennium, the delivery of health care services will continue to change. The accompanying display lists factors that will continue to shape reform of the health care delivery system.

The states and private sector will lead the way through a process to a product suited to the American character. The nursing profession has reached a point in time where there are few questions about the direction or process of health care reform. As health care reform occurs, some professions will experience opportunities while others will experience losses (O'Neil, 1993). The challenge is to improve the nation's delivery of health care services by positioning nursing to preserve its integrity and guarantee its preferred future. Nurses must continue to be in the forefront of change.

KEY CONCEPTS

- The three levels of health care services can be categorized as primary, secondary, and tertiary levels.
- Health care services are delivered by both the public (official, voluntary, and nonprofit agencies) and private (hospitals, extended care facilities, home health agencies, hospices, outpatient settings, schools, industrial clinics, managed care organizations, community nursing centers, and rural hospitals) sectors.
- The health care team is composed of nurses, APRNs, physicians, physician assistants, pharmacists, dentists, dietitians, social workers, therapists, and chaplains.
- Health care in the United States is financed through a combination of both private and public funding.
- Managed care organizations seek to control health care costs by monitoring the delivery of services and restricting access to costly procedures and providers.
- Managed care plans include health maintenance organizations, preferred provider organizations, and exclusive provider organizations.
- The primary federal government insurance plans are Medicare, the program that provides health care coverage for the elderly and disabled, and Medicaid, the jointly administered program that provides health care services for the poor.
- Health care reform must address the three critical issues of cost, access, and quality of health care services to achieve equity for all Americans.
- The cost of health care has been influenced by the oversupply of specialists, a surplus of hospital beds, the passive role assumed by most consumers, and the inequitable financing of health care services.
- The challenges that the health care delivery system need to overcome are the public's disillusionment with providers, the public's loss of control over health care decisions, the decreased use of hospitals and the related impact on quality of care, the change in practice settings, ethical issues, and the health care needs of vulnerable populations.
- *Nursing's Agenda for Health Care Reform*, written by the American Nurses Association and endorsed by over 70 professional organizations, outlines nursing's proposals for easing the current problems in health care delivery.
- The Agency for Health Care Research and Quality aims to identify therapeutic standards for which the health care community can be held accountable.
- For advanced practice nurses to continue to provide access to high quality care, issues such as direct reimbursement for services, prescriptive authority, comprehensive professional liability insurance, autonomy in managed care plans, professional staff privileges in health care facilities, and adequate practice acts need to be resolved.
- A primary goal of the nursing profession within the areas of public health, community health, and long-term care is to provide health care services that emphasize prevention and primary health care to clients in these settings and thus help reduce the cost and increase the quality of health care.

CRITICAL THINKING ACTIVITIES

1. What are some contributing factors to the current status of the health care delivery system?
2. Compare the American and Canadian health care delivery systems in terms of universality, accessibility, and portability.
3. Imagine that you are lobbying your state legislators about health care reform. List five points you would present to them.
4. Select three tenets of *Nursing's Agenda for Health Care Reform* and state some specific ways for implementing them.
5. One challenge encountered in health care today is shorter length of hospital stays. State some specific ways nurses can address this challenge. Note that many of your ideas may already be implemented in certain areas of the health care delivery system.

- 10** Evaluation

Critical Thinking and the Nursing Process

The principal goal of education is to create men and women . . . who have minds which can be critical, can verify, and not accept everything they are offered.

Jean Piaget

COMPETENCIES

1. Identify the components of critical thinking.
2. Describe the relationship between critical thinking and problem solving and decision making.
3. Compare critical thinking and creative thinking.
4. Relate critical thinking to the nursing process
5. Describe the components of the assessment step of the nursing process.
6. Describe the four types of nursing diagnoses.
7. List the tasks involved in the outcome identification and planning step of the nursing process.
8. Discuss the types of skills that nurses must possess in order to perform the nursing interventions during the implementation step of the nursing process.
9. Identify factors that may influence evaluation.
10. Relate the nursing process to the problem-solving method.

Thinking is an ongoing activity for professional nurses. This chapter presents information about critical thinking, an overview of the nursing process, and elements that compose each step of the process. Also included is a discussion on how the nurse uses critical thinking in each step of the nursing process and on the relationship between problem solving, decision making, and the nursing process.

Noted nursing leaders (Benefield, et al., 2000) predict that “critical thinking will be expected of all professional nurses (p. 22).” **Critical thinking** is the process that allows nurses to see the big picture (envision the overall perspective) instead of focusing only on details.

CRITICAL THINKING

There are many definitions of critical thinking, including Ennis’ (1987) classic description, “reasonable reflective thinking that is focused on deciding what to believe or do (p. 10).” Every day, nurses make decisions that are derived through critical thinking. Making clinical judgments relies on critical thinking. Critical thinking is identified as an essential nursing competency by the National League for Nurses (1997). Nursing students and graduates must demonstrate critical thinking skills.

Knowing how one thinks helps the nurse work collaboratively with other health care providers (Rubinfeld & Scheffer, 1999). Critical thinkers are people who know how to think. They possess intellectual autonomy, in that they refuse to accept conclusions without evaluating the evidence (facts and reasons) for themselves. Critical thinkers have the ability to think beyond the obvious and make connections between ideas.

Components of Critical Thinking

According to Jenkins and Turick-Gibson (1999), critical thinking is composed of three primary components: mental operations, knowledge, and attitudes.

Mental Operations

Mental operations include activities such as decision-making and reasoning that are used to find or create meaning. Nurses engage in such activities whenever they search for solutions based on sound rationale and develop outcomes accordingly. The result of these mental operations is creative, appropriate problem solving. Other cognitive operations involved in critical thinking are strategizing (planning) and evaluating one’s thinking (Jenkins & Turick-Gibson, 1999).

Knowledge

Critical thinking calls for a knowledge base that includes **declarative knowledge**, (specific facts or information) and **operative knowledge** (an understanding of the nature of that knowledge). Nursing curricula assist the student in learning specific facts about nursing and the delivery of quality care. Students are also taught how to examine the beliefs underlying the facts in order to analyze and interpret those facts. In other words, students are not expected to merely repeat facts that have been memorized (learned by rote) but instead to understand the reasoning behind the knowledge. Finding meaning in what one is learning is the core of critical thinking.

In order to think critically, to solve problems, and to make decisions, nurses must develop a broad base of knowledge. This knowledge base includes information from other disciplines such as science (anatomy, physiology, biology), psychology, and philosophy (logic). Nurses apply this knowledge to specific client situations through critical thinking.

Attitudes

Certain attitudes enhance a person’s ability to think critically. One of the most important attitudes needed by a critical thinker is a sense of curiosity that allows the person to question assumptions upon which decisions are based. Analysis of basic assumptions allows the person to plan and act in a rational manner rather than out of habit or routine. The accompanying display lists other attitudes of critical thinkers.

ATTITUDES OF CRITICAL THINKERS

- Tolerance, open-mindedness, nonjudgmental mind-set
- Curiosity
- Persistence, intellectual courage
- Respect for others' perspectives
- Comfort dealing with ambiguity, uncertainty
- Intellectual humility (knowing that one does not have all the answers)
- Self-confidence (belief in own ability to think things through and make appropriate decisions)

(Data from: Beyer [1987]; Ennis [1987]; Krathwohl, Bloom, & Masia [1964]; Paul, [1993]; and Rubenfeld & Scheffer [1999].)

In addition to the attitudes discussed in the display, Alfara-LeFarve (1998) has identified the following as characteristics of critical thinkers:

- Open-minded and curious
- Consciously work in a planning mode
- Proactive instead of reactive
- Flexible
- Organized

Phases of Critical Thinking

Critical thinking is a higher level of cognitive functioning that, according to Brookfield (1991), occurs in four phases:

1. Trigger event: A problem that is reframed as an opportunity for improvement
2. Appraisal of the situation: Self-examination of one's underlying assumptions
3. Exploration: Searching for new ideas, solutions, and/or approaches
4. Integration: Incorporating new information and new ways of thinking

Critical thinking helps the nurse make a smooth transition from the old to the new by facilitating analysis and planning.

Development of Critical Thinking Skills

The development of critical thinking skills is a gradual process related to the individual's maturity, in that maturity enhances the ability to suspend judgment until the data have been collected. It takes time to break habitual ways of thinking and doing.

Listed below are some specific strategies that promote the development and application of critical thinking:

- Identify goals.
- Determine what knowledge is required.
- Assess the margin for error.
- Determine the amount of time available for decision making.
- Identify available resources.
- Recognize factors (i.e., biases, fatigue) that may influence decision making (Alfaro-LeFevre, 1998).

Table 5-1 lists skills necessary for critical thinking to occur.

TABLE 5-1
Critical Thinking Skills

Interpretation	Categorize, decode sentences, clarify meanings
Analysis	Examine ideas, identify and analyze arguments
Influence	Query evidence, conjecture alternatives, draw conclusions
Explanation	State results, justify procedures, present arguments
Evaluation	Assess claims, assess arguments
Self-regulation	Self-examination, self-correction (if necessary)

(Data from Pesut, D. J., & Herman, J. [1999]. *Clinical reasoning: The art and science of critical and creative thinking*. Albany, NY: Delmar.)

Critical Thinking and Creativity

Critical thinkers are also creative thinkers. Both types of thinking require assessment and result in new discoveries (Paul & Ballin, 1988). Creative nurses think in new ways when searching for innovative solutions to problems. The process of **creative problem solving** is goal-directed thinking that leads to achievement by using new ideas or methods. Creativity is, according to Gilmartin (1999), "the basic building block of invention and thus innovation" (p. 2). The challenges presented by the current health care environment demand that nurses be creative thinkers.

Creative thinking is the foundation for individualizing client care, in that the nurse identifies unique needs of each client and develops interventions specific to those needs. Without creative thinking, nursing care would become routine, that is, the same for every client.

There is a strong link between critical and creative thinking. In order to develop creative solutions to problems, the nurse needs to use critical intellect. Also, to be an excellent critical thinker, the nurse exercises creative thinking (Le Storti et al, 1999). Table 5-2 compares critical and creative thinking behaviors.

TABLE 5-2
Comparison of Critical and Creative Thinking

Critical Thinkers	Creative Thinkers
<ul style="list-style-type: none"> • Defines the parameters of a problem 	<ul style="list-style-type: none"> • Defines the existing problem
<ul style="list-style-type: none"> • Identifies key issues 	<ul style="list-style-type: none"> • Breaks usual cognitive set by considering new ways of problem solving
<ul style="list-style-type: none"> • Sets reasonable criteria for assessing the appropriateness of an action 	<ul style="list-style-type: none"> • Delays judgment or suspends criticism of alternatives
<ul style="list-style-type: none"> • Adapts one's behavior as needs and/or norms change 	<ul style="list-style-type: none"> • Exercises judgment in selecting the best alternative
<ul style="list-style-type: none"> • Transfers learning from one situation to another 	<ul style="list-style-type: none"> • Learns from mistakes
<ul style="list-style-type: none"> • Pays attention to the problem at hand 	<ul style="list-style-type: none"> • Breaks away from usual problem-solving methods to develop creative responses
<ul style="list-style-type: none"> • Detects ambiguity or false inferences 	
<ul style="list-style-type: none"> • Analyzes interrelationships of ideas from several perspectives 	
<ul style="list-style-type: none"> • Tests out inferences by considering opposing viewpoints 	
<ul style="list-style-type: none"> • Creates innovative solutions to complex problems 	

(Data from Gilmartin [1999] and Paul [1993].)

It is easy to fall into routine ways of thinking instead of being creative. The accompanying display lists some common barriers to creative thinking.

Another major block to creativity is **groupthink** (going along with the majority opinion while personally having another viewpoint). Nurses who engage in groupthink generally wish to avoid interpersonal conflict. It takes intellectual courage to think something new and different from one's peers, and then act on those thoughts. Independent thinking is a hallmark of persons who think critically and creatively.

Critical Thinking and Problem Solving

Critical thinking includes problem solving and decision making processes. People use problem solving in their daily lives. With the problem-solving method, problems are identified, information is gathered, a specific problem is named, a plan for solving the problem is developed, the plan is put into action, and results of the plan are evaluated. However, this kind of problem solving is frequently based on incomplete data, and plans are sometimes based on guesses. Conversely, the nurse uses the **nursing process** to identify and to make decisions

BLOCKS TO CREATIVE THINKING

Habit
 Comfort with the status quo
 Fear of making mistakes
 Tradition
 Use of meaningless routines and rituals
 Rigid mind-set

about client needs. It is a systematic and scientifically based process that requires the use of many cognitive and psychomotor skills.

According to Costello-Nikitas (1997, p. 85), the following actions interfere with effective problem solving:

- Jumping too quickly toward a conclusion before exploring all the aspects of a problem
- Failing to obtain critical facts, about either the problem or proposed change
- Selecting problems or changes that are too general, too complex, or poorly defined
- Failing to articulate a rational solution to the problem or proposed change
- Failing to implement and evaluate the proposal appropriately

Critical thinkers avoid the pitfalls listed above by clearly defining the problem, analyzing the data, understanding the causes, and creating new ideas that will lead to problem resolution.

Critical Thinking and Decision Making

When making a clinical decision, the nurse determines action that will help move the client toward achievement of the expected outcomes. Thus, **decision making** is defined as considering and selecting interventions from a repertoire of actions that facilitate the achievement of a desired outcome (Pesut, 1999). Nurses exercise clinical judgment by making sound decisions; clinical judgment can be viewed as critical thinking applied in clinical situations. Nursing judgments are formed after collecting assessment data and examining the relationships among those data. Since nursing judgments form the basis of client care, they occur in every phase of the nursing process (Rubenfeld & Scheffer, 1999).

Nurses make decisions every day. It is important that those decisions be the best decisions possible, that they be based on reliable information, and that they be made with as much critical thought as possible. Bevis (1989) states that “decision making is the acquiring, ordering, and selecting of tools or alternatives for reaching goals or fulfilling needs” (p. 117). Through a process of problem solving, one arrives at the point at which decisions can be made. The nursing process is the specific problem-solving method used by nurses to arrive at the point at which decisions about client care can be made.

A comparison of problem solving and the nursing process is presented later in this chapter.

THE NURSING PROCESS

The **nursing process** is the framework for providing professional, quality nursing care. It directs nursing activities for health promotion, health protection, and disease prevention and is used by nurses in every practice setting and specialty. “The nursing process provides the basis for critical thinking in nursing” (Alfaro-LeFavre, 1998, p. 64).

HISTORICAL PERSPECTIVE

Lydia Hall first referred to nursing as a “process” in a 1955 journal article, yet the term was not widely used until the late 1960s (Edelman & Mandel, 1997). Referring to the “nursing process” as a series of steps, Johnson (1959), Orlando (1961), and Wiedenbach (1963) further developed this description of nursing. At this time, the nursing process involved only three steps:

assessment, planning, and evaluation. In their 1967 book *The Nursing Process*, Yura and Walsh identified four steps in the nursing process:

- Assessing
- Planning
- Implementing
- Evaluating

The *Standards of Practice*, first published in 1973 by the American Nurses Association (ANA), included eight standards. These standards identified each of the steps, including nursing diagnosis, that are now included in the nursing process.

Fry (1953) first used the term **nursing diagnosis**, but it was not until 1974, after the first meeting of the group now called the North American Nursing Diagnosis Association (NANDA), that Gebbie and Lavin added nursing diagnosis as a separate and distinct step in the nursing process. Prior to this, nursing diagnosis had been included as a natural conclusion to the first step, assessment.

Following publication of the ANA standards, the nurse practice acts of many states were revised to include the steps of the nursing process specifically. The ANA made revisions to the standards in 1991 to include outcome identification as a specific part of the planning phase. Currently, the steps in the nursing process are:

- Assessment
- Diagnosis
- Outcome identification and planning
- Implementation
- Evaluation

The American Nurses Association practice standards address each step of the nursing process.

OVERVIEW OF THE NURSING PROCESS

A **process** is a series of steps or acts that lead to accomplishment of some goal or purpose. The purpose of the nursing process is to provide care for clients that is individualized, holistic, effective, and efficient. The steps of the nursing process build upon each other, but they are not linear. There is overlap of each step with the previous and subsequent steps (Figure 5-1).

The nursing process is dynamic and requires creativity for its application. The steps remain the same, but the application and results will be different in each client situation. The nursing process is designed to be used with clients throughout the life span and in any setting in which a nurse provides care for clients. It is also a basic organizing system for the National Council Licensure Examination for Registered Nurses (NCLEX-RN).

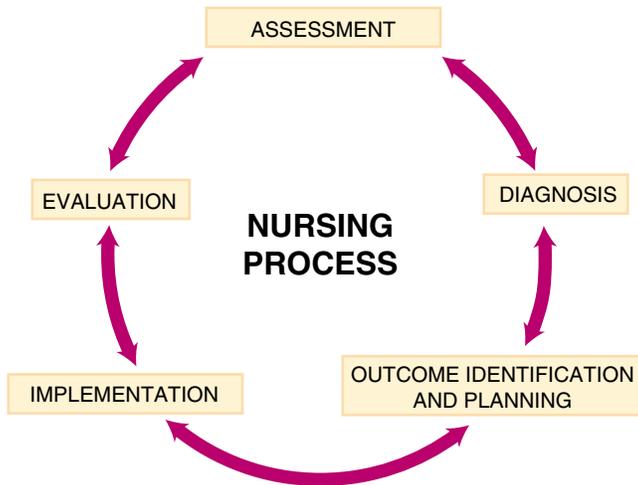

Figure 5-1 Components of the Nursing Process

Assessment

Assessment is the first step in the nursing process and includes collection, verification, organization, interpretation, and documentation of data. The completeness and correctness of the information obtained during assessment are directly related to the accuracy of the steps that follow. Assessment involves several steps:

- Collecting data from a variety of sources
- Validating the data
- Organizing data
- Categorizing or identifying patterns in the data
- Making initial inferences or impressions
- Recording or reporting data

Data are collected from a variety of sources; however, the client should be considered the **primary source** of data (the major provider of information about self). As much information as possible should be gathered from the client, using both interview techniques and physical exam-

THINK ABOUT IT

Cultural Influences

You are collecting data from a 35-year-old Asian American woman while her parents and older brother are in the room. Family is very important to this client, whose parents consistently interrupt her while she is answering your questions. If you ask the family to leave the room while you complete the interview, you risk offending the client and her family and creating barriers to your communication process. If you allow the family to remain in the room, the parents may influence the client's responses so that you are unable to make a complete assessment. How do you respect family dynamics while ensuring that the client receives the most appropriate care?

ination skills. Sources of data other than the client are considered **secondary sources** and include family members, other health care providers, and medical records.

Assessment provides information that will form the client database. Two types of information are collected through the assessment component: subjective and objective.

Subjective data are data from the client's point of view and include feelings, perceptions, and concerns. The method of collecting subjective information is primarily the interview. Using therapeutic interviewing techniques, the nurse collects data that will begin to build the client database. Examples of subjective information include such statements as:

- "I drink only coffee for breakfast."
- "I have had pains in my legs for three days now."
- "I go to sleep easily each night, but I wake up about two hours later and cannot go back to sleep until it is time to get up in the morning."

Objective data are observable and measurable data that are obtained through both standard assessment techniques performed during the physical examination and diagnostic tests. The primary method of collecting objective information is the physical examination, which provides information about the function of body systems (Figure 5-2). Examples of objective information include:

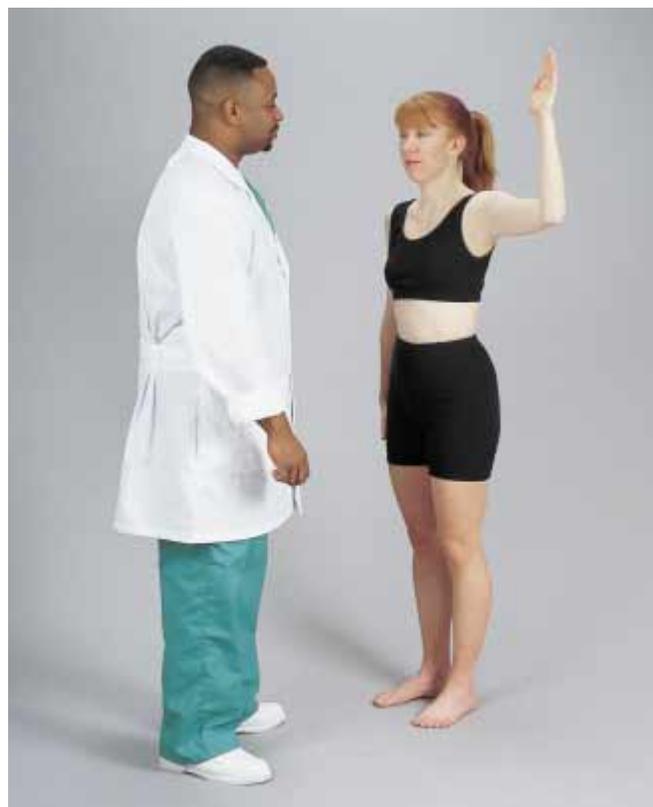

Figure 5-2 Nurse assessing client's ability to perform ROM activity. This nurse is gathering objective data through assessment of the client's ability to perform range-of-motion (ROM) activity.

- T 98.6°F, P 100, R 12, B/P 130/76
- Bowel sounds auscultated in all four quadrants
- Gait slow, shuffling, and unsteady

This objective information may add to or validate subjective information. Validation is a critical step in data collection to avoid omissions, prevent misunderstandings, and avoid incorrect inferences and conclusions.

Data that are collected must be organized to be useful to the health care professional collecting the data as well as others involved with the client's care. Clustering similar pieces of information assists the nurse in constructing a picture of the client's problems and strengths. There are a number of organizing frameworks for collection of data—for example, Gordon's Functional Health Patterns. Many health care agencies use an admission assessment format, which assists the nurse in collecting data in specific categories of functioning.

Critical thinking is used in determining the significance of data collected. Once data are organized into categories, the data are clustered into groups of related pieces. Placing data into clusters helps the nurse to recognize patterns of response or behavior. When data are placed into clusters, the nurse can:

- Distinguish between relevant and irrelevant data
- Determine if and where there are gaps in the data
- Identify patterns of cause and effect

With this information, the nurse, through critical thinking, can begin to develop impressions or inferences about what the data mean.

Assessment data must be recorded and reported. The nurse must make a judgment about which data are to be reported immediately and which data need only to be recorded at that time. Data that reflect a significant deviation from the normal (for example, rapid heart rate with irregular rhythm, severe difficulty in breathing, or high levels of anxiety) would need to be reported as well as recorded. Examples of data that need only to be recorded at the time include a report that prescribed medication has relieved a headache and a determination that an abdominal dressing is dry and intact.

Assessment does not end with the initial interview and physical examination. Assessment is dynamic and continues with each nurse-client interaction.

Diagnosis

The second step in the nursing process involves further **analysis** (breaking the whole down into parts that can be examined) and **synthesis** (putting data together in a new way) of the data that have been collected. Formulation of the list of nursing diagnoses is the outcome of this process. According to the North American Nursing Diagnosis Association (NANDA) a **nursing diagnosis**

is a clinical judgment about individual, family, or community responses to actual or potential health problems/life processes. Nursing diagnoses provide the basis for selection of nursing interventions to achieve outcomes for which the nurse is accountable. (Carroll-Johnson, 1990, p. 50)

The nursing diagnoses developed during this phase of the nursing process provide the basis for client care delivered through the remaining steps.

Client problems are labeled by both medical and nursing diagnoses. Clients receive both medical and nursing diagnoses. Table 5-3 compares the two categories of diagnoses.

TABLE 5-3
Comparison of Medical Diagnoses
and Nursing Diagnoses

Medical Diagnosis	Nursing Diagnosis
Focuses on the illness, injury, or disease process.	Focuses on the responses to actual or potential health problems or life processes.
Remains constant until a cure is effected.	Changes as the client's response and/or the health problem changes.
Identifies conditions the health care practitioner is licensed and qualified to treat.	Identifies situations in which the nurse is licensed and qualified to intervene.

The nurse uses critical-thinking and decision-making skills in developing nursing diagnoses. This process is facilitated by asking questions such as:

- Are there problems here?
- If so, what are the specific problems?
- What are some possible causes for the problems?
- Is there a situation involving risk factors?
- What are the risk factors?
- Is there a situation in which a problem can develop if preventive measures are not taken?
- Has the client indicated a desire for a higher level of wellness in a particular area of function?
- What are the client's strengths?
- What data are available to answer these questions?
- Are more data needed to answer the question?
- If so, what are some possible sources of the data that are needed?

See the accompanying display for a clinical example of applying critical thinking when determining nursing diagnoses.

CLINICAL APPLICATION: CRITICAL THINKING AND DIAGNOSING

Read the information below about Mr. Jona. As you read, think about questions that are stimulated by the information presented. Write your questions as you think of them and compare them with those listed later.

Mr. Jona is a client on your unit. He is a 70-year-old widower, admitted 2 days ago with a broken left hip. While bowling with his church bowling league, Mr. Jona tripped, fell, fractured his hip, and sprained his right wrist. He has recently retired from an administrative position with a large company and moved to Florida from his home in Iowa. He has two children, who both live about 500 miles away. Mr. Jona lives alone in a one-bedroom apartment about 10 blocks from the hospital. In 2 days, Mr. Jona will be discharged and referred to the home health division for follow-up care.

Questions for consideration include: Is he right-handed? What tasks can he perform with his left hand? Will there be anyone to stay with him when he gets home? Who will shop for and prepare food? Does he live in an upstairs apartment? If yes, is there an elevator? Is there someone in his church who could help with errands and food? What about his children: Can one of them come to stay with him for a while? Did you identify any other questions about Mr. Jona's situation?

Types of Nursing Diagnoses

Analysis of the collected data leads the nurse to make a diagnosis in one of the following categories:

- Actual problems
- Potential problems (including those where risk factors exist and there are possible problems)
- Wellness conditions
- Collaborative problems

Examples of the various types of diagnoses are shown in Table 5-4.

An **actual nursing diagnosis** indicates that a problem exists, and is composed of the diagnostic label, related factors, and signs and symptoms. An example of an actual diagnosis is: *Impaired Skin Integrity* related to prolonged pressure on bony prominence as manifested by (AMB) Stage II pressure ulcer over coccyx, 3 cm in diameter.

A **risk nursing diagnosis** (potential problem) indicates that a problem does not yet exist, but special risk factors are present. A risk diagnosis is composed of the diagnostic label preceded by the phrase “risk for,” with the specific risk factors listed. An example of a risk diagnosis is: *Risk for Impaired Skin Integrity* related to inability to turn self from side to side in bed.

A **possible nursing diagnosis** indicates a situation in which a problem could arise unless preventive action is

TABLE 5-4
Types of Nursing Diagnoses

Nursing Diagnosis	Example
Actual diagnosis	<i>Deficient Fluid Volume</i> related to nausea and vomiting as manifested by dry skin and mucous membranes and decreased oral intake of fluids
Risk diagnosis	<i>Risk for Infection</i> related to presence of invasive lines (intravenous line and indwelling bladder catheter)
Possible diagnosis	<i>Possible Imbalanced Nutrition: Less Than Body Requirements</i> related to insufficient oral intake
Wellness diagnosis	<i>Readiness for Enhanced Spiritual Well-Being</i>
Collaborative problem	<i>Potential Complication (PC): Increased Intracranial Pressure</i>

taken. In addition, a possible diagnosis may state a “hunch” or intuition by the nurse that cannot be confirmed or eliminated until more data have been collected. A possible diagnosis is composed of the diagnostic label and related factors. An example of a possible diagnosis is: *Possible Self-Esteem Disturbance* related to recent retirement and relocation. The nurse may not yet have enough data to confirm this diagnosis or a more specific one. However, this diagnosis will alert other nurses to collect data that will either confirm this or another diagnosis, verify a risk diagnosis, or rule out the existence of a problem.

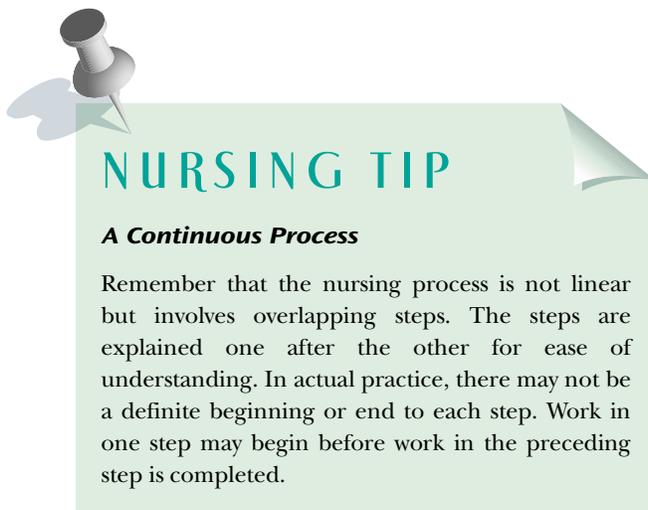

A **wellness nursing diagnosis** indicates the client's expression of a desire to attain a higher level of wellness in some area of function. It is composed of the diagnostic label preceded by the phrase “potential for enhanced.” For example a client who is neither overweight nor underweight tells the nurse that she knows she could improve her diet in some ways. She states that she eats only a small number of vegetables and fruits and thinks that the fat content of her diet is probably high. She expresses a desire to know more about how to improve her diet. The nurse would make a wellness diagnosis of *Potential for Enhanced Nutrition*.

Carpenito introduced the bifocal clinical practice model that includes nursing diagnoses and collaborative problems. **Collaborative problems** are defined as physiologic complications monitored by nurses to assess changes in client status. Collaborative problems are managed through the use of interventions prescribed by other health care practitioners and/or nurses (Carpenito, 1999). Collaborative problems include those conditions in which the nurse seeks medical input for treatment of potential medical problems. Usually,

collaborative problems involve alterations in organ and/or system function or structure (e.g., myocardial infarction, duodenal ulcer). Collaborative problems begin with the label *Potential Complication* (PC) followed by the situation—for example, *Potential Complication: Hemorrhage*.

Analysis of the data also assists the nurse in identifying strengths of the client. For example, the client's strong family support system would be identified as a strength. These areas of positive functioning will be reinforced and used as a basis for planning care for those areas where functioning is less than optimal.

After it is formulated, the list of diagnoses is presented to the client for confirmation if possible. If that is not possible, family members may be able to confirm the diagnoses. Finally, the list of nursing diagnoses is recorded on the client's record. Once this list is developed and recorded, the remainder of the client's plan of care can be completed. The list of nursing diagnoses is not static. It is dynamic, changing as more data are collected and as client goals and client responses to interventions are evaluated.

NURSING TIP

A Continuous Process

Remember that the nursing process is not linear but involves overlapping steps. The steps are explained one after the other for ease of understanding. In actual practice, there may not be a definite beginning or end to each step. Work in one step may begin before work in the preceding step is completed.

Outcome Identification and Planning

Planning is the third step of the nursing process and includes the formulation of guidelines that establish the proposed course of nursing action in the resolution of nursing diagnoses and the development of the client's plan of care. Once the nursing diagnoses have been developed and client strengths have been identified, planning can begin. The planning phase involves several tasks:

- The list of nursing diagnoses is prioritized.
- Client-centered long- and short-term goals and outcomes are identified and written.
- Specific interventions are developed.

- The entire plan of care is recorded in the client's record.

Once the list of nursing diagnoses has been developed from the data, decisions must be made about priority. Critical thinking enables the nurse to make decisions about which diagnoses are the most important and need attention first. There are a number of frameworks used to prioritize nursing diagnoses; however, those diagnoses involving life-threatening situations are given the highest priority. For example, the following nursing diagnoses would be stated in this order of priority:

- *Ineffective Airway Clearance* related to excessive and thick secretions and pain secondary to surgery and inability to cough effectively; respirations: 25, shallow, wheezing
- *Risk for Injury* (falls) related to unsteady gait
- *Imbalanced Nutrition: Less Than Body Requirements* related to nausea and vomiting

Client-centered goals are established in collaboration with the client whenever possible. A **goal** is an aim, intent, or end. Goals are broad statements that describe the intended or desired change in the client's behavior. Goal statements refer to the diagnostic label (or problem statement) of the nursing diagnosis. If the client or significant others are unable to participate in goal development, the nurse assumes that responsibility until the client is able to participate. Client-centered goals assure that nursing care is individualized and focused on the client.

Expected outcomes are specific objectives related to the goals and are used to evaluate the nursing interventions. They must be measurable, have a time limit, and be realistic. Once goals and expected outcomes have been established, nursing interventions are planned that enable the client to reach the goals.

A **nursing intervention** is the activity that the nurse will execute for and with the client to enable accomplishment of the goals. Nursing interventions refer directly to the related factors in the actual nursing diagnoses and the risk factors in risk nursing diagnoses. If the nursing interventions can remove or reduce the related factors and the risk factors, the problem can be resolved or prevented. Nursing interventions also refer to the diagnostic label for possible diagnoses and focus on data needed to confirm or eliminate the diagnosis.

For each nursing diagnosis there may be a number of nursing interventions. Nursing interventions are individualized and are stated in specific terms. Examples of nursing interventions are:

- Turn, cough, and deep breathe q 2 h beginning at 0800, 2/10.
- Teach “nipple care when breastfeeding” at 1000, 2/11.
- Weigh client at each visit.

Once the interventions have been determined for each diagnosis, the interventions are recorded on the client's plan of care. As is true with other steps in the nursing process, the list of interventions is not static. As the nurse interacts with the client, assesses responses to interventions, and evaluates those responses, interventions may change.

Implementation

The fourth step in the nursing process is implementation. **Implementation** involves the execution of the nursing plan of care derived during the planning phase. It consists of performing nursing activities that have been planned to meet the goals set with the client. Nurses may delegate some of the nursing interventions to other persons assigned to care for the client—for example, the licensed practical nurses and unlicensed assistive personnel.

Implementation involves many skills. The nurse must continue to assess the client's condition before, during, and after the nursing intervention. Assessment prior to the intervention provides the nurse with baseline data. Assessment during and after the intervention allows the nurse to detect positive or negative responses the client may have to the intervention. If negative responses occur during the procedure, the nurse must take appropriate action. If positive responses occur, the nurse adds this information to the database for use in evaluating the efficacy of the intervention. The nurse must also possess psychomotor skills, interpersonal skills, and critical thinking skills to perform the nursing interventions that have been planned. The nurse uses psychomotor skills when performing procedures such as giving injections, changing dressings, and helping the client perform range-of-motion (ROM) exercises. Interpersonal skills are necessary as the nurse interacts with the client and the family to collect data, provide information in teaching sessions, and offer support in times of anxiety. Critical thinking skills enable the nurse to think through the situation, ask the appropriate questions, and make decisions about what needs to be done.

The implementation step also involves reporting and documentation. Data to be recorded include the client condition prior to the intervention, the specific intervention performed, the client response to the intervention, and client outcomes.

Evaluation

Evaluation, the fifth step in the nursing process, involves determining whether the client goals have been met, partially met, or not met. If the goal has been met, the nurse must then decide whether nursing activities will cease or continue in order for status to be maintained.

If the goal has been partially met or not been met, the nurse must reassess the situation. Data are collected to determine why the goal has not been achieved and what modifications to the plan of care are necessary. There are a number of possible reasons that goals are not met or are only partially met, including:

- The initial assessment data were incomplete.
- The goals and expected outcomes were not realistic.
- The time frame was too optimistic.
- The goals and/or the nursing interventions planned were not appropriate for the client.

Evaluation is an ongoing process. Nurses continually evaluate data in order to make informed decisions during other phases of the nursing process.

Title of Study

"Acknowledging Intuition in Clinical Decision Making"

Author

Rew, L.

Purpose

To develop a scale that measures nurses' acknowledgment of using intuition in clinical decision making. The overall objective is to obtain reliable valid data about the development and application of this skill (intuitive thinking) in expert nursing practice.

Methods

The study was conducted in three phases:
Phase 1: Construction of the survey instrument
Phase 2: Distributing the scale via mail to nurses practicing in psychiatric/mental health settings
Phase 3: Refinement of the scale, which was then presented to a convenience sample of 112 nurses with various clinical backgrounds.

Findings

This three-phased study indicates that acknowledging the use of intuition as a skill in clinical decision making can be measured with a reliable and valid self-report tool.

Rew, L. (2000). Acknowledging intuition in clinical decision making. *Journal of Holistic Nursing*, 18(2), 94–108.

CRITICAL THINKING APPLIED IN NURSING

Critical thinking is a skill that can be learned just as other skills are learned. The skill of critical thinking is important and useful in all aspects of a person's life. However, it is a vital tool for the nurse in using the nursing process. Critical thinkers develop a questioning attitude and delve into situations in order to seek possible explanations for what is happening. Examples of questions the nurse as a critical thinker might ask at each step in the nursing process are listed in Table 5-5.

There are many similarities between the nursing process and the problem solving process, as shown on Table 5-6.

Nurses use critical thinking skills in each step of the nursing process. "Everything nurses do require high-level thinking; no action is performed without critical thinking" (Rubenfeld & Scheffer, 1999, p. 3). Table 5-7 provides examples of how critical thinking is used in each phase of the nursing process.

"Because the conclusions and decisions we as nurses make affect people's lives, our thinking must be guided by sound reasoning—precise, disciplined thinking that

promotes accuracy and depth of data collection, and seeks to clearly identify the issues at hand" (Alfaro-LeFavre, 1998, p. 64).

TABLE 5-6
Comparison of Problem Solving and Nursing Process

Problem Solving	Nursing Process
Encountering problem	Assessing
Collecting data	Assessing
Identifying exact nature of problem	Formulating nursing diagnosis
Determining plan of action	Planning
Carrying out plan	Implementing
Evaluating plan in new situation	Evaluating

TABLE 5-5
Examples of Critical-Thinking Questions for Use with the Nursing Process

Nursing Process Step	Critical Thinking Question
Assessment	Are the data complete? What other data do I need? What are some possible sources of those data? What assumptions or biases do I have in this situation? What is the client's point of view? Are there other points of view?
Diagnosis	What do these data mean? What else could be happening? Are there any gaps in the data? How are these data similar and how are they different? What assumptions or biases do I have in this situation? Have my assumptions affected my interpretation of the data? If so, in what way?
Outcome identification and planning	What are the goals for this client? What do I want to accomplish? How are my goals related to what the client wants to accomplish? What are the expected outcomes for this client? What interventions are to be used? Who is the best-qualified person to perform these interventions? How much involvement can the client and family or significant others have at this time? How much involvement does the client wish to have at this time?
Implementation	What is the client's current status? What are the most critical steps in this intervention? How must I alter the intervention to best meet this client's needs and maintain principles of safety? What is the client's response during and after the intervention? Is there a need to alter the intervention in any way? If so, why and how?
Evaluation	Were the interventions successful in assisting the client to achieve the desired goals? How could things have been done differently? What data do I need to make new decisions? Where will I get the data? Were there assumptions, biases, or points of view that I missed that affected the outcomes? What can be done about these assumptions, biases, or points of view?

TABLE 5-7
Application of Critical Thinking to Nursing Process

Assessment	Diagnosis	Outcome Identification and Planning	Implementation	Evaluation
<ul style="list-style-type: none"> • Gather pertinent data • Interpret data • Keep an open mind by questioning assumptions about data • Thinking about what information to collect • Determining the significance of data • Making conclusions based on the data 	<ul style="list-style-type: none"> • Develop well thought out conclusions • Seek reasons and principles that justify nursing judgments • Test conclusions against criteria • Suspend judgment when data is insufficient • Differentiate essential and trivial data 	<ul style="list-style-type: none"> • Explore alternative actions • Collaborate with others • Examine assumptions • Reframe problems in order to generate solutions • Generate ideas and possible solutions 	<ul style="list-style-type: none"> • Communicate with others to solve complex problems • Accurately report data and clues • Action is based on sound rationale 	<ul style="list-style-type: none"> • Establish standards (criteria) based on logic rather than assumptions • Analyze course of action • Critique outcomes • Evaluate the soundness of conclusions

KEY CONCEPTS

- Critical-thinking, problem-solving, and decision-making skills are important for use in the nursing process.
- Critical thinkers ask questions, evaluate evidence, identify assumptions, examine alternatives, and seek to understand various points of view.
- The nursing process is an organized method of planning and delivering nursing care.
- The nursing process is composed of five steps: assessment, diagnosis, outcome identification and planning, implementation, and evaluation.
- Assessment is the first step in the nursing process and involves collecting, validating, organizing, categorizing, and recording data.
- Both subjective data (information given by the client) and objective data (information collected by the health care provider using the senses) are collected during the assessment process.
- The second step in the nursing process involves further analysis and synthesis of the data and results in a list of nursing diagnoses.
- Types of nursing diagnoses include: actual, potential (including risk and possible), and wellness.
- Planning, the third step in the nursing process, involves prioritizing nursing diagnoses, identifying and writing goals and client outcomes, developing nursing interventions, and recording the plan of care in the client's record.
- Implementation, the fourth step in the nursing process, involves performing or delegating nursing activities.

- The nurse uses psychomotor skills, interpersonal skills, and cognitive skills when performing nursing activities.
- Evaluation, the fifth step in the nursing process, involves deciding whether the client goals have been met, been partially met, or not been met.
- The steps in the nursing process are similar to those in the problem-solving method in that problems are identified, information is gathered, a specific problem is named, a plan for solving the problem is developed, the plan is put into action, and the results of the plan are evaluated.

CRITICAL THINKING ACTIVITIES

1. Think of all the ways you can use your senses when assessing clients. What type of information can you gather through vision, hearing, smell, and touch?
2. Mrs. Rose was admitted to your unit 2 hours ago. The following data are recorded on her chart. Which data are objective? Which data are subjective? Use "S" and "O" to indicate your response.

<input type="checkbox"/> Temperature 102°F	<input type="checkbox"/> Pulse 98, irregular
<input type="checkbox"/> "My head hurts."	<input type="checkbox"/> Red maculopapular rash
<input type="checkbox"/> Nausea	<input type="checkbox"/> Vomiting for 3 days
<input type="checkbox"/> Grimaces when blinds open	<input type="checkbox"/> Skin flushed, hot
3. Match the steps in the nursing process (Column B) with the activities listed in Column A. Use the letters to indicate your answers.

COLUMN A

1. __ Examine the data for pattern.
 2. __ Write client outcomes.
 3. __ Take the client's blood pressure.
 4. __ Take the health history, using interviewing techniques.
 5. __ Select appropriate nursing actions.
 6. __ Document client response to walking.
 7. __ Conduct a physical assessment.
 8. __ Measure results of nursing interventions.
 9. __ Identify client strengths.
 10. __ Prioritize nursing diagnoses.
4. Which of the following statements would not be used to describe the nursing process?
- a. It is a cyclical dynamic process.
 - b. Creativity is required for its application.
 - c. Cognitive, critical-thinking, and psychomotor skills are used.
 - d. It is a linear static procedure.
 - e. It is used with clients in any setting.

COLUMN B

- a. Assessment
- b. Diagnosis
- c. Outcome identification and planning
- d. Implementation
- e. Evaluation

5. What do you believe about how people react when they are in pain? How do you and the people you know respond when in pain? Your beliefs form the basis for assumptions about pain response. How could these assumptions influence your interpretation of client responses to pain?

Assessment

The most important thing in communication is to hear what isn't being said.

—Peter Drucker (in Van Ekeren, 1994)

COMPETENCIES

1. Identify major purposes of data collection.
2. Describe three types of assessment.
3. Differentiate subjective and objective data.
4. Identify examples of nursing and nonnursing models used in collecting and organizing data.
5. Describe five methods involved in data collection.
6. Explain the stages of the assessment interview.
7. Outline the elements of the health history and their importance.
8. Describe the purposes of the physical assessment.
9. Discuss assessment techniques used in the physical examination.
10. Discuss the use of data clustering in organizing the information obtained about the client.
11. Identify four types of assessment formats.

**KEY
TERMS**

assessment
assessment model
auscultation
closed questions
comprehensive assessment
data clustering
data interpretation

data verification
focused assessment
health history
inspection
interview
objective data
observation

ongoing assessment
open-ended questions
palpation
percussion
review of systems
subjective data

Assessment is the first step in the nursing process and includes systematic collection, verification, organization, interpretation, and documentation of data for use by health care professionals. The accompanying display presents the essential elements of the assessment process. Effective planning of client care depends on a complete database and accurate interpretation of information. Incomplete or inadequate assessment may result in inaccurate conclusions and incorrect nursing interventions. Proper collection of assessment data directs decision-making activities of professional nurses.

The goal of assessment is the collection and analysis of data that are used in formulating nursing diagnoses, identifying outcomes and planning care, and developing nursing interventions. This chapter discusses the purpose of assessment, types of assessment, and the use of data in the assessment process.

**ELEMENTS OF THE ASSESSMENT
PROCESS**

- Data collection
- Data verification
- Data organization
- Data interpretation
- Data documentation

PURPOSE OF ASSESSMENT

The purpose of assessment is to establish a database concerning a client's physical, psychosocial, and emotional health in order to identify health promoting behaviors as well as actual and/or potential health problems. The American Nurses Association (ANA), in its *Standards of Clinical Nursing Practice* (1998), supports the use of the nursing process and outlines the essential components of assessment in this process (see the accompanying display). Through assessment, the nurse determines the client's functional abilities and the absence or presence of dysfunction. The client's normal routine for activities of daily living and lifestyle patterns are also assessed. Identification of the client's strengths provides the nurse and other members of the

treatment team information about the skills, abilities, and behaviors the client has available to promote the treatment and recovery process. Some examples of client strengths are family support, intelligence, spiritual beliefs, and coping skills (how previous problems have been solved). The assessment phase also offers an opportunity for the nurse to form a therapeutic interpersonal relationship with the client. During assessment, the client is provided an opportunity to discuss health care concerns and goals with the nurse.

**ASSESSMENT AS A STANDARD
COMPONENT OF CARE:
ANA STANDARDS****Standard I. Assessment**

The nurse collects client health data.

Guidelines:

Data must be:

- Relevant to client needs
- Collected from a variety of sources
- Collected using appropriate techniques
- Collected in a systematic manner
- Documented in a usable format

(From American Nurses Association, [1998], *Standards of clinical nursing practice*. (2nd ed.) Washington, DC: Author. Reprinted with permission.)

TYPES OF ASSESSMENT

The type and scope of information needed for assessment are usually determined by the health care setting and needs of the client (see Figure 6-1). Three types of assessment are comprehensive, focused, and ongoing. Although a comprehensive assessment is most desirable in initially determining a client's need for nursing care, time limitations or special circumstances may dictate the need for abbreviated data collection, as represented by the focused assessment. The assessment database can then be expanded after the initial focused assessment, and data should be updated through the ongoing assessment process.

Figure 6-1 In this focused assessment, the nurse is collecting data about the client prior to her elective surgery.

Comprehensive Assessment

A **comprehensive assessment** is usually completed upon admission to a health care agency and includes a complete health history to determine current needs of the client. This database provides a baseline against which changes in the client's health status can be measured and should include assessment of physical and psychosocial aspects of the client's health, the client's perception of health, the presence of health risk factors, and the client's coping patterns.

Focused Assessment

A **focused assessment** is an assessment that is limited in scope in order to focus on a particular need or health care problem or potential health care risks. Focused assessments are not as detailed as comprehensive assessments and are often used in health care agencies in which short stays are anticipated (e.g., outpatient surgery centers and emergency departments), in specialty areas such as labor and delivery, and in mental health settings or for purposes of screening for specific problems or risk factors (e.g., well-child clinics). See the accompanying display for sample questions used to assess a client experiencing labor.

SAMPLE FOCUSED ASSESSMENT: THE WOMAN EXPERIENCING LABOR

Following are examples of questions that focus on essential information for the nurse caring for a woman during labor:

- When did your contractions begin?
- How far apart are the contractions?
- Are they getting stronger?
- When did your water break?

Ongoing Assessment

Systematic follow-up is required when problems are identified during a comprehensive or focused assessment. An **ongoing assessment** is an assessment that includes systematic monitoring and observation related to specific problems. This type of assessment allows the nurse to broaden the database or to confirm the validity of the data obtained during the initial assessment. Ongoing assessment is particularly important when problems have been identified and a plan of care has been implemented to address these problems. Systematic monitoring and observations allow the nurse to determine the response to nursing interventions and to identify any emerging problems.

The nurse delivering care to a client at home uses ongoing assessment. In the home, the nurse often has to direct the client to provide information relevant to the current problem, as the client may have a tendency to spend a lot of time telling stories of past medical problems and treatment, as opposed to providing information relevant to the situation at hand (Humphrey, 1994). Use of specific questions will be most helpful in eliciting specific information (see the accompanying display).

ONGOING ASSESSMENT: THE HOME HEALTH CLIENT

- What led up to your most recent hospitalization?
- What medications were prescribed for you during that time?
- What kind of diet were you on?
- What type of activities did you do while you were in the hospital?
- While in the hospital, what did you learn about . . . ?
- What adaptations for your comfort and care have you and your family made since your return home?

DATA COLLECTION

The nurse must possess strong cognitive, interpersonal, and technical skills in order to elicit appropriate information and make relevant observations during the data collection process. This process often begins prior to initial contact between the nurse and the client, primarily through the nurse's review of biographical data and medical records. Upon meeting the client, the nurse continues data collection through interview, observation, and examination. A variety of sources and methods are used in compiling a comprehensive database.

Types of Data

Client data include information that the client communicates concerning perceptions of his or her own health status, as well as specific observations made by the nurse. These two types of information are referred to as subjective and objective data. **Subjective data** are data from the client's point of view and include feelings, perceptions, and concerns. The data (also referred to as symptoms) are obtained through interviews with the client. They are called subjective because they rely on the feelings or opinions of the person experiencing them and cannot be readily observed by another.

Objective data are observable and measurable (quantitative) data that are obtained through observation, standard assessment techniques performed during the physical examination, and laboratory and diagnostic testing. These data (also called signs) can be seen, heard, or felt by someone other than the person experiencing them. Assessments that are comprehensive and accurate include both subjective and objective data. See Table 6-1 for examples of both types of data.

Sources of Data

A comprehensive database should include data from every possible source (see the accompanying display). The client should always be considered the primary source of information; however, other sources should not be overlooked. The client's family and significant others can also provide useful information, especially if the client is unable to verbalize or relate information. In addition, other health care professionals who have cared for the client may contribute valuable information. Medical records should also be reviewed, including the medical history and physical examination; results of laboratory and diagnostic tests and various health care professionals should also be consulted.

Pertinent literature should be investigated in order to pursue relevant information and plan appropriate nursing interventions. Written standards are valuable sources of data for comparison, for example, a standard table of infant growth to determine if an infant's weight and height are within normal growth range. Another valuable source of data is knowledge about the client's normal parameters of functioning. The nurse's knowledge based on experience is another important source of data.

SOURCES OF DATA

- Client
- Family/significant other
- Other health care professionals
- Medical records
- Interdisciplinary conferences, rounds, and consultations
- Results of diagnostic tests
- Relevant literature

TABLE 6-1

Sample Application: Types of Data

Data	Type of Data
Charlene Rhodes, age 47, has come to the clinic after "passing out" twice in the last 2 days. She tells the nurse that she becomes "lightheaded" after almost any type of activity. She has experienced some nausea since yesterday and vomited after eating breakfast this morning. She also tells the nurse that she is very nervous about these occurrences because she remembers her mother having similar symptoms when the mother suffered from a brain disorder. The nurse observes that the client's gait is unsteady and her skin is pale. The client also has large bruises on her right arm and the right side of her face, which she states occurred when she fell.	Subjective Report of fainting Complaint of dizziness Nausea Verbalization of anxiety Self-reported fall
	Objective Vomiting Unsteady gait Pale skin Bruises on right side of face and right arm

THINK ABOUT IT

Sources of Data

Mrs. Palmer, age 76, was admitted to the hospital following a stroke. She is responsive but unable to speak or move extremities on the right side. Her daughter, who lives next door, is present at the bedside. Who would be the best source of data in this situation?

Methods of Data Collection

The nurse collects information through the following methods: observation, interview, health history, symptom analysis, physical examination, and laboratory and diagnostic data. These approaches require systematic use of assessment skills that are discussed below.

Observation

The nurse uses the skill of **observation** to carefully and attentively note the general appearance and behavior of the client. These observations occur whenever there is

contact with the client and include factors such as client mood, interactions with others, physical and emotional responses, and any safety considerations. Observation helps the nurse determine the client's status, both physical and mental. By carefully watching the client, the nurse can detect nonverbal cues that indicate a variety of feelings, including presence of pain, anxiety, and anger. Observational skills are essential in detecting the early warning signs of physical changes (e.g., pallor and sweating).

Interview

An **interview** is a therapeutic interaction that has a specific purpose. The purpose of the assessment interview is to collect information about the client's health history and current status in order to make determinations about the client's health needs. Effective interviewing depends on the nurse's knowledge and ability to skillfully elicit information from the client using appropriate techniques of communication. Observation of nonverbal behavior during the interview is also essential to effective data collection.

Interview Preparation

The interview is more productive if the nurse has an opportunity to prepare for the interaction. Such preparation includes review of the client's medical records, conversations with other health care team members (e.g., personnel in emergency departments or long-term care facilities), and research of the presenting medical diagnosis. This information can be useful in obtaining the client's relevant history and formulating a current needs assessment.

Interview Stages

Since the assessment interview often occurs at the beginning of a nurse-client relationship, it is helpful to begin the process with an orientation phase. During this period introductions are made, rapport is established, and roles are defined. The nurse interviews for a variety of reasons throughout the nurse-client relationship, including data collection, teaching, exploration of the client's feelings or concerns, and provision of support. The first few minutes of the nurse-client meeting may give an indication of the type of interviewing needed, so it is important that the nurse exhibit good listening skills as the relationship leads into the interview process. There are three phases to an interview: introduction, working, and closure.

Introduction The introduction stage of the interview establishes the goals for the interaction. The primary goal of the assessment interview is the collection of data about the client. In this phase of the interview, the purpose and use of the data collection should be discussed. For example, the nurse might state, "I need to ask you a few questions and talk to you for a few minutes

about your health so that we can better plan your care." Adequate time and privacy should be allowed for the interview so that the client feels free to share any information that may be relevant. The nurse should also inform the client about the approximate duration of the interview.

The client is more likely to respond freely if the interview environment provides comfort and privacy and if rapport exists between the client and the nurse. The nurse should sit (if possible), establish eye contact with the client, and listen attentively. It is the nurse's responsibility to note nonverbal messages that can indicate that the client is uncomfortable, tired, or preoccupied with other matters. If this situation occurs, it might be necessary to complete the interview at a later time. For example, if the client is guarding an incision and verbalizing discomfort or is extremely anxious about an impending procedure, only essential data are collected and the comprehensive interview is postponed until immediate needs have been met.

Working The working stage of the interview focuses on the details of data collection. The scope of the assessment interview depends on the type of assessment to be conducted (e.g., comprehensive or focused). The interview may be structured and formal (used in situations when a large amount of information needs to be obtained) or unstructured and informal (used in interactions that focus on a specific area of concern to the client). The nurse should be familiar with the specific assessment format used by the health care agency so that attention can be focused toward the client rather than the form itself.

The interview generally begins with questions about biographical and other nonthreatening information. The client's reason for seeking health care is also addressed early in the working phase. The depth of the majority of questions that the nurse will ask the client depends on the data collection model used by the health care agency. Information is usually gathered from the general to the specific, with details about intimate or potentially embarrassing topics reserved until

NURSING CHECKLIST

Preparing the Interview Environment

- Assure adequate lighting.
- Maintain a comfortable room temperature.
- Select an environment that is as free of noise and distractions as possible.
- Maintain client privacy.
- Make sure that the interview is timed appropriately.
- Promote client comfort.

later in the interview. The Nursing Checklist provides guidelines for interview preparation.

Techniques used during the interview will be determined by the setting and purpose of the interview. A comprehensive interview that seeks to identify problems and concerns is facilitated by open-ended questions, while an interview that focuses on specific details about a presenting problem will be facilitated by direct, closed questions. For example, an emergency setting would likely employ more direct, closed questions, while admission to a long-term care facility might require greater use of open-ended questions.

Closed questions are questions that can be answered briefly or with one-word responses. For example, the question “Have you been in the hospital before?” is a closed question that can easily be answered by a one-word response. Questions about the dates of and reasons for the hospitalizations are also closed questions that require brief answers.

THINK ABOUT IT

Assessment Interview

Mrs. Klein arrives at the clinic because of extreme fatigue for the last few weeks. Number each of the following topics in the order you would address them in your interview with this client:

- _____ Describe the type and amount of food you eat in a typical day.
- _____ Describe what you mean by “extreme fatigue.”
- _____ How has your fatigue affected your sex life?
- _____ What kind of family or other support systems do you have?
- _____ Describe your exercise patterns.
- _____ What kind of stressful events have occurred recently?

Open-ended questions are questions that encourage the client to elaborate about a particular concern or problem. For example, the question “What led to your

THINK ABOUT IT

Interview Techniques

Formulate both a closed and open-ended question to elicit information from a client about the following areas:

- Diet
- Perception of health status
- Activity/exercise

Which questions do you think will extract the most useful and complete information from the client? Under which circumstances would each type of question be best used?

coming here today?” is open-ended and allows the client flexibility in response. Both closed and open-ended questions can be effective in collecting information.

Closure Closure is established in the introduction phase when approximate time parameters are set. As the interview session is concluding, the nurse should indicate this fact by stating that almost all the information needed has been obtained or that the time for the interview is almost over. This action allows the client an opportunity to present any other relevant information and it avoids surprises when the interview terminates. During the closure phase, the nurse summarizes what was covered or accomplished during the interview and requests validation of perceptions with the client. If the nurse or the client feels that additional time is needed for further exploration of specific points discussed during this session, plans can be made for future interviews.

Health History

A primary focus of the data collection interview is the health history. The **health history** is a review of the client’s functional health patterns prior to the current contact with a health care agency. While the medical history concentrates on symptoms and the progression of disease, the nursing health history focuses on the client’s functional health patterns, responses to changes in health status, and alterations in lifestyle. The health history is also used in developing the plan of care and formulating nursing interventions.

Demographic Information

Personal data including name, address, date of birth, gender, religion, race/ethnic origin, occupation, and type of health plan/insurance should be included. This information may be useful in helping to foster understanding of a client’s perspective.

Reason for Seeking Health Care

The client’s reason for seeking health care should be described in the client’s own words. For example, the statement “fell off four-foot ladder and landed on right shoulder; unable to move right arm” is the client’s actual report of the event that precipitated his or her need for health care. The client’s perspective is important because it explains what is significant about the event from the client’s point of view. It is also important to determine the time of the onset of symptoms as well as a complete symptom analysis.

Perception of Health Status

Perception of health status refers to the client’s opinion of his or her general health. It may be useful to ask clients to rate their health on a scale of 1 to 10 (with 10 being ideal and 1 being poor), together with the clients’ rationale for their rating score. For example, the nurse

may record a statement such as the following to represent the client's perception of health: "Rates health a 7 on a scale of 1 (poor) to 10 (ideal) because he must take medication regularly in order to maintain mobility, but the medication sometimes upsets his stomach."

Previous Illnesses, Hospitalizations, and Surgeries

The history and timing of any previous experiences with illness, surgery, or hospitalization are helpful in order to assess recurrent conditions and to anticipate responses to illness, since prior experiences often have an impact on current responses.

Client/Family Medical History

The nurse needs to determine any family history of acute and chronic illnesses that tend to be familial. Health history forms will frequently include checklists of various illnesses that the nurse can use as the basis of the questions about this aspect. The client should be instructed that family history refers to blood relatives. It is also helpful to indicate *who* the relative is in relation to the client (e.g., mother, father, sister).

NURSING TIP

Clients Who Were Adopted

Keep in mind that clients who were adopted will have varying degrees of knowledge about their biological parents. Sensitivity to this issue is critical in gaining client trust during the interview process.

Immunizations/Exposure to Communicable Disease

Any history of childhood or other communicable diseases should also be noted. In addition, a record of current immunizations should be obtained. This is particularly important with children; however, records of immunizations for tetanus, influenza, and hepatitis B can also be important for adults. If the client has traveled out of the country, the time frame should be indicated in order to determine incubation periods for relevant diseases. The client should also be asked about potential exposure to communicable diseases, such as tuberculosis, or to human immunodeficiency virus (HIV).

Allergies

Any drug, food, or environmental allergies should be noted in the health history. In addition to the name of the allergen, the type of reaction to the substance should also be noted. For example, a client may report

NURSING ALERT

Assessment for Allergies

It is essential that the nurse explore possible allergies prior to administering any medications. Allergic reactions can be life-threatening and can occur even with very low dosages of medications. A client's sensitivity to a drug can also change over time, resulting in severe reactions even though the client has successfully taken the drug during prior illnesses or experienced only mild reactions to the drug in the past.

that he or she developed a rash or became short of breath. This reaction should be recorded. Clients may report an "allergy" to a medication because they developed an upset stomach after ingesting it, which the nurse will recognize as a side effect that would not necessarily preclude administration of the drug in the future.

Current Medications

All medications currently taken, both prescription and over-the-counter, are to be recorded by name, frequency and dosage. Remind clients that this information should include medications such as birth control pills, laxatives, and nonprescription pain relief medications. Ask which, if any, herbal preparations the client uses. Patterns related to caffeine and alcohol intake and use of tobacco or recreational drugs should also be explored. Use of alternative/complementary treatment methods, including herbals, is often not shared by health care consumers. Some clients fear rejection or ridicule when divulging such information with health care providers. The nurse uses a sensitive, nonjudgmental approach when assessing for the client's use of all healing practices.

Developmental Level

Knowledge of developmental level is essential for considering appropriate norms of behavior and for appraising the achievement of relevant developmental tasks. Any recognized theory of growth and development can be applied in order to determine if clients are functioning within the parameters expected for their age group. For example, if the nurse uses Erikson's stages of psychosocial development, validation of an adult client attaining the developmental task of generativity versus stagnation can be validated by the nurse's statement, such as "client prefers to spend time with his family; very involved in children's school activities."

Psychosocial History

Psychosocial history refers to assessment of dimensions such as self-concept and self-esteem as well as usual

sources of stress and the client's ability to cope. Sources of support for clients in crisis, such as family, significant others, religion, or support groups, should be explored.

Sociocultural History

In exploring the client's sociocultural history, it is important to inquire about the home environment, family situation, and client's role in the family. For example, the client could be the parent of three children and the sole provider in a single-parent family. The responsibilities of the client are important data through which the nurse can determine the impact of changes in health status and thus plan the most beneficial care for the client.

Activities of Daily Living

The activities of daily living is a description of the client's lifestyle and capacity for self-care and is useful both as baseline information and as a source of insight into usual health behaviors. This database should include the following areas:

- *Nutrition:* Includes type of diet and foods eaten and fluids consumed regularly, food preparation, the size of portions, and the number of meals per day. Food preferences and dislikes, as well as the client's need for assistance in food preparation or eating should also be determined.
- *Elimination:* Includes both urinary and bowel elimination frequency and patterns. Any recent changes or problems in these patterns should be noted.
- *Rest/sleep:* Includes the usual number of hours of sleep, number of hours of sleep needed to feel rested, sleep aids used, and the time within the day or night when sleep usually occurs. Any bedtime rituals (especially with children) should also be noted.
- *Activity/exercise:* Includes types of exercise and patterns in a typical day or week. If assistance is needed with activities such as walking, standing, or meeting hygienic needs, this information should be noted.

Review of Systems

The **review of systems** (ROS) is a brief account from the client of any recent signs or symptoms associated with any of the body systems. This allows the client an opportunity to communicate any deviations from normal that have not been otherwise identified. The review of systems relies on subjective information provided by the client rather than on the nurse's own physical examination. When a symptom is encountered, either while eliciting the health history or during the physical examination of the client, the nurse should obtain as much information as possible about the symptom. Relevant data include:

- *Location:* The area of the body in which the symptom (such as pain) can either be pointed to or described in detail.
- *Character:* The quality of the feeling or sensation (e.g., sharp, dull, stabbing).

- *Intensity:* The severity or quantity of the feeling or sensation and its interference with functional abilities. The sensation can be rated on a scale of 1 (very little) to 10 (very intense).
- *Timing:* The onset, duration, frequency, and precipitating factors of the symptom.
- *Aggravating/alleviating factors:* The activities or actions that make the symptom worse or better.

Physical Examination

The purpose of the physical examination is to make direct observations of any deviations from normal and to validate subjective data gathered through the interview. Baseline measurements are obtained, and physical examination techniques are used to gather objective data.

Baseline Data

Baseline data collection is the systematic organization of observations obtained during the physical examination that forms the basis for comparison and evaluation to establish the status of a client at a given point in time. Measurement of height, weight, and vital signs (temperature, pulse, respirations, and blood pressure) is important for comparison with future measurements in order to judge the significance of any changes (progress or regression) over time.

Assessment Techniques

The physical examination incorporates the use of visual, auditory, tactile, and olfactory senses and the use of systematic assessment techniques. The use of visual, auditory, and tactile senses will be described with each of the specific assessment techniques. In addition, olfaction (sense of smell) is helpful in detecting characteristic odors as well as those associated with altered health states. For example, presence of infection is sometimes first detected by the change in the characteristic odor of body fluids or drainage. The four assessment techniques used in physical examination are inspection, palpation, percussion, and auscultation.

Inspection **Inspection** involves careful visual observation. The client is observed first from a general point of view and then with specific attention to detail. For example, the nurse first observes for patterns of skin lesions and then focuses on the specific characteristics of individual lesions. Instruments such as a penlight and otoscope are often used to enhance visualization. Effective inspection requires adequate lighting and exposure of the body parts being observed. Beginning nurses often feel self-conscious or embarrassed using the technique of inspection; however, most become comfortable with the technique over time. Nurses must also be sensitive to the client's feelings of embarrassment with the use of inspection and respond to this situation by discussing the technique with the client and

ELEMENTS OF THE HEALTH HISTORY

- Demographic information: name, age, gender, marital status
- Reason for seeking health care: concern that initiated visit
- Perception of health status: client's view of health
- Previous illnesses, hospitalizations, surgeries: any chronic illness or acute episodes that led to hospitalization or surgery
- Client/family medical history: illness or cause of deaths in blood relatives
- Immunizations/exposure to communicable disease: childhood immunizations or relevant immunizations of adulthood; any known exposure to communicable disease
- Allergies: prior allergic reactions to medications, food, or environmental substances
- Current medications: prescription or over-the-counter medications, including laxatives, birth control pills, pain medications
- Developmental level: evidence of accomplishing developmental tasks for age group
- Psychosocial history: sources of stress, coping mechanisms, self-concept
- Sociocultural history: role in family, relationships, occupational history, personal habits, religious beliefs
- Activities of daily living: patterns of nutrition, elimination, rest/sleep, and activity/exercise
- Review of systems: recent signs and symptoms associated with body systems

using measures such as draping in order to increase the client's comfort level.

Palpation **Palpation** uses the sense of touch to assess texture, temperature, moisture, organ location and size, vibrations and pulsations, swelling, masses, and tenderness. Palpation requires a calm, gentle approach and is used systematically, with light palpation preceding deep palpation and palpation of tender areas performed last.

NURSING ALERT

Palpation

Deep palpation is a technique requiring expertise and should not be employed by beginning nursing students without supervision.

The technique of palpation uses the hands and fingers in different ways for assessment of:

- *Temperature*: Best detected using the dorsal (back) surface of the hand
- *Texture, pulses, and swelling*: Best detected using fingertips
- *Vibration*: Best detected with the base of the fingers
- *Shape and consistency of organs or masses*: Best detected by grasping organ or mass between fingertips

Percussion **Percussion** uses short, tapping strokes on the surface of the skin to create vibrations of underlying organs. It is used for assessing the density of structures or determining the location and the size of organs in the body. Structures with relatively more air (such as the lungs) produce louder, deeper, and longer sounds with percussion than more dense, solid structures (such as the liver), which produce softer, higher, and shorter sounds.

Auscultation **Auscultation** involves listening to sounds in the body that are created by movement of air or fluid. Areas most often auscultated include the lungs, heart, abdomen, and blood vessels. Although direct auscultation is sometimes possible, a stethoscope is usually employed in order to channel the sound.

Laboratory and Diagnostic Data

Results of laboratory and diagnostic tests can be useful objective data as these values often serve as defining characteristics for various altered health states; these can also be helpful in ruling out certain suspected problems. For example, diabetic clients who are poorly controlled on diet and/or medication will usually have an elevated blood glucose level. The pattern of these types of variations is useful in determining a plan of care. In addition, the effectiveness of nursing and medical interventions and progress toward health restoration are often monitored through laboratory and diagnostic test data.

DATA VERIFICATION

Data verification is the process through which data are validated as being complete and accurate. Once the nurse completes the initial data collection, the data are reviewed for inconsistencies or omissions. This process is particularly important if data sources are considered unreliable. For example, if a client is confused or unable to communicate, or if two sources provide conflicting data, it is necessary for the nurse to seek further information or clarification. Data verification is done by examining the congruence between subjective and objective data. For example, a client might exhibit non-verbal expressions of pain (e.g., guarding a part of the body, facial grimacing) but verbally deny feeling pain.

The nurse would need to consider possible reasons for this discrepancy in findings and collect more information before formulating conclusions or planning care. Findings should also be compared with norms. Any grossly abnormal findings should be rechecked and confirmed.

DATA ORGANIZATION

After data collection is completed and information is validated, the nurse organizes, or clusters, the information together in order to identify areas of strengths and weaknesses. This process is known as **data clustering**. How data are organized depends on the assessment model used.

Assessment Models

An **assessment model** is a framework that provides a systematic method for organizing data. The use of a model helps to ensure comprehensive and organized data collection. A guiding framework also provides direction for decision making about nursing diagnoses. A number of nursing and nonnursing models are used to assist with organization of data. This section describes only a few of the many assessment models available to nurses.

Nursing Models

Nursing models have been developed to focus on a wide range of human responses to alterations in health status. These models typically include psychosocial, sociocultural, and behavioral data as well as biophysical data. Nursing models may offer the advantage of organizing information in a mode that more easily allows transition from data collection to nursing diagnoses.

Functional Health Patterns

Marjory Gordon's Human Functional Health Patterns (Gordon, 1997) is not based on a particular theory of nursing but does provide a systematic framework for data collection that focuses on 11 functional health patterns. The accompanying display presents Gordon's functional health patterns. These patterns can be used in assessment of individuals, families, and communities.

These functional health pattern areas allow gathering and clustering of information about a client's usual patterns and any recent changes in order to determine if the client's response is functional or dysfunctional. For example, the activity-exercise pattern is assessed for a client who recently experienced a stroke. Data collection would be focused on mobility and exercise patterns prior to the stroke, current muscle strength and joint mobility, and the effect of any changes on the client's lifestyle and functional ability.

Human Response Pattern

The North American Nursing Diagnosis Association (NANDA), in an effort to standardize terminology related to client problems, has developed a taxonomy of

FUNCTIONAL HEALTH PATTERNS

1. Health perception–health management pattern: Describes client's perceived pattern of health and well-being and how health is managed.
2. Nutritional-metabolic pattern: Describes pattern of food and fluid consumption relative to metabolic need and pattern indicators of local nutrient supply.
3. Elimination pattern: Describes patterns of excretory function (bowel, bladder, and skin).
4. Activity-exercise pattern: Describes pattern of exercise, activity, leisure, and recreation.
5. Cognitive-perceptual pattern: Describes sensory-perceptual and cognitive pattern.
6. Sleep-rest pattern: Describes pattern of sleep, rest, and relaxation.
7. Self-perception–self-concept pattern: Describes self-concept pattern and perceptions of self.
8. Role-relationship pattern: Describes pattern of role engagements and relationships.
9. Sexuality-reproductive pattern: Describes patterns of satisfaction or dissatisfaction with sexuality; describes reproductive patterns.
10. Coping–stress-tolerance pattern: Describes coping pattern and its effectiveness in stress tolerance.
11. Value-belief pattern: Describes goals and value and belief patterns that underlie decision making.

(From Gordon M., [1997]. *Manual of nursing diagnoses 1997–1998*. St. Louis, MO: Mosby.)

nursing diagnoses (North American Nursing Diagnosis Association, 2001). The first taxonomy was completed in 1973 and consisted of 31 diagnostic categories. This taxonomy has developed into over 100 diagnostic categories arranged in a hierarchical structure organized according to nine human response patterns. This framework suggests that a person's health status is evidenced by observable phenomena that can be classified into one of these response patterns. These human response patterns can then be used as a model for organizing data collection.

Theory of Self-Care

The theory of self-care, developed by Orem (1995), is based on a client's ability to perform self-care activities. Self-care is a learned behavior and a deliberate action in response to a need. It includes activities that an individual performs to maintain health. A major focus of this theory is the appraisal of the client's ability to meet self-care needs and the identification of existing self-care deficits. Since this theory focuses on deficits in care, it primarily addresses illness states.

Roy Adaptation Model

The Roy Adaptation Model is organized around adaptive behaviors (Andrews & Roy, 1991). The individual is considered a product of biological, psychological, and sociological influences and is in constant interaction with the environment. The ability of the person to cope with internal and external stressors determines the health status of the individual. Assessment is focused toward an individual's response to stimuli in the environment in the areas of physiological status, self-concept, role function, and interdependence.

Title of Study

"The Assessment of Recovery in Patients After Myocardial Infarction Using Three Generic Quality-of-Life Measures"

Authors

Taylor, R., Kirby, B., Burdon, D., & Caves, R.

Purpose

To evaluate the sensitivity to change of three quality-of-life measures in clients post myocardial infarction (MI).

Methods

Clients admitted to a coronary care unit over a 9-month period were selected according to the criteria of being younger than 80 years of age and having experienced a first MI. Quality of life was assessed 6 weeks and again at 6 months following the MI. Quality of life was measured by three tools: the Sickness Impact Profile, the Nottingham Health Profile, and the McMaster Health Inventory Questionnaire.

Findings

Eighty-six respondents completed the surveys at both 6 weeks and 6 months post-MI. The Sickness Impact Profile indicated slight sensitivity to change regarding body care and movement, emotional behavior, work, and eating.

Implications

Other quality-of-life indicators need to be developed to assess cardiac rehabilitation.

Taylor, R., Kirby, B., Burdon, D., & Caves, R. (1998). The assessment of recovery in patients after myocardial infarction using three generic quality-of-life measures. *Journal of Cardiopulmonary Rehabilitation*, 18(2), 139.

Nonnursing Models

Nursing, of course, neither exists nor functions in a vacuum. Nursing uses related health concepts from other disciplines, some of which are discussed next.

Body Systems Model

Approaching data collection by examining body systems is sometimes referred to as the "medical model," since it is frequently used by physicians to investigate presence or absence of disease. This method organizes data collection according to the organ and tissue function in various body systems (e.g., cardiovascular, respiratory, gastrointestinal). Although nurses often use this method as well, the body systems model does not facilitate the formulation of nursing diagnoses. In addition, psychosocial aspects of the client's status are often neglected with resultant fragmentation of care.

Hierarchy of Needs

Abraham Maslow's hierarchy of needs proposes that an individual's basic needs (physiological) must be met before progressing to higher-level needs. Maslow's framework can be used to prioritize needs. Use of a hierarchy of needs model requires initial assessment of all physiological needs, followed by assessment of higher-level needs. Using Maslow's theory, a person's needs should be addressed in the following order:

First: Physiologic needs—the basic survival needs, such as food, water, and oxygen

Second: Safety and security needs—both physical (e.g., protection from bodily harm) and psychological (e.g., security and stability) needs

Third: Need for love and belonging—humans have an innate need to be a part of a group, and to feel accepted by others

Fourth: Self-esteem needs—individuals need to feel they are valued and worthwhile

Fifth: Self-actualization needs—the need to function at one's optimal level, and to be personally fulfilled.

THINK ABOUT IT

Assessment Models

Consider the following client data:

- Breathing is rapid and labored.
- Client states "nervous about what might be wrong."
- Unable to eat or sleep for last 3 days.
- Becomes short of breath with minimal activity.
- Unable to work for 3 days. Client is afraid will not be able to return to work.

Where would each observation be included using the various models described? Which of these models do you feel most comfortable using? Why?

DATA INTERPRETATION

Data clustering facilitates recognition of patterns, and determination of further data that are needed. **Data interpretation** is necessary for identification of nursing diagnoses.

DATA DOCUMENTATION

Accurate and complete recording of assessment data are essential for communicating information to other health care team members. In addition, documentation is the basis for determining quality of care and should include appropriate data to support identified problems.

Types of Assessment Formats

Health care agencies may choose from a variety of assessment forms for documentation depending on the type of agency, the population served by the facility, and the primary reasons for documentation. For example, clients seeking health care in a clinic or physician's office might be asked to complete a brief self-questionnaire, while a client admitted to an acute-care facility for labor and delivery might be asked to provide only information directly related to pregnancy and child care needs. Four types of documentation formats include open ended, checklist, combination, and specialty. See Figure 6-2 for an example of a form used in occupational nursing.

Open-Ended Formats

The open-ended format for documentation allows the nurse to write a narrative description of observations (see Figure 6-3). This format is more time-consuming for the nurse, but allows flexibility in recording findings.

Checklist Formats

Formats that include checklists facilitate documentation by summarizing findings in an abbreviated form (see Figure 6-4). They also provide more consistency in the recording of information and reduce the likelihood of omitting relevant information. However, checklists may discourage nurses in obtaining elaboration about observations from clients that require further explanation. For example, if a checklist indicates that mobility is impaired, further explanation is required in order to determine the extent of the impairment and thus plan the necessary interventions.

Combination Formats

Combination formats often allow the convenience of a checklist together with space to document a complete narrative description of any significant or abnormal findings (see Figure 6-5). Some agencies provide cues on the form to alert personnel when further informa-

tion is needed. This format provides for some consistency in recording data while allowing flexibility for documenting specific information.

Specialty Formats

Specialty areas such as outpatient surgery, labor and delivery, and psychiatric facilities may use abbreviated formats focused directly on assessment needs for the particular service provided. In addition, specialty assessment forms may be included together with comprehensive assessment forms for clients at particular risk for various conditions (e.g., falls, impaired skin integrity).

Documentation of assessment data is essential as a means of communication among health care team members to assure accurate problem identification, determination of appropriate client outcomes, and continuity of care.

The Minimum Data Set (MDS)

The Minimum Data Set (MDS) was developed by the Health Care Financing Administration (HCFA) to promote the development of a comprehensive care plan for every resident of Medicare/Medicaid certified nursing homes. As such, the MDS is a standardized assessment instrument used in all long-term care facilities that are funded by HCFA. The MDS is a comprehensive assessment tool designed to collect data on the following resident characteristics:

- Activities of daily living (ADLs)
- Medical needs
- Mental status
- Therapy use (American Nurses Association, 2000)

NURSING CARE PLAN: ASSESSMENT

Martin Bell has been admitted to an acute-care facility after complaining of chest pain of increasing intensity over the last 3 days. Mr. Bell is 37 years old, is 68 inches tall, and weighs 235 lb. He states that he becomes short of breath with minimal activity. The nurse observes that his skin is pale and he is diaphoretic (sweating). Mr. Bell reports use of laxatives for frequent constipation and use of ibuprofen for occasional headaches or muscular aches and pains. He smokes 2 packs of cigarettes per day and reports infrequent use of alcohol. He lives with his wife and three young children and works as a truck driver, which he describes as very stressful.

- Which of the three types of assessments discussed in this chapter is most appropriate at the time of his admission?
- Distinguish between the subjective and objective data presented about Mr. Bell.
- Organize the data presented using a functional health pattern model.
- What further data should be collected at this time?

Application: Assessment in the Industrial Clinic

The following is an example of an occupational health history used in industrial settings.

I. Current Job:

A. What is your current job title? _____

B. How long have you had this job? _____

C. What are specific tasks you perform on the job? _____

D. Are you exposed to any of the following on your present job?

- | | | |
|--|--|--|
| <input type="checkbox"/> Chemicals | <input type="checkbox"/> Infectious agents | <input type="checkbox"/> Stress |
| <input type="checkbox"/> Dusts | <input type="checkbox"/> Loud noise | <input type="checkbox"/> Vapors, gases |
| <input type="checkbox"/> Extreme temperature changes | <input type="checkbox"/> Radiation | <input type="checkbox"/> Vibrations |

E. Do you think you have any work-related health problems?

If so, describe: _____

F. How would you describe your satisfaction with your job?

Very satisfied Satisfied Somewhat satisfied Dissatisfied Very Dissatisfied

G. Have there been any recent changes in your job or work hours?

H. Do you use protective equipment/clothing on your job?

If so, list items used: _____

II. Past Work Experience:

Please provide the following information, starting with your first job:

Job Title	Dates Held	Brief description of job	Exposures	Injuries/Illnesses

Figure 6-2 Application: Assessment in the Industrial Clinic

HEALTH HISTORY

Name _____ Date _____ Time _____

Demographic Data: Date of birth _____ Gender _____ Marital status _____

Reason for Seeking Health Care: _____

Perception of Health Status: _____

Previous Illness/Hospitalization/Surgeries: _____

Client/Family Medical History:

Addiction (drugs/alcohol) _____	Diabetes _____	Mental disorders _____
Arthritis _____	Heart disease _____	Sickle cell anemia _____

Patients At Risk to Develop Pressure Sores (May be completed by an LPN)

Identify any patient at risk to develop pressure sores by assessing the seven clinical condition parameters and assigning a score. Patients with intact skin, but scoring 8 or greater, should have the Nursing Diagnosis "Potential Impairment of Skin Integrity." Directions: Choose the number which best describes the patient's status. Total the seven numbers.

Clinical Condition Parameters	Score	Clinical Condition Parameters	Score	Clinical Condition Parameters	Score
General physical condition (health problem)		Mobility (extremities)		Skin/Tissue Status	
Good (minor)	0	Full active range	0	Good (well nourished/skin intact)	0
Fair (major but stable)	1	Limited movement with assistance	2	Fair (poorly nourished/skin intact)	1
Poor (chronic/serious not stable)	2	Move only with assistance	4	Poor (skin not intact)	2
		Immobile	6

Figure 6-5 Sample Assessment Form: Combination

KEY CONCEPTS

- Assessment includes collection, verification, organization, interpretation, and documentation of data.
- The nurse uses the process of assessment to establish a database about the client, to form an interpersonal relationship with the client, and to provide the client with an opportunity to discuss health care concerns.
- Assessment can be comprehensive, focused, or ongoing, depending on the health care setting and needs of the client.
- The two types of data collected during the assessment process are subjective (data from the client's point of view) and objective (observable and measurable data that are obtained through both the physical examination and laboratory and diagnostic tests).
- Although a variety of sources should be used in data collection, the client is the primary source of information.
- Assessment models such as Gordon's Functional Health Patterns, NANDA's Human Response Patterns, Orem's Theory of Self-Care Model, Roy's Adaptation Model, the body systems model, and Maslow's hierarchy of needs model ensure comprehensive data collection and organization.
- Data are collected through the interview, health history, symptom analysis, physical examination, and laboratory and diagnostic tests.
- The three stages of assessment interview are the introduction, working, and closure phases.
- A comprehensive health history is useful in determining the client's functional health patterns, responses to changes in health status, and alterations in lifestyle.
- The elements of the health history are demographic information; reason for seeking health care; perception of health status; previous illnesses, hospitalizations, and surgeries; client/family medical history; immunizations/exposure to communicable disease; allergies; current medications; developmental level; psychosocial history; sociocultural history; activities of daily living; and review of systems.
- The purposes of the physical examination are to gather baseline data, confirm data obtained in the interview and health history, and evaluate progress toward established goals. The examination includes the techniques of inspection, palpation, percussion, and auscultation.

- Accurate and complete documentation of assessment findings is essential for communication to other health care team members and may be recorded on a variety of assessment tools, such as open-ended, checklist, combination, and specialty formats.

CRITICAL THINKING ACTIVITIES

1. Write S in the blank if the data listed is subjective and O if the data is objective:

__Temperature 103.2	__Right upper quadrant pain
__Nausea	__Swelling in ankles
__Hematocrit 33%	__Itching
2. Change each of the following closed questions to open-ended questions:
 - a. Are you able to take care of yourself at home?
 - b. Is your cough productive?
 - c. Are you satisfied with your health status?
 - d. Is your chest pain sharp or dull?
3. Millie Jones is a new employee in the corporation in which you are employed as a nurse. What categories of information would you need to include for a complete health history of Ms. Jones?
4. List the four assessment techniques and give an example of how each is used in a physical examination.
5. In reviewing data collected from Mr. Robbins, a client admitted to the adult acute-care unit, you note his statement that he takes his blood pressure medication as prescribed. His blood pressure is very high (190/110). His wife does not remember the prescription being filled for over 2 months. What would you say to Mr. Robbins to clarify this incongruence?
6. Mr. Larsen, age 72, is visiting the clinic with a complaint of difficulty urinating. What type of assessment is most appropriate for this situation?

Nursing Diagnosis

The two important things I did learn were that you are as powerful and strong as you allow yourself to be, and that the most difficult part of any endeavor is taking the first step.

—Davidson (in Schaff, 1990)

COMPETENCIES

1. Describe nursing diagnosis as a nursing function.
2. Explain the purposes of nursing diagnoses.
3. List the components of a nursing diagnosis.
4. Explore characteristics of the nursing diagnosis taxonomy.
5. Describe the process of developing a nursing diagnosis.
6. Identify errors that can occur in the development of a nursing diagnosis.
7. Discuss the limitations of a nursing diagnosis.
8. Explore barriers that can affect the use of a nursing diagnosis.
9. Describe strategies to overcome the barriers to using nursing diagnosis.
10. Describe how a nursing diagnosis enables the delivery of holistic or comprehensive nursing care.
11. Explain how a nursing diagnosis enhances accountability and empowerment in the nursing profession.

diagnoses

The **nursing diagnosis** is the second step in the nursing process and is the clinical judgment about individual, family, or community (aggregate) responses to actual or risk health problems, wellness states, or syndromes. This judgment is based on a critical analysis of the assessment data. The purpose of a nursing diagnosis is to effectively communicate the health care needs of individuals and aggregates among members of the health care team and within the health care delivery system. Society tends to interpret nursing through the use of nursing language. When a nursing diagnosis is a part of the client's plan of care, the nurse is able to communicate the client's needs to other professionals involved in that care. These needs encompass physiologic, role function, self-concept, interdependence, and spiritual dimensions. In order to determine individualized therapeutic nursing interventions, the nurse must first collect and organize assessment data before developing appropriate nursing diagnoses.

This chapter describes the nature of a nursing diagnosis, its purposes, and the components of a nursing diagnostic statement. It also discusses the process involved in developing a nursing diagnosis and methods through which nurses can avoid errors in the formulation of nursing diagnoses. This chapter concludes with strategies for overcoming barriers to the use of a nursing diagnosis in the clinical setting.

WHAT IS A NURSING DIAGNOSIS?

Diagnosis is the science and art of identifying problems or conditions. Although this process has been linked primarily with physicians, it is also used by members of other professions, such as nurses, lawyers, social workers, mechanics, psychologists, and teachers. Though the term *nursing diagnosis* may convey multiple meanings, “in effect, nursing diagnosis defines nursing practice” (Sparks & Taylor, 1994, p. 32H).

There are many definitions of nursing diagnosis that have evolved over the past decades. At the ninth North American Nursing Diagnosis Association (NANDA) conference, the following definition of nursing diagnosis was approved:

A clinical judgment about individual, family or community responses to actual and potential health problems/life processes. Nursing diagnoses provide the basis for selection of nursing interventions to achieve

outcomes for which the nurse is accountable (NANDA, 1996, p. 8).

Additional definitions of nursing diagnosis abound in the nursing literature. It is clear that although all definitions are not exactly alike, there are similar attributes among them, such as a focus on client-centered problems; the promotion of nursing accountability; an awareness of the human response to health problems; the formation of clinical judgments about individuals, families, or communities; and the development of nursing interventions that a nurse is licensed to enact. Following are selected descriptions of nursing diagnoses that reflect the historical evolution of the concept:

- “A creative approach to nursing involves a nursing diagnosis and the design and means for carrying out a plan for the care of an individual person. There are five areas of patients’ needs on which the nursing diagnosis is based . . . treatment and medication, personal hygiene, environmental, guidance and teaching and human or self needs” (Fry, 1953, p. 301).
- “Use of the term diagnosis is gaining acceptance as the logical end product of nursing assessment” (Gebbie & Lavin, 1974, p. 250).
- “A nursing diagnosis is a statement that describes the human response (health state or actual/potential altered interaction pattern) of an individual or group which the nurse can legally identify and for which the nurse can order the definitive interventions to maintain the health state or to reduce, eliminate, or prevent alterations” (Carpenito, 1989, p. 5).
- “Nursing diagnosis is defined in the Roy Adaptation Model as a judgment process resulting in a statement conveying the person’s adaptation status” (Roy & Andrews, 1991, p. 37).
- “Nursing diagnosis provides the basis for selection of nursing interventions to achieve outcomes for which the nurse is accountable” (NANDA, 1996, p. 8).

Comparison of Nursing and Medical Diagnoses

It is important to have a clear understanding of the nature of a nursing diagnosis as compared to a medical diagnosis. Clarification of this point is necessary to distinguish between the nursing and medical professions and the potential legal ramifications.

Delineation of “What is the nature of nursing?” versus “What is the nature of medicine?” is critical. In order

to practice nursing, nurses need to know what it is that they do. Nursing diagnoses assist nurses in defining their scope of practice just as medical diagnoses assist physicians in defining their scope of practice. In addition, the use of diagnoses in nursing and medicine enables clarification of the legal boundaries for practice.

Medicine uses the term *medical diagnosis* and nursing uses the term *nursing diagnosis* to identify problems relating to a client's health status:

- **Medical diagnosis** is the terminology used for a clinical judgment by the physician that identifies or determines a specific disease, condition, or pathologic state.
- **Nursing diagnosis** is the terminology used for a clinical judgment by the professional nurse that identifies the client's or aggregate's actual, risk, wellness, or syndrome responses to a health state, problem, or condition.

COMPARISON OF SELECTED NURSING AND MEDICAL DIAGNOSES

Nursing	Medicine
<i>Ineffective Breathing Pattern</i>	• Chronic Obstructive Pulmonary Disease
<i>Activity Intolerance</i>	• Cerebrovascular Accident
<i>Acute Pain</i>	• Appendectomy
<i>Body Image Disturbance</i>	• Amputation
<i>Risk for Altered Body Temperature</i>	• Strep Throat

See the accompanying display for a comparison of nursing and medical diagnoses.

It is important to emphasize that the term *nursing diagnosis* has been used in three contexts: “the process of diagnosis, the product of diagnosis or individual diagnoses, and the taxonomy of diagnoses” (Wooldridge, Brown, & Herman, 1993, p. 51). The *process* of diagnosis is identified as the second step of the nursing process. In this step, the nurse collects data, validates and critically analyzes the data, clusters the data into groups, and identifies the client, family, or community health problems or conditions. The *product* of diagnosis is the diagnostic label that is assigned to the identified problem. The *taxonomy* of diagnosis is a classification system in which nursing diagnoses are organized according to client responses to specific conditions.

There are both similarities and differences between medical and nursing diagnoses. The similarities include (1) using the diagnostic process, with “process” imply-

ing purpose, organization, and creativity (Bevis, 1978); (2) using cognitive, interpersonal, and psychomotor skills; (3) collecting and critically analyzing assessment data; (4) evaluating outcomes to ascertain continuation, resolution, or change of identified diagnosis; and (5) performing within legal dimensions and standards of the respective profession. An example of these similarities can be illustrated by considering Alan Brown, a client who has a medical diagnosis of asthma. The physician and nurse would both collect assessment data on respiratory status. The physician would use this information to treat the disease of asthma and the nurse would use this information to focus on Mr. Brown's response to the disease, which would result in a nursing diagnosis of *Ineffective Breathing Pattern*.

Nursing diagnoses are different from medical diagnoses in (1) purpose, (2) goals, and (3) therapeutic interventions. The *purpose* of a nursing diagnosis is to focus on the human response or responses of the individual family or community to identified problems or conditions. Medical diagnoses center on the disease state or pathological condition. For example, if the medical diagnosis for Sheila Barrington is breast cancer, appropriate nursing diagnoses may include *Fear*, *Deficient Knowledge* related to treatment measures, *Anticipatory Grieving*, *Body Image Disturbance*, *Powerlessness*, and *Ineffective Coping*. In addition, the *goals* (aims, intent, or ends) that accompany these nursing diagnoses differ, as do the specific, individualized therapeutic nursing *interventions* (nursing actions to promote or restore health and enhance general well-being).

HISTORICAL PERSPECTIVE

The term *nursing diagnosis* has been in the literature since the early 1950s. Fry (1953) identified that nursing diagnosis is integral to the plan of nursing care and is an important tool for individualizing client care. However, these ideas were slow to gain momentum despite the interests of several nurse theorists and the focus on client-centered problems in the 1960s and the 1970s. In 1973, the First National Conference for the Classification of Nursing Diagnoses convened in St. Louis, Missouri. Nurses met at that time and “began the formal effort to identify, develop, and classify nursing diagnoses” (NANDA, 1996, p. 107). In 1982, at the fifth national conference, the organization was renamed the North American Nursing Diagnosis Association (NANDA) (Kim, McFarland, & McLane, 1984). Since its inception, NANDA continues to hold conference meetings every 2 years.

Additional endorsement for nursing diagnosis came from the American Nurses Association (ANA) in 1973 in the publication entitled *Standards of Nursing Practice* (ANA, 1973). Ongoing discussions occurred in the nursing literature, with increasing support evident by the 1980s for nursing diagnosis and the diagnostic process. The ANA

continued to support nursing diagnosis as the second step of the nursing process through publication of *Nursing: A Social Policy Statement* (ANA, 1995) and *Standards of Clinical Nursing Practice* (ANA, 1998). See the accompanying display for the standard of care related to nursing diagnosis. At the 13th conference in 1998, NANDA developed 21 new nursing diagnoses and revised 37 nursing diagnoses by clarifying existing diagnoses and their definitions, defining their characteristics, and related factors. Following the biennial conference in April 1994, the Taxonomy Committee identified the need to revise the structure of Taxonomy I. During the 14th biennial conference in April 2000, NANDA adopted the taxonomy, Taxonomy II. “Taxonomy II was designed to be multiaxial in its form, thereby substantially improving the flexibility of the nomenclature and allowing for easy additions and modifications” (NANDA, 2001, p. 212). With the publication of these standards, the nurse has both a professional and legal obligation to practice as defined by the professional organization for nurses.

DIAGNOSIS AS A STANDARD COMPONENT OF CARE: ANA STANDARDS

Standard II. Diagnosis

The nurse analyzes the assessment in determining diagnoses. Guidelines: Diagnoses must be:

- Based on data collected during assessment of client
- Validated with client, significant others, and health care providers
- Documented so that they can be used in further development of expected outcomes and plan of care

(Data from American Nurses Association. [1998]. *Standards of clinical nursing practice*. [2nd ed.]. Washington, DC: Author.)

Research

With the inception of the first conference on nursing diagnoses, NANDA supported research endeavors on the development of a nursing diagnosis classification system. The first type of research conducted was identification studies, where the clinician repeatedly observed a condition in order to label a nursing diagnosis. At the sixth conference in 1986, Fehring identified the need for two standardized research methodologies for data collection: (1) diagnostic content validity (DCV), retrospective evidence from experts on the characteristics of a given label; and (2) clinical diagnostic validity (CDV), prospective evidence on the characteristics from a clinical perspective (Whitley, 1999). In 1989, NANDA sponsored an invitational conference on research methodologies for generating and validating existing diagnoses and to develop new methodologies to direct future studies. Although there is an abundance of DCV studies, only a few clinical studies have been conducted because

the CDV model is more complicated to execute. *Nursing Diagnosis: The Journal of Nursing Language & Classification* is the official publication of NANDA. The journal was first published in 1989 to promote the development,

Title of Study

“The Congruence of Nursing Diagnoses and Supporting Clinical Evidence”

Authors

Roberts, B. L., Madigan, E. A., Anthony, M. K., & Pabst, S. L.

Purpose

The purpose of this study was to measure the congruence of nursing diagnoses and the supporting clinical evidence of clients transferred from intensive care to medical-surgical units.

Methods

A secondary analysis of 890 clients 40 years of age and older were assessed within 24 hours of transfer from intensive care to medical-surgical units. The nursing diagnoses documented in the client’s chart were compared to supporting clinical evidence from subjects, the client’s record, and interviews with subjects and care givers. Using the kappa statistic, the congruence between nursing diagnoses and clinical evidence ranged from 0.1% for altered thought processes to 10% for impaired physical mobility and potential for injury. It was noted that there were diagnoses made for self-care deficits or sensory alterations—when clinical evidence for these visual diagnoses was available. The findings highlight that it is not clear whether nurses in this study failed to recognize the clinical evidence to make a nursing diagnosis or whether they made a diagnosis but failed to record it in the client’s record. Other variables to consider in this study are the client’s acuity level, the complexity of clinical information, and the nurse’s overload of critical clinical data.

Implications

This study supports the fact that more research needs to be done to examine how NANDA-approved diagnoses are used in clinical practice to identify client’s health problems, select interventions, and evaluate outcomes of care.

Roberts, B. L., Madigan, E. A., Anthony, M. K., & Pabst, S. L. (1996). The congruence of nursing diagnoses and supporting clinical evidence. *Nursing Diagnosis*, 7(3), 108–115.

refinement, and utilization of nursing language and classification.

Roberts, Madigan, Anthony, and Pabst (1996) conducted a secondary analysis study to examine the congruence between nursing diagnoses and clinically relevant data of clients being transferred from intensive care to medical-surgical units. The results of this study showed that diagnoses were not made or were made less frequently than indicated by the supporting clinical evidence (see the Research Focus). One of the findings indicated that a system still needs to be developed for determining that clients being observed have the diagnosis being studied and that nurses accurately identify all relevant diagnoses in the clinical setting.

Whitley (1999) suggests the development of a “research agenda” to promote research in a coordinated fashion since interest about nursing diagnoses has spread in the international community, at a time when a common nursing language is needed to strengthen nursing’s bases for practice. In 1998, the NANDA Board instituted an ad hoc research committee to coordinate nursing diagnosis research and funding and to develop a “research agenda.”

PURPOSES OF NURSING DIAGNOSIS

Nursing diagnosis is unique in that it focuses on a client’s *response* to a health problem, rather than on the problem itself, and it provides the structure through which nursing care can be delivered. Although these characteristics have always been in existence within nursing, they were unidentified prior to the mid-20th century. One of the requisites of a profession is a unique body of knowledge or frame of reference (Adams, 1983). Wooldridge, Brown, and Herman (1993) “propose that nursing diagnoses collectively, as contained within a taxonomy, provide a central focus for conceptualization of the domain of nursing” (p. 51). Clearer conceptualization of knowledge unique to nursing increases both professional accountability and autonomy (Carpenito, 1995). Therefore, nursing diagnosis contributes to the professional status of the discipline.

Nursing diagnosis also provides a means for effective communication. It is generally agreed among nurses, health care practitioners, and other health care professionals that there is a need for a common language within the health care sector. A mutual vocabulary that can be used for describing practice, research, and education benefits both the profession and the consumer. With this language, collaboration and international exchanges regarding nursing and health care are possible and benefit from “common definitions of the phenomena of concern within the discipline” (Fitzpatrick & Zanotti, 1995, p. 42). In addition, communication about nursing diagnoses is possible through computer search. The *Cumulative Index to Nursing and Allied Health*

Literature (CINAHL) has listed the term *nursing diagnosis* since 1983 (Dougherty, Jankin, Lunney, & Whitley, 1993).

Holistic client, family, and community-focused care are facilitated with the use of nursing diagnosis. The list of NANDA-approved nursing diagnoses (NANDA, 2001) for clinical use provides assistance for the nurse in individualizing care and developing comprehensive therapeutic nursing interventions. Quality care and continuity of care are enhanced with identified nursing diagnoses as part of the client’s plan of nursing care. The accompanying display illustrates the value of applying nursing diagnosis to a home health care situation.

Nursing diagnoses also have the potential of providing an avenue for theory development and nursing research. Dougherty, Jankin, Lunney, and Whitley (1993) published a listing of theory and research-based articles on accepted nursing diagnoses from 1950 to 1993.

Nursing diagnosis has an important impact on the health care delivery system: “Nursing diagnoses provide a method for synthesizing and communicating nurses’ observations and judgements” and “the ability to communicate the health needs of clients can influence funding of preventive and comprehensive health care services” (Gordon, 1994, p. 12).

APPLICATION: HOME HEALTH CARE SETTING

Individualizing care of the home health client is an important function of nursing diagnosis. For example, the following questions can be used as a guide in developing nursing interventions as a response to the nursing diagnosis of *Compromised Family Coping*; related to a caregiver appearing to be unable to assist a client with management of a health problem:

- Is the client experiencing difficulty with the response being received from the caregiver about the type and level of care needed?
- Has the caregiver expressed concern or anxiety about performing certain functions for the client?
- Does the care performed by the caregiver for the client yield satisfactory results in terms of alleviation of symptoms?
- What changes have occurred within the family situation that have altered the dynamics between the client and caregiver?

In summary, nursing diagnosis allows for empowerment of the profession of nursing, facilitates effective communication, and provides a means to individualize nursing care. Nursing diagnosis is essential to clinical practice and education and pivotal for theory development and research.

Nursing Diagnoses and Diagnostic-Related Groups

Diagnostic-related groups (DRGs) were developed and implemented in the health care industry in 1983 as a response to escalating health care costs in America. Diagnostic-related groups were developed on the basis of the medical model of identifying signs and symptoms that then result in the formulation of medical diagnoses. Therefore, this reimbursement system is centered on medical diagnoses, not nursing diagnoses. As a result, this federally regulated system lacks a mechanism for direct financial reimbursement based on nursing diagnoses.

Over the years, in light of the fact that the nursing process is more than just a response to medical diagnosis (Caterinicchio, 1984), there have been attempts to identify nursing's contribution to the over 400 different DRGs. In these studies, efforts have mostly been directed at attempting to isolate nursing care delivered to the client (McKibbin, Brimmer, Clinton, & Galliher, 1985; Wolf, Lesic, & Leak, 1986). Through the use of elaborate formulas, nursing care costs have been derived for many of the DRGs. However, few studies have evaluated the relationship between nursing diagnoses and DRGs.

One of the best attempts to identify nursing costs has been described by Adams (1983). At one hospital, a computerized client classification system that integrates client acuity with client care plans and nursing diagnoses has been developed (Adams, 1983). Through the use of this system, direct cost accounting of nursing care is possible, nurses must explore every avenue to be appropriately compensated for their share of the health care dollar.

According to Fitzpatrick (1995), if the nursing profession does not have and use a common language, nurses will be unable to assign a monetary status to their

services for reimbursement. At present, consensus still needs to be established by the profession for use of nursing diagnosis language. With agreement on what nurses define as client problems or conditions, the profession will be able to establish a system that reimburses nurses for what they contribute to the health care industry.

COMPONENTS OF A NURSING DIAGNOSIS

There are several formats that have been used to structure nursing diagnosis statements. Two formats that are frequently seen in the nursing literature are the two- and three-part statements. The two-part statement is NANDA approved and is used by most nurses, in large part because of its brief and precise format. The three-part statement is preferred by those nurses desiring to strengthen the diagnostic statement by including specific manifestations, an attribute that is not possible through the use of the two-part format.

The Two-Part Statement

The components of a nursing diagnosis typically consist of two parts. Hence, the nursing diagnosis is often described as a "two-part statement." The first component is a problem statement or diagnostic label that describes the client's response to an actual, possible, and risk health problem or a wellness condition. Table 7-1 presents the list of NANDA-approved nursing diagnoses.

The second component of a two-part nursing diagnosis is the etiology. The **etiology** is the related cause or contributor to the problem. The diagnostic label and etiology are linked by the term *related to* (RT). Examples of nursing

(Used with permission from North American Diagnosis Association. [2001]. *Nursing diagnoses: Definitions and classification 2001–2002*. Philadelphia: Author.)

diagnoses are *Disturbed Body Image* RT loss of left lower extremity and *Activity Intolerance* RT decreased oxygen-carrying capacity of cells. Descriptive words or terms may be added to clarify specific nursing diagnoses. These descriptive words are called qualifiers and include Acute, Chronic, Decreased, Deficient, Depleted, Disturbed, Dysfunctional, Enhanced, Excessive, Impaired, Increased, Ineffective, Intermittent, Potential for, and Risk. These terms specify a degree of qualification for the identified nursing diagnosis and are placed (used) before the problem statement.

The Three-Part Statement

The nursing diagnosis can also be expressed as a three-part statement. As in the two-part statement, the first two components are the diagnostic label and the etiology. The third component consists of **defining characteristics** (collected data that are also known as signs and symptoms, subjective and objective data, or clinical manifestations). In the three-part nursing diagnosis format, the third part is joined to the first two components with the connecting phrase “as evidenced by” (AEB). Defining characteristics list the relevant clinical manifestations, such as signs or symptoms for the identified client problem and the related etiology. Defining characteristics are

identified for each NANDA-approved diagnosis. These characteristics continue to evolve as they are reviewed and updated at the biennial conference. It is important to emphasize that defining characteristics may assist the nurse in identifying client goals, measurable client outcome criteria, and relevant nursing interventions.

Some nurses believe that the three-part statement strengthens the diagnostic process. However, other nurses prefer the two-part statement and refer to the defining characteristics as part of the original database. Table 7-2 depicts the components and relationship of the one-, two-, and three-part statements. Although the most commonly used format is the two-part statement, it is beneficial for the nurse to be knowledgeable about the use of the three-part statement for development of a nursing diagnosis. See Table 7-3 for a comparison of selected approved NANDA diagnoses in the two- and three-part statements.

CATEGORIES OF NURSING DIAGNOSES

Nursing diagnoses may be classified into three categories: actual, risk, and wellness. The most common nursing diagnoses used are actual and risk diagnoses.

TABLE 7-2
Comparison of One-, Two-, and Three-Part Nursing Diagnosis Statements

One-Part Statement	Two-Part Statement	Three-Part Statement
Part 1: Wellness condition/state to be enhanced (no Related to, no etiology, and no defining characteristics)	Part 1: Problem Related to Part 2: Etiology (no defining characteristics)	Part 1: Problem Related to Part 2: Etiology Part 3: Defining characteristics

<i>Deficient Knowledge</i>	<i>Deficient Knowledge</i> RT misinterpretation of information	<i>Deficient Knowledge</i> RT misinterpretation of information AEB inaccurate return demonstration of self-injection
<i>Spiritual Distress</i>	<i>Spiritual Distress</i> RT separation from religious ties	<i>Spiritual Distress</i> RT separation from religious ties AEB crying and withdrawal

(Data from American Nurses Association. [1997]. *Standards of clinical nursing practice* [pp. 7–9]. Washington, DC: Author.)

Wellness diagnoses were adopted by NANDA 1996, and Carpenito (1995) described possible nursing diagnoses.

- *Actual diagnoses* are those problems identified by the nurse that are already in existence. Actual diagnoses may include *Excess Fluid Volume* related to (RT) intravenous infusion therapy overload and *Anxiety* RT unknown results of breast biopsy.
- *Risk diagnoses* are identified by the nurse in situations in which problems might occur but are not currently in existence. Examples of risk diagnoses may include *Risk for Poisoning* RT increased mobility of infant and failure to have house childproofed and *Risk for Deficient Fluid Volume* RT excessive number of stools.
- *Wellness diagnoses* identify the individual or aggregate condition or state that may be enhanced by health-promoting activities. These consist of a one-part statement (no “related to” phrase) that uses the label “Potential for Enhanced” followed by the state the nurse desires to enhance. Examples of wellness diagnoses may include *Readiness for Enhanced Community Coping* and *Readiness for Enhanced Spiritual Well-Being*.

TAXONOMY OF NURSING DIAGNOSIS

The **taxonomy of nursing diagnoses** is the type of classification under which the diagnostic label is grouped based on which human response the client is demonstrating to the actual or perceived stressor. Rather than consult the alphabetical listing of NANDA diagnoses, some nurses might find it more helpful to review the NANDA listing by pattern of human response. This listing is called the NANDA Taxonomy II and organizes the NANDA-approved nursing diagnoses under the corresponding human response category. The NANDA nursing diagnosis taxonomy is composed of nine patterns of human response:

- Exchanging
- Communicating
- Relating
- Valuing
- Choosing
- Moving
- Perceiving
- Knowing
- Feeling

Although the word *taxonomy* may be somewhat overwhelming for the beginning practitioner, remember it is

only an organizational framework and one should not be intimidated by it. Rather, view this approach as another way to find appropriate nursing diagnoses for clients on the basis of the classification of human response.

STEPS IN DEVELOPING A NURSING DIAGNOSIS

1. Data cues are collected from the assessment phase.
2. Data cues are validated and examined.
3. Data cues are interpreted and assigned a meaning through the use of critical thinking.
4. Data are grouped into clusters.
5. The NANDA list is consulted.
6. The first part of the nursing diagnosis statement is written.
7. Related to (RT) factors are identified.
8. Phrases from steps 6 and 7 are combined to form a two-part nursing diagnosis.

(Data from American Nurses Association. [1998]. *Standards of clinical nursing practice* [2nd ed.] [p. 9]. Washington, DC: Author.)

DEVELOPING A NURSING DIAGNOSIS

The development of a nursing diagnosis is a systematic process in which certain activities need to be executed. The accompanying display illustrates the steps in the development of nursing diagnoses.

Assessing Database

In the assessment phase, the nurse collects data cues from the client. **Cues** are small amounts of data that are applied to the decision-making process. Nurses should be attentive to the cues gathered from the interview, health history, symptom analysis, physical examination, and laboratory and diagnostic data since they increase the index of suspicion and stimulate further observation of additional sets of cues. Examples of cues might be poor skin turgor, parched lips, dry skin, decreased urine output, and complaint of thirst. The expert nurse immediately processes these cues and determines a nursing diagnosis, plans client outcomes, and implements therapeutic nursing interventions. The novice nurse must proceed more cautiously and use additional time to process these data cues.

Validating Cues

After reviewing the data cues, the nurse validates that information and examines it carefully (see Figure 7-1). In the example of Mr. Zachary, the nurse determines if the information is accurate and complete. This process

Figure 7-1 This nurse is validating the cues collected from this client during the assessment phase.

involves verifying subjective and objective data. Verification can be done by interviewing Mr. Zachary again and reassessing data cues, for example, weighing him and measuring abdominal girth.

Interpreting Cues

Through interpretation of data cues and use of critical-thinking strategies, the nurse assigns a meaning to the data cues. In order to interpret Mr. Zachary's subjective and objective data cues, the nurse should ask the following questions:

THINK ABOUT IT

Identifying Data Cues

What are the relevant data cues that can be gathered from the following assessment data for Peter Zachary, age 44?

Subjective Data

- "I am the father of two boys."
- "I paint houses for a living."
- "I go to church every Sunday."
- "I always seem to be hungry, and I eat five or six times a day."
- "I've gained 12 pounds this year."

Objective Data

- Client is 5 feet 10 inches and weighs 204 pounds.
- Protruding abdomen over belt and waist of pants.
- Double chin.
- Fleshy loose upper arms.
- Dimpling of buttocks.
- One bowel movement every other day.
- Vital signs: HR 92; BP 130/80; R 17; T 98.9°F.
- Red scaly patches on skin.
- Nonproductive cough.
- Birthmark right upper hip.

- What is this information telling me?
- Is there a pattern?
- Can this information be put together?
- Is the information falling into a logical arrangement?
- Is the information forming natural groupings?

Critical Thinking in Nursing Diagnosis

Contemporary nursing practice, with its focus on nursing diagnoses, interventions, and outcomes, requires critical thinking (Pesut & Herman, 1999). Interpreting data cues is one example of critical thinking that the nurse must do on a daily basis when working with clients. Specifically, the synthesis of information that takes place when interpreting data cues demonstrates how essential it is for the nurse to think critically. Interpreting Mr. Zachary's cues is pivotal for correctly diagnosing his actual, or at-risk problem, or wellness state. The accompanying display provides questions that are helpful in developing appropriate diagnoses.

Clustering Cues

Once the cues have been collected, validated, and interpreted, the data are then grouped into clusters. A **cluster** is a set of data cues in which relationships between and among cues are established to identify a specific health state or condition. Related pieces of information about the client are grouped together. Conclusions are drawn from the data cues. One piece of information by itself can be misleading. This idea is analogous to the assembly of a jigsaw puzzle. One puzzle piece by itself does not give an accurate idea of the picture. In the same way, one data cue (or piece of assessment data) does not have much relevance by itself. When more pieces of the puzzle are put together or when more data assessment cues are put together, the nurse may

have a beginning idea of what the puzzle picture or the client's health looks like.

In Mr. Zachary's situation, data cues that can be clustered together include: Subjective: "I always seem to be hungry and I eat five or six times a day" and "I've gained 12 pounds in the past year." Objective: weight 204 pounds, protruding abdomen, double chin, fleshy loose upper arms, and dimpling of buttocks.

Consulting NANDA List of Nursing Diagnoses

After the data have been organized into clusters, the nurse needs to consult the NANDA list to ascertain similarities and differences between the clusters and NANDA diagnoses. The clustered data are then matched with a particular NANDA diagnosis. In Mr. Zachary's case, the NANDA-approved diagnosis is *Imbalanced Nutrition: More Than Body Requirements*.

Writing the Nursing Diagnosis Statement

The nursing diagnosis selected from the NANDA list becomes the diagnostic label, the first part of the diagnosis statement. Etiologies are also identified from the NANDA list. The appropriate etiology is selected and joined to the first part of the statement with the "related to" phrase. Because the NANDA list of nursing diagnoses is constantly evolving, there may be times when no etiology is provided. In such cases, the nurse should attempt to describe likely contributing factors to the client's condition. In a two-part statement, the nursing diagnosis for Mr. Zachary would be *Imbalanced Nutrition: More Than Body Requirements* RT excessive food intake. The three-part statement would be *Imbalanced Nutrition: More Than Body Requirements* AEB weight gain, increased appetite, excess adipose tissue, and increased abdominal girth.

CRITICAL THINKING EXERCISE

The following questions should be considered by the nurse in the development of a nursing diagnosis:

- Do I have enough data to formulate a nursing diagnosis?
- Are any data missing?
- Is there any information on my database that seems incomplete or uncertain?
- Should I talk to the client and family again?
- What data fit together or have something in common?
- What specific cues from the client made me form this conclusion?
- What elements of this situation/condition/problem are able to be enhanced or resolved by therapeutic nursing interventions?
- What elements need to be referred to another discipline (e.g., medicine, social services, dietary)?

NURSING TIP

Nursing Diagnosis Process

The nursing diagnosis must be developed from the data, never the other way around. You should not try to fit a client to a nursing diagnosis but rather select the appropriate diagnosis from the data cues presented by the assessment of the client. Failure to do this may result in errors in developing a nursing diagnosis.

AVOIDING ERRORS IN DEVELOPING A NURSING DIAGNOSIS

Following is a discussion of common errors that may occur in the process of developing nursing diagnoses.

Problem with Assessment Data

There is an underlying assumption that nurses have adequate assessment skills and are knowledgeable about what data need to be collected. However, this is not always the case. The novice nurse may have only rudimentary assessment skills and limited clinical experience. Experienced nurses are challenged to keep current and sometimes are ill-equipped to collect appropriate assessment data. Because of the potential for these deficits, there may be errors made when writing a nursing diagnosis related to an incomplete database or inappropriately collected assessment data. When assessment data are missing, regardless of the cause, the end result is either an omission of nursing diagnoses, inaccurate diagnoses, or incorrect qualifying statements about the diagnoses.

Incomplete Collection of Assessment Data

Incomplete collection can occur when the nurse has neither had nor taken the time to appropriately address all subjective and objective data. For example, during admission of a new client to a health care facility, a nurse is interrupted during the data collection and fails to return to finish the admission process at the end of the shift.

Restricted Data Collection

Restricted data collection occurs when a client is unable or unwilling to provide the necessary data. An example would be a newly admitted client with a cerebrovascular accident who has impaired speech and can only provide limited assessment data.

Failure to Validate Data

Failure to validate occurs when the nurse does not confirm previously collected data. An example would be failure by the nurse to recheck an admission blood pressure that was elevated. A follow-up blood pressure may have revealed a transient elevation due to the stress of the admission process.

Misinterpretation of Data

Misinterpretation can occur when the meaning attached to the data is incorrect. An example would be a client who comes to the ambulatory care clinic and

THINK ABOUT IT

Errors in Data Interpretation

Your client, a 35-year-old married man with two children, has been discharged home following an appendectomy. During your first two visits to assess the healing of the incision, you notice that the client seems reluctant to leave his bed and expresses minimal interest in topics other than the television programs he has been watching. When you inquire about his attempt to participate in leisure activities with his wife and children, he shrugs his shoulders and appears bored with the discussion. On the basis of this assessment, you formulate a nursing diagnosis of *Deficient Diversional Activity* RT client's lack of engagement in recreational activities. If you were to determine on your third visit that the client has refrained from these kinds of activities because of his fear of reopening the incision, how would you reconcile the discrepancy between the assessment data gathered and the nursing diagnosis that was developed? Do you think that your values relating to this client's conduct may have played a role in the misinterpretation of the data and the resulting nursing diagnosis?

presents with several signs and symptoms, including a reported 4-pound weight gain that month. Further investigation indicates this finding is not related to increased adipose tissue but, rather, is associated with fluid retention that accompanies an edematous state.

Inappropriate Data Clustering Associated with Lack of Clinical Knowledge

Inappropriate data clustering may occur when the nurse lacks sufficient theoretical and clinical expertise and knowledge to appropriately cluster data cues. An example would be the client who visits an industrial clinic with complaints of flulike symptoms, stomach cramps, and vomiting. The nurse attributes the vomiting to the influenza, but further analysis indicates that, in addition to this condition, this client is actually manifesting symptoms of a toxic reaction to prescribed drug therapy that is causing the vomiting.

Incorrect Writing of the Nursing Diagnosis Statement

Incorrect writing of the statement can occur when the nurse does not follow the guidelines for formulating a two- or three-part statement. An example would be in the two-part statement *Imbalanced Nutrition: Less Than Body Requirements* RT renal disease. Renal disease is a medical diagnosis, and, according to the guidelines, the etiology

must be a human response that the nurse is licensed and competent to treat. This diagnosis would be better stated as *Imbalanced Nutrition: Less Than Body Requirements* RT inadequate intake of an appropriate renal diet.

In conclusion, when the nurse makes premature conclusions without allowing sufficient time for analysis and interpretation of data, the subsequent care plan may be inappropriate for the client (Dobrzyń, 1995). The Nursing Checklist provides selected questions that nurses can ask themselves in order to avoid making mistakes when developing nursing diagnoses.

NURSING CHECKLIST

Avoiding Common Diagnostic Errors

When nurses are in the process of developing nursing diagnoses, the following questions should be considered:

- Am I saying the same thing twice?
- Am I using the medical diagnosis in my nursing diagnosis?
- Am I implying negligence or blaming anyone in my diagnosis?
- Have I stated the diagnosis with a client response or a client need?
- Am I making any value judgments about the client?

Values play an important role in interpretation of data, clustering of data, and ultimately the development of the diagnosis. Nurses must be cognizant of personal biases, being careful not to impose their value systems on clients. Personal prejudices should be avoided in the diagnostic statement.

Nurses must also remember to focus on the client when developing a nursing diagnosis. The problem statement is client centered, not nurse centered. Kim (1985) stated that the diagnosis plays a pivotal role in the nursing process by directing nursing actions and providing the focus for evaluating outcomes.

LIMITATIONS OF NURSING DIAGNOSIS

There are a number of limitations and professional concerns associated with nursing diagnosis. The primary concern is directed toward the lack of consensus among nurses regarding the NANDA-approved nursing diagnosis list. Criticisms about the list include disagreement over specific labels in the classification system and the perception that the list is confining, incomplete, medically oriented, and confusing. Many nurses are not familiar with the NANDA list and do not know how to

use it or feel “it doesn’t have the diagnosis” they need. It should be noted that this list is not meant to be inclusive. Development and refinement of diagnoses continue to be a focus of NANDA conferences. In addition, nurses may disagree with or refuse to use diagnoses such as noncompliance or knowledge deficit (Carpenito, 1995). In this instance, the nurse then has the choice and the right to not use these specific diagnoses.

Novice nurses need to know nursing diagnosis and nursing process in order to understand how the discipline of nursing intersects with the other health care providers. NANDA (1999) recognizes that health care is moving into an interdisciplinary, client-focused care environment that requires standardization of languages across disciplines. Many acute care facilities use an interdisciplinary care plan such as care maps and/or critical pathways to monitor client outcomes. All health care providers use the same care plan to document the client’s response to specific interventions. Common “client problems” listed on a critical pathway are written as nursing diagnoses such as **risk for infection** or **risk for injury**.

There are also legal considerations concerning the use of nursing diagnoses. Nurses are accountable for their actions and must document their interventions. If a nursing diagnosis is inappropriate or a nursing diagnosis list is incomplete and, as a result, the interventions are inappropriate or lacking, the nurse is liable for these errors in clinical judgment. These errors can be avoided by collecting comprehensive assessment data and by critically analyzing these data.

OVERCOMING BARRIERS TO NURSING DIAGNOSIS

According to Iyer, Taptich, and Bernocchi-Losey (1994), objections to using nursing diagnoses include: (1) nurses are more overworked than ever and have less time to spend with clients; (2) care is still organized around the medical diagnosis and nurses are involved in the completion of tasks based on this focus; (3) nurses are afraid they may be ridiculed for using nursing diagnoses; and (4) the nursing diagnosis list does not always fit the client situation. Carlson-Catalano (1993) asserted that health care agency administrators and health care practitioners dominate nursing’s focus and activities. This domination may contribute to the devaluation of the nursing diagnosis language and promote the use of the medical diagnosis.

NANDA’s language is still relatively new (approximately 25 years) compared to modern medical language that has existed for several hundred years. Some nurses would rather wait until the NANDA listing is complete before they use it. However, it is unrealistic to think that a system such as NANDA should not be used until it is completed. The ever-changing health care scene dictates that nurses participate in evolving methods to communicate within the health care industry.

Another barrier to the use of nursing diagnoses is the numerous approaches for application that are found in the nursing literature. Due to these various methods, it may be difficult for nurses to choose “one” method that they feel comfortable with. Nurses may also be unable and unwilling to use nursing diagnoses because of incomplete knowledge about the process and disagreements about wording. As a result, they elect not to participate at all.

After identifying the existence of barriers to the use of nursing diagnoses, it is possible to design strategies to overcome them. According to Carlson-Catalano (1993), the only way society will understand professional nursing is through the language used by nurses. Nursing diagnoses serve as a language that can be shared among the entire community of nurses (Carlson-Catalano, 1993). Familiarity with this language empowers the nurse to communicate more effectively with other nurses and health care team members. Effective communication, in turn, improves the accuracy in nursing diagnoses. Ultimately, the quality of care should improve and the costs associated with that care should decrease. Due to the fact that many acute-care facilities are asking nurses to do more with fewer resources, nurses are challenged to learn more efficient ways of performing their duties. Nurses’ time is spent more efficiently if less time is spent deciphering meanings of words.

Health care agency administrators and medical staffs need to be more supportive of the use of nursing diagnoses in their respective settings. In a survey by Thomas and Newsome (1992), findings suggested that institutional support makes a difference in the nurses’ use of nursing diagnoses. As the nursing profession becomes more confident in the use of the language, nurses will speak more sincerely and enthusiastically about nursing diagnoses. Increased professional confidence will then empower nurses to become more supportive of each other and less subject to ridicule.

THINK ABOUT IT

Nursing Diagnosis: A Standard Language

- How do you think nursing diagnoses assist nurses with communication among themselves?
- How do nursing diagnoses influence communication among nurses and other health care professionals?

When a nurse encounters client situations that do not readily fit the nursing diagnosis language, every attempt should be made to describe the phenomena. The nurse may be on the threshold of documenting the need for a new, as-yet-undiscovered nursing diagnosis.

As nurses collaborate on the refinement of nursing diagnoses, it may be possible to agree on certain aspects of the language. The achievement of this goal will end the use of multiple approaches and will make choices

NURSING CHECKLIST

Strategies for Optimizing the Use of Nursing Diagnosis

Nurses should implement the following strategies when working with nursing diagnoses:

- Agree on a common language.
- Acknowledge and embrace the fluid nature of the language of nursing diagnosis.
- Discuss the purpose and value of nursing diagnosis with administrators and medical staff.
- Support colleagues when they use nursing diagnosis language.
- Adopt a positive attitude toward the principles and taxonomy of nursing diagnosis.
- Be willing to add to the existing body of knowledge by describing unusual nursing phenomena.
- Participate in conferences, workshops, and other educational activities that advance and promote nursing diagnosis.
- Continue communicating with other nurses about nursing diagnosis

APPLICATION: WRITING NURSING DIAGNOSIS

Mr. Lowder is a 62-year-old male who was admitted last night through the emergency room because of difficulty breathing. He was also experiencing some difficulty voiding. His lower extremities are very swollen. History reveals he smokes one pack of cigarettes a day and has done this for the past 45 years. His vital signs are P 112; R 30; BP 172/96; T 101.1°F. He has an eighth-grade education, attends church every week, is estranged from his daughter, and says, “I hate hospitals because my mother died in one.”

1. From the data cues in this case study, group data into clusters.
2. Look at the NANDA list of diagnoses and see which diagnoses “fit” best with your data clusters.
3. Write the first part of the NANDA diagnosis for each cluster.
4. Attempt to identify etiological (related to) factors for the list you started in step 3.
5. Write two-part nursing diagnosis statements by combining steps 3 and 4.
6. Identify whether the nursing diagnoses on your list are actual, possible, risk, or wellness-oriented nursing diagnosis statements.
7. Prioritize the nursing diagnoses.

less complicated. Enhanced communication among nurses in everyday settings and among professionals who convene nationally and internationally to exchange ideas about nursing diagnoses is essential.

Most nursing educational programs now offer standardized content related to nursing diagnoses. In addition, experienced nurses need opportunities to review principles of nursing diagnoses, especially since so many are working in settings that tend to favor medical diagnoses and focus on achievement of tasks by the nurse (Brackstone, 1993). See the Nursing Checklist for a list of strategies that are helpful in overcoming barriers to the use of nursing diagnoses.

KEY CONCEPTS

- Nursing diagnosis is the second step in the nursing process and is the clinical judgment about individual, family, or community (aggregates) responses to actual or risk problems, wellness states, or syndromes.
- Through the efforts of NANDA and ANA, the identification and validation of nursing diagnosis as the second step of the nursing process has been substantiated and forms the basis for professional accountability.
- Nursing diagnosis contributes to a clearer conceptualization of knowledge unique to nursing, improved communication among nurses and other health care professionals, promotion of individualized client care, and support for theory development and nursing research.
- Nursing diagnoses can be written as either two-part statements (diagnostic label and etiology) or three-part statements (diagnostic label, etiology, and defining characteristics).
- The NANDA nursing diagnosis taxonomy is composed of nine human response patterns: exchanging, communicating, relating, valuing, choosing, moving, perceiving, knowing, and feeling.
- The process of developing a nursing diagnosis includes analysis of assessment cues, validation of cues, interpretation of cues, clustering of data, consulting NANDA's list of approved nursing diagnoses, and writing the nursing diagnosis statement.
- When the nurse is knowledgeable about the components of the nursing diagnosis process and is equipped to develop the diagnostic statement, the nurse is able to make appropriate decisions regarding therapeutic nursing interventions.
- To avoid committing errors in the nursing diagnostic process, nurses should ensure that the data collection is complete, that the interpretation of the data is accurate and based upon the nursing and not the medical diagnosis, and that the client's response to a health problem is amenable to therapeutic nursing interventions.
- The barriers that have been identified as preventing the use of nursing diagnosis in a more universal manner are the constraints on the time nurses can devote to client care; the continuing organization of health care according to medical diagnosis; the misunderstanding and ridicule that nurses can encounter when using nursing diagnoses; the nonapplicability of the list of nursing diagnoses to every client situation; the constantly evolving refinement of the nursing diagnosis language; and the availability of numerous approaches for formulation and application of nursing diagnoses.
- Although barriers to the use of nursing diagnosis may be present, they may be overcome by employing specific strategies such as agreeing on a common language; supporting colleagues' attempts to use nursing diagnoses; adopting a nonjudgmental attitude; and continuing to communicate with other nurses at national and international levels.

CRITICAL THINKING ACTIVITIES

1. Nate Jefferson, a nursing student, was reviewing his client's chart. The list of nursing diagnoses included in the chart seemed to describe him well. However, something disturbed him about the list. The list he reviewed appears below. What is your response to this list? Identify the nursing diagnoses that seem to be problematic and the reasons for your conclusions.
 - a. *Impaired Swallowing* RT stasis of food in oral cavity after chewing
 - b. *Risk for Injury* RT weight and being dropped by staff
 - c. *Impaired Skin Integrity* RT infrequent repositioning by staff
 - d. *Chronic Confusion* RT Alzheimer's disease
 - e. *Acute Pain* RT pain in right foot
2. Mr. Tyler is a 37-year-old client who limps into the clinic with pain in the right foot and swelling in the extremity. He is 5 feet 6 inches tall and weighs 275 pounds. While consulting the approved NANDA list of diagnoses, develop initial nursing diagnoses based on these data.
3. Alison Jones, RN, performs the nursing assessment and physical exam on Mr. Evans, a newly admitted client. Due to an emergency at home, Ms. Jones must leave and Dolores Smythe, RN, is assigned to care for Mr. Evans. Discuss possible sources of errors and ways to avoid them in planning Mr. Evans's care.
4. *Impaired Physical Mobility* is an approved NANDA diagnosis. List several etiologies that are appropriate for this diagnosis. Develop a two-part nursing diagnostic statement.

5. Select one strategy to overcome barriers to using nursing diagnoses. Describe how you would use this strategy in your clinical setting.
6. John Babcock, RN, asks: “What’s all the fuss about nursing diagnoses?” What would your response to him be?
7. Nursing diagnoses empower the nursing profession. Money is usually associated with power. Discuss how the use of nursing diagnoses affects both power and reimbursement in the nursing profession.

Outcome Identification and Planning

Four steps to achievement: plan purposefully, prepare prayerfully, proceed positively, pursue persistently.

—William A. Ward

COMPETENCIES

1. Explain the purposes of outcome identification and planning.
2. Describe the four elements of the planning component.
3. Describe the characteristics of goals and expected outcomes.
4. Discuss the five components in the construction of goals and expected outcomes.
5. Describe common problems in planning nursing care.
6. Explain the three categories of nursing interventions.
7. Describe the use of the plan of care in the outcome identification and planning step of the nursing process.
8. Discuss strategies for overcoming barriers to effective planning of nursing care.

short-term goal

Planning, the third step of the nursing process, includes the formulation of guidelines that establish the proposed course of nursing action in the resolution of nursing diagnoses and the development of the client's plan of care. Preceding this step is the collection of assessment data and the formulation of nursing diagnoses. After a nurse thoroughly assesses a client and determines the client's unique nursing diagnoses (or problems), a plan of action is developed with specific goals to resolve the nursing diagnoses or health problems of the client. Following the planning component, the nursing process continues with implementation of nursing interventions and evaluation of the client's plan of care.

The four critical elements of planning include:

- Establishing priorities
- Setting goals and developing expected outcomes (outcome identification)
- Planning nursing interventions (with collaboration and consultation as needed)
- Documenting

This chapter explains the planning component of the nursing process. The purpose, as well as the entire process, of the planning concept is illustrated with theory and examples. Strategies for effective planning of quality nursing care are described together with problems frequently encountered in this stage of the nursing process. The role of critical thinking in planning and outcome identification is emphasized.

PURPOSES OF OUTCOME IDENTIFICATION AND PLANNING

The American Nurses Association (1998), in its *Standards of Clinical Nursing Practice*, identifies outcome identification and planning as essential principles for ensuring the delivery of competent nursing care and outlines these components in terms of their significance within the nursing process. Although the overall purpose of a client's plan of care should be to maintain or improve health at an optimal level, planning is a framework on which to base scientific nursing practice.

OUTCOME IDENTIFICATION AND PLANNING AS A STANDARD COMPONENT OF CARE: ANA STANDARDS

Standard III. Outcome Identification

The nurse identifies expected outcomes individualized to the client.

Guidelines

Outcomes should be:

- Based on diagnoses
- Documented in measurable terms
- Developed with the client and health care providers
- Realistic and achievable

Standard IV. Planning

The nurse develops a plan of care that prescribes interventions to attain expected outcomes.

Guidelines

Planning should:

- Be individualized to the client's needs and status
- Be developed with the client, significant others, and health care providers
- Be documented
- Promote continuity of care

(Used with permission from American Nurses Association. [1998]. *Standards of Clinical Nursing Practice*. (2nd ed.). Washington, DC: Author.)

Therefore, the purposes of the planning component of the nursing process are to provide adequate direction to ensure quality nursing care for individual clients, to present a vehicle to improve staff communication, and to provide continuity in the delivery of individualized, quality nursing care to all clients.

PROCESS OF OUTCOME IDENTIFICATION AND PLANNING

The five steps of the nursing process are at the very core in using scientific reasoning for the delivery of individualized, quality nursing care in any setting (Doenges,

Moorhouse, & Geissler, 1997). The ability to make appropriate decisions based on a strong knowledge base and problem-solving strategies is an expected behavior of the professional nurse.

Critical Thinking

More specifically, professional nurses are expected to think critically to process data and to make convincing, intelligent decisions concerning the planning, management, and evaluation of health care for their clients (Prechter, 1993). By combining the critical-thinking skills inherent in the nursing process with the client's identified nursing diagnoses, the nurse can focus on resolving the client's nursing diagnoses with greater proficiency.

The planning of nursing care occurs in three phases: initial, ongoing, and discharge. Each type of planning contributes to the coordination of the client's comprehensive plan of care. **Initial planning** involves development of beginning of care by the nurse who performs the admission assessment and gathers the comprehensive admission assessment data. Because of progressively shorter lengths of hospitalization, initial planning is important in addressing each prioritized problem, identifying appropriate client goals, and correlating nursing care to hasten resolution of the client's problems. **Ongoing planning** entails continuous updating of the client's plan of care. Every nurse who cares for the client is involved in ongoing planning. As new information about the client is gathered and evaluated, revisions may be formulated and the initial plan of care becomes further individualized to the client. **Discharge planning** involves critical anticipation and planning for the client's needs after discharge.

Planning is sequential, dynamic, and future-oriented. Planning includes establishing priorities, identifying goals and expected outcomes, developing nursing interventions, and documenting the client's plan of care. Appropriate guidelines are used to prioritize urgent needs. The client's nursing diagnoses are determined and then ranked by mutual agreement of the nurse and client or significant others. The planning component continues with thorough examination of this prioritized list of nursing diagnoses and determination of the client's goals and desired expected outcomes. After a clear picture is obtained regarding the diagnoses and goals, the nursing interventions can be planned to achieve the desired outcomes.

In the planning phase, the nurse organizes "thought processes for clinical decision making" (Doenges et al., 1997). To think critically is to examine an issue purposefully from a goal-directed perspective. Critical thinking "is based on principles of science and scientific method" (Alfaro-LeFevre, 1998). Therefore, critical thinking is a useful procedure in the development of objectives and in the formulation of a blueprint to achieve those objectives. The formulation of objectives is accomplished by using valid and reliable data previously gathered during the assessment component of the nursing process.

Establishing Priorities

The establishment of priorities is the first element of planning. In establishing priorities, the nurse examines the client's nursing diagnoses and ranks them in order of physiological or psychological importance. This method organizes a client's nursing diagnoses into an operational format for the planning of nursing care. These diagnoses should be mutually ranked by the nurse and client or family and significant others. Involving the client in shared decision-making power helps motivate the client and gives the client a feeling of control, which inspires successful achievement of each goal (Doenges et al., 1997).

When an individual client has more than one diagnosis, the nurse and client need to establish priorities to identify which nursing diagnosis will be addressed initially in the plan of care (Carpenito, 1999). By communicating this decision-making process to other members of the health care team, the nurse encourages an orderly approach to the achievement of optimal health for each client.

Various guidelines are used in the establishment of priorities for determining which nursing diagnosis will be addressed initially. The client's basic needs, safety, and desires, as well as anticipation of future diagnoses must be considered. One of the most common methods of selecting priorities is the consideration of Maslow's hierarchy of needs, which requires that a life-threatening diagnosis be given more urgency than a non-life-threatening diagnosis. Once the basic physiological needs (e.g., respiration, nutrition, hydration, elimination) are met to some degree, the nurse may consider needs on the next level of the hierarchy (e.g., safe environment, stable living condition) and so on up the hierarchy until all the client's nursing diagnoses have been prioritized.

THINK ABOUT IT

Prioritizing Nursing Diagnoses

Mr. Clyde Morrison, an elderly homeless client, was admitted to the hospital with a medical diagnosis of malnutrition. Identified nursing diagnoses include *Imbalanced Nutrition, Less Than Body Requirements* related to inability to procure appropriate food; *Constipation* related to inadequate fluid intake; and *Disturbed Body Image* related to feelings of inadequacy and inability to live up to identified standards. What should the priority ranking of this client's nursing diagnoses be?

A useful guide for the beginning nursing student would be to examine each nursing diagnosis, determine its level of need, and rank the need in order of priority. Table 8-1 illustrates this process.

Another consideration in the designation of priorities is client preferences. If at all possible, the client

TABLE 8-1
Ranking Nursing Diagnoses

Nursing Diagnosis	Maslow's Hierarchy of Needs	Rank
Anxiety related to hospitalization	Safety and security	Moderate
Ineffective Coping	Self-esteem	Low
Ineffective Airway Clearance related to excessive secretions	Physiological	High

should always be involved in the decision-making process of establishing priorities. If the nurse and the client do not mutually set priorities, there may be a contradictory course of direction and motivation, which may lead to noncompliance and nonresolution of the client's nursing diagnoses. The client must participate in the identification of priorities so that the nature of the problem, as well as the client's values, are reflected in the selected course of action.

An additional point regarding the establishment of priorities is the anticipation of future diagnoses. Nursing diagnoses of low and moderate priorities often involve the prevention of anticipated potential or risk diagnoses. Although potential nursing diagnoses may not be a current threat to the client, their seriousness may require that the nurse consider the development of nursing interventions directed toward prevention of the problem. For example, a client in the Postanesthesia Care Unit may have a high-priority nursing diagnosis of *Ineffective Breathing Pattern* related to the anesthesia and sedative drugs. Despite the fact that the client currently has no problem in this area, this diagnosis is indeed the basis for the Postanesthesia Care Unit protocol of monitoring the client closely.

Establishing priorities does not mean that one diagnosis must be totally resolved before giving attention to another diagnosis. Nursing interventions for several diagnoses may be carried out simultaneously. However, at times, it is crucial that the nurse and client correctly identify the order of priority of the client's nursing diagnoses so that maximum effort can be directed toward resolution of the most urgent diagnosis. Table 8-2 illustrates this process.

Establishing Goals and Expected Outcomes

After assessing the client, formulating nursing diagnoses, and establishing priorities, the nurse sets goals and identifies and establishes expected outcomes for each nursing diagnosis. The purposes of setting goals

TABLE 8-2
Prioritizing Nursing Diagnoses with Accompanying Nursing Implications

Priority	Diagnosis	Nursing Implications
High	<i>Ineffective Breathing Pattern</i>	<ul style="list-style-type: none"> Assess breath sounds. Auscultate lungs. Monitor vital signs. Reposition client.
Moderate	<i>Risk for Impaired Skin Integrity</i>	<ul style="list-style-type: none"> Perform comprehensive skin assessment. Keep skin clean and dry. Provide turning schedule.
Low	<i>Ineffective Coping</i>	<ul style="list-style-type: none"> Assist to identify problem. Encourage keeping daily journal. Teach client strategies for expressing feelings.

and expected outcomes are to provide guidelines for individualized nursing interventions and to establish evaluation criteria to measure the effectiveness of the nursing care plan.

A **goal** is an aim, an intent, or an end. A goal is a broad or globally written statement describing the intended or desired change in the client's behavior, response, or outcome. An **expected outcome** is a detailed, specific statement that describes the methods through which the goal will be achieved. It includes aspects such as direct nursing care and client teaching.

THINK ABOUT IT

Setting Mutual Priorities

Mr. Jules Gordon has been admitted with third-degree burns of approximately 80% of his body. He is particularly concerned with the nursing diagnosis of Body Image Disturbance related to scarring and disfigurement, whereas the nurse's major concern is with the nursing diagnosis of Deficient Fluid Volume related to fluid shifts because it is far more life-threatening. In this situation, the nurse's and client's priorities are not set mutually because they have separate primary goals. This situation is leading to conflict and a hindrance of goal accomplishment. What are some ways that this situation can be approached so that both nursing diagnoses may be resolved?

Writing Goals

Written goals need to be constructed clearly. Clear, precise terminology improves the chances that goals will be achieved. When goals are clearly written, their establishment provides direction for the nursing plan of care and for determination of effectiveness in the evaluation of nursing interventions. A guideline is provided for the desired change in the client, and the client has a clear idea of the direction to be taken for achieving resolution of each nursing diagnosis. Goals establish appropriate evaluation criteria to measure the effectiveness of planned nursing interventions for the resolution of the client's individual nursing diagnoses.

Goals should be established to meet the immediate, as well as long-term prevention and rehabilitation, needs of the client. A **short-term goal** is a statement written in objective format demonstrating an expectation to be achieved in resolution of the nursing diagnosis in a short period of time, usually in a few hours or days. A **long-term goal** is a statement written in objective format demonstrating an expectation to be achieved in resolution of the nursing diagnosis over a longer period of time, usually over weeks or months (Alfaro-LeFevre, 1997). See the accompanying display for examples of short-term and long-term goals.

SHORT- AND LONG-TERM GOALS

Nursing Diagnosis: Chronic pain related to rheumatoid arthritis

Short-term (focused on etiology)	<ul style="list-style-type: none"> • Verbalizes the presence of pain • Identifies factors that influence the pain experience • Client or significant other administers pain medication appropriately
Long-term (focused on the problem)	<ul style="list-style-type: none"> • Verbalizes comfort

Another consideration is the accuracy in identifying the etiology of the problem. If the etiology of the problem is incorrectly identified, the client may meet the short-term goal but the problem will not be resolved. Thus, it is important to correctly identify the etiology of the problem.

Setting long-term goals is important in successful discharge planning. It assists in coordinating all health care team members to accomplish the same overall purpose, that is, client discharge. Coordination promotes continuity of care into settings such as restorative care or home health (see the accompanying display).

Expected Outcomes

After the goal is established, the expected outcomes can be identified based on the goal. Given the client's

unique situation and resources, expected outcomes are constructed to be:

- Realistic
- Mutually desired by the client and nurse
- Attainable within a defined time period

These desired outcomes are the measurable steps toward achieving the previously established goals (Doenges et al., 1997). Because nursing care is based on a holistic approach, expected outcomes may be written in the spiritual, emotional, physiological, developmental, and social dimensions. An expected outcome depicts measurable behavioral change or evidence of change in the client when the goal has been met. Several expected outcomes may be required for each goal. Expected outcomes are used in the evaluation process by providing a standard for comparison to determine if the client successfully accomplished the goal.

APPLICATION: RESTORATIVE CARE SETTING

Rosa Martinez is recovering from orthopedic back surgery in a restorative care facility. A nursing diagnosis of *Risk for Disuse Syndrome* related to immobilization due to skeletal traction has been identified. The following factors need to be considered in writing the short-term and long-term goals for this client:

- Immediate needs: Maintenance of elimination patterns, promotion of skin integrity, preservation of effective breathing patterns, and minimization of long-term immobility
- Rehabilitative needs: Resumption of normal musculoskeletal function, ability to use assistive devices correctly, increase in activity tolerance, and enhancement of self-esteem and well-being

The short-term goals should focus on maintenance of physiological patterns involving elimination, skin integrity, respiration, and mobility. The long-term goals should concentrate on the client's return to maximal functional capability and independence.

In the construction of both goals and expected outcome objectives, essential components include: subject, task statement, criteria, the conditions (if necessary), and time frame (Doenges et al., 1997). When goals and outcomes are written clearly, the nurse can select nursing interventions to ensure that the client's baseline data are thoroughly assessed, individual client needs are identified, and appropriate approaches are used in the plan of care.

Usually, each nursing diagnosis has one global goal and several expected outcomes. In writing the goal statement, the nurse considers the nursing diagnosis for the formulation of a suitable client behavior that illustrates reduction or alleviation of the nursing diagnosis.

Nursing Process Highlight

NURSING DIAGNOSIS: Disturbed Sleep Pattern

Goal: Client will sleep uninterrupted for 6 hours.

EXPECTED OUTCOMES

- Client will request back massage for relaxation.
- Client will set limits to family and significant other visits.

NURSING DIAGNOSIS: Ineffective Tissue Perfusion: Peripheral

Goal: Client will have palpable peripheral pulses in 1 week.

EXPECTED OUTCOMES

- Client will identify three factors to improve peripheral circulation.
- Client's feet will be warm to touch.

These concepts are demonstrated in the Nursing Process Highlight.

Each component of an appropriately written goal is discussed in the following paragraphs. For clarity of each concept, examples are provided with related discussion. The examples are designed with the intent of developing skills in the construction of goals.

APPLICATION: SUBJECT

Examples

1. By Saturday, the client will ambulate the entire length of the hallway three times a day.
2. The client will demonstrate the technique for self-administration of insulin by Friday.
3. The client will take own radial pulse and obtain the same results as the nurse by Saturday.
4. By Friday, the client will plan a low-salt diet for 24 hours in accordance with the diet plan left by the dietitian.

Question

Who is to achieve the desired behavior in each of the preceding examples?

Because the plan of nursing care is based on the client, the subject is the client.

Subject

The component to be considered initially in writing a goal is the subject. The subject identifies the person who will perform the desired behavior or meet the goal. In a client-centered plan of nursing care, the client is the person who needs to achieve a desired change in behavior. See the accompanying display for an application of the subject component.

Task Statement

The next component in writing goals is the task statement or the action verb. This component describes what the client (or subject) will do to obtain an expected change in behavior. The task statement enables the evaluator to determine achievement of observable behavior. When the actual behavior is stated as a task statement that can be clearly and directly measured, the nurse can determine whether the client is demonstrating achievement of the goal.

Only one task statement should be used for each goal. It is clearer to write separate goals than to try to accurately measure a combination of tasks. See the accompanying display for an application of the task statement.

APPLICATION: TASK STATEMENT

Examples

1. By Saturday, the client will ambulate the entire length of the hallway three times a day.
2. The client will demonstrate the technique for self-administration of insulin by Friday.
3. The client will take own radial pulse and obtain the same results as the nurse by Saturday.
4. By Friday, the client will plan a low-salt diet for 24 hours in accordance with the diet plan left by the dietitian.

Question

What is the action that the subject or client is expected to do in each of the preceding examples?

The examples demonstrate exactly what the subject, or client, is to perform ("will ambulate"; "will demonstrate"; "will take"; "will plan").

Criteria

The next essential component is the criteria of a goal. **Criteria** are standards used to evaluate whether the behavior demonstrated indicates accomplishment of the goal. Criteria may be written in a variety of ways. Criteria may include:

- A time limit
- Amount of activity

- Important characteristics of accurate performance
- Description of the performance to be followed

The nurse should specify the precise performance to be considered acceptable in accomplishment of the goal.

It is not always possible to specify a criterion with as much detail as one would like; however, the nurse should continue to communicate precise criteria as explicitly as possible. To provide better direction to the client, the nurse considers how well the client, family member, or significant other should perform the task. See the accompanying display for an application of criteria.

APPLICATION: CRITERIA

Examples

1. By Saturday, the client will ambulate the entire length of the hallway three times a day.
2. The client will demonstrate the technique for self-administration of insulin with aseptic technique.
3. The client will take own radial pulse and obtain the same results as the nurse by Saturday.
4. By Friday, the client will plan a low-salt diet for 24 hours in accordance with the diet plan left by the dietitian.

Question

What are the standards that will be used to evaluate the client's achievement of the objective in each of the preceding examples?

The examples indicate the standards used to evaluate whether the behavior demonstrated by the client indicates that the goal has been reached. The criteria in example 1 include a time limit and the amount of activity.

Example 2 demonstrates important characteristics of performance accuracy by stating "with aseptic technique."

Example 3 sets standards of performance accuracy and includes a time limit.

Example 4 includes a time limit and a sample plan to be followed.

Conditions

The next component to be included in writing proper goals is the conditions under which the client should perform or demonstrate mastery of the task. Although this component is optional in terms of writing goals, conditions may provide clarity and assist the client in demonstrating the expected behavior. The conditions may include the experiences that the client is expected to have before performing the task. See the accompanying display for an application of conditions.

Time Frame

The last component to be included in writing goals appropriately is the time frame in which the client should perform or demonstrate mastery of the task.

APPLICATION: CONDITIONS

Examples

1. By Saturday, the client will ambulate the entire length of the hallway three times a day with the use of a walker.
2. The client will restrict fluids to 1000 ml daily beginning today.
3. The client will take own radial pulse and obtain the same results as the nurse by Saturday.
4. By Friday, the client will plan a low-salt diet for 24 hours in accordance with the diet plan left by the dietitian.

Question

What are the conditions under which the activity must be performed in each of the preceding examples?

Example 1 states the conditions with which the activity must be performed ("with the use of a walker"). Example 4 cites the condition by which the activity must be performed ("in accordance with the diet plan left by the dietitian").

Problems Frequently Encountered in Planning

Nursing students, as beginners in the use of the nursing process, often fall into some common pitfalls when applying the steps to practice. These pitfalls are described with the intent of providing a clear direction for the use of this process and proposing suggestions for avoiding these common errors.

In regard to writing goals, the errors frequently observed in this component involve improper format. Format errors include goals that are nurse-centered instead of client-centered, unrealistic, negative rather than positive, generically copied from a reference and not individualized to the client, unmeasurable, nonspecific, nonbehavioral, vague, wordy, and without a time frame.

Another challenge in the development of goals and expected outcomes is the establishment of appropriate time frames for accomplishment of the intended results. Although this component may be difficult at first to master, nursing students should practice writing goals that are realistic and include appropriate time frames using available literature and resources to gain expertise. It is preferable for a goal to include an excessively short, rather than an excessively long, time frame, because the goal is brought to attention in the evaluation process more frequently. By inserting the time frame "daily" for specific goals, the expected outcome will be brought up frequently for evaluation. Through a process of building on continued professional growth and experience, students and beginning

nurses will become more adept and realistic in applying the nursing process to client situations.

Finally, novices as well as experienced nurses tend to make decisions for clients in a paternalistic fashion by deciding what is best for the client without input from the client. To correct this problem, the nurse must establish a trusting nurse-client relationship that promotes mutual understanding and caring. The nurse should encourage clients to make their own decisions regarding health care.

Planning Nursing Interventions

Once the goals have been mutually agreed on by the nurse and client, the nurse should use a decision-making process to select appropriate nursing interventions. A **nursing intervention** is an action performed by a nurse that helps the client to achieve the results specified by the goals and expected outcome. These terms are based on scientific principles and knowledge from behavioral and physical sciences. Usually, several nursing interventions are developed for each of the goals identified for the client (Sparks & Taylor, 1993). It is important to identify as many nursing interventions as possible so that if one proves to be unsuitable, others are readily available. The interventions are prioritized according to the order in which they will be implemented.

With the inclusion of scientific problem solving and critical thinking, the delivery of quality, individualized nursing care is greatly enhanced. Through critical thinking, sound conclusions are reached in the selection of nursing interventions to prevent, reduce, or eliminate the nursing diagnoses or problems. The nurse studies the entire issue thoroughly in the planning component of the nursing process by examining the assessment data and nursing diagnoses, analyzing the client's goals and expected outcomes, and selecting which nursing interventions should be used from a multitude of possibilities to ensure the delivery of quality nursing care for each client.

Several factors can assist the nurse in selecting nursing interventions. Just as the client's goals can be derived from the nursing diagnosis, the nursing interventions can be developed from the etiology of each nursing diagnosis. The effective nurse plans interventions that are directed toward the cause of the client's nursing diagnosis or problem. For example, for a client with angina who may have the nursing diagnosis of *Pain* related to myocardial ischemia, an appropriate nursing intervention would be to help the client conserve energy (i.e., bedrest).

The nurse may use various guidelines in selecting appropriate nursing interventions. These guidelines include the individual nurse practice acts, state boards of nursing standards, and the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) standards for nursing care. Other determining factors of appropriate nursing interventions include whether

an action is realistic in terms of the abilities of the client and nurse, and if it is compatible with available resources, the client's values and beliefs, and other therapies planned for the client.

In determining which nursing interventions to use, the nurse should critically consider the consequences and the risks of each intervention. After considering these factors, the nurse selects those that are most likely to be effective with the minimum of risk. Table 8-3 applies the guidelines for selection of appropriate nursing interventions for a specific nursing diagnosis.

After setting the goals and planning the appropriate nursing interventions, the nurse writes nursing orders to communicate the exact nursing interventions that are to be implemented for the client. A **nursing order** is a statement written by the nurse that is within the realm of nursing practice to plan and initiate. These statements specify direction and individualize the client's plan of care. For example, a health care practitioner's order to force fluids must be specified in the nursing order as the number of milliliters per hour or per shift (e.g., 100 ml/h or Day shift = 800 ml; Evening shift = 800 ml; Night shift = 400 ml).

TABLE 8-3
Nursing Interventions: Selection Guidelines

<p><i>Nursing Diagnosis:</i> Acute Pain related to myocardial ischemia</p> <p><i>Goal:</i> Client will resume normal activities of daily living.</p> <p><i>Expected Outcome:</i> Client will verbalize relief of pain.</p>	<p><i>Etiology:</i> Myocardial ischemia</p> <p>Nursing Interventions:</p> <ul style="list-style-type: none"> • Assess pain characteristics such as location, quality, severity, duration, onset, relief. • At first signs of pain, instruct client to relax and discontinue activity. • Instruct client to take sublingual nitroglycerin. • If pain continues after repeating doses every 5 minutes for a total of three pills, notify the health care practitioner or nurse practitioner. • Administer oxygen as prescribed. • Note time interval between episodes of pain. • Maintain bed rest and quiet environment to decrease oxygen demands. • Give analgesic medications as prescribed. • Offer assurance and emotional support by explaining all treatments and procedures and by encouraging questions.
--	--

Ensuring that nursing orders are well written requires several essential elements. These elements include: the nursing order date, action verb, detailed description, time frame, and signature (Wilkinson, 1998). See the accompanying display for a summary of the elements of a nursing order.

ELEMENTS OF NURSING ORDERS

- **Date:** The date on which the order is written. This information is updated to reflect review and revision.
- **Action verb:** Directs the nurse's action. Examples of action verbs are *explain*, *demonstrate*, and *auscultate*.
- **Detailed description:** Precisely clarifies what the nurse's action will be. This phrase explains what, when, where, and how.
- **Time frame:** Describes when, how often, and how long the nursing order is to be performed.
- **Signature:** Indicates the nurse who writes the order. This element implies legal and ethical accountability.

The type of nursing order written is determined by the client problem. The nurse is responsible for writing nursing orders that involve health promotion, observation, prevention, and treatment (Wilkinson, 1998). Table 8-4 gives examples of types of nursing orders.

Categories of Nursing Interventions

Nursing interventions are classified according to three categories: independent, interdependent, and dependent. **Independent nursing interventions** are nursing actions initiated by the nurse that do not require direction or an order from another health care professional. These interventions are sanctioned by professional nurse practice acts derived from licensure laws. In many states, the nurse practice acts allow independent nursing interventions regarding activities of daily living, health education, health promotion, and counseling. An example of an independent nursing intervention is the nurse's action to elevate a client's edematous extremity.

Interdependent nursing interventions are those actions that are implemented in a collaborative manner by the nurse with other health care professionals. **Collaboration** is a partnership in which all parties are valued for their contribution. Collaboration is used to gather data, plan, implement, evaluate, and gain objectivity by examining another's viewpoint. Interdependent nursing interventions allow the client's nursing diagnoses to be resolved on the basis of recommendations of

TABLE 8-4
Types of Nursing Orders

Type	Description	Example
Health promotion	Nursing orders that encourage behaviors leading to a higher level of wellness	Teach the importance of a daily exercise regimen.
Observation	Nursing orders that include observations regarding potential complications as well as observations of client's current responses	Auscultate lungs q4h.
Prevention	Nursing orders that direct nursing care in the reduction of risk factors or the prevention of complications	Turn, cough, and deep breathe q2h.
Treatment	Nursing orders that include teaching, referrals, or physical care necessary in the treatment of an existing problem	Refer client to occupational therapist for assistance with skills for activities of daily living.

an interdisciplinary health care team approach. For example, a client care conference or a discharge planning committee uses an interdisciplinary approach that includes health care members such as a nursing supervisor, a home health care nurse, a dietitian, a social worker, a physical therapist, and occasionally a physician. The nurse assumes the responsibility of being both the primary coordinator of the client's plan of nursing care and intermediary of interdepartmental collaboration (Doenges et al., 1997).

In addition to collaboration, the planning of interdependent nursing interventions may also include consultation. **Consultation** is a method of soliciting help from a specialist in order to resolve nursing diagnoses. The need for consultation arises when an individual nurse identifies a problem that cannot be solved using own knowledge, skills, or resources. In the management of the client's plan of care, nurses may consult with other health care personnel including health care practitioners, clinical nurse specialists, nutritionists, physical therapists, and social workers. Nurses frequently consult to verify assessment data or to obtain clinical advice: for example, discussing the effects of chemotherapy on a client's self-esteem with an oncology clinical nurse specialist.

Consultation can be informal or formal. An informal consultation may simply involve another health care practitioner's ideas regarding a nursing problem. Some agencies have a formal protocol for the consultation of

a health professional and may require that certain forms be completed. Steps in formal consultation reflect a logical sequence, and include:

- Identifying the problem
- Collecting all relevant data
- Selecting a suitable consultant
- Communicating unbiased data regarding the problem
- Discussing recommendations with the consultant
- Incorporating the recommendations into the client's plan of care

The consultation process often generates new approaches to the client's individualized plan of care. Acquiring supplementary knowledge may help in ensuring that the best conceivable plan of care is being developed. In addition, nurses who have sought the help of a consultant are presented with an opportunity to learn from the recommendations for future situations.

Dependent nursing interventions are those actions that require an order from another health care professional. An example of a dependent intervention is administration of a medication. Although this intervention requires specific nursing knowledge and responsibilities, it is not within the realm of legal nursing practice in many states to prescribe medications. The nurse may not order medications but, when administering them, the nurse is responsible for knowing the classification, the pharmacologic action, normal dosage, adverse effects, contraindications, and nursing implications of the drugs. Therefore, dependent nursing interventions must always be guided by appropriate knowledge and judgment. It should be noted that many state nurse practice acts sanction advanced practice registered nurses to prescribe medications. In those states, prescriptive authority is an independent intervention for nurses in advanced practice. Figure 8-1 illustrates the three categories of nursing interventions.

All nursing interventions require critical thinking in making appropriate nursing judgments. Alfaro-LeFevre (1998) states that the development of critical reasoning skills by nurses is a progressive process that requires a dedication to examine common health problems, participate in diverse clinical experiences, and prepare for delivery of care in clinical settings. Given the emphasis on critical thinking in the planning step of the nursing process, the nurse does not automatically carry out a health care practitioner's order without due consideration. All requested orders are given consideration for their appropriateness. An in-depth knowledge base is necessary to recognize an error and seek clarification. The use of rationales helps the nurse practice decision making and substantiate judgments. The rationales should accompany the nursing intervention or nursing order statement on the written plan of nursing care. A **rationale** is an explanation based on theories and scientific principles of natural and behavioral sciences and the humanities.

Evaluating Care

Evaluating care involves determining the client's progress toward achievement of expected outcomes. Effective planning is essential if evaluation is to be effective. In other words, the planned outcomes are the yardsticks by which effectiveness of therapies are evaluated. If there is no stated expectation of care (i.e., client outcome), how can progress be measured?

NURSING OUTCOMES CLASSIFICATION (NOC)

Measuring outcomes in nursing began with Nightingale, who relied on mortality statistics as an indicator of quality of care for British soldiers in the

A

B

C

Figure 8-1 Examples of Types of Nursing Interventions: (A) Independent (B) Interdependent (C) Dependent

Crimean War. Nightingale proved that the mortality rate for soldiers declined as a result of improved sanitation (Oermann & Huber, 1999). Recently, there has been increased emphasis by the nursing community on evaluating outcomes. Nurse researchers (Mass & Johnson, 1997) at the University of Iowa have developed classifications of client outcomes, the Nursing Outcomes Classification (NOC). The NOC provides a standardized language that can be used to measure the effects of nursing practice on client outcomes. Just as the North American Nursing Diagnosis Association (NANDA) and the Nursing Interventions Classifications (NIC) are continuing to develop standardized nursing language relative to diagnosis and intervention, NOC is striving toward a similar goal of standardized language for classifying nursing interventions. An outcome classification system can be used to enhance decision-making in clinical practice and research.

Linking nursing interventions to improved client outcomes through scientific research is important. Nurse researchers who are observing, measuring, and studying client outcomes believe that outcomes indicate the quality or effectiveness of the nursing interventions provided. Porter-O'Grady (1999) states that nurses need to provide empirical evidence of the "insights and intuition of their practice" (p. 7). Strengthening the links between nursing interventions and client outcomes will benefit not only clients, but nursing as well. Having solid research evidence that documents the effectiveness of nursing care on client outcomes will influence political and financial decisions relative to nursing. "By measuring patient outcomes, nurses can answer two pivotal questions; Do our patients benefit from our care? And if so, how?" (Oermann & Huber, 1999, p. 41).

The NOC taxonomy focuses on function, physiology, psychosocial aspects, health knowledge and behavior, and perceived self-health and family health. The NOC system, which defines over 190 client outcomes that are sensitive to nursing interventions, allows nurses to evaluate client status over time.

PLAN OF CARE

The **plan of care** is a written guide that organizes data about a client's care into a formal statement of the strategies that will be implemented to help the client achieve optimal health. Nursing care plans usually include components such as assessment, nursing diagnoses, goals and expected outcomes, nursing interventions, and evaluations. The nurse begins the nursing care plan on the day of admission and continually updates and individualizes the client's plan of care until discharge.

The plan of care directs the efforts of the entire health care team regarding each client. This plan promotes the health care team's delivery of quality, holistic,

individualized, and goal-oriented care to the client. Attention to a comprehensive assessment of the entire person allows for a holistic approach. Individualization is enhanced by continuous reviewing and updating of the plan of care. A carefully formulated written plan of care prioritizes problems and addresses short- and long-term needs of the client. JCAHO standards state that each client will be assessed and reassessed according to the health care facility policy (JCAHO, 2000). The written plan of care authenticates activities of assessment by maintaining written records and providing evidence of nursing interventions, the client's response to nursing interventions, and changes in the client's condition.

Although plans of care differ in various institutions from handwritten to computerized forms, they all have the same basic elements in common. The plan of care is realistically designed and customized to each individual client's health status and is the final result of the planning component of the nursing process. The nursing plan of care documents health care needs, coordinates nursing care, promotes continuity of care, encourages communication within the health care team, and promotes quality nursing care.

There are several types of care plans. These different types include student-oriented, standardized, institutional, and computerized care plans. The student-oriented care plan promotes learning of problem-solving skills, the nursing process, verbal and written communication skills, and organizational skills. This comprehensive care plan has great depth for teaching the process of planning care. Educational programs vary, but usually the student-oriented care plan begins with assessment and proceeds in a sequential manner until it concludes with the plan of care evaluation.

The standardized care plan is a preplanned, preprinted guide for the nursing care of client groups with common needs. This type of care plan generally follows the nursing process format (i.e., problem, goals, nursing orders, and evaluation). The nurse may use standardized care plans when a client has predictable, commonly occurring problems. Individualization may be accomplished by the inclusion of additional handwritten notes on unusual problems.

Institutional nursing care plans are concise documents that become a part of the client's medical record after discharge. The Kardex nursing care plan is an example of this type of care plan and is frequently used. The institutional nursing care plan may simply include the problem, goal, and nursing action. In addition, the Kardex nursing care plan may be expanded to include assessment, nursing diagnosis, goal, implementation, and evaluation. Figure 8-2 provides an example of an institutional care plan.

Computers are used for creating and storing nursing care plans and can generate both standardized and individualized nursing care plans. The nurse selects appropriate diagnoses from a menu suggested by the computer, which then lists possible goals and nursing

NURSING DIAGNOSIS	NURSING INTERVENTIONS	EVALUATION
Ineffective breathing pattern R/T operative site/incisional pain.	1. Auscultate breath sounds q 4h. & PRN 2. Assist Opt. to TCDB q 2h while awake.	1. Lung clear on auscultation. 2. "It doesn't hurt as much to cough today."
Potential for infection R/T surgical incision & indwelling catheter	Assess for s/s of infection q 4h.	T-100.2°, incision site warm & pink, non-edematous. "It really hurts under the bandage."
Altered bowel elimination R/T abdominal surgery.	1. Restart oral fluids gradually. Offer clear liquids frequently 2. Observe for abd. distension & evaluate tolerance when pt. begins taking fluids/foods.	Unable to tolerate oral fluids - vomited p taking pre chips.

Figure 8-2 Handwritten Institutional Care Plan

interventions. The nurse has the option of reading the client's plan of care from the computer screen or printing out an updated working copy. Figure 8-3 presents an example of a computerized nursing care plan.

STRATEGIES FOR EFFECTIVE CARE PLANNING

In planning quality nursing care for each client, the nurse assumes responsibility for the coordination of total nursing care. The nurse coordinates the participation of various health care team members to implement their recommendations into the delivery of quality nursing care. Critical thinking assists the nurse in establishing collaborative relationships with other members of the health care team and managing complex nursing systems.

An important strategy for effective planning is clear communication of the client's plan of care to other health care personnel.

THINK ABOUT IT

Coordination of Care

Mr. Eduardo Rodriguez has been admitted with arthritis. His left knee is extremely edematous, and the health care practitioner has ordered heat application of 100°F to the left knee four times a day for 2 hours. In considering the appropriateness of this order, the nurse detects an error regarding the time frame because heat produces maximum vasodilation in 20 to 30 minutes to dissipate the edema; further application of heat may lead to a rebound phenomenon of tissue congestion and vessel constriction, as well as potential burns. At this point, the nurse needs to seek clarification of the order from the health care practitioner. What would be appropriate methods of handling this situation?

The nurse must always communicate the plan of care in clear, precise terms. Avoid using vague terminology such as *improved*, *adequate*, and *normal*.

resolution of all nursing diagnoses, the nursing plan of care that is individualized can improve health to the client's optimal level.

KEY CONCEPTS

- The outcome identification and planning component of the nursing process is a sequential, orderly method of using problem-solving skills and critical thinking to formulate a nursing plan of care to resolve nursing diagnoses.
- The planning component of the nursing process includes establishing priorities, setting goals, developing expected outcomes, selecting nursing interventions, and documenting the plan of care.
- The purposes of outcome identification and planning are to provide direction for nursing care, to improve staff communication, and to provide continuity of nursing care.
- The establishment of priorities may be guided by such factors as endangerment of well-being, Maslow's hierarchy of needs, client preferences, and anticipation of future diagnoses.
- Setting goals and expected outcomes provides guidelines for directing nursing interventions and establishes evaluation criteria by deciding on goals that illustrate a desired change in the client's behavior.
- Goals and expected outcome objectives include the components of subject, task statement, criteria, conditions, and time frame.
- Two common problems frequently encountered in planning in regard to goals are the improper format and unrealistic and nonmeasurable qualities of this component.
- In planning nursing care, the nurse uses an expansive scientific knowledge base and critical thinking to select independent, interdependent, and dependent nursing interventions guided by local and federal standards of care.
- The plan of care documents health care needs, coordinates nursing care, promotes continuity of care, encourages communication within the health care team, and promotes quality nursing care.
- Strategies for effective care planning include communication of the client's plan of care within the health care team, establishment of a realistic plan of care, and formulation of measurable and future-oriented goals.

CRITICAL THINKING ACTIVITIES

1. Decide whether the following statements are client-centered and place a mark in front of all client-centered goals.
 - _____ 1. The nursing assistant will ambulate client in the hall three times a day by Saturday.
 - _____ 2. Will teach the client to plan a low-fat diet for 24 hours.
 - _____ 3. The client will describe two purposes of a low-fat diet by Wednesday.
 - _____ 4. Will encourage the client to walk the entire length of hallway two times a day by Thursday.
2. Decide whether the following statements have action verbs for their task assignment and place a mark in front of all goals with action verbs.
 - _____ 1. The client will know five reasons for proper nutrition.
 - _____ 2. The client will be able to state where diabetic injection equipment may be purchased after discharge.
 - _____ 3. The client will explain the purpose of maintaining asepsis in daily dressing changes by Wednesday.
 - _____ 4. The client will understand how to change dressings on abdomen.
3. Indicate whether the following statements have criteria and place a mark in front of all goals with criteria.
 - _____ 1. The client will describe two purposes of the low-salt diet by Friday.
 - _____ 2. The client will know the cause of low blood sugar.
 - _____ 3. The client will understand the importance of returning for follow-up visits to the health care practitioner.
 - _____ 4. The client will demonstrate crutch walking the entire length of the hallway twice a day.
4. Decide whether the following statements have conditions and place a mark in front of all goals with conditions.
 - _____ 1. The client will describe two purposes of the low-salt diet by Friday.
 - _____ 2. The client will know the cause of low blood sugar.
 - _____ 3. The client will understand the importance of returning for follow-up visits to the health care practitioner.
 - _____ 4. The client will demonstrate crutch walking.
5. Decide whether the following statements have time frames and place a mark in front of all goals with time frames.
 - _____ 1. The client will describe two purposes of the low-salt diet by Friday.
 - _____ 2. The client will know the cause of low blood sugar.
 - _____ 3. The client will understand the importance of returning for follow-up visits to the health care practitioner.
 - _____ 4. The client will demonstrate crutch walking.

MULTIPLE CHOICE QUESTIONS

6. The plan of nursing care includes:
 - a. Client assessment data, medical treatment regime and rationales, and diagnostic test results and significance
 - b. Doctor's orders, demographic data, and medication administration and rationales
 - c. Collected documentation of all team members providing care for your client
 - d. Client's nursing diagnoses, goals and expected outcome objectives, and nursing interventions
7. When establishing priorities of a client's plan of nursing care, the nurse should rank the highest priorities to life-threatening diagnoses and the lowest priorities to:
 - a. Safety-related needs
 - b. The client's social, love, and belonging needs
 - c. Needs of family members and friends who are involved in plan of care
 - d. Needs of client regarding referral agencies
8. What is the main purpose of the expected outcome?
 - a. To describe the education plans to be taught to the client
 - b. To describe the behavior the client is expected to achieve as a result of nursing interventions
 - c. To provide a standard for evaluating the quality of health care delivered to the client during the hospital stay
 - d. To make sure that the client's treatment does not extend beyond the time allowed under the diagnosis-related group system
9. What are the essential components of an expected outcome?
 - a. Nursing diagnosis, interventions, and expected client behavior
 - b. Target date, nursing action, measurement criteria, and desired client behavior
 - c. Nursing action, client behavior, target date, and conditions under which the behavior occurs
 - d. Client behavior, measurement criteria, conditions under which the behavior occurs, and target date
10. Which guideline is most appropriate when developing nursing interventions?
 - a. Choose actions that a nurse can perform without leaving the unit or consulting with medical staff.
 - b. Make intervention statements specific to ensure continuity of care.
 - c. Write interventions in general terms to allow maximum flexibility and creativity in delivering nursing care.
 - d. Make sure that nursing care activities receive priority over other aspects of the treatment regime.

Implementation

The great thing in this world is not so much where we are, but in what direction we are moving.

—Holmes (in Wilson, 1994)

COMPETENCIES

1. Describe the purposes of the implementation step of the nursing process.
2. Explore the types of skills required for effective implementation.
3. Discuss various implementation activities that nurses execute as directed by the nursing plan of care.
4. Explain the nurse's roles and responsibilities in the delegation of care to assistive personnel and its impact on implementation.
5. Identify the specific types of nursing interventions that are implemented by the nurse and the characteristics of each type.
6. Discuss the importance of documentation in the implementation process.

**KEY
TERMS**

delegation
 discharge planning
 implementation
 nursing intervention
 protocol
 rationale
 standing order

Implementation, the fourth step in the nursing process, involves the execution of the nursing plan of care derived during the planning phase of the nursing process. It involves completion of nursing activities to accomplish predetermined goals and to make progress toward achievement of specific outcomes. The execution of the implementation phase of the nursing process, as with the other phases of the process, requires a broad base of clinical knowledge, careful planning, critical thinking and analysis, and judgment on the part of the nurse.

This chapter discusses the purposes of implementation, the specific skills associated with effectively implementing the nursing plan of care, and the activities involved in this process. Although identified as the fourth step of the nursing process, the implementation phase begins with assessment and continually interacts with the other steps in the process to reflect the changing needs of the client and the response of the nurse to those needs.

THINK ABOUT IT**Implementation Activities**

When you think of the activities performed by nurses on a daily basis, what specific actions come to mind? How would you categorize the level of skill that is required for each activity? How comfortable would you feel executing all of these activities yourself?

**PURPOSES OF
IMPLEMENTATION**

Implementation is directed toward a fulfillment of client needs that results in health promotion, prevention of illness, illness management, or health restoration in a variety of settings including acute care, home health care, ambulatory clinics, or extended care facilities. It also involves the delegation of tasks to staff members and assistive personnel and documentation of the specific activities executed by the nurse and the client's response to these activities.

The American Nursing Association (1998), in its *Standards of Clinical Nursing Practice*, describes the standards applicable to implementation in terms of both a standard of care and standards of professional performance. Adherence to these standards requires that the nurse have a current knowledge base, be proficient with technical and communication skills, and use sound judgment in determining safe and efficient use of personnel and materials.

**REQUIREMENTS
FOR EFFECTIVE
IMPLEMENTATION**

The implementation phase of the nursing process requires cognitive (intellectual), psychomotor (technical), and interpersonal skills. These skills serve as competencies through which effective nursing care can be delivered and are used either in conjunction with each other or individually as required by the client and the specific needs of the situation.

Cognitive skills enable nurses to make appropriate observations, understand the rationale for the activities performed, and appreciate the differences among individuals and how they influence nursing care. Critical thinking is an important element within the cognitive domain because it helps nurses to analyze data, organize observations, and apply prior knowledge and experiences to current client situations.

Proficiency with psychomotor skills is necessary to safely and effectively perform nursing activities. Nurses must be able to handle medical equipment with a high degree of competency and to perform skills such as administering medications and assisting clients with mobility needs (e.g., positioning and ambulating).

The use of interpersonal skills involves communication with clients and families as well as with other health care professionals. The nurse-client relationship is established through the use of therapeutic communication that helps ensure a beneficial outcome for the client's health status. Interaction between members of the health care team promotes collaboration and enhances holistic care of the client.

**IMPLEMENTATION
ACTIVITIES**

Nursing implementation activities include:

- Ongoing assessment
- Establishment of priorities
- Allocation of resources
- Initiation of nursing interventions
- Documentation of interventions and client response

These activities are interactive and each is discussed in further detail.

Ongoing Assessment

The nursing plan of care is based on the initial assessment data collected by the nurse and the nursing diagnoses derived from those data. Because a client's condition can change rapidly, or new data may become available through interaction with the client, ongoing assessment is necessary to validate the relevance of proposed interventions. Goals, expected outcomes, and interventions may need to be altered as new data are collected or progress toward outcomes is evaluated. Although a focused assessment should be completed during the initial interaction with the client, continuous observations during the implementation process allow for adaptations to be made to better individualize care.

It is not unusual for nursing diagnoses to change or to be resolved in a short period of time. For example, the nursing care plan for Mrs. Cline, a preoperative client, might include an intervention to teach her about the use of a patient-controlled analgesia (PCA) pump. As the use of this equipment is being demonstrated, the nurse observes that Mrs. Cline is unable to depress the button easily with the fingers of her right hand. Mrs. Cline informs the nurse that she forgot to mention that her joints swell occasionally and she has very little strength in her hand during these times. This information is essential for both developing a nursing diagnosis concerning Mrs. Cline's impaired physical mobility and determining appropriate teaching methods for use of the PCA pump.

THINK ABOUT IT

Relationship between Assessment and Implementation

Mrs. James, who has been diagnosed with diabetes, will be discharged from the hospital within a few days. The expected outcome in the nursing plan of care is that Mrs. James will correctly and accurately withdraw the prescribed amount of insulin and inject her own insulin. While implementing this teaching intervention, you observe that Mrs. James is unable to visualize the correct amount of insulin to withdraw in the syringe because of her impaired vision. How does the assessment of her response to the expected outcome affect your interventions related to the teaching strategies that need to be implemented with the client?

Ongoing assessment demands attention to verbal and nonverbal cues from the client and requires knowledge of expected responses to specific interventions. If nurses observe that responses are different from those expected, this assessment data can lead to a change in expected outcomes and accompanying interventions.

Ongoing assessment is of equal importance in home health care or extended care settings when contact with skilled health care providers might occur less frequently and the length of time that the care is required varies (see the accompanying display). The nurse's assessment and clinical judgment often determine whether the client needs continued care or referral to other health care providers.

APPLICATION: EXTENDED CARE SETTING

An important element in the ongoing assessment of clients in the extended care setting is the appraisal for the risk of falls. The following questions can help the nurse determine the seriousness of this risk.

- Which medications are currently prescribed for the client, and what are their effects on the central nervous system?
- Are elimination problems such as incontinence being experienced?
- Has the mental status of the client recently changed in terms of orientation to time and place?
- Does the client's level of mobility require ambulatory assistance devices such as a cane, walker, or wheelchair?
- If the client has previously experienced a fall, what were the conditions under which it occurred?

Establishment of Priorities

Following ongoing assessment and review of the problem list, priorities are determined for implementation of care. Priorities are based on:

- Which problems are deemed most important by the nurse, the client, and family or significant others
- Activities previously scheduled by other departments (e.g., surgery, diagnostic testing)
- Available resources

The change-of-shift report can also be a valuable tool in determining priorities. A client's condition and variables in the clinical setting can change quickly and frequently—especially in acute care settings—requiring that the nurse exercise strong clinical judgment and maintain flexibility in organizing care. For example, the nursing care plan for Mr. Jenkins, who had hip replacement surgery, might reflect a priority nursing diagnosis of *Impaired Physical Mobility* with interventions focused toward learning to ambulate. When the nurse listens to Mr. Jenkins' breath sounds on a particular morning, it is noted that his breathing is more labored and crackles can be auscultated in the lung bases. This assessment is noted on the change-of-shift report, and the priorities of interventions change to focus on this new development.

Time management is important whether the nurse is caring for one client or a group of clients. It is helpful to make a list of tasks that need to be accomplished throughout the day and to create a worksheet outlining a target time for these activities. Those activities with specified times for completion should be scheduled first. For example, medications usually allow a narrow time frame for administration and must be scheduled at specific times on the worksheet. An example of a worksheet that outlines a plan for activities is shown in Table 9-1. The time allotted for activities depends on the complexity of the task and the amount of assistance required by the client. An example of a worksheet for a group of clients is presented in Table 9-2.

Allocation of Resources

Before implementing the nursing plan of care, the nurse reviews proposed interventions to determine the level of knowledge and the types of skills required for safe and effective implementation. The assessment provides data for determining if an activity can be per-

formed independently by the client, can be completed with assistance from family, or requires assistance of health care personnel.

Delegation of Tasks

The registered nurse is legally responsible for all nursing care given. Whereas some interventions are complex and require the knowledge and skills of a registered nurse, other interventions are relatively simple and can be delegated to assistive personnel. **Delegation** is the process of transferring a selected nursing task in a situation to an individual who is competent to perform that specific task. It must be remembered that, although some activities can be assigned to other health care personnel, the registered nurse remains accountable for appropriate delegation and supervision of care provided by these individuals. In general, registered nurses are authorized by law to both provide nursing care to clients directly and supervise and instruct others to deliver this care. Further, the registered nurse is empowered to delegate selected tasks to either licensed or unlicensed nursing personnel (see Figure 9-1).

Decisions about delegation are guided by the needs of the client, the number and type of available personnel, and the nursing management system of the unit or agency. In performing delegated tasks, nursing students must either determine if the intervention is one that they have performed with supervision and can safely accomplish independently or is one for which assistance is needed.

The first consideration in determining the most appropriate nursing personnel to administer care is client safety. Nurse practice acts dictate to some extent which tasks can be legally delegated. For example, administration of blood or blood products is not an act

TABLE 9-1
Sample Worksheet of Nursing Activities (One Client)

Time	Activity
6:45 am	Listen to change-of-shift report.
7:00	Perform head-to-toe assessment of client, including vital signs.
7:10	Check routine medication times.
7:30	Chart assessment findings.
8:00	Serve breakfast. While client eats breakfast, review chart for new laboratory test data,
8:30	Record I&O after breakfast; remove breakfast tray.
8:40	Gather supplies for hygiene. Assist with AM care.
9:15	Assist up to chair. Show films about diabetic skin care.
10:00	Document interventions and observations on chart.
10:15	Review care plan for any needed revisions.
10:30	Report status of client to charge nurse. Attend inservice on IV care.
11:45	Take and record vital signs.

Figure 9-1 The registered nurse is responsible for delegating nursing tasks to other members of the health care team.

THINK ABOUT IT

Delegation

Your employer, a large acute care hospital, has hired consultants to examine the cost of care expended in the facility and recommend a more cost-effective system. These consultants recommend decreasing the number of both registered nurses and licensed practical/vocational nurses and increasing the responsibilities of unlicensed assistive personnel. As a registered nurse in charge of the care of medical-surgical clients, what questions would you ask regarding this proposal? In what ways do you think your responsibilities would increase because of this situation? Do you think your responsibilities would decrease significantly? What impact would this proposal have on the ethical delivery of care to clients, specifically the nurse's need to cause no harm and promote good?

that can be legally delegated to licensed practical nurses or unlicensed assistive personnel in most states. Other activities, such as assisting clients with activities of daily living (ADL, those activities performed by a person usually on a daily basis), ordering supplies, or transcribing orders, can often be safely delegated to other personnel.

If delegation of a particular activity is legally allowed, the nurse should validate the knowledge and skill level of personnel before delegation. If uncertain about the level of competence of an individual to perform an activity, the nurse should not delegate the task even though it might be legally performed by that level of personnel. The registered nurse is held accountable to delegate only such care that can safely be done by the other individual and would be performed with the same level of competency and respect for state laws and regulations as would be evident in the nurse's performance of this care.

Types of Management Systems

Wise use of resources dictates that tasks be assigned to the most cost-effective level of personnel who can safely and proficiently perform the activity. The nursing management system often determines the numbers and types of personnel available. Changes in health care delivery in recent years have resulted in an increasing emphasis on cost containment and have subsequently created several unique management models. The redesign of the workplace in many health care agencies has included cross-training of employees, with nurses frequently assuming responsibilities formerly assigned to other health care providers. For example, nurses might draw blood for laboratory tests, perform electrocardiograms, or administer respiratory treatments, as care is focused around the client rather than the various departments in the agency. Nurses in community health settings have traditionally exercised a variety of roles in their practice. As health care delivery continues to evolve in this country, a variety of innovative approaches will emerge to better meet the needs of clients. The most common management systems currently used include functional nursing, team nursing, primary nursing, total client care, modular nursing, and case management.

Functional Nursing

The functional nursing approach divides care into tasks to be completed and uses various levels of personnel depending on the complexity of the assignment. Each member of the staff performs his or her assigned task for each client. For example, one nurse may assess each client and document findings and another may give all medications and treatments. Another nurse may be assigned to complete client teaching or **discharge planning** (process that enables the client to resume self-care activities before leaving the health care environment). One nursing assistant might serve all trays and collect

intake and output records for each client while another is responsible for giving baths or making beds.

The advantage of this system is that a large number of clients can be cared for by a relatively small number of personnel. In addition, it allows the use of less skilled (and less expensive) personnel for some tasks and allows personnel to be used in areas for which they have special knowledge or skill. However, this system can also result in fragmented and depersonalized care and may invite omissions in care because no *one* person is responsible for the total care of the client.

Team Nursing

The team nursing approach uses a variety of personnel (professional, technical, and unlicensed assistants) in the delivery of nursing care. The registered nurse is leader of the team and is responsible for supervision of the team, as well as planning and evaluating the results of caregiving activities. This management system uses professional nurses for skilled observations and interventions and provision of direct care to acutely ill clients, while licensed practical nurses care for less acutely ill clients, and nursing assistants are responsible for serving trays, making beds, and assisting the nurses with other tasks. This management system is frequently used because it is cost-effective and provides more individualized care than the functional approach.

Primary Nursing

In the primary nursing management system, the professional nurse assumes full responsibility for total client care for a small number of clients. Although care may be delegated to nurse associates for shifts when the primary nurse is not in attendance, the primary nurse maintains responsibility for total client care 24 hours a day (see Figure 9-2). The primary nurse sets health care goals with the client and plans care to meet those goals. The principal advantage of this approach is the continuity of care inherent in the system. Primary nursing is most effective with a total staff of registered nurses, which makes this system expensive to maintain.

Total Client Care and Modular Nursing

Total client care and modular nursing are variations of primary nursing. Although these systems imply that one nurse is responsible for all the care administered to a client, responsibility for the client actually changes from shift to shift with the assigned caregiver. This system uses both registered nurses and licensed practical nurses; the registered nurses are assigned to more complex client situations. A unit manager or charge nurse typically coordinates activities on the unit. Modular nursing attempts to assign caregivers to a small segment or “module” of a nursing unit, ensuring that clients are cared for by the same personnel on a regular basis.

Case Management

In the case management system, the nurse assumes responsibility for planning, implementing, coordinating, and evaluating care for a given client, regardless of the client’s location at any given time. This approach is often used when care is complex and a number of health care team members are involved in providing care. Generally, a case management plan, or critical pathway, is developed (based on the norm or typical course of the condition), and the nurse evaluates the progress of the client in relation to what is expected, investigating and following up on any variance in the time required or the amount of improvement noted. Although the case load for the individual nurse might be smaller (thus making this approach expensive), continuity of care and collaboration are enhanced.

THINK ABOUT IT

Nursing Management Systems

If you were a *client* in a hospital, which management style would you prefer? Why?

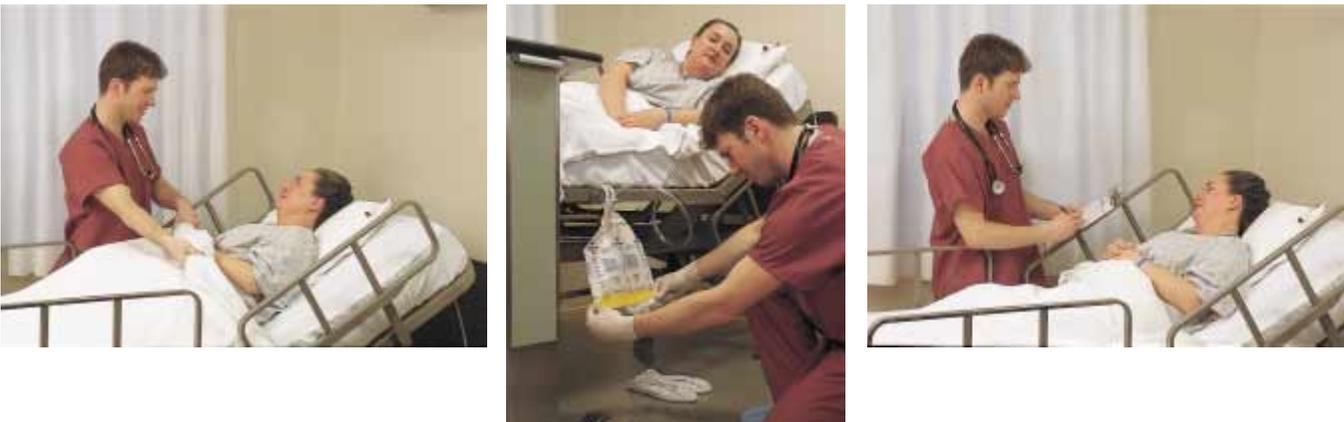

Figure 9-2 Delivery of client care occurs via the primary nursing management system. This primary nurse is responsible for meeting the total health care needs of this client.

Nursing Interventions

After reviewing the client's current condition, verifying priorities, and examining resources, the nurse should be ready to initiate nursing interventions. A **nursing intervention** is an action performed by the nurse that help the client to achieve the results specified by the goals and expected outcomes. All interventions must conform to standards of care. Nurses should understand the reason for any intervention, the expected effect, and any potential problems that may result. Understanding the reason for a nursing intervention is the hallmark of a professional nurse, in that the nurse is using logic and/or scientific reasoning as the basis of practice. Nursing interventions are a blend of science (rational acts) and art (intuitive actions). It is important for novice nurses to identify the **rationale** (the fundamental principle) of all interventions in order to implement theory-based practice. Prior to implementation, it is necessary to determine exactly:

- What is to be done
- How it is to be done
- When it should be done
- Who will do it
- How long it should be done

Interventions are determined by and directed toward the cause of the problem or factors contributing to the nursing diagnosis and may vary for clients with similar nursing diagnoses depending on realistic expected outcomes for the individual. Consideration should be given to client preferences, the developmental level of the client, and availability of resources. In addition, the health care practitioner's orders often have an impact on nursing interventions by imposing restrictions on factors such as diet or activity.

Types of Nursing Interventions

Nursing interventions are written as orders in the care plan and may be nurse-initiated, health care practitioner-initiated, or derived from collaboration with other health care professionals. These interventions can also be categorized as independent, dependent, or interdependent, depending on the authority required for initiation of the activity.

Interventions can be implemented on the basis of standing orders or protocols. A **standing order** is a standardized intervention written, approved, and signed by a health care practitioner that is kept on file within health care agencies to be used in predictable situations or in circumstances requiring immediate attention. Nurses can implement standing orders in these situations after they have assessed the client and identified the primary or emerging problem. For example, nurses in an ambulatory clinic or home health care agency may have standing orders for administering certain medications or ordering laboratory tests when indicated, or a health care practitioner may establish standing orders on an inpatient unit that specify certain medications that can be administered

for common complaints such as headache. Table 9-3 provides an example of standing orders used for client preparation for a barium enema.

A **protocol** is a series of standing orders or procedures that should be followed under certain specific conditions. They define what interventions are permissible and under what circumstances the nurse is allowed to implement the measures. Health care agencies or individual health care practitioners frequently have standing orders or protocols for client preparation for diagnostic tests or for immediate interventions in life-threatening circumstances. These protocols prevent needless duplication of writing the same orders repeatedly for different clients and often save valuable time in critical situations.

Nursing Interventions Classification

The Iowa Intervention Project has developed a taxonomy of nursing interventions that includes both direct and indirect activities directed toward health promotion and illness management (Iowa Intervention Project, 1993). This taxonomy, the Nursing Interventions Classification (NIC), is a standardized language system that describes nursing interventions performed in all practice settings. "NIC offers a standardized language that communicates the nature and worth of the work we do. Without it, nursing will remain in jeopardy" (Eganhouse, Comi-McCloskey, & Bulechek, 1996). NIC is a method for linking nursing interventions to diagnoses and client outcomes (McCloskey, Bulechek, & Eoyang, 1999).

The format for each intervention is as follows: label name, definition, a list of activities that a nurse performs to carry out the intervention, and a list of background readings (McCloskey & Bulechek, 1996) (See Table 9-4). NIC offers standardized language for research on nursing interventions and is a promising tool for determining reimbursement for nursing services.

TABLE 9-3
Example of Standing Orders

Date	Physician's Orders
8/1	Standing Orders for Barium Enema
	<i>Prior to test:</i>
	Clear liquid supper evening prior to test
	16 oz citrate of magnesia 6 PM
	Ducolax tabs iii at 8 PM
	NPO after midnight
	Enemas until clear AM of test
	<i>Following test:</i>
	Milk of magnesia 30 ml PO

Nursing Intervention Activities

Nursing interventions include:

- Assisting with ADL
- Delivering skilled therapeutic interventions
- Monitoring and surveillance of response to care
- Teaching
- Discharge planning
- Supervising and coordinating nursing personnel

Implementing nursing interventions requires that consideration be given to client rights, nursing ethics, and the legal implications associated with providing care.

Clients have the right to refuse any intervention. However, the nurse must explain the rationale for the intervention and possible consequences associated with refusing treatment. If the intervention refused was health care practitioner-initiated, the health care practitioner should be informed of the refusal of care. Ethical standards require that clients be afforded privacy and confidentiality. Matters related to a client's condition and care should be discussed only with individuals directly involved with the client's care, and any discussion should be held in a location where information cannot be overheard by visitors or bystanders. From a legal standpoint, the nurse must ensure that the authority for prescribing any intervention has been satisfied and that applicable standards of care are maintained during implementation of all nursing interventions.

Activities of Daily Living

Clients frequently need assistance with ADL such as bathing, grooming, ambulating, eating, and eliminating. The goal for most clients is to return to self-care or to regain as much autonomy as possible. The nurse's role is to determine the extent of assistance needed and to provide support for ADL while at the same time fostering independence. Ongoing assessment is important for determining the appropriate balance between ensuring safety and promoting independence. For example, maintaining personal grooming is important for purposes of hygiene and comfort as well as for promoting self-esteem. The nurse must always provide privacy when assisting clients with personal hygiene. If these tasks are assigned to other personnel, adequate supervision is imperative to ensure compliance with these principles.

Therapeutic Interventions

Therapeutic nursing interventions are those measures directed toward resolution of a current problem and include activities such as administration of medications and treatments, performing skilled procedures, and providing physical and psychological comfort. Written orders must be verified before implementing interventions requiring prescriptive authority. Reassessment of the client is also needed to determine if the intervention remains appropriate. In addition, a nurse must also

NURSING ALERT

If nurses have never performed a specific procedure or feel unsure about their ability to safely perform the skill, they must always secure assistance before implementation.

understand the rationale, expected effects, and possible complications that could result from any intervention.

Monitoring and Surveillance

Observation of the client's response to treatment is an integral part of implementation of any intervention. Monitoring and surveillance of the client's progress or lack of progress are essential in determining the effectiveness of the plan of care and for detection of potential complications. Specific interventions require specific monitoring activities; however, typical monitoring activities include observations such as vital signs measurement, cardiac monitoring, and recording of intake and output.

Teaching

A key element in health promotion and illness management is the counseling of clients to help them modify their behaviors in response to potential health risks and actual health alterations. As part of this teaching process, nurses must also discuss the rationales for the interventions that are included in the nursing plan of care.

Numerous opportunities arise every day for informal teaching related to client care. For example, teaching clients about the medications they are taking and possible side effects should occur routinely as medications are administered. Similarly, as nurses perform assessment activities, the sharing of observations with the client can be informative in terms of what characteristics are desirable and what observations are sources of concern. This knowledge can be valuable to a client when self-monitoring.

Effective teaching requires insight into the client's knowledge base and readiness to learn. Realistic teaching goals and learning outcomes should be set on the basis of these factors. It is also desirable to include the family or significant others in teaching plans. A suitable learning environment should be created that is non-threatening and allows active participation by the client. Nurses should be careful to use terminology easily understood by the client. It is important that learning outcomes are validated to be sure that clients can safely and effectively care for themselves on discharge.

Discharge Planning

Preparation for discharge begins at the time of admission to a health care facility. As the average length of

Title of Study

“Nursing Outcome Indicator: Preventing Falls for Elderly People”

Authors

Bezon, J., Echevarria, K. H., & Smith, G. B.

Purpose

To design and test interventions that prevent falls in elderly people.

Methods

In the study group (consisting of 115 subjects), each participant received a complete nursing assessment and a fall risk appraisal. The clients' risk factors determined which nursing interventions were implemented. Interventions used in this study included medication education, reducing medications, correcting visual and auditory impairments, providing assistive devices (e.g., walkers, canes) to people with a history of previous falls, and exercise to increase strength and flexibility.

Findings

Prior to implementation of the fall prevention program, 26% of the participants had fallen. During the initial year of the program, 3% experienced falls.

Implications

This study demonstrated that it is possible to decrease falls in the elderly through nursing interventions.

Bezon, J., Echevarria, K. H., & Smith, G. B. (1999). Nursing outcome indicator: Preventing falls for elderly people. *Outcomes Management for Nursing Practice* 3(2), 112–117.

stay in acute care settings continues to decrease, early discharge planning becomes imperative. Expected outcomes dictate the type of planning required and the interventions necessary to attain the desired outcomes. Interventions directed toward discharge planning include activities such as teaching and consultation with other agencies (e.g., home health, rehabilitation facilities, nursing homes, social services) concerning follow-up care. Teaching related to any changes in diet, medications, or lifestyle must be implemented; any barriers or problems in the home environment must be resolved before discharge. Some agencies employ personnel with the primary responsibility of teaching or discharge planning for groups of clients; however, the nurse who is car-

ing for the individual client is also responsible for ensuring that all appropriate interventions have been implemented before discharge.

Supervision and Coordination of Personnel

The management style and type of facility, as well as the needs of the client, determine the scope of interventions associated with supervision and coordination of client care. In a health care facility in which nurses are assigned clients within a total client care management system, responsibilities for supervision might be minimal, whereas facilities that use a variety of ancillary personnel for certain client activities might require a large percentage of time devoted to supervision of care. In home health care, for example, the primary role of the professional nurse might be supervision of personnel who provide assistance with ADL. Although a nurse might delegate certain tasks to other personnel, it is still the nurse's responsibility to ensure that the task was completed according to standards of care and to note the response of the client in order to evaluate progress toward expected outcomes.

Regardless of management style or type of facility, coordination of client activities among various health care providers remains the nurse's responsibility. For example, in acute care settings, the nurse needs to coordinate client activities around the schedule of diagnostic tests or physical therapy. Scheduling of procedures, therapy, treatments, and medications for a number of clients often requires considerable organizational skills, creativity, and resourcefulness.

Evaluating Interventions

An important step to assure the delivery of quality care is evaluation of nursing interventions. One approach to determining the efficacy of nursing interventions is by evaluating clients' achievement of expected outcomes. The Nursing Intervention Classification (NIC), previously described in this chapter, provides a systematic method for linking nursing activities to client outcomes. When treatment can be shown to directly improve client outcomes, both nursing and health care consumers benefit.

Another taxonomy, the Nursing Outcomes Classification (NOC) has been specifically designed to evaluate nursing interventions. NOC provides a common language for measuring client responses to nursing interventions.

Documentation of Interventions

Communication concerning implementation of interventions must be provided through written documentation and should also be verbally conveyed when responsibility of the client's care is transferred to another nurse. The nurse is legally required to record all interventions

and observations related to the client's response to treatment. This not only provides a legal record but also allows valuable communication with other health care team members for continuity of care and for evaluating progress toward expected outcomes. In addition, written documentation provides data necessary for reimbursement for services and tracking of indicators for continuous quality improvement.

The recording of information can be in the form of either checklists, flow sheets, or narrative summaries. A complete description must be provided if there are any deviations from the norm or if any changes have occurred.

Verbal interaction among health care providers is also essential for communicating current information about clients. Nurses who delegate the delivery of client care to assistive personnel must be careful to elicit their feedback related to activities completed and the client's response to any interventions. In addition, assistive personnel should be alerted as to what additional data are meaningful, and these data should be conveyed to the nurse responsible for the client's care. For example, if a nursing assistant observes that Mrs. Robbins, hospitalized with a deep vein thrombosis of the left leg, is having difficulty swallowing and has eaten very little, this information should be reported to the nurse. This is especially important if the behavior is a new occurrence and not a part of the established problem list, because the nurse might not otherwise seek this information.

Communication between nurses generally occurs at the change of shift, when the responsibility for care changes from one nurse to another. Nursing students must communicate relevant information to the nurse responsible for their clients when they leave the unit. Information that should be shared in the verbal report includes:

- Activities completed and those remaining to be completed
- Status of current relevant problems
- Any abnormalities or changes in assessment
- Results of treatments (i.e., client response)
- Diagnostic tests scheduled or completed (and results)

All communication—written and/or verbal—must be objective, descriptive, and complete. The communication includes observations rather than opinions and is stated or written so that an accurate picture of the client is conveyed. For example, if it is noted that a client is less alert today than yesterday, the *behavior* that led to that conclusion should be documented. This observation can be objectively and descriptively communicated by the statement: “Does not respond unless firmly touched; quickly returns to sleep.” This description results in a more complete picture of the client than simply stating: “Less alert today.” Thorough and detailed communication of implementation activities is fundamental to ensuring that client care and progress toward goals can be adequately evaluated.

KEY CONCEPTS

- The implementation step of the nursing process is directed toward meeting client needs and results in health promotion, prevention of illness, illness management, or health restoration and also involves delegation of nursing care activities to assistive personnel and documentation of the implementation activities performed.
- Implementation requires cognitive, psychomotor, and intellectual skills to accomplish goals and make progress toward expected outcomes.
- Implementation activities include ongoing assessment, establishment of priorities, allocation of resources, initiation of specific nursing interventions, and documentation of interventions and client responses.
- Ongoing assessment is necessary for determining effectiveness of interventions and for detection of new problems.
- Changing variables in clients and the environment demand clinical judgment and flexibility in organizing care.
- Time management skills are essential in implementing client care.
- The nurse maintains responsibility for care delegated to other health care personnel.
- The most common management systems currently used include functional nursing, team nursing, primary nursing, total client care, modular nursing, and case management.
- Interventions can be nurse-initiated, health care practitioner-initiated, or collaborative in origin, and thus are considered dependent, independent, or interdependent.
- Nursing Interventions Classification (NIC) is a system for sorting, labeling, and describing nursing interventions.
- Nursing interventions include assisting with activities of daily living, skilled therapeutic interventions, monitoring and surveillance of response to care, teaching, discharge planning, and supervision and coordination of nursing personnel.
- Communication concerning interventions should be provided verbally and in writing.

CRITICAL THINKING ACTIVITIES

1. Label each of the following nursing interventions as dependent (dep.), independent (ind.), or interdependent (int.).
 - _____ a. Applying a heating pad to a shoulder for 20 minutes
 - _____ b. Administering a pain medication as needed following surgery
 - _____ c. Turning a client with impaired mobility every 2 hours

- _____ d. Teaching a client about side effects of a medication
- _____ e. Assisting a client with oral care
- _____ f. Sending an order for a diagnostic laboratory test
- _____ g. Reviewing and conveying abnormal lab test results
- _____ h. Starting intravenous fluids
- List five implementation activities and give an example of each.
 - List two reasons for documentation of client care.
 - Situation:* Mary Long, age 42, has come to the clinic because of recurrent chest pains (although symptom-free at this time). Although there is a strong family history of heart disease, she has no personal history of heart problems. She is approximately 60 lb overweight and you determine that her lifestyle is rather sedentary and her diet high in fat content. She lives at home with her husband. Her children no longer live at home. Although she works part-time as a receptionist, her favorite activity is cooking.
Her health care practitioner mentions diet, exercise, and weight control as long-term activities, orders a series of tests to be done as an outpatient, and gives her a prescription for nitroglycerin tablets for chest pain.
What interventions do you think will be necessary and appropriate for Mrs. Long? How would you organize priorities for Mrs. Long?
 - Consider your most recent clinical experience. How could you have organized your time more effectively? Apply these same time management principles to your study time. How could you arrange your time more efficiently?
 - The next time you are in a clinical agency, examine your client's record for the previous 8 hours. Does it provide a vivid and accurate description of the client? How could the written documentation be improved?
 - Ask a nurse what activities occupy most of his or her time. What activities does the nurse most enjoy? What does the nurse least enjoy? Compare this nurse's perceptions with your own ideas.
 - How does the Nurse Practice Act in your state address delegation? Does the definition specifically address the registered nurse's role in supervising other nursing personnel? Licensed practical nurse's role? Delegation of nursing care to others? Has the Board of Nursing in your state established rules on delegation? If so, what do these rules allow? If not, how is the issue of delegation of nursing care addressed?
 - You are caring for Mr. Sims, who has had a stroke. The care plan includes the following activities and interventions:
 - Up in chair at bedside 3 times a day for at least 30 minutes
 - Assist bed bath/assist with eating
 - CT of head at 10:00 am
 - Strengthening exercises per physical therapy at 9:00 am
 - Routine medications at 9:00 am and 1:00 pm
 You are responsible for total client care for Mr. Sims. Write a plan of your activities with Mr. Sims.

Evaluation

Any profession which doesn't monitor itself becomes a technology.
—Phaneuf (in Gillies, 1994)

COMPETENCIES

1. Explain the purposes of evaluation in professional nursing practice.
2. Describe the components of comprehensive evaluation in nursing.
3. Identify the steps through which evaluation is conducted.
4. Describe the three types of evaluation.
5. Discuss the relationship between evaluation and accountability.
6. Discuss the significance of multidisciplinary collaboration in evaluating aspects of client care.

**KEY
TERMS**

evaluation
nursing audit
outcome evaluation
peer evaluation
process evaluation
structure evaluation

Evaluation is the fifth step in the nursing process and involves determining whether the client goals have been met, have been partially met, or have not been met. Even though it is the final phase of the nursing process, evaluation is an ongoing part of daily nursing activities that determines the effectiveness of those activities in helping clients achieve expected outcomes. Evaluation is not only a part of the nursing process, but it is also an integral process in determining the quality of health care delivered. In addition to discussing evaluation as part of the nursing process, this chapter also describes the role of evaluation in delivering quality care.

This chapter discusses the purposes, components, and methods of evaluation. The relationship between evaluation and quality of care is described.

EVALUATION OF CLIENT CARE

Evaluation is the measurement of the degree to which objectives are achieved. Therefore, evaluating the care provided to clients is an essential part of professional nursing. “Evaluation is a planned, systematic process . . . [that] compares the client’s health status with the desired expected outcomes” (Kenney, 1995, p. 195). The American Nurses Association (1998), in its *Standards of Clinical Nursing Practice*, designates evaluation as a fundamental component of the nursing process (see the accompanying display).

The purposes of evaluation include:

- To determine the client’s progress or lack of progress toward achievement of expected outcomes
- To determine the effectiveness of nursing care in helping clients achieve the expected outcomes
- To determine the overall quality of care provided
- To promote nursing accountability (discussed later in this chapter)

Evaluation is done primarily to determine whether a client is progressing—that is, experiencing an improvement in health status. Evaluation is not an end to the nursing process, but rather an ongoing mechanism that assures quality interventions. Effective evaluation is done periodically, not just prior to termination of care. Evaluation is

EVALUATION AS A STANDARD COMPONENT OF CARE: ANA STANDARDS

Standard VI: Evaluation

The nurse evaluates the client’s progress toward attainment of outcomes.

Guidelines

Evaluation must:

- Be performed as a systemic process
- Occur on an ongoing basis
- Lead to revision of the plan of care when needed
- Involve the client, significant others, and other members of the health care team
- Be documented

From American Nurses Association. (1998). *Standards of clinical nursing practice*. (2nd ed.). Washington, DC: Author. Reprinted with permission of the author.

closely related to each of the other stages of the nursing process. The plan of care may be modified during any phase of the nursing process when the need to do so is determined through evaluation. Client goals and expected outcomes provide the criteria for evaluation of care.

COMPONENTS OF EVALUATION

Evaluation is a fluid process that is dependent on all the other components of the nursing process. As shown in Figure 10-1, evaluation affects, and is affected by, assessment, diagnosis, outcome identification and planning, and implementation of nursing care. Table 10-1 shows how evaluation is woven into every phase of the nursing process. Ongoing evaluation is essential if the nursing process is to be implemented appropriately. As Alfaro-LeFevre (1998) states:

When we evaluate early, checking whether our information is accurate, complete, and up-to-date, we’re able to make corrections *early*. We avoid making deci-

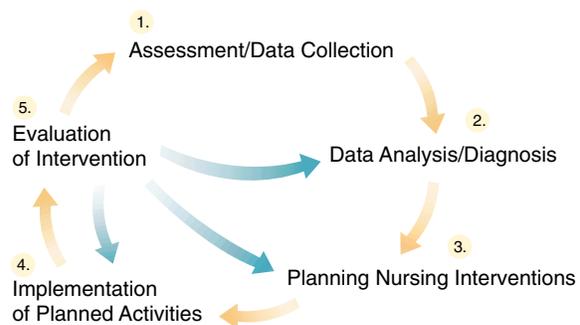

Figure 10-1 Relationship of Evaluation to Nursing Process

TABLE 10-1
Interaction between Evaluation and the Other Phases of the Nursing Process

Nursing Process Phase	Evaluation Focus
Assessment	Data collection was thorough and complete. Data were collected from multiple, varied sources. Data were relevant to client needs. Appropriate methods were used to obtain data. A systematic, organized method was used in collecting data.
Diagnosis	Nursing diagnoses were client-centered, accurate, and relevant. Each nursing diagnosis was complete. Nursing diagnoses were comprehensive. Diagnoses were based on the collected data. Nursing diagnoses guided planning and implementation of care.
Outcome identification and planning	Expected outcomes were relevant to nursing diagnoses. Objectives were prioritized. Outcomes were realistic and achievable. Resources (including team members) were used efficiently. Nursing plans were documented.
Implementation	Team members followed the plan of care. Necessary resources were available. Nursing actions assisted client in meeting expected outcomes. Client achieved expected outcomes.

(Data from Gillies, D. A. [1994]. *Nursing management: A systems approach* [3rd ed., pp. 511–535]. Philadelphia: Saunders; Kenney, J. W. [1995]. Evaluation. In P. J. Christensen & J. W. Kenney [Eds.], *Nursing process: Application of conceptual models* [4th ed., pp. 195–207]. St. Louis, MO: Mosby.)

sions based on outdated, inaccurate, or incomplete information. Early evaluation enhances our ability to act safely and effectively. It improves our *efficiency* by helping us stay focused on priorities and avoid wasting time continuing useless actions. (p. 22)

There are specific criteria to be used in the process of evaluation. The evaluation criteria must be planned, goal-directed, objective, verifiable, and specific (that is, strengths, weaknesses, achievements, and deficits must be considered).

Techniques

Effective evaluation results primarily from the nurse's accurate use of communication and observation skills. Both verbal and nonverbal communication between the nurse and the client can yield important information about the accuracy of the goals and expected planned outcomes and the nursing interventions that have been executed for resolution of the client's problems. The nurse needs to be sensitive to clients' willingness or hesitation to discuss their responses to nursing actions and must use the techniques of therapeutic communication to collect all necessary data.

The nurse must be sensitive to changes in the client's physiological condition, emotional status, and behavior. Because these changes are often subtle, they require astute observational skills on the part of the nurse. Observation occurs through use of the senses. In other words, what the nurse sees, hears, smells, and feels when touching the client all provide clues to the client's current health status.

Sources of Data

Evaluation is a mutual process occurring among the nurse, client, family, and other health care providers. Both subjective and objective data are used in evaluating the client's status. Asking clients to describe how they feel results in subjective data. Objective data consist of observable facts, such as laboratory values and the client's behavior. When a nurse communicates an assessment of a client's response to an actual or potential health problem, clients and families are empowered to discuss their concerns and questions. When feedback is given, the nurse must avoid being defensive, because that attitude may cause clients or families to avoid being open and honest. As a result, they may only say what they think the nurse wants to hear or they may

completely refuse to participate in the evaluation process. The nurse's verbal and nonverbal communication establishes the atmosphere in which clients and families freely share their comments, both positive and negative.

Goals and Expected Outcomes

The effectiveness of nursing interventions is evaluated by examination of goals and expected outcomes. Goals provide direction for the plan of care and serve as measurements for the client's progress or lack of progress toward resolution of a problem.

Realistic goals are necessary for effective evaluation. These goals must take into consideration the client's strengths, limitations, resources, and the time frame for achievement of the objectives. Examples of client strengths are educational background, family support, and financial resources (for instance, money to purchase medications and foods that support the prescribed interventions). Examples of client limitations are delayed developmental level, poverty, and unwillingness to change (lack of motivation).

METHODS OF EVALUATION

The nurse who successfully evaluates nursing care uses a systematic approach that ensures thorough, comprehensive collection of data. Evaluation is an orderly process consisting of seven steps, which are explained here.

Establishing Standards

Specific criteria are used to determine whether the demonstrated behavior indicates goal achievement. Standards are established before nursing action is implemented. Evaluation of criteria examines the presence of any changes, direction of change (positive or negative), and whether the changes were expected or unexpected.

Collecting Data

Assessment skills are used to gather data pertinent to goals and expected outcomes. The nurse must be proficient in assessment skills for effective, comprehensive evaluation to occur. Evaluation data are collected to answer the following question: Were the treatment goals and expected outcomes achieved?

Determining Goal Achievement

Data are analyzed to determine whether client behaviors indicate goal achievement. This process is validated through analysis of the client's response to the specific

nursing interventions that are developed in the plan of care. For example, these data can take the form of either physiological responses (such as the client's being able to cough productively in order to promote effective breathing patterns) or psychosocial responses (such as the client's being able to verbalize concerns about an impending surgical procedure in order to alleviate anxiety).

Relating Nursing Actions to Client Status

Nursing interventions are examined to determine their relevance to the client's needs and nursing diagnoses. Efficient nursing actions are those that address pertinent client needs and are proven to be primary factors in helping clients appropriately resolve actual or potential problems.

Judging the Value of Nursing Interventions

Critical-thinking skills are employed to determine the degree to which nursing actions have contributed to the client's improved status. These skills enable the nurse to apply an analytical focus to the client's responses to the nursing interventions and thus to evaluate the benefits of those actions and identify additional opportunities for change.

Reassessing the Client's Status

The client's health status is reevaluated through use of assessment and observation skills. Evaluation focuses on the client's health status and compares it with baseline

NURSING CHECKLIST

Evaluating Nursing Care

Following are guidelines useful in analyzing the application of the nursing process:

- Assessment was thorough and accurate.
- Nursing diagnoses were relevant.
- Client and family participated in goal setting.
- Goals were specific, measurable, and realistic.
- Nursing actions addressed client's problems.
- Client and family participated in evaluation.
- Evaluation was ongoing and resulted in a revised plan of care as the client's status changed.
- Plan of care was revised according to the client's needs.
- Documentation reflected the client's status, including responses to nursing interventions.

data collected during the initial assessment. Omissions or incomplete data within the database are identified so that an accurate picture of the client's health status is obtained.

Modifying the Plan of Care

If the evaluation data indicate a lack of progress toward goal achievement, the plan of care is modified. These revisions are developed through the following process: reassessment of the client; formulation of more appropriate nursing diagnoses; development of new or revised goals and expected outcomes; and implementation of different nursing actions or repetition of specific actions to maximize their effectiveness (for instance, client teaching). See the Nursing Checklist for guidelines for evaluating effective application of the nursing process to client care.

Evaluation is performed by every nurse, regardless of the practice setting. For example, the home health nurse evaluates the care provided regularly throughout the client's relationship with the agency. Evaluation of the home care client is carried out in order to determine whether the care was delivered in an effective and efficient manner, to modify the plan of care as needed, and to decide when the client is ready for discontinuation of home care services. The accompanying display provides an example of evaluation performed by the home health care nurse.

Critical Thinking and Evaluation

Evaluation is a critical thinking activity. It is a deliberate mechanism used to analyze and make judgments. Nurses need to remain objective when evaluating client care in order to modify care based on reason rather than emotion. One critical thinking strategy, juxtaposing, is described as "putting the present state condition next to the outcome state in a side-by-side contrast"

APPLICATION: EVALUATION IN THE HOME HEALTH CARE SETTING

When evaluating the effectiveness of care, the home health care nurse can use the following questions to examine client achievement of expected outcomes:

- Were the goals realistic in terms of client abilities and time frame?
- Were there external variables (for example, housing problems, impaired family dynamics) that prevented goal achievement?
- Did the family have the resources (for example, transportation) to assist in meeting the goals?
- Was the care coordinated with other providers to facilitate efficient delivery of care?

(Pesut & Herman, 1999, p. 93). Nurses use juxtaposing throughout evaluative activities by comparing client responses to expected behaviors. They make conclusions about whether expected outcomes have been met. In order to make such conclusions, assessment data is needed to determine client progress toward achievement of objectives. Evaluation involves analysis and is much more complex than merely answering questions.

EVALUATION AND QUALITY OF CARE

Evaluation is performed at the individual and institutional levels. For example, individual evaluation focuses on the client's achievement of goals and also on the individual nurse's delivery of care. Quality and evaluation are closely related. This section examines the role of evaluation in assuring the delivery of quality health care. Because it is the mechanism used by nurses in determining the need for improvement, evaluation assists in the provision of quality care. The aspects that need to be evaluated to determine the quality of health care are:

- Appropriateness (the care provided adhered to standards and resulted in achievement of goals)
- Clinical outcomes
- Client satisfaction
- Cost-effectiveness
- Access to care
- Availability of resources

Quality management involves constant, ongoing evaluation (monitoring of activities).

Elements in Evaluating the Quality of Care

Organizational evaluation examines the agency's overall ability to deliver quality care. Evaluation can be classified according to what is being evaluated: the structure, the process, or the outcome. Table 10-2 provides an overview of the types of evaluation. Figure 10-2 illustrates the variables to be assessed in each type of evaluation.

Structure Evaluation

Structure evaluation is a determination of the health care agency's ability to provide the services offered to its client population. This type of evaluation focuses on assessing the systems by which nursing care is delivered (Barnum & Kerfoot, 1995). Structure evaluation examines the physical facilities, resources, equipment, staffing patterns, organizational patterns, and the agency's qualifications for staff. The majority of problems with providing effective health care stems from

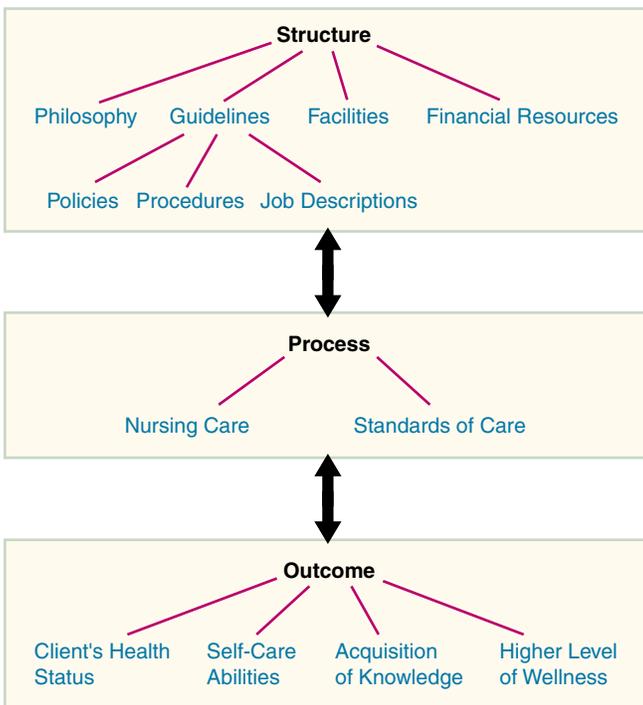

Figure 10-2 Elements within Each Type of Evaluation

problems in the structural area. The purpose of structure evaluation is to identify any system errors, which can then be corrected.

Structure evaluation involves determining whether client care meets legal and professional standards. A frequently used method to evaluate whether the agency provides care within legal parameters is a review of policy and procedure manuals to check for compliance with regulations.

Process Evaluation

Process evaluation is the measurement of nursing actions by examination of each phase of the nursing process. This type of evaluation is done to determine whether nursing care was adequate, appropriate, effective, and efficient. Nursing interventions are judged to be effective when use of the action results in the desired outcome. A nursing intervention is determined to be efficient through analysis of the intervention's cost-benefit ratio (Gillies, 1994). Process evaluation determines the nurse's ability to establish an environment that promotes the client's health. See Table 10-2 for sample questions used during process evaluation.

Outcome Evaluation

Outcome evaluation is the process of comparing the client's current status with the expected outcomes. This type of evaluation examines all direct care activities that affect the client's health status. According to Kenney (1995), "Outcome evaluation, though difficult, is the

most meaningful way to judge the effectiveness of nursing interventions" (p. 200).

Outcome evaluation focuses on changes in the client's health status. A basic question to ask when evaluating the outcome is: Has the expected change occurred? Such changes may include "modifications of symptoms; signs; knowledge; attitudes; satisfaction; skill; and compliance with treatment regimen" (Gillies, 1994, p. 517). Another variable assessed during outcome evaluation is the client's self-care ability. Has the client demonstrated an improved ability to care for self? Does the client verbalize knowledge related to self-care needs? See Table 10-2 for suggested approaches to performing outcome evaluation.

Title of Study

"Managing the Outcome of Infection: Nosocomial Infection Initiative"

Author

Houston, S.

Purpose

To demonstrate that the incidence of nosocomial pneumonia can be reduced by changing clinical practice.

Methods

This study was conducted on clients who had cardiovascular surgery. A tool was designed to identify clients who were at high risk for developing pneumonia. Clients scoring higher than the cut-off rate on the scoring tool were placed on a newly designed protocol for pneumonia prevention. Two clinical practices, handwashing and suctioning techniques, were selected as the variables for evaluating (by use of a checklist) clinicians' skills.

Findings

Within 1 year following implementation of the protocol, the pneumonia rate for cardiovascular surgery clients decreased by 37%.

Implications

This study demonstrates that changing clinical practice affects client outcomes. Evaluation of other nursing interventions could be considered for future study.

Houston, S. (1999). Managing the outcome of infection: Nosocomial infection initiative. *Outcomes Management for Nursing Practice*, 3(2), 73-77.

TABLE 10-2
Types of Evaluation

Purpose	Data Sources	Sample Evaluation Questions
Structure Evaluation		
Measures the adequacy of facility to meet needs of clients.	Policy and procedure manuals	Does the orientation program provide nurses with information relevant to the needs of their assigned areas?
	Job descriptions (including qualifications)	
	Staffing patterns	Do the nursing policies adhere to legal requirements?
	Credentials of staff	Are nursing policies easily accessed by staff?
	Written care plans	Do staffing patterns reflect ability to meet acuity needs of clients?
	Orientation programs	
Process Evaluation		
Measures the adequacy of nursing activities in implementing the nursing process.	Client interviews	Is every client assessed by a nurse upon admission to the agency?
	Demonstration of client's skills and knowledge	Is the plan of care individualized for each client?
	Documentation in client's record of nursing actions performed	Is the nursing care based on identified client needs? Is the client's response to the nursing actions documented?
Outcome Evaluation		
Compares client's progress to expected outcomes.	Observation of client	Does the client demonstrate new knowledge or skills?
	Client interview	Is there documented evidence of client progress toward achievement of expected outcomes?
	Chart audits	Is there documentation of the client's abilities to cope with the problem after discharge?
	Written discharge plans	

(Data from Barnum, B. S., & Kerfoot, K. M. [1995]. *The nurse as executive* [4th ed., pp. 236–248]. Gaithersburg, MD: Aspen; Gillies, D. A. [1994]. *Nursing management: A systems approach* [3rd ed., pp. 511–535]. Philadelphia: Saunders; Kenney, J. W. [1995]. Evaluation. In P. J. Christensen & J. W. Kenney [Eds.], *Nursing process: Application of conceptual models* [4th ed., pp. 195–207]. St. Louis, MO: Mosby.)

Nursing Audit

A **nursing audit** is the process of collecting and analyzing data to evaluate the effectiveness of nursing interventions. A nursing audit can focus on implementation of the nursing process, client outcomes, or both in order to evaluate the quality of care provided. Nursing audits examine data related to:

- Safety measures
- Treatment interventions and client responses to the interventions
- Preestablished outcomes used as basis for interventions
- Discharge planning
- Client teaching
- Adequacy of staffing patterns

Audits are based on components such as institutional policies; federal, state, and local regulations; accreditation standards; and professional standards (see Figure 10-3). Audits assist in identifying strengths and weaknesses that, in turn, provide direction for areas needing revision. Corrective action plans are developed in accordance with the audit results.

Peer Evaluation

Another method of evaluating quality of care is **peer evaluation** (also referred to as *peer review*), the process by which professionals provide to their peers critical performance appraisal and feedback that are geared toward corrective action. According to the ANA (1988):

Figure 10-3 Influences Affecting Nursing Audit

Peer review in nursing is the process by which practicing Registered Nurses systematically assess, monitor, and make judgments about the quality of nursing care provided by peers, as measured against professional standards of practice. (p. 3)

In 1984, Lucille Joel postulated that peer review is the basis of nursing's autonomy and self-governance (Joel, 1984). This perspective is still very relevant in today's health care climate. By evaluating itself, nursing is demonstrating an essential criterion by which professions are recognized. Peer evaluation promotes both professional and individual accountability.

The quality of nursing care is strongly evident to coworkers and nurses who are expected to assess the work of their peers. "Peer review is an essential mechanism for evaluating the judgment and performance of clinical providers" (Wakefield, Helms, & Helms, 1995, p. 11).

Such judgment may result in one of the following outcomes:

- Destructive: Complaints and attacks that undermine morale and cohesiveness
- Constructive: Positive feedback that improves the quality of care

Peer evaluation can be destructive if the parties involved begin to personalize the process, misunderstand the purpose, or deliver feedback in an unfeeling and

NURSING TIP

Objective Peer Evaluation

To make peer evaluations more effective, focus on observable behaviors rather than on the individual's personality. A focus on the personality can be threatening and counterproductive to the evaluation process.

THINK ABOUT IT

Peer Evaluation and Friendship

Your coworker is also a close friend. You are assigned to perform a peer evaluation with her. Before the process begins, she asks you to be especially lenient when evaluating her performance. When collecting information about the quality of her work, you discover that she is often hurried and unorganized, a practice that results in her providing only mediocre care. You know that if the evaluation is not above average, your friend will likely experience disciplinary action from her supervisor. In view of your friendship, what do you do in this situation?

PRINCIPLES OF EFFECTIVE PEER EVALUATION

Effective peer evaluation:

- Improves the quality of client care
- Promotes professional growth
- Is timely, frequent, and ongoing
- May be formal or informal, verbal or written
- Is not anonymous
- Is objective—that is, addresses specific behavior
- Is not linked to financial rewards (salary raises) or promotional opportunities
- Needs to be documented

(Data from Cohen, B., Berube, R., & Turrentine, B. [1996]. A peer review program for professional nurses. *Journal of Nursing Staff Development*, 12 (1), 13.)

EVALUATION AND ACCOUNTABILITY

Accountability means assuming responsibility for one's actions. Evaluation enhances nursing accountability by providing a mechanism for assisting the nurse to define, explain, and measure the results of nursing actions. Accountability is increased by ongoing evaluation; nurses are continually checking their own progress against predetermined standards.

Accountability is an integral part of professional nursing practice and is an important method through which commitment to quality client care can be demonstrated. "Nurses are accountable for designing effective care plans, implementing appropriate nursing actions, and judging

nonobjective manner. Peer evaluation can be threatening when guidelines have not been established for the process and when the assessment focuses on emotions and personalities instead of on behaviors. Conversely, peer evaluation is constructive when the focus remains on quality improvement and encourages the continued growth and learning of all the parties involved. The accompanying display provides principles that promote the use of objective, nonbiased peer evaluation.

the effectiveness of their nursing interventions” (Kenney, 1995, p. 195). In other words, nurses are accountable, for their judgments, decisions, and actions, to:

- Clients, families, and significant others
- Colleagues
- Employers
- The general public (society)
- The nursing profession
- Themselves

Nurses demonstrate their commitment in a variety of ways, including:

- Maintaining expertise in skills
- Participating in continuing education programs
- Achieving and maintaining certification
- Participating in peer evaluation

NURSING CARE PLAN

The Client Experiencing Self-Care Deficits and Risk for Injury

Case Presentation

Mr. Bobby Magee was admitted yesterday with right-sided weakness. His medical diagnosis is cerebral vascular accident (CVA). He is 68 years of age and resides alone in the house on his farm where he and his wife lived for 40 years. She died last year. He reports that he is right-handed and has difficulty holding a fork.

Assessment

- “I can’t handle this milk carton with only one hand.”
- “I do not like to use that walker. It gets in my way.”
- Gait unsteady and shuffling
- Asymmetrical strength in arms and legs
- Unable to hold fork in right hand

Nursing Diagnosis #1

Feeding Self-Care Deficit related to weakness in right hand and inability to hold fork.

Expected Outcomes

The client will:

1. Attend a teaching session on feeding himself with his left hand at 1000, on 2/12.
2. Practice using adaptive spoon at 1400 on 2/12.
3. Use adaptive spoon for meals beginning with breakfast on 2/13.

Interventions/Rationales

1. Present a teaching session “Feeding oneself with the nondominant hand” at 1000, on 2/12. *For clients recovering from illness and/or injury, information about adapting to limitations fosters independence.*
2. Provide the client with four foods of differing textures, adaptive spoons, and apron for a practice session at 1400, on 2/12. *Providing practice time reinforces skills learned and fosters an improved confidence level in the learner.*
3. Notify the dietary department to include a left-hand adaptive spoon with breakfast tray on 2/13. *Using adaptive devices provides safety and promotes independence.*
4. Encourage client to feed self independently at each meal, beginning 2/13. *Recognizing and commending success promotes positive self-esteem.*
5. Assist client with food preparation and feeding as needed at each meal, beginning 2/12. *Assistance preserves strength and avoids tiring the client, promotes safety, and decreases frustration as the client strives for independence.*

Evaluation

1. Mr. Magee attended teaching session on 2/12, asked questions, and participated in the practice session.
2. Goal partially met. Mr. Magee practiced using a spoon in his left hand to feed himself oatmeal, soup, ice cream, and canned peaches on 2/12. Successful self-feeding with all foods except soup. Continue practice, reevaluate 2/19.
3. Goal partially met. On 2/13, fed self 75% of each meal, using adaptive spoon. Continue. Reevaluate on 2/15.

(continues)

NURSING CARE PLAN**The Client Experiencing Self-Care Deficits and Risk for Injury
(continued)****Nursing Diagnosis #2***Risk for Injury: Falls* related to unsteady, shuffling gait.**Expected Outcomes**

The client will:

1. Participate in physical therapy evaluation of mobility strengths and weaknesses on 2/11 at 1100.
2. Attend a muscle-strengthening class on 2/12 at 1600.
3. Perform all strengthening exercises prescribed BID at 1000 and 1600, beginning 2/13.

Interventions/Rationales

1. Request physical therapy consultation for appropriate assistive devices, strengthening exercises, and gait training on 2/11. *Collaboration with other health care providers provides the best care for the client.*
2. Escort client to muscle-strengthening class on 2/12 at 1600. *Provides safety and support as the client begins to learn new skills.*
3. Assigned caregiver will record each exercise, number of repetitions, and client response BID. *Documenting client progress toward the achievement of goals aids in outcome attainment and evaluation of care.*

Evaluation

1. Goal not met. Appointment not kept on 2/11. Dental emergency. Continue. Reevaluate 2/15.
2. Goal not met. Unable to evaluate on 2/12. Continue. Reevaluate on 2/15.
3. 2/15: Goal met. Client attended muscle-strengthening class and has performed exercises as prescribed two times each day.

**MULTIDISCIPLINARY
COLLABORATION
IN EVALUATION**

Evaluating the quality of care provided is a responsibility shared among members of the health care team. In addition to those directly involved (the health care providers, clients, and families), others interested in the outcomes of evaluation include the community and third-party payers (both public and private reimbursement organizations).

An ongoing monitoring process is implemented to evaluate quality of care. Ideally, every discipline monitors its own quality efforts. No single discipline is responsible for all-inclusive evaluation of client care. However, in most health care agencies, nurses are actively involved in monitoring evaluation activities. Many agencies have nurses on staff who function either as quality management coordinators, utilization review evaluators, or both.

When health care providers from all the relevant disciplines are involved in evaluation, the result is decreased fragmentation of care. The team approach mandates active involvement of all care providers in the evaluation of quality care. Multidisciplinary evaluation helps promote a continuum of care for the client, from the preadmission phase to discharge planning and follow-up care.

KEY CONCEPTS

- Evaluation, the fifth step in the nursing process, involves determining whether the client goals have been met, have been partially met, or have not been met.
- The purposes of evaluation are to determine the client's progress or lack of progress toward achievement of client objectives, to judge the value of nursing actions in helping clients to achieve objectives, to determine the health care agency's overall ability to deliver care in an effective and efficient manner, and to promote nursing accountability.
- Evaluation is based primarily on the skills of communication and observation.
- Evaluation is a mutual, ongoing process occurring among the nurse, client, family, and other health care providers.
- The effectiveness of nursing interventions is evaluated by examination of goals and expected outcomes that provide direction for the plan of care and serve as standards by which the client's progress is measured.
- Evaluation is an orderly process consisting of seven steps: establishing standards; collecting data related to the goals and expected outcomes; determining goal achievement; relating nursing actions to client status; judging the value of nursing interventions in assisting clients to achieve goals and objectives;

reassessing the client's status; and modifying the plan of care if necessary.

- There is a relationship between quality management and evaluation. Evaluation is necessary in the provision of quality care because it is the mechanism used by nurses in determining how to improve care.
- Structure evaluation judges a health care agency's ability to provide the services offered to its client population.
- Process evaluation measures nursing actions by examining each phase of the nursing process to determine the effectiveness of the actions in helping clients meet expected outcomes and goals.
- Outcome evaluation compares the client's current status with the expected outcomes and examines all direct care activities that affect the client's status.
- A nursing audit can focus on implementation of the nursing process, client outcomes, or both in order to evaluate the quality of care provided.
- Peer evaluation (peer review) is the process by which professionals provide to their peers performance appraisal feedback geared toward corrective action.
- Evaluation enhances professional nursing accountability by providing a mechanism for assisting the nurse to define, explain, and measure the results of nursing actions.
- Evaluating the quality of care is a shared responsibility among members of the health care team.

CRITICAL THINKING ACTIVITIES

1. When does evaluation of nursing care occur?
2. Describe the three types of evaluation and compare them in terms of purpose and methodology.
3. How does evaluation promote the individual nurse's accountability?
4. State specific ways in which a nurse can perform process evaluation.
5. What are the advantages of peer evaluation?
6. Develop criteria for conducting a nursing audit related to client safety in an extended-care facility.

The Therapeutic Nature of Nursing

- 11** Nursing, Healing, and Caring
- 12** Therapeutic Communication
- 13** Client Education
- 14** Nursing and Complementary/Alternative Treatment Modalities

Nursing, Healing, and Caring

Above all, nursing is caring.

—Diers (1986)

COMPETENCIES

1. Discuss the therapeutic value of nursing.
2. Explore the value of nursing care in today's technologically advanced health care system.
3. Compare selected perspectives on the relationship between caring and nursing.
4. Identify the three phases of the therapeutic relationship.
5. Discuss therapeutic use of self.
6. Identify the characteristics of a therapeutic relationship.
7. Discuss the use of the nursing process as a therapeutic modality.
8. Explore the various roles in which nurses function.

KEY
TERMS

active listening
attending behaviors
catharsis
client advocate
depersonalization
empathy
empowerment

healing
nurse-client relationship
orientation phase
paraverbal communication
presence
rapport
role

termination phase

therapeutic relationship
therapeutic use of self
working phase

This chapter presents information about caring—the fundamental value in nursing. The relationship between caring and nursing is explored and nursing’s impact on healing is examined. The nurse-client relationship is discussed, and the stages of this relationship are described with attendant nursing goals and behaviors frequently exhibited by clients.

NURSING’S THERAPEUTIC VALUE

Nursing is both an art and a science that leads to therapeutic outcomes in clients. The term **therapeutic** describes actions that are beneficial to the client.

Definition of Nursing

According to the American Nurses Association (ANA) (1995), nursing is defined as “the diagnosis and treatment of human responses to actual or potential health problems” (p. 9). This definition places nursing’s focus on the individual experiencing a health problem rather than on the problem (or disease) itself—that is, on caring for clients as they deal with health issues. Fitzpatrick (1983) perceives nursing “as facilitating the developmental process toward health, thereby helping clients to more fully develop their human potential” (p. 296). The idea of helping persons to grow and achieve their potential is pivotal in nursing.

The Canadian Nurses Association (1986), similarly, describes nursing as a caring relationship that helps the client achieve and/or maintain an optimal level of health.

Nursing: A Blend of Art and Science

Nursing creates therapeutic change through the application of scientific principles. As the science of nursing has rapidly progressed over the past decade, nurse theorists have formulated various frameworks by which to organize nursing’s unique body of knowledge. While continuing to expand its theoretical base, nursing must remain firmly rooted in its essence—caring. In other

words, nursing does not rely on science alone. The “art” of nursing refers to the caring, compassionate manner in which interventions are performed. “Nursing art is defined as helping patients create coherence in lives threatened by illness and change” (LeVasseur, 1999, p. 48). A prerequisite for the nursing art is the nurse’s commitment to helping the client; this trait is also referred to as intentionality. As Isenalumhe (2000) states:

Therapeutic use of self marks the art of nursing as different from the science of nursing. . . . The theories, concepts, and standard procedural techniques for clinical performance or practice in any profession constitute its scientific base. . . . The art of nursing can be learned, through shared, as well as hands-on, experience. (p. 25)

Purposes of Nursing

A **therapeutic relationship** is one that benefits the client’s health status. The therapeutic relationship is based on the belief that a person has a natural drive toward optimal health. Caring—being willing and able to nurture others—is an attribute of the effective nurse. Curing rids the client of the disease or disability; caring nurtures the person even if the disorder is incurable. When it is understood that complete, or perhaps even partial, recovery is not possible, nursing goals focus on facilitating comfort by alleviating pain and promoting as much client autonomy as possible.

CARING BEHAVIORS DEMONSTRATED IN NURSING PRACTICE

- Demonstration of concern
- Anticipation of client needs
- Providing preprocedural information
- Alleviation of anxiety and fear
- Effective communication
- Responding to client requests

(Data modified from Dingman, S. K., Williams, M., Fosbinder, D., & Warnick, M. [1999]. Implementing a caring model to improve patient satisfaction. *Journal of Nursing Administration*, 29(12), 30–37.)

Nursing promotes healthy lifestyle behaviors, prevents the development of illness and/or injury, and restores individuals to their optimal level of functioning.

Another purpose of nursing is to improve client satisfaction with the delivery of health care services. Consumer satisfaction greatly influences where services are provided. “Nurse caring is an important predictor of patient satisfaction” (Dingman, Williams, Fosbinder, and Warnick, 1999, p. 30). Nurses who demonstrate caring behaviors enhance the quality of care provided; thus, clients are more satisfied with the care delivered in a caring, compassionate manner. The accompanying display lists some specific caring behaviors.

Nursing: A Healing Modality

As stated by LeVasseur (1999), “Nurses endeavor to nurse patients through an illness to a satisfactory outcome, whether this is regaining health and function or coping with disability or the ultimate transition of a peaceful death” (p. 61).

Nursing is a humanistic discipline that provides care from a holistic framework. Seeing and responding to the client as a whole person instead of a disease, disorder, or case leads to complete care of the total person.

Healing is the process of recovery from illness, accident, or disability. This return to an optimum level of functioning may occur rapidly or gradually. Healing encompasses the physical, emotional, and spiritual domains of individuals. Nursing and caring are essential components in the healing process. See Chapter 15 for further discussion of nurses as healers.

CARING: AN INTEGRAL COMPONENT OF NURSING

Caring is a universal value that directs nursing practice. Leininger (1981) defines caring in the nurse-client relationship as “the direct (or indirect) nurturant and skillful activities, processes, and decisions related to assisting people to achieve or maintain health.” Even though clients cannot always be cured, caring is ongoing within the nurse-client relationship.

There are numerous concepts relative to caring in nursing. Some major ideas related to caring have been postulated in Watson’s Theory of Human Caring, Leininger’s Theory of Transcultural Caring, and Benner’s Novice to Expert model. Table 11-1 provides an overview of these concepts. Watson’s 10 carative factors are fully described in Chapter 2. The following

TABLE 11-1
Perspectives of Caring in Nursing

Theorist	Theory	Major Concepts
Watson	Theory of Human Caring	<ul style="list-style-type: none"> • Caring is central to nursing practice. • Emphasis is on the dignity and worth of individuals. • Each person’s response to illness is unique. • Caring is demonstrated interpersonally. • Caring involves a commitment to care and is based on knowledge.
Leininger	Transcultural Care Theory	<ul style="list-style-type: none"> • Caring is the essence of nursing. • Caring is universal, occurring in all cultures. • Caring behaviors are determined by and occur within a cultural context.
Benner	Novice to Expert	<ul style="list-style-type: none"> • Caring is central to all helping professions. • Caring is the foundation of being. • People and interpersonal concerns are important. • Caring is communicated through actions. • Problem-solving is a major component of caring. • Advocacy is caring.

(Data from Benner, P. [1984]. *From novice to expert: Excellence and power in clinical nursing practice*. Menlo Park, CA: Addison-Wesley; Benner, P., & Wrubel, J. [1988]. Caring comes first. *American Journal of Nursing*, 8[4], 1072–1075; Leininger, M. [1994]. *Transcultural nursing: Concepts, theories, and practices*. Columbus, OH: Greyden Press; Watson, J. [1999]. *Nursing. Human science and human care: A theory of nursing*. Norwalk, CT: Appleton-Century-Crofts; Watson, J. [1979]. *Nursing: The philosophy and science of caring*. Boston: Little, Brown.)

CARING BEHAVIORS THAT OCCUR IN DIFFERENT CULTURES: LEININGER'S TRANSCULTURAL CARE THEORY

Comfort	Protection
Empathy	Personalized help
Tenderness	Surveillance
Attention	Presence
Support	Trust
Compassion	Nurturance
Love	Restoration
Touch	Instruction

(Data modified from Leininger, M. [1994]. *Transcultural nursing: Concepts, theories, and practices*. Columbus, OH: Greyden Press.)

carative factors are directly related to the science of caring (Watson, 1999):

- Developing a humanistic-altruistic value system
- Nurturing faith-hope
- Cultivating sensitivities to one's self and others

Leininger identifies several behaviors as caring and states that these behaviors occur in various cultures; see the accompanying display.

Caring—being willing and able to nurture others—is a hallmark of the effective nurse. Caring occurs when a nurse acts in a genuine, authentic manner with the client. The professional mask is removed, allowing the nurse to respond in a compassionate manner. Providing emotional support is central to the act of caring.

Caring is more than an intuitive process; it can be learned both intellectually and interpersonally. One learns caring by interacting with others who demonstrate caring. When nurses exhibit caring behaviors, they are serving as role models—to students, colleagues, clients, and families. Caring is a process and an art that requires commitment and knowledge. Caring is a combination of behaviors and attitudes. The way in which nursing actions are implemented expresses caring. Specific behaviors that indicate caring are provision of information, relief of pain, spending time with clients and families, and promoting client autonomy. Treating each client in a dignified, courteous manner is the true expression of caring. Touch is an effective method for communicating a sense of caring (Figure 11-1). Touch, no matter how well intended, may sometimes be misinterpreted by a client. Therefore, it is wise to avoid touching clients who are suspicious, hostile, or very confused. Dingman et al. (1999) described the following as nursing behaviors that demonstrate caring:

- Introduce self to client.
- Call clients by their preferred names.
- Spend time with the client to review the plan of care.

THINK ABOUT IT

Importance of Caring

A television commercial for a real estate agency stated “People don't care how much you know till they know how much you care.” Do you think this statement is applicable to nursing? Why? Why not?

Care in the High-Tech Environment

Caring is the soul of nursing. It is what clients want and need most from nurses. Although technological advances have resulted in many possibilities in health care, the major risk of reliance on technology is that clients can be perceived as objects. The focus of attention becomes the disease, instead of the individual experiencing the illness. The professional nurse treats each client with respect and dignity because “persons in a technologically driven health care system will feel the need to be comforted, listened to, and treated with the utmost dignity and respect” (Bernardo, 1998, p. 47). **Depersonalization** is the process in which individuals are treated as objects instead of people. Some dehumanizing actions are checking on the equipment and not the person, failing to respond to the client, or communicating a lack of interest in what the client says. Nursing care counteracts depersonalization by seeing that “technology can be used so that care is person focused rather than technologically focused” (Bernardo, 1998, p. 41). (Figure 11-2).

The reason people are admitted to acute care facilities is to receive nursing care. Most diagnostic testing, treatment procedures, and some surgical interventions can be performed in outpatient settings such as clinics

Figure 11-1 Clapping the client's hand is one way to communicate through touch.

Figure 11-2 Nursing is caring. It is showing concern for and interest in the client. Identify behaviors of the nurse that demonstrate caring.

or physicians' offices. While receiving care, people want to be treated with compassion. The nontechnical element of care makes clients feel cared for as individuals; the use of high-touch activities communicates caring. As society continues to place a high value on technology, caring is often undervalued. Nursing makes a crucial contribution by valuing both care *and* technology. Ideally, "in the best of nursing practice, science and technology are only the tools for caring" (Benner & Wrubel, 1989, p. 211). Nursing care counteracts depersonalization by emphasizing a client's individuality. It is through caring that the nurse humanizes the client. Simpson (1999) states, "no matter how advanced we get technologically, humans and human interaction are at the core of everything that humans do" (p. 33).

THINK ABOUT IT

Caring and Client Control

What are some *specific* ways the nurse can help the client regain control of the situation?

NURSE-CLIENT RELATIONSHIP

Caring is communicated interpersonally, thus the vehicle for communicating a caring intent is the nurse-client relationship. The **nurse-client relationship** is the one-to-one interactive process between client and nurse that is directed at improving the client's health status or assisting in problem solving. The primary goal of the relationship is the client's achievement of therapeutic outcomes. The nurse-client relationship is a planned process that focuses on meeting the needs of the client. There are many differences between the therapeutic nurse-client relationship and a social relationship as shown in Table 11-2.

The interactive process between client and nurse greatly influences the client's progress in healing. Peplau (1952), the first nurse theorist to define nursing as an interpersonal process, viewed the nurse-client relationship as the basis of nursing. Interpersonal skills are the foundation for establishing the therapeutic relationship. Only through interacting does the nurse have the ability to adequately assess the client's needs, teach methods for best meeting those needs, empower the client to achieve goals, and evaluate the outcome of nursing interventions.

Phases of Therapeutic Relationship

The three phases of the nurse-client relationship are orientation, working, and termination. These phases overlap and influence each other. Each phase is characterized by specific client behaviors and nursing goals. Figure 11-3 illustrates the phases of the interactive relationship.

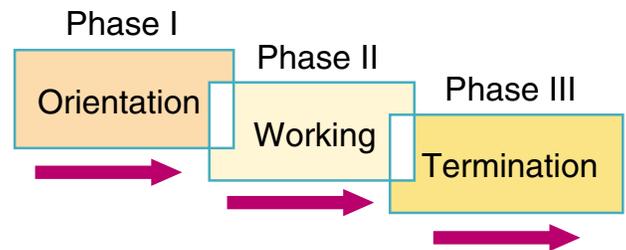

Figure 11-3 Phases of Nurse-Client Relationship

TABLE 11-2
Comparison of Social and Therapeutic Relationships

Social

- Is spontaneous, just happens.
- Is mutually beneficial.
- Often has no planned agenda.
- Is based on mutual interests.
- Each participant expects to be liked by the other.
- Problems are shared.
- Communication is spontaneous.

Therapeutic

- Is planned and goal-directed.
- Seeks to meet client's needs.
- Is based on theory.
- Privileged information is available to health care provider.
- Client is emotionally vulnerable.
- Client must be accepted as is.
- Communication is planned.
- Has clear-cut boundaries.

Orientation Phase

The **orientation** (or introductory) **phase** is the first stage of the therapeutic relationship, in which the nurse and client become acquainted with each other, establish trust, and determine the expectations of the other. Usually, the only knowledge the client and nurse have of each other is preconceived ideas. The nurse gets to know the client as an individual by giving up biases and judgmental thoughts. This stage is especially important because it is the time in which the foundation for the relationship is established.

The most important nursing goal during the orientation phase is to assess the client—to determine the client's needs, knowledge base, strengths and limitations, coping mechanisms, and support system. Often clients do not express their needs directly; behavior is the only clue to their needs. The nurse's goal is to determine the real meaning of the behavior and to assess the client's perception of the most crucial needs and problems.

To reduce a client's anxiety and promote trust, the nurse provides some specific information. Information the client should receive during the orientation phase includes:

- Nurse's name
- Nurse's role
- Confidentiality and its parameters
- Reasons the nurse must ask questions

The usual response of the client in the orientation stage is anxiety, which can result from several factors:

- Fear of the unknown
- Pain or distress
- Unfamiliar environment
- Undergoing unfamiliar, often painful, procedures
- Loss of freedom

As a result of the client's insecurity, anxiety escalates. Because anxiety is communicated interpersonally, the

nurse should project a calm, relaxed attitude during every interaction with the client to decrease anxiety.

Another behavior frequently exhibited by the client during the orientation stage is testing. The client attempts to determine the degree of the nurse's trustworthiness. Through behavior, the client is asking:

- Is the nurse truly willing to help?
- Is the nurse competent to help?
- Is the nurse reliable and trustworthy?

The nurse answers such questions through consistent, reliable behavior which promotes the development of trust.

THINK ABOUT IT

Management of Anxiety

Remember the last time you were anxious. What methods helped you calm down? Think of some specific actions that would reduce the client's anxiety level during the orientation phase.

Working Phase

The **working phase** is the second stage of the therapeutic relationship in which problems are identified, goals are established, and problem-solving methods are selected. Actions are chosen after carefully considering both the consequences of actions and the client's values. It is necessary to consider the client's value system when determining problem-solving methods. Client participation increases when consideration of values is incorporated into care planning. See Chapter 16 for a complete discussion of the concepts of culture, one of which is a system of dominant values.

The client engages with the nurse in active problem solving to achieve mutually developed outcomes. The nurse seeks to maximize the client's success in problem solving. Behaviors that indicate the client is in the working phase are:

- Asking questions about own problems
- Seeking clarification from the nurse
- Being attentive to instructions
- Asking for more information about his role in recovery

Nursing goals to be achieved during the working phase are to:

- Reevaluate goals and related activities as new information arises
- Support realistic problem-solving activities of the client

THINK ABOUT IT

Confidentiality in the Therapeutic Relationship

Nurses have an ethical and legal responsibility to protect client confidentiality. Consider what you would do in each of the following situations:

- You are assisting Ms. Adams with her AM care when she says, "Isn't it just terrible about Mr. Denton across the hall? I heard his tests came back negative. What are his chances of making it?"
- Your neighbor asks you if a mutual friend is being treated for AIDS.
- In a crowded elevator at work, you overhear two coworkers discussing a client's condition

Termination Phase

The **termination phase** is the third and final stage of the of the therapeutic relationship. It focuses on the evaluation of goal achievement and effectiveness of treatment. It is important that the client has been prepared for the final stage of the relationship by encouraging discussion of feelings. Some clients welcome this final phase, whereas other clients who have become overly dependent on their nurse will be more resistant to saying goodbye. Planning for termination is actually initiated during the beginning of the relationship. A relationship that ends abruptly is likely to place the client at risk for difficulties such as increased:

- Anxiety levels
- Frustration
- Suspiciousness
- Unwillingness to engage in future relationships with health care providers

Evaluation is the primary goal for the client and nurse in the third stage of the nurse-client relationship. Questions to be answered include:

- Were the goals meaningful?
- Were the goals realistic?
- Were the client and family actively involved?

The following nursing checklist can be used to evaluate skill in establishing a therapeutic nurse-client relationship.

NURSING CHECKLIST

Establishing Therapeutic Relationships

- Introduce self on initial contact
- Explain own role
- Develop groundwork for trust
- Establish therapeutic boundaries
- Determine client's perception of problem(s)
- Understand client's expectations of care
- Communicate at client's level of comprehension
- Involve client in evaluating treatment

THERAPEUTIC USE OF SELF

The interpersonal process between nurse and client is a therapeutic process because interventions are planned and implemented to benefit the client. The nurse's most effective tool for bringing about positive change is the **therapeutic use of self**, a process in which nurses deliberately plan their actions and approach the relationship

with a specific goal in mind before interacting with the client. The nurse's most effective tool for demonstrating caring is not some technologically sophisticated machine with lights and alarms but rather one's self. Figure 11-4 illustrates therapeutic use of self. Therapeutic use of self is "an opportunity for the nurse to be with persons at a human-to-human level" (Bernado, 1998, p. 48). The term **presence** refers to the process of "just being with" another. According to Bulechek and McCloskey (1985), presence is "a therapeutic tool of the nurse . . . an intervention instrument by merely remaining physically present with the patient" (p. 31).

Therapeutic use of self involves verbal and nonverbal communication. Just as important as what one says is *how* one says it. In this deliberate, planned approach, the nurse communicates a sense of caring and willingness to help: the nurse is committed to helping clients find ways to help themselves. The nurse's true expression of humanistic concern for a client is shown by taking the time to simply "be with" the client. Watson (1988) describes therapeutic use of self as the transpersonal aspect of nursing, that is, "an intersubjective human-to-human relationship in which the person of the nurse affects and is affected by the person of the other. Both are fully present in the moment and feel a union with the other" (p. 32).

Figure 11-4 In this situation, what factors indicate that rapport has been established between nurse and client?

CHARACTERISTICS OF THERAPEUTIC RELATIONSHIPS

“The route to therapeutic support for any client starts with establishing a positive relationship” (Isenalumhe, 2000, p. 25). To establish therapeutic relationships, the nurse must possess certain interpersonal skills (listed in the accompanying display), in order to encourage the client’s expression of feelings.

CHARACTERISTICS OF THERAPEUTIC NURSES

Warmth	Compassion
Hope	Self-awareness
Rapport	Flexibility
Trust	Risk-taking
Empathy	Active listening
Acceptance	Nonjudgmental
Humor	approach

The term **catharsis**, which refers to the relief experienced from verbalizing one’s problems, is illustrated in Figure 11-5. This “getting things off one’s chest” is a universal experience that is therapeutic for individuals experiencing anxiety.

Nurses use interpersonal skills to help clients meet their needs. A discussion of each characteristic follows.

Warmth

Warmth means exhibiting positive behaviors toward the client. Respect, genuine interest, caring—all are expressions of warmth. The nurse who demonstrates warmth is

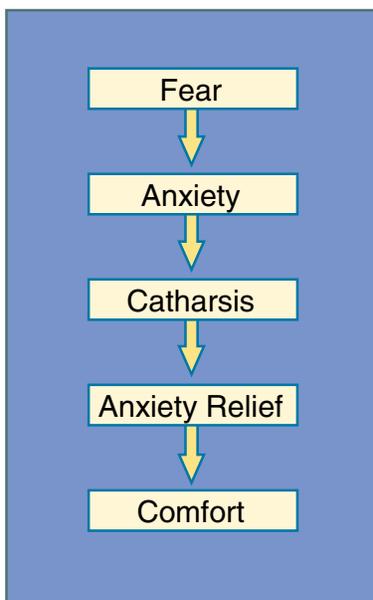

Figure 11-5 Cycle of Catharsis

approachable and available rather than aloof. Warmth means projecting a friendly, interested attitude without overwhelming the client with a false sense of cheerfulness. The nurse demonstrating warmth responds to the client as one human being to another. The therapeutic nurse is approachable and available yet maintains objective boundaries.

Hope

Hope means anticipating the future by helping clients look realistically at their potential. Hope is strengthened by relationships with others; social isolation reinforces a sense of despair. Many clients, especially those with great losses, experience distress, despair, and hopelessness. The reemergence of hope may be a gradual process. Hope is not to be confused with false reassurance. “Hope is the energy source that allows individuals to plan, act, and achieve” (Forbes, 1994, p. 6). See chapter 15 for a discussion of hope and spirituality.

THINK ABOUT IT

Hope Versus False Reassurance

Consider the following example of false reassurance. Mrs. Ngyuen is awaiting results of diagnostic testing that will confirm or deny the suspected diagnosis of cancer. She says to her nurse, “I think it’s taking a long time to get the results. Something must be wrong.” The nurse replies, “Oh, don’t worry, everything’s going to be just fine!”

- What do you suppose motivated the nurse’s response?
- What will be the impact of the nurse’s behavior on Mrs. Ngyuen?

Rapport

Rapport is a bond or connection between two people that is based on mutual trust. Such a bond does not just happen spontaneously; it is planned by the nurse who purposefully implements behaviors that promote trust. The nurse sets the tone of the relationship by creating an atmosphere in which the client feels free to express feelings. When seeking to establish trust, the nurse recognizes the client as a unique individual and reinforces that individuality. In other words, actions that humanize the client are therapeutic. To establish rapport, the nurse’s actions show that the client is considered important. Actions are implemented to boost the level of the client’s self-esteem. Nonverbal interventions are of utmost importance in helping establish rapport. Interacting with family and significant others is also helpful in establishing rapport with the client (Figure 11-6). Recognizing the importance of the family’s influence on the healing process allows the nurse to bond with those who will encourage and support the client.

Figure 11-6 Through interaction with the client's family, how can the nurse help the client obtain optimal health?

RESEARCH FOCUS

Title of Study

“Outcomes of Nurse Caring as Perceived by Individuals with Spinal Cord Injury During Rehabilitation”

Author

Lucke, K. T.

Purpose

To describe the meaning and consequences of nurse caring from the perspective of people with spinal cord injuries (SCI) during their rehabilitation.

Methods

A comparative analysis was done of subjects' responses to structured interview questions. Participants were interviewed at various stages of rehabilitation.

Findings

Nurses were perceived as caring when they had knowledge, interpersonal skill, technical skill, and competence. The nurses identified as caring assisted clients with SCI in achieving relevant outcomes during rehabilitation.

Implications

This study illustrates an ethical obligation of nurses working with SCI clients to demonstrate caring behaviors and form a working partnership with the clients. Caring relationships encouraged the emergence of hope, enabled clients to engage in self-care, and fostered feelings of dignity in the clients.

Lucke, K. T. (1999). Outcomes of nurse caring as perceived by individuals with spinal cord injury during rehabilitation. *Rehabilitation Nursing*, 24(6), 247–253.

Trust

Trust must be present for help to be given and received. A therapeutic relationship is firmly rooted in trust. How does the nurse promote a trusting relationship? Three major activities will facilitate the development of trust: *consistency*, *respect*, and *honesty*. Table 11-3 lists actions that facilitate the development of trust. Being consistently trustworthy is an expression of the nurse's personal integrity and builds the foundation for nursing effectiveness.

Empathy

Empathy—understanding another person's perception of the situation—is a key element in the therapeutic relationship. The phrase “Walk a mile in my shoes” describes empathy well. The empathic nurse understands that the client's perception of the situation is real to the client. By perceiving clients' understanding of their own needs, the nurse is better able to assist clients in determining what will work best. Empathy enables the nurse to assist the client to become a fully participating partner in treatment rather than a passive recipient of care.

Through empathy, the nurse validates the experiences of the client. The challenge for the nurse is to see the world from the client's perspective with as much understanding as possible. Empathy is not the same as sympathy. Sympathy is rarely therapeutic; in fact, a barrier occurs when the nurse is caught in sympathy and becomes paralyzed by the expression of pity. For example, through empathic listening does the nurse encourage the client to find meaning in his experience and move on to problem solving.

Acceptance

Accepting the client as a person worthy of dignity and respect is basic to providing nursing care. Acceptance means accepting and working with clients, even those

TABLE 11-3
Trust: Essential Behaviors

Consistency	Respect	Honesty
Follow through on plans.	Call client by name.	Ask client about personal preferences.
Adhere to schedule.	Provide clear explanations.	Keep any promises.
Seek out client for extra time to interact.	Recognize own strengths and limitations.	Maintain confidentiality.
Be straightforward/ no hidden motives.	Listen to client.	Be flexible in responding to requests.

THINK ABOUT IT

Acceptance of Clients

Think of some client behaviors that you may not approve of, such as smoking, using alcohol, refusing to comply with treatment, or aborting a fetus. Even when clients engage in behavior that nurses think is wrong, bad, or immoral, those clients still have a legal and ethical right to quality nursing care. How will you respond when caring for someone whose behavior opposes your basic values?

who sometimes exhibit undesirable behaviors. It is extremely important for the nurse to show acceptance of the client while setting limits on unhealthy or undesirable behavior. The accepting nurse conveys the message that the client does not have to put on a front. The client knows it is safe to be genuine because of the nurse's acceptance. Acceptance means caring for individuals whose value system may differ greatly from that of the nurse and not expressing shock or surprise at the client's behavior.

Active Listening

Active listening (listening that focuses on the feelings of the individual who is speaking) is the basic skill for interpersonal effectiveness. Active listening is facilitated by **attending behaviors**, a set of nonverbal listening skills that conveys interest in what the other person is saying. These behaviors allow the nurse to show caring, concern, and acceptance. Behaviors such as sitting down, maintaining eye contact, facing the client, and head nodding facilitate the development of trust. Active listening requires the nurse to turn down inner dialogue. Total attention must be focused on what the client is saying.

Also, it is important for the nurse to avoid looking rushed or distracted. The primary message that is communicated through active listening is the nurse's concern and intent to assist in problem solving. Active listening is required in *every* nurse-client relationship.

The active listener is cognizant of all three elements of communication: the *verbal, paraverbal, and nonverbal*. The verbal message is *what* is said. **Paraverbal communication** is the way in which a person speaks, including voice tone, pitch, and inflection, and the nonverbal message is body language. The active listener pays attention to all three aspects to hear the true intent of the communicator. Active listening means that the nurse focuses on the feelings behind the words, *not* just the words themselves. It is important for the nurse to note any incongruities between the client's verbal and nonverbal messages. For example, if the client says, "Oh, I'm just fine!" and is slumped over with head hanging down, there is an incongruity—the behavior and the words do not match.

The client's expression of feelings demonstrates trust in the nurse. This expression of trust must be recognized and respected. By listening carefully to the client,

TABLE 11-4
Outcomes of Active Listening

Establishment of rapport
Expression of genuine concern
Communication of intent to assist in problem solving
Promotion of comfort level
Decreased level of anxiety
Client empowerment for self-care
Learning is facilitated

the nurse is able to learn what the client perceives as the most crucial problem. *Listening is the first step in personalizing care for each client.* Listening can improve client outcomes. Table 11-4 lists outcomes of active listening.

Humor

Humor is another characteristic of therapeutic nurses. The use of humor as a therapeutic intervention is not a new concept for nurses. Nightingale (1860) recognized the influence of the mind on the body and acknowledged humor as an important nursing intervention.

As shown in Figure 11-7, humor can assist in establishing a relationship because it helps break the ice, decreases fear, and establishes trust. Humor is a medium for sharing; thus, it can be used to strengthen the therapeutic relationship.

Humor is defined to a great deal by one's cultural background, so it is imperative that the nurse be sensitive to the client's interpretation and use of humor. A humor assessment can be conducted by noting:

- What makes the client smile or laugh
- The use of jokes by clients
- Type of humor expressed by the client

Humor is a powerful tool for coping. Humor helps individuals to relieve stress and to express anger in a socially acceptable manner.

Nurses turn to humor to defuse the stress of the life-and-death situations that they face on a daily basis. Although humor can relieve tension and stabilize high-stress situations, it must be used with caution. It can be dangerous and destructive if used carelessly. See chapter 14 for guidelines on using humor with clients.

Compassion

Compassion is truly caring about what happens to another person. Kindness and genuine concern are demonstrated through compassionate acts. Some

Figure 11-7 Note the exchange of laughter between client and nurse. What are some therapeutic outcomes facilitated by the nurse's deliberate use of humor?

behaviors that communicate the nurse's compassion include:

- Acting on the belief that everyone is equally deserving of care.
- Treating individuals with dignity.
- Respecting a client's privacy—simple acts such as keeping the client covered and knocking on the door before entering the room show compassion.

Other examples of compassion are a nurse caring for the homeless in a shelter or holding the hand of a person with acquired immunodeficiency syndrome (AIDS).

Self-Awareness

Self-awareness is necessary for the nurse to be therapeutic. Being aware of one's feelings is the first step in developing therapeutic behavior. Knowledge of one's assets is necessary in that effective nurses are able to identify their own skills and abilities. Conversely, only after identifying deficits in knowledge and skills can the nurse initiate necessary improvements. This process of analyzing one's strengths and limitations is an ongoing basic part of learning. The therapeutic nurse knows that learning is a lifelong process that contributes to growth—personally and professionally. Self-awareness allows the nurse to remain objective, that is, separate

enough to distinguish one's own feelings and needs from those of the client.

Nonjudgmental Approach

Nonjudgmental behavior must be used if nursing interventions are to be therapeutic. Nonjudgmental means acting without biases, preconceptions, or stereotypes. Nonjudgmental nurses do not evaluate the client's moral values nor tell the client what to do; these nurses accept people as they are. Nonjudgmental nurses do not stereotype people, nor expect others to behave in certain ways because they belong to a certain group. Judgment influences perceptions because people tend to see what they expect to see. According to Sayer (1992, p. 48):

We see individuals as being representative of a social group. Here our own stereotypes and prejudices about the group come into play. Individuals may be seen as a representative of race, age group, socioeconomic level, gender, occupation, or disability. They will then be given the characteristics we believe people in that group have.

Judgmental behavior based on biases can interfere with the therapeutic value of nursing interventions. It is nontherapeutic for nurses to allow biased views that stem from personal values to influence their actions. The initial assessment of clients is often influenced by preconceived ideas.

Becoming nonjudgmental is an ongoing process. In a classic article, Blumenstock (1970, p. 37) stated:

Becoming nonjudgmental is hard work and a life time process, for none of us is ever free of judgmental feelings arising from our own evolving values. Thus, each of us is always in a state of "becoming."

There are several steps in becoming nonjudgmental:

- The first step is the most difficult—recognizing that one's thoughts are biased and prejudicial.
- Second, to change, nurses must accept their own feelings.
- The third step is identifying the source of the negative feelings—not to blame but to gain an understanding of the origins.

To counter such negative feelings, learn about different cultures. Getting to know people with diverse cultural backgrounds expands the knowledge base and helps one become more tolerant and open-minded.

Flexibility

Flexibility is another trait necessary for nurses to create a therapeutic relationship. A flexible nurse is one who is ready for the unexpected—knowing that every day is filled with unplanned events and situations. The flexible

nurse is able to adapt by “taking things in stride” and making necessary adjustments. Some of the unexpected events require immediate actions. The flexible nurse is able to establish priorities by determining which needs are urgent and which can be tended to later. Staying calm during a crisis is characteristic of the flexible nurse.

Risk-Taking

Risk-taking is a behavior that leads to innovative problem solving. To become effective risk-takers, nurses must give themselves permission to try something new, to step outside the ordinary, and to not be bound by tradition or fear. The result is creative solutions to problems. Successful risk-takers give themselves credit for trying something new regardless of the outcome. Smart risk-takers learn from those risk-taking ventures that are less than successful. They do not allow themselves to become complacent, content to stay at a comfortable plateau.

THERAPEUTIC VALUE OF THE NURSING PROCESS

The nursing process provides a framework for the delivery of compassionate care. It gives direction by organizing the nurse’s actions: assessing, diagnosing, planning, implementing, and evaluating.

The nursing process itself is therapeutic because it focuses on the client’s response to illness, disease, or disability rather than just on the problem. By focusing on the caring aspects, the nursing process helps nursing define its practice. Professional accountability is reinforced by the use of this process, which is client-centered. When functioning within the parameters of the nursing process, the nurse assumes a variety of roles.

NURSING ROLES

A **role** is a set of expected behaviors associated with a person’s status or position. Role includes behaviors, rights, and responsibilities. Nurses function in a variety of roles every day (see the accompanying display). Often roles overlap, which may lead to a conflict in expectations or responsibilities. A discussion of some predominant nursing roles follows.

NURSING ROLES

Caregiver	Change agent
Counselor	Team member
Teacher	Resource person
Client advocate	

Caregiver

The caregiver is the role most commonly associated with nursing by the general public. In the role of caregiver, the nurse provides direct care when clients are unable to meet their own needs. Specific activities characteristic of the caregiver role include feeding, bathing, and administering medications.

Counselor

When acting as a counselor, the nurse assists clients with problem identification and resolution. The counselor facilitates client action and does *not* tell clients what to do but assists clients to make their own decisions. Counseling is done to help clients increase their coping skills. Clients are frequently counseled in stress management, how to deal with chronic conditions, grief and bereavement. Effective counseling is holistic, in that it addresses the individual’s emotional, psychological, spiritual, and cognitive dimensions.

Teacher

Teaching is an intrinsic part of nursing. The nurse views *each* interaction as an opportunity for education; both client and nurse can learn something from every encounter with each other (Figure 11-8). Teaching by nurses can be formal, informal, intentional, or incidental. See Chapter 13 for information on increasing effectiveness of the teacher role.

Client Advocate

A **client advocate** is a person who speaks up for or acts on behalf of the client. Advocacy empowers clients to be partners in the therapeutic process rather than passive

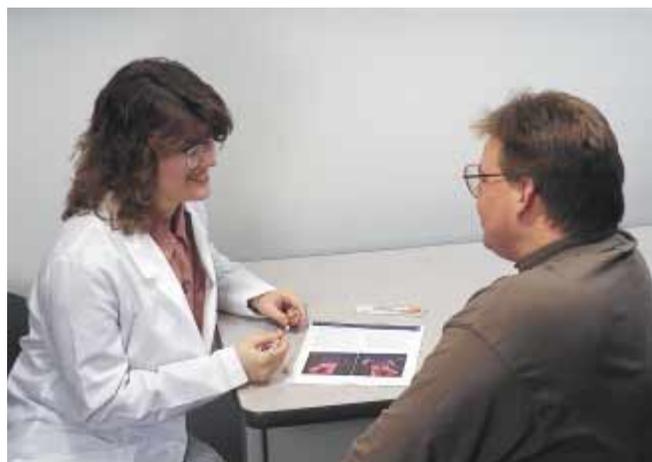

Figure 11-8 In this situation, the nurse is instructing the client on self-administration of medication before hospital discharge.

recipients of care. The relationship that encourages client empowerment is one of mutual participation by client and nurse. Clients and families are actively involved in establishing goals.

Frequently, clients and families do not communicate their concerns to physicians but will do so to the nurse with whom a bond has been established. Nurses function as client advocates by listening and communicating the expressed concerns to other health care providers and including those concerns into care planning.

Change Agent

Nurses who function in the role of change agent recognize that change is a complex process. The nurse change agent is proactive (takes the initiative to make things happen) rather than reactive (responding to things after they have happened). Change should not be done in a random manner. It should be planned carefully and implemented in a deliberate way to facilitate the client's progress.

Team Member

A vital role of the nurse is that of team member. The nurse does not function in isolation but rather works with other members of the health care team. Collaboration requires the nurse to use effective interpersonal skills and promotes continuity of care. See Chapter 12 for a discussion of the communication skills applicable to promoting healthy relationships with clients and colleagues.

Resource Person

The nurse functions as a resource person by providing skilled intervention and information. Identifying resources and making referrals as needed also fall under the auspices of this role. Nurses must consider the client strengths and access to resources, including physical, intellectual, economic, social, and environmental.

client problems, and communicate acceptance of the client.

- Nursing is an interpersonal process between someone who needs help in meeting needs and someone who is competent to assist in meeting those needs.
- The three interwoven phases of the nurse-client relationship are orientation, working, and termination.
- Therapeutic use of self is a process in which nurses deliberately plan their actions and approach the relationship with a specific goal in mind before interacting with the client.
- Several interpersonal characteristics and skills can be developed to increase the therapeutic value of a nurse's interventions. These include warmth, hope, rapport, trust, empathy, acceptance, active listening, humor, compassion, awareness, nonjudgmental attitude, flexibility, and risk-taking.
- The nursing process is the framework for providing compassionate care.
- Nurses function in a variety of roles when working with clients. The roles overlap and have specific responsibilities.

CRITICAL THINKING ACTIVITIES

1. Interview professional nurses. Ask them to identify specific ways they demonstrate caring.
2. Briefly write your philosophy of health, including your beliefs about healing and caring.
3. Talk with a family member who has been ill. Ask that person what promoted healing for them.
4. Analyze your next interaction with a client and determine:
 - a. Which attending behaviors you used
 - b. Other actions that let the client know you were actively listening
 - c. How you actualized the concept of therapeutic use of self
5. Some nurses believe it is "unprofessional" to laugh with clients, even when laughter is a natural response. What do you think of nurses using humor? Answer the following to help you decide:
 - a. What are the risks of using humor with clients?
 - b. Name two benefits of implementing humor with a client.
 - c. Answer the following true/false quiz:
 - _____ Humor has no place in health care.
 - _____ Humor is universally defined—what is funny to one person is funny to all.
 - _____ Medical research shows laughter results in positive physiological benefits.
 - _____ It is unprofessional to laugh when a client shares a funny experience with you.
 - d. Identify a situation in which humor has helped you cope with an anxiety-provoking situation.

KEY CONCEPTS

- Caring is the fundamental value in nursing.
- Today's "high-tech" environment requires that nurses provide humanistic caring.
- The therapeutic nurse-client relationship is the one-to-one interactive process between client and nurse that is directed at improving the client's health status or assisting in problem solving.
- Therapeutic relationships differ from social relationships in that they are deliberately planned, focus on

Therapeutic Communication

I learn a great deal by merely observing you, and letting you talk as long as you please, and taking note of what you do not say.

—T. S. Eliot

COMPETENCIES

1. Explain the process of communication.
2. Describe the modes of communication.
3. Discuss the types of communication.
4. Describe the benefits of communicating with other health care professionals.
5. Discuss the principles of therapeutic communication.
6. Identify approaches that facilitate therapeutic communication between nurses and clients.
7. Explore the barriers to effective therapeutic communication.

Communication is the fundamental element of the nurse-client relationship, client teaching, case management, staff development, and all the activities performed by nurses. In order to be an effective communicator, the nurse must be aware of the different levels on which communication is conducted between nurses and clients and among members of the health care team.

This chapter discusses the communication process, modes of communication, types of communication, and barriers to therapeutic interaction. Knowledge of these aspects of communication helps the nurse establish a therapeutic relationship with the client and thereby achieve successful outcomes of care.

THE COMMUNICATION PROCESS

Communication, the process of transmitting thoughts, feelings, facts, and other information, includes verbal and nonverbal behavior. Stuart & Laraia (1998) describe communication as every aspect of behavior and, therefore, more than simply transmitting or imparting facts. Meaning must be assigned to those facts for communication to occur. All people engage in the dynamic process of communication. In fact, people cannot *not* communicate.

In nursing, communication is the vehicle for establishing a therapeutic relationship with a client. There would be a void if the nurse did not relate to clients—if there were no fondness, no closeness, no bonding. In fact, communication *is* the relationship between nurse and client (Stuart & Laraia, 1998). The quality of the relationship between the nurse and the client is directly associated with the quality of communication between them.

Components of the Communication Process

The five major components of the communication process are sender, message, channel, receiver, and feedback (Figure 12-1). This model provides a framework for understanding the process of communication.

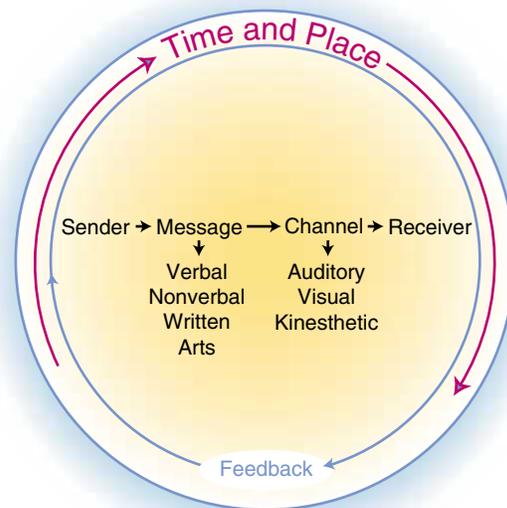

Figure 12-1 A Communication Model

The Sender

The communication process begins when a person, known as the **sender**, generates a message. Messages stem from a person's need to relate to others, to create meanings, and to understand various situations. Messages are generated by external factors, such as what the sender sees, hears, touches, tastes, or smells. However, the sender also perceives internal stimuli that generate messages. Examples of internal stimuli that affect communication include hunger, fatigue, or the mental activities of thinking and fantasizing (i.e., self-talk). The source (or encoder) is the stimulus, such as the idea, event, or situation. **Encoding** involves the use of language and other specific signs and symbols for sending messages.

The Message

The **message** is a stimulus produced by a sender and responded to by a receiver. Messages may be verbal, nonverbal, written materials, and arts. Verbal and nonverbal transmissions of messages are discussed at length later in this chapter.

The Channel

The **channel** is the medium through which a message is transmitted. There are three major communication channels: visual, auditory, and kinesthetic. The **visual channel** is sight, observation, and perception. The **auditory channel** consists of spoken words and cues. The **kinesthetic channel** refers to experiencing sensations. These channels are described in Table 12-1. Each person has a dominant channel that influences communication.

THINK ABOUT IT

Your Dominant Channel

To determine which channel—visual, auditory, or kinesthetic—is your dominant mode, ask yourself these questions. How do I learn best: by seeing, hearing, or doing? When people speak, what do I pay most attention to: their appearance, their words, or their actions?

The Receiver

The **receiver** is the person who intercepts the sender's message. Receiving is influenced by complex physiological, psychological, and cognitive processes.

The physiological component involves the process of hearing. Intact, healthy ears, as well as those areas of the brain involved in the hearing process, enable the receiver to hear messages. Good eyesight allows for the reception of messages via the visual channel. Likewise, homeostasis in those bodily structures where touch is applied allows for reception of those stimuli.

The psychological process refers to mental mechanisms that affect human behavior. This component may enhance or impede the receiving process. For example,

anxiety may restrict the perceptual field, causing the client to hear, see, or feel less accurately. However, during mild and moderate levels of anxiety, the perceptual field broadens, causing the client to be more alert and to hear, see, or feel more. See Chapter 20 for a complete discussion of the relationship between anxiety and perception.

The cognitive aspect is the “thinking” part of receiving and involves interpretation of stimuli, thus converting them into meaning. The receiver assigns meaning through his own brand of perceiving and “self-talk,” or communication with oneself. Engaging in too much self-talk may cause the receiver to do a poor job of listening. Controlling this self-talk requires continuous focusing and validating of the sender's message. Through cognitive processing, the receiver decodes messages, interprets them, and then provides feedback to the sender.

Feedback

Feedback is the information the sender receives about the receiver's reaction to the message. The function of feedback is to provide the sender with information about the receiver's perception of a situation. Having this information, the sender can then adjust the delivery of the message to communicate more effectively.

Communication is reciprocal in that both the sender and receiver must be involved; the sender must transmit the message, and the receiver must provide feedback for a communication to be complete. The accompanying display lists characteristics of effective feedback.

Factors Influencing Communication

In addition to channels, there are many other variables that influence communication. The primary influential factors are discussed below.

TABLE 12-1
Communication Channels

Channel	Mode of Transmission	Congruent Words
Visual	Sight	“I see what you mean.”
	Observation	“It looks perfectly clear that . . .”
	Perception	“Show me where it hurts.”
Auditory	Hearing	“I hear you.”
	Listening	“Tell me what you mean.” “Sounds like you're saying . . .” “Tell me what you mean.”
Kinesthetic	Procedural touch	“How does that feel?”
	Caring touch	“Just the cold, hard facts.” “That is so touching.”

CHARACTERISTICS OF EFFECTIVE FEEDBACK

- Specific rather than general
- Descriptive
- Provided in a supportive, nonthreatening manner
- Given in a timely manner (as soon as possible after the behavior or the message)
- Usable and appropriate to client needs
- Clear and unambiguous
- Direct and honest

Perception

Perception is a person's sensing and understanding of the world. Perception of an event or situation is unique in that it varies from person to person. "Perceptions are influenced by our culture, socialization, education, and experience" (Ward-Collins, 1998, p. 29). They help a person determine the meaning of the words and the content of the messages being communicated. It is important for the listener to confirm what she thinks

she has heard, because interpretation of the message depends upon the hearer's perception of the message.

Cultural Context

Because behavior is learned, nonverbal communication varies from culture to culture. For example, the messages communicated by touch and eye contact depend to a great extent on one's cultural context. See Chapter 16 for a complete discussion of cultural variations related to communication.

Space and Distance

Proxemics is the study of the distance between people and objects. Each person has an invisible buffer zone or personal space. Table 12-2 describes the types of personal space. Culturally defined, this boundary alerts a person as to how close another can comfortably approach. Invasion of personal space produces discomfort, anxiety, and the fight-or-flight response. The nurse respects the client's personal space in several ways, such as not touching or moving the client's possessions unless necessary.

TABLE 12-2
Types of Personal Space

Type	Description	Nursing Implications
Intimate distance (0 to 18 inches around the person's body)	<ul style="list-style-type: none"> • Reserved for people who feel close • Vision is affected in that it is restricted to one portion of the other's body; may be distorted • Tone of voice may seem louder • Body smells noticeable • Increased sensation of body heat 	<ul style="list-style-type: none"> • Nurses often must intrude on this space to provide care • Explain intention to client • Respect client's space as much as possible • May be used for comforting and protecting • Therapeutic examples: <ul style="list-style-type: none"> —Rocking a toddler —Administering a massage —Checking vital signs (temperature, pulse, respiratory rate, and blood pressure)
Personal distance (zone extends 1.5 to 4 feet around person's body)	<ul style="list-style-type: none"> • Usually maintained with friends • Vision is clear since more of the other person is visible • Tone of voice is moderate • Sensations of body smells and heat are lessened 	<ul style="list-style-type: none"> • Better able to read nonverbal communication at this distance • Therapeutic examples: <ul style="list-style-type: none"> —Conversation between client and nurse usually occurs in this zone —1-to-1 teaching —Counseling
Social or public distance (zone extends from 4 feet and beyond)	<ul style="list-style-type: none"> • Generally used when conducting impersonal business • Communication is more formal and less intense • Sensory involvement is less intense • Increased eye contact 	<ul style="list-style-type: none"> • Therapeutic examples: <ul style="list-style-type: none"> —Making rounds —Leading a group —Teaching a class

(From Giger, J. N., & Davidhizar, R.E. [1999]. *Transcultural nursing: Assessment and intervention* [3rd ed.]. St. Louis, MO: Mosby; Johnson, B. S. [1996]. *Psychiatric-mental health nursing: Adaptation and growth* [4th ed.]. Philadelphia: Lippincott.)

Time

The study of the effects of time on the communication process is referred to as **chronemics**. The amount of time spent in communicating depends on the client's needs. Some clients will require more of the nurse's time than others. The client who is seriously ill or non-trusting may respond better to brief, frequent contact than to prolonged, infrequent contact. If the nurse is hurried during the interaction with the client, a non-verbal message of impatience may be transmitted. Keeping clients waiting conveys a message that they are unimportant. On the other hand, the nurse who is prompt and who allows time for the client to talk communicates nonverbally, "You are important to me," and "I value you as a person."

The whole communication process is influenced by time. For example, the same message received at 3:00 AM will be perceived and responded to differently at 3:00 PM.

Levels of Communication

Communication occurs at different levels, with each level influencing the others. Discussed below are the intrapersonal, the interpersonal, and group levels of communication.

Intrapersonal Level

Intrapersonal communication is the messages one sends to oneself, including self-talk, or communication with oneself. A person receiving internal or external messages organizes, interprets, and assigns meaning to the messages. Figure 12-2 illustrates the process of self-talk. The result of this process is the individual's unique way of perceiving.

The message of the speaker may differ from that heard by the receiver because of the intrapersonal communication of each. Also, self-talk can interfere with attention to others and cause much to be missed during interpersonal exchanges.

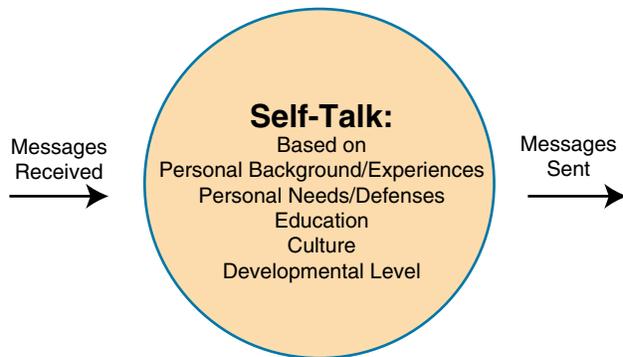

Figure 12-2 Intrapersonal Communication

Interpersonal Level

Interpersonal communication is the process that occurs between two people either in face-to-face encounters, over the telephone, or through other communication media. Interpersonal communication builds on the intrapersonal level in that each person communicating must communicate with the self in order to communicate with others. An important outcome of interpersonal communication is the development of an interpersonal relationship (see Figure 12-3). Interpersonal skills are essential competencies for nurses.

Group Communication Level

Group communication occurs when three or more people meet in face-to-face encounters or through another communication medium, such as a conference call. This level of communication is complex because of both the number of people communicating intrapersonally and interpersonally and the combinations of the people involved.

The study of the events that take place during group interaction is called **group dynamics**. The dynamics of any group can and will influence the productivity of the group. Nurses deal with groups constantly as they interact with families of clients, treatment teams, therapy groups, and committees within their health care settings (see Figure 12-4).

Figure 12-3 A Nurse Communicating with Client on the Interpersonal Level

Figure 12-4 Team Conference. What factors could improve communication in this situation?

Table 12-3 highlights some of the differences between one-to-one and small group interactions.

In dealing with groups, the nurse should be aware of the various nonverbal messages derived from the spatial arrangement of group members. For example, the leader tends to sit at the end or head of the table. Timid or uninterested participants tend to sit at the back of the room. Seating clients in a circle rather than in rows promotes interaction; drawing group members close together promotes cohesion. The study of proxemics in small group situations is called **small group ecology** and provides a potent source of nonverbal messages about participants.

A group is formed around a common purpose or goal; this common goal is the factor that leads to **cohesiveness** (bonding among group members). Several types of groups exist; see Table 12-4 for a listing of groups in which nurses usually participate. Nurse's participation in groups depends upon educational level. According to the ANA (2000), nurse generalists (those prepared at the baccalaureate level or below) may lead and/or co-lead all types of groups except psychotherapy groups. Only nurse specialists (those with graduate degrees) are to lead psychotherapeutic groups.

Since groups are interventions to improve a client's health status, it is important for nurses to refer clients to groups when necessary. Listed below are three mechanisms used by nurses to connect clients with health-promoting groups:

1. Communication—The nurse actively listens to the client to determine needs.
2. Critical thinking—The nurse uses cognitive processes to decide which groups are congruent with the client's needs.
3. Collaboration—The nurse works with multidisciplinary team members (i.e., social workers, clergy) to start the referral process.

MODES OF COMMUNICATION

Communication occurs in a variety of ways: through words, actions, or a combination of words and actions. When there is congruence (“a match”) between one's words and actions, communication is enhanced.

Verbal Messages

Verbal messages are messages communicated through words and language, either spoken or written. Verbal messages are accompanied by **paraverbal** (also referred to as *paralinguistic*) **cues**: tone and pitch of voice; speed, inflection, and volume; grunts and other nonlanguage vocalizations. Paraverbal cues embellish a verbal message, thus adding to its meaning. Paraverbal communication often influences the listener more than the actual words do. Even when the words themselves are not understood, the power of the paraverbal cues can lead to understanding. For example, when a person speaking a foreign language is angry, the paraverbal cues of yelling, shouting, grunting, or hissing through clenched teeth convey the message despite any language barrier.

Nonverbal Messages

Unspoken messages often carry more weight than verbal and paraverbal ones, and they can be more reliable. **Nonverbal messages** are messages communicated without words: that is, through body language. Much of the communication between people is nonverbal. Nurses must pay attention to nonverbal communication in order to determine the meaning of changes in client behavior. Major nonverbal aspects of communication are discussed below.

TABLE 12-3
Differences between One-to-One and Group Communication

One-to-One Interactions	Group Interactions
<ul style="list-style-type: none"> • One sender and one receiver, each with own unique perceptions. • Influenced by dynamics of creating, maintaining, and terminating a therapeutic nurse-client relationship. • Requires understanding of nurse-client relationship theory, communication theory, and an overall theoretical approach (e.g., Rogers, Peplau, Reusch). • Problem identification and problem solving are done by the client, with input from the nurse. • The nurse is the major support for the client during the interaction. • The logical outcome of one-to-one communication is the development of the nurse-client relationship. 	<ul style="list-style-type: none"> • Numerous senders and receivers, each with unique perceptions. • Influenced by group dynamics. • Requires understanding of underlying modalities as well as a theoretical framework to guide both interventions and interpretations (e.g., psychoanalytic approach, interpersonal model). • Problem identification and problem solving are done by the group, with assistance from the leader. • The group is the major support for the client during the interaction. • The logical outcomes are group cohesiveness and group productivity.

TABLE 12-4
Types of Groups

Type	Description	Examples
Task group	Focuses on achievement of a specific goal Emphasizes problem-solving and decision-making	Diabetes education group Committee to study staffing issues Student Nurses Association
Therapeutic group	Increases members' coping abilities Offers support Provides education and information	Stress management class Bereavement and grieving Exercise group (i.e., mall-walkers club)
Therapy group	Helps members learn about and change problematic behaviors Focuses on emotional and behavioral disorders	Psychotherapy group Cognitive-behavioral group
Self-help group	Focuses on a common experience of all members Often led by nonprofessionals	Weight Watchers Reach for Recovery (a group for women who have had mastectomies) Alcoholics Anonymous

THINK ABOUT IT

Elements of Communication

Nonverbal behavior is a more accurate indicator of the individual's intended message than words. Why do you think the adage "Actions speak louder than words" is true?

A client yells, "I am NOT angry!" while pounding his fist on the bedside table.

Which message—the verbal or the nonverbal—do you heed? Why?

Facial Expression

The face is the greatest conveyor of nonverbal messages. Facial expressions give clues that support, contradict, or disguise the verbal message. Many types of feelings and reactions are reflected in a person's face. Facial expressions serve as clues to emotionally charged topics and often communicate the client's need.

The eyes often belie facial expressions, because there is little voluntary control over the eyes. For example, a frightened client might say, "I am fine," and voluntarily control the muscles of the face to portray inner calm. However, the pupils of the eyes dilate widely in fear, thus alerting the receiver to the real message. Eyes, together with the use of the eyebrows and eyelashes, give numerous signals to others. They show interest, concern, sadness, dishonesty, or honesty. The eyes may also indicate shock, shyness, pleasure, displeasure, excitement, and flirtation. They exemplify all feelings: anger, happiness, sadness, and fear.

The lips also communicate several messages, such as:

- Warmth and friendliness when they smile
- Malevolence when they snarl

- Anger when they pout
- Fear when they quiver

People who do not wish to share their feelings might clamp their jaws shut or purse their lips. Anxious people often chew their bottom lips. The nurse can use such clues to understand the client's messages.

Posture

Much about an individual may be learned by observing and interpreting posture. Posture indicates anxiety, relaxation, and negative or positive self-image. Leaning forward usually indicates interest; leaning backward may communicate aversion or rejection. Standing straight and tall with chest forward generally shows confidence, while depressed, tired, or bored individuals often slump.

Gestures

Gestures refer to the movement of body parts. Shrugging the shoulder, waving the hands, tapping the feet—all add a distinct dimension to verbal communication. The nurse communicates openness and a willingness to listen by facing the client in a relaxed position, with hands resting palms up on the lap. Crossed arms pulled closely against the body may indicate nonacceptance and a lack of desire to hear the client.

Touch

Touch is a powerful nonverbal medium for communication. It can be used to soothe, comfort, and establish rapport. Touch can communicate a sense of caring—as it does when a nurse holds a person's hand during a

THINK ABOUT IT

The Meaning of Nonverbal Messages

Never assume that you know what another is saying through body language. Nonverbal messages can have several interpretations. Consider a client who has his arms crossed when you are speaking with him. What does his nonverbal behavior mean? It could be a signal that the client:

- Is shutting out your message
- Is cold and is trying to warm up
- Is sitting in a comfortable posture

Validate your interpretation of the meaning with the client.

painful procedure—or it can be perceived as intrusive or hostile. Touch should be used cautiously with clients who are:

- *Confused*: They may misinterpret the intent of the touch.
- *Aggressive*: They may see the touch as a threat and lash out.
- *Suspicious*: They may think the touch is harmful.
- *Victims of abuse*: Touch may frighten them.

The nurse must understand various cultural perceptions of touch in order to prevent problems; see Chapter 16 for discussion of the cultural significance of touch.

Physical Appearance and Artifacts

Physical appearance and **artifacts** (specific types of nonverbal messages that include items in the client's environment, grooming, or use of clothing and jewelry) convey nonverbal messages that enhance or hinder the spoken words. For example, uniforms often send nonverbal messages that stifle interpersonal exchange by setting up a boundary of superiority. For this reason, nursing uniforms are not worn in certain areas, such as pediatrics, psychiatry, and some home health settings. If worn, a uniform that is clean and pressed, along with shoes that are polished, can help inspire confidence in the caregiver.

NURSING ALERT

Interpreting Nonverbal Behavior

Never assume that a nonverbal behavior has the same meaning for everyone. Interpretation of various nonverbal aspects of communication varies among people because of developmental, cultural, and experiential factors.

Metacommunication

Metacommunication is the relationship aspect of communication. It refers to the message about the message. For example, a person who is silent is still sending out messages through nonverbal communication. Metacommunication refers to all the factors that influence how messages are received. It involves focusing on the communication process rather than only on the content. The “reading between the lines” that occurs in metacommunication allows the receiver to better understand the sender's true message (Edelman & Mandle, 1997).

TYPES OF COMMUNICATION

There are several types of communication: social, therapeutic, and formal. See Chapter 11 for a comparison of social and therapeutic relationships. Formal communication, which consists of written messages and the arts, may include lectures, reports, charting in the client's record, and public speaking. Usually, with formal communication, there is one sender transmitting messages to several others.

Interdisciplinary Communication

The health care team consists of the client and all medical personnel involved in providing care. All members of the team perform important, though different, roles in the health care delivery system (see Chapter 4 for a complete discussion of the roles of health care team members). It is important that all health care team members communicate with each other regarding assessment, intervention outcomes, and client status. The interdependent nature of teams requires thoughtful and effective communication. Breakdown of communication between different team members can interfere with the client's treatment.

Therapeutic Communication

Therapeutic communication is the use of communication for the purpose of creating a beneficial outcome for the client. The accompanying display lists characteristics of therapeutic communication. Ruesch (1961), who originated the term *therapeutic communication*, stated that the purpose is to improve the client's ability to function. Furthermore, therapeutic communication facilitates the establishment of the nurse-client relationship and fulfills the purposes of nursing (Stuart & Laraia, 1998). Therapeutic communication forms a connection between client and nurse. According to Susman (1998), “Brain scans, biochemistry, and other technology cannot replace dialogue; with its use, nurses have a unique, demanding, and irreplaceable role in caring for

Title of Study

“The Developing Nurse-Client Relationship: Nurses’ Perspectives”

Authors

Forchuk, C., Westwell, J., Martin, M., Bamber-Azzopardi, W., Kosterewa-Tolman, D., and Hux, M.

Purpose

(1) To describe the evolving nurse-client relationship from the nurses’ perspective. (2) Compare the patterns described by the participants to those in Peplau’s theory.

Methods

This was a descriptive study that used interviews that were audiotaped and transcribed for qualitative analysis using the Leninger method. Nurses and clients in newly formed relationships engaged in separate audiotaped interviews. Interactions between nurses and clients were videotaped for observation. The study setting was a tertiary care psychiatric hospital in Ontario, Canada.

Findings

Some of the relationships progressed well, and others experienced difficulties. Relationships that were working well involved frequent, regularly scheduled, private interactions. Feelings of trust developed, and clients were able to discuss problems. This study revealed the following factors in relationships: (1) *helping factors*: consistency, pacing, listening, positive initial impression, comfort, a balance of control, and client factors; (2) *hampering factors*: inconsistency and unavailability; (3) *nurses’ feelings and awareness*.

Implications

In order to be developed, therapeutic relationships require consistent, regular, and private interactions with clients. The nurses in this study emphasized the importance of listening, pacing, and consistency. The helping factors are consistent with Peplau’s theory.

Forchuk, C., Westwell, J., Martin, M., Bamber-Azzopardi, W., Kosterewa-Tolman, D., & Hux, M. (2000). The developing nurse-client relationship: Nurses’ perspectives. *Journal of the American Psychiatric Nurses Association*, 6(1), 3–10.

patients” (p. 25). Table 12-5 presents the essential elements of therapeutic communication: empathy, trust, honesty, validation, caring, a nonjudgmental approach, and use of active listening.

Refer to Chapter 11 for a more detailed discussion of therapeutic elements.

THERAPEUTIC COMMUNICATION

- Is purposeful and goal-directed
- Has well-defined boundaries
- Is client-focused
- Is nonjudgmental
- Uses well-planned, selected techniques

Principles of Therapeutic Interaction

Regardless of the type of interaction, principles and guidelines of therapeutic communication are used to direct the nurse when relating with clients. A discussion of basic principles for guiding therapeutic communication follows.

Plan to interview at an appropriate time. The time frame within which an interaction occurs influences the outcome. For example, it is unwise to plan to talk with a client during visiting hours, during change of shift, or when the client is distracted by environmental stimuli (e.g., the homebound client is watching a favorite television show). In such situations, the nurse may be rushed or the client may be preoccupied. Neither situation would be conducive to effective interaction.

Assure privacy. Clients are entitled to confidentiality. Nobody wants to discuss private matters when or where other people are listening. Privacy can be arranged by screening the client’s bed, closing the door to the room, or finding a quiet secluded place in which to talk. In the home setting, it may be necessary to ask family members or visitors for time and space to promote confidentiality.

Establish guidelines for the therapeutic interaction. During the initial contact with the client, the nurse should share certain information. This includes the nurse’s name and affiliation and the reason for or purpose of the interaction, the expected length of the contact with the client, and the assurance of confidentiality. The client needs to have this basic information, and it serves as an introduction to the development of the therapeutic nurse-client relationship.

Provide for comfort during the interaction. Discomfort can be distracting. The Nursing Checklist provides guidelines for promoting a client’s comfort in order to improve communication.

Accept the client exactly as is. Being judgmental blocks communication. Nurses who put aside personal prejudices, curiosities, feelings, and values are more receptive

TABLE 12-5
The Elements of Therapeutic Communication

Definition	Behaviors of the Nurse	Outcomes
<p>Empathy: An emotional linkage between two or more people through which feelings are communicated; involves trying to imagine what it must be like to be in another person's situation</p>	<p>Verbal comments:</p> <ul style="list-style-type: none"> • "This must make you feel sad." <p>Nonverbal actions:</p> <ul style="list-style-type: none"> • A nod of the head to indicate understanding. • Mirroring the client's facial expression in a genuine way. 	<ul style="list-style-type: none"> • Promotes understanding of the client's feelings and condition. • Enables the nurse and client to relate better. • Provides the client with clues that the nurse is following and understanding what is being said.
<p>Trust: The client's belief that the nurse will behave predictably and competently while respecting the client's needs</p>	<ul style="list-style-type: none"> • Ensure confidentiality. • Be consistent. • Do exactly what you say you will do for the client. • Arrive on time. • End the session on time. • Return when you say you will. • Be consistently friendly, open, and honest. 	<ul style="list-style-type: none"> • Provides the basis for progress during future encounters. • Sets up the foundation of the therapeutic relationship. • Makes the client feel comfortable with the nurse, rather than guarded or afraid.
<p>Honesty: The ability to be truthful, frank, and sincere</p>	<ul style="list-style-type: none"> • Provide realistic reassurance. • Avoid false reassurance. • Develop insight into the way your feelings and reactions affect the client. • Accept yourself. 	<ul style="list-style-type: none"> • Promotes the development of trust. • Enables the nurse to gain personal insight. Consequently, behavior with the client can be modified as needed.
<p>Validation: Listening to the client and responding congruently in order to be sure that the nurse and client have the same understanding of a problem or issue</p>	<p>Verbal comments:</p> <ul style="list-style-type: none"> • "So you are saying that ..." • "Let me be sure I understand what you are saying." • "Tell me what you understand about what I just said." 	<ul style="list-style-type: none"> • Clarifies communication. • Helps the client to feel accepted, respected, and understood.
<p>Caring: The level of emotional involvement between the nurse and the client</p>	<p>Nonverbal actions:</p> <ul style="list-style-type: none"> • Seeking the client out each day. • Spending quality time with the client. • Paying attention to the client's needs. • Using tactile messages, such as a pat on the back, to show support. 	<ul style="list-style-type: none"> • Makes the client feel accepted. • Provides the client with the knowledge that the nurse is willing to help.
<p>Active listening: Hearing and interpreting language, noticing nonverbal and paraverbal enhancements, and identifying underlying feelings</p>	<ul style="list-style-type: none"> • Taking time to listen. • Giving the client your undivided attention. • Making eye contact. • Responding to verbal and nonverbal leads, clues, and signals from the client. • Analyzing and validating throughout the conversation. • Suspending judgment. • Listening between the lines. • Understanding the feelings behind the facts. • Noticing discrepancies between facts and feelings. • Noticing things omitted such as topics that the client should be discussing but avoids. • Using communication principles and techniques to be a sounding board. 	<ul style="list-style-type: none"> • Promotes understanding of the client. • Allows the client to express self more freely. • Helps the client gain a better understanding of the problem(s). • Promotes problem solving by the client. • Enhances the client's self-esteem.

**NURSING CHECKLIST***Meeting the Client's Comfort Needs*

- Regulate the temperature of the environment.
- Sit in comfortable chairs.
- Provide for adequate ventilation.
- Implement measures to decrease pain.

to the feelings and behaviors of the client, regardless of content stated by the client. Nonjudgmental nurses are less encumbered by their own personal needs.

Encourage spontaneity. The nurse gathers more data when the client is talking freely. Also, the client experiences relief and freedom from worries by talking without inhibition.

Focus on the client and on the leads and clues presented. Asking questions just for the sake of talking or for the satisfaction of one's own curiosity does not contribute to effective interviewing. Therapeutic interaction involves discussing the client's problems, needs, or concerns. Therefore, allow the client to initiate the topic to be discussed; then, use techniques to focus on that topic. Pay attention to the verbal, paraverbal, and nonverbal cues and signals of the client, and focus on them when they occur.

Encourage the expression of feelings. Simply allowing the client to talk is not interviewing. Therapeutic interaction occurs when the client is permitted to voice feelings about troublesome events or interpersonal situations. Doing so requires the nurse to identify those areas that are emotionally charged and to focus on them.

Be aware of your own feelings during the interaction. The nurse's feelings influence the interaction. For example, the nurse who becomes anxious may change the subject or make comments that finalize the session. The nurse must make a conscious effort to prevent personal feelings from getting in the way of the client's progress. Identifying one's own feelings and behavior and recognizing the way they affect the client lead to better communications.

Therapeutic Approaches with Clients

In addition to using the above principles for interviewing, there are numerous techniques that are helpful in promoting therapeutic communication. It is important to use the communication techniques as tools for building relationships with clients. "I do not think therapeutic techniques matter as much as how professionals use their work to communicate a genuine, caring, and loving attitude toward someone else's pain" (Masching, 1996, p. 26). See Table 12-6 for an analysis of these techniques.

BARRIERS TO THERAPEUTIC INTERACTION

Communication barriers present real challenges to the nurse, but need not stop communication. Rather, barriers pose hurdles that the nurse is able to scale by using creative and different approaches with the client. The nurse develops strategies for overcoming barriers by use of critical-thinking skills. Common communication barriers are discussed below.

Language Differences

When English is the clients' second language, they may have problems navigating through the health care system. An inability to communicate effectively with health care providers adversely affects clients' responses to interventions. The impact of this barrier can be lessened by learning the language (or parts of it), or by using interpreters, pictures and symbols, and foreign language dictionaries. Other ways of ameliorating language problems are discussed later in this chapter.

Communication problems can also occur when everyone speaks English as a first language. For example, complex sentence structure and the different meanings of words may lead to communication difficulties. The use of value-laden terms also blocks the exchange of information, ideas, and feelings.

Cultural Differences

Various cultures and subcultures use language differently. A person's communication patterns reflect their culture. In some cultures, expression of thoughts and feelings is spontaneous and exuberant, whereas people of other cultural groups may be reserved and stoic in their verbalizations. Some of the communication variables that are culture specific include eye contact, proximity to others, direct versus indirect questioning, and the role of social small talk. See Chapter 16 for a discussion of the influence of culture on communication.

THINK ABOUT IT

Traditional sex-role beliefs support the idea that women bear the primary responsibility for family well-being. How might the gender-biased expectations of both nurse and client affect the messages communicated? What are your gender-biased expectations of women as either clients or care providers? What approaches could you take to make your communication more gender conscious?

TABLE 12-6
Therapeutic Communication Techniques

Technique	Description	Example
<i>Techniques that allow the client to set the pace</i>		
Offering self	Nurse is available, physically and emotionally Indicates nurse's willingness/intent to help Nurse's presence is reassuring; may prompt client to continue Indicates nurse's attention and interest	"I'll sit with you awhile." "Go on." "Uh-huh." Head nodding
Broad openings	Encourages client to choose topic for discussion Demonstrates respect for client's thoughts Emphasizes importance of client's needs	"What do you want to talk about?" "Can you tell me more about that?" "How have things been going?"
Silence	Gives client time to reflect Encourages client to express self Indicates interest in what client has to say Increases nurse's understanding of client's message Helps to structure and pace the interaction Conveys respect and acceptance	Sit quietly and observe client's behavior Use appropriate eye contact Employ attending behaviors Control own discomfort during quiet periods or conversation lulls
<i>Techniques that Encourage Spontaneity</i>		
Open-ended comments	Unfinished sentences that prompt client to continue Questions that cannot be answered with a one-word answer Allows client to decide what content is relevant	"Tell me about your pain?" instead of "Are you in pain?" "Tell me about your family" rather than "How many children do you have?"
Reflection	Focuses on content of client's message and feelings Repeating client's last words in order to prompt further expression Communicates nurse's interest Lets client know the nurse is actively listening	<i>Client:</i> "Do you think I should tell the doctor I stopped taking my medication?" <i>Nurse:</i> "What do you think about that?" <i>Client:</i> "I probably should. But the medicine makes me so tearful and agitated." <i>Nurse:</i> "You sound a bit agitated now."
Restating	Repeating or paraphrasing client's main idea Indicates nurse is listening to client Encourages further dialogue Gives client an opportunity to explain or elaborate	<i>Client:</i> "I told the doctor that I had problems with this medicine, but he just didn't listen to me!" <i>Nurse:</i> "Sounds like you're pretty angry at him." <i>Client:</i> "I don't sleep well anymore." <i>Nurse:</i> "You're having problems sleeping?"
<i>Techniques that focus on the client by responding to verbal, paraverbal, and nonverbal cues</i>		
Exploring	Attempts to develop in more detail a specific area of concern to client Identifies patterns or themes	"Tell me more about how you feel when you do not take your medication." "Could you tell me about one of those times when you felt so upset?"
Recognition	Nurse points out observed cues to client	"I notice that you became embarrassed when . . ." "I see that you have some pictures of the new baby."
Focusing	Questions or statements that help client develop or expand an idea Directs conversation toward key topics	"You mentioned that you are having a problem with . . ." "You say you feel nauseous a lot."

(continues)

TABLE 12-6 (continued)
Therapeutic Communication Techniques

Technique	Description	Example
Directing	Comments that elicit specific information from the client Is used to collect assessment data, not to satisfy nurse's curiosity	<i>Client:</i> "They told me I needed to see a specialist." <i>Nurse:</i> "What made them say that to you?" or "When were you told this?" or "Where were you when they told you?" or "How do you feel about seeing another doctor?"
<i>Techniques that encourage expression of feelings</i>		
Verbalizing the implied	An attempt to detect the true meaning of verbal messages	<i>Client:</i> "How much is this x-ray going to cost?" <i>Nurse:</i> "You're worried about your medical bills?"
Making observations	Nurse calls attention to behavior indicative of feelings	"You seem sad today." "You're limping as if your leg hurts."
Clarifying	Makes the meaning of client's message clear Prevents nurse from making assumptions about client's message	<i>Client:</i> "Whenever I talk to my doctor, I feel upset." <i>Nurse:</i> "Tell me what you mean by upset." <i>Client:</i> "They said I could be discharged tomorrow." <i>Nurse:</i> "Who told you this?"
<i>Techniques that encourage the client to make some changes</i>		
Confronting	Nurse's verbal response to incongruence between client's words and actions Encourages client to recognize potential areas for change	<i>Client:</i> "I am so angry at her" (stated while smiling). <i>Nurse:</i> "You say you're angry, yet you're smiling." <i>Client:</i> "I never know which of my symptoms to pay attention to. I think maybe I'm just a hypochondriac." <i>Nurse:</i> "You say you're not sure which symptoms are important, yet you knew when to come to the clinic for help."
Limit setting	Stating expectations for appropriate behavior Establishing behavioral parameters	<i>Nurse:</i> "It seems that you are feeling unsure of how to behave right now." <i>Client:</i> "What do you mean?" <i>Nurse:</i> "Well, you're asking me a lot of personal questions. The reason you're here is because you have some health problems. How can I help you tell me more clearly what brought you here to the clinic?"

(From Johnson, B. S. [1996]. *Psychiatric-mental health nursing: Adaptation and growth* [4th ed.]. Philadelphia: Lippincott; Kneisl, C. [1996]. Therapeutic communication. In H. S. Wilson & C. R. Kneisl, *Psychiatric nursing* [5th ed.]. Menlo Park, CA: Addison-Wesley; Stuart, G. W. & Laraia, M. T. [1998]. *Stuart & Sundeen's principles and practice of psychiatric nursing* [6th ed.]. St. Louis: Mosby; Varcarolis, E. & Rader, I. [1998]. *Foundations of mental health psychiatric nursing* (3rd ed.). Philadelphia: Saunders.)

Gender

Sending, receiving, and interpreting messages can vary between men and women. The effect and use of nonverbal cues are often gender-dependent. For example, women tend to be better decoders of nonverbal cues, and men prefer more personal distance between themselves and others than do women (Boggs, 1999).

Health Status

One's health status affects communication. For example, the client who is oriented will communicate more reliably than a client who is delirious, confused, or disoriented. Communication is affected by sensory perceptual alterations, such as loss of vision or hearing.

Developmental Level

Failure to communicate at the client's developmental level can be a roadblock. For example, communication with children requires the use of different words and approaches than are used with adults because a child cannot think in abstract concepts. Relating at the client's own developmental level is necessary for understanding. A discussion of communicating with children is presented later in this chapter.

Knowledge Differences

All people need to be understood. Nurses consistently assess the knowledge levels of clients in order to determine the best way to correct knowledge deficits. When assessing knowledge level, the nurse should:

- Take note of the client's vocabulary
- Observe the numbers and kinds of facts the client has
- Determine the client's educational background

With this information, the nurse is able to assess the teaching needs of the client, as well as determine the method of instruction to use.

Emotional Distance

Satisfying encounters are described by words such as *rappor*t and *empathy*, and they occur when both parties are willing to be "present" as persons. Emotional distance, on the other hand, involves treating the client as a curiosity, a problem, or a disease, thus preventing satisfying interaction and possibly causing hostility. Consider, for instance, a client who is on strict isolation for an infectious disease, or someone who is confused and disoriented. By maintaining rapport with clients regardless of their status, nurses are able to decrease emotional distance.

Emotions

When the nurse or the client is anxious, communication may change, stop, or take a nonproductive course. Nurses should be aware of their own feelings and try to control them in order to ensure progress in the interview. It is important that the nurse present a calm manner in order to ease the client's apprehension and, thus, improve the quality of communication.

Daydreaming

People can hear words faster than they can speak. Therefore, the listener's mind may wander and the whole point of a message may be missed. Mind-wandering can also happen because the listener is bored or preoccupied with worrisome thoughts. Nurses can keep

themselves from daydreaming by constantly attending to what the client has to say, by staying alert, and by controlling their own thoughts.

Use of Healthcare Jargon

The use of healthcare jargon can provoke anxiety in the client. Nurses and other healthcare providers have a language unique to their subculture. Nurses who use healthcare jargon with clients are likely contributing to blocked communication. Terms or phrases such as "CBC," "prn," "intake," "BP," and "take your vitals" are often not understood or are misinterpreted by clients and families. "To health care consumers, some words are frightening or even demeaning" (Ward-Collins, 1998, p. 28). It is important that nurses use language that is easily understood and explain medical terminology so that it is comprehensible.

COMMUNICATION BLOCKS

Certain responses that would be acceptable during social conversation are not useful during therapeutic interaction. Unhelpful techniques are those that halt the progress of the interview and may result in the client's experiencing feelings of inadequacy, intimidation, or confusion. Table 12-7 describes several communication roadblocks that are to be avoided. Nurses must constantly be aware of potential barriers to effective communication between themselves, their clients, and members of the health care team, and they must develop strategies to maximize their therapeutic interactions with clients.

COMMUNICATION, CRITICAL THINKING, AND NURSING PROCESS

Critical thinking is an important part of effective communication. As Ward-Collins (1998) states, "As nurses, we need to consider ideas from all perspectives—including the exploration of conceptual meanings" (p. 28). In other words, nurses carefully formulate questions and propose answers through thinking critically. Interpersonal skills (as evidenced by effective communication) and critical thinking are competencies upon which nursing practice is based; see the accompanying display.

Assessment

The nurse theorist Peplau (1951) stated, "To encourage the patient to participate in identifying and assessing his problem is to engage him as an active partner—an enterprise of great concern to him" (p. 47). Therapeutic communication

TABLE 12-7
Communication Roadblocks

Roadblock	Definition	Examples
Reassuring	Comments that indicate to the client that concerns or fears are unwarranted.	<ul style="list-style-type: none"> • “Everything will be fine.” • “You will feel better soon.”
Agreeing	Comments that indicate that the nurse’s views are those of the client.	<ul style="list-style-type: none"> • “I agree.” • “I think you are right.”
Approving	Comments that indicate that the client’s views, actions, needs, or wishes are “good” rather than “bad.”	<ul style="list-style-type: none"> • “That’s good.” • “I think you did the right thing.”
Defending	Comments that are aimed at protecting the nurse, someone else, or something from verbal attack.	<ul style="list-style-type: none"> • “I did not say that.” • “Doctor Jones is a good doctor.” • “I am sure your father meant nothing by that comment.”
Using yes-or-no questions	Questions or comments that can be answered by the client with a Yes or No.	<ul style="list-style-type: none"> • “Are you tired?” • “Would you like some water?” • “Could we talk now?” • “Did you sleep well?”
Using stereotyped comments	“Pat” answers or clichés that indicate that the client’s concerns are unimportant or insignificant.	<ul style="list-style-type: none"> • “C’est la vie.” • “That’s the way the ball bounces.” • “It will all come out in the wash.”
Changing focus	Switching to a topic that is more comfortable to discuss.	<ul style="list-style-type: none"> • <i>Client</i>: “I wish I were dead.” • <i>Nurse</i>: “Did your wife visit today?”
Judging	Comments or actions by the nurse that indicate pleasure or displeasure with what the client says.	<ul style="list-style-type: none"> • A stern look. • Rolling the eyes. • “I like that.” • “I do not like that.”
Blaming	Accusing the client of misconduct; undermines the client’s need to be loved and accepted.	<ul style="list-style-type: none"> • “You should know better than to talk like that.” • “If you had not moved, I would have been able to complete this venipuncture.”
Belittling the client’s feelings	Indicating to the client that feelings expressed are unwarranted or unimportant.	<ul style="list-style-type: none"> • “Don’t feel that way.” • “Be a big boy and stop crying.”
Advising	Giving the client opinion or direction about solving a problem.	<ul style="list-style-type: none"> • “If I were you, I would talk to your husband about this.” • “I think you should do something for yourself for a change.”
Rejecting	Indicating to the client that certain topics are not open to discussion.	<ul style="list-style-type: none"> • “Let’s not talk about that right now.”
Disapproving	Indicating displeasure about comments or behaviors and/or placing a value on them.	<ul style="list-style-type: none"> • “That’s bad.”
Probing	Pressuring the client to discuss something before she is ready.	<ul style="list-style-type: none"> • “Why do you feel this way?” • “Why did you come to the hospital?” • “Why are you angry with your son?”

(From Johnson, B. S. [1996]. *Psychiatric-mental health nursing: Adaptation and growth*. [4th ed.]. Philadelphia: Lippincott; Kneisl, C. R. [1996]. Therapeutic communication. In H. S. Wilson, & C. R. Kneisl. *Psychiatric nursing* [5th ed.]. Menlo Park, CA: Addison-Wesley; Sundeen, S. J., Stuart, G. W., Rankin, E. A., & Cohen, S. A. [1998]. *Nurse-client interaction: Implementing the nursing process* [6th ed.]. St. Louis: Mosby; Varcarolis, E. [1998]. *Foundations of mental health-psychiatric nursing*. [3rd ed.]. Philadelphia: Saunders.)

RELATIONSHIP BETWEEN COMMUNICATION AND NURSING PROCESS

Assessment

- Asking questions to elicit key information
- Observing nonverbal behavior
- Reading medical records

Diagnosis

- Posing questions to assist in analyzing and clustering data into meaningful patterns
- Talking with client and family or significant others to determine perception of needs and problems

Planning/Outcome Identification

- Talking with clients to mutually determine areas of concern and to formulate goals and objectives
- Staff meetings with coworkers to develop plans of care
- Writing and reading plans of care

Implementation

Determination of most appropriate intervention or method of responding; calls for input from client, significant others, and/or healthcare team members

Evaluation

Critiquing the client's response to interventions; requires direct communication with client and/or significant others

is the vehicle for establishing a partnership between client and nurse. When performing the admission assessment, the nurse seeks to understand the client's entire message by focusing on both verbal and nonverbal communication. For example, note what a client is doing when stating "I have a terrible headache." What nonverbal cues support the words? Or is there an incongruity between the words and behavior? Hubert (1998) provides the following guidelines for communicating with clients during assessment:

- Use encouraging questions to help the client feel in control.
- Pay attention to the client's age, cultural background, and health status.
- Be mindful of the client's literacy level.
- Act calm and unhurried even if time is limited.

Following these guidelines facilitates communication and thereby improves the accuracy and usefulness of assessment data. Assessing the client's communication ability involves collecting data relevant to the presence of physical and psychological barriers.

Assessment of the client's ability to communicate must be ongoing. The presence of **aphasia** (impairment or

absence of language function) should not be misinterpreted as confusion. Table 12-8 describes the types of aphasia.

Nursing Diagnosis

"Accurate diagnosis is an art of communication perfected by experience" (Hubert, 1998, p. 16). This art can be achieved by establishing a therapeutic relationship with the client. By paying meticulous attention to the client's communication, nurses are able to determine pertinent needs and, thus, develop accurate diagnostic judgments. Through effective communication, the nurse develops an atmosphere in which the client feels safe to express all relevant concerns.

The North American Nursing Diagnosis Association (NANDA, 2001) defines communication as "a human response pattern involved in sending messages." Whenever a client is unable to send, receive, or interpret messages accurately, the diagnosis Impaired Verbal Communication is applicable; see the Nursing Process Highlight.

Other diagnoses that may be relevant for the person experiencing communication difficulties include the following:

- Social isolation related to impaired verbal communication
- Anxiety related to impaired verbal communication
- Self-esteem disturbance related to impaired verbal communication

TABLE 12-8
Classification of Aphasias

Broca's aphasia	Slow hesitant speech Difficulty selecting and organizing words Naming, word, and phrase repetition Writing impaired Slight comprehension defects
Wernicke's aphasia	Auditory comprehension impaired Impaired speech content Client unaware of deficits
Anomic aphasia	Unable to name objects or places Comprehension and repetition of words and phrases intact
Conduction aphasia	Difficulty repeating words, substitutes incorrect sounds for another
Global aphasia	Severe impairment of oral and written comprehension Impaired naming and repetition of words Impaired writing ability

Planning and Outcome Identification

After identifying communication problems, the nurse and client work together to develop goals and outcomes. The nurse then formulates nursing interventions to promote goal achievement. A major goal for every client is to develop an ability to communicate effectively, whether by verbalization or alternate means. See the Nursing Checklist for guidelines in dealing with language barriers.

Implementation

More than 46 million people, nearly one in five Americans, have some form of communication disorder (Matthews-Flint & Lucas, 1999). It is extremely challenging for nurses to communicate with clients experiencing communication disorders. Technological advances have led to the development of telecommunication relay services (TRS), which often can be used

with clients experiencing communication disorders. See Table 12-9 for a description of methods for communicating with clients who have special needs.

Refer to Chapter 13 for specific guidelines on communicating with children, adolescents, and elderly clients.

NURSING CHECKLIST

Overcoming Language Barriers

- Speak slowly and distinctly in a normal tone of voice.
- Use gestures or pictures to emphasize meaning of words.
- Avoid clichés, medical jargon, or value-laden terms.
- Avoid defensive or challenging body language.
- Provide reading material written in the appropriate language.
- Use an interpreter who is fluent in health care terminology.
- Speak to the client rather than to the interpreter.
- Use the same interpreter for every interaction if feasible.

Nursing Process Highlight

NURSING DIAGNOSIS Impaired Verbal Communication

DEFINITION State in which a person experiences a decreased, delayed, or absent ability to process, receive, or transmit meaning.

DEFINING CHARACTERISTICS

- Disorientation
- Inability or unwillingness to speak
- Difficulty speaking
- Difficulty expressing thoughts verbally
- Partial or total visual defect
- Stuttering or slurring of words
- Willful refusal to speak
- Unable to speak dominant language

RELATED FACTORS

- Cultural differences
- Decreased cerebral bloodflow
- Physical barrier (e.g., tracheostomy)
- Anatomical defect (e.g., cleft palate)
- Developmental differences

(From North American Nursing Diagnosis Association. [2001]. *Nursing diagnoses: Definitions & classification: 2001–2002*. Philadelphia: Author.)

NURSING ALERT

Impaired Communication

Use caution when “just talking” in the room of a comatose client. Remember *to* talk to unconscious clients rather than *about* them.

Evaluation

Evaluation of communication effectiveness involves both nurse and client. Communication is a major tool for evaluating a client’s achievement of expected outcomes. For example, the nurse observes nonverbal behavior, talks with the client, and listens actively to the client’s comments. The nurse uses critical thinking to analyze the client’s responses, as well as his or her own use of communication skills.

KEY CONCEPTS

- Communication is a vital aspect of all phases of nursing practice.
- The five components of the communication process are the sender, message, channel, receiver, and feedback.

TABLE 12-9
Communicating with Vulnerable Populations

Clients who are hearing impaired	<p>Determine if the client reads lips. If so, face the client and reduce background noise to a minimum.</p> <p>If client is using a hearing aid, check to see that it is in working order.</p> <p>Always face the client.</p> <p>Speak at a normal pace in a normal tone of voice</p> <p>Focus on nonverbal cues from the client.</p> <p>Use gestures and facial expressions to reinforce verbal messages.</p> <p>Provide pen and paper to facilitate communication if client is literate.</p>
Clients who are visually impaired	<p>When speaking to visually impaired clients, always face them as if they were sighted.</p> <p>Follow the cues of the clients in order to allow as much independence as possible.</p> <p>Look directly at the client.</p> <p>Speak in a normal tone of voice; it is demeaning to yell.</p> <p>Ask for permission before touching the client.</p> <p>Orient the client to the immediate environment.</p>
Clients who are aphasic	<p>Assess the client's usual method of communication; adapt the interaction to accommodate the client's abilities.</p> <p>Use a written interview format, letter boards, or yes/no cards.</p> <p>Allow additional time for client's responses.</p> <p>Do not answer for the client.</p> <p>Use closed (one-word response) questions when possible.</p> <p>Repeat or rephrase the comment if client does not understand.</p> <p>Speak directly to the client, not to the intermediary.</p> <p>To reinforce verbal messages, use facial expressions, gestures, and voice tone.</p>
Unconscious clients	<p>Assume the client can hear.</p> <p>Talk to the client in a normal tone of voice.</p> <p>Engage in normal conversational topics as with any client.</p> <p>Speak to the client before touching.</p> <p>Use touch to communicate a sense of presence.</p> <p>Decrease environmental stimuli (especially auditory).</p>
Confused clients	<p>Maintain appropriate eye contact.</p> <p>Keep background noises to a minimum.</p> <p>Use simple, concrete words and sentences.</p> <p>Use pictures and symbols.</p> <p>Use closed rather than open-ended questions.</p> <p>Give the client time to respond.</p>
Angry clients	<p>Use caution when communicating with a client who has a history of violent behavior or poor impulse control.</p> <p>Do not turn your back on the client. Arrange the setting so that the client is not between you and the door to the room.</p> <p>Focus on the client's body language.</p> <p>Be alert for physical indicators of impending aggression: narrowed eyes, clenched jaw, clenched fist, or a loud tone of voice.</p> <p>Model the expected behavior by lowering your tone of voice.</p> <p>Stay within the client's line of vision.</p> <p>Do not use touch.</p>

- Factors such as perception, cultural context, space and distance, and time influence communication.
- The three levels of communication are intrapersonal, interpersonal, and group.
- Using language or other symbols, the sender produces verbal, paraverbal, and nonverbal messages that are delivered through a channel (visual, auditory, or kinesthetic) to a receiver.
- Interdisciplinary communication is a type of interaction in which members of the health care team collaborate on a client's care.
- Therapeutic communication is the use of communication for the purpose of creating a beneficial outcome for the client.
- Elements of effective therapeutic communication include empathy, trust, honesty, validation, caring, and active listening.
- The nurse needs to observe specific principles and techniques in order to initiate and maintain therapeutic communication with clients.
- Barriers such as language differences, sociocultural differences, gender, health status, developmental level, knowledge differences, emotional distance, emotions, and daydreaming can pose challenges for nurses in communication with clients.
- Communication barriers can be overcome if creativity, innovation, awareness, sensitivity, and critical-thinking skills are used by the nurse.

CRITICAL THINKING ACTIVITIES

1. Explain the following statement: "Communication is reciprocal, irreversible, and continuous."
2. What are the major components of the communication process?
3. Why is it important to pay attention to nonverbal communication?
4. How do you recognize nonverbal messages?
5. Define therapeutic communication.
6. State four basic principles that direct and guide therapeutic interaction.
7. Which unhelpful techniques used by the nurse could cause the client to feel threatened?
8. Which therapeutic techniques could be used by the nurse to decrease the client's confusion?

Client Education

Learning is not attained by chance, it must be sought for with ardor and attended to with diligence.

—Abigail Adams (in McWilliams & McWilliams, 1991)

COMPETENCIES

1. Explain the importance of client education in today's health care climate.
2. Relate principles of adult education to client teaching.
3. Identify common barriers to learning.
4. Explain how learning varies throughout the life cycle.
5. Discuss the nurse's professional responsibilities related to teaching.
6. Relate the teaching-learning process to the nursing process.
7. Describe teaching strategies that make learning meaningful to clients.

KEY
TERMS

affective domain
auditory learner
cognitive domain
kinesthetic learner
learning

learning plateau
learning style
philosophy
psychomotor domain
readiness for learning

self-efficacy
teaching
teaching-learning process
teaching strategies
visual learner

Client education is an integral part of nursing care. It is the nurse's responsibility to assist the client to identify the learning needs and resources that will restore and maintain an optimal level of functioning. This chapter offers an overview of the teaching-learning process, including learning barriers and teaching responsibilities of nurses. Client education is extremely important today in a health care environment that demands cost-effective measures. With shorter hospital stays, clients are being discharged to the home or other health care settings in more critical condition than ever before. Client education, a hallmark of quality nursing care, is a fiscally responsible intervention that encourages health care consumers to engage in self-care and to develop healthy lifestyle practices.

THE TEACHING-LEARNING PROCESS

The **teaching-learning process** is a planned interaction that promotes behavioral change that is not a result of maturation or coincidence. **Teaching** is an active process in which one individual shares information with others to provide them with the information to make behavioral changes. Teaching refers to all the activities used by a teacher to assist the learner to absorb new information; it consists of activities that promote change. Teaching is a goal-directed process that provides the opportunity for learning.

Learning is the process of assimilating information with a resultant change in behavior. Nurses and clients have shared responsibilities in the teaching-learning process. Knowledge is power. By sharing knowledge with clients, the nurse empowers clients to achieve their maximum level of wellness. The teaching-learning process will be familiar to nurses in that it mirrors the steps of the nursing process: assessment, identification of learning needs (nursing diagnosis), planning, implementation of teaching strategies, and evaluation of learner progress and teaching efficacy.

Purposes of Client Teaching

According to Edelman and Mandle (1997), the goal of health education is to help individuals achieve optimum states of health through their own actions. Teaching, one of the most important nursing functions, addresses

clients' need for information. Often, a knowledge deficit about the course of illness and/or self-care practices hinders a client's recovering from illness or engaging in health promotion behaviors. The nurse's charge is to help bridge the gap between what a client knows and what a client needs to know in order to achieve optimum health.

Client teaching is done for a variety of reasons, including:

- Promotion of wellness
- Prevention of disease/injury
- Restoration of health
- Facilitation of coping abilities

(See Table 13-1). Client education focuses on the client's ability to practice healthy behaviors. The client's ability to care for self is enhanced by effective education. As Redman (1993, p. 1) stated:

Many will agree that patients need assistance with understanding their health situations, making health care decisions, and changing health behaviors. Patient and family education has become an integral part of safe, cost-effective, quality patient care.

To be more effective teachers, nurses need a basic understanding of learning theories. There are many schools of thought (theories) about how people learn. Table 13-2 provides an overview of major learning theories.

Each nurse needs to develop an individual **philosophy** (statement of beliefs that is the foundation for behavior) of learning. When formulating a philosophy about teaching-learning, nurses need to consider the common beliefs about learning listed in the accompanying display.

BELIEFS ABOUT LEARNING

- Each individual has the capacity to learn; learning ability varies from person to person and is situational.
- The pace of learning varies with each person.
- Learning is a continuous process, occurring throughout the life cycle.
- Learning can occur in formal and informal settings and interactions.
- Learning is an individualized process.
- Learning new information is based on previous knowledge and experiences.
- Motivation and readiness are necessary for learning to occur.
- Prompt feedback facilitates learning.

TABLE 13-1
Client Education Topics

Health Promotion	Health Restoration
<ul style="list-style-type: none"> • Parenting Skills • Nutrition • Exercise • Family planning 	<ul style="list-style-type: none"> • Medication information • Community resources • Information about treatment modalities
Illness/injury prevention	Facilitating coping
<ul style="list-style-type: none"> • Immunizations • Health screenings • Smoking cessation • Breast self-examination • Safety measures (e.g., car seat/restraining devices) 	<ul style="list-style-type: none"> • Safe use of medical equipment • Dietary modifications • Information about the disease process • Counseling related to anger, grief, self-esteem • Stress management

TABLE 13-2
Overview of Learning Theories

Theorist	Description
John Watson	Learning is: A result of conditioning and experiences. Encouraged by changing the environment.
Ivan Pavlov	The learner is passive, controlled by the environment.
B. F. Skinner	Teaching is the deliberate manipulation of the environment.
Edward L. Thorndike	Learning can be transferred from one situation to another. Assessment of learner's behavior is necessary.
John Dewey	The learner must have an understanding of the goals. Education should promote learner independence.
Jerome Bruner	Learning is affected by culture and value system. The learner is an active participant in the learning process.
Robert Gagne	Learning occurs in an orderly fashion, from the simple to the complex, from the concrete to the abstract.
Albert Bandura	Behavior is regulated by internal mechanisms, such as self-efficacy.

THINK ABOUT IT

Your Beliefs about Learning

Consider the information presented in the display and Table 13-2. Which statements mirror your own philosophy about learning? Which statements are most congruent with a nursing philosophy that views clients not as recipients of care but as partners in the caring and healing process?

Facilitators of Learning

Certain fundamental principles of education can be used by nurses to facilitate client learning. Knowles (1984) stated four basic assumptions about adult learners, which are applicable to client education:

- *Assumption:* An individual's personality develops in an orderly fashion from dependence to independence. *Nursing Application:* Plan teaching-learning activities that promote client participation, thus encouraging independence; this increases client control and self-care through empowerment.
- *Assumption:* Learning readiness is affected by developmental stage and sociocultural factors. *Nursing Application:* Conduct a thorough psychosocial assessment before planning the teaching-learning activities.
- *Assumption:* An individual's previous learning experiences can be used as a foundation for further learning. *Nursing Application:* Perform a complete assessment to determine what the client already knows and build on that knowledge base.

- *Assumption:* Immediacy reinforces learning. *Nursing Application:* Provide opportunities for immediate application of knowledge and skills. Incorporate feedback as a continuous part of each nurse-client interaction.

Table 13-3 describes key learning principles.

It is a good idea to keep in mind that **learning plateaus**, or peaks in effectiveness of teaching and depth of learning, will occur in relation to the client's motivation, interest, and perception of relevance of the material. Frequent reinforcement of learning through immediate feedback and continual reassessment of effectiveness will enhance the value of the learning process for both the teacher and the learner. Making the information acquisition process as user-friendly as possible will also increase satisfaction and success. This can be done by organizing content from the simple to the complex and from the familiar to the new, making learning as creative and interesting as possible, and adopting a flexible approach to allow the learning process to be dynamic.

Barriers to Learning

Receiving information does not, in and of itself, guarantee that learning will occur. Several barriers can impede the learning process. In a nursing situation,

TABLE 13-3
Principles of Learning

Principle	Explanation
Relevance	The material should be: <ul style="list-style-type: none"> • Meaningful to client • Easily understood by client • Related to previously learned information
Motivation	Client should: <ul style="list-style-type: none"> • Want to learn • Perceive value of information
Readiness	Client should be able and willing to learn.
Maturation	Client should be developmentally able to learn and have requisite cognitive and psychomotor abilities.
Reinforcement	Feedback to learner should be: <ul style="list-style-type: none"> • Positive • Immediate
Participation	Active involvement promotes learning.
Organization	The material should: <ul style="list-style-type: none"> • Incorporate previously learned information • Be presented in sequence of simple to complex
Repetition	Retention of material is reinforced by practice, repetition, and presentation of same material in a variety of ways.

BARRIERS TO LEARNING

External Barriers

Environmental

- Interruptions
- Lack of privacy
- Multiple stimuli

Sociocultural

- Language
- Value system
- Educational background

Internal Barriers

Psychological

- Anxiety
- Fear
- Anger
- Depression
- Inability to comprehend

Physiological

- Pain
- Fatigue
- Sensory deprivation
- Oxygen deprivation

learning barriers can be classified as either internal (psychological or physiological) or external (environmental or sociocultural). Examples of these barriers are shown in the accompanying display.

The nurse must assess for the presence of barriers to facilitate the learning process. Specific assessment information is presented later in this chapter.

THINK ABOUT IT

Barriers to Learning

Do you think knowledge acquisition alone results in learning (behavior change)? Why? Why not? Consider, for example, all the information available regarding the harmful effects of smoking. Every cigarette package has a similar statement: "Warning: Cigarette smoking can cause lung cancer, heart disease, emphysema, and interfere with pregnancy." However, dissemination of this information has not led to complete cessation of smoking in our society. Why do you think this is so? What learning barriers may be interfering with smokers' taking action in response to this warning?

Domains of Learning

Bloom, in his classic work (1977), identified three areas or domains in which learning occurs: the **cognitive domain** (intellectual understanding), the **affective domain** (emotions and attitudes), and the **psychomotor domain** (motor skills). Each domain responds to and processes information in very different ways. Table 13-4 briefly describes the three domains of learning through clinical examples. What can be learned during the process of client education? "New thinking strategies, new motor skills, and new attitudes are learned in complex patterns that can promote a new performance" (Redman, 1993, p. 78).

TABLE 13-4
Domains of Learning

Domain	Definition	Clinical Example
Cognitive	Learning that involves the acquisition of facts and data. Used in problem solving and decision making.	Client states the name and purpose of prescribed medications.
Affective	Learning that involves changing attitudes, emotions, beliefs. Used in making judgments.	Client accepts that he has a chronic illness.
Psychomotor	Learning that involves gaining motor skills. Uses physical application of knowledge.	Client gives self an injection.

Nurses need to be sensitive to all three domains of learning when developing effective teaching plans and to use **teaching strategies**, or techniques to promote learning, that will tap into each of the domains. For instance, teaching a diabetic client how and why to measure the proper daily balance of insulin against glucose levels is within the cognitive domain. Helping this client learn how to self-administer insulin falls within the psychomotor domain, and seeing that the client learns to view diabetes as only one part of an entire individual stimulates the affective domain.

PROFESSIONAL RESPONSIBILITIES RELATED TO TEACHING

Through teaching, the nurse empowers clients in their self-care abilities. Teaching is the tool for providing information to clients about specific disease processes, treatment methods, and health-promoting behaviors.

Legal Aspects

The American Nurses Association, in its *Social Policy Statement* (1995), identifies health teaching as an essential function of nursing. Each state has its own definition of nursing practice; in most states, teaching is a required function of nurses. As stated by the Louisiana State Board of Nursing (1993, p. 9), “The practice of a registered nurse includes such activities as health instruction, and health counseling.”

Client teaching is also mandated by several accrediting bodies, such as the Joint Commission for

Accreditation of Healthcare Organizations (JCAHO, 1998). The American Hospital Association’s *Patient’s Bill of Rights* (1980) calls for the client’s understanding of health status and treatment approaches. Informed consent for treatment procedures can be given only by clients who are well informed. The nurse assesses the client’s level of understanding about treatment methods and corrects any knowledge deficits. The nurse is often a physician interpreter to the client—explaining in easily understood terms, clarifying, and referring.

Teaching supports behavior change that leads to positive adaptation. Thus, teaching involves decreasing the fear of change. Reducing anxiety and anticipatory stress is an important component of teaching.

Client teaching is an essential function of every professional nurse regardless of the practice setting. Table 13-5 outlines learning needs as they relate to the three phases of nursing care: primary, secondary, and tertiary. Clients who are hospitalized need information regarding their condition, the hospital environment, and expectations regarding treatment.

Documentation

The reasonable, prudent standard calls for nurses to document client education. See Chapter 23 for a discussion of this standard. From a legal perspective, if the nurse teaches the client and fails to document it, then the educational activities never occurred. Documentation of teaching promotes continuity of care and facilitates accurate communication to other health care colleagues.

Many different approaches can be used to document client teaching. Figure 13-1 provides one example of documentation for client teaching in an inpatient setting. For a sample form documenting teaching in the home setting, see Figure 13-2.

TABLE 13-5
Learning Needs in Various Phases of Care

Primary: Health Maintenance	Secondary: Diagnosis and Treatment	Tertiary: Follow-up
Disease prevention	Disease process	Care at home

Figure 13-2 Documentation Form for Client Teaching: Home Health

Because client education is a standard and essential component of nursing practice, teaching interventions and the client's response must be documented. Elements for documenting client education in all practice settings include:

- Content taught
- Teaching methods used
- Who was taught (e.g., client, which family member, other caretaker)
- Client/family response to teaching activities

LEARNING THROUGHOUT THE LIFE CYCLE

One basic assumption underlies teaching effectiveness—*all people are capable of learning*. This ability to learn varies from person to person and from situation to situation. Most clients—because of anxiety, pain, or other stressors related to illness—have only limited adaptive resources. They may not have much energy or interest to invest in learning.

Learning needs and learning abilities change throughout life. The client's chronological age and developmental stage greatly influence the ability to learn. The principles of learning discussed earlier in this chapter have relevance to learners of all ages. However, teaching approaches must be modified according to the client's developmental stage and level of understanding. Specific information about teaching children, adolescents, and older adults is described in the following sections. Table 13-6 lists teaching strategies for different age groups.

Children

Readiness for learning (evidence of willingness to learn) varies during childhood according to maturational level. Responding to knowledge deficits of young children requires that the nurse work closely with the child's caretaker; including the family or significant others in teaching is essential when caring for young children.

Young children learn primarily through play, which can be incorporated into teaching activities (Figure 13-3). For example, puppets, toys, and coloring books can be effective teaching tools for the young child.

Older children can also benefit from the use of art materials and medical supplies (e.g., medicine cups, putting bandages on dolls). While the child is involved in play, the nurse is alleviating anxiety by teaching the child what to expect regarding treatment procedures.

Biddinger (1993, p. 148), in discussing the learning needs of children prior to treatment procedures, stated:

Children need preprocedural teaching. Preparation of children and parents for medical procedures usually decreases their anxiety levels, reduces their resistant behaviors, and helps them to cope. Young children respond better to health teaching when play is involved, and older children learn from age-appropriate films.

The nursing checklist provides guidelines for teaching children.

Adolescents

As children approach adolescence, they are better able to conceptualize relationships between things. Usually, reading skills and comprehension ability have

Figure 13-3 Using play and games helps children learn and decreases their anxiety about the health care setting.

advanced, and the adolescent can understand more complex information. One of the strongest influences on an adolescent is peer support; therefore, group meetings are often useful in teaching. Nurses also teach by acting as role models. Relate to adolescents on their level by trying to understand how they think. Listening allows the nurse to hear the adolescent's feedback relative to learning needs. It is also important when teaching adolescents to focus on the present and to be aware of their need to maintain control. "Independence is crucial to adolescents. By enlisting teens as active participants in their health care and encouraging them to participate in other activities, you can increase independ-

THINK ABOUT IT

Do As I Say

The adage "Do as I say and not as I do" goes against all wisdom. Individuals learn from examples set by role models. Adolescents are especially sensitive to discrepancies between an adult's words and actions. How does this apply to you as a beginning practitioner of nursing? What messages are communicated by your health behaviors?

NURSING CHECKLIST

Guidelines for Teaching Children

- Make sure the client is comfortable.
- Encourage caregiver participation.
- Assess developmental level. Do not equate age with developmental level.
- Assess client's learning readiness and motivation.
- Assess client's psychological status.
- Determine self-care abilities of client and caregiver.
- Use play, imitation, and role playing to make learning fun and meaningful.
- Use different visual stimuli such as books, chalkboards, and videos to convey information and check understanding.
- Use terms that are easily understood by the client and caregiver.
- Provide frequent repetition and reinforcement.
- Develop realistic goals that are consistent with developmental abilities.
- Verify client's understanding of information presented.

NURSING CHECKLIST

Guidelines for Teaching Adolescents

- Show respect for adolescents by recognizing that they still have to gain the knowledge and experience of adulthood while struggling to break away from the grasp of childhood.
- Boost adolescents' confidence by asking their input and opinions on health care matters.
- Encourage adolescents to explore their own feelings about self-concept and independence.
- Be sensitive to the peer pressure many adolescents face.
- Help adolescents identify their positive qualities and build on those.
- Use language that is clear yet appropriate to the health care setting.
- Gear teaching to the adolescent's developmental level.
- Engage adolescents in problem-solving activities to encourage independent and informed decision making.

ence and decrease noncompliance" (Muscari, 1998, p. 29). The nursing checklist provides additional guidelines for teaching adolescents.

Older Adults

Aging is accompanied by many physiological changes. As a result of these changes, some older adults have perceptual impairments such as impaired vision and hearing. The nurse must assess for perceptual changes and adjust teaching materials accordingly. For example, provide large-print written material and make sure the client can hear all your instructions and directions. The nursing checklist provides guidelines for teaching older adults.

NURSING CHECKLIST

Guidelines for Teaching Older Adults

- Make sure the client is comfortable. Pain, fatigue, and hunger can impair learning.
- Assess client's learning readiness and motivation; also assess developmental level. Do not equate age with developmental level.
- Assess client's psychological status. Depression, severe anxiety, and denial interfere with learning.
- Determine client's self-care abilities.
- Use terms that are easily understood by the client. Avoid talking down to the client; a condescending, paternalistic manner impedes learning.
- Determine the time of day in which the client is better able to concentrate.
- Assess for perceptual impairments and individualize teaching strategies accordingly.

(Adapted from Beare, P. G., & Myers, J. L. [1999]. *Principles and practices of adult health nursing* [3rd ed., p. 111.]. St. Louis: Mosby.)

TEACHING-LEARNING AND THE NURSING PROCESS

The teaching-learning process and the nursing process are interdependent. Both are dynamic and consist of the same phases: assessment, diagnosis, planning, implementation, and evaluation. Figure 13-4 compares the nursing process and the teaching-learning process. See Chapter 5 for more information about the nursing process.

Assessment

The nurse should assess each learning situation for every client. Primary and secondary data sources are used by nurses for assessment of learning needs. See Chapter 6 for a discussion of these sources. Communicating with the client and family or significant others is the foundation of assessment related to learning. Several factors need to be considered during assessment, including:

- Learning styles
- Learning needs

Title of Study

“Health Teaching Needs of Clients with Serious and Persistent Mental Illness: Client and Provider Perspectives”

Authors

Payson, A. A., Wheeler, K., & Wellington, T. A.

Purpose

The purpose of this study was threefold: (1) to investigate demographic characteristics of people with serious and persistent mental illness; (2) to assess the health teaching needs of people with serious and persistent mental illness; and (3) to compare clients' and providers' perceptions of the clients' health teaching needs.

Methods

Clients of a mental health clinic were asked to volunteer in a study after an explanation of its purpose. Data were collected over 6 months. After completing a questionnaire, clients participated in focus groups to determine priority learning needs.

Findings

Ninety-three percent of participants completed the needs assessment questionnaires. The study indicated that psychiatric clients are interested in gaining more information about psychiatric illnesses and methods for solving problems.

Implications

There is a discrepancy between client-determined priority learning needs and provider-determined needs. The results support the practice of assessing clients' own perceptions of their learning needs.

Payson, A. A., Wheeler, K., & Wellington, T. A. (1998). Health teaching needs of clients with serious and persistent mental illness: Client and provider perspectives. *Journal of Psychosocial Nursing*, 36(2), 32–35.

- Potential learning needs
- Ability to learn
- Readiness to learn
- Client strengths
- Previous experience and knowledge base

Learning Styles

Each individual has a unique way of processing information. The manner in which an individual incorporates new data is called **learning style**. Some people

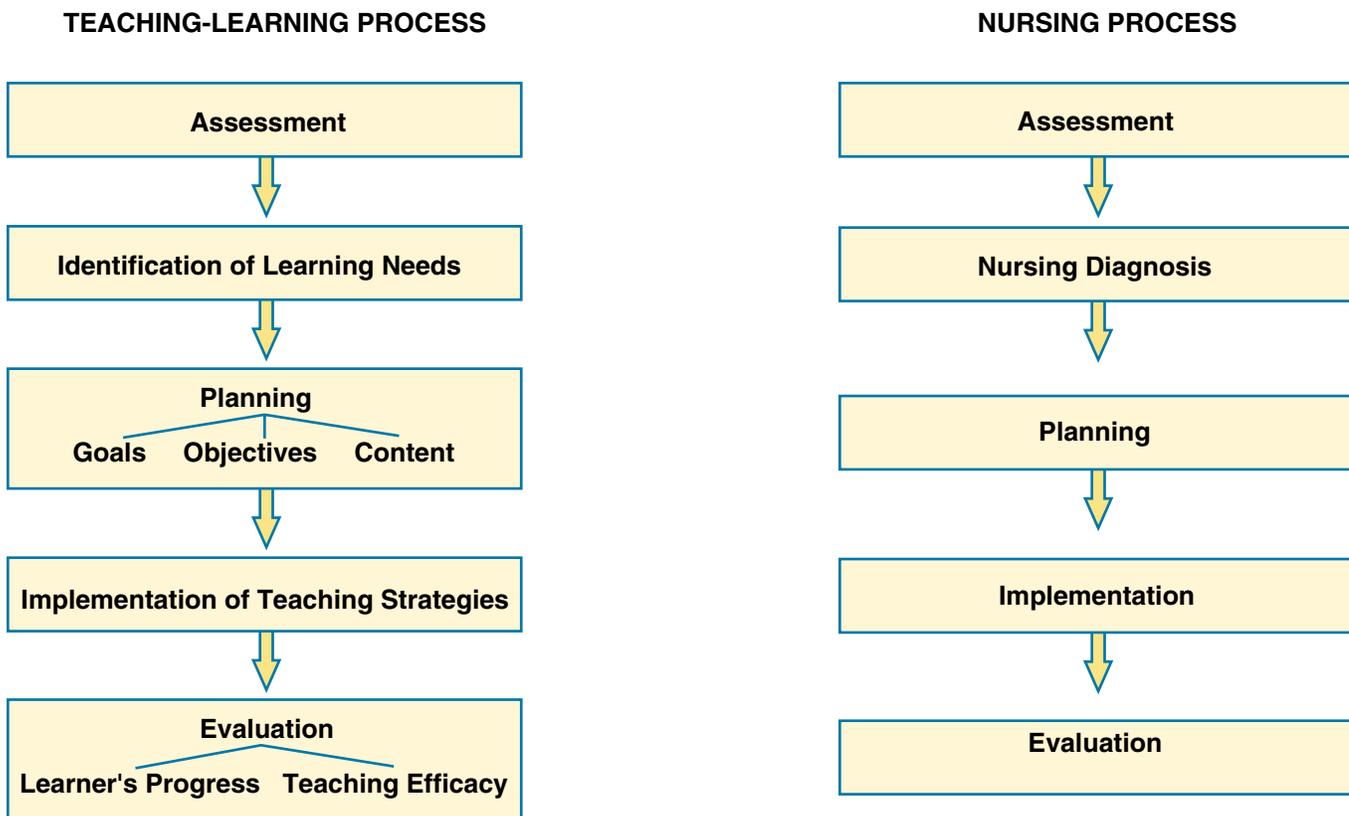

Figure 13-4 Teaching-Learning Process and Nursing Process: A Comparison

learn by processing information visually (**visual learners**), others by listening to words (**auditory learners**), and others by doing (**kinesthetic learners**). The nurse should use a variety of techniques, such as lecture, discussion, small group work, role playing, modeling, return demonstration, imitation, problem solving, games, and question-and-answer sessions, to match different learning styles of clients. A good way to discover learning style is to ask the client, “What helps you to learn?” or “What kinds of things do you enjoy doing?”

Learning Needs

Everyone who receives health care services has some need for learning. Client teaching may be indicated when a client:

- Expresses a need for information to make decisions
- Has a need for new skills
- Desires to make modifications in lifestyle
- Is in an unfamiliar environment

Comprehensive assessment is a mutual process between client and nurse. A crucial step in teaching is to determine the client’s learning needs—what the client needs to know and what the client already knows. The nurse must evaluate the client’s knowledge about the content that is to be taught. This previous knowledge can then be used as a foundation for new concepts. If the client is

NEEDS ASSESSMENT GUIDELINES

Listen to what the client’s words and actions are communicating.

- Does the client express uncertainty and/or anxiety over an upcoming procedure?
- Is the client able to tell you about medications, purposes, and side effects?
- Can the client describe necessary lifestyle modifications?
- Does the client perform self-care activities correctly?
- Is the client able to demonstrate necessary treatment procedures (e.g., colostomy irrigations, injections, blood glucose monitoring)?

misinformed, the nurse develops a remediation plan for learning. Determination of the client’s learning needs is accomplished in a variety of ways, including:

- Questioning the client directly
- Observing client behaviors
- Interacting with the client’s family or significant others

It is imperative that the nurse address the client’s immediate need for knowledge first. This is facilitated by assessing the client’s perception of learning needs and prioritizing those needs on the basis of client input and status.

Potential Learning Needs

The nurse also assesses for potential learning needs so that anticipatory planning can be done to avert a relapse in the recovery process and to maintain wellness. Some examples of anticipatory learning needs include:

- Mrs. Stone is pregnant for the first time. *Potential Learning Need:* Infant care
- Mr. Carpenter has just been diagnosed with diabetes that is currently controlled by dietary modifications. He has been told that he may have to take insulin daily in the future. *Potential Learning Need:* Self-administration of insulin

Ability to Learn

The nurse assesses the client for characteristics that will hinder or facilitate learning. One such characteristic is the client's developmental stage. For example, do not automatically assume that a client who is 34 years old has mastered the developmental tasks of earlier stages. Age is not synonymous with developmental level; observation of behavior provides the clearest clue to developmental level.

The client's maturity level greatly influences the ability to learn information. Every developmental stage is characterized by unique skills and abilities that affect the response to various teaching tools. Developmental stage greatly determines the type of data to be taught, the method(s) to be used, the language that is used, and the location for teaching. In addition to developmental stage, assessment should include evaluation of the client's cognitive skills, problem-solving abilities, and attention span.

Readiness to Learn

Another characteristic to be assessed is the client's learning readiness. Table 13-7 shows some factors that influence readiness.

Readiness is closely related to growth and development; for example, does the client have the requisite cognitive and psychomotor skills for learning a particular task? Can the client comprehend the information? Learning readiness is present when the client asks ques-

TABLE 13-7
Factors Influencing Learning Readiness

Capability	Comfort	Motivation
Maturity level	Basic physiological needs met	Care for self
Physical ability	Feelings of safety and security	Get well
Cognitive ability	Low degree (or absence of) pain	Achieve a higher level of wellness
Attitude	Pleasant surroundings with few distractions	Know and understand
		Return to work
	Rapport with caregiver	Please others
		Be a "good patient"
		Avoid complications and relapse

tions. Another indicator that the client is ready to learn is client participation in learning activities, such as actively participating in return demonstration of a dressing change. Some behaviors that indicate lack of client readiness are anxiety, avoidance, denial, lack of participation in discussion or demonstration, and lack of participation in self-care activities.

Closely related to readiness is client motivation. Individuals must believe that they need to learn the information before learning occurs. Does the client perceive relevance (meaningfulness) in the current information to be taught? If an individual sees the information as being personally valuable, the information is more likely to be learned. However, if the client does not think that the content is relevant, learning is not likely to occur. Relevance is determined individually; the nurse must assess the personal meaning of learning content for each client.

Albert Bandura, a psychologist, described the concept of **self-efficacy** (a belief that one will succeed in attempts to change behavior) as having a profound influence on motivation (1977). If clients feel they will not achieve the goals, they will lack motivation to try. To maximize motivation, keep the teaching-learning goals realistic. Break the content down into small steps that are achievable and provide feedback on the progress.

Client Strengths

Identifying the client's strengths and limitations provides a foundation for realistic expectations. An understanding of the client's strengths and weaknesses allows

THINK ABOUT IT

Checking Literacy

"Lscean uyro sdhna. Seu yver dloc rwheat."

The preceding statement is what many of your clients will see when you give them printed educational materials. Be sure to assess the client's ability to comprehend written materials, and avoid making assumptions about your clients' literacy level. Check for comprehension through return explanation of the written material.

THINK ABOUT IT

Relevance of Learning

Consider the concept of relevancy as it applies to you as a learner. What motivates you to study? How do you “psych yourself up” to learn new material? What helps you perceive material as relevant?

the nurse to plan successful teaching-learning experiences. Determination of client strengths assists the nurse in selecting appropriate teaching methods.

Previous Experience and Knowledge Base

The client has a knowledge base acquired through life experiences. Previous knowledge affects the client’s attitudes about learning and perception of the importance of information to be learned and is related to the client’s type of educational experiences.

Certainly when considering a client’s previous knowledge, the nurse recognizes that culture plays an important role in knowledge acquisition. Attitudes (which are derived from a cultural context) toward what is appropriate to learn and who should teach may require alterations in the nurse’s approach. The nurse’s sensitivity to cultural values affects every aspect of the teaching-learning process.

Nursing Diagnosis

Several nursing diagnoses can apply to the client when barriers to the learning process exist. When lack of knowledge is the primary barrier to learning, the diagnosis of *Deficient Knowledge* is applicable. For example:

- A client who does not understand how to use crutches for assisted ambulation may have the diagnosis of *Deficient Knowledge: Crutchwalking*, related to inexperience as evidenced by multiple questions and hesitancy to walk.
- A client who has had a colostomy and will be discharged soon may have a diagnosis of *Deficient Knowledge: Follow-Up Care* related to colostomy care and maintenance as evidenced by requests for information.

Deficient knowledge may also be a component of many other nursing diagnoses in which risk or impaired behavior exists. For instance, *Risk for Infection* may relate to a client’s compromised health status; this risk can be modified or reduced through certain physical and environmental changes and also through proper client education. A client presenting with a diagnosis of a *Self-Care Deficit: Bathing* may need assistance acquiring the physical supplies to remedy the deficit, as well as instruction in techniques related to present physical and mental abilities.

Planning and Outcome Identification

Informal teaching can occur in any setting at any time; formal teaching is planned and goal directed (Figure 13-5). Teaching is a goal-directed, purposeful process, which means that teaching-learning activities must be planned. Reread this chapter’s opening quotation as a reminder that learning does not just happen by chance—it is planned. Planning, an ongoing phase of the teaching process, involves consideration of the following:

- What to teach
- How to teach
- Who will teach and who will be taught
- When teaching will occur
- Where teaching will be done

“Meeting the patient educational needs of the consumer is one well-recognized aspect of quality care. Delivering quality care does not happen by chance, rather, it requires intense planning” (Patyk, Gaynor, & Verdin, 2000, p. 14).

Determination of *what* to teach is done through comprehensive assessment. The content to be taught depends greatly on the client’s knowledge base, readiness to learn, and current health status.

Figure 13-5 Nurses engage in formal and informal teaching, with both individual and group clients. (Photo courtesy of Bellevue, The Woman’s Hospital, Niskayuna, NY.)

Deciding *how* to teach involves matching teaching strategies with client's learning needs, readiness, and ability. The nurse who is an effective teacher uses methods that capture the client's interest. A variety of teaching methods can be used to match the client's learning styles.

Planning also means deciding *who* will teach the client. Effective client education is the result of a multidisciplinary effort. However, the nurse is the coordinator of the health care team's teaching activities. Responsibility for planning a comprehensive teaching approach, from admission to postdischarge, remains with the nurse. Continuity of care is greatly affected by the teaching plan. The "who" part of planning also means determining who should be taught. In addition to the individual client, the nurse must determine who else in the family needs to be taught about the illness and recovery process.

An enormous wealth of health educational materials is available to families. Appendix D provides a listing of resources for caregivers.

Timing of *when* to teach should be carefully considered. The nurse recognizes that *every* interaction with the client is an opportunity for informal teaching. Whenever a client asks a question, there is an opportunity for teaching. These windows of teaching opportunities must be used. Nothing destroys a client's motivation for learning more quickly than hearing such comments as "Ask your doctor that" or "We'll talk about that later, right now take your medicine." The best time for teaching is when the client is comfortable—physically and psychologically.

In addition to capitalizing on informal teaching time, the nurse must plan time during which formal teaching can be done. Teaching must match the pace of the client's progress. Some clients learn more quickly than others; some need more repetition. Timing of the teaching session is crucial. The more information presented, the more a client is likely to forget. Therefore, teaching sessions must be kept brief to avoid overwhelming the client. Throughout the teaching session, use repetition and frequently ask the client questions to allow you to pace the delivery of information.

The location for teaching activities must also be well-planned. *Where* teaching occurs affects the quality of learning. Some factors to be considered in determining the location of teaching include provision for privacy and availability of equipment. Selection of teaching methods is often determined by the location. For example, videos can often be used effectively in inpatient settings; however, the same information may need to be presented with flipcharts or brochures in the home setting.

An important part of planning in the teaching-learning process is goal setting. The client and family or significant others must be involved in setting goals. Mutually determined learning goals promote learning. Specific learning goals should include these elements:

- Measurable behavioral change
- Time frame
- Methods and intervals for evaluation

Teaching-learning goals must be realistic, that is, based on the abilities of the learner and the teacher.

Establishing teaching-learning goals involves setting priorities. See Chapter 18 for a description of the process of establishing goals. One way to prioritize goals is to teach the "need-to-know" information (that which is necessary for survival) before moving on to the "nice-to-know" content. For example, Mrs. Stone, who is in her first trimester of pregnancy, *must* know guidelines for diet and exercise ("need-to-know" goal); learning about infant care can occur later in the pregnancy ("nice-to-know" goal).

Teaching Vulnerable Populations

When planning to teach individuals with special needs, it is important that the usual teaching strategies be modified according to the client's individual needs. This section describes education of individuals who experience developmental delays, chronic illness, low literacy skills, and sensory impairments.

Developmental Delays

Individuals with limited cognitive abilities have a medical diagnosis of mental retardation if the IQ level is 70 or less (American Psychiatric Association, 1994). The client's learning depends upon the degree of cognitive impairment, so teaching strategies must be selected accordingly. For example, a client who has Mild Mental Retardation (IQ level of 50–70) may be able to learn by discussion of simple concepts that are stated in easily understood terms. Note that it is important to use concrete language and frequent repetition with clients in this category; the use of simple games is often effective. On the other hand, a client who is profoundly mentally retarded (IQ level below 25) may be unable to learn in the traditional sense. Frequent communication and repetition are required when working with a client with this degree of mental impairment.

Chronic Illness

Clients who experience chronic illness (such as arthritis, hypertension, diabetes, asthma) have many learning needs, both actual and potential. Some chronic disorders, such as arthritis, may impair mobility and thus interfere with learning psychomotor skills as a result of decreased flexibility and dexterity of the fingers. Other chronic illnesses, such as diabetes, require ongoing assessment of the client's level of understanding about self-care (e.g., diet, exercise, and lifestyle changes). Essential hypertension, another chronic disease process, often leads to client's noncompliance with the prescribed treatment regimen. Ongoing education related to antihypertensive medication helps improve compliance.

MANAGING PROBLEMS WITH POOR READERS

Problem

Misses meaning of words

Takes words literally

Reads slowly, tires easily, gives up

Skips unfamiliar words

Intervention

Use simple, noncomplex terms.

Avoid use of medical jargon.

Provide examples.

Use simple explanations.

Use concrete terms and avoid references to abstract concepts.

Use short segments with frequent breaks.

Provide simple organization of material.

Explain.

Review and repeat definitions.

(Adapted from Doak, C. C., Doak, L. G., & Root, J. H. [1996]. *Teaching patients with low literacy skills* [2nd ed.]. Philadelphia: Lippincott.)

Low Literacy Skills

It is imperative that nurses assess the reading and comprehension abilities of clients before using printed educational materials. The majority of health care teaching involves the use of printed materials. However, approximately one in five Americans is functionally illiterate, which translates to more than 20 million American adults who cannot read (Hunt & Zurek, 1997, p. 158). It is a common mistake to equate the highest educational level achieved with reading level. Typically, individuals read at three to five grade levels lower than their achieved educational level (Doak, Doak, & Root, 1996). The accompanying display lists some guidelines for working with clients with low literacy skills.

Sensory Impairments

Many clients have sensory impairments as a result of illness, injury, or the aging process. Effective nurses modify their teaching approaches in order to accommodate such impairments. A common mistake many people make when talking with someone who has a sensory impairment is to talk loudly. Screaming and yelling do not help the person who has auditory or visual impairments. See the accompanying nursing checklist for guidelines in working with clients who have visual, auditory, or memory impairments.

Implementation

There are several characteristics of nurses that influence the outcome of the teaching-learning process. Nursing self-awareness, an all-important first step in teaching, focuses on the concepts discussed in the following sections. The nursing checklist provides some implementation guidelines for making teaching more meaningful to clients.

Knowledge Base

It is impossible for nurses to teach if they lack the knowledge or skills that are to be taught. Staying current in knowledge and proficient in skills is the first

NURSING CHECKLIST

Guidelines for Teaching Clients with Sensory Impairments

For memory-impaired clients:

- Use repetition.
- Use a variety of cues (verbal, written, pictures, and symbols).

For visually impaired clients:

- Provide large-print materials.
- Provide prescription eyeglasses and magnifying glasses.
- Provide adequate lighting while reducing glare.

For hearing-impaired clients:

- Face the client directly when you speak.
- Use short sentences and words that are easily understood.
- Use signals to reinforce verbal information—point, gesture, demonstrate.
- Eliminate distracting noises or activities from the environment as much as possible.

For all clients:

- Encourage client involvement and participation.
- Ask for feedback and listen actively.
- Provide frequent feedback.

(Adapted from Beare, P. G., & Myers, J. L. [1998]. *Principles and practice of adult health nursing* [3rd ed.]. St Louis: Mosby.)

step to maintaining efficacy and credibility as a teacher. It is impossible for one individual to be an expert in every area of nursing. Therefore, knowing when to refer the client to others for teaching can augment learning.

NURSING CHECKLIST

Guidelines for Effective Client Teaching

- Assess client's knowledge and needs.
- Focus on client's perceived needs.
- Relate material to prior knowledge.
- Encourage client's active participation.
- Provide opportunity for immediate application of knowledge or skill.
- Expect learning plateaus to occur.
- Reinforce learning frequently.
- Provide immediate feedback to facilitate learning.
- Ensure a comfortable environment.
- Organize content from the simple to the complex, building on what the client already knows.
- Use a variety of teaching methods.
- Emphasize verbal instructions with writing and pictures.
- Stay flexible in your approach.
- Be creative!

Interpersonal Skills

Effective teaching is based on the nurse's ability to establish rapport with the client. "Information in itself does not ensure health-promoting behavior. There is no substitute for a relationship between you and your patients" (Gallagher & Zeind, 1998, p. 16AAA). The nurse who is empathic to the client shows sensitivity to the client's needs and preferences. An atmosphere in which the client feels free to ask questions promotes learning. Activities that help establish an environment conducive to learning include:

- Showing genuine interest in the client.
- Including the client in *every* step of the teaching-learning process.
- Using a nonjudgmental approach.
- Communicating at the client's level of understanding.

"Learning should take place in an environment that fosters mutual trust, respect, and helpfulness. Creating such an environment takes a conscious effort on your part" (Hansen & Fisher, 1998, p. 58). In other words, deliberately plan to communicate a sense of empathy and caring; see Chapters 11 and 12 for more information on these therapeutic factors.

Teaching Clients At Home

Clients, and their families, who are recovering at home also have significant learning needs. A primary role of the home health nurse is to teach the client how to care for himself at home; this often involves teaching family members how to provide care (Figure 13-6). Home-based clients need infor-

Figure 13-6 Preparing clients to re-enter their home environment often means including family members in the teaching process.

mation regarding their chronic illness, accident, or injury. They also need to learn how to achieve and maintain a maximum state of wellness. Accurate teaching plans for the home-based client and family are established by assessing multiple factors, some of which are listed in Table 13-8.

APPLICATION: HOME CARE

Preparing the client and family for home care begins not at the time of hospital discharge but rather with hospital admission. The nurse's effective teaching is the link to thorough follow-up care in the home. Discharge planning considers the current learning needs for clients and caregivers as well as potential needs after discharge. Thus, teaching includes consideration of community resources and possible referral.

THINK ABOUT IT

Medical Jargon and Teaching

Consider the language used by most nurses—think of the terms nurses take for granted. When you ask a client to "void," does he understand what is meant? Think of the following frequently used terms, which can easily be misunderstood by clients and families:

ambulate	defecate	dangle
NPO	vital signs	contraindicated

Listen to the language you use when communicating with clients. How can you communicate without using professional jargon?

Evaluation

Evaluation of teaching-learning is a twofold process:

1. Determining what the client has learned
2. Assessing the nurse's teaching effectiveness

TABLE 13-8
Factors Affecting Learning Needs
of Home Health Clients

Type	Example
Environmental	<ul style="list-style-type: none"> • Accessibility of home to client with physical disability • Need and availability of equipment and supplies • Space to accommodate special needs of client • Need for information about environmental cleanliness as it relates to health • Need for assistance with self-care activities
Economic	<ul style="list-style-type: none"> • Ability to purchase medications, equipment, and supplies • Available financial assistance
Support system	<ul style="list-style-type: none"> • Persons available to assist with caregiving • Caregiver's deficient knowledge regarding necessary care
Community resources	<ul style="list-style-type: none"> • Resources in the immediate area • Awareness of and access to support services • Available respite to the family

Evaluation of Learning

Evaluation, a continuous process, consists of determining what the client has learned. Is there a behavior change? Is the behavior change related to learning activities? Is further change necessary? Will continued behavior change promote health? The following strategies can be used to evaluate client learning:

- Verbal questioning
- Observation

NURSING CHECKLIST

Evaluation of Learning

- Did the client meet mutually-established goals and objectives?
- Can the client demonstrate skills?
- Have the client's attitudes changed?
- Can the client cope better with illness-imposed limitations?
- Does the family understand health problems and know how to help?

- Return demonstration
- Written follow-up (e.g., questionnaires)

The accompanying nursing checklist provides guidelines for evaluation of learning.

Evaluation of Teaching

A major purpose of evaluation is to assess the effectiveness of the teaching activities and decide which modifications, if any, are necessary. When learning objectives are not met, reassessment is the basis for planning modification of teaching-learning activities. Several activities can evaluate teaching effectiveness, including the following:

- Feedback from the learner
- Feedback from colleagues
- Situational feedback
- Self-evaluation

Evaluation is facilitated through the use of goals that are measurable and specific. Use of the accompanying nursing checklist facilitates evaluation of teacher effectiveness.

Client education has been credited with the following (Seley, 1994):

- Improved quality of care
- Shorter length of hospital stays
- Decreased chances of hospital readmission
- Greater compliance with prescribed treatment regimen

These benefits will be enhanced through nurses' continued active participation as client educators.

NURSING CHECKLIST

Evaluation of Teacher Effectiveness

- Was content presented clearly and at the client's level of comprehension?
- Was the presentation (session) interesting?
- Did the nurse use a variety of teaching aids?
- Were the teaching aids appropriate for the client and the content?
- Was client participation encouraged?
- Was the nurse supportive?
- Did the nurse communicate an interest in the client and in the material?
- Did the nurse give frequent feedback and allow for immediate return demonstration?
- Were learning objectives stated in behavioral terms (i.e., easy to evaluate)?

NURSING CARE PLAN**The Client with Ineffective Breastfeeding****Case Presentation**

Mrs. Gozalo is a 32-year-old attorney who presents to the clinic requesting help in breastfeeding her 3-day-old daughter. She states that her first few attempts at breastfeeding in the hospital were marginally successful and that her baby was given formula by the staff prior to her discharge. Since being home, she has given the baby bottled formula when she cannot get the baby to latch on and suck successfully; these unsuccessful attempts at breastfeeding have made her question whether the effort to nurse is worthwhile. She says her husband has suggested using only bottle feedings, and she is frustrated and confused but wants to be successful at breastfeeding, which she describes as “the right thing to do.”

Assessment

- Verbalizations of desire to be successful at breastfeeding
- Lack of understanding of correct latch-on procedure

Nursing Diagnosis #1

Ineffective Breastfeeding related to unsatisfactory breastfeeding process as evidenced by infant’s receiving supplemental feedings with artificial nipple, interruption in breastfeeding, maternal anxiety, and deficient knowl-

Expected Outcomes

The client will:

1. Explain and return demonstrate correct latch-on and breastfeeding procedure (cognitive and psychomotor domains)
2. Express confidence that breastfeeding will be successful (affective domain)
3. Show desire to continue efforts at breastfeeding (affective domain)

Interventions/Rationales

1. Ask client, or determine through the interview process, what teaching strategies (lecture, literary, visuals) are most likely to be effective for her, and tailor teaching accordingly. *Matching teaching strategies to learning styles and needs increases the chance of successful education.*
2. Explain briefly the mechanics of the breastfeeding process, such as milk letdown, signs of breastfeeding readiness, and signs of infant hunger and satisfaction. *Knowledge of the process of correct breastfeeding will help bring client expectations in line with reality.*
3. Demonstrate correct infant holds and maternal postures. *Proper position of both the child and mother facilitates breastfeeding.*
4. Teach client effective techniques for latch-on, such as supporting the breast to correctly position it in the baby’s mouth, and tickling the baby’s lips or cheeks to stimulate rooting. *Correct techniques greatly enhance the likelihood of latch-on.*
5. Show client video or literature demonstrating successful breastfeeding. *Seeing other mothers successfully nursing should promote confidence and maintain desire to learn correct process.*
6. Encourage client to have her husband participate in the breastfeeding process by bringing the baby to her when she cries, stroking the baby’s head while she is nursing, and burping the baby after each feeding. *Partner support and involvement in the breastfeeding process will boost client’s confidence and strengthen desire to continue breastfeeding process.*

Evaluation

Client verbalizes confidence and comfort level with attempts at breastfeeding. Client achieves correct latch-on with minimal difficulty. Client states the signs of successful breastfeeding and states that she will look for such signs as the breasts feeling less full and the infant sucking strongly and seeming content at each feeding.

KEY CONCEPTS

- Client education is done to help individuals achieve optimum states of health.
- The teaching-learning process is a planned interaction that promotes behavioral change that is not a result of maturation or coincidence.
- Teaching supports behavior change that leads to positive adaptation.
- Learning is the process of assimilating information with a resultant change in behavior.
- Learning occurs in three domains: the cognitive (intellectual), the affective (emotional), and the psychomotor (motor skills).
- Learning readiness is affected by developmental and sociocultural factors, and is a lifelong process occurring in every developmental stage.
- Elements for documenting client education include the content taught, teaching methods used, who was taught, and response of the learners.
- The teaching-learning process and the nursing process are interdependent dynamic processes.
- Evaluation of the teaching-learning process involves two aspects: (1) determination of what the client has learned and (2) efficacy of the teacher.

CRITICAL THINKING ACTIVITIES

1. Give an example of each of the three domains of learning.
2. List four barriers to learning. What nursing interventions would you implement to overcome each barrier?
3. Why is it important for the nurse to use more than one teaching method?
4. Write your own philosophy of learning.

5. What are some of your own learning needs right now? How are they being addressed?
6. Compare the teaching roles of the nurse in different practice settings, such as hospitals, extended care facilities, clinics, schools, industries, home environments, and health maintenance organizations.
7. Develop a flow sheet for client teaching to use in one of your clinical agencies.
8. Identify two learning needs of a selected client. What will you do to help the client overcome the knowledge deficits?
9. Is it ethical for a nurse to attempt to get a client to change beliefs under the guise of teaching? Think of the many areas in which your value system may conflict with the beliefs of your clients. Whose belief system is “right”? Which belief system should prevail? Should you “teach” a client the “right” attitude or belief?
10. Have you or has anyone in your family ever had a health-related learning need that was dealt with inadequately? If so: (1) Why do you think that happened? (2) How did you feel as a result?

Nursing and Complementary/Alternative Treatment Modalities

Only nature heals.

—Hippocrates

COMPETENCIES

1. Describe the historical influences on current complementary/alternative modalities.
2. Discuss the connection between mind and body and the effect of this relationship on a person's health.
3. Identify the various mind-body, body-movement, energetic-touch healing, spiritual, nutritional, and other modalities that can be used as complementary therapies in client care.
4. Discuss the use of complementary/alternative modalities throughout the life cycle.
5. Explain the concept of the nurse as an instrument of healing in holistic nursing practice.

KEY
TERMS

acupressure	effleurage	nutraceuticals
acupuncture	endorphins	petrissage
allopathic	energetic-touch therapies	phytonutrients
alternative therapies	friction	psychoneuroimmunology
aromatherapy	healing touch	relaxation response
Ayurveda	imagery	shaman
biofeedback	integrative therapy	shamanism
bodymind	meditation	tapotement
centering	moxibustion	therapeutic massage
chakra	music-thanatology	therapeutic touch
chiropractic	neuropeptides	touch
complementary therapies	neurotransmitters	vibration

Western society tends to think of healing in terms of medical, surgical, and other technological interventions. However, in many other cultures—both past and present—healing has been promoted by faith, magic, ritual, and other nonmedical approaches.

The use of **alternative therapies** (treatment approaches that are not accepted by mainstream medical practice) and **complementary therapies** (treatment approaches that can be used in conjunction with conventional medical therapies) is becoming more prevalent among the general public. This chapter discusses complementary/alternative medicine (CAM) treatment methods that are currently being used in holistic nursing practice. Nurses are encouraged to think critically before recommending or implementing these approaches and to also be open to the possibilities that are available to help people live to their fullest potential. It is important to remember that what is considered “alternative” to one culture may be viewed as “traditional” in another, for example, Traditional Chinese Medicine and Ayurvedic medicine.

HISTORICAL INFLUENCES ON CONTEMPORARY PRACTICES

For as long as history has been recorded, people have tried to cure ills and relieve pain. Early cave drawings depict healers practicing their art. Primitive healers attributed the cause of mysterious diseases to magic and superstition; as a result, religious beliefs and health practices became intertwined.

From Ancient Tradition to Early Science

Remedies and practices that are based in ancient traditions are being rediscovered and used by contemporary holistic healers. This section discusses the impact of ancient healing practices on current use of CAM modalities.

Ancient Greece

The ancient Greek culture perceived health as the maintenance of balance in all dimensions of life. In Greek mythology, Asclepius was the god of healing. Temples (called Asclepions) were beautiful places for people (regardless of ability to pay) to rest, restore themselves, and worship. The elaborate healing system consisted of myths, symbols, and rites administered by rigorously trained priest-healers.

Influences from the Far East

Healing systems from the Far East have traditionally integrated mind, body, and spirit into a system of balanced energy between the individual and the universe. The concept of a life force or life energy permeates Eastern philosophies. The accompanying display lists the names of the life force in various cultures.

THE LIFE FORCE IN VARIOUS CULTURES

CULTURE	LIFE FORCE
Chinese	Chi
Indian	Prana
Japanese	Qi
Native American	Flow of Spirit
Mystic Christianity	Holy Spirit
Greek	Pneuma

China

The traditional Chinese healing system is based on the belief in the oneness of all things in nature. Life energy (*chi*) flows through both the universe and the person, thus creating a wholeness among all things and people. Chi provides warmth, protection from illness, and vitality. Chi flows along an invisible system of meridians (pathways) that link the organs together and connect them to the external environment and, therefore, to the universe. Illness and injury can alter the flow of this

energy. The energy flow can be influenced by stimulating points along the meridians.

Herbalism is an essential component of traditional Chinese healing practice. In seeking to promote balance, healers use herbs for dual purposes. For example, the herb *dong quai* relaxes the uterus when it is contracted and tightens it if it is too relaxed. A complete discussion of the use of herbs in contemporary health practices appears later in this chapter.

Many contemporary Western health care providers are studying and now using Traditional Chinese Medicine (TCM). These healing techniques have been used in various situations, such as with clients who are experiencing chronic pain associated with illness or injury. **Acupuncture**, one technique used in TCM, is the application of needles to various points on the body to alter the energy flow (see Figure 14-1).

India

Ayurveda, a healing system based on Hindu philosophy and Indian philosophy, embraces the concept of an energy force in the body that seeks to maintain balance or harmony. From the Ayurvedic perspective, the body and mind are filled with a vital energy (*prana*) that is the life force. “Like all enlightened healing methods, Ayurveda emphasizes prevention above curing disease” (Goldberg, 1999, p. 68). The life energy (*prana*) is transported through the body by a “wind” or *vata*. *Vata* regulates every type of movement. The accompanying display shows the types of *vata* in the human body.

The Hindu concept of chakras refers to seven primary energy centers in the physical body. A **chakra** is a concentrated area of energy. The chakras are vertically aligned through the center of the body from the crown of the head to the pelvis. Chakras influence the physical body, emotions, mental patterns, and spiritual awareness. Each chakra has specific functions and a corresponding relationship to body structures and organs; see Figure 14-2.

Figure 14-1 Acupuncture Needles Inserted for Treatment of Depression (Courtesy of Photodisc)

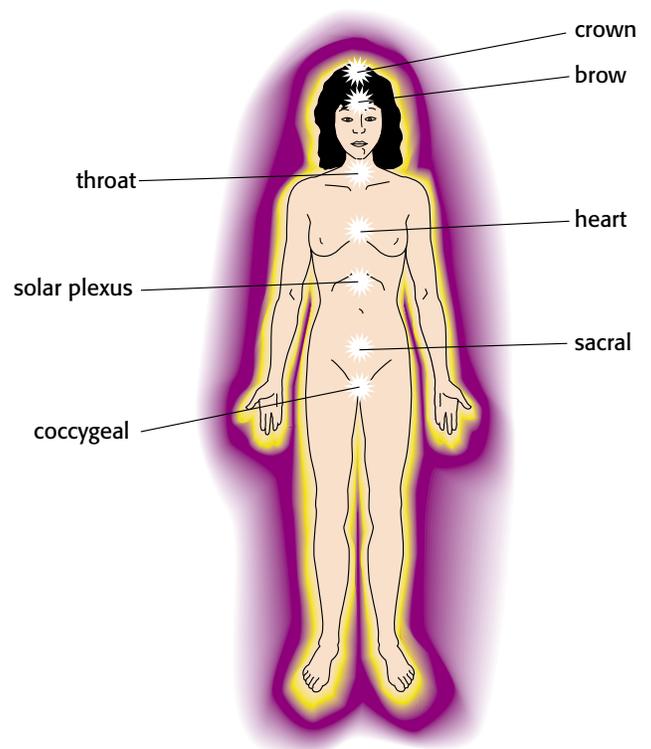

Figure 14-2 Locations of the Seven Major Chakras

VATA IN THE HUMAN BODY

Types of Vata

Regulatory Effect

Prana vata	Nervous system
Udana vata	Cognitive skills, speech, and memory
Samana vata	Digestion
Vyana vata	Circulation
Apana vata	Excretion

(Data from Goldberg, B. [1999]. *Alternative medicine: The definitive guide*. Tiburon, CA: Future Medicine Publishing.)

Prevention of illness and restoration of health through inner search and spiritual growth are the primary goals in the Ayurvedic system. Union of the Divine and the Truth occurs through the physical and meditative practice of yoga. In contemporary practice, Ayurvedic intervention may consist of yoga, herbs, diet, exercise, steam baths, cathartics, and detoxifying massage.

Shamanistic Tradition

A need to understand and explain life processes (i.e., birth, health, illness, and death) is part of being human. Ritualized practices have been used to keep peace with the great spirits, to harness their power, to promote power, and to prevent death.

Shamanism refers to the practice of entering altered states of consciousness with the intent of helping others. The **shaman** (a folk healer-priest who uses natural and supernatural forces to help others) has an extensive knowledge of herbs, is skilled in many forms of healing, and serves as guardian of the spirits. Illness is considered to be the result of spirit loss. Shamans have the power to heal by working with the spirits to encourage their full return to the individual. The shaman functions as both healer and priest and one who has access to the supernatural.

Seeking wisdom about the universe, a relationship with the creator, and avoidance of death are all accomplished through ritualized processes that are performed by the shaman. The shaman's practice incorporates special objects such as power animals, totems, and fetishes as well as ritual songs, dances, food, and clothing. Sleep deprivation, ritual chants, isolation, imagery, drumming, and hallucinogenic drugs may be used to create a trancelike state that is the vehicle through which the shaman contacts the spirit world.

ALLOPATHIC MEDICINE

Western medicine (referred to as **allopathic** medicine) is relatively new in that it was begun about 200 years ago. Its fundamental principle is that body and mind are separate entities. Allopathic medicine views the human as a collection of separate body parts. This conventional medical approach views health as the absence of disease and sees the goal of treatment as curing the disease or “fixing” the problem (such as trauma). The Western medical model focuses on ridding the body of symptoms induced by disease or injury.

The allopathic system is effective when aggressive treatment is needed for an emergency situation. State-of-the-art technology and advanced surgical techniques have become true lifesavers for many in our society. However, with its emphasis on curing symptoms, allopathic medicine overlooks the crucial role of energy, emotions, and thoughts. Conventional medicine has been less effective in treating chronic conditions such as hypertension and arthritis. “The value of alternative medicine is especially effective for people with chronic, debilitating illnesses for which conventional medicine has few, if any, answers” (Fontaine, 2000, p. 6). See Table 14-1 for a comparison of allopathic and Ayurvedic perspectives.

CONTEMPORARY TRENDS

The contemporary public perception of CAM treatment methods has been changing over the past few decades. In the late 1960s and early 1970s, the “natural,” “new age,” and “self-help” movements began to attract adherents, first among consumers and later among health

TABLE 14-1
Comparison of Allopathic and Alternative Medicine

Allopathic Perspective	Alternative Perspective
Health is absence of disease.	Health is a state of well-being characterized by mind/body balance.
Focus is on cure of disease.	Emphasis is on health maintenance and disease prevention through lifestyle choices.
Mind and body are treated as separate entities.	Mind and body are one; what affects one affects the other.
Disease results from causative agents, usually external.	Disease originates from within and is the result of imbalances that occur in response to unhealthy lifestyle and/or inner disharmonies.
Healing depends on outside agents to cure the disease.	The body has a natural ability to heal itself.
Treatment consists of drugs, surgery, and radiation.	Treatment consists of diet, exercise, herbal medicines, social support, and stress management.
Healing is aggressive, quick, and seeks to destroy the invading agents.	Healing is a slow, natural process.
The doctor plays the central role in healing.	The client has the most important role in healing (i.e., lifestyle choices).

(Data from: Fontaine, K. L. [2000]. *Healing practices: Alternative therapies for nursing*. Upper Saddle River, NJ: Prentice Hall; Froemming, P. [1998]. *The best guide to alternative medicine*. Los Angeles: Renaissance Books; Goldberg, B. [1999]. *Alternative medicine: The definitive guide*. Tiburon, CA: Future Medicine Publishing.)

care practitioners. During that time, there was a growing trend toward rejection of traditional medicine because of its perceived invasiveness, painfulness, cost, and ineffectiveness. A rekindled interest in Eastern religions, lifestyle, and medicine has fueled the development of contemporary holistic, CAM modalities. CAM therapy has a major tenet—holism—that is, the connection among mind, body, and spirit.

Ever increasing numbers of consumers who are seeking natural and safe approaches to health care are using CAM. The goals of CAM are numerous, including the following (Rimmer, 1998):

- Health promotion
- Pain relief
- Treatment of chronic illness
- Spiritual growth

There is an increasing prevalence of the use of CAM in the United States. Forty percent of those surveyed in one study (Astin, 1998) reported use of some form of alternative health care. The growing interest in complementary therapies is evidenced by the increased sale of natural substances, such as herbs and vitamins, which has become a multimillion dollar industry over the last few years (Rimmer, 1998, p. 761).

According to a survey published in 1998, up to 54% of adults (83 million people) in the United States used one or more types of alternative medicine in the previous year. Sixty percent of these health care consumers did not tell their primary care provider about their use of alternative approaches. In total, 629 million visits were made to alternative healers in 1997. Approximately \$27 billion dollars were paid by consumers as out-of-pocket expenditures on alternative therapies (Eisenberg, 1998).

Several factors have contributed to the increased use of CAM in the United States. Many health care consumers want to be more involved in their own healing and see complementary/alternative modalities as a way to promote this autonomy and control (Collins, 2000). Astin (1998) found that predictors of alternative health care use include higher education, poorer health status, certain health problems (anxiety, chronic pain, back problems, urinary tract infections, chronic fatigue syndrome, addictions, arthritis, headaches), and a holistic view of health.

Nurses are encouraged to teach clients to use the best of all systems in order to promote positive health outcomes. The term **integrative therapy** (a clinical approach that combines Western technological medicine with techniques from Eastern medicine) is becoming more prevalent in the United States. The integrative approach “neither rejects conventional medicine nor embraces alternative medicine uncritically” (Froemming, 1998, p. xi).

In 1992, the U.S. government established the Office of Alternative Medicine (OAM) at the National Institutes of Health to study the efficacy of unconventional, alternative treatment methods. The OAM is now the National Institutes of Health (NIH) National Center for Complementary and Alternative Medicine (NCCAM). Its mission is to conduct and support research and training, and to disseminate information on complementary and alternative medicine to the public and health care practitioners.

Mind-Body Medicine and Research

The traditional medical model is founded on the dualistic belief that the mind, body, and spirit are separate entities. However, **psychoneuroimmunology** (PNI), a relatively new field of science, is studying the complex relationship between the cognitive, affective, and physical aspects of humans. Psychoneuroimmunologists are investigating how the brain transmits signals along the nerves to enhance the body’s normal immune functioning. PNI research supports the idea that the human mind can alter physiology.

All body cells have receptor sites for **neuropeptides** (amino acids produced in the brain and other sites in the body that act as chemical communicators) that are released when **neurotransmitters** (chemical substances produced by the body that facilitate nerve transmission) signal emotions in the brain. Thus, it is possible for cells to be directly affected by emotions. In other words, people can affect their health by what they think and feel. The intermeshed complex system of psyche and body chemistry is now referred to as the **bodymind** (inseparable connection and operation of thoughts, feelings, and physiological functions).

HOLISM AND NURSING PRACTICE

The growth of the holistic health movement is based on acceptance of the concept that body, mind, and spirit are interconnected. Holism refers to the concept that the whole is greater than the sum of its parts. Nursing in its broadest sense (theory, concept, and practice) is truly holistic in nature. As discussed in Chapter 15, holism encompasses consideration of the physiological, psychological, sociocultural, intellectual, and spiritual aspects of each individual. Holistic nursing can be described as the art and science of caring for the whole person, knowing that each person is unique in all expressions of self. As holistic healers, nurses often employ CAM techniques to promote clients’ well-being. The accompanying display lists concepts basic to a holistic philosophy of caring.

HOLISTIC CONCEPTS

- Mind and body are one, not separate.
- People are responsible for their own choices.
- People have the power to solve their own problems.
- Well-being is multifaceted—physical, emotional, mental, and spiritual.

The Nature of Healing

The word *healing* is derived from the Anglo-Saxon word *hael*, which means to make whole, to move toward, or to become whole. It is important to establish that healing is not the same as curing (ridding one of disease) but is a process that activates the individual’s healing forces from within. As a healing facilitator, the nurse enters into a relationship with the client and can assist the client by offering to be a guide, change agent, or instrument of healing (a means by which healing can be achieved, performed, or enhanced). Gilkeson (2000) describes healing by saying, “healing potential exists in each of us . . . it is important to recognize that it is not so much that the ‘healer’ heals another person, but rather that he triggers the other person’s own self-healing potential” (p. 6).

COMPLEMENTARY/ ALTERNATIVE INTERVENTIONS

Many CAM interventions are used in holistic nursing practice. These interventions are categorized as mind-body, body-movement, energetic-touch, spiritual, nutritional, and other methodologies (see Table 14-2). Although different in technique, many of the CAM therapies have common ideological threads, as shown in the accompanying display.

CONCEPTUAL THREADS SHARED AMONG COMPLEMENTARY/ALTERNATIVE INTERVENTION METHODS

- The whole system must be considered if the *parts* of the individual are to be helped to function.
- The person is integrated and related to his or her surroundings.
- There exists some life force or energy that can be used in the healing process.
- Ritual, prescribed practice, and skilled practitioners are integral parts of holistic healing interventions.

Mind-Body: Self-Regulatory Techniques

Self-regulatory techniques are methods by which an individual can consciously control some functions of the sympathetic nervous system (for example, heart rate, respiratory rate, and blood pressure). Self-regulatory techniques include relaxation, meditation, imagery, biofeedback, and hypnosis.

Relaxation

As a result of the flight-or-flight response (see Chapter 20 for details), the body releases epinephrine, speeds up metabolism, and increases heart and respiratory

ELEMENTS OF THE RELAXATION RESPONSE

- A quiet environment
- Comfortable position
- Focused attention
- Passive attitude
- Practice

rate. Relaxation techniques offer a way for a person to reduce stress and return to a normal physiological state.

Cardiologist Herbert Benson (1975) studied the effects of meditation on individuals. He then incorporated the basic elements of meditation into the therapeutic process he called the **relaxation response**, a state of increased arousal of the parasympathetic nervous system, which leads to a relaxed physiological state. Benson employed the relaxation response with individuals experiencing high blood pressure and heart disease. While initially trying to avoid a mystical flavor in his work, Benson later discovered that the techniques were more effective if individuals focused on an inspirational prayer or phrase. The basic elements of the relaxation response are shown in the accompanying display.

“Relaxation techniques are skills anyone can use. These skills can be taught to clients when educating them about nutrition and exercise” (Grotbo, 1999, p. 24KK). One method for achieving relaxation is progressive muscle relaxation (PMR), which is the alternate tensing and relaxing of muscles (see Chapter 20 for a complete discussion of PMR). Aids to relaxation training include music or nature sounds, hypertonic saline relaxation tanks, isolation chambers, yoga, and imagery.

Nurses can use relaxation techniques in their work with clients to reduce pain and stress. Relaxation techniques are also an essential aspect of cognitive behavioral therapy when treating people with phobias, fear, and depression.

TABLE 14-2
Categories of Complementary/Alternative Interventions

Mind-Body	Body-Movement	Energetic-Touch	Spiritual	Nutritional/ Medicinal	Other
<ul style="list-style-type: none"> • Hypnosis • Imagery • Biofeedback • Meditation • Relaxation 	<ul style="list-style-type: none"> • Chiropractic • Yoga • Tai chi 	<ul style="list-style-type: none"> • Therapeutic touch • Healing touch • Massage • Acupuncture • Acupressure • Reflexology 	<ul style="list-style-type: none"> • Faith healing • Prayer • Laying on of hands • Shamanism: <ul style="list-style-type: none"> —Sand painting —Sweat lodges —Drumming 	<ul style="list-style-type: none"> • Herbs • Antioxidants • Macrobiotic diet 	<ul style="list-style-type: none"> • Humor • Pet therapy • Music • Aromatherapy

Meditation

The practice of **meditation** (quieting the mind by focusing one's attention) can bring about remarkable physiological changes. People who meditate strive for a sense of oneness within themselves and a sense of relatedness to a greater power and the universe.

A person can be guided into a meditative or relaxed state by using breath coaching (assisting client to become aware of or focus on breathing and thus slow it). Nurses can teach this modality to clients by using verbal cues, counting the client's inhalations and exhalations, and showing the client how to take slow, deep breaths. Some therapeutic benefits of meditation are:

- Stress relief
- Relaxation
- Reduced levels of lactic acid
- Decreased oxygen consumption
- Slowed heart rate
- Decreased blood pressure
- Improved functioning of immune system

To evoke the relaxation response through meditation, repeat a word or short phrase, preferably one that has special meaning to the individual. For example, some individuals repeat an affirmation or short prayer.

Imagery

Imagery is a type of thinking without words in which the senses are used to evoke one's imagination. The practitioner encourages the client to use as many of the senses as possible in order to enhance the formation of vivid images. The accompanying display presents examples of images that can be evoked by the five senses.

Imagery is not a new concept in nursing. In the mid-1800s, Nightingale wrote in *Notes on Nursing* about nurses helping the ill to alter their thoughts through images of nature, such as a bouquet of flowers (Nightingale, 1860). Visualization has been used effectively by nurses with clients of all ages in settings as varied as schools, homes, hospitals, and nursing homes (Hoffart & Keene, 1998).

Nurses can create guided imagery for many clients who are capable of hearing and understanding the nurse's suggestions of meaningful and physiologically correct images. For example, a nurse can show a chart of the stages of bone healing to a client who has suffered a fracture and ask the client to imagine this sequential activity in his or her body.

In addition to being a tool for distraction when a person is confronting pain, discomfort, and fear, imagery is also a powerful mechanism for making decisions and for altering behaviors. Imagery is also used to reduce pain and anxiety during procedures, decrease the need for medication and/or restraints, and promote relaxation (Hoffart & Keene, 1998). See Chapter 20 for directions on performing imagery and progressive muscle relaxation exercises.

NURSING ALERT

Precaution for Imagery

Imagery is not recommended for clients who are emotionally unstable.

Biofeedback

Biofeedback is a measurement of physiological responses that yields information about the relationship between the mind and the body and helps clients learn how to manipulate those responses through mental activity. It was developed by experimental psychologists and rehabilitation clinicians in the 1960s. Biofeedback allows a person to see the effect of the mind over the body. Froemming (1998) describes biofeedback as “[a] method of gaining conscious control over many bodily reactions involved in creating wellness by monitoring your own emotional state with specially designed equipment” (p. 224). While attached to sensitive devices that measure such bodily responses as skin temperature, blood pressure, galvanic skin resistance, and electrical activity in the muscles, the individual imagines stressful experiences. The person's physiological responses are then measured and recorded. Subsequent physiological responses to the relaxation response are also recorded. The individual receives an interpretation of these responses and is taught methods for practicing relaxation.

Biofeedback is used as a restorative method in rehabilitation settings to help clients who have lost sensation and function as the result of illness or injury. Biofeedback also enhances relaxation in tense muscles, relieves tension headaches, reduces bruxism (grinding of the teeth), reduces the pain of temporomandibular joint syndrome, and relieves backache. Temperature biofeedback is useful in training people to purposefully warm their hands to treat Raynaud's disease (a circulatory disorder), to lower

INCORPORATING ALL FIVE SENSES INTO IMAGERY

Hear the babbling brook

Kinesthetic

Feel yourself floating on a cloud

Gustatory

Taste the tartness of the freshly cut lemon

Olfactory

Smell the salt air at the ocean

blood pressure, and to prevent or relieve migraine headaches.

Hypnosis

The practice of hypnosis was once fraught with mystery and misconceptions. Currently hypnosis is becoming a more common nursing intervention. Therapeutic hypnosis induces altered states of consciousness or awareness (a trance) during which the person is more receptive to suggestion. It also enhances the client's ability to form images.

In 1955, the British Medical Association approved hypnotherapy as a valid medical intervention. The American Medical Association did likewise in 1958. Approximately 15,000 American physicians currently use hypnosis in conjunction with conventional medical interventions (Goldberg, 1999).

Therapeutic use of suggestion is the heart of hypnosis. Suggestions can be phrased directly ("You will feel more comfortable") or indirectly ("You may feel different").

Hypnosis is a potentially effective and powerful tool for altering pain, anxiety, and some physiological processes. Although hypnosis is useful as an adjunct to treatment, it does not magically cure such problems as nicotine addiction, alcoholism, and eating disorders, and should be used in conjunction with other modalities.

Nurses wishing to use hypnosis in their practice must be aware of the guidelines concerning this modality in the scope of practice as defined by the respective state boards of nursing. Advanced training in hypnosis is also necessary.

Body-Movement: Manipulation Strategies

As the name implies, body-movement therapies employ techniques for moving or manipulating various body parts to achieve therapeutic outcomes. Modalities such as movement and exercise, yoga, tai chi, and chiropractic treatment are discussed in the following sections.

Movement and Exercise

Movement, as a therapeutic intervention and health-promoting activity, is associated with athletic exercise, dance, celebration, and healing rituals. Although the primary goal of exercise is fitness (muscle strength, flexibility, endurance, and cardiovascular and respiratory health), there are many other positive outcomes of exercise (see Chapter 20 for a complete discussion of the benefits of exercise).

Nurses can help clients use movement as therapy in a variety of ways, such as range of motion exercises, water exercises, physical therapy, and stretching exercises. It is an effective method through which people of all ages can improve their level of functioning. Some of the therapeutic benefits of exercise are as follows (Rechtschaffen & Cohen, 1999):

- Improves circulation
- Enhances respiratory function
- Promotes elimination
- Stimulates the release of **endorphins** (brain chemicals that boost mood and help fight depression)
- Helps regulate metabolism
- Enhances immune function

THINK ABOUT IT

Exercise

What movement programs might you suggest to your clients? What are the factors in this decision? Does your recommendation depend on their health status?

Yoga

Many cultures believe that particular forms of movement keep the body's life forces in correct balance and flow. Yoga and tai chi are examples of ancient ritual movements that enhance overall health including spiritual enlightenment and well-being. Both of these approaches require concentration, strength, flexibility, and use of symbolic movements. The three main elements of yoga are breathing, movement, and posture. Yoga involves completing a series of postures carried out in sequential order; see Figure 14-3, which illustrates

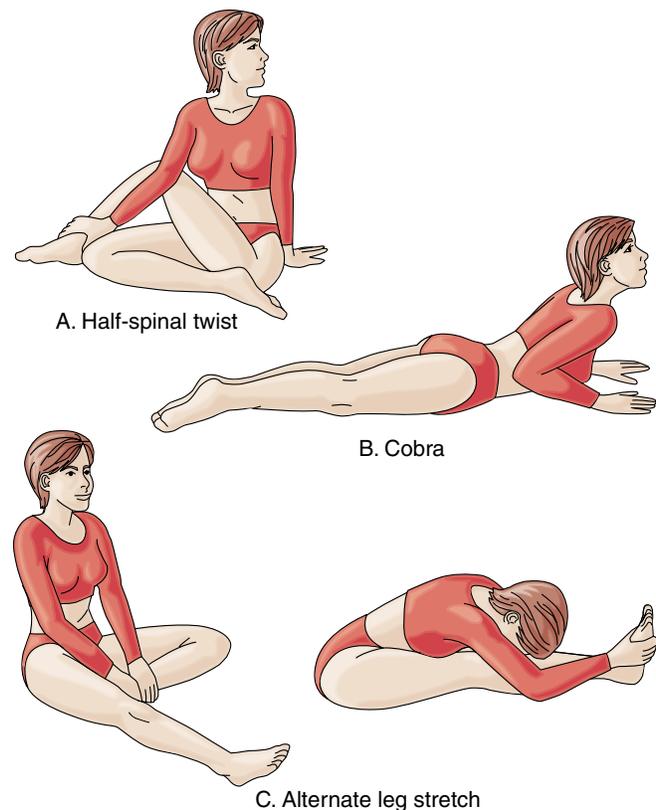

Figure 14-3 Yoga Postures

some basic yoga postures. “By promoting disciplined focus on mind and body, yoga is said to enable a greater consciousness of daily life and of its divine origins” (Cassileth, 1998, p. 249).

Yoga rejuvenates, promotes longevity and self-realization, and speeds up the natural evolution of the person toward self-enlightenment. Yoga, a form of meditative exercise, originated in India and is an essential component of Ayurvedic healing.

Tai Chi

Tai chi is based on the philosophy of the quest for harmony with nature and the universe through the laws of complementary (yin and yang) balance. When perfect harmony exists, everything functions effortlessly, spontaneously, perfectly, and in accordance with the laws of nature. If one moves to the right, then one must also move to the left. Tai chi consists of a series of sequential dancelike moves connected in a smooth flowing process.

People who regularly perform tai chi believe it enhances stamina, agility, and balance and that it boosts energy and confers a sense of well-being. Tai chi has been shown to lower blood pressure and heart rate in people in cardiac rehabilitation programs, and it is also a method for improving balance and, thus, reducing falls, especially helpful in older adults (Fontaine, 2000).

Chiropractic

The major principle underlying chiropractic therapy is that the brain sends vital energy to every organ in the body via the nerves originating in the spinal column. Disease results from interferences along that pathway; therefore, manipulation of the spinal column is useful in alleviating a variety of ills. Removing the blocks with quick thrusts and adjustments allows the body to restore its innate recuperative power.

Chiropractic is widely accepted by the medical community. Chiropractors are staff members of some medical centers/hospitals and are commissioned to military branches as health care providers (Goldberg, 1999). As with any CAM intervention, nurses should encourage clients considering the use of chiropractic services to undergo comprehensive health assessments first to rule out any contraindications.

Energetic-Touch Healing

A category of CAM therapies that has been incorporated into nursing within the past 30 years are the **energetic-touch therapies** (a group of techniques that work with the body’s energy field by the use of the hands to direct or redirect the energy to enhance balance within the field). These modalities are effective interventions for many client problems and can be used to restore harmony in all aspects of a person’s health. Energetic-touch therapies can be used with persons of all ages.

THINK ABOUT IT

Energy Field

Do you believe that people have an energy field that extends beyond the boundaries of the physical body? How would this belief affect your care of a client?

Energetic-touch therapies have their roots in traditional Chinese, ancient Eastern, and Native American philosophies. The fundamental concept is that individuals are composed of a life force, a source of energy that is not confined to physical skin boundaries. “Energywork, by its nature, brings us face to face with the spiritual” (Gilkeson, 2000, p. 3). Figure 14-4 illustrates the energy field that extends beyond a person’s physical body. Collinge (1998) lists the following as commonly accepted beliefs about energy and healing:

- All things are manifestations of energy.
- Energy comes from one universal source.
- Life depends on the movement of energy.

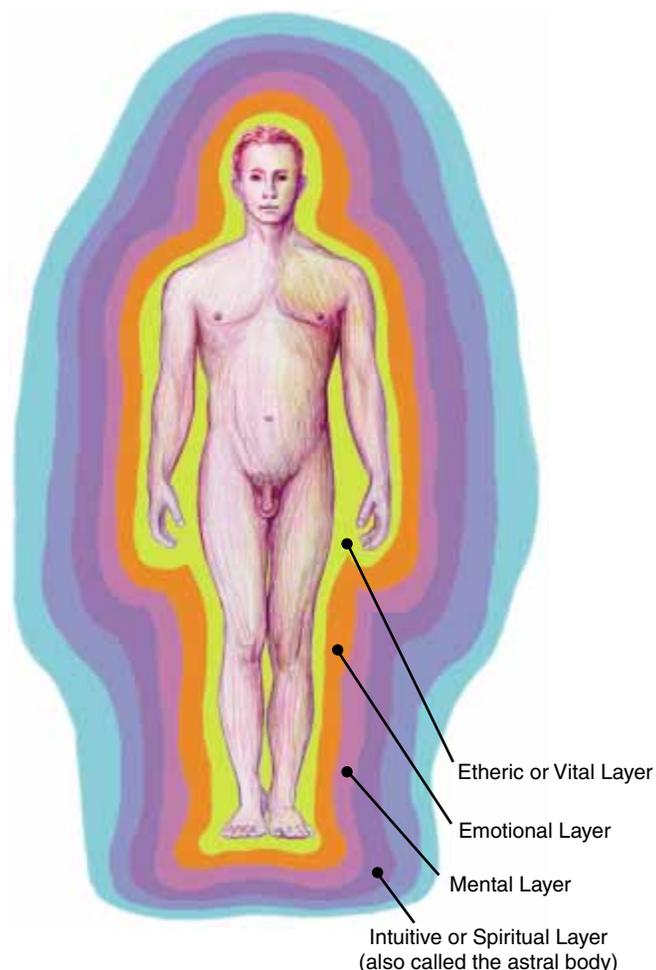

Figure 14-4 Layers of the Human Energy Field Extending Beyond the Physical Boundaries

- People consist of several energy fields that interact with the environment.
- Interpersonal relationships are influenced by energy exchanges.

An individual's energy field consists of layers of energy that are in constant flux. The energy layers can be diminished or otherwise adversely affected by any type of illness, trauma, or distress. The energy system can also be positively affected by the intentionally directed use of the hands of a practitioner.

Holistic nurses were integral in helping the North American Nursing Diagnosis Association to establish the diagnosis *Disturbed Energy Field*. See the Nursing Process Highlight for explanation of this diagnosis.

There are many energetic-touch therapies being used by nurses today. These therapies are being effectively integrated into holistic practice. "Western bodywork looks on your body as a machine in need of repair and manipulations. Eastern bodywork looks on your body as an energy field in need of constant balancing to function well" (Rush, 2000, p. 133). Massage, therapeutic touch, healing touch, reiki, jin shin jyutsu, and jin shin do are some examples. Three of those therapies—massage, therapeutic touch, and healing touch—are discussed in more detail.

Nursing Process Highlight

NURSING DIAGNOSIS Disturbed Energy Field

DEFINITION A disruption of the flow of energy surrounding a person's being that results in disharmony of the body, mind, and/or spirit.

DEFINING CHARACTERISTICS

- Movement in the energy field (wave/spike/tingling/dense/flowing)
- Sounds (tone/words)
- Temperature change (warmth/coolness)
- Visual changes (image/color)
- Disruption of the field (vacant/hold/spike/bulge)

RELATED FACTORS

- To be developed

(From North American Nursing Diagnosis Association. [2001]. *Nursing diagnoses: Definitions and classification: 2001–2002*. Philadelphia: Author.)

Touch

One of the most universal CAM modalities is touch. **Touch**, simply defined, is the means of perceiving or experiencing through tactile sensation. According to anthropologist Montague (1986), touch is the earliest sense to develop in humans and, thus, it provides a basic means of interacting with others and the environment. Tactile stimulation is necessary for survival and the healthy behavioral development of an individual (Bowlby, 1984). Touch carries with it taboos and prescriptions. It was used in all ancient cultures and shamanistic traditions for healing. The advent of scientific medicine and Puritanism led many healers away from the purposeful use of touch. Some cultures are very comfortable with physical touch; others specify that touch may be used only in certain situations within specified parameters. See Chapter 16 for a complete discussion about the phenomena of culture.

Because touch involves personal contact, the nurse must be sure to convey positive intentions. When in doubt, the nurse should withhold touch until effective communication with the client has been established. Touch has several important uses in nursing practice in that it:

- Is an integral part of assessment
- Promotes bonding between nurse and client
- Is an important means of communication, especially when other senses are impaired
- Assists in soothing, calming, and comforting
- Helps keep the client oriented

NURSING ALERT

Contraindications for Touch

It is important to know when *not* to touch. It may be difficult for persons who have been neglected, abused, or injured to accept touch therapy. Touching those who are distrustful or angry may escalate negative behaviors. Persons with burns or overly sensitive skin may not benefit from touch.

Therapeutic Massage

Therapeutic massage is the application of pressure and motion by the hands with the intent of improving the recipient's well-being. It involves kneading, rubbing, and using friction. The primary techniques used to perform a massage are described in the accompanying display.

For the past 30 years, many touch therapies have been assimilated into mainstream nursing practice. Massage therapy is now recognized as a highly beneficial modality and is prescribed by a number of physicians. In addition, many states now have licensing requirements for massage practitioners.

BASIC MASSAGE TECHNIQUES

- **Effleurage:**
 - The whole hand is used.
 - Gliding and long rhythmic strokes are used.
 - Firm, even-pressured strokes are directed toward the heart to assist blood return.
 - Lighter pressure is used when moving away from the heart.
- **Petrissage:**
 - Pressing, squeezing, kneading, and rolling movements by both hands (use entire hand) are used.
 - Deep circulation is enhanced.
 - C-shaped motions stimulate the muscle body.
 - Promotes muscle relaxation.
- **Friction:**
 - Thumb pads, heel of hand, or fingertips are used.
 - Focused, deep, circular motions are used.
 - Penetrates deeper muscle layers.
 - Is done after effleurage and petrissage.
- **Tapotement:**
 - Palms, fingertips, and knuckles are used.
 - Brisk, vigorous, rhythmic, percussive movements are used.
 - Hands alternately tap, cup, slap, and pummel muscles.
 - Invigorates and stimulates tired muscles.
- **Vibration:**
 - Very fine, rapid, shaking movements are administered by the entire hand.
 - Stimulates or relaxes muscles.

Traditionally, back rubs have been administered by nurses to provide comfort to hospitalized clients. Today, they are considered standard practice. Massage techniques can be used with all age groups and are especially beneficial to those who are immobilized. A back rub or massage can achieve many results, including relaxation, increased circulation of the blood and lymph, and relief from musculoskeletal stiffness, pain,

and spasm. Research (Beeken, Parks, Cory, & Montopoli, 1998) suggests that individuals with chronic obstructive lung disease benefit from massage therapy. The subjects in this study experienced positive changes in heart rate, oxygen saturation, and blood pressure as a result of massage. Procedure 14-1 describes the techniques involved in performing a massage. Boards of Nursing in some states (e.g., Louisiana, Massachusetts) state that it is within the scope of nursing practice for nurses to employ complementary therapies, including massage (LSBN, 1999; MBRN, 1997). The National Association of Nurse Massage Therapists (NANMT) was established in 1990 to promote professional ethical standards for nurse massage therapists. The NANMT-established standards reflect those of the American Nurses Association.

Therapeutic Touch

Therapeutic touch (TT), which is based on ancient healing practices (such as the laying on of hands), consists of assessing alterations in a person's energy field and using the hands to direct energy to achieve a balanced state. The practice of TT was developed in the early 1970s by Dolores Krieger, PhD, RN, then professor of nursing at New York University, and Dora Kunz, a noted healer. TT is based on four assumptions that are shown in the accompanying display.

The TT process is readily learned in workshops, can be done with hands either on or off the body in the energy field, complements medical treatments, and has reasonably consistent and reliable results (see Figure 14-7). Table 14-3 presents the five-phase process of TT.

The relaxation response may be apparent in the client as quickly as 2 to 5 minutes after a TT treatment has begun, and some clients may fall asleep or require less pain medication after a treatment.

Research has been documenting the effectiveness of therapeutic touch in wound healing, relaxation, and immunological functioning. A study conducted by Gordon and Merenstein (1998) shows that therapeutic touch can decrease knee pain caused by arthritis. Research

NURSING ALERT

Precautions with Massage

- Massage should be used with caution for people with heart disease, diabetes, hypertension, or kidney disease because increased circulation in these conditions may be harmful.
- Massage should never be attempted in areas of circulatory abnormalities such as aneurysm, varicose veins, necrosis, phlebitis, or thrombus or in areas of soft-tissue injury, open wounds, inflammation, joint or bone injury, dermatitis, recent surgery, or sciatica.

FOUNDATIONAL CONCEPTS OF THERAPEUTIC TOUCH

- A human being is an open energy system.
- Anatomically, a human being is bilaterally symmetrical.
- Illness is an imbalance in an individual's energy field.
- Human beings have natural abilities to transform and transcend their conditions of living.

(From Krieger, D. [1993]. *Accepting your power to heal: The personal practice of therapeutic touch*. Santa Fe, NM: Bear & Company Publishing.)

PROCEDURE 14-1

Administering Therapeutic Massage

Equipment

- | | |
|---|---|
| <ul style="list-style-type: none"> ■ Flat sheet ■ 1 or 2 pillows ■ Lotion or oil | <ul style="list-style-type: none"> ■ Bath blanket or light coverlet ■ Towel |
|---|---|

Action

1. Set room temperature at approximately 75°F. Provide low or indirect lighting, privacy, and background music.
2. Prepare the massage table or hospital bed by laying a clean sheet on the surface. Adjust the surface height.
3. Remove rings and watch. Wash hands.
4. Explain the procedure to the client.
5. Assist the client to assume either a prone, Sim's, supine, or sitting position, depending on client's condition.
6. Loosen or remove clothing from the client's back and arms. Drape the client with a sheet to cover areas not being treated directly.
7. Squeeze a small amount of lotion or oil into the palm of the hand to warm before applying to the client.
8. Begin with light to medium effleurage (see explanation in text) at lower back and continue upward following muscle groups, being careful to avoid the spine and spinal processes (see Figure 14-5). Move hands up toward the base of the neck and continue outward over the trapezius muscles with circular motions, over and around shoulders and upper arms, and return with lighter downward strokes laterally over the latissimus dorsi to the upper gluteals. Use slow rhythmic movements, keeping in contact with the skin at all times. Check pressure. Continue the effleurage for approximately 3 minutes.

Rationale

1. Maintains client's body heat, protects privacy, and promotes relaxation.
2. Both the massage table and hospital bed are adjustable so that the height of the work surface can be raised or lowered as necessary.
3. Avoids scratching the client and prevents transmission of microorganisms.
4. Prepares the client for the treatment.
5. Appropriate position enables the nurse to apply the necessary amount of pressure to the back without causing discomfort for the client.
6. Exposes parts of the back on which the massage will be performed. Draping untreated parts of the back helps keep the client warm.
7. Cold lotion or oil can cause discomfort to the client.
8. Prevents damage to internal structures, stimulates circulation, and promotes relaxation.

Figure 14-5 Effleurage from Lower Back to Base of Neck

(continues)

PROCEDURE 14-1

Administering Therapeutic Massage (continued)

9. Continue treatment if appropriate with gentle petrissage (see explanation in text) to major muscle groups in the back, shoulders, and upper arms (see Figure 14-6).

Figure 14-6 Petrissage of Shoulders

10. Use friction (see explanation in text) to particular muscle groups where tension is being held.
 11. Use tapotement (see explanation in text) to stimulate any muscle groups that may be fatigued.
 12. Finish treatment with effleurage.
 13. Wipe any excess lotion or oil from skin with towel, or use small amount of warm soap and water to clean client's skin, taking care to dry completely.
 14. Assist client into comfortable position for a period of rest or sleep.
 15. Document treatment, client's response, and skin assessment data.
9. Enhances circulation, stimulates muscles, and promotes relaxation.
 10. Penetrates deeper muscle layers, thus promoting further relaxation.
 11. Invigorates and stimulates tired muscles.
 12. Assists with relaxation and provides a sense of completion.
 13. Promotes/maintains skin integrity.
 14. Allows client to fully experience therapeutic benefit of massage.
 15. Communicates pertinent data to other members of treatment team; promotes continuity of care

participants who received TT reported significantly less pain and improved function than those in the control group.

Healing Touch

Healing touch (HT) is an energy-based therapeutic modality that alters the energy field through the use of touch. HT was developed by Janet Mentgen, a nurse, in the 1980s. In 1993, HT was established as a certification program of the American Holistic Nurses Association (AHNA). Its curriculum includes varied techniques for use of HT in general balancing of the body's energy

field, relaxation, and for specific problems such as headaches, spinal problems, and pain.

Table 14-4 lists the five steps of HT. HT recognizes the need for follow-up or sequential treatments as well as discharge planning and referral to assist the client in adequately meeting goals.

In both TT and HT, the practitioner uses **centering** (a process of bringing oneself to an inward focus of serenity) before initiating treatment. Centering is a useful tool to employ before performing any treatment or before any situation that may be stressful or difficult (such as a major school examination).

TABLE 14-3
Phases of Therapeutic Touch

Phase	Definition	Techniques
Centering	<ul style="list-style-type: none"> • Bringing body, mind, and emotions to a quiet, focused state of consciousness • Being still • Being nonjudgmental 	Become centered by use of: <ul style="list-style-type: none"> • Controlled breathing • Imagery • Meditation
Assessment (“Scanning”)	<ul style="list-style-type: none"> • Using the hands to determine the nature of the client’s energy field • Being attuned to sensory cues (e.g., warmth, coolness, static, pressure, tingling) to detect changes in client’s energy 	<ul style="list-style-type: none"> • Hold hands 2 to 6 inches away from person’s energy field while moving the hands from the head to the feet in a rhythmic, symmetrical manner.
Unruffling (“Clearing”)	<ul style="list-style-type: none"> • Facilitating the symmetrical and rhythmic flow of energy through the field 	<ul style="list-style-type: none"> • Use slightly more vigorous hand movements from midline while continuing to move in a rhythmic and symmetrical manner from the head to the feet.
Treatment (“Balancing,” “Rebalancing,” or “Intervention”)	<ul style="list-style-type: none"> • Projecting, directing, and modulating energy on the basis of the nature of the living energy field • Assisting to reestablish order in the system 	<ul style="list-style-type: none"> • Because each practitioner experiences the living energy field uniquely, the law of opposites serves as a guideline for intervening (e.g., if a pulling or drawing sensation is detected, then direct energy to the depleted area until it feels replenished). • Continue to assess, clear, and balance the field while remaining centered.
Evaluation	<ul style="list-style-type: none"> • Using professional, informed, and intuitive judgment to determine when to end the session 	<ul style="list-style-type: none"> • Reassess the field. • Elicit feedback from the client. • Give the client an opportunity to rest and integrate the process.

The phases, although learned sequentially by beginners, are dynamic and often are performed concurrently and repetitively by experienced practitioners. (Adapted from Nurse Healers-Professional Associates, Inc. [1992]. *Therapeutic touch: Teaching guidelines: Beginner’s level Krieger/Kunz method*. New York: Author.)

Figure 14-7 A nurse administering therapeutic touch to a client. Is there a therapeutic relationship between the use of TT as a therapeutic modality and the healing systems that can be traced to Far Eastern cultures?

In addition to therapeutic massage, TT, and HT, there are many other touch modalities that can be integrated into nursing practice. Some of the more common types of touch therapies are reflexology and acupressure with its many variations. These techniques involve deep-tissue body work and require advanced training for practitioners.

Shiatsu Acupressure

Shiatsu acupressure is based on East Asian philosophy and Japanese methodology. *Shiatsu*, from the word meaning “finger pressure,” differs from acupuncture, a procedure that uses needles and heat to deliver treatment. In Shiatsu, blocked energy within the client is released by application of the practitioner’s fingers, thumbs, and heel of the hands along certain pressure points (meridians). When practicing Shiatsu, nurses need to be

TABLE 14-4
Steps of Healing Touch

Step	Description	Nursing Guidelines
Initial interview	<ul style="list-style-type: none"> Provides the working base for energetic interventions and functions as an intake assessment. 	<ul style="list-style-type: none"> Introduce yourself. Explain enough about your work so that a feeling of confidence can begin to develop. Determine the main problem or reason for treatment. Identify relevant health history: hospitalizations, diseases, injuries, diagnoses, medications (past and present) including use of recreational drugs, nicotine, alcohol, caffeine, vitamins, and herbs. All of these factors can influence the energy field.
Assessment	<ul style="list-style-type: none"> In wellness, the energy flows evenly from head to toe without blocks, breaks, unevenness, or temperature variations. Any disruption of the flow reflects disharmony in that area. 	<ul style="list-style-type: none"> Approach the client from a centered state. Begin by determining the shape of the energy field by slowly scanning its outer edges. Start 3 to 4 feet away from the body and move toward it using the palms until you can determine the actual outline of the energy field. Continue the assessment by feeling the vital layer 1 to 6 inches off the skin. Identify areas in relation to the physical body where the field is different, perhaps not as vibrant or as smooth as in other areas.
Documentation	<ul style="list-style-type: none"> Begins with the initial client contact. 	<ul style="list-style-type: none"> Mentally take note of all sensations, even the ones that may seem very subtle. A picture of the energy pattern is usually easy to execute by drawing the perceived pattern on a simple outline of the body. Areas of energetic differences can be drawn in, as can injuries, swelling, scars, or the track of a pain ridge.
Intervention	<ul style="list-style-type: none"> The healer can choose many healing interventions in this sequence: therapeutic touch, full body techniques, and localized and specific techniques. 	<ul style="list-style-type: none"> During the intervention, which may last 20 to 30 minutes, all of the healer's skill and experience are used.
Completion and grounding	<ul style="list-style-type: none"> After completion of the interventions, carefully ground the client to help restore balance and promote integration. Carefully determine that the client is fully alert if the client will leave after the session. 	<p>Grounding can be done in a variety of ways, including:</p> <ul style="list-style-type: none"> Hold the feet until you sense a flow and a connection with the client and sense that the client's energy is back in the feet. Brush down the body from head to toe and down the arms toward the ground. Repeat briskly several times. Give a suggestion: "Feel your fingers, and your toes; now gently move them until you return to full awareness in this room." Reassess the energy field at this time and document the changes. Spend some time with the client to obtain feedback. Focus on what the client experienced. Talking helps the client to feel grounded.

self-aware and grounded: that is, focused on their inner energy. This focus enables the practitioner to concentrate completely on promoting the client's comfort.

Acupuncture

Acupuncture is the use of needles inserted at specific points on the body (energy pathways) to promote healing. Acupuncture is done to manipulate the energy flow throughout the body; treatment focuses on correcting the flow of *chi* (energy) when imbalances (blockages) occur. TCM practitioners believe that meridians conduct *chi* between the body's surface and internal organs. Acupuncture points are believed to stimulate the central nervous system to release chemicals into the muscles, spinal cord, and brain. These chemicals either alter the experience of pain or produce other chemicals that lessen pain (National Institutes of Health, 1997).

Acupuncture is one of the oldest, most commonly used medical procedures in the world. It originated in China over 2,000 years ago and is effective in treating a variety of health problems. Acupuncture is rapidly gaining acceptance in mainstream Western medicine. As of 1997, an estimated one-third of certified acupuncturists in the United States are medical doctors (Culliton, 1997). The use of acupuncture needles is officially approved for use by licensed practitioners. The Food and Drug Administration requires manufacturers of acupuncture needles to label them for single use only (U.S. Food and Drug Administration, 1996).

One of the major reasons Americans use acupuncture is for relief of chronic pain, especially pain caused by arthritis or low back disorders (Bullock, Pheley, Kiresuk, Lenz, & Culliton, 1997). Several studies on acupuncture have been sponsored by the NCCAM, including:

- A small randomized controlled clinical trial showed that more than half the women with a major depressive episode who received acupuncture therapy improved significantly (Allen, 1998).
- Another study found that **moxibustion** (application of heat from certain burning substances, such as herbs, at acupuncture points on the body) applied to pregnant women with breech presentations significantly increased the number of normal head-first births (Cardini & Weixin, 1998).

NURSING ALERT

Acupuncture is contraindicated for people with acute cardiovascular disorder, hemophilia, and pregnancy.

Reflexology

Reflexology is rooted in ancient healing arts. Egyptian wall paintings from approximately 2300 BC show the use of reflexology. Contemporary use of reflexology is credited to the work of William H. Fitzgerald, an American

physician, who, in the early 1900s, discovered that applying pressure to certain parts of the fingers could relieve pain in other body parts (Cassileth, 1998). In the 1930s, Eunice Ingham discovered that certain points on the feet were more responsive to pressure and provided better pain relief than points on the hand.

The fundamental concept of reflexology is that the body is divided into 10 equal, longitudinal zones that run the length of the body from the top of the head to the tip of the toes. These 10 zones are correlated with the 10 fingers and toes. The foot is viewed as a microcosm of the entire body. Reflexology theory posits that illness manifests itself in calcium deposits and acids in the corresponding part of the person's foot. Pressing specific points on the foot stimulates energy movement and produces relaxation, reduces stress, and promotes health by relieving pressures and accumulation of toxins in the corresponding body part (see Figure 14-8).

Reflexology can be used as a complementary method for managing chronic conditions such as asthma, sinus infections, migraines, irritable bowel syndrome, kidney stones, and constipation. Once the pressure points are learned, the nurse can massage the areas of the client's foot to relieve pain and produce relaxation.

THINK ABOUT IT

Application of Touch

Is there a group of people whom you can identify as being socially isolated or in distress who could benefit from one or more of the touch therapies? Consider residents of extended-care facilities, caregivers of chronically ill children or elderly parents, and hospice clients. Do you think that touch therapies can be used as routine preventive care for well populations?

Spiritual Therapies

A state of wholeness or health is dependent not only on one's relationship to the physical and interpersonal environment but also to the spiritual aspects of self. See Chapter 15 for a discussion of the relationship between spirituality and health. The idea that there is a relationship between spirituality and health is not new. "At the core of many holistic modalities are spirituality and healing, which encompass a person's values, meaning, and purpose in life . . . The concept of spirit implies a quality of transcendence, a guiding force, or something outside the self and beyond the individual nurse or patient" (Dossey, 1998).

The role of the spirit in healing is witnessed in all cultures. The inseparable link between the state of one's soul (life energy or spirit) and the state of one's health is accepted by many cultures. Scientists (especially psychoneuroimmunologists) are beginning to validate that there are inner mechanisms of healing within individuals. Many of the major religions have ideologies relating to health, illness, and healing.

Health maintenance implies having a balanced spiritual life. Dossey and Dossey (1998) quote a study that examined factors contributing to successful coronary artery bypass surgery. The best single predictor of survival was the degree of religious faith and spiritual meaning in the client's life. "Over 250 studies now show that religious practice—the specific religion doesn't seem to matter—is correlated with greater health and increase longevity" (Dossey & Dossey, 1998, p. 37).

Faith Healing

At the heart of spiritual or faith healing is the practitioner's belief that one has to purify one's self and reach a state of unity with God or a Higher Power. This process, based on religious belief, is usually done through prayer. During preparation for healing, the practitioner adapts a passive and receptive mood in order to be a channel for divine power. To benefit from the healer's intervention, the ill person's belief enhances, but is not crucial, to the success of healing.

Healing Prayer

When individuals pray, they believe they are communicating directly with God or a Higher Power. Prayer is an integral part of a person's spiritual life and, as such, can affect well-being. Florence Nightingale (1860) recognized that prayer helps connect individuals to nature and the environment. Many religions adhere to established rituals for organized prayer. For example, Tibetan Buddhists use prayer wheels—wooden and metal cylinders with prayers written on them. Islam has five periods of prayer scheduled daily. Some religious groups, such as Christian Scientists, relay on prayer in lieu of conventional medical therapy due to the belief that prayer alone can heal disease (Cassileth, 1998).

"Research has shown that religious practices such as worship attendance and prayer have significant health and survival implications" (Fontaine, 2000, p. 346). Medical research is currently investigating the effects of prayer on physical health. The exact mechanism for the effect of prayer on healing is not known; see Figure 14-9. However, "people are nourished by life-affirming beliefs and philosophies. They meditate and say prayers that elicit physiological calm and a sense of peacefulness, both of which contribute to longer survival" (Fontaine, 2000, p. 346). Cassileth (1998) states:

There is no doubt about the numerous benefits of prayer and spirituality: solace in times of suffering, uncertainty, and loss; a community of people who share one's values and beliefs; principles to help guide us through difficult situations. These benefits are helpful and healing in the deepest sense of the term. (p. 312)

Larry Dossey (1998), a physician, is so strongly convinced of prayer's effect on health that he postulates that treatment plans should include prayer.

Nutritional Therapies

In the last 30 years, nutritional interventions for prevention and treatment of disease have received increased interest from consumers and health care providers. This section addresses the CAM nutritional approaches.

Nutraceuticals

Currently, many foods are being studied for their medicinal value. **Nutraceuticals** refer to any natural substances found in plant or animal foods that act as

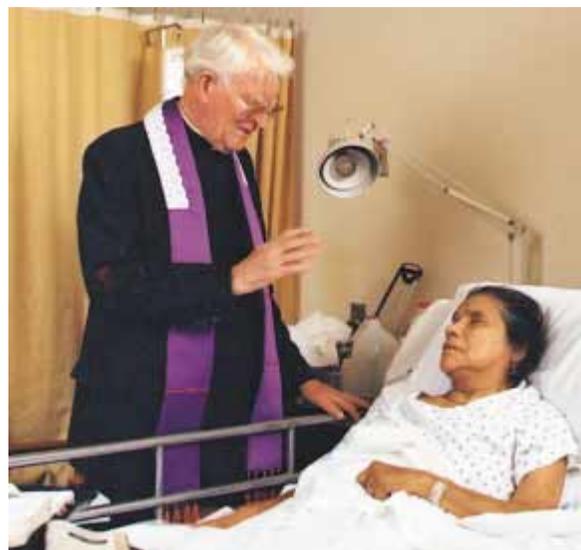

Figure 14-9 Prayer brings a sense of peace and healing to many individuals.

protective or healing agents. **Phytonutrients** refer to those chemicals found in plants; see Table 14-5 for a listing of the major phytonutrients and their actions.

Foods that are being investigated by the National Cancer Institute for possible cancer preventive qualities include carrots, celery, citrus fruits, flaxseed, garlic, licorice root, parsley, and soybeans.

The best source of nutrients is fresh whole foods, preferably eaten in their natural form. The standard Western diet lacks many essential nutrients due to processing and contains many harmful additives. In contrast, the TCM diet contains fresh, semiraw, and slightly cooked ingredients. “Ultimately, one might say there is much wisdom in the ancient Chinese view of food. The Chinese diet emphasizes natural food alchemy taking place inside the body by virtue of food enzyme activity, instead of the synthetic food alchemy that we now accept in the package processed goods the Western

consumer has been conditioned to buy” (Froemming, 1998, p. 45).

Antioxidants and Free Radicals

Vitamins C and E, and beta-carotene which converts to vitamin A, may prevent heart disease and some forms of cancer. Antioxidants exert several beneficial effects, including prevention of cancer, reduction of heart disease, and possible retardation of the aging process (Ferguson & Ferguson, 2000, p. 28). Antioxidants react with free radicals, preventing them from damaging cells and from altering DNA. Dietary antioxidants have shown to be effective in protecting the body from free radicals. “Absorbed from the intestines, these antioxidants are available to scavenge free radicals in the bloodstream as well as be absorbed into cells and lipid areas” (Ferguson & Ferguson, 2000, p. 28). Sources for

TABLE 14-5
Actions and Sources of Major Phytonutrients

Phytonutrient	Sources	Actions
Ascorbic acid	Citrus fruits, broccoli, most fruits and vegetables	Binds iron, preventing it from becoming a cancer-causing prooxidant
Capsaicin	Red chili peppers	Helps prevent carcinogens from binding with DNA at the cellular level
Catechins	Green tea, black tea	Reduces the risk of gastrointestinal cancers
Fiber lignans	Soybeans, flaxseed, nuts	Inhibits growth of tumors
Fiber pectins	Apples, pears, plums, prunes	Improves colon health; encourages growth of beneficial intestinal flora
Lycopene	Tomatoes, tomato sauce	Protects against prostate cancer; helps block UVA and UVB rays
Phytoestrogens	Soy products, alfalfa sprouts	Helps reduce menopausal symptoms; may block some cancers (i.e., breast, prostate)
Phytosterols	Plant oils, corn, sesame, soy, safflower, pumpkin, wheat	Inhibits uptake of cholesterol from foods; blocks hormonal role in cancer production
Protease inhibitors	Soybeans and soy products, eggs, cereals, potatoes	Protects against negative effects of radiation and free radical damage; prevents activation of certain genes that cause cancer
Sulfur compounds	Onions, garlic	Lowers blood pressure; improves immune system response; fights infections; antimicrobial effect; lowers cholesterol; reduces triglycerides

(Data from Froemming, P. [1998]. *The best guide to alternative medicine*. Los Angeles: Renaissance Books; Mayo Clinic. [2000]. Phytoestrogens: Getting your hormones from plants. *Women's Healthsource*; 4(2), 1–2; Weil, A. [2000]. *Eating well for optimum health: The essential guide to food, diet, and nutrition*. New York: Alfred A. Knopf.)

dietary antioxidants include vitamin C (in fruits and vegetables), beta-carotene (yellow-orange pigment in fruits and vegetables), and vitamin E (in polyunsaturated oils, butter, and eggs). The antioxidants devour free radicals (unstable molecules that alter genetic codes and trigger the development of cancer growth in cells).

Other vitamins, minerals, trace elements, and enzymes are being investigated for possible therapeutic value. See Chapter 38 for a thorough discussion of the essential vitamins, their functions, and major sources.

Macrobiotic Diet

In the 1960s, macrobiotic diets (Greek *makro* meaning long and *bios* meaning life) became popular because of the heightened interest in “natural” and more spiritual approaches to managing health and illness. The basis for macrobiotics is the Taoist concept of balance between opposites that is achieved through food intake. Food has the qualities of *yin* (associated with death, cold, and darkness) and *yang* (associated with immortality, heat, and light). For example, tropical sweet foods are yin, and meat and eggs are yang. Overindulgence in either type causes difficulties; for example, too much yin yields worry and resentment whereas too much yang leads to hostility and aggression. People need balance and, therefore, should consume foods that are neither too yin nor too yang.

Because brown rice and whole grains are categorized as balanced foods, they are major staples in a macrobiotic diet. The diet should be flexible and related to the season; it should consist of foods indigenous to the area in which the individual lives. Foods to be avoided include processed and treated foods, red meat, sugar, dairy products, eggs, and caffeine.

NURSING ALERT

Macrobiotic Diets

Children and pregnant women should use the macrobiotic diet with caution. It may not have sufficient variety and, therefore, could be deficient in vitamins D and B₁₂.

Herbal Therapy

Herbal medicine has been a powerful tool in folk healing for centuries. Medicinal herbs have been catalogued for thousands of years and have probably existed in every culture. Many drugs commonly used today were folk remedies derived from plants. For example, salicin, the active chemical ingredient found in white willow bark, has been used by TCM practitioners and Native Americans for pain relief. This same salicin is a precursor to salicylic acid, an ingredient in aspirin. Herbal medicine, also known as botanical medicine or phytotherapy, uses plant extracts for therapeutic outcomes. Many holistic practitioners incorporate the use of herbs into their practice.

NURSING ALERT

Use of Medicinal Plants

Avoid casual treatment of self or others with plants. Just because the substance is “natural” does not mean it is harmless. If not processed properly, many plants (including some herbs) can be poisonous.

Learning about herbal treatment is similar to learning pharmacology. Herbs work because of their chemical composition. Different herbs contain different compounds that can strengthen the immune system, alter the blood chemistry, or protect specific organs against disease. Peppermint oil may help relieve the symptoms of irritable bowel syndrome by exerting a relaxant effect on the muscles of the gastrointestinal tract (Pittler & Ernst, 1998). “Herbal immune system enhancers help the body fight common viral illnesses and assist in preventing the overuse of antibiotics” (Collins, 2000, p. 3). Echinacea is frequently used for its immune-enhancing properties. However, it should not be taken longer than 8 to 10 consecutive weeks due to the potential for liver toxicity.

Herbs are not cure-alls, and many take time to exert their healing properties. Generally, it is wise to use herbs for treating conditions one would ordinarily self-treat. See the accompanying display for conditions that generally respond well to herbal therapy.

CONDITIONS THAT RESPOND WELL TO HERBAL THERAPY

- Allergies
- Arthritis
- Digestive problems (indigestion, diarrhea)
- Headache
- Insomnia
- Kidney and urinary tract infections
- Menopausal symptoms
- Menstrual problems
- High or low blood pressure
- Skin disorders

Table 14-6 lists medicinal uses of commonly used herbs.

In the past decade, more than 53,000 natural products were tested by the National Cancer Institute. Approximately one-third of all new cancer therapies are derived from natural sources (Cassileth, 1998).

Herbs are not to be used indiscriminately, as their use may result in some negative outcomes. Some individuals may experience allergic reactions to certain botanicals; see the accompanying display for a listing of possible allergic reactions to herbs.

TABLE 14-6
Medicinal Value of Herbs

Herb	Medicinal Use(s)	Herb	Medicinal Use(s)
Aloe vera (<i>Aloe vera</i>)	<ul style="list-style-type: none"> Promotes wound healing Minor cuts and abrasions Burns 	Ginger (continued)	<ul style="list-style-type: none"> Stimulates circulation in feet and hands Expectorant Helps relieve indigestion and flatulence Diarrhea
Calendula (<i>Calendula officinalis</i>)	<ul style="list-style-type: none"> Promotes wound healing Cuts, abrasions Minor burns Sunburn Acne Athlete's foot Oral thrush (as a mouthwash) Vaginal thrush (as a douche) 	Ginkgo (<i>Ginkgo biloba</i>)	<ul style="list-style-type: none"> Enhances cerebral blood flow Mild depression Dementia Impotence Peripheral vascular insufficiency PMS Memory impairment
Celery seed (<i>Apium graveolens</i>)	<ul style="list-style-type: none"> Cholesterol-lowering effect Dizziness, headache Diuretic effect 	Lavender (<i>Lavandula angustifolia</i>)	<ul style="list-style-type: none"> Headache Reduces muscle spasms Increases relaxation
Chamomile (<i>Matricaria chamomilla</i> ; <i>Anthemis nobilis</i>)	<ul style="list-style-type: none"> Produces a calming effect Nausea Tension headache 	Milk thistle (<i>Silybum marianum</i>)	<ul style="list-style-type: none"> Liver disorders Hepatitis Cirrhosis Gallstones
Dandelion (<i>Taraxacum officinale</i>)	<ul style="list-style-type: none"> Produces a diuretic effect Helps decrease edema (especially that of premenstrual fluid retention) Indigestion 	Peppermint (<i>Mentha × Peperita</i>)	<ul style="list-style-type: none"> Headache Sinus congestion Digestive aid
Eucalyptus (<i>Eucalyptus globulus</i>)	<ul style="list-style-type: none"> Antibacterial Produces a decongestant effect 	Saint John's wort (<i>Hypericum pereforatum</i>)	<ul style="list-style-type: none"> Mild to moderate depression Sleep disorders Viral infections
Evening primrose (<i>Oenothera biennis</i>)	<ul style="list-style-type: none"> Atopic eczema Asthma Migraine PMS symptoms (e.g., mood swings, breast pain, and tenderness) Arthritis 	Sage (<i>Salvia officinalis</i>)	<ul style="list-style-type: none"> Antibacterial properties
Feverfew (<i>Tanacetum parthenium</i>)	<ul style="list-style-type: none"> Migraine headache 	Thyme (<i>Thymus vulgaris</i> , <i>T. serpyllum</i>)	<ul style="list-style-type: none"> Antimicrobial properties Helps relieve symptoms of common cold Antispasmodic effect on bronchioles Relieves cystitis Antifungal effect (especially as a mouthwash for oral thrush)
Garlic (<i>Allium sativum</i>)	<ul style="list-style-type: none"> Decreases cholesterol Helps protect against and treat respiratory infections Expectorant in cases of bronchitis or a cold 	Valerian (<i>Valeriana officinalis</i>)	<ul style="list-style-type: none"> Sedative effect Counters insomnia
Ginger (<i>Zingiber officinale</i>)	<ul style="list-style-type: none"> Nausea (especially effective with motion sickness and morning sickness associated with pregnancy) 	White willow (<i>Salix alba</i>)	<ul style="list-style-type: none"> Headache Fever Muscular aches and pains

Note: This information is not intended to be a guide for self-medication or the treatment of others. Consult a health care practitioner trained in the use of herbs before consuming any herb for medicinal purposes.

(Goldberg, B. [1999]. *Alternative medicine: The definitive guide*. Tiburon, CA: Future Medicine Publishing; Ody, P. [1999]. *100 great natural remedies: Using healing plants at home*. New York: Barnes & Noble; Tierra, M. [1998]. *The way of herbs*. New York: Pocket Books.)

POSSIBLE REACTIONS TO CERTAIN BOTANICALS

Botanical

- Apricot
- Arnica
- Celery
- Garlic
- Motherwort
- Tansy

Reaction

- Contact allergy
- Contact allergy
- Photosensitivity
- Systemic reaction
- Photosensitivity
- Systemic reaction

(Data from Mustalish, S. H. (2000). Avoiding allergic reactions in children from botanical medicines. *Integrative Medicine Consult*, 1, 6.)

Consumers need to be taught the following regarding herbs and allergies: to recognize the potential for developing allergic reactions to herbs; to identify the indicators of such reactions; and to immediately stop using the herb if allergic symptoms occur.

Individuals using herbs need to understand that problems can occur when taking herbal products and medications concurrently. The chemical constituents of herbs may alter the effects of some medications; see Table 14-7.

To assure client safety, nurses should:

- Ask clients about over-the-counter preparations and herbs that they take.

- Discuss the risks and benefits of the herbs taken.
- Suggest that clients purchase and use only herbal products labelled “standardized” for quality checks.

Other CAM Methodologies

The mind-body, body-movement manipulation, energetic-touch, spiritual, and nutritional treatment modalities are not the only available CAM therapies. Others, such as aromatherapy, humor, pet therapy, and music therapy, are being used as methods to improve health status.

Aromatherapy

Aromatherapy is defined as the therapeutic use of concentrated essences or essential oils that have been extracted from plants and flowers. When diluted in a carrier oil for massage or in warm water for inhalation, essences may be stimulating, uplifting, relaxing, or soothing. Essential oils help relax the mind and the body by promoting balance between the sympathetic and parasympathetic nervous systems. They stimulate the production of endorphins and rejuvenate the immune system (Froemming, 1998). “Essential oils enter the body in several ways. They can be absorbed through the skin and passed into the circulatory system. Oils can also be inhaled, passing into the bloodstream through the lungs, or by causing signals to

TABLE 14-7
Interactions Between Herbs and Medications

Herbal Product	Drug	Effect When Combined
Aloe	<ul style="list-style-type: none"> • Thiazide diuretics and corticosteroids • Cardiac glycosides and antiarrhythmic agents 	<ul style="list-style-type: none"> • Enhanced potassium loss • Potentiated by potassium loss
Belladonna	Tricyclic antidepressants, amantadine, quinidine	Increased anticholinergic effect
Brewer’s yeast	MAO inhibitor antidepressants	Increased blood pressure
Danshen	Warfarin	<ul style="list-style-type: none"> • Increased warfarin bioavailability • Increased prothrombin time
Ginkgo	Warfarin, heparin	Increased risk of bleeding
Licorice root	<ul style="list-style-type: none"> • Acetaminophen • Antihypertensives • Estrogens • Fludrocortisone • Thiazide diuretics and corticosteroids 	<ul style="list-style-type: none"> • Speeds acetaminophen excretion • Decreased antihypertensive effect • Increased estrogenic effect • Increased blood pressure • Enhanced potassium loss

(Data from Blumenthal, M., Goldberg, A., & Brinkman, J. [Eds.]. [2000]. *Herbal medicine: Expanded commission E monographs*. Newton, MA: Integrative Medicine Communications; Lilley, L. L., & Gunk, R. [1998]. Grapefruit and medication: Help your patient understand potential dangers of food–drug interactions. *American Journal of Nursing*, 98 [12], 10.)

CONDITIONS RESPONSIVE TO AROMATHERAPY

- Stress and anxiety-related problems
- Muscular and rheumatic pains
- Digestive disorders (e.g., nausea)
- Female sexual health conditions (e.g., PMS, postpartal problems, and menopausal symptoms)
- Skin conditions

be transmitted through the nervous system directly into the limbic system of the brain” (Walters, 1999, p. 16).

Aromatherapists use concentrated oils derived from roots, bark, or flowers, of herbs and other plants to treat specific ailments. The aromas cause physiological, psychological, and pharmacological reactions within a person (Schnaubelt, 1999). Aromatherapy is used to treat a variety of conditions and promote a sense of well-being; see the accompanying display.

Some essential oils have antibacterial properties and are found in a wide variety of pharmaceutical preparations. Essential oils should be used intelligently and with caution (see the Nursing Checklist).

NURSING CHECKLIST

Guidelines for Using Aromatherapy

1. Always dilute essential oils in a carrier oil.
2. Do a skin patch test for sensitivity before applying essential oils to the skin.
3. Avoid contact with the eyes.
4. Inhale essential oils only for short periods of time.
5. Store in dark glass bottles, tightly capped and away from heat and sunlight.
6. Store only in glass containers, not plastic.
7. Use only pure essential oils, not synthetics.

NURSING ALERT

Precautions with Essential Oils

Some essential oils can trigger asthma attacks or epileptic seizures, cause harm to people with cancer, or elevate or depress blood pressure. Instruct clients with asthma, cancer, epilepsy, or hypertension, or those who are pregnant to avoid the use of essential oils.

Humor

Of all the complementary interventions presented in this chapter, humor is the one that can be used most often to promote wellness. Humor is a frequently used

modality. Fritz (1998) questioned clients with chronic cancer pain about self-initiated, nondrug measures that they used to cope with pain. The clients rated laughing as the most effective type of therapy.

Humor has many therapeutic outcomes, including:

- Increased ability to cope with pain
- Enhanced immune functioning
- Reduced preprocedural anxiety

Former chairman of the Task Force in Psychoneuroimmunology at the School of Medicine at UCLA, Norman Cousins, related how he enhanced his recovery from an incurable connective tissue disorder, ankylosing spondylitis, by the daily watching of films and movies that made him laugh (Cousins, 1979). Humor can be used effectively to relieve anxiety and promote relaxation, improve respiratory function, enhance immunological function, and decrease pain by stimulating the production of endorphins.

It is important to determine the client's perception of what is humorous in order to avoid offending. Differentiation between humorous and offensive situations varies greatly from culture to culture and person to person. Nurses can use humor with clients in a variety of ways. A humor cart (portable cart or carrier filled with joke books, magic tricks, and funny videos) is easy to use and allows clients to select their own humor tools for health. The type of humor should be age-appropriate and culturally sensitive. See the Nursing Checklist.

NURSING CHECKLIST

Using Humor as a Therapeutic Intervention

1. Establish a trusting nurse–client relationship.
2. Conduct a humor assessment to determine the type of humor appreciated by the client and the client's usual response to humor.
3. Follow the client's lead in the type of humorous strategies used (i.e., jokes, satire, puns).
4. Involve the family and significant others in the humor.
5. Use humor as an adjunct, not a substitute, for pain medication.
6. Continually evaluate the humor strategy for its effectiveness.

(Data modified from Smith, N., & Oliver, N. [1998]. Using humor while caring for patients. *American Journal of Nursing*; 98(12), 14.)

Pet Therapy

The use of animals to enhance health status has a long history. In Britain in the 18th and 19th centuries, pets were used in institutions to give a sense of meaning

and purpose to people institutionalized because of developmental delays (mental retardation). Florence Nightingale (1860) stated “a small pet is often an excellent companion for the sick, for long chronic cases especially.” The therapeutic use of pets may be particularly helpful with elderly people. “Many health care professionals are finding that loneliness may be as serious as cancer and heart disease for older adults” (Fontaine, 2000, p. 391). Playing with and/or petting animals can help people feel less isolated. A study by Jennings (1998) has shown that blood pressure tends to decrease when people talk to their pets; see Figure 14-10. Pet therapy is currently used as adjunctive treatment for people in both acute and long-term care settings.

There are many uses for pet therapy. It can be implemented to help overcome physical limitations, improve mood, decrease blood pressure, and improve socialization skills and self-esteem.

Music

Music enters the bodymind through the auditory sense. Therapeutic use of music consists of playing music to elicit positive changes in behavior, emotions, or physiological response. Music complements other treatment modalities and encourages clients to become active participants in their health care and recovery.

Music is a good adjunct to use with imagery as it can add to the relaxation response and, therefore, heighten images; see Figure 14-11. Music can be used to relax

Figure 14-10 Interacting with pets can lead to therapeutic benefits.

RESEARCH FOCUS

Title of Study

“Nurses’ Perspectives on Unconventional Therapies”

Authors

Fitch, M. I., Gray, R. E., Greenberg, M., Labrecque, M., & Douglas, M. S.

Purpose

To examine nurses’ perspectives about the use of unconventional therapies.

Methods

A telephone interview approach was used to gather information about nurses’ perspectives on unconventional therapies. Twenty nurses were randomly selected from a list of nurses who had purchased a book on the use of unconventional therapies. An additional 20 nurses were sent a free copy of the same book with a request to review the book and participate in an interview. All but four of the participants worked in oncology settings. Three were occupational health nurses, and one worked in a psychiatric setting. The telephone interviews, which used open-ended questions, lasted from 15 to 45 minutes and were audiotaped.

Findings

The analysis of interview data revealed five prominent themes: (1) Information regarding unconventional therapies needs to be available. (2) Various people use unconventional therapies. (3) People seek unconventional therapies for a variety of reasons. (4) Communication about unconventional therapies needs to be open. (5) A place should be found for unconventional therapies.

Implications

People have a right to information, that information is critical for making decisions, and ultimately, decisions about health are up to the individual. All of the participants stated the need for health care providers to learn more about the unconventional therapies.

Fitch, M. I., Gray, R. E., Greenberg, M., Labrecque, M., & Douglas, M. S. (1999). Nurses’ perspectives on unconventional therapies. *Cancer Nursing*, 22(3), 238–245.

or stimulate. “Music has been used for everything from lulling infants to sleep to stirring warriors to battle” (Grotbo, 1999, p. 24)]. Music is used for celebrations, spiritual ceremonies, entertainment, and recreation.

Figure 14-11 This individual is experiencing the combined effects of music and imagery, which potentiate the relaxing effects of each modality.

In hospitals in India, traditional Indian music is used to help restore balance in body rhythms (Fontaine, 2000). The healing power of music has been extensively studied. Campbell (1998) states that Mozart's music alters the energetic fields in the human brain and thus alters an individual's inner rhythms. The basic elements of music—rhythm, pitch, and intensity—are transmitted by sensory impulses from the cochlea to the thalamus, where they are mediated, then to the cerebral cortex, affecting the autonomic nervous system (Grotbo, 1999).

Listed here are some ways in which music has been used as a therapeutic intervention (Campbell, 1998):

- Music is used by hospice nurses to reduce clients' pain and ease the transition to death.
- Neonatal nurses often use lullabies to calm infants who are on ventilators or are irritable.
- Many labor and delivery nurses provide tape players and cassettes of relaxing music to clients.
- In rehabilitation units, relaxing music is often played.
- People with rheumatoid arthritis used guided imagery and music for 18 weeks and reported a reduction in pain as well as an improved ability to ambulate.

- Children with attention deficit disorder (ADD) who listened to Mozart had better attention spans, improved mood control, decreased impulsivity, and improved social skills.

Music on audiocassette used with a tape player and headphones can be a very useful tool for clients who may be immobilized, who must wait for diagnostic tests, or who undergo the perioperative experience. Some clients request that their music and tape player accompany them during surgery. Pleasurable sounds and music can reduce stress, perception of pain, anxiety, and feelings of isolation. To promote relaxation, select music that is repetitive and low-pitched. Rhythm is most soothing when it has a 3/4 beat. Relaxation is induced by repetition of music, such as lullabies and chants. Music can also be especially useful in helping adolescent clients relax.

Although music is therapeutic for people at all stages of the life cycle, **music-thanatology** is a holistic and palliative method for use of music with dying clients. Music-thanatology is used to help dissipate obstacles to the client's peaceful transition to death.

NURSING AND COMPLEMENTARY/ALTERNATIVE APPROACHES

Nurses play an important role in educating consumers about unconventional interventions by providing information about the safety and efficacy of such methods. "In this new millennium, a major challenge facing nursing will be the promotion of integrative care in which clients use the best of CAM and conventional medicine. An integrative approach to practice will demand that nurses promote integration rather than replacement of conventional care" (Eliopoulos, 2000, p. 2). Education is a major function of nursing and is greatly needed as consumers try to determine which CAM methods to use. Consumers should be taught to recognize the signals of fraudulent practice and to avoid healers who:

- Promise immediate relief or success
- State that their way is the only sure therapy
- Refuse to work with other health care providers
- Claim to have all the answers
- Place more priority on money than the client's well-being (Tiedje, 1998)
- Use testimonials that claim amazing results
- Make statements using phrases such as "miraculous cure," "scientific breakthrough," or "secret ingredient" (Federal Trade Commission, 1998)

Other nursing interventions are to provide clients with information about the appropriate use of CAM; to protect clients from unsafe practices and practitioners; and to assist colleagues in being informed of the ever-changing knowledge base about CAM.

THINK ABOUT IT

Complementary/Alternative Treatment: To Seek It or Not?

Your close friend has AIDS and is experiencing a great deal of pain and discouragement. She wants to find alternative methods to ease the pain. She confides in you that she believes that there may be a cure available at the holistic health center. How do you best help your friend with this situation? What do you advise? Evaluate the same scenario by changing the friend to a client. Is your approach different? Do you give the same advice?

Many clients do not discuss their use of CAM techniques with their primary care providers because they fear ridicule or censure (Fontaine, 2000). It is imperative that nurses establish a setting in which clients feel free to express all issues related to their health. “When we nurses demonstrate an openness to clients’ questions and self-care ideas without judgment, we can learn a lot more about our clients and help them find the treatments that work best for them” (Collins, 2000, p. 3).

Holistic nurses individualize every intervention on the basis of the client’s unique needs. From the time before birth until the moment of death, people of all ages experience trauma, stress, and life challenges and

have needs in all dimensions. Nurses are challenged to discover and meet those needs. Table 14-8 provides suggestions for the use of complementary modalities throughout the life cycle.

Holistic nurses must maintain technical expertise, interpersonal skills, and critical thinking abilities. In addition to these requisite competencies, Fontaine (2000) states, “We need scientific principles, methods, and skills, but we also need to teach people ways to become more self-reliant as we shift in the role from caregiver to healer” (p. 17).

Nurse as Instrument of Healing

When the nurse serves as an instrument of healing, the objective is to help the clients call forth their inner resources for healing. In order to accomplish this goal, nurses must develop the following attributes:

- Knowledge base: Initially established in nursing school and then continuously expanded through life-long learning
- Intentionality: A conscious direction of goals that is essential in helping the healer to focus
- Respect for differences: Demonstrated by honoring clients’ culturally based health beliefs
- Ability to model wellness: Tending to own needs and attempting to stay as healthy and balanced as possible

TABLE 14-8
Complementary/Alternative Therapies for Use throughout the Life Cycle

Population	Recommended Complementary Therapies
Premature infants	<ul style="list-style-type: none"> • Massage (with modifications) • Energetic-touch therapies • Sound (e.g., recorded human heartbeat) • Gentle movement • Touch (stroking, skin-to-skin contact)
Infants	<ul style="list-style-type: none"> • Massage (with modifications) • Energetic-touch therapies • Music (e.g., lullabies) • Movement (e.g., rocking)
Toddlers and preschoolers	<ul style="list-style-type: none"> • Massage • Energetic-touch therapies • Music (e.g., playing and listening to songs, singing) • Movement • Play (all activities should be age-appropriate) • Humor • Imagery • Storytelling • Art/drawing • Aromatherapy (with precautions)

TABLE 14-8 (continued)
Complementary/Alternative Therapies for Use throughout the Life Cycle

Population	Recommended Complementary Therapies
School-age children	<ul style="list-style-type: none"> • Massage • Energetic-touch therapies • Music (playing and listening) • Movement (e.g., dance) • Play (all activities should be age-appropriate) • Humor (e.g., riddles, jokes) • Imagery • Storytelling • Art/drawing • Aromatherapy (with precautions) • Hypnosis • Yoga • Tai chi • Pet therapy
Adolescents	All modalities discussed in this chapter, as appropriate to condition
Adults	All modalities discussed in this chapter, as appropriate to condition
Women during childbirth	<ul style="list-style-type: none"> • Massage (emphasis on lower back and legs) • Energetic-touch therapies • Breath coaching • Imagery • Hypnosis
Older adults	<ul style="list-style-type: none"> • Massage (lighter pressure and modifications for body's status) • Aromatherapy (with precautions) • Heat and cold applications (with precautions) • Any other modalities discussed in this chapter, as appropriate to condition and with precautions
Terminally ill	<ul style="list-style-type: none"> • Massage • Reflexology • Energetic-touch therapies • Music-thanatology • Prayer • Any other modalities discussed in this chapter, as appropriate to condition and with precautions

KEY CONCEPTS

- Ever-increasing numbers of health care consumers are using nontraditional treatment modalities.
- Psychoneuroimmunology is the study of how the body and mind are connected and how beliefs, thoughts, and emotions affect health.
- Holistic nursing practice encompasses consideration of each client as a unique and whole being with many aspects: physiological, psychological, sociocultural, intellectual, and spiritual.
- Healing is not curing but rather is regaining balance and finding harmony and wholeness as changes take place from within the individual.
- No one can heal another, but a nurse can act as a guide, support system, or instrument of healing for a client.
- Some of the mind-body modalities that nurses use are meditation, relaxation, imagery, biofeedback, and hypnosis.
- Body-movement modalities include movement and exercise, and chiropractic therapy.
- Energetic-touch therapies can be used with persons of all ages and in various stages of illness and wellness.
- Energetic-touch therapies include massage, therapeutic touch (TT), healing touch (HT), shiatsu acupressure, and reflexology.
- Spiritual therapies such as faith healing, healing prayer, and laying on of hands are helpful modalities to use in caring for clients.

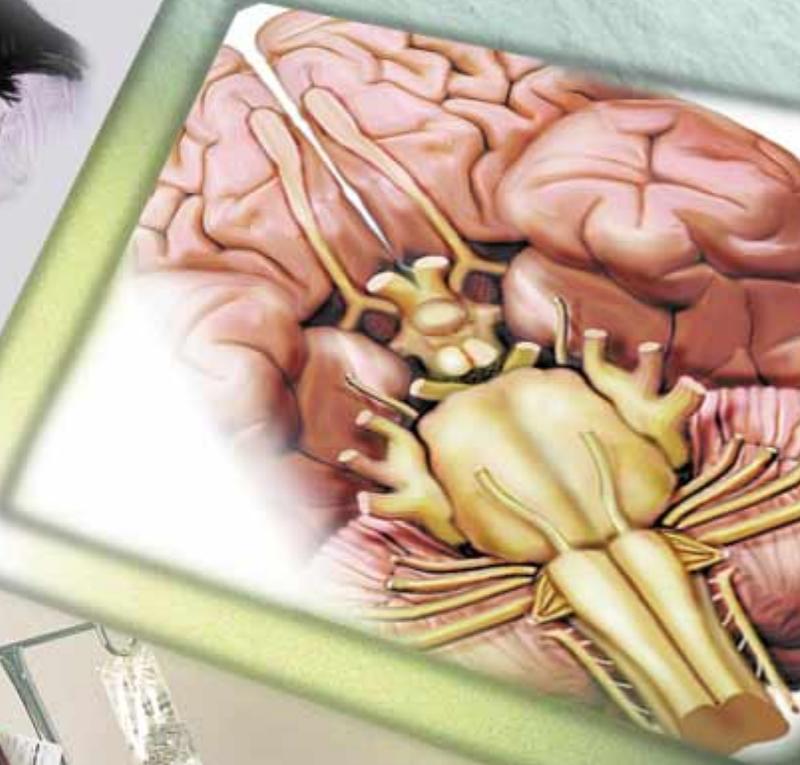

- Nutritional therapies include antioxidants, macrobiotic diets, and herbal therapy.
- Other modalities, such as aromatherapy, humor, pet therapy, and music therapy, are valuable adjuncts to conventional treatment.

CRITICAL THINKING ACTIVITIES

1. List at least two CAM therapies that would be appropriate for each of the following holistic dimensions: physical, emotional, social, and spiritual.
2. Look at the telephone book Yellow Pages to identify any complementary/alternative practitioners in your community.
3. Make a list of items that you could put on a humor cart or in a humor basket. Could you make a humor basket for under \$10.00?
4. Select a classmate and perform a guided imagery exercise with him or her. Find a quiet place and, if feasible, use soft music to enhance the experience. Then switch roles and have your partner guide you. Try doing this before a major examination. Does it make a difference? If so, how?
5. Imagine that you are assigned to care for a 6-year-old boy who does not speak your language, who is confined to bed, and whose parents must leave him for periods of time because of work obligations. During these periods he cries and is uncooperative with staff. The parents feel guilty, and everyone on your unit finds his behavior unsettling. Your nurse manager asks you to devise a care plan to meet the child's needs and help him cope. What CAM treatment modalities can you employ to deal with his anxieties? Do you need a physician's order to use them?

Health, Holism, and the Individual

Every individual is a marvel of unknown and unrealized possibilities.

—Goethe

COMPETENCIES

1. Differentiate health, illness, and wellness.
2. Identify the theoretical models of health and their assumptions.
3. Relate the achievement of basic needs to health status.
4. Explain the relationship of variables such as lifestyle, locus of control, self-efficacy, health care attitudes, and self-concept to health behaviors.
5. Describe the three approaches to health maintenance.
6. Discuss nursing's role in health promotion.
7. Discuss the influence of a holistic viewpoint on health and health care delivery.
8. Describe the nurse's roles regarding clients' spirituality.
9. Discuss the nurse's role in promoting the sexual health of clients.

KEY
TERMS

acute illness	health promotion	self-concept
adaptation	health-seeking behaviors	self-efficacy
basic human need	heterosexuality	self-esteem
behavior	high-level wellness	sex roles
bisexuality	homeostasis	sexuality
body image	homosexuality	sexual orientation
chronic illness	illness	spiritual distress
empowerment	locus of control	spirituality
gender identity	need	transsexuality
health	psychoneuroimmunology	wellness
health-promoting behaviors	restorative care	

Health and illness can be defined in many ways. Health is a concept that includes physical and mental status, emotional well-being, and spiritual well-being. Historically, Western cultures defined health as the absence of illness. It is easier to measure illness than it is to measure health because definite parameters can be used to determine whether an individual has symptoms indicative of disease processes. What criteria are used for determining one's health? Is health merely the absence of disease, or is health more comprehensive?

In addition to examining these questions, this chapter describes health promotion activities with an emphasis on nursing's role. There is a discussion of holism, basic human needs, and the physiological, psychological, sociocultural, intellectual, spiritual, and sexual dimensions of the individual.

HEALTH, ILLNESS, AND WELLNESS

Health, the process through which a person seeks to maintain an equilibrium that promotes stability and comfort, is a dynamic process that varies according to a person's perception of well-being. The traditional definition of health as the absence of illness is a narrow concept. **Illness** is the inability of an individual's adaptive responses to maintain physical and emotional balance that subsequently results in an impairment of functional abilities. **Wellness** is the condition in which an individual functions at optimal levels. An in-depth discussion of wellness appears later in this chapter.

Health is a global term because it refers to every aspect of a person's life, including:

- Physical status
- Emotional well-being
- Social relationships
- Intellectual functioning
- Spiritual condition

Models of Health

There are several theoretical models of health, as shown in Table 15-1. These models help clarify the link between the states of well-being and illness and clients' responses to these processes.

The American Holistic Nurses' Association (1994) describes health as a maintenance of harmony and balance among body, mind, and spirit. Balance refers to **homeostasis**, which is an equilibrium among psychological, physiological, sociocultural, intellectual, and spiritual needs. The process by which a person adjusts to achieve homeostasis is called **adaptation**. When people describe their health status, basically three areas are considered:

- Presence or absence of symptoms (physical and emotional)
- How they feel (emotionally and physically)
- What they are able to do (ability to function)

Health can be studied both in individuals and in groups (e.g., families and communities). Health status is influenced by:

- Beliefs and attitudes
- Cultural factors
- Lifestyle behaviors

An individual, within the context of the family unit, gives meaning to health and makes adjustments necessitated by the illness. A family's adaptation to changes in health status is strongly influenced by each member's personal resources and social support systems.

Cultural Influence on Health

Health-related concepts evolve within the context of one's culture; that is, culture affects how an individual views health and illness. One's cultural background influences health-related behaviors and expectations of treatment when illness occurs. For example, how an individual cares for self is directly related to cultural

TABLE 15-1
Theoretical Perspectives of Health

Model	Theorist	Assumptions
Clinical model	Traditional perspective	<ul style="list-style-type: none"> • Health is absence of illness. • Individuals who are not “sick” (i.e., experiencing a disease) are healthy.
Health-belief model	Rosenstock	<ul style="list-style-type: none"> • Expectations direct behaviors that lead to fulfillment of the expectations. • Group values exert influence on beliefs about health. • Beliefs may change as a person grows and develops.
High-level wellness model	Dunn	<ul style="list-style-type: none"> • Health is influenced by the interaction between the individual, family, and community. • Health is viewed as an attempt toward achieving one’s fullest potential.
Social learning theory	Bandura Rosenstock	<ul style="list-style-type: none"> • Beliefs strongly influence actions. • Behavior is influenced by expectations and reinforcements (or incentives).
Host-agent-environment model (“Ecologic” model)	Leavell and Clark	<ul style="list-style-type: none"> • Health depends on the interaction of host, agent, and environment. • Balance among these elements results in health. • Illness occurs when there is an imbalance in one of the three elements. • Model is used most often in predicting risk of illness.
Health promotion model	Pender	<ul style="list-style-type: none"> • Model focuses on activities that improve wellness and prevent disabilities. • People use health-promoting activities when they: <ol style="list-style-type: none"> 1. Value health 2. Perceive health as being within their control 3. Can identify benefits in self-care activities 4. Have a positive perception of their own health status

(Data from Bandura, A. [1977]. *A social learning theory*. Englewood Cliffs, NJ: Prentice Hall; Becker, M. H. [1974]. The health belief model and sick role behavior. *Health Education Monogram*, 2, 409–419; Dunn, H. [1961]. *High-level wellness*. Arlington, VA: R.W. Beatty; Edelman, C., & Mandel, C. L. [1997]. *Health promotion throughout the lifespan* (4th. ed.). St Louis: Mosby-Yearbook; Leavell, H., & Clark, A. E. [1965]. *Preventive medicine for doctors in the community*. New York: McGraw-Hill; Pender, N. J. [1987]. *Health promotion in nursing practice*. East Norwalk, CT: Appleton & Lange; and Rosenstock, I. [1974]. Historical origin of the health belief model. In M. H. Becker (Ed.), *The health belief model and personal health behavior*. Thorofare, NJ: Charles B. Slack.)

norms. “It is essential for the nurse to provide cultural care by acquiring knowledge about the cultural practices and beliefs of the family and community and their effects on health” (Collins & Diego, 2000, p. 29). See Chapter 16 for a complete discussion of cultural beliefs and behaviors affecting health.

Family Influences on Health Care

Because health is defined uniquely by each client’s culture, the nurse must assess the family’s health definitions and beliefs. Generally, families are the first to identify signals of impending illness. Also, families help determine the following:

- Whether to seek treatment
- What type of treatment is appropriate
- Who should provide the treatment or care
- Where the treatment or care should be provided

Families are often the major caregivers for their relatives. Extended families and communities have traditionally acted as a buffer against excessive stress and illness. Lack of social support from family or significant others results in psychological and spiritual isolation, which negatively impacts a person’s physiological state. Thus, it is important to help clients identify, strengthen, and use their social support systems. Sometimes, families need guidance to optimize health

behaviors. Nursing assessment *must* include the client's (including the family's) perspective of the *most* pressing problem. See the Nursing Process Highlight for a listing of nursing actions that promote family collaboration.

Nursing Process Highlight

IMPLEMENTATION

Actions to Promote Collaboration with Families

1. Listen as family members express feelings.
2. Assess the extent to which family members wish to be involved in the treatment process.
3. Involve family members to the extent they desire.
4. Encourage participation in problem-solving activities.
5. Participate in family support groups.

(From Pickens, J. [1998]. Formal and informal care of people with psychiatric disorders: Historical perspectives and current trends. *Journal of Psychosocial Nursing*, 36[1], 37–43.)

Illness Perspectives

Illness means different things to different people. It is more than just the existence of physical signs and symptoms. Illness is the result of a disease (either physiological or psychological) or injury that affects functioning, and occurs when there is an inability to meet one's needs.

There are two major classifications of illness: acute and chronic. An **acute illness** is a disruption in functional ability usually characterized by a rapid onset, intense manifestations, and a relatively short duration. Acute illnesses are usually reversible. A **chronic illness** is a disruption in functional ability usually characterized by a gradual, insidious onset with lifelong changes that are usually irreversible. Chronic illnesses last a long time, frequently throughout the individual's life. An example of an acute illness is influenza. Arthritis is an example of a chronic illness. It is possible for a person to have both a chronic illness and an acute illness at the same time, for example, the person with diabetes (chronic) who also develops pneumonia (acute).

Chronic illness affects individuals across the lifespan. Up to 10% of children in the United States have a chronic illness. "The impact of these disorders become most dramatic during adolescence, and you can play a critical role in addressing their concerns and fostering more normal development in children" (Muscarelli, 1998b, p. 20). Adolescents experiencing chronic illnesses need two major nursing interventions: support and education.

Even though many elderly individuals have multiple chronic conditions, it is important to remember that chronicity is *not* an experience unique to the elderly. However, as life expectancy continues to increase, an increasing number of people are living with chronic illness. The implications for nursing are far-reaching. "As care in the home for acute and chronically ill clients continues to expand, advanced practice nurses will continue to integrate psychosocial care with physical care" (Collins & Diego, 2000, p. 28). Some of the goals of caring for people with chronic illnesses include:

- Coping with lifestyle changes and the subsequent modification of self-care activities
- Coping with long-term discomfort or pain
- Establishing or maintaining a sense of personal control
- Maintaining a positive self-esteem (Edelman & Mandle, 1997)

Wellness Perspectives

Wellness further describes health status. It allows health to be placed on a continuum from one's optimal level ("wellness") to a maladaptive state ("illness"), as shown in Figure 15-1.

Wellness is a dynamic process that is ever changing. The well person usually has some degree of illness and the ill person usually has some degree of wellness. This concept of a health continuum negates the idea that wellness and illness are opposite because they may occur simultaneously in the same person in varying degrees. The classic description of wellness was developed by Dunn in the early 1960s. According to Dunn (1961), **high-level wellness** means functioning to one's maximum health potential while remaining in balance with the environment.

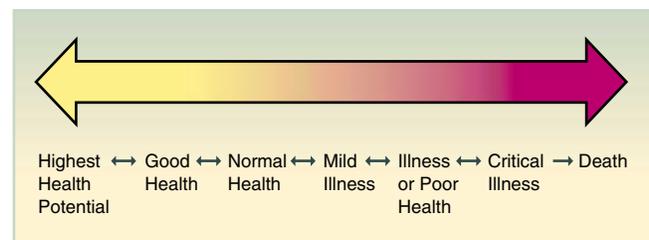

Figure 15-1 Health Continuum

HEALTH BEHAVIORS

To understand how people influence their health status, it is important to know about health behaviors. **Behavior** is defined as the observable response of an individual to external stimuli. An important concept to remember when caring for clients is that *all behavior has meaning*. In

other words, behavior is the individual's attempt to achieve satisfaction of needs. Nurses must sometimes act as detectives to determine the need(s) underlying client behavior. Thorough assessment is the key for nurses in determining the meaning of client behavior. **Health-seeking behaviors** are those activities directed toward attaining and maintaining a state of well-being.

Variables Influencing Health Behaviors

There are several variables that influence health including:

- Lifestyle
- Perceived locus of control
- Perceived ease or difficulty in accomplishing a task (self-efficacy)
- Health care attitudes
- Self-concept

Lifestyle

Individuals determine their health status through their actions (Figure 15-2). Lifestyle consists of a person's usual daily activities and routines that are acceptable practices in the person's life. Such routines and habits influence health status. For example, consumption of large amounts of caffeine, cigarette smoking, consistent intake of high-fat foods, and a sedentary routine can adversely affect health status. Lifestyles are developed within one's family and one's cultural environment. The family is the primary influence on a child's development of health-promoting (or health-defeating) behaviors.

When lifestyle modifications are necessary to improve health, many individuals have difficulty implementing the suggested changes. Individuals are less likely to comply with recommended lifestyle changes if there is a perception of increased inconvenience and cost. Also, the required degree of change in lifestyle may affect compliance. "A person is more likely to comply when he perceives the severity of an illness and his susceptibility to complications; when he believes in the reliability of his health care providers; and when he trusts the benefits of the prescribed therapy" (Muscarelli, 1998a, p. 27).

Locus of Control

Locus of control refers to individuals' sense of control over events and situations affecting their lives. A person with an external locus of control feels like a victim with little, if any, control over life events. However, a person with an internal locus of control feels able to influence significant events and occurrences affecting self, that is, they see themselves as responsible for their own lives. Thus, those with an internal locus of control are more willing to make lifestyle changes that will lead to wellness.

Figure 15-2 Through exercise, this woman is demonstrating a lifestyle choice that will enhance her health status. How would this type of behavior contribute to a person's fulfillment of basic human needs and, thus, promote wellness?

Self-Efficacy

Psychologist Albert Bandura (1977) coined the term **self-efficacy** to describe an individual's perception of one's own ability to perform a certain task. Self-efficacy has a powerful impact on initiating behavior change.

When clients are able to make informed decisions about their health behaviors and feel that they are successful in these areas, they are more likely to attempt behavior change. Thus, an essential component of nursing care is to provide opportunities for clients to achieve this level of self-motivation. For example, when teaching a

THINK ABOUT IT

Barriers to Wellness

Identify specific behaviors that promote a person's ability to stay healthy. What are some behaviors that create barriers to wellness?

client how to self-administer injections, the nurse breaks the task down into small manageable objectives and has the client do a return demonstration. The client receives immediate feedback, which encourages further success.

Self-efficacy is a form of self-confidence that leads to successful behavior performance; it is a strong influencing factor on behavior (Borsody, Courtney, Taylor, & Jairath, 1999). As described by Bandura (1986), self-efficacy encompasses two types of expectations:

1. *Outcome expectations*: Beliefs about whether behavior will produce desirable results
2. *Efficacy expectations*: Beliefs the person has about his or her own ability to perform the behavior

Health implies moving toward self-care, in other words, becoming and remaining independent. Self-responsibility, as it relates to health-promoting activities, is a fairly new concept to the majority of Americans. For years, individuals have looked to physicians to “fix things” and “make it better.” Only when individuals enter into active partnerships with their primary health care provider (nurse, physician, or other healer) will self-responsibility for health become a reality.

Health Care Attitudes

Beliefs are *powerful* shapers of behavior. Health behaviors are based on beliefs. Attitudes about health and personal vulnerability (which are initially learned in the family unit) greatly influence behavior. Socialization (which occurs within the family) influences the development of beliefs about health care. These beliefs determine the person’s willingness to participate in health care. For example, if the person believes in the use of herbs or folk healers, such nontraditional health care practices could either enhance or interfere with traditional treatment approaches.

There are some gender differences in beliefs regarding health care. U.S. men, when seeking help for health-related issues, tend to use an indirect approach. The following may interfere with a man asking for help from health care providers:

- A sense of immunity
- Difficulty in relinquishing control
- A belief that seeking help is unacceptable (Tudiver & Talbot, 1999)

Nurses must be sensitive to the fact that all clients do not share the same beliefs about health care issues. Using a nonjudgmental attitude helps the nurse to be more accepting of clients with diverse beliefs and behaviors.

Self-Concept

Self-concept is an individual’s perception of self. It includes **self-esteem** (an individual’s perception of self-worth) and **body image** (perception of physical self).

THINK ABOUT IT

The Media and Health Beliefs

The media are extremely powerful in shaping attitudes and beliefs. Here are some examples of how various media discourage health-promoting behaviors:

- Advertising foods with high sugar, salt, and fat content
- Promoting alcohol use
- Encouraging use of tobacco products

What other examples can you identify? Recently, there seems to be an emerging trend to advertise healthier lifestyles. What examples come to mind?

The relationship between self-concept and health is strong.

Self-concept influences individuals’ health behaviors in that people who think highly of themselves will tend to take care of themselves. On the other hand, a person with a negative self-concept will engage in reckless or self-destructive behaviors that endanger health. Persons with a low self-concept frequently ignore their own needs because they are perceived to be less important than the needs of other people.

Self-concept is dynamic and may change according to health status. Not only does self-concept influence health, but changes in health status may influence self-concept. For example, consider the person who has lost a limb due to amputation. This person’s self-concept would be altered as a result of the physical change.

HEALTH PROMOTION

Prior to the 1990s, most health-related research focused on behaviors that prevent illness. Currently, however, the trend among health care professionals is to emphasize behaviors that promote wellness. The United States Public Health Service (1990), in its *Healthy People 2000* initiative, focused on the individual’s responsibility in promoting health. The individual is viewed as having the ability to influence his or her own health and also that of the country. There are several approaches to health maintenance:

- Health promotion
- Health protection
- Disease prevention (United States Public Health Service, 1990)

In 1979, the U.S. Department of Health and Human Services mobilized public health agencies to work toward developing healthier Americans. This initiative, *Healthy People*, is now in its third decade and is called *Healthy People 2010* (Chrvala & Bulger, 1999). The program, coordinated by the U.S. Public Health Service, will focus efforts on

allowing equal access of all Americans to preventive health care services. Most states use the *Healthy People* framework to guide the development and implementation of local health policies and programs. *Healthy People 2010* recognizes the need to focus on improving the quality of life, as well as reducing disparities in the type of health care services received by Americans (Wilson, 1999).

Healthy People 2010 has established the four objectives that are to be emphasized through the efforts of health care agencies, both public and private, for the next 20 years; see Table 15-2.

Health Promotion Activities

Health promotion is a process undertaken to increase the levels of wellness in individuals, families, and communities. It involves activities and programs provided by nurses and other health care providers to foster lifestyle behaviors conducive to optimum health status.

HEALTH PROMOTION GOALS

- Respect and support clients' right to make decisions
- Identify and use client strengths and assets
- Empower clients to promote own health or healing

THINK ABOUT IT

Nurses as Healthy Role Models

Nurses have an opportunity to model healthy behaviors. Think about the messages many nurses communicate through certain behaviors such as smoking, overwork, and inadequate use of stress management techniques.

- Do you think nurses have an obligation to demonstrate healthy behaviors? Explain the rationale for your answer.
- What type of health-promoting behaviors do you demonstrate?

How do nurses encourage the development of healthy behaviors in clients? Providing information alone is *not* the key. The key is to motivate clients to *want* to change. The accompanying display lists major nursing goals related to health promotion.

Nurses identify high-risk individuals and determine and strengthen their social support, thus encouraging disease prevention. Clients who are attempting to adopt **health-promoting behaviors** (actions that increase well-being or quality of life) must receive support and reinforcement for their attempts.

TABLE 15-2
Healthy People 2010 Objectives

Objective	Description	Examples
Promote healthy behaviors	Focuses on behaviors resulting from personal choice	<ul style="list-style-type: none"> • Physical activity • Nutrition • Tobacco use
Promote healthy and safe communities	Addresses programs that have an impact on individual health through education and community-based programs	<ul style="list-style-type: none"> • Environmental health • Food safety • Occupational health • Injury prevention • Violence prevention
Improve systems for personal and public health	Emphasizes the need for all citizens to have access to health care services (goal: to reduce racial and ethnic disparities)	<ul style="list-style-type: none"> • Maternal, infant, and child health • Family planning • Medical product safety • Health education • Public health infrastructure
Prevent and reduce diseases and disorders	Outlines specific interventions related to chronic, prevalent health problems	<ul style="list-style-type: none"> • Cancer • Cardiovascular disease • Stroke • Arthritis • Mental illness

(Data from Chrvala, C. A., & Bulger, R. J. [1999]. *Leading health indicators for healthy people 2010: Final report*, Division of Health Promotion and Disease Prevention, Institute of Medicine; Wilson, L. M. [1999]. Healthy people—a new millennium: progress and comparison on the Healthy People 2000 and Healthy People 2010 objectives. *JONAS Healthcare Law, Ethics, and Regulation*, 1(2), 29–32.)

As beginning health care providers, nursing students are encouraged to develop their own health-promoting behaviors to be better role models for clients.

Individuals are becoming more aware of the relationship between daily behavior and health status. Types of health promotion programs can include smoking cessation, nutrition, and exercise. Changing health behaviors means focusing on the whole person within the context of the environment. “As the emphasis in health care shifts from an illness to a wellness orientation, health promotion and protection take on greater importance for all nurses” (Collins & Diego, 2000, p. 27).

Health promotion activities are holistic in nature in that they target physical and emotional health concerns. The accompanying display lists nursing activities to promote and protect mental health.

MENTAL HEALTH PROMOTION AND PROTECTION ACTIVITIES

- Guiding parents
- Teaching conflict resolution
- Supporting families through grieving and bereavement
- Using cognitive and behavioral techniques
- Teaching stress management skills
- Assessing and respecting cultural diversity
- Teaching interpersonal communication skills
- Monitoring for child abuse
- Advocating on behalf of families in need of health care

(From Collins, A. M., & Diego, L. [2000]. Mental health promotion & protection. *Journal of Psychosocial Nursing*, 38(1), 30.)

Health Protection Activities

Health protection includes a variety of activities. Prevention of accidental injury in the home, at school, and the workplace is an example. Programs that focus on occupational safety and health are designed to protect employees' health. Governmental efforts to ensure the safety of food and drug products is another example of health protection. Environmental strategies, such as water purification, sewage disposal, and air quality control, are used to protect the health of individuals and communities. As stated by Upchurch (1999, p. 254), “health-protecting behaviors can enable a person to perform activities of daily living in such a way that a happy, satisfying, and productive life result. In other words, health-protecting behaviors are ‘good’ for a person . . .”

Disease Prevention Activities

Disease prevention occurs on a continuum, from averting the development of disease to limiting its course once developed. The purpose of *primary prevention* is to

decrease the person's vulnerability to disease. Primary preventive measures include parenting education, attention to personal hygiene, and avoidance of toxins. The goal of *secondary prevention* is early detection of disease to initiate early intervention. Examples of secondary preventive activities are screening for particular diseases and preventing the spread of communicable disease. When a disease (such as a chronic condition) already exists, *tertiary prevention* is used to minimize its effects and to prevent further disability. Nurses who work in rehabilitation settings, including the home, are engaged in tertiary prevention. The focus is on **restorative care**, therapeutic interventions directed at helping clients reach and maintain their optimal level of functioning.

Nurse's Role in Health Promotion, Health Protection, and Disease Prevention

Nurses play a key role in promoting health and wellness. Through health promotion and risk reduction, the individual develops behavior patterns that promote a healthy lifestyle and reduce the risk of disease. The challenge for nurses is to find ways to motivate clients and families to develop health-promoting behaviors. When behaviors that once worked for the individual are no longer effective, the client must give up the old behaviors to be able to adopt new, healthier ones. Client teaching is a major intervention for promoting health (Figure 15-3). An essential component of teaching is encouraging clients to make necessary lifestyle changes to promote health.

Motivation is a key component of achieving and maintaining health. Nurses can better help clients engage in

Figure 15-3 To promote the health of this expectant couple and their baby, the nurse is providing information about nutritional intake during pregnancy. What incentives can the nurse offer in this situation that would encourage these clients to practice health-promoting behaviors? (Courtesy of Bellevue, The Woman's Hospital, Niskayuna, NY)

THINK ABOUT IT

Rewarding Healthy and Unhealthy Behaviors

In general, Western society does not reward health-promoting behaviors. For example, children get attention when they are sick, not well. This attention takes the form of goodies, treats, and relief from responsibilities, such as homework and chores. This attention reinforces the value of “being sick” to children. Another example of our society’s rewarding illness occurs in the workplace. Most employees are entitled to sick days, but time off is not given for “well days.” What message is communicated by such behaviors?

healthy behaviors by considering the client’s beliefs and experiences when planning care. Many factors help clients feel motivated to change health behaviors:

- Perception of self as able to succeed (self-efficacy)
- Belief that health status will improve
- Response to their attempts to change in the form of feeling healthier and receiving confirmation of these changes from others

Health Promotion and Vulnerable Populations

Risk factors that threaten the health of individuals include teen parenting, poverty, and chronic disease (Olds, Henderson, Kitzman, & Cole, 1999). The health of certain population groups is threatened. Especially vulnerable groups include:

- Children
- The elderly
- Those who are economically disadvantaged
- Those who are immunocompromised
- The homeless

THINK ABOUT IT

Inexpensive Health-Promoting Behaviors

Several behaviors, such as walking and breastfeeding, are relatively inexpensive and promote health. Think of some other examples of inexpensive behaviors that nurses can encourage people of all socioeconomic groups to incorporate into their lifestyles.

One primary variable affecting health promotion is socioeconomic status. Middle- and upper-income families are more likely to demonstrate healthy behaviors as they have the financial means to purchase nutritional foods, buy exercise equipment, and pay for recreation.

The monies of lower socioeconomic families are typically used in meeting basic needs such as food, shelter, and acute medical care. Health-promoting options must be affordable and readily available to people of all economic levels. Political involvement is one avenue for nursing to advance the health status of all. Nurses must be actively involved in shaping delivery of health care to influence the establishment of resources for underserved, disenfranchised groups.

Another variable affecting health is age. Elderly individuals tend to describe themselves as well when they are physically active, relatively free from pain, and able to maintain meaningful social ties. Maintaining independence and quality of life are of great importance for most elders. Nurses can promote self-care activities with elders to facilitate their wellness. For more discussion of working with clients in vulnerable groups, see Chapters 4 and 16.

THE INDIVIDUAL AS A HOLISTIC BEING

Due to the interwoven nature of the body and mind, it is impossible to separate physiological needs from psychosocial ones. **Psychoneuroimmunology** (the study of the complex relationship between the cognitive, affective, and physical aspects of individuals) is based on recognition of the concept that mind, body, and spirit are one. “Our biology and our minds are in constant communication” (Leighton, 1998, p. 36). For example, a person who is physically ill also experiences psychosocial disruptions. On the other hand, when a person is anxious or depressed, physical manifestations occur. “In the natural world, there is no mind–body split. Rather, mind, body, and spirit are intricately connected” (Edmands, Hoff, Kaylor, Mower, & Sorrel, 1999, p. 35.)

The practice of body–mind medicine is not new and is rooted in the origins of healing, as shown in the following examples:

- Hippocrates taught doctors to establish trust with their patients.
- Hippocrates taught doctors to observe the emotional states of patients.
- Socrates suggested that curing the soul leads to healing.
- The fundamental principle of traditional Chinese medicine is to honor the spirit (Leighton, 1998).
- Florence Nightingale recognized “the need to honor the physiological and spiritual aspects of our patients” (Dossey & Dossey, 1998, p. 35).

This holistic viewpoint guides the total care of the individual as a *complete being* rather than fragmented care focused on parts of the person. Only when nurses treat clients as individuals and not as “cases” to be “cured” do nurses respond in a holistic, caring way. A major role for nurses is to put the *caring* back into the process of healing. In the holistic model, “health is seen

as the achievement of a full and happy life characterized by social and spiritual connection, mental and emotional balance, and a healthy body” (Leighton, 1998, p. 36).

THINK ABOUT IT

Holistic Nurturing

How do you nourish each dimension of your being? In other words, how do you feed your body? Your mind? Your spirit?

NEEDS AND HEALTH

Since human beings are not merely physiological creatures, basic needs occur in the emotional, sociocultural, intellectual, and spiritual realms as well as the physiological realm. The entire person (body, mind, and spirit) is influenced by satisfaction of needs. Figure 15-4 illustrates the various human dimensions in which needs occur. A variety of needs emerge, are met, and re-emerge in each area of a person’s life.

A **need** is anything that is absolutely *essential* for one’s existence. **Basic human needs** (also known as universal needs) are those that are necessary for every person’s survival. Table 15-3 provides an overview of basic needs.

Maslow (1970) classified human needs as they occur on a tier with the most basic needs at the foundation of the hierarchy (Figure 15-5). These basic needs must be met before the individual can satisfy higher-level needs. For example, an individual who is starving must be fed before achieving the need for acceptance. An individual

TABLE 15-3
Basic Human Needs

Need	Example
Physiological	Oxygen, water, food, temperature (shelter and clothing), elimination, sleep, activity and sex
Psychological	Self-esteem, feelings of security, happiness, sadness
Sociocultural	Feelings of belonging, relationships
Intellectual	Thinking, learning
Spiritual	Being connected to others, having a sense of purpose

Figure 15-5 Maslow’s Hierarchy of Needs

with a deficient self-esteem and who is hemorrhaging must have the biologic needs met first. The satisfaction of basic needs enhances wellness. Conversely, an impairment in the satisfaction of basic needs can result in a client’s altered health status.

The following section describes basic needs related to the physiological, psychological, sociocultural, intel-

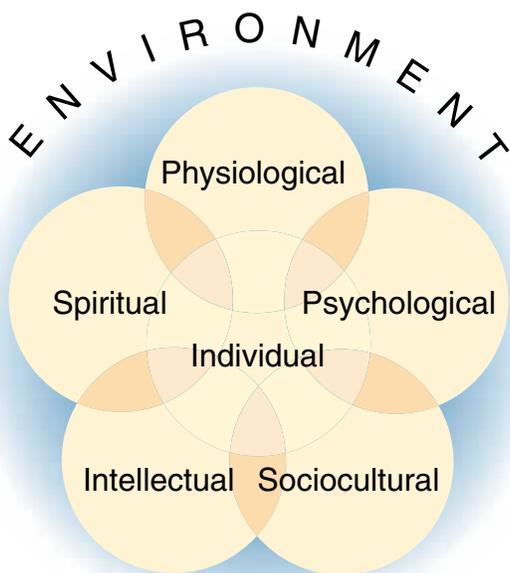

Figure 15-4 Holistic Perspective of the Individual

THINK ABOUT IT

Prioritizing Needs

Jane Thompson visits the public health clinic because of severe headaches. During the interview, the nurse practitioner learns that Jane and her three children frequently have no place to sleep because she has no income. Identify Ms. Thompson’s problems. Using Maslow’s hierarchy, which problem would be of the first priority? How do you determine which problem to address first?

lectual, spiritual, and sexual dimensions. There is extensive discussion of the nursing process as it relates to spiritual and sexual areas to demonstrate how the process can be applied to all dimensions of an individual's being.

Physiological Dimension

Providing physiological care focuses on achievement of the basic needs such as oxygenation, circulation, sleep and comfort, nutrition, and elimination. Refer to Chapters 32, 33, 38, and 39 for a thorough discussion of the nurse's role in helping meet these basic physiologic needs.

Psychological Dimension

Individuals have psychological needs for security, a sense of belonging, and self-esteem. Nursing actions that promote a sense of emotional comfort include the following:

- Treating the client as a unique individual
- Protecting confidentiality and privacy
- Using touch and personal space in a therapeutic manner
- Recognizing and respecting cultural differences
- Decreasing anxiety through stress management techniques

Goals for clients experiencing unmet psychological needs usually revolve around the following issues:

- Improve self-esteem
- Establish trusting relationships
- Develop social skills
- Cope with losses

Sociocultural Dimension

As social creatures, all people rely on others to some extent. "The need for others seems as vital to our health as food and shelter" (Leighton, 1998, p. 35). Research (Dossey & Dossey, 1998) has shown that social connection is correlated with positive health outcomes. It is difficult for some people to ask for help or to accept assistance when it is offered. It is important for nurses to assess the client's degree of dependence. Often, the nurse becomes involved in a balancing act in an effort to maintain equilibrium between the client's needs for dependence and independence.

Empowerment is a process of enabling others to do for themselves. It consists of encouraging the client to be an active participant in treatment rather than a passive recipient of care. Nurses empower clients by teaching them and their families how to develop skills for self-care and for healthier living.

Intellectual Dimension

The intellectual dimension consists of cognitive functions such as judgment, orientation, memory, and the ability to take in and process information. Refer to Chapter 36 for information on cognition and perception.

Piaget conducted landmark studies on children to determine how children think at various developmental stages; refer to Chapter 17 for a complete discussion of cognitive development throughout the life cycle.

Intellectual functioning can be impaired by multiple factors, including infection, exposure to toxins, substance abuse, trauma, and psychological problems. It is important for nurses to determine the client's intellectual abilities in order to communicate effectively. Using words that are easily comprehended by the client and implementing teaching strategies appropriate to developmental level promotes client learning.

Spiritual Dimension

Spirituality is multidimensional in that it refers to one's relationship with one's self, a sense of connection with others, and a relationship with a higher power or divine source. Spirituality assists a person in determining the sense of meaning or purpose in one's life. It is an integral component, or core, of one's being. Spirituality is somewhat difficult to define as it is determined at an individual level. A survey conducted by Moeller (1999) interviewed hospitalized clients to determine their meaning of spirituality. Some of the clients' comments included "spirituality ties my heart to my head like a ligament and is strong and flexible," and "spirituality is hope there is something better" (p. 6).

Spirituality is *not* the same as religion which refers to a set of beliefs and practices associated with a particular church, synagogue, mosque, or other formal organized group. Spirituality is a personal, individualized set of beliefs and practices that are not church related. Table 15-4 describes the characteristics of spirituality.

Factors that affect spirituality include cultural context, family, developmental stage, and health status. Families influence a person's development of spiritual beliefs. Nurses understand the importance of families in providing spiritual support and encourage the provision of that support. Spirituality evolves throughout one's life. See Chapter 17 for a discussion of the development of spirituality related to Fowler's stages of faith.

Health status can also have an impact on spiritual beliefs and vice versa. For example, when they are seriously ill, many people turn to religion for support. On the other hand, serious illness may cause some people to question their beliefs. In some cases, a person's belief system may interfere with the prescribed medical treatment regimen. For example, a person's religious or spiritual beliefs may require fasting. Acceptance or

TABLE 15-4
Characteristics of Spirituality

Characteristic	Description
Relationship with self	Knowledge of who one is and one's capabilities
Relationship with others	Caring for others when they need help Sharing of self
Harmony with nature	Knowledge of plants and animals Preserving nature Communing with nature (being outdoors)
Relationship with a higher power	Meditation Prayer Participating in religious services Performing religious rituals

(Adapted from Burkhardt, M. A. [1993]. Characteristics of spirituality in the lives of women in a rural Appalachian community. *Journal of Transcultural Nursing*, 4 [12], 12–18).

rejection of prescribed therapies may be rooted in spiritual beliefs (Figure 15-6). Table 15-5 presents an overview of the practices of selected major world religions that can relate to issues such as diet, birth, death, and health care.

Individuals with spiritually satisfying lives are those people who have a source of inner strength. Spiritual beliefs can enhance self-esteem and help protect individuals from stress. They help people adjust to stressful events such as illness.

Figure 15-6 Rituals such as the laying on of hands may be an integral part of some individuals' expressions of spirituality.

Nursing Process and Spirituality

Spiritual care is an essential component of holistic care. The International Code of Nursing Ethics (1973) calls for nurses to promote an environment that respects the client's spiritual beliefs.

Spiritual care, in addition to being an ethical duty of nurses, is now a requirement of some accreditation organizations. The right of clients to receive care that respects spiritual values was added to the Joint Commission for Accreditation of Healthcare Organizations (JCAHO) standards in 1998. In response to these criteria, some hospitals have revised policies to reflect the staff's ability to minister with persons of diverse cultural and religious backgrounds. Also, the JCAHO calls for documentation of interventions addressing clients' spiritual needs (JCAHO, 1999).

Assessment

Assessment primarily consists of observation and communication, which is based on a therapeutic nurse–client relationship. Some clients may be hesitant or embarrassed to discuss their spiritual beliefs. The nurse's presence communicates to the client that it is appropriate for clients to discuss all their concerns and issues. Presence helps establish the nurse–client relationship that is built on trust. As clients develop trust in the nurse, they are more likely to discuss sensitive issues. See the accompanying display for guidelines on assessing spiritual needs. Table 15-6 is a tool for assessing clients' spirituality.

NURSING TIP

Clues for Spiritual Assessment

Observe the client's immediate environment for clues about his or her spirituality. Are the get-well cards focused on spiritual or religious messages? Does the client and/or family pray before meals? Does the client wear any religious artifacts (medals, scapula, amulet)? Are there religious books or literature (e.g., Torah, Bible) nearby?

(Adapted from Estes, M. E. [2001]. *Health assessment & physical examination*. Albany, NY: Delmar.)

Nursing Diagnosis

Nurses must differentiate between spiritual well-being and **spiritual distress** in a client. Spiritual distress is the client's perception that their belief system, or their place within it, is threatened. Listed below are some of the ways in which spiritual distress is manifested:

TABLE 15-5
World Religions and Health Implications

Beliefs Affecting Dietary Practices	Beliefs About Birth	Beliefs About Death	Beliefs Affecting Health Care	Comments
<i>Seventh Day Adventists; Church of God</i>				
<ul style="list-style-type: none"> • No alcohol. • Coffee and tea prohibited. • Some groups prohibit meat. 	<ul style="list-style-type: none"> • No infant baptism 	<ul style="list-style-type: none"> • No last rites 	<ul style="list-style-type: none"> • Practice anointing with oil and use of prayer for those who are ill. • Some believe in divine healing. • Some groups oppose hypnosis as a therapeutic modality. • When ill, may want baptism or communion. 	<ul style="list-style-type: none"> • Literal acceptance of the Bible. • For many, Saturday is the Sabbath.
<i>Baptist</i>				
<ul style="list-style-type: none"> • Alcohol prohibited. • Some discourage consumption of coffee and tea. 	<ul style="list-style-type: none"> • No infant baptism 	<ul style="list-style-type: none"> • Believe in heaven and hell • Prayer and counseling from clergy with client and family 	<ul style="list-style-type: none"> • See physician as an instrument for God's intervention. • Oppose abortion. • Some believe in healing power of "laying on of hands." 	<ul style="list-style-type: none"> • Those who believe in predestination (see illness as "God's will") often respond passively to treatment approaches.
<i>Buddhism</i>				
<ul style="list-style-type: none"> • Alcohol and drug use discouraged. • Some sects are vegetarian. 	<ul style="list-style-type: none"> • No infant baptism • Infant presentation 	<ul style="list-style-type: none"> • Chanting of last rite at bedside immediately following death 	<ul style="list-style-type: none"> • See illness as a result of negative Karma • View cleanliness as very important • Often hesitant to receive treatment (such as surgery) on holy days. 	<ul style="list-style-type: none"> • When a death occurs, contact the priest.

TABLE 15-6
Spiritual Assessment Tool

Dimension	Question
Meaning and purpose	<ul style="list-style-type: none"> • What gives your life meaning? • Do you have a sense of purpose in your life? • How hopeful are you about getting better?
Inner strengths	<ul style="list-style-type: none"> • What brings you peace and joy? • What do you like about yourself? • What are your life goals? • What do you believe in?
Interconnectedness	<ul style="list-style-type: none"> • Who are the important people in your life? • Do you belong to any groups? • Can you ask others for help when you need it? • Do you participate in any religious activities? • Do you believe in God or a higher power?

(Adapted from: Dossey, B. M., Keegan, L., & Guzzetta, G. E. [2000]. *Holistic nursing: A handbook for practice* [3rd ed.]. Gaithersburg, MD: Aspen.)

- Expressed anger toward God (e.g., "It's not fair! Why is God doing this to me?")
- Inner conflict about one's beliefs (e.g., "I'm not even sure what the right thing to do is any more. Things used to be so clear.")
- Questions about the meaning of life, illness, death (e.g., "I wonder what I'm supposed to learn from all this.")
- Crying and/or sighing
- Withdrawn behaviors
- Verbal requests for spiritual assistance (e.g., "Keep me in your prayers.")

Spirituality helps individuals to find meaning in suffering. Receiving a diagnosis of a terminal condition such as cancer or acquired immunodeficiency syndrome (AIDS) often triggers a spiritual crisis.

The North American Nursing Diagnosis Association (NANDA) has established three diagnoses related to spirituality; see Table 15-7.

Planning and Outcome Identification

Planning nursing care is directed at helping clients meet their needs. A study conducted by Moeller (1999) asked clients hospitalized for treatment of psychiatric disorders to describe their experiences related to spirituality. Four themes were identified to describe spiritual

TABLE 15-7
Diagnosis Related to Spiritual Needs

Diagnosis	Definition	Related Factors
Spiritual Distress (Distress of the Human Spirit)	Disruption in the life principle that pervades a person's entire being and that integrates and transcends one's biological and psychosocial nature	<ul style="list-style-type: none"> • Belief and value system challenged (due to moral/ethical implications of treatment, intense suffering) • Separation from religious/cultural ties
Readiness for Enhanced Spiritual Well-Being	The process of an individual's developing/unfolding of mystery through harmonious interconnectedness that springs from inner strengths	Not identified by NANDA
Risk for Spiritual Distress	At risk for an altered sense of harmonious connectedness with all of life and the universe in which dimensions that transcend and empower the self may be disrupted	<p>[NOTE: Listed as "Risk Factors"]</p> <ul style="list-style-type: none"> • Energy-consuming anxiety • Low self-esteem • Illness, mental or physical • Poor relationships • Substance abuse • Loss of loved one • Inability to forgive

(Data from North American Nursing Diagnosis Association. [2001]. *Nursing diagnoses: Definitions & classification: 2001–2002*. Philadelphia: Author.)

needs during hospitalization on a psychiatric unit: comfort, companionship, conversation, and consolation. Table 15-8 describes interventions directed at meeting each need.

Planning the provision of spiritual care is directed toward "helping patient maintain their individuality without conflicting with the dominant culture . . . When you interpret the meaning of spirituality from the patient's perspective . . . your responses may be more therapeutic to your patient's immediate needs" (Sumner, 1998, p. 30).

TABLE 15-8
Meeting Spiritual Needs of Clients

Spiritual Need	Nursing Interventions
Comfort	<ul style="list-style-type: none"> • Convey a sense of caring; communicate a sense of respect.
Companionship	<ul style="list-style-type: none"> • Spend time with client. • Encourage family, significant others, and clergy to visit.
Conversation	<ul style="list-style-type: none"> • Listen actively. • Use concrete terms. • Be genuine rather than authoritative.
Consolation	<ul style="list-style-type: none"> • Be prepared for difficult questions (i.e., "Why me?") • Do not express pity or sympathy.

(Adapted from Moeller, M. D. [1999]. Meeting spiritual needs on an inpatient unit. *Journal of Psychosocial Nursing*, 37(11), 5–10.)

Implementation

Meeting spiritual needs of clients often evokes anxiety in nurses. However, it is imperative that nurses use self-awareness to prevent their own feelings from interfering with the meeting of clients' needs. According to Moeller (1999), many clients "expressed tremendous frustration in their inability to find staff who would just listen to and help them sort out their confusion . . ." (p. 7). The Nursing Checklist provides guidelines for working with clients who need spiritual intervention.

Nurses are the professionals who are there to "just listen" and communicate compassion and support. As Sumner (1998) states:

NURSING CHECKLIST *Providing Spiritual Care*

1. Listen actively. Avoid using clichés, and take the client's concerns seriously.
2. Demonstrate an interested, empathetic response to the client's comments.
3. Respect the client's beliefs. For example, allow the client to pray without interruption.
4. Provide privacy for the client to perform religious practices or rituals. For example, if the client's religious practice involves chanting, find a location where this can be done.
5. Make referrals to clergy when appropriate. Ask the client's permission first to avoid imposing own values on the client.

Often when patients are coping with life-threatening diseases, the most consistent aspect of their experience is contact with a nurse. We're present 24 hours a day, seven days a week, regardless of physical setting. When patients are at their lowest physical, mental level, and when their support systems weaken or fade away, we are there. This presence gives us an opportunity to promote spiritual health and integrity by being open to and accepting . . . spirituality" (p. 30).

Essential nursing interventions directed at spiritual needs include helping clients to find meaning in their

current situation and assisting clients to use their sources of strength.

The instillation of hope helps clients meet their spiritual needs. Hope is necessary for coping with severe stressors, such as illness. Spirituality provides a feeling that one is not alone. Nurses must determine the personal meaning of clients' experiences to help bolster spiritual support. The nurse should determine the client's source of hope, which may include the following.

- Relationships with others
- Positive emotions
- Anticipating the future
- Availability of resources

According to Smith-Stoner and Frost (1999):

No matter what his prognosis, a patient draws on hope for the energy to move forward. Even if no cure is possible, hope helps him plan his last days, act on personal desires, mend fences, and strengthen relationships. (p. 29)

Evaluation

Evaluation focuses on client achievement of expected outcomes or objectives, and on the efficacy of nursing care provided. Estes (2002) identifies the following as indicators that the client's spiritual distress has lessened:

- Acceptance of spiritual support from the source with which the client feels most comfortable
- Decrease in restlessness, insomnia, and crying
- Decrease in statements of worthlessness and hopelessness
- Verbalization of satisfaction with spiritual beliefs and the comfort provided by them

See the accompanying display that lists factors that are useful in evaluating the effectiveness of nursing interventions directed at spiritual needs.

Sexual Dimension

Sexuality is a complex human characteristic that refers not just to genital sex but to all the aspects of being male or female, including feelings, attitudes, beliefs, and behavior. It is an essential part of one's personality. Sexuality is a pervasive aspect of the total self from birth to death and is an important aspect of health for people of all ages. Sexuality includes a person's attitudes toward relationships with people of the same sex, relationships with those of the opposite sex, and about touching and being touched. The ways people dress, talk, and relate to others are indicators of their sexuality.

Sex roles are culturally determined patterns associated with being male and female. These patterns are developed as a result of cultural expectations, customs, norms, habits,

RESEARCH FOCUS

Title of Study

"Predictors of Oncology and Hospice Nurses' Spiritual Care Perspectives and Practices"

Authors

Taylor, E. J., Highfield, M. F., & Amenta, M.

Purpose

(1) To identify factors that predict nurse's spiritual care perspectives and practices. (2) To compare perspectives and practices between nurses in two subspecialties, oncology and hospice nursing.

Methods

The sample included 181 oncology nurses and 638 hospice nurses. The subjects completed the Spiritual Care Perspectives Survey by mail.

Findings

The hospice nurses reported offering spiritual care more often. In those surveyed, hospice nurses had more positive attitudes regarding spiritual caregiving than oncology nurses.

Implications

(1) The most influential factor on spiritual perspectives and practices was the spirituality of the nurse. Nurses must continue to explore how their personal spirituality contributes to their caregiving practices. (2) The adequacy of training for providing spiritual care predicted the frequency of, ability to, and comfort with spiritual caregiving. Thus, training in spiritual care should be included in curricula.

Taylor, E. J., Highfield, M. F., & Amenta, M. (1999). Predictors of oncology and hospice nurses' spiritual care perspectives and practices. *Applied Nursing Research*, 12(1), 30–37.

SPECIAL CONSIDERATIONS

Evaluation of Nursing Interventions to Promote Spiritual Health

The following factors are useful in evaluating the effectiveness of nursing care and the client's spiritual health status:

- A trusting relationship between client and nurse was established.
- The client demonstrated decreased evidence of anxiety and guilt.
- The client was encouraged to engage in spiritual practices that were not detrimental to overall health status.
- The client verbalized satisfaction with his or her own spiritual condition.

(Data from Murray, R. B., & Zentner, J. P. [1997]. *Nursing assessment and health promotion: Strategies through the life span* [6th ed., pp. 108–109]. Norwalk, CT: Appleton & Lange.

and traditions. For example, the differences between the sexes are evident in the ways infants are treated during their first days of life. Infant boys and infant girls are talked to, handled, and, many times, dressed differently. In many cultures, the role of the man is to be strong and protective, whereas the woman is expected to be passive and nurturing. Sex roles change as societal norms change and may be accepted or rejected by individuals.

Development of Sexuality

Physiological sexual development begins with conception. Chromosomes from each parent transport programming information to the embryo. During the first 6 weeks of fetal development, there is no anatomic difference between males and females. At approximately 7 to 8 weeks, if there is a high level of testosterone, testes develop. Ovaries form in fetuses with lower levels of testosterone (Guyton & Hall, 1995).

Human sexual feelings develop throughout the life span. Feelings, attitudes, and behavior related to sexuality are learned in the family of origin and reflect the cultural context. There are no universally accepted sexual values. For example, a sexual practice that is considered normal in one culture may be prohibited in another culture.

Gender Identity

Gender identity is how one views oneself as male or female in relationship to others. It is how the person decides to express sexuality in behaviors with others of the same and opposite sex. This perspective on one's sexuality is not inborn but rather evolves throughout the life span and may vary according to cultural expectations and preferences (Johnson, 1996).

Sexual orientation describes an individual's preference for ways of expressing sexual feelings. Like all human behavior, sexual behavior is complex. Sexual orientation is a dynamic lifelong process of growth. The prevailing sexual

orientation in current Western society is **heterosexuality** (sexual activity between a man and a woman). Approximately 10% of the population engages in **homosexuality** (sexual activity between two members of the same sex) (Johnson, 1996). For another 20% to 40% of the population, the sexual choice could be either male or female (Johnson, 1996). **Bisexuality** is having an equal or almost equal preference for partners of either sex. Another type of sexual orientation is **transsexuality** (the belief that one is psychologically of the sex opposite his or her anatomic gender). Many transsexual individuals will undergo surgery, hormone therapy, and psychotherapy in an attempt to restore their sexual identity and self-concept.

In many cultural groups, homosexuals, bisexuals, and transsexuals are discriminated against due to their alternative lifestyles. Nurses must respect all individuals, regardless of sexual orientation.

Needs

Sexual integrity is an integral part of a person's well-being. Even though there are no universal values about sexuality, individuals do experience some common sexual needs. The accompanying display lists specific needs related to sexuality.

HUMAN NEEDS RELATED TO SEXUALITY

- Tenderness
- Intimacy
- Sensuality
- Attachment
- Caring
- Procreation

Human Sexual Response

The human sexual response is a combination of physiological responses and emotional responses (thoughts and feelings). Masters and Johnson (1966) were the first to describe the physiological phases that occur during the sexual response. These four phases, listed in the accompanying display, are experienced by both men and women.

PHASES OF THE HUMAN SEXUAL RESPONSE

Excitement: Begins with sexual stimulation; characterized by vasocongestion of the genitals (results in vaginal lubrication and penile erection)

Plateau: Characterized by maintenance of sexual arousal and the building of excitement leading to orgasm

Orgasm: A highly pleasurable reflex characterized by muscle spasms and male ejaculation

Resolution: Characterized by a gradual return to the pre-excitement phase

Sexuality and Health

Nurses often encounter clients whose sexuality is threatened. Illness, disability, surgery, medications, and hospitalization may impair a person's sexual integrity.

Chronic illnesses such as diabetes and cardiovascular disease may negatively affect sexuality. Other conditions that may contribute to the development of sexual problems are listed in the accompanying display.

RISK FACTORS FOR SEXUAL DYSFUNCTION

Anemia	Multiple sclerosis
Anxiety	Previous traumatic sexual experience
Cigarette smoking	Prostate surgery
Concern about sexual performance	Renal failure
Depression	Spinal cord injuries
Hormonal imbalances	Substance abuse
Hyperlipidemia	Thyroid abnormalities
Hypertension	Vascular bypass surgery

Medications, especially those used to treat hypertension and depression, can also interfere with normal sexual activity; see the accompanying display. In such cases, the medication should be changed if possible. Also, clients and their sexual partners need to be informed about the cause of the problems. Chronic pain often interferes with clients' sexual functioning; they need to be taught methods for increasing their comfort level (e.g., relaxation techniques). Clients who are hospitalized may experience sexual dysfunction for a variety of reasons. For example, being in unfamiliar surroundings, separation from significant others, and loss of privacy all may interfere with sexual function. Nurses who are sensitive create an atmosphere that communicates consideration.

THINK ABOUT IT

Client's Sexual Activity

You walk into an adult client's room and find her engaged in sexual intercourse with a visitor. You know that the visitor is not the married client's husband. What should you do?

MEDICATIONS ASSOCIATED WITH SEXUAL DYSFUNCTION

Antiarrhythmics (Digoxin)	Estrogens
Anticonvulsants	Lipid-lowering drugs (Statins)
Antihypertensives	Narcotics
Antipsychotics	Tricyclic antidepressants (Clomipramine)
Beta blockers	
Diuretics	

(Data from Sadovsky, R. [1999]. Management of erectile dysfunction. *CNS, 1*[1], 79–83.)

Nursing Process and Sexuality

Sexuality is a significant part of health, whether the client is sexually active or not. Talking and listening to clients promotes intimacy. Some nurses, as well as clients, are embarrassed to talk about sexuality. It is imperative to deal with one's own feelings in order to decrease the client's discomfort. Nurses must not express shock or disapproval regarding a client's sexual practices. It is not necessary to change beliefs and attitudes, but it is necessary to suspend them in order to spare the client any judgment, directly or indirectly. A question as simple as "what sexual concerns do you have?" may be used to introduce the topic of sexuality in a nonthreatening manner.

Assessment

Discussion about sexuality must be sensitive to cultural and religious differences. The sensitive nurse will establish an atmosphere that encourages the client to freely discuss his or her concerns. Some actions that are conducive to such discussion include the following:

- Assure privacy and maintain confidentiality.
- Use simple, direct language.
- Provide explanations in terms understood by the client.
- Allow time for the clients' questions.
- Demonstrate respect by adopting a nonjudgmental attitude.
- Use open-ended questions to elicit more information.

Sexual assessment produces feelings of fear, anxiety, indignity, and loss of control in many people. These feelings may be alleviated by the sensitivity of the nurse throughout the assessment process. Remember that you are assessing a person, not just a body part, and respect the client's wishes regarding privacy.

Nursing Process Highlight

ASSESSMENT

Preparing for the Sexual Assessment

1. Review the client's medical history.
2. Greet the client and explain the assessment techniques that you will be using.
3. Assess the client's anxiety level, and provide reassurance that this is normal.
4. Ensure that the room temperature is warm and comfortable.
5. Use a quiet room that will be free from interruptions; it may be necessary to post a "do not disturb" sign on the door of the client's room or the examination room.
6. Have the client void prior to the examination.

Before beginning the genitalia examination, consider your patient’s cultural background and the beliefs that may affect the examination. For example, some cultures forbid assessment of a female by a male caregiver. The following Nursing Process Highlight describes some guidelines to use in preparing for the sexual assessment.

Diagnosis

The NANDA has established two diagnoses related to sexuality; see Table 15-9.

Planning and Outcome Identification

Nurses cannot provide holistic client care without considering the client as a person with sexual needs. In order to plan accurate delivery of nursing care, it is necessary to ask all clients, regardless of age, about their sexual history. Some nurses do not discuss sexual

concerns with adolescents due to their own values about adolescents, sexual behavior, and engaging in sexual behavior prior to marriage. In such instances, the nurses are counter-therapeutic to clients’ needs. Many nurses reflect the societal belief that elderly clients are asexual. Acting on such a belief is a disservice to the clients.

Planning takes into consideration the age-specific variations regarding the need for information on sexuality; see Table 15-10.

Planning of care also calls for consideration of the client’s history of possible sexual abuse. No client, regardless of age, should be excluded from evaluation for sexual abuse. See the accompanying display for signs of sexual abuse.

Most states have laws mandating nurses to report suspected incidences of abuse. It is important to also know the employing agency’s policies about reporting abuse and/or suspected abusive situations. It is critical that the nurse plan on establishing an environment that communicates a sense of safety to clients who may have experienced sexual abuse or exploitation

“Treatment plans need to be goal-oriented, ideally aimed at satisfying the needs of both the man and his partner. The goal(s) for treatment can be (1) having a better physiologic erection, (2) improving the patient’s self-esteem, and (3) enhancing the patient’s relationship(s)” (Sadovsky & Dunn, 1999, p. 12).

INDICATORS OF SEXUAL ABUSE

- Bruises, lacerations, scars in genital area
- Presence of STDs
- Extreme anxiety or guarding during the physical examination
- Suspiciousness or reluctance in answering questions
- Lack of eye contact

TABLE 15-9
Diagnoses Related to Sexuality

Diagnosis	Definition	Defining Characteristics	Related Factors
Sexual Dysfunction	Change in sexual function that is viewed as unsatisfying, unrewarding, inadequate	<ul style="list-style-type: none"> • Values conflicts • Changed interest in self and others • Inability to achieve desired satisfaction • Verbalization of a sexual problem • Alterations in achieving perceived sex role • Actual and/or perceived limitations as a result of disease and/or treatment 	<ul style="list-style-type: none"> • Lack of knowledge or misinformation • Abusive relationships • Physical abuse • Altered body structure or function • Lack of privacy
Ineffective Sexuality Patterns	Expressions of concern regarding his/her own sexuality	<ul style="list-style-type: none"> • Verbalized difficulties, limitations, or changes in sexual behaviors or activities 	<ul style="list-style-type: none"> • Lack of significant other • Conflict with sexual orientation • Fear of acquiring a sexually transmitted disease • Fear of pregnancy • Ineffective or absent role models • Lack of privacy • Lack of knowledge

(Data from North American Nursing Diagnosis Association. [2001]. *Nursing diagnoses: Definitions & classification: 2001–2002*. Philadelphia: Author.)

TABLE 15-10
Sexual Information: Age-specific Needs

Children	<ul style="list-style-type: none"> • Parenting skills to decrease possibility of child abuse • Children need to learn to differentiate “good” touching and “bad” touching • Teach children how to say “no” when they are uncomfortable with any touch • The importance of reporting any sexual advances to parents, teachers, or other adults
Adolescents	<ul style="list-style-type: none"> • Education about physiological changes (i.e., signs of onset of puberty; growth and development concepts) • Information on psychosocial responses to physiological changes (i.e., body image changes) • Sexual abuse prevention (including date rape) • Safe sex education (contraception, sexually transmitted disease [STD] prevention) • Information on sexual preference/orientation
Young Adults	<ul style="list-style-type: none"> • Safe sex education (contraception, STD prevention) • Establishment/maintenance of intimate relationships • Pregnancy and childbirth • Parenting skills
Middle-aged Adults	<ul style="list-style-type: none"> • Effects of aging on sexuality (e.g., menopause, erectile dysfunction) • STD prevention • Contraception
Older Adults	<ul style="list-style-type: none"> • Effects of aging on sexuality • STD prevention • Ways other than intercourse to express sexuality and to meet intimacy needs • Specific information for older women: (1) If vaginal secretions are decreased, use a water soluble lubricant. (2) Extended foreplay may help in achieving orgasm. (3) Provide a reminder that there is no pregnancy risk. • Specific information for older men: (1) Avoid factors that interfere with circulation (i.e., smoking, alcohol abuse, sedentary lifestyle). (2) Encourage dietary changes to reduce fat and cholesterol. (3) Stress management. (4) Compliance with medications prescribed for diabetes and cardiovascular disorders. (5) Need for a relaxed atmosphere and patience.

Implementation

When addressing sexual concerns of clients, there are two major nursing interventions that must be employed: communication and education.

Communication skills are necessary to assure optimal exchange of essential information regarding sexual concerns. Reminding the client that the information discussed is confidential helps reinforce a trusting relationship. Self-awareness can help improve communication and, therefore, overall effectiveness when working with sexual issues, particularly issues that can be value laden such as STDs. It is helpful for nurses to assess their attitudes toward sexual practices and STDs. Other nursing actions useful in work-

ing with clients with STDs include maintenance of a non-judgmental approach, avoiding imposing own values on the patient, and not talking down to the client.

Education is an integral part of treating clients with sexual problems. The nurse must teach prevention of sexually transmitted disease. It is also important to discuss the effects of aging on the sexual response to allay client's anxiety and to correct any misperceptions. “Safer-sex education is crucial for controlling the spread of HIV and this education is within the realm of nursing practice” (Hajagos, Geiser, Parker, & Tesfa, 1998, p. 37). If test results are positive, the partner needs to be tested and treated to prevent reinfection (Centers for Disease Control and Prevention, 1998). “It is always valuable to include the partner in discussions about sexual activity so that both can learn, understand, and agree to the treatment options” (Sadovsky & Dunn, 1999, p. 13).

Another essential education topic related to sexuality focuses on preventive measures: breast self-examination (BSE) and testicular self-examination (TSE). See Chapter 27 for details on performing BSE and TSE.

THINK ABOUT IT

Patients with Recurrent Sexually Transmitted Diseases

Ask yourself how you feel about patients who come in for treatment of recurrent STDs. Will your personal feelings influence the quality of nursing care you provide? How would you feel if such a patient showed no interest in learning about ways to avoid contracting STDs?

Evaluation

To determine the client's achievement of expected outcomes, the nurse uses observation and communication. Client and/or partner verbalizations help in evaluating

outcome achievement. The nurse observes the client and partner for expressions of intimacy. During the evaluation process, it is important that the nurse remain open-minded and nonjudgmental when working with clients who may have sex alone, with one partner of the opposite gender, with one partner or the same gender, or with several partners of either gender. Personal values can interfere with, or encourage, the client's achievement of expected outcomes and, thus, promote the client's sexual wholeness.

Because sexuality is such an integral part of individuals and their health status, it is addressed throughout the remainder of this text when relevant.

KEY CONCEPTS

- Health is a process through which the person seeks to maintain an equilibrium that promotes stability and comfort and varies depending on context and situation.
- Illness is the inability of an individual's adaptive responses to maintain physical and emotional balance and results in an impairment in functional ability.
- Wellness is the condition in which an individual functions at optimal levels and is a dynamic process that occurs in varying degrees.
- The various theoretical models of health, such as the clinical, health-belief, high-level wellness, social learning theory, the host-agent-environment, and health promotion models, help nurses to understand the relationship between the experience of health and illness and clients' behaviors in response to this process.
- The two major classifications of illness are acute and chronic. Acute illness is usually characterized by rapid onset, short duration, and intense symptoms. Chronic illness is usually characterized by a gradual insidious onset, lifelong duration, and irreversible changes.
- The satisfaction of basic human needs, such as physiological, psychological, sociocultural, intellectual, and spiritual needs, is necessary for every person's survival.
- An impairment in meeting basic needs results in an altered health status.
- A holistic viewpoint helps nurses to recognize the body-mind connection and see the client as a whole person rather than fragmented parts.
- Spirituality is the aspect of a person that seeks a sense of meaning and purpose in life and that also can provide support in times of stress.
- Sexuality affects an individual's relationships with everyone else, male and female. Sexuality evolves throughout a person's life.

- Lifestyle, locus of control, self-efficacy, health care attitudes, and self-concept are examples of variables that influence health-promoting behaviors.
- The three approaches to health maintenance (health promotion, health protection, and disease prevention) are centered on the individual's responsibility in promoting one's own health.
- Nurses play a key role in helping clients to adopt healthy lifestyles and use approaches such as role modeling and formal teaching to motivate client change.
- Nurses must focus their efforts on improving the health status of vulnerable populations.

CRITICAL THINKING ACTIVITIES

1. What are the nursing implications of Maslow's hierarchy of basic needs?
2. Critique one article from your local newspaper about a sociopolitical or economic issue that currently affects the health of the citizens in your community.
3. Select a classmate to interview. Note any relationship between attitudes and physical symptoms. Does your partner feel better physically when mentally relaxed? Vice versa?
4. Interview five people in your community. Ask them how they know when they are healthy. Compare the answers and develop a brief list of determinants of health.
5. Think about motivation and lifestyle changes. What motivates you to engage in healthy behaviors? How can you find incentives to "use" in teaching clients about the need to modify habits that affect health?
6. What do you think are the three most important issues that affect the health of Americans today? List in terms of priority.
7. What health promotion activities or programs are currently available for vulnerable populations in your community?

Cultural Diversity

There is a richness to diversity that is lacking in a homogeneous environment. We need to embrace and cultivate that richness.

—Fralic (1995)

COMPETENCIES

1. Identify the concepts of culture, ethnicity, race, ethnocentrism, and stereotyping.
2. Describe dominant values in the United States.
3. Discuss the impact of culture on health beliefs and health behaviors.
4. Discuss the six organizing phenomena of culture.
5. Recognize the impact of cultural values on utilization of health care services.
6. Describe the process of transcultural nursing.
7. Explain how nurses maintain sensitivity to cultural diversity.
8. Discuss nursing strategies that ensure delivery of culturally sensitive care.

KEY
TERMS

acculturation
cultural assimilation
cultural competence
cultural diversity
culture

dominant culture
ethnicity
ethnocentrism
minority group
oppression

race
racism
stereotyping
subculture
transcultural nursing

Every aspect of one's life (including attitudes, beliefs, and values) is influenced by one's culture. Behavior, including behavior affecting health, is culturally determined. As the population of the United States continues to diversify, recognition of cultural differences and their impact on health care becomes more critical. Nurses provide health care to culturally diverse client populations in a variety of settings. Knowledge of culturally relevant information is essential for delivery of competent nursing care. This chapter discusses the various concepts related to culture, the importance of diversity in American society, the influence of culture on health, and transcultural nursing.

CONCEPTS OF CULTURE

Each individual is culturally unique. Behavior, self-perception, and judgment of others all depend on one's cultural perspective. This section discusses the concepts of culture, race, ethnicity, and stereotyping and provides an overview of the dominant cultural values in the United States. To provide holistic care, the nurse needs a thorough understanding of the following concepts.

Culture

Culture refers to knowledge, beliefs, behaviors, ideas, attitudes, values, habits, customs, languages, symbols, rituals, ceremonies, and practices that are unique to a particular group of people. This structure of knowledge, behaviors, and values provides a group with a “blueprint” or a general design for living “that guide their worldview and decision-making” (Purnell & Paulanka, 1998, p. 4).

Culture is not static nor is it uniform among all members within cultural groups. Culture represents adaptive dynamic processes learned through life experiences. People have culturally predetermined values and beliefs that may change as new information is gained. There is much diversity among cultural groups. Such differences result from individual perspectives and practices. Consider for example how a family deals with a crisis. A crisis may cause some families to become closer, whereas the same situation may cause another family to withdraw and create distance among its members.

Cultural messages are transmitted in a variety of ways such as through schools and churches. The various media are also powerful transmitters and shapers of culture.

People learn about culture through traditions. When people state “That’s how we’ve always done it,” they are describing cultural traditions. Cultural beliefs, values, customs, and behaviors are transmitted from one generation to another. Grandparents, other elders, and parents teach children cultural expectations and norms through role modeling, demonstration, and discussion (Figure 16-1).

Characteristics of Culture

Differences exist among cultural groups and among individuals within a single culture. Despite these variances, all cultures exhibit the characteristics shown in the accompanying display.

CHARACTERISTICS OF CULTURE

- *Culture is learned and taught.* Cultural knowledge is transmitted from one generation to another. A person is not born with cultural concepts but instead learns them through socialization.
- *Culture is shared.* The sharing of common practices provides a group with part of its cultural identity.
- *Culture is social in nature.* Culture develops in and is communicated by groups of people.
- *Culture is dynamic, adaptive, and ever-changing.* Adaptation allows cultural groups to adjust to meet environmental changes. Cultural change occurs slowly and in response to the needs of the group. This dynamic and adaptable nature allows a culture to survive.

Figure 16-1 Cultural expectations and traditions are shared through formal and informal activities such as meal times.

Ethnicity and Race

Ethnicity is a cultural group's perception of themselves (group identity). This self-perception influences how the group's members are perceived by others. Ethnicity is a sense of belongingness and a common social heritage that is passed from one generation to the next. Members of an ethnic group demonstrate their shared sense of identity in common customs and traits.

Race refers to a grouping of people based on biological similarities. Members of a racial group have similar physical characteristics such as blood group, facial features, and color of skin, hair, and eyes. There is often overlap between racial and ethnic groups because the cultural and biological commonalities support one another (Giger & Davidhizar, 1999). The similarities of people in racial and ethnic groups reinforce a sense of commonality and cohesiveness.

Labeling and Stereotyping

Problems arise when differences across and within cultural groups are misunderstood. Misperception, confusion, and ignorance often accompany people's expectations of others. There are numerous ways in which people are different and, thus, classified by others. See the accompanying display.

WAYS IN WHICH PEOPLE DIFFER

- Age
- Gender
- Educational level
- Language
- Occupation
- Residence (rural, urban, suburban)
- Socioeconomic status
- Religion
- Functional abilities
- Cognitive abilities
- Racial composition
- Nationality
- Family structure and ties

Members of some cultural groups have historically and globally experienced oppression in the forms of racism, sexism, and classism. The basic underlying premise of these biases is that one way is assumed to be better or "right" and every other way is inferior. **Ethnocentrism** is the belief that one's own culture is superior to all others. According to the American Nurses Association (1994):

This belief is common to all cultural groups, all groups regard their own culture as not only the best but also the correct, moral, and only way of life. This

belief is pervasive, often unconscious and is imposed on every aspect of day-to-day interaction and practices including health care. It is this attitude which creates problems between nurses and clients of diverse cultural groups. (p. 3)

Ethnocentrism results in oppression. **Oppression** occurs when the rules, modes, and ideals of one group are imposed on another group. Oppression is based on cultural biases, which stem from values, beliefs, tradition, and cultural expectations. **Racism**, a form of oppression, is defined as discrimination directed toward individuals who are misperceived to be inferior due to biologic differences.

Stereotyping is an expectation that all people within the same racial, ethnic, or cultural group act alike and share the same beliefs and attitudes. Stereotyping results in labeling people according to cultural preconceptions; therefore, an individual's unique identity is often ignored.

Dominant Values in the United States

Cultural differences refer to values, practices, and rituals that vary from those of the dominant culture. The dominant culture of the United States is composed of white middle-class Protestants of European ancestry. A **dominant culture** is the group whose values prevail within a society. The European value orientation has had an important influence on U.S. culture, as illustrated by the following dominant beliefs:

- Achievement and success
- Individualism, independence, and self-reliance
- Activity, work, and ownership
- Efficiency, practicality, and reliance on technology
- Material comfort
- Competition and achievement
- Youth and beauty

Frequently, these dominant values (which may be blatant or subtle) conflict with the values of minority

THINK ABOUT IT

Comparison of Personal Values with Dominant U.S. Values

Consider the dominant U.S. values, and compare them with your personal beliefs. For example, how do you measure success? Are you results oriented? How important are independence and self-reliance to you? Do you value material comfort? If so, what are you willing to do to gain it? How do you feel about elderly people? How do you feel about people who are physically unattractive?

groups. A **minority group** can be composed of an ethnic, racial, or religious group that constitutes less than a numerical majority of the population. Because of their cultural or physical characteristics, such groups are labeled and treated differently from others in the society. Minority groups are usually considered to be less powerful than the dominant group (Giger & Davidhizar, 1999).

People assume the characteristics of the dominant culture through **acculturation** (process of learning norms, beliefs, and behavioral expectations of a group). Acculturation is encouraged through schools and the media. Assimilation is “cultural and structural blending into a dominant entity” (Kavanaugh et al., 1999, p. 10). **Cultural assimilation** occurs when individuals from a minority group are absorbed by the dominant culture and take on the characteristics of the dominant culture.

MULTICULTURALISM IN THE UNITED STATES

“The United States, already one of the most diverse societies in the world, is becoming increasingly multicultural and multilingual” (Lester, 1998, p. 26). The U.S. population is composed of many ethnic/racial subcultures. A **subculture** is a group of people “who have experiences different from those of the dominant culture by virtue of status, ethnic background, residence, religion, education, or other factors that functionally unify the group” (Purnell & Paulanka, 1998, p. 8). It is important to note that, even though a number of these subcultures possess less than their equal shares of money, influence, and prestige, these populations are increasing at a rapid rate. “By the year 2050, white Americans’ share of the total population will decline from 75% to under 50%. In many localities so called minorities are now, in fact, the majority” (American Nurses Association, 1998, p. 5). The numbers of immigrants and refugees entering the United States from non-European countries have added to this multicultural composition within the American universal culture. Native Americans, African-Americans, Asian-Americans, and Hispanic Americans will be the most populous groups in the future. All four of these cultural groups have shown significant growth and are expected to increase. Within the next 50 years, the Asian population is expected to increase to 11%, the Black population to 16%, and the Hispanic population to 21% (Campinha-Bacote, 1999, p. 203).

Value of Diversity

Cultural diversity is the differences among people that result from ethnic, racial, and cultural variables. “Cultural diversity refers to the differences between people based on a shared ideology and value set of beliefs, norms, customs, and meanings evidenced in a way of

life” (American Nurses Association, 1994, p. 2). The United States has a vast potential of human resources, which with divergent viewpoints and behaviors, enriches the sociopolitical climate. New ideas, other viewpoints, increased problem-solving approaches, and increased tolerance are all outcomes of a diverse population. In addition to these advantages, there are also some disadvantages to living and working within such a culturally diverse environment. For example, the amount and types of variances can lead to splitting and ethnocentrism.

Cultural diversity presents special challenges for nurses who must provide care that is congruent with a person’s expectations. Nurses caring for clients who are different from themselves must remember to determine the client’s perception and significance (meaning) of the event (illness). The nurse honors each individual’s differences while understanding that culture influences how clients are viewed and treated within health care settings.

ORGANIZING PHENOMENA OF CULTURE

Cultural factors determine the worth of behaviors, whether behaviors are acceptable, and whether behaviors are incorporated into daily living. When these behavioral concepts are applied to health, they influence the individual’s expectation of health care. Diversity among cultural groups regarding expectations influences health care. The nurse must be sensitive to the client’s cultural context in order to provide care that meets individual needs. Each cultural group has the same basic organizational factors (see the accompanying display). Following is a discussion of the six organizing factors that must be considered when delivering culturally competent care. Table 16-1 presents specific examples of cultural variances in these six phenomena.

ORGANIZING PHENOMENA OF CULTURE

- Communication
- Space
- Orientation to time
- Social organization
- Environmental control
- Biological variations

Communication

Communication is the vehicle for transmitting and preserving culture. To share complete and accurate information, nurses must be aware of the cultural variances related to communication. See Chapter 12 for a complete discussion of communication.

TABLE 16-1
Application of Cultural Phenomena to Nursing Care

Cultural Group	Communication	Space	Time Orientation	Social Organization	Environmental Control	Biological Variations	Nursing Implications
African-Americans	<p><i>Language(s):</i></p> <ul style="list-style-type: none"> English <p><i>Silence:</i></p> <ul style="list-style-type: none"> Head-nodding does not necessarily mean agreement. <p><i>Eye Contact:</i></p> <ul style="list-style-type: none"> Direct eye contact is often viewed as being rude. <p><i>Other:</i></p> <ul style="list-style-type: none"> Nonverbal communication is very important. It is intrusive to ask personal questions of someone one has just met. 	<p><i>Social Distance:</i></p> <ul style="list-style-type: none"> Close, personal space <p><i>Touch:</i></p> <ul style="list-style-type: none"> Touching another's hair is sometimes viewed as offensive. 	<ul style="list-style-type: none"> Present over future Flexible concept of time 	<p><i>Family:</i></p> <ul style="list-style-type: none"> Large, extended family networks are important. <p><i>Gender Roles:</i></p> <ul style="list-style-type: none"> Women serve as both breadwinners and caretakers. <p><i>Religion:</i></p> <ul style="list-style-type: none"> Protestant (Baptist) Strong church affiliation with community <p><i>Other:</i></p> <ul style="list-style-type: none"> Social organizations are strong within communities. 	<p><i>Definition of Health:</i></p> <ul style="list-style-type: none"> Harmony with nature No separation of body, mind, and spirit <p><i>Causative Factors of Illness:</i></p> <ul style="list-style-type: none"> Disharmonious state that may be caused by demons or spirits Can be prevented by nutritious meals, rest, and cleanliness 	<p><i>Dietary Practices/ Preferences:</i></p> <ul style="list-style-type: none"> Foods slow-cooked in added fat Some pregnant African-Americans engage in pica (ingestion of non-food items, such as laundry starch). <p><i>Increased Susceptibility:</i></p> <ul style="list-style-type: none"> Lactose intolerance Keloid formation Sickle cell anemia Hypertension Cancer (especially stomach and esophageal) Coronary heart disease 	<ul style="list-style-type: none"> Encourage involvement of extended family. Know that a folk healer (or herbalist) may be consulted before individual seeks out traditional treatment. Clarify meaning and intent of client's words. Validate the meaning of client's nonverbal behavior. Avoid rigidly scheduling care procedures; be flexible with use of time.
Asian-Americans	<p><i>Language(s):</i></p> <ul style="list-style-type: none"> Chinese (especially Mandarin) Japanese Korean Vietnamese English 	<p><i>Social Distance:</i></p> <ul style="list-style-type: none"> Avoid physical closeness <p><i>Touch:</i></p> <ul style="list-style-type: none"> Usually do not touch others during conversation 	<ul style="list-style-type: none"> Present 	<p><i>Family:</i></p> <ul style="list-style-type: none"> Highly value immediate and extended family Family unit is very structured and hierarchical. 	<p><i>Definition of Health:</i></p> <ul style="list-style-type: none"> A state of physical and spiritual harmony with nature A balance between positive and negative energy forces (yin and yang) 	<p><i>Dietary: Practices/ Preferences:</i></p> <ul style="list-style-type: none"> Soy sauce Raw fish Rice 	<ul style="list-style-type: none"> Expect that a traditional healer will probably be consulted first. Clarify responses to questions. Avoid excessive touch.

Navajos prefer meat and blue cornmeal and tend to avoid consumption of milk. <p><i>Increased Susceptibility:</i></p> <ul style="list-style-type: none"> Tuberculosis Diabetes Heart disease Arthritis American Eskimos are susceptible to glaucoma. Because there are over 400 tribes in North America (including Eskimos and Aleuts), expect diversity according to specific tribe. 	<ul style="list-style-type: none"> Elicit input from extended family members. Actively accommodate extended family visitors in hospital and clinic settings. In the home, modify infection control and hygiene practices according to availability of resources. Closely monitor own use of body language. Encourage client to personalize space in which health care is delivered (e.g., bring personal items, objects to hospital room). Clarify messages. Understand that the client may be attentive even when eye contact is absent.

(Data from Andrews, M. M., & Boyle, J. S. [1998]. *Transcultural concepts in nursing care* (3rd ed.). Philadelphia: Lippincott; Giger, J. N., & Davidhizar, R. E. [1999]. *Transcultural nursing: Assessment and intervention* (3rd ed.). St. Louis: Mosby-Yearbook; Degazon, C. [2000]. Cultural diversity and community health nursing practice. In M. Stanhope, & J. Lancaster, (Eds.), *Community health nursing: Promoting health of aggregates, families, and individuals* (5th ed.). St. Louis: Mosby-Yearbook; Grossman, D. [1996]. *Cultural dimensions in home health nursing. American Journal of Nursing*, 96 (7), 33-36.)

Nurses provide information to clients by using two types of communication: verbal and nonverbal. Verbal communication consists of words, both spoken and written. When cultural variances exist, communication problems may occur. The nurse must validate the meaning of and interpret words to ensure that clients receive the intended message. For example, a communication barrier exists when different languages are spoken by the client and nurse. In such cases, the use of an interpreter facilitates communication. The interpreter can either be a bilingual family member or staff member. Even when both client and nurse speak the same language, communication problems may occur because of varying cultural contexts in which words have different meanings to different people.

NURSING ALERT

Assumptions and Communication

When the nurse assumes that the client understands the intended message and fails to confirm client understanding, cultural blindness can hamper the communication process

Nonverbal communication consists of body language (such as facial expressions, posture, and gestures); the use of silence; and paralinguistic cues (voice tone, pitch, and rate). An example of how nonverbal communication can be culturally misunderstood is the presence or absence of eye contact. For example, in Native American and Asian-American cultures, eye contact is considered intrusive and disrespectful. However, in the dominant U.S. cultural group, eye contact between individuals indicates trustworthiness.

Space

An individual's personal space includes one's body, the surrounding environment, and objects and people within that environment. Culture determines the amount of social distance tolerated by a person. Members of British, German, and American cultures usually require more personal space than do people of Hispanic and French backgrounds (Giger & Davidhizar, 1999).

Nurses must be aware of the client's degree of comfort with closeness since diverse groups have varying norms for the use of touch. Touch may be perceived as invasive by clients from some cultures. Who can touch a person, when a person can be touched, and what forms of touch are appropriate are culturally determined. For example, members of the dominant U.S. culture often greet each other with handshakes while it is commonly accepted in European cultures to greet others with a kiss on the cheek.

Orientation to Time

Time orientation (being focused on the past, the present, or the future) varies according to cultural group. European Americans are future oriented as evidenced by

their development of plans, such as retirement savings. Many Native Americans have a different concept of time in that they tend to live in the present moment (Giger & Davidhizar, 1999). For many Native Americans, watching the clock and timeliness/tardiness have little importance. Time is considered a circular, rather than a linear, process. Most health care providers value quickness and efficiency, which is interpreted by members of the Lakota tribe as insincerity and a lack of interest (Kavanagh et al., 1999). The nurse's nonverbal behavior can be changed to build interpersonal rapport by spending time, sitting down with clients, and demonstrating presence.

NURSING TIP

Time Orientation

In the mainstream American culture, time is a valuable commodity (i.e., "Time is money!"). When caring for clients of diverse cultures, be sensitive to the fact that they may view time differently. Avoid jumping to conclusions that the client who is late for an appointment is lazy or inconsiderate.

Social Organization

Social organization refers to the ways in which groups determine rules of acceptable behavior and roles of individual members. Examples of social organizations include family and other kinship ties, religious groups, and ethnic groups.

Family

General Systems Theory (GST) considers the family to be a system that seeks to maintain balance. From the GST perspective, the family functions as a unit. Thus, if an event affects one family member, all the other members will be affected in one way or another. The various types of family structures are described in the accompanying display. It is vital for the nurse to know who will be involved in making decisions related to health care. Including the family according to their cultural expectations is a hallmark of quality nursing care. Family patterns usually are of one of three types: linear, collateral, or individualist. See Table 16-2 for an explanation of these types of family patterns.

In many cultures, the family assumes greater importance than the individual (Figure 16-2). For example, in most Native American tribes, the extended family is the basic family structure. The extended family is also extremely important in Hispanic American cultural

TYPES OF FAMILY STRUCTURES

- *Nuclear* Parents and children
- *Extended* Parents, children, and other relatives (such as grandparents, cousins)
- *Attenuated* Single parent with children
- *Incipient* Married couple with no children
- *Blended* Married couple and their children from previous unions; may indicate step-parents, step-siblings, half siblings.

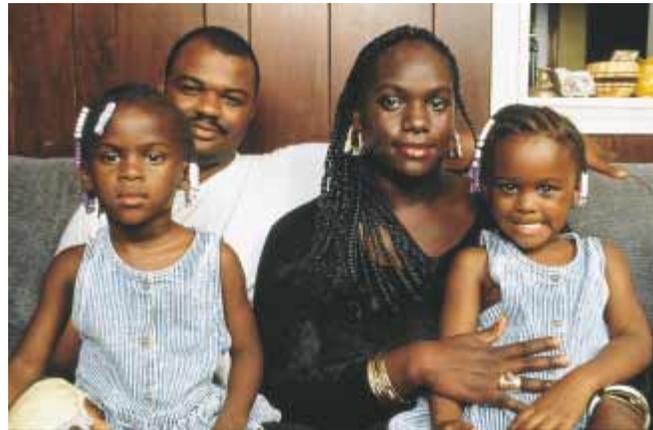

Figure 16-2 Within this family, decisions about health care are made on a very personal level among the parents and children.

groups. In some Hispanic groups, the family may include third and fourth cousins as well as close friends who are not related by ties of kinship.

Pickens (1998) identified the following attributes as necessary for nurses in order to collaborate with families:

- Nonjudgmental attitude (i.e., do not expect all families to be alike and behave similar to one’s own)
- Self-awareness of own preconceptions about family members
- Respect for others’ beliefs and values
- Recognition of families as significant providers of support
- Value the participation of families in caregiving

Gender

Gender roles vary according to cultural context. For example, in families with a patriarchal structure (the man is the head of the household and chief authority fig-

ure), the husband/father is the dominant person. Such expectations are the cultural norm for Latino, Hispanic, and traditional Muslim families. The husband/father is the one who makes decisions regarding health care for all family members. Also, in such cultures, the wife is responsible for child care and household maintenance, whereas the father’s role is to protect and support the family members (Luckmann, 2000).

Lifestyle

In addition to an increased heterogeneity of population groups in the United States, lifestyles are also becoming more diverse. Some examples of alternative lifestyles are homosexual couples, single parent families, and communal groups. Figure 16-3 illustrates a variety of types of families. Nurses must demonstrate respect for clients’

TABLE 16-2
Family Patterns

Kinship Pattern	Explanation	Most Common Cultural Context
Linear	<ul style="list-style-type: none"> • Goals focus on needs of extended and hereditary family. • Patriarchal structure is present. • Enculturation of children is an important function. • Elders are respected. 	<ul style="list-style-type: none"> • Asian • Middle Eastern • Upper-class Euro-American
Collateral	<ul style="list-style-type: none"> • Individual member’s goals are less important than those of the family. • Nuclear family is present. • Men are “head of household,” yet women contribute to decision making (especially about childcare). • Children are highly valued. • Socialization revolves around family groups 	<ul style="list-style-type: none"> • Hispanic • Native American
Individualist	<ul style="list-style-type: none"> • Individual’s goals take precedence over that of family. • Emphasis is on individual accountability and self-responsibility. • There is less respect for authority figures. • Elders are not as honored. • Family responsibilities are shared between men and women. 	<ul style="list-style-type: none"> • Middle-class Euro-American • Single-parent family • Gay family

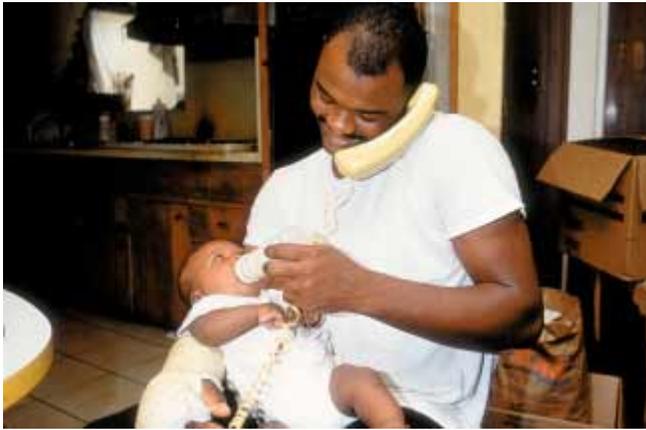

Figure 16-3 There are diverse family structures and types, as shown in these photographs.

lifestyles even when they differ from those of the nurse. Some specific ways in which nurses can respect clients with differing lifestyles are:

- Be aware of own tendency to be ethnocentric.
- Be sensitive to client's needs, especially those expressed nonverbally.
- Use self-awareness to determine the impact of own beliefs and values.

Often the nurse and client are of different cultural backgrounds; see Figure 16-4. The nurse must be culturally

Figure 16-4 Providing culturally sensitive care depends on establishment of a therapeutic nurse–client relationship.

sensitive in order to promote the development of a therapeutic nurse–client relationship.

Religion

Religious beliefs influence a person's response to major life events such as birth, illness, and death. Religious practices are often a source of comfort during stressful life events and provide support during the healing process. Table 15-5 presents an overview of the practices of selected major world religions that relate to issues such as diet, birth, death, and health care. Crises such as illness and treatment modalities are often the catalyst for increased spiritual needs; see Figure 16-5.

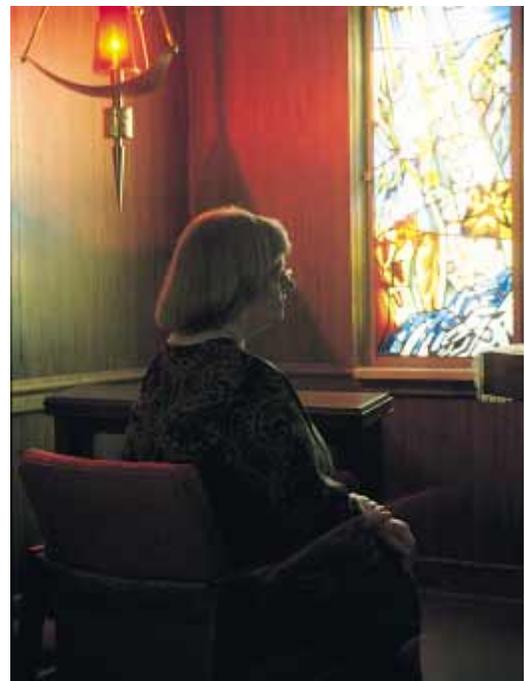

Figure 16-5 Spiritual needs often become more important during times of stress such as illness.

CULTURAL DISPARITIES IN HEALTH AND HEALTH CARE DELIVERY

“Researchers suggest that cultural insensitivity can create more than mere discomfort. It can create real barriers to accessing health care” (Lester, 1998, p. 28). Language and other cultural differences often present barriers to necessary health care including:

- Appointment procedures
- Transportation
- Directions written in an unfamiliar language.

There are disparities in the health of Americans. According to the ANA (1998), minorities experience some diseases at a much higher rate than white Americans. The following examples are listed in the ANA’s *Position Statement on Discrimination and Racism in Health Care* (1998):

- Cancer is the leading cause of death for Chinese and Vietnamese individuals.
- Vietnamese women suffer from cervical cancer at nearly five times the rate of white American women.
- Compared with the general population, Hispanics have a higher incidence of cancer of the stomach, esophagus, pancreas, and cervix.
- African-Americans have a life expectancy that is six years shorter than the life expectancy for white Americans.
- The Native American population has significant rates of diabetes, sudden infant death syndrome, and congenital malformations.

“Overall Native American and Alaskan Native rates of diabetes, tuberculosis, fetal alcohol syndrome, alcohol-related morbidity and mortality, and suicide significantly exceed those of other racial and ethnic groups in the United States” (Kavanagh et al., 1999, p. 10). One of the major objectives established by the U.S. Office of Public Health in its *Healthy People 2010 Objectives* is the elimination of disparities in health status by providing equitable services for people of all groups (Chrvala & Bulger, 1999).

Vulnerable Populations

As a result of societal changes, more people are at risk for health problems. Groups that are especially susceptible for health-related problems include the poor, the homeless, migrant workers, abused individuals, the elderly, pregnant adolescents, and people with sexually transmitted diseases such as acquired immunodeficiency syndrome (AIDS).

The United States is currently facing many economic, social, and political challenges related to the delivery of health care services to vulnerable population groups

(Edelman & Mandle, 1997). As a result, many vulnerable populations are underserved because of the high demand for services, lack of services, and limited availability and access to services.

The Poor

Poverty affects health status and accessibility to health care services. According to the Centers for Disease Control and Prevention (CDC) (1998), “increase in either income or education increases the likelihood of good health status. This relationship between socioeconomic status and health was observed for persons in every race and ethnic group examined” (p. 52). Living in poverty means being unable to meet the financial demands of basic living expenses, such as food, shelter, and clothing. Socioeconomic status is determined by family income, educational level, and occupation. “Childhood poverty has long-lasting negative effects on one’s health. Children in low-income families fare less well than children in more affluent families. In 1999, 17% of American children lived in poverty” (U.S. Bureau of the Census, 2000). In 1999, a family of four with an annual income below \$17,029 was below the Federal poverty threshold. The poor population has more complex health problems including a higher incidence of chronic illness (U.S. Bureau of the Census, 2000).

The CDC (1998) has identified the following as health risk factors that are related to lower income:

- Higher prevalence of cigarette smoking
- Greater incidence of obesity
- Elevated blood pressure
- Sedentary lifestyle
- Less likely to be covered by health insurance
- Less likely to receive preventive health care services

Increasing numbers of federally mandated health care initiatives are being implemented to address the historic racial and class disparities in health care. Entitlement programs imply that the government is legally mandated to provide services to the programs’ eligible populations. Entitlement programs such as Medicare, Medicaid, and Women, Infants, and Children (WIC) were developed, in part, because of social and political pressures. WIC, a special supplemental food program for women, infants, and children, is a U.S. Public Health sponsored program that targets low-income pregnant and breastfeeding mothers and their children age 5 years or younger. WIC links health care services, food supplements, and health education into a combined service package for eligible members. Medicaid is a program designed to provide access to health care for medically needy infants, children, and adults. Medicare is an entitlement program that finances health care services for individuals over the age of 65.

Poverty interferes with a child’s ability to be housed, clothed, and fed adequately and can deprive the child

of a safe (physical and psychological) environment. Children with access to health care have the possibility of getting necessary health care services. Children with health insurance (public or private) are much more likely than children without insurance to have a regular and accessible source of health care (U.S. Bureau of the Census, 2000). “There are many reasons why a child’s parent(s) are uninsured . . . related to employment, limited health care benefits, and recent immigration” (Scott, 2000, p. 26).

THINK ABOUT IT

Socioeconomic Status and Health Care

Think about the following questions regarding poverty and health:

1. When you see a child who is hungry, what do you feel?
2. When an adult approaches you on the street asking for money, what do you do?
3. What do you think causes a person to be economically impoverished? Is poverty a result of socioeconomic political conditions, the individual’s lack of initiative, or other factors?
4. How do you feel about a person who cannot afford adequate health care services?

The Homeless

Even though it is difficult to determine the exact number of homeless people, it is estimated that 350,000 to 6 million people are homeless in the United States (Walker, 1998, p. 27). Societal factors that contribute to homelessness are:

- Lack of affordable housing
- Increasingly stringent criteria for public assistance
- Decreased availability of social services
- Inadequate or lack of employment
- A history of psychosocial trauma
- Deinstitutionalization of clients from mental health facilities *without* adequate community support (such as half-way houses and group homes)

THINK ABOUT IT

Is Basic Shelter a Guarantee?

Every person in this country has a basic right to shelter. Do you agree or disagree with this statement? Consider the ethical ramifications of this statement. In light of the current political and social climate, what do you think the homeless population can expect from government and society?

Approximately 85% of homeless people are on the streets because they have some form of mental illness or are addicted to alcohol or other drugs (Walker, 1998). “We must confront the mistaken notion that hopelessness is a choice . . . It’s important to understand the connection between hopelessness and chronic mental illness, for with understanding can come the sensitivity and compassion necessary to serve this population” (Walker, 1998, p. 27).

Those who are homeless are at greater risk for illness and injuries (Edelman & Mandle, 1997). Hatton (1997) identified the following as major health care needs of homeless women: mental health, sexually transmitted diseases, and substance abuse. Access to basic health care services is limited because the homeless lack health insurance coverage. Those few facilities that do provide services to the homeless are not always accessible due to lack of transportation.

COMMON HEALTH PROBLEMS EXPERIENCED BY THE HOMELESS

Problem	Impact of Homelessness
Diabetes	<ul style="list-style-type: none"> • Lack of regularly scheduled nutritious meals • Inadequate rest • Insufficient exercise
AIDS	<ul style="list-style-type: none"> • Higher rate of sexual assault • Intravenous drug use • Lack of treatment or inadequate follow-up
Respiratory diseases (e.g., tuberculosis, pneumonia)	<ul style="list-style-type: none"> • Crowded living conditions • Inadequate nutrition • Limited or no access to treatment facilities
Cardiovascular diseases	<ul style="list-style-type: none"> • Impaired peripheral circulation as a result of extended time of walking on the streets and/or sleeping in upright, seated position • Food served in many shelters has a high sodium content • Consumption of alcohol and tobacco products
Parasitic infestations	<ul style="list-style-type: none"> • Shared personal items (clothing, bedding, hairbrushes) • Close physical contact (as in shelters) • Lack of facilities for bath, showers • Inability to treat all those in contact with the affected person

Data from Acquaviva, T., & Lancaster, J. (2000). Poverty and homelessness. In M. Stanhope, & J. Lancaster, (Eds.), *Community health nursing: Promoting health of aggregates, families, and individuals* (5th ed.). St. Louis: Mosby-Yearbook.

Children are especially vulnerable to the perils of homelessness. Presently, the federal government does not regularly collect data on the number of homeless children in the United States. However, 1998 statistics (U.S. Bureau of the Census, 2000) show that 36% of U.S. households with children had housing problems, including physically inadequate housing and crowded housing. Adolescents who are homeless are at high risk for physical and mental health problems, including malnutrition, substance abuse, accidental pregnancy, and sexually transmitted disease.

The social and political reforms that are needed to create solutions to homelessness have just begun. There is great *urgency* to meet the immediate needs of the homeless and to provide health care that emphasizes both disease prevention and health promotion.

“Nonprofit nursing centers and clinics try to halt the epidemic of uninsured children” (Scott, 2000, p. 26). Listed below are a few examples of nursing’s efforts in responding to the needs of vulnerable clients:

- Community Volunteers in Medicine is a nonprofit organization in which nurses, doctors, and dentists volunteer their time and services to treat uninsured people of all ages living in Chester County, Pennsylvania.
- Philadelphia-based Regional Nursing Centers Consortium (RNCC) sees approximately 250,000 clients annually. Up to 50% of these clients are uninsured.
- In 1999, LaSalle Neighborhood Nursing Center in Philadelphia identified 300 uninsured children and enrolled them in the Children’s Health Insurance Program (CHIPs) or for medical assistance (Scott, 2000).

Environmental Control

Environmental control refers to the relationships between people and nature and to a person’s perceived ability to control activities of nature, such as factors causing illness.

A person’s belief about the causation of disease will determine the type of treatment (if any) sought. According to Andrews and Boyle (1998), there are three types of health belief systems: magicoreligious, biomedical, and holistic. The magicoreligious belief system is based on the concept that health and illness are determined by supernatural forces (such as a Higher Power or the gods). The biomedical belief system states that illness is a result of an impairment in physical or biochemical processes. The holistic belief system views health as a result of harmony among the elements of nature; conversely, disease is caused by disharmony.

Folk Medicine

Most cultures have preferences about health care, including:

- The type of care that is necessary and appropriate
- When care/treatment should be sought
- The appropriate caregiver

Because the presence of a folk medicine system (also referred to as alternative medicine) can present challenges to nurses caring for clients from diverse cultures, knowledge of basic beliefs about illness, factors contributing to illness, and home remedies is necessary. See Chapter 14 for a complete discussion of complementary/alternative treatment methods.

Folk healers are knowledgeable about cultural norms and are usually familiar to the one seeking care (Edelman & Mandle, 1997). Table 16-3 presents the various healers within different cultures and describes common folk healing practices within these cultures. Nurses must be able to relate care and treatment to the client’s cultural context to incorporate informal caregivers, healers, and other members of the clients’ support system as allies in treatment. “The patient-centered orientation of nursing makes it imperative that nurses be able to respond to the unique cultural needs of different people. Nurses are challenged to provide effective caring and curing in varied cultural contexts” (Lester, 1998, p. 26).

Biologic Variations

Biologic variations that distinguish one cultural group from another include enzymatic differences and susceptibility to disease (Andrews & Boyle, 1998; Giger & Davidhizar, 1999). Enzymatic differences account for diverse responses of some groups to dietary therapy and drugs (Table 16-4). Nutritional variations include food preferences that may contribute to health problems (Table 16-5).

TRANSCULTURAL NURSING

The American Nurses Association (1994) states that culture is a central concept of nursing. Acknowledgment and acceptance of cultural differences and understanding of culturally specific responses to illness are prerequisites for providing safe and effective care.

The conceptual framework for understanding cultural diversity and providing culturally competent care is based on Leininger’s transcultural nursing theory. **Transcultural nursing**, according to Leininger (1978), focuses on the study and analysis of different cultures and subcultures with respect to cultural care, health beliefs and health practices, with the goal of providing health care within the context of the client’s culture.

A basic assumption of transcultural nursing is that when health care providers see problems from the client’s cultural viewpoint, they are more open to understanding, appreciating, and working effectively with

TABLE 16-3
Folk Medicine: Healers and Practices

Cultural Group	Traditional Healers	Healing Practices
<i>African-American</i>	<ul style="list-style-type: none"> • Elderly women healers • “Community Mother” or “Granny” • “Root doctor” • Voodoo healer (“Mambo” or “oungan”) • Spiritualist 	<ul style="list-style-type: none"> • Herbs, roots • Poultices • Oils • Religious healing through rituals, (e.g., laying on of hands) • Talismans are worn around the wrist or neck, or carried in a pouch to ward off disease
<i>Asian-American</i>	<ul style="list-style-type: none"> • Herbalist • Physician 	<ul style="list-style-type: none"> • Use of hot and cold foods • Herbs (e.g., ginseng root which is used as a restorative potion) • Soups • Cupping, pinching, and rubbing • Meditation • Acupuncture (puncturing the skin at specified areas with metal needles) • Acupressure (applying pressure with the fingertips to specified areas of the body) • Application of tiger balm (a salve) to relieve muscular pains • Energy to restore balance between yin and yang
<i>European American</i>	<ul style="list-style-type: none"> • Nurse • Physician 	<ul style="list-style-type: none"> • Exercise • Medication (prescribed and over-the-counter) • Modified diets • Amulets • Religious healing rituals
<i>Hispanic American</i>	<ul style="list-style-type: none"> • <i>Curandero</i> • <i>Espiritualista</i> • <i>Yerbero</i> (herbalist) • <i>Brujo</i> (healer who uses witchcraft) • <i>Sobadora</i> • <i>Santiguadora</i> 	<ul style="list-style-type: none"> • Hot and cold foods to treat some conditions • Herbal teas, such as <i>Manzanilla</i>, used to treat gastrointestinal problems, insomnia, and menstrual cramps • Prayers and religious medals • Massage • <i>Azabache</i>, a black stone worn as a necklace or bracelet to ward off the “evil eye” • Some Haitian mothers practice the “three baths” ritual: they bathe for the first 3 postpartum days in water boiled with special leaves

these clients (Figure 16-6). Other assumptions of transcultural nursing theory are:

- Every culture has some kind of system for health care that is based on values and behaviors.
- Cultures have certain methods for providing health care. These methods of care are often unknown to nurses from other cultures (Leininger, 1978).

THINK ABOUT IT

Transcultural Nursing

In 1978, Dr. Madeleine Leininger, the originator of the concept of transcultural nursing, stated that nursing is caring, and the core of transcultural nursing is caring for people from diverse cultural contexts. What is your immediate response when reading this statement? Do you think this statement is as applicable today as when Leininger first made it?

Due to rapid globalization, every nurse must have an understanding of human conditions in diverse societies. Nurses do not need to travel to foreign countries to engage in international nursing. Nurses encounter cultural diversity everywhere—from inner city hospitals to suburban clinics, from technologically sophisticated institutions to homes in rural, inner city, and suburban areas.

Cultural Competence

Community, social and kinship ties, religion, language, food, and cultural perceptions of illness are all areas that need to be considered by the nurse when working with culturally diverse clients. Cultural diversity chal-

Figure 16-6 The relationship between this nurse and client is based on a mutual acceptance of each other's cultural viewpoints. In your interactions with clients, what factors or cultural phenomena would you explore to ensure acknowledgment of the client's cultural beliefs and values?

lenges nurses to bridge cultural gaps with clients by providing culturally relevant care. An understanding of the client's cultural context permits nurses to become familiar with the client as a person instead of focusing only on the illness or problem.

Cultural competence is the process through which the nurse provides care that is appropriate to the client's cultural context. Culturally competent nurses are those who demonstrate knowledge and understanding of the client's culture; accept and respect cultural differences; and adapt care to be congruent with the client's culture (Purnell & Paulanka, 1998). Culturally competent nurses have knowledge about cultural values related to health and illness. Also, nurses who provide care in a culturally sensitive manner are flexible in their approaches and thinking. Campinha-Bacote (1999) defines five elements of cultural competence; see Table 16-6 for an explanation of each element.

CULTURAL COMPETENCE AND NURSING PROCESS

Cultural sensitivity is requisite in every phase of the nursing process. The nurse's role in providing culturally competent care includes performing a cultural assessment, formulating nursing diagnoses, identifying expected client outcomes, planning care to assist clients in achieving the expected outcomes, intervening to address the client's nursing diagnoses, and evaluating the plan of care. In its *Guide to Nurses for Providing Culturally Sensitive Care*, the College of Nurses of Ontario (1991) identifies four elements of providing culturally sensitive care:

TABLE 16-6
Elements of Cultural Competence

Element	Definition
Cultural Awareness	A cognitive process in which the nurse becomes aware of and sensitive to the client's cultural values, beliefs, and practices
Cultural Knowledge	The nurse seeks a sound educational base about different cultures.
Cultural Skill	The nurse's ability to perform a culturally specific assessment (i.e., physical and psychosocial)
Cultural Encounters	The nurse interacts with clients from diverse cultural backgrounds.
Cultural Desire	The nurse's motivation ("want to") to become culturally competent

(Data from Campinha-Bacote, J. [1999]. A model and instrument for addressing cultural competence in health care. *Journal of Nursing Education*, 38[5], 204–205.)

RESEARCH FOCUS

Title of Study

“Preparing Culturally Competent Practitioners”

Authors

St. Clair, A., & McKenry, L.

Purpose

To evaluate whether international student nursing clinical experiences could change student’s ethnocentricism, cultural sensitivity, and cultural self-efficacy.

Methods

This exploratory study examined the relationship among cultural immersion, cultural self-efficacy, and cultural competence by using a triangulated research design. The study involved 10 different groups of students who volunteered to participate in international nursing experiences. The study was conducted during a 2-year time frame.

Findings

Quantitative analysis found statistically significant differences in the achievement of cultural self-efficacy for the students who completed international nursing clinical experiences as compared to the students who remained in the United States.

Implications

Short-term clinical cultural immersion experiences help move nursing students toward a greater understanding and achievement of cultural competence.

St. Clair, A., & McKenry, L. (1999). Preparing culturally competent practitioners. *Journal of Nursing Education*, 39(5), 228–234.

THINK ABOUT IT

Cultural Assessment

With every client, take time, listen carefully, and convey warmth, openness, and honesty when collecting information.

self-reflection, facilitating client choice, gaining cultural knowledge, and effective communication. These four elements permeate the nursing process.

Assessment

Caring for a client from a different culture can be challenging to the nurse. Using the client’s strengths and

respecting the client’s values are essential components of effective nursing care. To begin providing culturally competent care, the nurse should use questions to gather information about the client’s cultural background. The factors pertinent to cultural assessment are listed in the accompanying display.

CULTURAL ASSESSMENT FACTORS

- Client’s ethnic heritage
- Family role and function
- Religious practices
- Food preferences
- Native language
- Social networks
- Educational experiences (formal and informal)
- Health care beliefs
- Family patterns of health care

The questions in the Cultural Assessment Interview Guide, shown in Figure 16-7, can either be incorporated into a general nursing assessment tool or used separately as a cultural assessment tool.

Nursing Diagnosis

Diagnoses approved by the North American Nursing Diagnosis Association (NANDA, 2001) are used extensively by nurses. However, one stated disadvantage to NANDA diagnostic statements is that sometimes the diagnoses are worded in ways that result in cultural bias (Luckmann, 2000). The accompanying display lists some diagnoses that may be culturally biased.

NURSING DIAGNOSES THAT MAY BE CULTURALLY BIASED

- Noncompliance
- Impaired verbal communication
- Impaired social interaction
- Deficient knowledge
- Disturbed thought processes
- Powerlessness

Consider the following examples of ways in which these diagnoses may be used in a culturally inappropriate manner:

- Applying the diagnosis *impaired verbal communication* to clients who speak a language different from the nurse
- Using the diagnosis *noncompliance* with a client who rejects a prescribed treatment method in order to adhere to their culturally sanctioned folk healing methods

Cultural Assessment Interview Guide

Name: _____

Nickname or other names or special meaning attributed to your name: _____

Primary language:

When speaking _____

When writing _____

Date of birth: _____

Place of birth: _____

Educational level or specialized training: _____

To which ethnic group do you belong? _____

To what extent do you identify with your cultural group? _____

Who is the spokesperson for your family? _____

Describe some of the customs or beliefs that you have about the following:

Health _____

Life _____

Illness _____

Death _____

How do you learn information best?

Reading

Having someone explain verbally

Having someone demonstrate

Describe some of your family's dietary habits and your personal food preferences. _____

Are there any foods forbidden from your diet for religious or cultural reasons? _____

Describe your religious affiliation. _____

What role do your religious beliefs and practices play in your life during times of good health and bad health? _____

Whom do you rely on for health care services or healing and what type of cultural health practices have you been exposed to? _____

Are there any sanctions or restrictions in your culture that the person taking care of you should know? _____

Describe your current living arrangements. _____

How do members of your family communicate with each other? _____

Describe your strengths. _____

Who /what is your primary source of information about your health? _____

Is there anything else that is important about your cultural beliefs that you want to tell me? _____

Figure 16-7 Cultural Assessment Interview Guide

It may be more appropriate to use another term instead of *noncompliant*. Ward-Collins (1998) suggests “nonadherent” by stating that this term may present less of a stigma to clients than “noncompliant.”

Planning and Outcome Identification

Cultural groups are not homogeneous; there are individual variations in personality, behavior, and expectations. It is important not to consider one member of a particular group to be like all the others of that same group.

In order to develop effective plans of care, nurses need to understand the following (American Nurses Association, 1994):

- Cultural groups’ perspectives on life processes (e.g., birth, death)
- Cultural definitions of health and illness
- How cultural groups maintain wellness
- Culture’s perspectives on the causes of illness
- Use of healers in the cure and care of illness
- The influence of the nurse’s cultural background on the delivery of care

It is also necessary to consider how the client’s beliefs may impact the plan of care. Cultural beliefs greatly influence perceptions about health and, therefore, may create barriers to adhering to prescribed treatment plans. Culture influences the following:

- Perceptions of illness versus health
- Responses to illness
- Perceptions about the significance of symptoms
- The types of treatment approaches (i.e., alternative and/or conventional) (Muscari, 1998, p. 27).

Implementation

Caring for culturally diverse clients requires three major nursing interventions: self-awareness, use of a nonjudgmental approach, and client education. Each of these aspects are discussed in the following section. The accompanying display provides guidelines for providing culturally sensitive care for clients at home.

PROVIDING CULTURALLY SENSITIVE NURSING CARE IN THE HOME

- Remember that the setting for care is controlled by the client and family, not by the health care provider.
- The nurse is often viewed as a guest by the client and family. Social chatter may be necessary to facilitate rapport.
- The nurse must be nonjudgmental about the condition of the home (e.g., presence of clutter and disarray).
- Show respect and consideration for the client. For example:
 - Ask permission to use sink or bathroom to wash your hands.
 - Wipe your feet before entering the home.
 - Ask permission before moving client’s belongings and replace items after you have finished the task.
- Take advantage of the home environment to assess cultural values and norms. Cultural clues may include:
 - Orderliness and decor of the home
 - Assignment of family roles and tasks
 - Types of interactions among family members
 - Value placed on privacy
 - Value placed on possessions

Self-Awareness

In an increasingly diverse society, the nurse must be aware of the potential for bias or misunderstanding. Self-awareness can be used to help nurses recognize their own stereotypes, biases, and prejudgments about clients who are culturally different. Further experience, introspection, and study empower nurses to appreciate their own cultures and the strengths of other cultures.

Nonjudgmental Approach

A nonjudgmental attitude is essential in the provision of culturally sensitive care. When caring in a manner sensitive to the client’s cultural background, the nurse enables the client to offer open, honest feedback, to disagree, or to discuss real or perceived problems. A health care partnership is the outcome of this approach. “A key component of successful interactions with culturally diverse patients is to avoid using stereotypical, judgmental words” (Ward-Collins, 1998, p. 30).

Client Education

Educating clients is an integral part of nursing practice. Education must be relevant not only to the client’s needs but also must be provided in a culturally sensitive manner. Lester (1998) states “you need to present the

**CLIENT TEACHING CHECKLIST***Culturally Sensitive Teaching Guidelines*

When caring for clients from diverse cultures, the nurse should consider the following guidelines for client teaching.

1. Assess and incorporate family history of health care:
 - Fluency in English
 - Extent of family support or disintegration of family
 - Community resources
 - Level of education
 - Change of social status as a result of coming to this country
2. Affirm client strengths and potential for growth.
3. Recognize informal caregivers (family members and significant others) as an integral part of treatment.
4. Evaluate the client's current knowledge base by asking the client to state what he or she knows about the specific topic.
5. To ascertain the client's perception of need, ask the client/family what they need/want to learn.
6. Observe the interaction between the client and family to determine family roles and authority figures. Include the dominant family member in your teaching.
7. Use language easily understood by the client.
8. Clarify your verbal and nonverbal messages with the client.
9. Have the client repeat the information taught. If feasible, have the client do a return demonstration of material taught.

information in a way that the patient grabs onto what is important to her. We need to learn how to present teaching so that people can hear it. If people can't hear it, then we will not succeed in what we are trying to teach" (p. 29). See the Client Teaching Checklist for culturally sensitive teaching guidelines.

Evaluation

The final phase of the nursing process, evaluation, is extremely important in determining the client's achievement of expected outcomes and the efficacy of nursing interventions in delivery of culturally sensitive care.

Provision of culturally competent care requires that the nurse view the client as a partner of the health care

team. It is important to demonstrate caring behaviors rather than just tolerating cultural variations in client's behavior. Awareness of cultural similarities and variations allow nurses to accept and appreciate the impact of culture on health care.

KEY CONCEPTS

- Every aspect of a person's life is influenced by one's culture.
- Behavior affecting health is culturally determined.
- Culture is a dynamic structure of behaviors, ideas, attitudes, values, habits, beliefs, customs, languages, rituals, ceremonies, and practices that are unique to a particular group of people. This structure of knowledge, behaviors, and values provides a group with a "blueprint" for behavior.
- Cultural norms are transmitted from one generation to another.
- Ethnicity is described as a sense of belongingness that is shared by other members of that same group. Ethnic groups are usually composed of people with the same racial composition.
- Race refers to a grouping of people based on biologic similarities. Members of a racial group have similar physical characteristics, such as blood type, facial features, and color of skin, hair, and eyes.
- Members of some racial and ethnic groups have experienced oppression in the forms of racism, sexism, and classism.
- The dominant values of the United States include achievement and success; individualism, independence, and self-reliance; activity, work, and ownership; efficiency, practicality, and reliance on technology; material comfort; competition and achievement; and youth and beauty.
- There is great value in cultural diversity, including a broader perspective of others, enhanced problem-solving ability and creativity, and improved productivity in the workplace.
- The six organizing phenomena of culture are communication, space, orientation to time, social organization, environmental control, and biologic variations.
- Transcultural nursing is based on the belief that when nurses view problems from the client's cultural viewpoint, they are more open to understanding and working more effectively with clients from other cultures.
- Understanding and accepting cultural differences and responses to illness are prerequisites for providing quality nursing care.
- The provision of culturally sensitive care is achieved through the use of approaches such as non-judgmental attitudes and self-awareness and tools such as cultural assessment guides and client education strategies.

CRITICAL THINKING ACTIVITIES

1. Spend some time with a person from a culture different from your own. Talk with that person about health care beliefs. What did you learn?
2. Identify some positive and negative stereotypes used to describe groups in your community. What are the nursing implications of such assumptions?
3. What health care services are available to the homeless population in your geographic area? Are any services provided by nurses to people in this vulnerable group?
4. To increase your cultural awareness, ask yourself:
 - To what ethnic group, socioeconomic class, and community do I belong? To what extent do I recognize and understand my own racial/ethnic backgrounds?
 - What are the values of my ethnic group(s)?*
 - What do I know about people from ethnic groups different from my own?
 - What are my assumptions and attitudes about people from other racial/ethnic cultures?
5. To determine your values, answer the following:
 - What is the most important book you have read?
 - Why is it significant to you?
 - Which is more important, your health or your appearance? State the approximate amount of time you spend each day attending to your appearance. Approximately how much time do you spend daily on personal health promotion activities?
 - State three qualities of a “good” nurse.

* Sometimes, an individual may be a descendent of a variety of racial/ethnic cultures.

The Life Cycle

The strongest principle of growth lies in human choice.

—George Eliot (in Herrmann, 1990)

COMPETENCIES

1. Discuss the basic principles of growth and development.
2. Identify the factors that influence growth and development.
3. Compare the major developmental theories.
4. Discuss the importance of development as a holistic framework for assessing and promoting health.
5. Identify the critical milestones for each developmental stage.
6. Describe the specific nursing interventions that are relevant to each developmental stage.

KEY
TERMS

accommodation	fixation	phenylketonuria
adaptation	germinal stage	preadolescence
adolescence	growth	prenatal period
anorexia nervosa	infancy	preschool stage
assimilation	intrapsychic theory	puberty
bonding	learning	school-age period
bulimia	maturation	self-concept
critical period	menarche	spirituality
development	middle adulthood	teratogenic substance
developmental tasks	moral maturity	toddler
embryonic stage	neonatal period	young adulthood
fetal alcohol syndrome	obesity	
fetal stage	older adulthood	

From conception to death, individuals are constantly changing. Physical growth, psychological development, emotional maturation, cognitive development, moral development, and spiritual growth occur throughout life. Progression through each developmental stage influences health status. A thorough understanding of developmental concepts is essential for professional quality nursing practice. This chapter discusses the changes occurring in each stage of the life cycle.

FUNDAMENTAL CONCEPTS OF GROWTH AND DEVELOPMENT

Development occurs continuously through the life span. Adults continue to have transition periods during which growth and development occur.

Growth is the quantitative (measurable) changes in physical size of the body and its parts, such as increases in cells, tissues, structures, and systems. Examples of growth are physical changes in height, weight, bone density, and dental structure. Even though growth is not a steady process through the life cycle, growth patterns can be predicted. Variations in growth, such as rapid increases contrasted with slower rates of physical change, occur with each individual. Rapid growth is most common in the prenatal, infant, and adolescent stages. **Development** refers to behavioral changes in functional abilities and skills. Thus, developmental changes are qualitative, that is, not easily measured. **Maturation** is the process of becoming fully grown and developed and involves physiological and behavioral aspects of an individual. Maturation depends on biological growth, functional changes, and **learning** (assimilation of information with a resultant change in behavior). During each developmental stage of the life cycle, certain goals (**developmental tasks**) must be achieved. These developmental tasks set the stage for future learning and adaptation.

The **critical period** is the time of the most rapid growth or development in a particular stage of the life cycle. During these critical periods, an individual is most vulnerable to stressors of any type.

Growth, development, maturation, and learning are interdependent processes. For learning to occur, the individual must be mature enough to grasp the concepts and make required behavioral changes. Cognitive maturation precedes learning. Physical growth is also a prerequisite for many types of learning; for example, a child must have the physical ability to control the anal sphincter before toilet training skills are learned.

Principles of Growth and Development

All persons have individual talents and abilities that contribute to their development as unique entities. *There are no absolute rules in predicting the exact rate of development for an individual.* However, some general principles relate to the growth and development of all humans (Table 17-1).

The sequence of development is predictable even though the emergence of specific skills varies with each person. For example, not all infants roll over at the same age, but most roll over before they crawl.

Factors Influencing Growth and Development

Multiple factors such as heredity, life experiences, health status, and cultural expectations influence a person's growth and development. The interaction of these factors greatly influences how an individual responds to everyday situations; the choices a person makes regarding health behaviors are also greatly determined by these factors.

Heredity

A complex series of processes transmits genetic information from parents to children. The genetic composition of an individual determines physical characteristics

TABLE 17-1
Principles of Growth and Development

Principle	Example/Description
Development occurs in cephalocaudal (head-to-toe) direction.	An infant raises his head before sitting up.
Development occurs in a proximodistal manner.	The infant is able to move his arms before picking up objects with hands and fingers. Functions closer to the midline (proximal) of the body develop before functions farther away from the body's midline (distal).
Development occurs in an orderly manner from simple to complex and from the general to the specific.	An infant crawls before walking. A child holds a crayon with the entire hand before being able to grasp it between thumb and finger. Gross motor control is achieved before fine motor coordination.
The pattern of growth and development is continuous, orderly, and predictable. However, growth and development do not proceed at a consistent rate.	Periods of rapid growth (similar to growth spurts of adolescence) alternate with periods of slower growth (as seen in middle adulthood).
All individuals go through the same developmental processes.	Individual differences occur but the process is consistent.
Every person proceeds through stages of growth and development at an individual rate.	A child who grows more slowly may be shorter than other children of the same age.
Every stage of development has specific characteristics.	An infant is dependent on others for physical and emotional survival. Adolescence is characterized by a search for identity.
Each stage of development has certain tasks to be achieved or acquired during that specific time. Tasks of one developmental stage become the foundation for tasks in subsequent stages.	An infant must master the psychological task of developing trust in order to mature as an adolescent who can establish a separate identity.
Some stages of growth and development are more critical than others.	The first trimester of pregnancy is a critical time for fetal development. During this critical phase, the developing human is most vulnerable to damage from toxins (e.g., drugs, chemicals, viruses).

THINK ABOUT IT

Nature or Nurture?

What determines a person's behavior—heredity or environment? This “nature versus nurture” issue remains a controversy today. What do you think is most important in determining a person's behavior: an individual's genetic predisposition or the response of other people and socialization? This question has no simple answers. As you continue to develop in your professional role, keep an open mind regarding the factors influencing behavior.

such as skin color, hair texture, facial features, body structure, as well as a predisposition to certain diseases (i.e., Tay-Sachs, sickle cell anemia). Heredity is a genetic blueprint from which an individual grows and develops; it determines to a great extent the rate of physical and mental development.

Life Experiences

A person's experiences can also influence the rate of growth and development. For example, contrast the differences in physical growth rates between a child whose family can afford food, shelter, and health care and a child whose family has little, if any, resources. The child who is poor has a higher risk of experiencing physical and mental lags in growth and development.

Another example of the influence of life experiences, is an elderly person who is enjoying retirement, has an adequate income, and an active support system. If this individual had an impairment in any of these variables, psychological development would likely be affected in a negative way.

Health Status

Individuals experiencing wellness are progressing normally along the life cycle. However, illness or disability

can interfere with the achievement of developmental milestones. Individuals with chronic conditions will often meet developmental milestones but with a time delay.

Cultural Expectations

Society expects people to master certain skills in each developmental period. The age at which an individual masters a particular task is determined in part by culture. For example, the time for mastery of toilet training is greatly influenced by cultural norms.

The following are examples of how societal expectations can either promote or hinder one's growth and development:

- A child who grows up in an economically deprived home may receive inadequate food, shelter, emotional nurturing, or intellectual stimulation with resultant impairments in physical, psychosocial, and cognitive development.
- A woman may not be expected to fully use her intellectual abilities, thus she has altered cognitive development.
- A man may be discouraged from showing tenderness and nurturing behaviors; such discouragement results in dysfunctional psychosocial development.

THINK ABOUT IT

Stereotyping

Consider how people are stereotyped today. Our society labels certain characteristics as “masculine” or “feminine.” How do you think these stereotypes influence the development of young boys and girls in our society?

THEORETICAL PERSPECTIVES OF HUMAN DEVELOPMENT

Nurses must have a thorough understanding of human growth and development in order to provide individualized care. Remember that chronological age and developmental age are not synonymous. An overview of the major developmental theories is presented below. These theories are discussed more fully in the specific sections about each developmental period.

Physiological Dimension

Physiological growth (physical size and functioning) of an individual is influenced primarily by interaction of genetic predisposition, the central nervous system (CNS), the endocrine system, and maturation. The role of heredity in human development is complex and not

yet fully understood. Genetics is the foundation for achievement of specific tasks. Factors such as the psychosocial environment and health status help individuals live up to their genetic potential.

Psychosocial Dimension

The psychosocial dimension of growth and development consists of subjective feelings and interpersonal relationships. A favorable **self-concept** (view of one's self, including body image, self-esteem, and ideal self) is likely the most important key to a person's success and happiness. Following are characteristics of an individual with a positive self-concept:

- Self-confidence
- Willingness to take risks
- Ability to receive criticism without defensiveness
- Ability to adapt effectively to stressors
- Innovative problem-solving skills

People with a healthy self-concept believe in themselves; as a result, they set goals that can be achieved. The goal achievement reinforces the positive belief about one's self. Figure 17-1 illustrates this positive cycle of self-fulfilling beliefs and actions. See Chapter 19 for a complete discussion about self-concept.

A person with a positive self-concept is likely to engage in health-promoting activities. For example, a person who values self is more likely to change unhealthy habits (such as smoking and sedentary lifestyle) to promote health. There are many different psychosocial theories that explain the development of self-concept. This chapter presents the intrapsychic and interpersonal models of personality development.

Intrapsychic Theory

Intrapsychic theory (also called psychodynamic) focuses on an individual's unconscious processes. Feelings, needs, conflicts, and drives are considered to be motivators of behavior, learning, and development. Sigmund Freud and Erik Erikson are two major intrapsychic theorists.

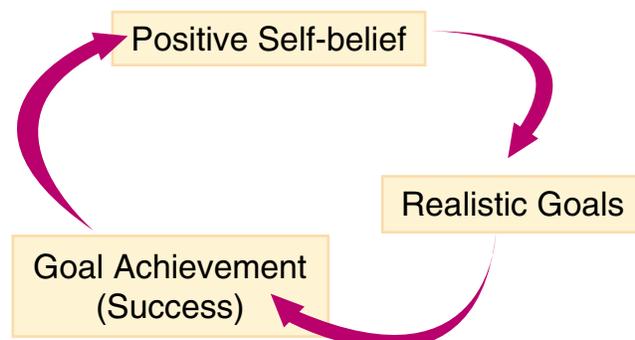

Figure 17-1 Self-Fulfilling Cycle in Positive Self-Concept

Freud's theories, developed in the early 1930s, continue to influence current concepts related to human development. A basic belief of the Freudian model is that *all behavior has some meaning*.

According to Freud (1961), to mature, a person must successfully travel through five stages of development (Table 17-2). In each stage, there is a task to be mastered; if the task is not achieved, the individual is halted (develops a fixation) at this stage. A **fixation** is characterized as either inadequate mastery or failure to achieve a developmental task. A fixation in earlier stages inhibits healthy progression through subsequent stages.

Erikson (1968) expanded Freud's concept of developmental stages by theorizing that psychosocial development is a lifelong process that does not end with the cessation of adolescence. Just as physical growth patterns can be predicted, certain psychosocial tasks must be mastered in each developmental stage. Erikson's model proposes that psychosocial development is a series of conflicts that can have favorable or unfavorable outcomes. These conflicts occur in eight developmental stages of life that are described in Table 17-3.

Havighurst (1972) theorized that there are six developmental stages of life, each with essential tasks to be achieved. Mastery of a task in one developmental stage is essential for mastery of tasks in subsequent stages. When a task in one stage is mastered, it is learned for life, independent of subsequent neurological change (which may occur with disease or injury). Table 17-4 presents Havighurst's developmental stages with the associated tasks.

Levinson (1978) studied men to determine developmental phases of young and middle adulthood. As a result of Levinson's research, five "seasons" or "eras" (phases) were identified (see the accompanying display). The midlife transition, which begins at approximately age 40, includes examining and structuring one's life to one's own satisfaction (Edelman & Mandle, 1997).

Interpersonal Theory

Harry Stack Sullivan theorized that relationships with others influence how one's personality develops. Approval and disapproval from significant others shape the formation of one's personality. To form satisfying relationships with others, an individual must complete six stages of development, which are shown in Table 17-5.

Cognitive Dimension

The cognitive dimension is characterized by the intellectual process of knowing, which includes perception, memory, and judgment, and develops as an individual

LEVINSON'S SEASONS OF ADULTHOOD

Age	Season (Phase)	Characteristics
18–20 years	Early adult transition	Seeks independence by separating from family
21–27 years	Entrance into the adult world	Experiments with different careers and lifestyles
28–32 years	Transition	Makes lifestyle adjustments
33–39 years	Settling down	Experiences greater stability
45–65 years	Pay-off years	Is self-directed and engages in self-evaluation

(Data from Levinson, D. [1978]. *The seasons of a man's life*. New York: Knopf.)

TABLE 17-2
Freud's Stages of Psychosexual Development

Stage	Age	Description
Oral	Birth to 18 months	Management of anxiety by using mouth and tongue
Anal	18 months to 3 years	Control of muscles, especially those controlling urination and defecation
Phallic ("Oedipal")	3–6 years	Awareness of sex and genitalia
Latency	6–12 years	Exhibition of latent sexual development and energy
Genital	12 years to adulthood	Emergence of sexual interests and development of relationships with potential sexual partners

(Data from Freud, S. [1961]. *Civilization and its discontents*. New York: Norton.)

TABLE 17-3
Erikson's Stages of Psychosocial Development

Stage	Age	Task to be Achieved	Implications
Trust vs. Mistrust	Birth to 18 months	Develop a sense of trust in others	Consistent, affectionate care promotes successful mastery. Inadequate, inconsistent care produces an unfavorable outcome at this stage.
Autonomy vs. Shame and doubt	18 months to 3 years	Learn self-control	The child needs support, praise, and encouragement to use newly acquired skills of independence. Shaming or insulting the child will lead to unnecessary dependence.
Initiative vs. Guilt	3–6 years	Initiate spontaneous activities	Give clear explanations for events and encourage creative activities. Threatening punishment or labeling behavior as “bad” leads to development of guilt and fears of doing wrong.
Industry vs. Inferiority	6–12 years	Develop necessary social skills	To build confidence, recognize the child's accomplishments. Unrealistic expectation or excessively harsh criticism leads to a sense of inadequacy.
Identity vs. Role diffusion	12–20 years	Integrate childhood experiences into a personal identity	Help the adolescent make decisions. Encourage active participation in home events. Assist with planning for the future.
Intimacy vs. Isolation	18–25 years	Develop commitments to others and to a life work (career)	Teach the young adult to establish realistic goals. Avoid ridiculing romances or job choices.
Generativity vs. Stagnation	21–45 years	Establish a family and become productive	Provide emotional support. Recognize individual accomplishments and provide appropriate praise.
Integrity vs. Despair	45+ years	View one's life as meaningful and fulfilling	Explore positive aspects of one's life. Review contributions made by the individual.

(Data from Erikson, E. [1968]. *Childhood and society*. New York: Norton; Varcacolis, E. & Rader, I. (1998). *Foundations of mental health psychiatric nursing* (3rd ed.). Philadelphia: Saunders.)

progresses through the life span. Intelligence is an adaptive process. Individuals use intelligence to adapt by changing the environment to meet their needs and by altering their responses to environmental stressors. The ability to change behavior in response to the demands of an ever-changing environment is characteristic of intelligent beings.

Jean Piaget (1963) studied the differences between children's thinking patterns at different ages and how intelligence is used to solve problems and answer questions. He theorized that children learn to think by playing. Four factors are catalysts to intellectual development:

1. Maturation of the endocrine and nervous systems
2. Action-centered experience that leads to discovery (“learning by doing”)

3. Social interaction with opportunities for receiving feedback
4. A self-regulating mechanism that responds to environmental stimuli (Murray & Zentner, 1997)

Piaget and Inhelder (1969) categorized intellectual development into four phases: sensorimotor, preoperational, concrete operations, and formal operations. Table 17-6 provides a description of each phase. Each phase is characterized by the ways in which the child interprets and uses the environment. Approximate ages are indicated for each phase, but there is great variation among individuals.

The individual learns by interacting with the environment through three processes: assimilation, accommoda-

TABLE 17-4
Havighurst's Developmental Stages and Tasks

Developmental Stage	Developmental Task
Infancy and Early Childhood	<ul style="list-style-type: none"> Eat solid foods Walk Talk Control elimination of wastes Relate emotionally to others Distinguish right from wrong through development of a conscience Learn sex differences and sexual modesty Achieve psychological stability Form simple concepts of social and physical reality
Middle Childhood	<ul style="list-style-type: none"> Learn physical skills required for games Build healthy attitudes toward oneself Learn to socialize with peers Learn appropriate masculine or feminine role Gain basic reading, writing, and mathematical skills Develop concepts necessary for everyday living Formulate a conscience based on a value system Achieve personal independence Develop attitudes toward social groups and institutions
Adolescence	<ul style="list-style-type: none"> Establish more mature relationships with same-age individuals of both sexes Achieve a masculine or feminine social role Accept own body Establish emotional independence from parents Achieve assurance of economic independence Prepare for an occupation Prepare for marriage and establishment of a family Acquire skills necessary to fulfill civic responsibilities Develop a set of values that guides behavior
Early Adulthood	<ul style="list-style-type: none"> Select a partner Learn to live with a partner Start a family Manage a home Establish self in a career/occupation Assume civic responsibility Become a part of a social group
Middle Adulthood	<ul style="list-style-type: none"> Fulfill civic and social responsibilities Maintain an economic standard of living Assist adolescent children to become responsible, happy adults Relate to one's partner Adjust to physiological changes Adjust to aging parents
Later Maturity	<ul style="list-style-type: none"> Adjust to physiological changes and alterations in health status Adjust to retirement and altered income Adjust to death of spouse Develop affiliation with one's age group Meet civic and social responsibilities Establish satisfactory living arrangements

(Data from Havighurst, R. J. [1972]. *Developmental tasks and education*. New York: Longman.)

TABLE 17-5
Sullivan's Interpersonal Model of Personality Development

Stage	Age	Description
Infancy	Birth to 18 months	Infant learns to rely on caregivers to meet needs and desires.
Childhood	18 months to 6 years	Child begins learning to delay immediate need for gratification of needs and desires.
Juvenile	6–9 years	Child forms fulfilling peer relationships.
Preadolescence	9–12 years	Child relates successfully to same-sex peers.
Early adolescence	12–14 years	Adolescent learns to be independent and forms relationships with members of opposite sex.
Late adolescence	14–21 years	Person establishes an intimate, long-lasting relationship with someone of the opposite sex.

(Data from Sullivan, H. S. [1953]. *Interpersonal theory of psychiatry*. New York: Norton.)

TABLE 17-6
Piaget's Phases of Cognitive Development

Phase	Age	Description
Sensorimotor	Birth to 2 years	Sensory organs and muscles become more functional.
Stage 1: Use of reflexes	Birth to 1 month	Movements are primarily reflexive.
Stage 2: Primary circular reaction	1–4 months	Perceptions center around one's body. Objects are perceived as extensions of the self.
Stage 3: Secondary circular reaction	4–8 months	Becomes aware of external environment. Initiates acts to change the environment.
Stage 4: Coordination of secondary schemata	8–12 months	Differentiates goals and goal-directed activities.
Stage 5: Tertiary circular reaction	12–18 months	Experiments with methods to reach goals. Develops rituals that become significant.
Stage 6: Invention of new means	18–24 months	Uses mental imagery to understand the environment. Uses fantasy ("make-believe").
Preoperational	2–7 years	Emerging ability to think.
Preconceptual stage	2–4 years	Thinking tends to be egocentric. Exhibits use of symbolism.
Intuitive stage	4–7 years	Unable to break down a whole into separate parts. Able to classify objects according to one trait.
Concrete Operations	7–11 years	Learns to reason about events in the here-and-now.
Formal Operations	11+ years	Able to see relationships and to reason in the abstract.

(Data from Piaget, J. [1963]. *The origins of intelligence in children*. New York: Norton.)

tion, and adaptation. **Assimilation** is the process of taking in new experiences or information. **Accommodation** allows for readjustment of the cognitive structure (mind-set) to take in the new information; thus, understanding is increased. **Adaptation** refers to the changes that occur as a result of assimilation and accommodation (Murray & Zentner, 1997).

Moral Dimension

The moral dimension consists of a person's value system that helps in differentiating right and wrong. **Moral maturity** (the ability to independently decide for oneself what is "right") is closely related to emotional and cognitive development. Lawrence Kohlberg (1977) estab-

lished a framework for understanding how individuals determine a moral code to guide their behavior. Kohlberg's model states that a person's ability to make moral judgments and behave in a morally correct manner develops over a period of time.

There are six stages of moral development. Each stage is built on the previous stage and becomes the foundation for successive stages. Moral development progresses in relationship to cognitive development. Individuals who are able to think at higher levels have the necessary reasoning skills on which to base moral decisions. Table 17-7 provides an overview of Kohlberg's stages of moral development. Kohlberg stated that individuals move through the six stages in a sequential fashion; however, not every-

one reaches stages 5 and 6 in their development of personal morality (Kohlberg, 1977).

Gilligan's theory of moral development is based on research that studied women. Women tend to describe moral issues in the context of human relationships and seek to avoid hurting others (Gilligan, 1982). Women's moral judgment revolves around three basic issues: a concern with survival, a focus on goodness, and an understanding of others' need for care (Gilligan & Attanucci, 1988). Table 17-8 provides an overview of Gilligan's theory.

Spiritual Dimension

The spiritual dimension is characterized by a sense of personal meaning. **Spirituality** refers to relationships with one's self, with others, and with a higher power or divine source. Spirituality does not refer to a specific religious affiliation; rather, it can be defined as the core of a person. Development of spirituality is an ongoing, lifelong process.

Fowler's theory of spiritual development was influenced by the works of Erikson, Piaget, and Kohlberg. Fowler's theory is composed of a pre-stage and six distinct stages of faith development (Fowler, 1981). Even though individuals will vary in the age at which they experience each stage, the sequence of stages remains the same. Table 17-9 describes Fowler's theory.

THINK ABOUT IT

Spiritual Awareness

The term *spirit* is derived from the Latin word meaning breath, air, and wind. Thus, *spirit* refers to whatever gives life to a person. What animates you? What is the core of your spirituality (life force)? The answers to these questions are truly individual. Remember that each client has a personalized definition of spiritual self, even though some clients seem to be unaware of their spiritual nature.

TABLE 17-7
Kohlberg's Stages of Moral Development

Level and Stage	Description
Level I: Preconventional (Birth to 9 years) <i>Stage 1: Punishment and obedience orientation</i> <i>Stage 2: Instrumental-relativist orientation</i>	Authority figures are obeyed. Misbehavior is viewed in terms of damage done. A deed is perceived as "wrong" if one is punished; the activity is "right" if one is not punished. "Right" is defined as that which is acceptable to and approved by the self. When actions satisfy one's needs, they are "right."
Level II: Conventional (9–13 years) <i>Stage 3: Interpersonal concordance</i> <i>Stage 4: Law and order orientation</i>	Cordial interpersonal relationships are maintained. Approval of others is sought through one's actions. Authority is respected. Individual feels "duty bound" to maintain social order. Behavior is "right" when it conforms to the rules.
Level III: Postconventional (13+ years) <i>Stage 5: Social contract orientation</i> <i>Stage 6: Universal ethics orientation</i>	Individual understands the morality of having democratically established laws. It is "wrong" to violate others' rights. The person understands the principles of human rights and personal conscience. Person believes that trust is basis for relationships.

(Data from Kohlberg, L. [1977]. *Recent research in moral development*. New York: Holt, Rinehart, & Winston.)

TABLE 17-8
Gilligan's Theory of Moral Development

Level	Characteristics
I. Orientation of Individual Survival Transition	Concentrates on what is best for self Selfish Dependent on others
Transition 1: From Selfishness to Responsibility	Recognizes connections to others Makes responsible choices in terms of self and others
II. Goodness as Self-Sacrifice	Puts needs of others ahead of own Feels responsible for others Is dependent May use guilt to manipulate others when attempting to “help”
Transition 2: From Goodness to Truth	Decisions based on intentions and consequences, not on others' responses Considers needs of self and others Wants to help others while being responsible to self Increased social participation
III. Morality of Nonviolence	Sees self and others as morally equal Assumes responsibilities for own decisions Basic tenet to hurt no one including self Conflict between selfishness and selflessness Self-judgment is not dependent on others' perceptions but rather on consequences and intentions of actions

(Data from Gilligan, C., & Attanucci, D. [1988]. Two moral orientations: Gender differences and similarities. *Merrill-Palmer Quarterly*, 34 [3], 332–333; Gilligan, C. [1982]. *In a different voice: Psychologic theory and women's development*. Cambridge, MA: Harvard University Press.)

TABLE 17-9
Fowler's Stages of Faith

Stage	Age	Characteristics
Pre-Stage: <i>Undifferentiated faith</i>	Infant	Trust, hope, and love compete with environmental inconsistencies or threats of abandonment
Stage 1: <i>Intuitive-projective faith</i>	Toddler-preschooler	Imitates parental behaviors and attitudes about religion and spirituality Has no real understanding of spiritual concepts
Stage 2: <i>Mythical-literal faith</i>	School-aged child	Accepts existence of a deity Religious and moral beliefs are symbolized by stories Appreciates others' viewpoints Accepts concept of reciprocal fairness
Stage 3: <i>Synthetic-conventional faith</i>	Adolescent	Questions values and religious beliefs in an attempt to form own identity
Stage 4: <i>Individuative-reflective faith</i>	Late adolescent and young adult	Assumes responsibility for own attitudes and beliefs
Stage 5: <i>Conjunctive faith</i>	Adult	Integrates other perspectives about faith into own definition of truth
Stage 6: <i>Universalizing faith</i>	Adult	Makes concepts of love and justice tangible

(Data from Fowler, J. W. [1981]. *Stages of faith: The psychology of human development and the quest for meaning*. New York: Harper & Row; Johnson, B. S. [1996]. *Psychiatric-mental health nursing: Adaptation and growth* [4th ed.]. Philadelphia: Lippincott.)

HOLISTIC FRAMEWORK FOR NURSING

Providing care to the whole person is a basic concept of professional nurses. Knowledge of growth and development concepts are essential for nurses because nursing interventions must be appropriate to each client's developmental stage. Nursing's holistic perspective recognizes the progression of individual development across the life span. Developmental progress, or lack of progress, in one aspect affects all other dimensions of life. Figure 17-2 shows the holistic nature of individuals.

Growth and development theories are useful to nurses as assessment parameters. Alterations in expected patterns are indicators for early intervention. Listed below are situations in which knowledge of developmental milestones is essential for prompt identification of problems and comprehensive intervention:

- The infant who does not sit, crawl, or walk at expected times
- The adolescent girl who has not experienced menarche at the expected time
- The adult who has failed to develop adequate problem-solving skills

STAGES OF THE LIFE CYCLE

For purposes of this discussion, eleven developmental stages are presented: prenatal period, neonate, infant, toddler, preschooler, school-age child, preadolescent, adolescent, young adult, middle adult, and older adult. For each stage, the manifestations of growth and devel-

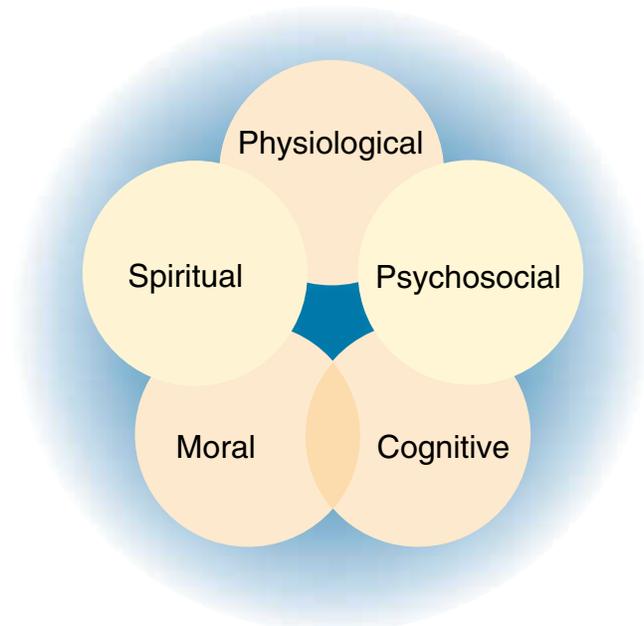

Figure 17-2 Holistic Nature of Human Beings

opment in the physiological, psychosocial, cognitive, moral, and spiritual dimensions are discussed with the relevant nursing implications.

Prenatal Period

The **prenatal period** (the developmental stage beginning with conception and ending with birth) is a critical time in a human being's development and consists of three developmental phases: the germinal, embryonic, and fetal stages. The **germinal stage** begins with conception and lasts approximately 10 to 14 days. This stage is characterized by rapid cell division and implantation of the fertilized egg in the uterine wall. In this very early stage, the CNS is already beginning to form.

The **embryonic stage** (the first 2 to 8 weeks after fertilization of an egg by a sperm) is characterized by rapid cellular differentiation, growth, and development of the body systems. This critical period is when the embryo is most vulnerable to noxious stimuli, which may lead to a spontaneous abortion (miscarriage) (Murray & Zentner, 1997).

The **fetal stage** (the intrauterine developmental period from 8 weeks to birth) is characterized by rapid growth and differentiation of body systems and parts. Table 17-10 provides an overview of fetal development.

Nursing Implications

The pregnant woman needs to have physical examinations and screenings during the entire pregnancy. Early prenatal care is essential for a positive pregnancy outcome.

Learning that one is pregnant is accompanied by several emotions: happiness, fear, sadness, excitement, and anxiety. Emotions lead to alterations in biochemicals; therefore, the mother's emotional state can bring about biochemical changes in the fetus. By teaching pregnant women how to relax, the nurse can promote a supportive environment for the developing embryo and fetus.

Wellness Promotion

The uterus is the primary environment affecting prenatal growth and development. Ideally, this environment nurtures positive growth of the embryo and fetus.

An ample supply of nutrients must be provided by the gestating woman. Women who consume insufficient

THINK ABOUT IT

Nutrition and Pregnancy

Do you think it is the responsibility of the federal government to ensure that pregnant women have adequate diets? What would happen if nutritional programs for pregnant women were abolished?

TABLE 17-10
Embryo and Fetus: Growth and Development

Age	Characteristics
Weeks 1–3	Rapid cell differentiation Heart starts to pulsate CNS formation Presence of all organs
Week 4	Beginnings of respiratory system Basic structures for eyes and ears Limb buds distinguishable
Week 5	Embryo has a C-shaped body with a tail and large head Each body system present in at least a rudimentary form Umbilical cord developed Brain vesicles developed Nerve tissues more fully developed
Week 6	Establishment of circulatory pathway (including heart with septa) Limbs distinguishable as arms and legs Intestine elongating Lungs formed, with bronchi beginning to branch out Liver begins production of blood cells
Week 9	Fingers, toes, eyelids, nose, and jaw evident
Week 12	Body growth speeds up while growth of head slows
Week 16	Ossification of skeleton begins Fingers and toes separated
Week 20	Fetal movement felt by mother Wake and sleep cycles evident Formation of small amounts of body fat
Week 24	Circulation of blood in vessels is visible Accelerated weight gain Ovaries/testes developed Kidney tubules branch out Brain grows rapidly
Week 28	Eyes open and close Thick hair on head Lanugo (thick coating of body hair) is present Rhythmic breathing patterns begin to be established
Week 32	Maturation of respiratory system and temperature-regulating mechanism Fat deposited in arms and legs Fingernails and toenails present
Week 36	Protrusion of mammary glands in both sexes Lack of melanin leads to white skin in all fetuses at this stage
Week 40	Completion of fetal development Fetus is ready for extrauterine environment Optimal time for birth

(Data from Guyton, A. C., & Hall, J. [1995]. *Textbook of medical physiology* [9th ed.]. Philadelphia: Saunders; Wong, D. L. [1999]. *Whaley & Wong's nursing care of infants and children* [6th ed.]. St. Louis: Mosby-Yearbook.)

amounts of protein during pregnancy have a high rate of giving birth to premature and low birth weight infants. Such infants are at risk for developmental alterations.

When teaching the pregnant woman about nutrition, the nurse must emphasize that vitamin supplements are *not* to be substituted for adequate intake of food. Other nursing interventions that promote prenatal health include:

- Screening (blood pressure measurement, urine sugar analysis)
- Teaching (nutritional guidelines)
- Counseling (e.g., guidance about bonding with the child and incorporating a child into a family unit)
- Promoting the use of complementary/alternative modalities to reduce stress
- Working with economically disadvantaged clients to obtain prenatal care

Safety Considerations

The fetus is especially vulnerable to substances consumed by the mother. In addition to providing the fetus with wholesome nutrients, maternal blood can also transport toxins.

Cigarettes contain several toxic substances, such as nicotine, that cross the placental barrier and interfere with the transport of oxygen to the fetus. Such toxins often result in increased risk of premature birth, retarded growth, learning difficulties, and fetal death.

Use of alcohol during pregnancy can result in **fetal alcohol syndrome** (FAS), a condition in which fetal development is impaired and is manifested in the infant by characteristic physical attributes and intellectual problems. Typically, FAS infants are small, have facial abnormalities (such as thin upper lips and short, upturned noses), and may have some degree of brain damage. Alcohol consumption is most dangerous during the first 3 months of pregnancy when the embryo's brain and other vital organs are developing. The effects of alcohol on the fetus are permanent. FAS is considered to be the leading cause of mental retardation among infants, and the incidence continues to increase (Wong, 1998).

In addition to nicotine and alcohol, there are many other teratogenic substances. A **teratogenic substance** is any substance that can cross the placental barrier and impair normal growth and development.

NURSING ALERT

Tocacco and Alcohol Use During Pregnancy

Total abstinence from cigarette smoking is advised during pregnancy. Because there has been no determination of "safe" amounts of alcohol consumption, caution all pregnant women to avoid drinking alcohol.

Client education consists of teaching pregnant women to check labels of *all* medicines for information about potential effects on the fetus. The Food and Drug Administration requires that all manufactured drugs list their potential for causing birth defects. The use of illegal drugs by pregnant women presents a very serious threat to the unborn. Substance abuse prevention programs can be effective in preventing or reducing this risk.

Neonate

The **neonatal** period (the first 28 days of life following birth) is a time of major adjustment to extrauterine life. The energies of the neonate (newborn) are focused on achieving equilibrium through stabilization of major body systems. Table 17-11 describes neonatal development.

The neonate's activities, which are reflexive in nature, consist primarily of sucking, crying, eliminating, and sleeping (Figure 17-3). The neonate blinks in response to bright lights and demonstrates the startle reflex in response to loud noises. Neonatal reflexes play a major role in the ability to survive. Table 17-12 lists the reflexive activities of the neonate.

During the first month of life, the neonate progresses developmentally from a mass of reflexes to behavior that is more goal directed (purposeful). In addition to the major physiological adjustments necessitated by extrauterine life, the neonate also undergoes psychological adaptation.

The major psychological task of neonates is to adjust to the parental figures. **Bonding**, the formation of attachment between parent and child, begins at birth when the neonate and parent make initial eye contact. The quality of parent-neonate bonding lays the foundation for trust that is necessary for the development of future interpersonal relationships. Figure 17-4 shows bonding between neonate and parent.

Nursing Implications

A complete and thorough assessment of the neonate, which is performed immediately after delivery, includes evaluation of the neonate's reflexes. In addition to focusing on the reflexes, the assessment also evaluates respiratory and cardiac functioning. Table 17-13 shows the Apgar assessment tool that is performed by the nurse at 1 minute and again at 5 minutes after birth.

In the first few hours after birth, encourage the parents to cuddle the newborn. Explain the neonate's interactive abilities. Encourage mutual eye contact between neonate and parents by showing parents how to hold the child facing them.

Wellness Promotion

Teaching is one of the most important nursing activities that promote neonatal wellness. First-time parents need information about basic newborn needs (to be held,

NURSING ALERT

Neonatal Reflexes

A complete assessment of neonatal reflexes should be performed immediately after birth or as soon as the neonate is physiologically stable.

rocked, and talked to), nutrition, infection control (especially handwashing and hygienic diaper changing practices), care of the umbilicus, and incorporating the newborn into the family unit. Knowledge of growth and development milestones is necessary for parents to provide appropriate neonatal stimulation and have realistic expectations.

TABLE 17-11
Neonate: Growth and Development

Dimension	Characteristics	Nursing Implications
<i>Physiological</i>	<p>Circulatory function shifts from the umbilical cord to heart.</p> <p>Gas exchange (oxygen and carbon dioxide) is transferred from placenta to lungs. Seconds after birth, respiratory reflexes are activated.</p> <p>Weak neck and shoulder muscles.</p> <p>Immature temperature-regulating mechanism.</p> <p>Incomplete ossification (process of cartilage changing to bone).</p> <p>Poor visual acuity; visual focus is generally rigid.</p>	<p>Accurately assess neonate's cardiovascular status.</p> <p>Immediately after birth, hold the neonate with head lower than body to allow for drainage of fluids that may block respiratory passages.</p> <p>If spontaneous respirations do not occur, resuscitate immediately.</p> <p>Carefully support the neonate's head.</p> <p>To conserve heat:</p> <ul style="list-style-type: none"> • Dry neonate immediately after birth and place in a warmed bassinet. • Place a stockinette cap on neonate's head. <p>Protect the anterior fontanelle on neonate's skull.</p> <p>Instruct parents to be directly in front of the neonate (about 9–12 inches away from child's face) when communicating.</p>
<i>Motor</i>	<p>Reflexes direct the majority of movement.</p> <p>The full-term neonate has some limited ability to hold the head erect.</p> <p>Able to lift head slightly when lying prone.</p>	<p>Support neck and head when lifting.</p>
<i>Psychosocial</i>	<p>Crying is the neonate's method of communication. There is a reason for the cry.</p> <p>The bonding process begins shortly after birth.</p>	<p>Teach parents about the dynamics of crying to avoid having the neonate labeled as "fussy" or the parents developing the misconception that they are inadequate caregivers.</p> <p>Encourage parents to learn to discriminate crying patterns.</p> <p>Teach parents the importance of interacting with the neonate during every contact (feeding, bathing, changing, cuddling).</p>
<i>Cognitive</i>	<p>Neonates learn through sensory experiences.</p> <p>Learning is enhanced by an environment that provides stimuli without bombarding the neonate.</p> <p>Learning occurs by repeated exposure to stimuli.</p>	<p>To promote learning, encourage parents to provide frequent sensory stimuli (touching, talking, looking the neonate in the eyes).</p>

(Data from Fuller, J., & Schaller-Ayers, J. [1999]. *Health assessment: A nursing approach* [3rd ed.]. Philadelphia: Lippincott; Murray, R. B., & Zentner, J. P. [1997]. *Nursing assessment and health promotion through the lifespan* [6th ed.]. East Norwalk, CT: Appleton & Lange; Wong, D. L. [1999]. *Whaley & Wong's nursing care of infants and children* [6th ed.]. St. Louis: Mosby-Yearbook.)

Figure 17-3 Selected Neonatal Reflexes: A, rooting; B, sucking; C, grasp; D, Moro; E, tonic neck.

Other nursing interventions that promote neonatal wellness are listed below:

- Continually assessing the neonate's physiological status
- Providing a warm environment (neonates breathe more easily when they are warm)
- Monitoring nutritional status. It is normal for neonates to lose weight (up to 10% of birth weight) during the first week of life.
- Providing a clean environment to protect neonates from infection and teaching parents that neonates need a clean environment, not a sterile one
- Conducting screening tests; for example, the blood test for **phenylketonuria (PKU)**, a genetic disorder that, if untreated, can lead to impaired intellectual functioning
- Promoting *early* parent-neonate interaction

Selection of a feeding method for the neonate is a major decision for parents. Breastfeeding is the most nat-

ural option. However, commercially prepared formula is sometimes used due to the neonate's special needs or parental choice. For a comparison of feeding methods, see the discussion about nutrition for the infant.

Safety Considerations

Safety is of primary concern when caring for neonates because neonates are totally dependent on others to meet their needs. Accidents are the primary cause of neonatal mortality (Fuller & Schaller-Ayers, 1999).

One of the most important neonatal accident prevention methods is to teach parents about the use of infant car seats. Under current federal law, neonates and infants must be secured in an approved infant car seat *every* time the child travels in a car.

In addition to accidents, infections pose a serious health risk to the neonate. Newborns should not be in contact with anyone experiencing an infectious disease. The skin is the body's major defense against invasion by disease-producing microorganisms; therefore, it is essential that the neonate's

TABLE 17-12
Major Neonatal Reflexes

Reflex	Description
Rooting	Turning the mouth and nose in the direction of any facial touch
Sucking	Using the tongue and mouth to take in liquid or food
Swallowing	Movement of throat muscles to push food from mouth to esophagus
Grasp	Firm contraction of hand muscles around an object
Babinski	When foot stroked, toes fan upward and outward
Moro	When startled, arms and legs swing quickly out, then immediately back and neonate curls up into a ball
Smiling	Turning lips upward; neonate looks “happy”
Blinking	Rapid closing and opening of eyelids
Sneezing	A violent, spasmodic, sudden expiration of breath
Coughing	Explosively expelling air from the lungs
Crying	Making a loud, wailing sound
Tonic neck	When head is turned to side, arm and leg on same side are extended in a fencing posture
Extrusion	Tongue pushes outward when touched by an object at the tip
Head turning	Moving face to one side or the other when airway is blocked by a surface, such as a bed or pillow

Figure 17-4 Bonding between a parent and neonate. Consider the factors that may have an impact on the early attachment between this father and daughter.

skin integrity be maintained. Parents must be taught the importance of skin cleanliness. Diaper rash is a common skin problem for newborns and infants because of the ammonia from urine in wet diapers. The ammonia burns and irritates the skin, resulting in localized irritation, blisters, or fissures. In addition to prompt changing of wet diapers, bathing and use of protective creams are useful in preventing skin breakdown. See chapter 31 for a complete discussion of safety considerations and infections control practices.

Infant

Infancy (the developmental stage from the first month to the first year of life) is a time of continued adaptation. During this stage, the infant experiences rapid

TABLE 17-13
Apgar Assessment Tool

Sign	Value		
	0	1	2
Heart rate	Absent	Less than 100 beats per minute	Over 100 beats per minute
Respiratory effort	Absent	Slow and irregular	Crying
Muscle tone	Flaccid	Some flexion of extremities	Active movement
Reflex irritability	No response	Weak cry or grimace	Vigorous cry
Color	Blue or pale	Pink body, cyanotic extremities	Entire body is pink

The neonate is rated in each of the above categories. The rating for each category is totaled. A score of 7–10 indicates normal function; a score of 4–6 indicates that neonate needs special assistance; and a score of less than 4 indicates the neonate’s need for *immediate* life-sustaining measures.

physiologic growth and psychosocial development (Figure 17-5). Table 17-14 provides an overview of infant development in the physical, motor, psychosocial, cognitive, moral, and spiritual dimensions.

Nursing Implications

The nurse caring for an infant must focus on safety, prevention of infection, and teaching parents about incorporating the child into the family. Teaching parents and other caregivers about developmental milestones is essential. Nursing care involves the provision of support, reassurance, and information to the parents.

Wellness Promotion

Nurses promote infant wellness by teaching growth and development concepts to parents and other caregivers. Knowledge of the type of behavior to expect at certain times during infancy serves as both guidance and reassurance for parents. Three specific areas in which parents need guidance from the nurse in caring for their infants are nutrition, protection from infection, and promotion of sleep.

A major factor influencing health maintenance of the infant is the provision of adequate nutrients delivered in a loving, consistent manner. Caregivers should be taught that the nutrients must be germ free and provide the recommended amounts of carbohydrates, protein, calcium, iron, and vitamins. It is recommended that infants be breastfed for the first 6 to 12 months (Murray & Zentner, 1997).

Breastmilk has several benefits over commercially prepared formulas, including:

- Offers immunologic benefits (e.g., contains immunoglobulins, lymphocytes, and other bacteria growth retardants)
- Is more easily digested because of smaller curds than those in cow's milk and formula

Figure 17-5 These children are exploring their world and are demonstrating mastery of both the physiological and cognitive dimensions of their development.

- Enhances absorption of fat and calcium
- Is readily available and economical.

The act of breastfeeding promotes maternal-infant bonding (Wong, 1998). There are some cultural sanctions against breastfeeding and some cultures view bottle-feeding as a status symbol.

Normal growth and development can occur without breastfeeding. Special formulas are available for infants who are hypersensitive to protein, who have PKU, and who experience fat malabsorption. Soy-based formulas have been developed for the infant with lactose deficiency or who is allergic to regular formula. Infants who are formula fed generally have greater deposits of subcutaneous fat (Murray & Zentner, 1997). The Nursing Checklist provides teaching strategies for parents of bottle-fed infants.

It is important that the nurse provide accurate information about the types of feeding available and support the parents' decision about the method chosen.

NURSING ALERT

Cow's Milk

Whole cow's milk is not recommended for infants under age 1 year. Human milk and commercially prepared formula are more easily digested.

Solid foods are usually introduced at 3 to 4 months of age. Rice cereal is the first solid food of choice because it has the fewest allergic responses (Murray & Zentner, 1997).

Infants are especially vulnerable to developing infections. Because the immune system is not fully matured, infections pose a great threat. Immunizations are of utmost importance in preventing infections. Nurses should confirm that infants receive all necessary immunizations. Figure 17-6 provides a recommended schedule for childhood immunization.

NURSING CHECKLIST

Bottle Feeding

- The baby should be in a semi-reclining position cradled close to the mother's body with the mother in a comfortable position. Never prop a bottle in the baby's mouth because choking may result.
- Use care if heating bottles. Do not warm bottles in the microwave because the hot liquid can cause esophageal and oropharyngeal burns.
- Avoid using the bottle as a pacifier because this action may result in tooth decay and set the stage for future obesity.

TABLE 17-14
Infant: Growth and Development

Dimension	Characteristics	Nursing Implications
<i>Physiological</i>	<p>Physical growth is rapid. Birth weight usually triples by end of first year. Height increases by approximately 50%. Progressive maturation of all body systems.</p> <p>Body temperature stabilizes. Heart rate slows (approximately 80–130 beats per minute). Blood pressure rises. At approximately 4–6 months, eruption of teeth begins. Rapid growth of brain (reaches about half the adult size) Posterior fontanel closes at approximately 2 months. Eyes begin to focus.</p>	<p>Inform parents of the developmental norms.</p> <p>Encourage parents to have “well-baby checkups” as recommended.</p> <p>Protect infant’s skull.</p>
<i>Motor</i>	<p>Physical maturation allows for development of motor skills.</p> <p>Primitive reflexes are replaced by movement that is more voluntary and goal directed.</p> <p>Motor skills develop rapidly: 6 months: rolls over voluntarily 6-7 months: crawls 8 months: sits alone</p> <p>Grasping objects is reflexive for first 2–3 months and gradually becomes voluntary.</p>	<p>Teach parents anticipated ages for motor skill development.</p>
<i>Psychosocial</i>	<p><i>Freud</i>: Oral stage</p> <p><i>Erikson</i>: Trust vs. mistrust</p> <p>A sense of self begins to develop. Responds to caregiver’s voice.</p> <p>Anxiety separation occurs at approximately 6 months. <i>Havighurst</i>: Learns to eat solid food, crawl, walk, and talk.</p>	<p>Seeks immediate gratification of needs. Receives pleasure and comfort through mouth, lips, and tongue.</p> <p>Encourage parents to feed in a prompt, consistent manner (feed on demand rather than a fixed schedule).</p> <p>Other activities that promote trust are providing warmth, diapering, and comforting.</p> <p>Teach parents approximate ages that developmental milestones are expected to occur.</p>
<i>Cognitive</i>	<p><i>Piaget</i>: Sensorimotor stage</p> <p>Infant learns by interacting with the environment.</p> <p>Language development includes babbling, repetition, and imitation.</p>	<p>Encourage parents to provide a variety of sensory stimuli: visual, sensory, auditory, and tactile (e.g., colorful mobiles; musical toys; soft plush animals; rubbing, patting, stroking the infant’s skin)</p> <p>Caregivers need to talk to infant often.</p> <p>Encourage caregivers to name objects that are the focus of infant’s attention.</p>
<i>Moral</i>	<p><i>Kohlberg</i>: Preconventional stage</p>	<p>Teach parents that now is the time to start teaching (by role modeling) the difference between “right” and “wrong.”</p>
<i>Spiritual</i>	<p><i>Fowler</i>: Stage of undifferentiated faith</p>	<p>Encourage caregivers to model the values they want the infant to learn.</p>

(Data from Murray, R. B., & Zentner, J. P. [1997]. *Nursing assessment and health promotion through the lifespan* [6th ed.]. East Norwalk, CT: Appleton & Lange; Wong, D. L. [1999]. *Whaley & Wong’s nursing care of infants and children* [6th ed.]. St. Louis: Mosby-Yearbook.)

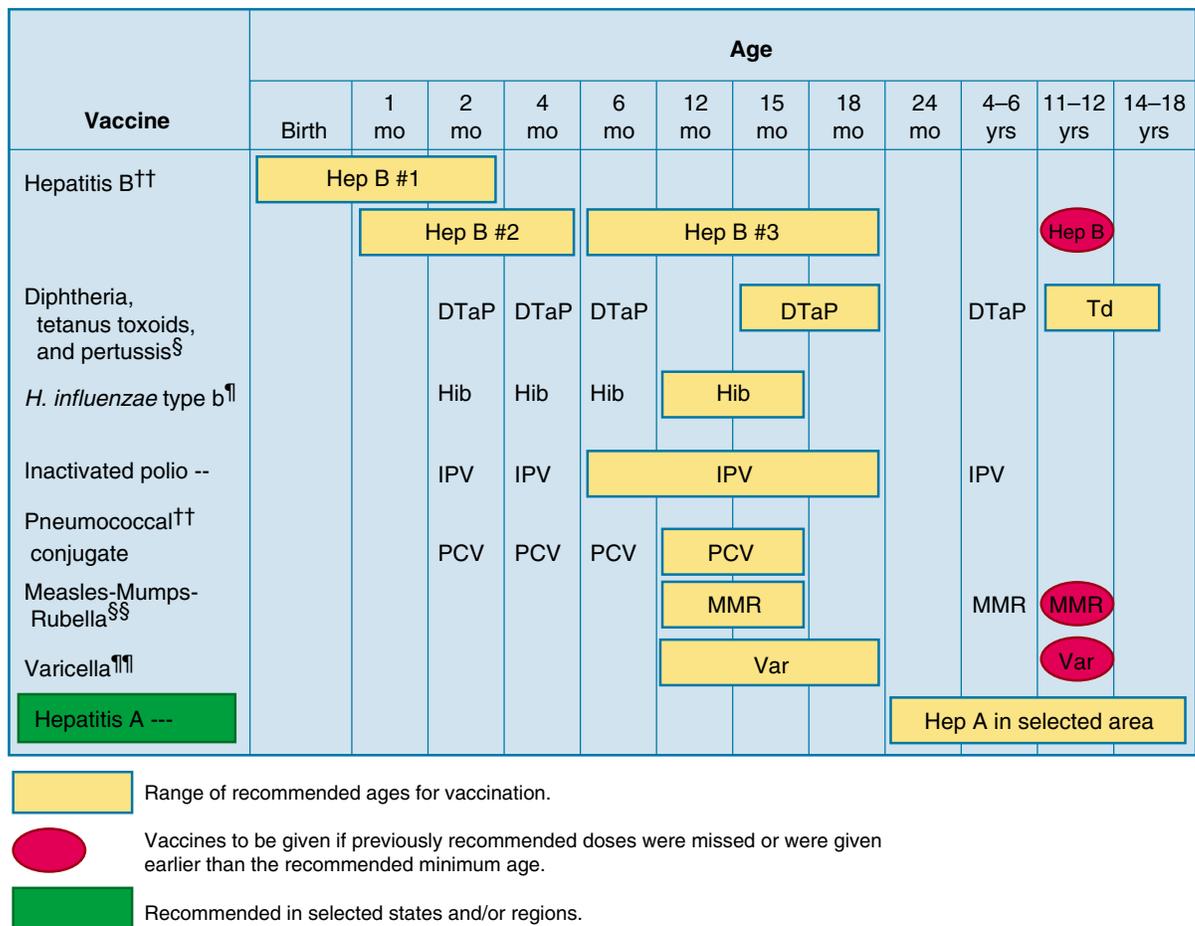

Figure 17-6 Recommended Childhood Immunization Schedule (From Centers for Disease Control and Prevention. Recommended childhood immunization schedule—United States, January-December 2001.)

NURSING TIP

Handwashing and Infant Care

Handwashing is the most useful action to prevent the transmission of microorganisms.

Parents often need information about normal sleep patterns of infants and how the patterns change with maturation. Activities that promote sleep include:

- Providing a quiet room for the infant
- Scheduling feedings and other care activities during periods of wakefulness instead of drowsy times
- Developing sensitivity to the unique sleep and rest periods established by the infant
- Providing comfort and security measures (e.g., rocking, singing)
- Establishing routine times for sleep

Safety Considerations

The majority of infant injuries and deaths are related to motor vehicle accidents. Therefore, the consistent and proper use of infant car seats is one of the most effective measures parents can take to ensure their infant’s safety.

See the Nursing Checklist for guidelines that the nurse can share with parents to prevent infant accidents.

Toddler

The **toddler** period begins at 12 to 18 months of age, when a child begins to walk alone, and ends at approximately age 3. The family is very important to the toddler in that the family promotes language development and teaches toileting skills. During this stage, the child becomes more independent. Frequently, when attempts to demonstrate autonomy are prevented, the child will have a temper tantrum; thus, this stage is often referred to as “the terrible twos.” Parents must understand that the toddler’s frequent use of the word “no” is an expression of developing autonomy.

Nurses can greatly influence the quality of parent-child interaction by teaching parents about developmental concepts. This information helps parents form *realistic* expectations of the toddler’s behavior. The use

NURSING CHECKLIST

Preventing Infant Accidents

- To avoid vehicular accidents: use infant seats and keep the infant out of the paths of automobiles and other vehicles. Many infants can crawl very quickly!
- To prevent burns: keep infant away from open heaters, furnaces, fireplaces, hot stoves, and matches.
- To protect from falls: keep crib rails up at all times, never leave the infant lying unattended on furniture, and use protective gates and barriers to block stairways.
- To prevent drowning: never leave the infant unattended near water (bathtubs, buckets, swimming pools).
- To prevent electrocution: as the infant begins to crawl, use plastic safety plugs to cover all electrical outlets and keep electrical cords out of infant's reach.
- To prevent choking: closely monitor the infant who is exploring the environment. During this oral phase of development, infants tend to test out their environment and seek pleasure through the mouth. Aspiration accidents are common with infants who choke on objects such as buttons, coins, and food. The Heimlich maneuver is *not* used with infants because it may force the foreign object further down the trachea. Figure 17-7 illustrates the proper technique to use with an infant who is choking.

NURSING ALERT

Aiding the Choking Infant

Never use the Heimlich maneuver on an infant who is choking. Instead, use alternating back blows and chest compressions to dislodge the object.

of firm limits set in a consistent manner helps the toddler learn while providing parameters for safe and socially acceptable behavior. Table 17-15 describes the toddler's growth and development in the physiological, motor, psychosocial, cognitive, moral, and spiritual dimensions.

Nursing Implications

Nurses who work with toddlers must be sensitive to the fact that children of this age are likely to be anxious and fearful in the presence of strangers. The establishment of rapport with the child will help alleviate this stranger anxiety. Play is an effective tool for building rapport with toddlers.

When toddlers are hospitalized (for an extended time or only a day), fear and anxiety can make the experience a negative one. The major stressor resulting from hospitalization is the toddler's separation from parents. An unfamiliar environment also results in stress for the toddler. Nurses can help reduce stress in the hospitalized toddler by teaching both the child and parents about procedures.

Toddlers need to have regular health examinations, and immunizations remain an essential part of health care. Encourage parents to be involved during the examination and immunizations. Parents can alleviate the toddler's stress by holding the child and talking in a calm manner when in the presence of the health care provider (Figure 17-8).

Figure 17-7 Intervention for a choking infant. Emergency care for an infant who is choking consists of a series of four blows to the back between the shoulder blades, followed by four thrusts midline on the chest approximately 1 inch below the nipple line.

Figure 17-8 By participating in this health examination, this mother is helping her son overcome his anxiety.

TABLE 17-15
Toddler: Growth and Development

Dimension	Characteristics	Nursing Implications
<i>Physiological</i>	<p>Overall rate of growth slows. By 24 months, the toddler usually weighs four times more than at birth.</p> <p>Rapid growth of brain.</p> <p>Bones in extremities grow in length.</p> <p>Physiological readiness for bowel and bladder training develops.</p>	<p>Instruct parents on need for vitamin D, calcium, and phosphorus.</p> <p>Recognize that “growing pains” are normal.</p> <p>Instruct parents of timing for toilet training and need for consistency and patience.</p>
<i>Motor</i>	<p>Walks and runs.</p> <p>Becomes more coordinated.</p>	<p>Assess home environment for safety as toddler becomes more mobile.</p>
<i>Psychosocial</i>	<p><i>Freud</i>: Anal stage (receives pleasure from contraction and relaxation of sphincter muscles)</p> <p><i>Erikson</i>: Autonomy vs. Shame and Doubt</p> <p><i>Havighurst</i>: Developmental tasks include:</p> <ul style="list-style-type: none"> • Beginning to learn sex differences • Learning to talk <p>Engages in parallel play (playing near other children but not necessarily interacting with them).</p> <p>A reemergence of separation anxiety often occurs.</p> <p>By age 3, most toddlers are able to tolerate being left with strangers.</p>	<p>Instruct parents to avoid overemphasis on toilet training.</p> <p>Teach parents to encourage toddler’s attempts at independence (e.g., trying to feed and dress self).</p> <p>Explain that sexual curiosity is normal.</p> <p>Encourage parents to talk to child frequently.</p> <p>Provide opportunities for child to socialize with peers.</p> <p>Reassure child that parents will return.</p>
<i>Cognitive</i>	<p><i>Piaget</i>: Preoperational stage</p> <p>Can follow simple directions.</p> <p>Concrete thought processes.</p> <p>Is able to anticipate future events.</p> <p>Short attention span.</p> <p>Comprehends self as a separate entity.</p> <p><i>Language</i>: At approximately 1 year, can make two-syllable sounds (e.g., ma-ma, da-da)</p> <p>At approximately 2 years, can form short sentences.</p> <p>Has a vocabulary of approximately 900 words.</p>	<p>Instruct parents to give only one direction at a time.</p> <p>Use a calendar to show today’s date and the number of days until a significant event.</p> <p>Teach caregivers importance of calling child by name.</p> <p>Talk to child frequently, avoiding use of “baby talk.”</p>
<i>Moral</i>	<p><i>Kohlberg</i>: Preconventional stage</p> <p>Learns to distinguish right from wrong.</p>	<p>Parents need to be consistent in setting limits.</p> <p>Understand the significance of role modeling desired behavior to child.</p>
<i>Spiritual</i>	<p><i>Fowler</i>: Intuitive-projective stage of faith</p>	<p>Instruct parents to provide simple answers to questions related to religion.</p> <p>Instruct on importance of incorporating religious rituals and ceremonies into daily life.</p>

(Data from Murray, R. B., & Zentner, J. P. [1997]. *Nursing assessment and health promotion through the lifespan* [6th ed.]. East Norwalk, CT: Appleton & Lange; Wong, D. L. [1999]. *Whaley & Wong’s nursing care of infants and children* [6th ed.]. St. Louis: Mosby-Yearbook.)

Some specific nursing approaches to use with toddlers are listed below:

- Explain what is being done in a calm tone of voice.
- Use play to alleviate anxiety (e.g., have the child examine a teddy bear or doll).
- Give short, simple directions.
- After a painful procedure, comfort the child (cuddling, rocking).
- Encourage parents' active participation in the care.

Wellness Promotion

Teaching is done with both toddlers and their parents. Play can be used to establish an effective relationship with the child. Play is a valuable process for toddlers in that it is the primary mechanism for learning and socialization. To facilitate teaching, approach toddlers at eye level and use terminology that they can understand.

Respiratory infections are common health threats to the toddler. Parasitic diseases are also fairly common. Teaching parents preventive measures becomes the focus of wellness promotion.

Nutritional needs change during the toddler period as the rate of growth slows. The need for calories decreases from the requirements for infants. The required amount of protein is also lower than that of the infant; however, toddlers still need more protein than do older children. The toddler needs fewer fluids than the infant (Wong, 1998). Because most toddlers become selective (“picky”) with the foods they enjoy, it is sometimes difficult to provide increased intake of calcium and iron due to the toddler’s food habits. The toddler should consume an average of 2 to 3 cups of milk a day to ensure adequate calcium intake. The toddler who drinks more than a quart of milk per day is at increased risk of developing anemia because the high milk consumption limits the amount of other nutrients taken in (Wong, 1998).

Nurses can play a key role in the toddler’s nutritional counseling. The following points should be shared with parents about dietary practices:

- Avoid using food as a reward because this may encourage overeating.
- Do not serve large helpings because the child may be overwhelmed and refuse to eat.
- Expect sporadic eating patterns (e.g., toddler eats a lot one day and very little the next; enjoys one food for several days then suddenly will not eat it).
- Avoid power struggles related to meals. Trying to force a child to eat is counterproductive to establishing healthy eating habits.
- Establish a mealtime routine and follow it (rituals are comforting to toddlers).
- Provide nutritional snacks to meet dietary requirements.

Safety Considerations

Accidents (especially those involving automobiles) are the most frequent cause of disability and death in tod-

dlers (Edelman & Mandle, 1997; Murray & Zentner, 1997). The information on the use of car seats for neonates and infants is applicable to toddlers.

Another common type of accident occurring with toddlers involves toys. Parents need to be taught to inspect toys for:

- Age appropriateness
- Sharp objects
- Small parts that can be swallowed
- Flammable or toxic materials (e.g., lead-based paint)

As children gain new skills, parents should be taught to reassess the safety of toys and of the home environment.

Toddlers, with their increased mobility and curiosity, are especially prone to accidental poisonings. Parents should be informed of the need for careful observation of the toddler and child-proofing the home. See Chapter 31 for a complete discussion of preventing poisoning in children.

Preschooler

The developmental stage from the ages of 3 to 6 is called the **preschool stage**. During this stage, physical growth slows and psychosocial and cognitive development are accelerated. Table 17-16 describes preschool development in detail.

During this period of childhood, curiosity becomes pronounced and the child is better able to communicate. When teaching the parents, let them know that the child’s frequent use of the word “why” is necessary for normal cognitive and psychosocial development.

The child’s world begins to expand outside the immediate home environment. Play is the mechanism used by the preschooler to learn about and develop relationships.

Nursing Implications

Play is a tool that can be used by nurses with preschoolers to help reduce fear and anxiety. Through the use of play, preschoolers learn about the environment, incorporate socially defined expectations for behavior, and reduce tension (Figure 17-9).

Wellness Promotion

When working with a preschooler, it is important for the nurse to communicate at the child’s level of comprehension without talking down to the child. Include the child in activities and decisions as much as possible. The preschool years are the optimum time for the child to begin showing interest in health. The astute nurse capitalizes on this by making health education fun to promote the development of lifelong health-promoting lifestyles.

A major wellness intervention for preschoolers is immunization. Teach parents about and encourage them to adhere to the recommended schedules. Each state in the United States has immunization requirements as

TABLE 17-16
Preschooler: Growth and Development

Dimension	Characteristics	Nursing Implications
<i>Physiological</i>	<p>Physical growth slows; average weight at age 5 is 45 pounds.</p> <p>Size of head is approximate adult size.</p> <p>Has a full set of deciduous teeth; these “baby teeth” start to fall out and be replaced by permanent teeth.</p>	<p>Can eat larger meals and a variety of foods.</p>
<i>Motor</i>	<p>Development of fine motor skills, (e.g., ability to skip, throw a ball overhand, use scissors, tie shoelaces).</p>	<p>Provide a safe environment for play and exploration.</p> <p>Praise attempted independent activities.</p>
<i>Psychosocial</i>	<p><i>Freud</i>: Phallic stage</p> <p>Oedipal conflict leads to development of superego (conscience)</p> <p><i>Erikson</i>: Initiative vs. Guilt</p> <p><i>Havighurst</i>: Developmental tasks include:</p> <ul style="list-style-type: none"> • Learning sex differences and modesty • Language development and basic ability to formulate concepts • Developing reading readiness • Distinguishing right from wrong 	<p>Inform parents that preschoolers learn self-control through interacting with others.</p> <p>Inform parents to provide sex education information at the child’s comprehension level.</p> <p>Encourage parents to read to child.</p>
<i>Cognitive</i>	<p><i>Piaget</i>: Preoperational stage</p> <p>Improved ability to use reason and logic and increased curiosity result in frequent use of questioning.</p> <p>Play becomes more reality based.</p> <p>As a result of increased ability to communicate, there is greater socialization with peers.</p>	<p>Parents need to know that children of this age learn through frequent use of the word “why.”</p>
<i>Moral</i>	<p><i>Kohlberg</i>: Preconventional stage</p> <p>A conscience begins to develop.</p> <p>Child fears wrongdoing.</p> <p>Child seeks parental approval.</p>	<p>Teach child basic values, ideally by role modeling.</p> <p>Provide consistent praise and acceptance of child.</p>
<i>Spiritual</i>	<p><i>Fowler</i>: Intuitive-projective stage of faith</p> <p>Not yet able to understand spiritual concepts.</p> <p>Imitates parental behaviors.</p>	<p>Remind parents that teaching by example is the best approach for a child this age.</p>

(Data from Murray, R. B., & Zentner, J. P. [1997]. *Nursing assessment and health promotion through the lifespan* [6th ed.]. East Norwalk, CT: Appleton & Lange; Wong, D. L. [1998]. *Whaley & Wong’s nursing care of infants and children* [6th ed.]. St. Louis: Mosby-Yearbook.)

Figure 17-9 Play is an important tool for socializing among preschoolers. Describe a few health care activities that nurses can incorporate through play that would correspond to a preschooler's level of development.

prerequisites for school admission. The nurse should encourage parents to have children immunized and to keep the immunization records current. All states offer exemptions for children who have medical problems such as severe illness, immunocompromised status, or allergies to vaccine constituents (Douma, 1997).

Safety Considerations

Accidents are the leading cause of death in young children. Eagerness to explore the environment and cognitive immaturity lead to the preschooler's risk for accidents. Children in this stage often act impulsively and cannot be expected to remember and follow all safety rules. Parents must understand the importance of teaching young children the meaning of "no" to prevent accidents.

Common accidents that involve preschoolers are automobile accidents, burns, falls, drowning, animal bites, and ingestion of poisonous substances.

It is important for the nurse to emphasize education about protection from potential hazards. The safety practices that are developed by the preschooler will tend to be lifelong. Adults can best teach preschoolers about accident prevention through role modeling. For example, parents who buckle their seatbelts every time they get into a car are not only protecting themselves but are also teaching their children an important accident preventive measure.

School-Age Child

During the **school-age period** (developmental stage from the ages of 6 to 12 years), physical changes occur in a slow, even, continuous pace. Table 17-17 gives an overview of growth and development of the school-age child.

The school-age child's world expands greatly. Participation in school activities, team sports, and play contributes to an enlarging social network. As children

continue to mature, their play time becomes more structured and less spontaneous. Communication increases and vocabulary expands greatly to accommodate the expression of needs, thoughts, and feelings.

As the school-age child's cognitive abilities expand, creativity is expressed in a variety of unique ways. Involvement in academic, sports, and social activities stimulates the development of creativity and provides outlets for its expression.

Nursing Implications

The most common health problems of school-age children are accidents and minor illnesses such as upper respiratory infections. Health promotion teaching is a major role of the nurse caring for school-age children.

Wellness Promotion

Lifestyles begin to be established during childhood; nurses can intervene to promote the development of healthy lifestyles with children in schools. Schools are an area in which health promotion behaviors can be taught in a cost-effective manner. Nurses can promote wellness in the school-age child by teaching parents to:

- Encourage healthy lifestyles (nonsedentary activities, nutritious meals)
- Have children immunized
- Provide nutritious meals
- Teach children appropriate hygienic measures
- Schedule regular checkups with the primary health care provider
- Schedule dental checkups and encourage daily brushing and flossing
- Establish sleep patterns alternating with periods of activity
- Report any symptoms of illness immediately to the health care provider
- Teach safety precautions

Safety Considerations

Many accidents experienced by school-age children occur during play. Injuries related to the use of skates, skateboards, in-line skates, and bicycles are common. Children should be taught safety rules for use of such toys (e.g., use of protective equipment; Figure 17-10). Parents must frequently remind children of the danger of playing near traffic. Children in this developmental stage must also be taught to use caution with strangers because of the possibility of abductions.

Preadolescent

Preadolescence (developmental stage from the ages of 10 to 12 years) is marked by rapid physiological changes with accompanying psychological and social implications. The child is beginning to experience hormonal changes that will result in the onset of **puberty** (appear-

TABLE 17-17
School-Age Child: Growth and Development

Dimension	Characteristics	Nursing Implications
<i>Physiological</i>	<p>Physical growth is steady (approximately 3–6 pounds and 2–3 inches per year).</p> <p>Due to changes in amount and distribution of fat, body has an overall slimmer shape.</p> <p>Maturation of CNS is nearly completed.</p> <p>By age 12, all permanent teeth are present (except second and third molars).</p>	<p>Emphasize with parents the need for a balanced diet to sustain growth requirements.</p> <p>Teach parents need for dental hygiene (daily brushing and flossing) and regularly scheduled visits to dentist.</p> <p>Instruct to change toothbrushes every 3 months.</p>
<i>Motor</i>	<p>Continued development of motor control.</p> <p>Becomes less dependent on parents for activities of daily living.</p>	<p>Encourage participation in physical activities.</p> <p>Provide praise for independent activities.</p>
<i>Psychosocial</i>	<p><i>Freud</i>: Latency stage</p> <p>Same-gender companions preferred.</p> <p><i>Erikson</i>: Industry vs. Inferiority</p> <p>Develops initiative and high self-esteem as shown in school and sports.</p> <p>Exhibits less dependency on family.</p> <p><i>Havighurst</i>: Developmental tasks include:</p> <ul style="list-style-type: none"> • Ability to perform more-complex motor functions (e.g., ride a bicycle, catch a ball) 	<p>To develop a sense of confidence, encourage child to:</p> <ul style="list-style-type: none"> • Participate in both group and individual activities • Become involved in a variety of activities <p>Encourage parents to praise child's efforts.</p>
<i>Cognitive</i>	<p><i>Piaget</i>: Concrete operations stage</p> <p>Ability to cooperate with others and begins to be able to see the other's point of view which leads to more meaningful communication.</p> <p>Reasoning ability moves from intuitive to logical and rational.</p> <p>Ability to think in the abstract is not fully developed.</p> <p>Develops the concept of time:</p> <ul style="list-style-type: none"> • Knows difference between past and present • Begins to learn to tell time • Better able to understand the process of aging <p>Able to order, categorize, and classify groups of objects as evidenced in increased interest in collections (coins, stamps, rocks).</p> <p>Sees relationships between objects.</p>	<p>Encourage child to engage in group activities.</p> <p>Communicate at child's level of comprehension.</p>
<i>Moral</i>	<p><i>Kohlberg</i>: Conventional stage</p> <p>Can understand what society deems as unacceptable behavior but cannot always choose between right and wrong without assistance.</p>	<p>Provide consistent limits.</p> <p>Role model appropriate behavior.</p> <p>Provide praise for appropriate behavior.</p>
<i>Spiritual</i>	<p><i>Fowler</i>: Mythical-literal stage of faith</p> <p>Accepts existence of a deity.</p> <p>Beliefs are symbolized through stories.</p>	<p>Encourage parents to discuss their beliefs.</p> <p>Story telling and use of parables can reinforce understanding of spiritual concepts.</p>

(Data from Edelman, C. L., & Mandle, C. L. [1997]. *Health promotion throughout the lifespan* [4th ed.]. St. Louis: Mosby-Yearbook; Murray, R. B., & Zentner, J. P. [1997]. *Nursing assesment and health promotion through the lifespan* [6th ed.]. East Norwalk, CT: Appleton & Lange.)

Figure 17-10 The use of equipment, such as safety helmets, helps to protect school-aged children from injury.

ance of secondary sex characteristics). Girls generally experience preadolescence at a younger age than boys—approximately age 9 to 10 for girls and age 10 to 11 for boys (Edelman & Mandle, 1997). Table 17-18 provides an overview of preadolescent development.

In girls, breast development begins between the ages of 10 and 11. Further breast development is stimulated by the release of estrogen that occurs during puberty. The pattern of female breast development is described in Table 17-19. Other aspects of female sexual development are described in Table 17-20.

Approximately 2 years after the appearance of breast buds, **menarche** (onset of the first menstrual period) occurs. The first menstrual periods are usually irregular, scant, and may or may not be accompanied by ovulation. The average age of menarche in the United States is 12.8 years, which has gradually declined over the past century. This is probably due to improved general health status, particularly nutrition and sanitation (Wong, 1998).

The menstrual cycle is a complex blend of physiological and psychological changes that occur approximately every month. After approximately the first 6 to 12 months, a girl's cycle will become established in a regular pattern. Some girls may have received inadequate or incorrect information regarding the onset of

menstruation. Client teaching should include information about the physiological changes, emotional changes, and hygienic practices. Teaching should emphasize that the cyclical hormone-induced changes are normal.

One menstrual problem experienced by many American females is premenstrual syndrome (PMS). PMS is a complex condition characterized by a variety of symptoms including headache, backache, fatigue, irritability, weight gain, and crying spells. Females need information about PMS to receive early intervention if needed.

NURSING TIP

Late Onset of Menarche

Late onset of menarche can be the result of several factors. If you encounter a client who has not experienced the onset of menstruation by age 16 to 18, evaluate her for the following:

1. Inadequate nutrition
2. Presence of eating disorders
3. Chronic diseases (e.g., Crohn's disease, hypothyroidism)
4. Environmental stressors
5. Use of steroids or opiates

In preadolescent boys, the first signs of puberty are:

- Testicular enlargement
- Penile enlargement
- The scrotum becomes thinner and redder
- Pubic hair growth

Table 17-21 illustrates the physiological changes in boys during sexual development of male genitalia.

Nursing Implications

Sensitivity is essential for the nurse working with the preadolescent child. To increase one's sensitivity, the nurse uses a nonjudgmental approach and attends to the child's body language. It is imperative that the nurse establish a trusting relationship with the preadolescent in order to encourage the child to ask questions about any health-related concerns.

Wellness Promotion

The preadolescent needs information about nutrition, rest and activity, and the physiological changes that are occurring. The child must learn about the growth spurt,

TABLE 17-18
Preadolescent and Adolescent: Growth and Development

Dimension	Characteristics	Nursing Implications
<i>Physiological</i>	<p><i>Physiological Changes:</i> Accelerated physical growth with changes in body proportion. Extremities grow first, then trunk and hips. Growth in skull and facial bones results in changes in physical appearance.</p> <p><i>Reproductive/Sexual Changes:</i> Hypothalamus stimulates secretion of pituitary gonadotropins, leading to reproductive maturity. Development of both primary and secondary sex characteristics.</p> <p>Beginning of puberty is evidenced in girls by:</p> <ul style="list-style-type: none"> • Breast development • Pubic and axillary hair growth • Menarche (onset of menses) • Increases in height <p>Beginning of puberty is evidenced in boys by:</p> <ul style="list-style-type: none"> • Genital development • Growth of facial, pubic, and axillary hair • Nocturnal ejaculations • Height increases • Voice changes <p><i>Musculoskeletal Changes:</i></p> <ul style="list-style-type: none"> • Ossification of bones • Increased muscle mass and strength <p><i>Cardiovascular Changes:</i></p> <ul style="list-style-type: none"> • Heart increases in size and strength • Heart rate decreases to adult norms • Increased blood volume and blood pressure <p><i>Respiratory Changes:</i></p> <ul style="list-style-type: none"> • Rate decreases to an average of 15–20 respirations per minute • Increased respiratory volume and vital capacity • Growth of larynx, laryngeal cartilage, and vocal cords and voice pitch deepens <p><i>Gastrointestinal and Genitourinary Changes:</i></p> <ul style="list-style-type: none"> • Spleen, liver, kidneys, and digestive tract enlarge but experience no functional changes <p><i>Dental Changes:</i></p> <ul style="list-style-type: none"> • Eruption of last four molars <p><i>Integumentary Changes:</i></p> <ul style="list-style-type: none"> • Skin becomes thicker and tougher • Activation of sebaceous glands leads to possibility of acne • Appearance of pubic hair 	<p>Teach the child and parents about expected growth spurts.</p> <p>Provide reassurance that it is not uncommon for facial appearance to change in only a few months.</p> <p>Provide support and information about emerging sexual changes.</p> <p>Remember that the physiological changes are accompanied by psychological and social alterations.</p> <p>Encourage physical activities and intake of adequate amounts of calcium.</p> <p>Instruct about anticipated changes.</p> <p>Emphasize importance of continued dental hygiene.</p> <p>Teach proper skin care:</p> <ul style="list-style-type: none"> • Wash two to three times daily with soap and water. • Avoid vigorous scrubbing. • Females should avoid cosmetics with a fat or grease base. • Use sunscreen and avoid prolonged exposure to sunlight. • Provide support to children experiencing acne.

sexual changes, and psychosocial changes. By preparing the preadolescent for upcoming changes, the nurse is promoting physical and emotional health.

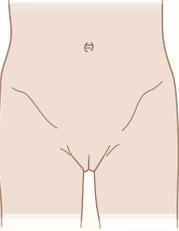

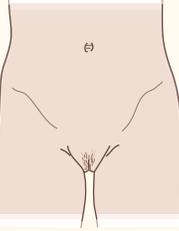

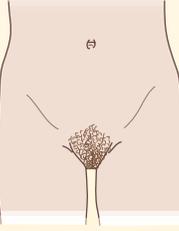

Safety Considerations

The preadolescent is at risk for injury from sports and play activities. Another major health risk posed to many

preadolescents is violence both in and away from the home. Education is a major preventive approach to violence; it is the tool for helping break the intergenerational cycle of child abuse.

Other topics for promoting preadolescent safety are: substance abuse prevention, sex education, and development of healthy lifestyles.

TABLE 17-20
Sexual Maturity Rating for Female Genitalia

Developmental stage	Description
Stage 1 	No pubic hair, only body hair (vellus hair)
Stage 2 	Sparse growth of long, slightly dark, fine pubic hair, slightly curly and located along the labia (ages 11 to 12)
Stage 3 	Pubic hair becomes darker, curlier, and spreads over the symphysis (ages 12 to 13)
Stage 4 	Texture and curl of pubic hair are similar to those of an adult but not spread to thighs (ages 13 to 15)
Stage 5 	Adult appearance in quality and quantity of pubic hair; growth is spread to inner aspect of thighs and abdomen

(Data from Estes, M.E. [2001]. *Health assessment and physical examination*. Albany, NY: Delmar Publishers.)

Adolescent

Adolescence (the developmental stage from the ages of 13 to 20 years) begins with the onset of puberty. During adolescence, the individual undergoes the major transi-

tion from child to adult. Numerous physiological changes and rapid physical growth occur during this stage. The rapid changes that occur during adolescence are not only physical. Many psychosocial adjustments must be made by the adolescent. Establishing a sense of personal identity uses a great amount of the adolescent's psychic energy. Questions such as "Who am I?" and "What is *really* important?" are common for adolescents to consider. See Table 17-18 for an overview of adolescent development.

Most adolescents are greatly concerned about their appearance. This emphasis on physical attractiveness sometimes results in eating disorders, such as **anorexia nervosa** (a self-imposed starvation that results in a 15% loss of body weight). Approximately 1% to 2% of female adolescents are affected by anorexia; the rate in males is much lower—about 5% to 10% of the anorectic population is male (Stuart & Laraia, 1998). Other types of eating disorders common in adolescents are **bulimia** (episodic binge eating followed by purging) and **obesity** (weight that is 20% or more above the ideal body weight).

The teaching checklist provides essential information about eating disorders to share with clients and families.

CLIENT TEACHING CHECKLIST Preventing Eating Disorders

- Encourage a balance between exercise and food consumption.
- Promote an increased sense of self-esteem.
- Emphasize the importance of a healthy lifestyle rather than physical appearance.
- Avoid pressuring children to seek perfection or to strive for unrealistic goals.
- Recognize the indicators of eating disorders.

Nursing Implications

The nurse can support adolescents by providing information about the numerous bodily changes. Adolescents should be encouraged to share their health concerns with parents. However, the nurse must honor the adolescent's choice to withhold sensitive information from parents. The use of a nonjudgmental attitude is essential to the establishment of rapport when working with adolescents. Adolescents should be treated in a respectful, dignified manner. Avoid using a condescending attitude when communicating with them. The Nursing Checklist discusses approaches that can be used when working with adolescents.

Wellness Promotion

The nurse promotes the adolescent's wellness primarily through teaching. Areas to be emphasized in health education of adolescents include hygiene, nutrition, sex

TABLE 17-21
Sexual Maturity Rating for Male Genitalia

DEVELOPMENTAL STAGE	PUBIC HAIR	PENIS	SCROTUM
1. 	No pubic hair, only fine body hair (vellus hair)	Preadolescent; childhood size and proportion	Preadolescent; childhood size and proportion
2. 	Sparse growth of long, slightly dark, straight hair	Slight or no growth	Growth in testes and scrotum; scrotum reddens and changes texture
3. 	Becomes darker and coarser; slightly curled and spreads over symphysis	Growth, especially in length	Further growth
4. 	Texture and curl of pubic hair are similar to an adult's but hair not spread to thighs	Further growth in length; diameter increases; development of glans	Further growth; scrotum darkens
5. 	Adult appearance in quality and quantity of pubic hair; growth is spread to medial surface of thighs	Adult size and shape	Adult size and shape

(Data from Estes, M.E. [2001]. *Health assessment and physical examination*. Albany, NY: Delmar Publishers.)

education, developmental changes, and substance abuse prevention.

Adolescents need education about the physical changes they are undergoing. Health teaching is often done by school nurses, and the establishment of nurse-managed

clinics in schools is one avenue for promoting wellness among adolescents. School-based clinics are rapidly increasing. *Nursing's Agenda for Health Care Reform* (American Nurses Association, 1990) calls for the delivery of primary health care services to individuals in convenient, familiar

NURSING CHECKLIST

Therapeutic Approaches with the Adolescent Client

- Treat the adolescent as an active participant in health care to form a collaborative partnership.
- Answer all questions honestly.
- Be especially sensitive to nonverbal clues. Adolescents are often too embarrassed to initiate discussion of their health-related concerns.
- Remember that the peer group is of major importance to adolescents, and use group settings whenever possible to provide health education.
- Demonstrate acceptance of the adolescent even when limits need to be established to intervene with unhealthy or inappropriate behaviors.
- Questioning adult authority is a normal part of adolescent rebelliousness. Do not personalize testing behaviors. Nurses who personalize the behavior become defensive and lose their interpersonal effectiveness and credibility with adolescents.

places. What better place to teach adolescents about health care than in the schools?

Safety Considerations

Unhealthy behaviors contribute to the three major causes of adolescent death: accidents, homicide, and suicide. The following developmental factors increase the adolescent's risk for accidents:

- Impulsive behavior
- Sense of being invulnerable to accidents (a feeling that "It can never happen to me!")
- Testing limits
- Rebelling against adult advice

As a result, many adolescents engage in unhealthy behaviors such as smoking, consuming alcohol and other drugs, reckless driving, violence, and unprotected sexual activity.

THINK ABOUT IT

Adolescent Behaviors

Think of the type of behaviors adolescents often demonstrate to prove that they are "grown up." Which of these behaviors have a negative impact on health? A positive impact?

Many health problems in adolescents are related to sexual behaviors including acquired immunodeficiency syndrome, sexually transmitted diseases (STDs), and unplanned pregnancy.

The effect of teen pregnancy on families and communities is great. Social programs that provide resources for meeting the special needs of pregnant adolescents are decreasing. Many pregnant teens become trapped in a cycle of school failure (or dropout), limited employment opportunities, and poverty. Adolescents who become pregnant experience developmental difficulties in that they must make adult decisions. Infants born to adolescent mothers are likely to experience health-related problems such as prematurity and low birth weight.

The pregnant adolescent needs expert prenatal care, a supportive environment, and information. Client teaching must emphasize the prevention of STDs because the pregnancy itself is evidence of high-risk (unprotected) sexual activity.

Sexually transmitted diseases present a serious health threat for adolescents. Diseases such as genital herpes virus, human papillomavirus (which causes genital warts), chlamydia, syphilis, and gonorrhea are spread through sexual contact. The human immunodeficiency virus (HIV), which causes AIDS, is also transmitted through unprotected sexual activity. Table 17-22 describes the most common STDs.

NURSING ALERT

Legal Mandate to Report STDs

Laws concerning the dissemination of information about STDs vary among states and provinces. However, most have legislation that requires nurses to report the names of clients with certain STDs to the state/provincial health department. You must know the requirements for your state or province.

Nurses must educate adolescents about methods for preventing the spread of STDs. Preventive education should include the following topics:

- Methods of transmission
- Incubation period
- Clinical manifestations
- Treatment methods
- Consequences of lack of or inadequate treatment
- Notification of sexual partner(s)

Nurses who teach adolescent clients about safe sex practices need to be especially sensitive to cultural influences on sexual activity.

Another major health problem during adolescence is the high risk of suicide. Often, suicide is perceived by the adolescent as the only alternative to an overwhelming situation. Low self-esteem, lack of maturity, and

TABLE 17-22
Sexually Transmitted Diseases: An Overview

Disease	Characteristics	Nursing Implications
<i>AIDS</i>	<p>Incurable and, often, fatal disease In addition to sexual activity, other modes of transmission are:</p> <ul style="list-style-type: none"> • Direct exposure to infected blood or blood products • Intrauterine transmission from infected woman to fetus 	<p>Know that the incubation period can range up to 15 years from time of initial exposure. The only “cure” is prevention. Teach safe sex methods (use of latex condoms). Provide information about the disease. Treatment is primarily supportive. Provide physical care and psychological support. Always follow standard precautions guidelines.</p>
<i>Chlamydia</i>	<p><i>Males:</i> Painful urination Urethral discharge <i>Females:</i> Usually none May experience purulent discharge Note: If untreated, pelvic inflammatory disease (PID) can develop.</p>	<p>Instruct client to notify sexual partner(s) of past 2 months of their need for treatment. Instruct clients to avoid sexual activity or to use condoms until both client and partner(s) are symptom free. Medication education.</p>
<i>Chancroid</i>	<p>A small, irregular shaped papule (on the penis, labia, or vaginal opening) that develops into a painful ulcer that drains pus or blood. Dysuria (painful urination) Painful regional lymph nodes (inguinal tenderness)</p>	<p>Partner(s) having sex within 10 days before onset of client’s symptoms need to be assessed. Client should be reassessed within 7 days after treatment begins. Instruct in proper use of condoms. Medication education.</p>
<i>Genital herpes: herpes simplex virus 2 (HSV-2)</i>	<p>Vesicles on penis, vagina, labia, perineum, or anus Can progress to painful ulceration Lesions may last up to 6 weeks Recurrence is common Note: May be asymptomatic</p>	<p>Refer sexual partner(s) for examination. Teach that virus can be transmitted even when the person experiences no symptoms. Instruct in use of condoms. Teach females of need for annual Pap smear. Medication education.</p>
<i>Gonorrhea</i>	<p><i>Male:</i> Urethritis (inflammation of the urethra) Purulent discharge Urinary frequency Epididymitis (inflammation of the epididymis) <i>Female:</i> Is often asymptomatic May lead to PID or salpingitis (inflammation of the fallopian tube) Can occlude the fallopian tubes with resultant sterility</p>	<p>Instruct client to return for further treatment if symptoms persist. Sexual partner(s) within past 60 days need to be assessed. Avoid sexual activity until symptoms subside in both client and partner(s). Medication education.</p>
<i>Hepatitis B virus (HBV)</i>	<p>Varies greatly from asymptomatic state to severe hepatitis to cancer</p>	<p>Partner(s) should receive medical prophylaxis within 14 days after exposure. For client and partner(s): recommend three-dose immunization series when this episode has abated.</p>
<i>Human papillomavirus (genital warts)</i>	<p>Fleshy, cauliflower-like growth on genitalia</p>	<p>Inform and treat sexual partner(s). Medication education.</p>

Sexually Transmitted Diseases: An Overview

Disease	Characteristics	Nursing Implications
<i>Syphilis</i>	<p>Disease consists of four stages with distinct manifestations:</p> <p><i>Primary:</i> A painless papule on penis, vagina, or cervix Serologic blood test usually negative Highly infectious during this stage</p> <p><i>Secondary:</i> Rash, especially prevalent on palms and soles Low-grade fever Sore throat Headache</p> <p><i>Early Latency:</i> Infectious lesions may occur, otherwise asymptomatic. Reactive serologic tests</p> <p><i>Late Latency:</i> Lesions may be present in central nervous and cardiovascular systems. Noninfectious except to fetus of pregnant woman</p>	<p>Interview client to identify sexual contacts. Protect confidentiality of all involved. All those exposed to the disease should be given penicillin.</p> <p>Educate client and sexual contacts about the disease. Medication education.</p> <p>Counsel and educate client.</p> <p>Counsel and educate client.</p>
<i>Trichomoniasis</i>	<p>Petechial lesions Profuse urethral or vaginal discharge that is foul smelling, yellow, and foamy</p>	<p>Treat sexual partners simultaneously with metronidazole (Flagyl). Medication education.</p>

(Data from Hale, P. J. [1996]. HIV, hepatitis, and sexually transmitted diseases. In M. Stanhope & J. Lancaster [Eds.]. *Community health nursing: Promoting health of aggregates, families, and individuals* [4th ed.]. St. Louis: Mosby-Yearbook; Harkness, G. A., & Dincher, J. R. [1999]. *Medical-surgical nursing: Total patient care* [10th ed.]. St. Louis: Mosby-Yearbook.)

THINK ABOUT IT

Values Clarification

As a nurse, you will often encounter clients whose value systems conflict with your own beliefs. How will you provide care to sexually active adolescents if you think their behavior is immoral or “wrong”? Is it ethical for you to try to change the adolescent’s values to be congruent with yours? Should you change your values to be congruent with those of the client?

impulsive behaviors may increase the risk of suicidal behavior. The rate of suicide is higher among adolescent males than females.

When assessing for suicidal potential, the nurse should always directly question the adolescent about any plans for harming or killing self. The accompanying display lists signs indicative of suicide risk in adolescents.

When teaching suicide prevention, inform people to *immediately* contact a health care professional if someone is exhibiting any of the indicators of suicide risk. Many communities have a special telephone suicide-cope line available.

NURSING ALERT

Suicide Prevention

Never leave the suicidal adolescent alone. Close observation is the best deterrent to suicide.

SIGNS OF SUICIDAL RISK IN ADOLESCENTS

- Anorexia
- Writing suicide notes
- Talking about suicide
- Aggressive behavior
- Substance abuse
- Running away from home
- Preoccupation with death
- Neglecting personal hygiene
- Giving away treasured objects
- Sudden changes in behavior
- Verbal cues (e.g., “You won’t have to worry about me much longer”)
- Fatigue
- Social withdrawal

Another significant health problem for many adolescents is substance abuse. Using alcohol or other drugs is a common maladaptive attempt to cope with the stressors of adolescence. The accompanying display lists indicators of substance abuse in adolescents.

INDICATORS OF ADOLESCENT SUBSTANCE ABUSE

- Decline in academic performance
- Mood swings
- Changes in personality (such as confusion, euphoria, belligerence, withdrawal)
- Fatigue
- Drowsiness
- Behaviors indicative of depression (such as appetite changes, insomnia, weight loss, apathy)

Nurses can play a key role in substance abuse prevention with adolescents. A comprehensive substance abuse prevention educational program includes:

- Hazards of drug use
- Misuse of legal substances, such as tobacco and alcohol
- Self-esteem boosting methods
- Assertive communication skills (how to say “no” to peers)
- Adaptive coping mechanisms for dealing with stress

By providing such information, nurses can help adolescents make responsible, informed decisions before experimentation with drugs begins.

Young Adult

Physical growth stabilizes during **young adulthood** (the developmental stage from the ages of 21 to approximately 40 years). The young adult continues to experience physical and emotional changes at a slower rate than adolescents. Table 17-23 describes the development of young adults. Young adulthood is a time of transition from an adolescent to a person capable of assuming adult responsibilities and making adult decisions.

Pregnancy, a time of transition and lifestyle adjustment, is experienced by many young women. Table 17-24 lists a few of the changes commonly experienced by women during pregnancy. Throughout pregnancy, women experience changes in self-concept and may need reassurance that such changes are normal.

Nursing Implications

Usually, young adulthood is the healthiest time in a person’s life. Consequently, concern for health is low among people in this age group and wellness is taken

for granted by many young adults. Preventive measures for young adults focus on two primary areas:

1. Avoidance of accident, injury, and violence
2. Development of health-promoting behaviors (e.g., lifestyle modification; Figure 17-11).

The nurse plays an important role in each of these areas of health promotion by teaching and counseling.

Other topics that are developmentally appropriate for the nurse to address are vocational counseling and establishing relationships.

Title of Study

“Feeling Old: Being in a Phase of Transition in Later Life”

Authors

Nilsson, M., Sarvimaki, A., & Ekman, S. L.

Purpose

To get a better understanding of the aging process in later life (among the old-old).

Methods

In-depth interviews were conducted on 15 people aged 85-96 years. The subjects lived in their own homes. Data were analyzed through a phenomenological-hermeneutic approach.

Findings

8 subjects stated that they felt old. The experience of being old included the following four factors:

1. Being able to date the beginning of feeling old
2. Fear of helplessness and of being dependent on others
3. Feeling different from others
4. Not recognizing one’s former self.

Each of these factors correspond to the characteristics of a transition phase.

Implications

Sensitivity to those who are very old is essential in delivery adequate health care. Knowledge about transition processes can assist the nurse in preventing unhealthy transitions.

Nilsson, M., Sarvimaki, A., & Ekman, S. L. (2000). Feeling old: Being in a phase of transition in later life. *Nursing Inquiry*, 7, 41-49.

<p><i>Third Trimester</i></p> Backache Stretch marks on abdomen or breasts Urinary frequency Heartburn Shortness of breath Varicose veins on legs	<p><i>Third Trimester</i></p> Feels less attractive Increased irritability Insomnia Anticipation of birth Plans for incorporating child into family unit

(Data from Edelman, C. L. & Mandle, C. L. [1997]. *Health promotion throughout the lifespan* [4th ed.]. St. Louis: Mosby-Yearbook; Fuller, J. & Schaller-Ayers, J. [1999]. *Health Assessment: A nursing approach* [3rd ed.]. Philadelphia: Lippincott.)

Figure 17-11 The assessment of this young adult's blood pressure is one part of a health promotion program that helps to enhance this client's wellness.

Wellness Promotion

Decision making by young adults affects their health status. Since young adults tend to take excessive risks, they are at greater risk for death from accident, suicide, or homicide (Edelman & Mandle, 1997). For example, driving recklessly, driving while intoxicated, engaging in unprotected sex, and participating in gang activities are examples of the lack of a sense of fear demonstrated by many young adults.

Sexually transmitted disease is a leading cause of infection with resultant reproductive dysfunction in young adults. The information presented about STDs in the discussion of safety considerations for adolescents is also applicable to young adults. Nurses should teach women how to perform a monthly breast self-examination (BSE). Men need to learn how to perform a testicular self-examination (TSE). See Chapter 27 for a complete discussion of the methods involved in performing BSE and TSE.

Safety Considerations

Because vehicular accidents are a major cause of health problems for young adults, providing information about driving safety is a must. Another activity that poses a health risk for many young adults is sunbathing. Exposure to direct sunlight with the resultant radiation or use of tanning salons is directly linked to skin cancer. Nurses can be influential in decreasing the occurrence of skin cancer through teaching and by role modeling safe behaviors.

Middle Adult

Middle adulthood (the developmental stage from the ages of 40 to 65 years) is characterized by productivity and responsibility. For most middle-aged adults, the majority of activity revolves around work and parenting, and success and achievement are measured in terms of career accomplishments and family life.

Physiological changes that affect many of the body systems occur during middle adulthood. Table 17-25 lists the major changes experienced by the middle-aged person.

The primary developmental task of the middle-aged adult revolves around the conflict of generativity (a sense that one is making a contribution to society) versus stagnation (a sense of nonmeaning in one's life). When an individual successfully resolves this developmental conflict, acceptance of age-related changes occurs. Achievement of the developmental task is indicated by the following:

- Demonstrating creativity
- Guiding the next generation
- Establishing lasting relationships
- Evaluating goals in terms of achievement

The evaluation of goals often leads to a midlife crisis, especially if individuals feel they have accomplished little or not lived up to earlier self-expectations.

Nursing Implications

A large proportion of the United States population consists of middle-aged adults (Edelman & Mandel, 1997). Individuals of the baby-boom generation have entered their midlife stage and will require more nursing care to maintain wellness and cope with illness.

Nurses have the opportunity to help middle-aged clients improve their health status (and thus quality of life) by identification of risk factors and early intervention. The major risk factors for adults in the middle years can be changed because they are primarily environmental and behavioral. Assisting the middle-aged client to change unhealthy behaviors can be done through one-to-one intervention or in group settings.

Wellness Promotion

As health educators, nurses can encourage middle-aged adults to assume more responsibility for their own health (Figure 17-12). Self-care education topics appropriate for the middle-aged adult include:

- Acceptance of aging
- Nutrition
- Exercise and weight control
- Substance abuse prevention
- Stress management
- Recommendations for health screening (cholesterol screening, prostate examination, mammogram, Papanicolaou [Pap] test).

Safety Considerations

Automobile accidents, especially those involving the use of alcohol, are a serious health problem for middle-aged adults. Another significant problem is occupational health hazards such as exposure to environmental tox-

Figure 17-12 Through activities such as running, these middle-aged adults have taken responsibility for their health and are learning to cope with the physiological changes that occur during this stage.

ins. Middle adulthood is also the time when a lifelong accumulation of unhealthy lifestyle practices, such as smoking, sedentary habits, inadequate nutrition, and overuse of alcohol, begins to exert adverse effects.

Most middle-aged individuals have increased leisure time. Consequently, there is an increased risk for recreational accidents, such as, boating accidents, sports-related injuries, and jogging mishaps.

Older Adult

Older adulthood is the developmental stage occurring from age 65 and beyond. Chapter 18 provides an in-depth discussion of the elderly adult. Therefore, this section only highlights the concepts of growth and development as they relate to the older adult. Table 17-26 provides an overview of growth and development in the older adult.

Older adults have several psychosocial tasks to accomplish, such as:

- Developing a sense of satisfaction with the life that one has lived (to find meaning in one's life)
- Establishing meaningful roles
- Adjusting to infirmities (if any exist)
- Coping with losses and changes
- Preparing for death

Nursing Implications

Professional nursing care is important in assisting aging people to develop a sense of well-being (Eliopoulos, 1996). Nurses who work with the elderly must be especially sensitive to their own feelings, attitudes, and beliefs about aging and be aware of the effect of these responses on their care of older clients.

When assessing the older adult for health-related needs, the nurse needs to learn about the client's background, family history, work history, hobbies, and

TABLE 17-25
Middle Adult: Growth and Development

Dimension	Characteristics	Nursing Implications
Physiological	<p><i>Cardiovascular Changes:</i> Decreased functional aerobic capacity results in decreased cardiac output. Blood vessels become thicker and lose elasticity.</p>	<p>Decreased capacity for physical activity. Instruct client about necessity of remaining physically active. Predisposition for hypertension (high blood pressure), coronary artery disease, cerebral vascular accidents (“strokes”). Teach client about lifestyle modifications related to cardiovascular health:</p> <ul style="list-style-type: none"> • Smoking cessation • Avoid secondary tobacco smoke • Nutrition (low fat, low cholesterol) • Engage in physical activity
	<p><i>Neurological Changes:</i> Cellular changes (regulation, repair, and atrophy) occur gradually. A gradual loss in efficiency of nerve conduction leads to impaired sensation of heat and cold.</p>	<p>Explain age-related changes. Provide support and reassurance. Teach safety precautions regarding:</p> <ul style="list-style-type: none"> • Exposure to sunlight • Sensitivity to heat stroke • Sensitivity to frostbite
	<p><i>Gastrointestinal Changes:</i> Slower gastrointestinal motility results in constipation.</p>	<p>Teach client about:</p> <ul style="list-style-type: none"> • Nutrition (high-fiber food intake; adequate amounts of fluid) • Maintaining physical activity
	<p><i>Genitourinary Changes:</i> Nephron units diminish in number and size; diminished blood supply to kidneys.</p>	<p>Teach normal age-related changes.</p>
	<p>Decreased glomerular filtration rate leads to decrease in urinary output with resultant dehydration.</p>	<p>Teach signs indicative of dehydration. Inform client of need to maintain adequate fluid intake.</p>
	<p><i>Integumentary Changes:</i> Decreased moisture and turgor of skin and loss of subcutaneous fat leads to development of wrinkles. Hair thins and turns gray.</p>	<p>Instruct client about effects of sun and cigarette smoking on the skin. Assess client for body image alterations. Use nonjudgmental listening. Provide support.</p>
	<p><i>Musculoskeletal Changes:</i> Decreased bone mass and density. Slight (from 1–4 inches) loss of height may occur.</p>	<p>Instruct client about:</p> <ul style="list-style-type: none"> • Need for calcium intake • Importance of decreasing caffeine and alcohol consumption • Effects of sedentary versus active lifestyle on osteoporosis
	<p>Thinning of intervertebral disks.</p>	<p>Increased risk of injury. Instruct client of need for proper posture (especially sitting), exercise, and adequate fluid intake.</p>
	<p>Generalized decrease in muscle tone; “flabby” appearance and less agility.</p>	<p>Instruct client on need for adequate physical activity.</p>
	<p><i>Endocrine Changes:</i> Decreased metabolism results in reduced production of enzymes and increased hydrochloric acid. Lead to acid indigestion and belching.</p>	<p>Instruct client to:</p> <ul style="list-style-type: none"> • Eat foods that are not spicy or fried • Avoid eating within 2 hours before bedtime

(continues)

TABLE 17-25 (continued)
Middle Adult: Growth and Development

Dimension	Characteristics	Nursing Implications
	<p><i>Reproductive/Sexual Changes: Women:</i> Cessation of estrogen and progesterone production during menopause. Regression of secondary sex characteristics (decreased breast size, loss of pubic hair). Decreased vaginal secretions. Note: With no pregnancy risk, some postmenopausal women enjoy sexual activity more.</p> <p><i>Reproductive/Sexual Changes: Men:</i> Decreased levels of testosterone. Reduced amount of viable sperm. Decline in sexual energy; takes longer to achieve an erection; erection is sustained longer. Adaptation to developing chronic diseases and sexual problems may diminish self-esteem.</p>	<p>Teach clients about age-related sexual/reproductive changes. Encourage responsible sexual behavior. Teach about prevention of sexually transmitted diseases.</p>
<i>Psychosocial</i>	<p><i>Erikson:</i> Generativity vs. Stagnation Adults who have achieved generativity feel good about their lives and are comfortable with themselves. Become more involved in altruistic acts (e.g., community activities, volunteer work). Usually experience changing family roles (e.g., caregiver to aging parents, grandparent).</p> <p><i>Havighurst:</i> Fulfill social and civic responsibilities. Assist children to become independent. Adult children leaving home may lead to happiness or depression (“empty nest syndrome”). Maintain relationship with one’s partner.</p>	<p>Provide support as the client deals with aging.</p> <p>Encourage to become involved in community activities. Teach leisure skills. Instruct in the need to care for self while caring for others.</p>
<i>Cognitive</i>	<p><i>Piaget:</i> Will use all stages, depending on the task (e.g., can move between formal operations, concrete operations, and problem-solving as needed). Able to reflect on the past and anticipate the future. Reaction time diminishes during late middle age. Memory is unimpaired. Learning ability remains intact if person is motivated and material is meaningful.</p>	<p>Encourage middle-age clients who are anticipating returning to school or engaging in other intellectually stimulating activities.</p>
<i>Moral</i>	<p><i>Kohlberg:</i> Postconventional stage</p> <p><i>Gilligan:</i> Women tend to judge morality of issues according to a sense of fairness and avoiding hurt to others. Establishes moral beliefs that are independent of what others think.</p>	<p>Use nonjudgmental approach when client discusses values.</p> <p>Respect personal differences by individualizing care.</p>
<i>Spiritual</i>	<p><i>Fowler:</i> Conjunctive faith Is able to appreciate others’ belief systems. Becomes less dogmatic with own beliefs. Religion is usually a source of comfort.</p>	<p>Encourage use of spiritual support. Refer to clergy if desired by client.</p>

(Data from Beare, P. B., & Myers, J. L. [1998]. *Adult health nursing* [2nd ed.]. St. Louis: Mosby-Yearbook; Edelman, C. L., & Mandle, C. L. [1997]. *Health promotion throughout the lifespan* [4th ed.]. St. Louis: Mosby-Yearbook; Fuller, J. & Schaller-Ayers, J. [1999]. *Health assessment: A nursing approach* [3rd ed.]. Philadelphia: Lippincott.)

TABLE 17-26
Older Adult: Growth and Development

Dimension	Characteristics	Nursing Implications
<i>Physiological</i>	<p><i>Cardiovascular Changes:</i> Reduced elasticity of heart muscle and arteries. Less efficient functioning of cardiovascular system; increased systolic blood pressure. Increased fat deposits on heart lead to reduced oxygen supply. Thickening of aortic and mitral valves leads to incomplete closure; murmurs may occur. Arterial diameter decreases as a result of arteriosclerosis Orthostatic hypotension may occur as the stiffened vessels are unable to constrict rapidly in response to postural changes. Thickening of venous walls leads to decreased elasticity. Development of varicose veins is common.</p> <p><i>Neurological Changes:</i> Decreased number of neurons. Fewer neurotransmitters. Slower transmission of nerve impulses. Decreased sensory threshold. The vestibulocochlear nerve (associated with balance and equilibrium) has decreased number of fibers.</p> <p><i>Vision</i> Pupils decrease in size and are less responsive to light. Cataracts and/or glaucoma often occur. Fewer tears are produced by the lacrimal glands so the cornea is likely to become irritated. Decreased ability to see colors; pastels fade; monotonous, blacks, and whites are difficult to see.</p> <p><i>Hearing</i> Ear canal may become blocked with cerumen (wax) which diminishes transmission of sound. Tympanic membrane is thinner and may become sclerotic. Diminished ability to hear high-frequency sounds.</p> <p><i>Taste and Smell</i> General decline in taste perception. Diminished salivation often occurs with aging. Olfactory nerve cells decrease in number.</p> <p><i>Respiratory Changes:</i> Decreased elasticity and muscle tone. Fewer functioning alveoli. Decreased number of cilia results in ineffective clearing of respiratory system. Calcification of chest wall and rib cage. Lungs tend to remain hyperinflated on exhalation which causes decreased vital capacity.</p>	<p>Decreased capacity for physical activity. Instruct client about the importance of remaining physically active and to balance activity with adequate rest/sleep. Teach client lifestyle modifications that promote cardiovascular health:</p> <ul style="list-style-type: none"> • Avoid smoking and other use of tobacco. • Avoid secondary tobacco smoke. • Proper diet (low fat, low cholesterol). • Avoid sedentary lifestyle. <p>A generalized slower response to environmental changes leads to increased risk for:</p> <ul style="list-style-type: none"> • Falls • Burns • Other injuries <p>Teach safety measures. Teach fall preventive measures.</p> <p>Be aware of client's increased sensitivity to glare; allow time for eyes to accommodate changes in lighting. The use of eye drops or artificial tears is helpful.</p> <p>Brighter colors compensate for decline in color discrimination.</p> <p>Teach proper hygiene for cleaning ears. Caution client to avoid inserting objects into ear during cleaning. Lower tone of voice and rate of speech; instruct family members to do likewise.</p> <p>Many elders prefer more highly seasoned foods, salt, and sugar; teach healthy diet plans. Increased loss of appetite often occurs; make food visually appealing and know the client's food preferences. Be alert for safety hazards associated with decreased sense of smell (inability to detect smoke, leaking gas, or spoiled food).</p> <p>Instruct client how to deep breathe and cough effectively. Encourage a balance between exercise/activity and rest/sleep.</p>

(continues)

TABLE 17-26 (continued)
Older Adult: Growth and Development

Dimension	Characteristics	Nursing Implications
	<p><i>Musculoskeletal Changes:</i> Loss of calcium from bones. Bone loss is a greater problem in women since it is accelerated by menopause. A gradual decrease in height results from bone loss. Less flexibility; muscle stiffness due to decreased number of elastic fibers in muscle tissues. General posture is flexion. Stands with feet apart. Center of gravity shifts with resultant changes in movement and balance.</p>	<p>Instruct women of all ages about importance of calcium consumption. Encourage the elderly to engage in physical activity, especially walking.</p> <p>Teach safety measures, including fall preventive measures. Encourage exercise to promote flexibility. Perform passive range of motion exercises for those who need it.</p>
	<p><i>Gastrointestinal Changes:</i> <i>Mouth</i> Atrophy of oral mucosa. Connective tissue loses elasticity. Decreased number of nerve cells. Saliva production is decreased and becomes more alkaline. Ability to chew food is impaired by loss of teeth, gum recession and degeneration of jaw bone.</p> <p><i>Gastrointestinal Tract</i> Peristalsis slows; decreased emptying of esophagus and stomach; slowed intestinal motility. Shrinkage of gastric mucosa leads to decreased amounts of hydrochloric acid. Reduction of pancreatic enzymes. Delayed time for emptying gallbladder; bile is thicker. Elimination is often impaired.</p>	<p>Decreased absorption of nutrients as a result of changes. Instruct on importance of adequate nutrition, especially fluids and bulky foods.</p> <p>Keep client well hydrated; instruct client to drink at least 8 glasses of fluid daily. Provide foods that are easily chewed.</p> <p>Encourage client to remain physically active. Teach importance of having a regular time for toileting.</p>
	<p><i>Endocrine Changes:</i> Metabolism slows. Alteration in pancreatic activity.</p>	<p>Inform client of need for fewer calories.</p>
	<p><i>Reproductive/ Sexual Changes:</i> Decreased amounts of growth hormone, estrogen, and testosterone blood levels.</p>	<p>Provide information about the normal changes associated with aging. Use nonjudgmental approach when client discusses sexual issues. Teach about effects of aging on reproduction and sexuality.</p>
	<p><i>Men:</i> Enlargement of prostate gland. Decreased reserves of testosterone. Testes softer and smaller. Sperm production decreased or inhibited. Ejaculations less forceful.</p>	
	<p><i>Women:</i> Breast tissue loses elasticity (starts to sag). Decreased size of uterus and fallopian tubes. Vaginal walls thin. Vaginal secretions decrease. Vulva and external genitalia shrink (due to loss of subcutaneous body fat).</p>	

(continues)

TABLE 17-26 (continued)
Older Adult: Growth and Development

Dimension	Characteristics	Nursing Implications
	<p><i>Integumentary Changes:</i> Decreased activity of sebaceous glands leads to drying. Decreased turgor. Thinning of epidermal layer. Decreased number of sweat glands (can result in heat exhaustion). Loss of subcutaneous fat increases susceptibility to cold. Wrinkles become more pronounced. Hair turns gray and thins.</p>	<p>When bathing:</p> <ul style="list-style-type: none"> • Avoid excessive use of soap, hot water, and brisk rubbing. • Pat, do not rub, skin dry. • Use tepid water. <p>Use lotion for itching and dryness. Avoid prolonged pressure on bony prominences. Protect from temperature extremes. Assess for body image alterations. For those with body image alterations:</p> <ul style="list-style-type: none"> • Assist with grooming as necessary. • Use photographs to help adjust to changing appearance. • Use touch to help clarify body boundaries.
<i>Psychosocial</i>	<p><i>Erikson:</i> Integrity vs. Despair Accepts one's life as it is. Feels a sense of worth when helping others.</p> <p><i>Havighurst:</i> Adjusts to retirement and changed financial status. Adjusts to decline in physical strength. Fulfills civic responsibilities. Meets social obligations. Adjusts to death of significant others. Develops affiliation with peers and age group (sees self as "old"). Retirement from employment affects finances, social activities, leisure time, and role identity (may be positive or negative impact). Potential for social isolation as significant others and peers die.</p>	<p>Ask the older person for advice. Identify and use their strengths. Encourage the use of reminiscence (life review).</p> <p>Encourage to express feelings concerning aging. Promote socialization with peers.</p>
<i>Cognitive</i>	<p><i>Piaget:</i> Formal operations stage; There is no decline in IQ associated with aging. Reaction time is usually slowed.</p> <p><i>Memory:</i> Short-term: decreased capacity for recall. Long-term: remains unchanged.</p>	<p>Allow client time to respond to questions or instructions. Be alert for the possibility of medication-induced confusion with resultant impact on memory.</p>
<i>Moral</i>	<p><i>Kohlberg:</i> Postconventional stage Makes moral decisions according to own principles and beliefs.</p>	<p>Support decision making. Respect values even when different from own.</p>
<i>Spiritual</i>	<p><i>Fowler:</i> Universalizing stage of faith. Is generally satisfied with one's spiritual beliefs. Tends to act on beliefs.</p>	<p>Listen carefully to determine spiritual needs. Acknowledge losses and encourage appropriate grieving.</p>

(Data from Firth, P. A., & Watanabe, S. J. [1996]. *Women's health: Instant nursing assessment*. Albany, NY: Delmar Publishers; Edelman, C. L., & Mandle, C. L. [1997]. *Health promotion throughout the lifespan* [4th ed.]. St. Louis: Mosby-Yearbook; Murray, R. B., & Zentner, J. P. [1997]. *Nursing assessment and health promotion through the lifespan* [6th ed.]. East Norwalk, CT: Appleton & Lange.)

THINK ABOUT IT

Nurses' Attitudes about Aging

Consider the “typical” older adult portrayed in our current society. What messages about the value of older people are communicated through the media? It is imperative that nurses become aware of their own attitudes toward aging. How do you feel about getting older? How do you feel about caring for aging people? Do you see aging as a progressive decline that ends in death? If so, you probably view aging as a depressing experience and, as a result, may project a hopeless attitude toward elderly clients. Or, do you view aging as time for continued development and change? If so, you are more likely to promote positive behaviors in elderly clients.

achievements (Figure 17-13). Clients should be encouraged to talk about their life experiences. When planning care, it is important to build on the client’s lifelong interests. By recognizing each client’s unique experiences and assets, the nurse is more likely to individualize care.

When clients express dissatisfaction and regrets about the past, the nurse should listen in a nonjudgmental manner and avoid trying to convince them that things are really better than they remember or perceive. It is important, however, to help clients put disappoint-

Figure 17-13 This older adult is able to maintain her independence and self-esteem through volunteer work. Describe the importance of incorporating information such as the ability and desire to make a contribution to society into an older adult’s nursing care.

ments into perspective by balancing them with accomplishments and achievements. Nurses should encourage families to engage in a positive life review with elderly clients. Most nursing interventions for the elderly center around introspection and reflection on their lives. Life review (or reminiscence therapy) promotes a positive self-concept in older people (Stuart & Laraia, 1998).

Wellness Promotion

Health promotion activities should be implemented with the elderly to maintain functional independence. Health promotion activities are aimed at maximizing the elder’s abilities and strengths. Specific topics that are developmentally appropriate for older clients are: use of leisure time, increased socialization, engaging in regular physical activity, maintaining a positive mental attitude, and developing and maintaining healthy lifestyles.

THINK ABOUT IT

Maintaining Autonomy

What type of behaviors can nurses promote to encourage an older client’s independence? In other words, how do nurses empower elderly clients to remain independent?

Safety Considerations

Falls pose a major health threat to the elderly. See Chapter 31 for information related to fall prevention and other specific safety promotion practices for elderly individuals. See Chapter 18 for information on other safety measures for the elderly.

KEY CONCEPTS

- Growth is the quantitative changes in physical size of the body and its parts.
- Development refers to behavioral changes in functional abilities and skills.
- Maturation is the process of becoming fully grown and developed and involves both physiological and behavioral aspects of an individual.
- During each developmental stage, certain developmental tasks must be achieved for normal development to occur.
- Growth and development of an individual are influenced by a combination of factors, including heredity, life experiences, health status, and cultural expectations.
- According to Freud, certain developmental tasks must be achieved at each developmental stage; failure to achieve or a delay in achieving the developmental task results in a fixation at a previous stage.
- Erikson stated that psychosocial development is a series of conflicts that occur during eight stages of life.

- Sullivan stated that personality development is strongly influenced by interpersonal relationships.
- Piaget's theory states there are four stages of cognitive development: sensorimotor, preoperational, concrete operations, and formal operations. Each stage is characterized by the ways in which the child interprets and uses the environment.
- Kohlberg's theory describes six stages of moral development through which individuals determine a moral code to guide their behavior.
- Gilligan states that women's moral judgment revolves around three issues: a concern with survival, a focus on goodness, and an understanding of others' need for care.
- Fowler's theory states that there are six distinct stages of faith development and, even though individuals will vary in the age at which they experience each stage, the sequence of stages remains the same.
- Providing care to the whole person is a basic concept of professional nurses, and knowledge of growth and development concepts guides holistic care of clients.
- The stages of the life cycle are the prenatal, neonate, infant, toddler, preschooler, school-age child, preadolescent, adolescent, young adult, middle adult, and older adult.
- Nurses have important roles in promoting the health and safety of individuals at each stage of the life cycle.

CRITICAL THINKING ACTIVITIES

1. State some ways in which Erikson's developmental theory relates to nursing.
2. Shaw stated, "Faith is the soul riding at anchor." What does this mean to you? In what ways do you demonstrate your faith? Observe several nurses. Note their demonstrations of faith.
3. You are assigned to care for a 4-year-old girl. What games and toys would be appropriate for her? Consider her developmental needs when answering.
4. You are a nurse in a clinic setting providing teaching to an adolescent male who has tested positive for chlamydia. What information will you discuss with him?
5. Name five beliefs you have about the elderly. Can you identify the source of these beliefs? How will these beliefs influence your care of elderly clients?

The Older Client

The setting sun is as beautiful as the rising sun.

—Japanese proverb

COMPETENCIES

1. Explain the meaning of “old age” in terms of theories and myths about aging.
2. Evaluate the multiple physical changes associated with aging and the impact these may have on an older adult’s ability to function and to perform activities of daily living.
3. Outline the physiological changes that occur with aging and ways that the older client can adapt to these changes.
4. Discuss the psychosocial impact that retirement, changes in social relationships, changes in living arrangements, and loss may have on the older client.
5. Define polypharmacy and its significance for nurses caring for older clients.
6. Identify physical and psychological signs of elder abuse.
7. Outline safety considerations for the elderly living at home.
8. Discuss the use of the nursing process with elderly clients.

KEY
TERMS

ageism
 chronological age
 lentigo senilis
 polypharmacy
 presbycusis
 restorative nursing care

When Ponce de Leon, the Spanish explorer, set out in search of the fountain of youth, he did not realize that the secret to longevity would be found—beginning in the late 20th century. Medical science has discovered what explorers could not: long life.

For most of the history of humankind, aging has been the problem of a fortunate few. Before 1900, when the average life expectancy was 47, relatively few people lived to be 50 years old. In the 20th century, great strides have been made in medicine, sanitation, hygiene, and control of infectious diseases. We have learned how to live longer, with life expectancy now over 75 years, but we are still trying to learn how to live well. The present challenge is not adding years to one's life, but rather to improve the quality of an extended life span. "The urgency, now, has begun to shift from that of medically prolonging life to ensuring that a prolonged life is worth living" (Volz, 2000, p. 24).

DEFINING OLD AGE

It is difficult to define *old age* in an era when factors such as medical breakthroughs and advanced health care techniques have extended the average lifetime by at least 20 years. The most obvious measure of age is a person's **chronological age**, or the exact age of a person from birth. But a person's chronological age does not dictate the state of health, attitude toward daily life, or beliefs about living. There are enormous differences among individuals. People in their seventies may look and act more as if they were 50, whereas some people in their thirties possess ideas and outlooks that resemble our worst stereotypes of the older generation. For these reasons, age is difficult to define chronologically.

So when does old age begin? For many centuries, people in their fifties were considered old. Today, Americans in their fifties generally consider themselves still young, and if asked at what age old age begins, are likely to respond "80." Nurses must respond to the needs of the *young old* (65 to 75 years of age), the *middle old* (ages 75 to 85), and the *old* (85 years and older). The U.S. population is rapidly aging; for example, between 1960 and 1996, the number of centenarians rose from 3,000 to 55,000 (Sadler, 2000).

There are approximately 34.4 million people in the America who are age 65 and older (American Association

of Retired Persons, 1999). As the fastest growing segment of the population, adults over the age 65 are projected to make up 16% of the total population by the year 2020 (U.S. Bureau of the Census, 1999); see Figure 18-1.

The graying of America's baby boomers will increase the demand for nurses with an increased sensitivity to and understanding of the needs, requirements, and capabilities of the older adult.

Theories of Aging

Aging is a complex process of biologic, psychosocial, cultural, and experiential changes. No one theory on aging completely embraces and explains all the many facets of change. Following is a discussion of several biologic and psychosocial theories on aging that provide a frame of reference for providing nursing care to elderly clients.

Biological Theories

There are several biological theories which address the physical changes of aging. The *stress theory* suggests that irreversible structural and chemical changes occur in the body as a result of stress throughout the life span and that individuals must learn to adapt to these changes. The *cross-linkage theory* describes the deterioration of tissues and organs as the cause of loss of flexibility and functional mobility that occurs with aging. The *somatic mutation theory* takes a similar cellular level approach in stating that changes in DNA that are not repaired lead to replication of mutated cells, which brings about decreased cellular functioning and loss of organ efficiency. The *programmed aging theory* states that life span is determined by heredity and that an internal genetic clock is responsible for the rate at which an individual develops, ages, and eventually dies.

Psychosocial Theories

Psychosocial theories on aging present the position that many factors in addition to genetics contribute to the aging process. The *disengagement theory* posits that as

Figure 18-1 People age 65 and over are the fastest growing segment of the U.S. population. (From U.S. Bureau of the Census. (2000). *Population estimates and projections*. [On-line]. Available: <http://www.childstats.gov/ac1999/poptxt.asp>)

individuals age, they inevitably withdraw from society and society withdraws from them in a mutually agreed-on dance of separation. The *continuity theory* suggests that an individual's values and personality develop over a lifetime and that goals and individual characteristics will remain constant throughout life; an individual thus learns to adapt to changes and will tend to repeat those reactions and behaviors that brought success in the past. The *activity theory* proposes that an individual's satisfaction with life depends on involvement in new interests, hobbies, roles, and relationships. Volunteering is one way that many retirees stay connected to the community. In addition to providing social connection, volunteer activities provide a daily routine, a way to make a contribution, and a sense of being needed.

THINK ABOUT IT

Personal Views on Aging

Consider your own beliefs about aging. Do you feel that one of these theories best represents the older adult population? Would you classify your opinion of older adults as basically positive or basically negative? On what information have you based your views?

Myths and Stereotypes of Aging

In our youth-driven society, old age has a negative connotation. In many cultures, elderly people are accorded a position of respect, and young people feel a moral and familial responsibility to care for parents and older relatives. In American culture, misconceptions about the elderly abound. Older adults are often stereotyped as being ill, bald, hard of hearing, forgetful, rigid, grumpy, or boring, simply on the basis of their age and regardless of their competencies and individual characteristics. Many younger Americans also believe that all older people live in nursing homes and fail to consider the independence of the older generation and their contributions to society. These types of attitudes are known as **ageism** (the process of stereotyping of and discriminating against people because they are old).

To many, aging is synonymous with death; these individuals have a negative view of the aging process, which usually results from fear, lack of exposure to older individuals, and a lack of understanding of how varied experiences can enhance the overall quality of life. Surprisingly, many older adults have negative attitudes toward other older adults; these often result from fear of stereotypes and social stigmas, or a sense of anxiety over “guilt by association.” Nurses need to be aware of these myths and stereotypes and to separate them from the realities of the aging process in order to provide sensitive and appropriate care to older clients.

NURSING TIP

Working with the Older Client

As you work with older clients, keep these concepts in mind:

- “Old” is a relative, subjective, and changing concept.
- Old age is experienced by individuals who were once young.
- Older persons are individuals; many of their attributes have nothing to do with their age.
- Ageism is unacceptable in the care and treatment of older persons.
- Older persons are entitled to the same high quality of health care as younger persons.

Quality of Life among the Elderly

Quality of life is gaining more emphasis in today's aging society. Sadler (2000) states that the United States is experiencing a *longevity revolution*, in that “many people are living twice as long as humans were previously expected to live. In 18th century America, the average life span was barely 40. With the approach of the 21st century, the average American life span is nearly 80” (p. 80). The increasing life span has both positive and negative outcomes. For example, Medicare beneficiaries (people aged 65 and over) spent an average of \$2,430.00 each (19% of their income) for health care services in 1999 (American Association of Retired Persons, 1999).

One of the greatest fears associated with advancing age is poor health. Everyone wants to live a long life, as long as it is a long *healthy* life. The elderly do have more health problems than the general population.

Fortunately, the trend is in fact for people to live longer *and healthier* lives. Many Americans over 65 live in relative financial comfort, able to continue working or start enjoying their retirement years. Good nutrition, proper exercise, continued work, travel, recreation, hobbies, and companionship are just a few of the healthy lifestyle choices many older people now have the means to afford.

Outlook and adaptation contribute to the high quality of life enjoyed by many older adults today. Although many people over 65 have some kind of chronic health problem, most have found ways to keep these ailments from lowering their enjoyment of life. Most older people accept a certain amount of declining health as a normal, expected part of aging, but do not allow health issues to interfere with the vigorous pursuit of enjoyment; see Figure 18-2.

Figure 18-2 Older adults often assume new roles, such as grandparent, as they mature, and can gain immense pleasure in spending time with family and sharing wisdom and ideas with the younger generation.

CHANGES ASSOCIATED WITH AGING

Change is an ongoing part of life. Anyone who has a difficult time accepting change, and therefore adapts poorly to it, will experience problems and pain, even if he or she lives to be 100. Changes of aging can be viewed as developmental, physiological, or psychosocial in nature.

Developmental Changes

At every stage of life, including old age, new developmental challenges constantly arise. Like developmental challenges faced earlier in life, these occasions are opportunities for success or failure. Older people may experience feelings of satisfaction or success over completing certain developmental tasks associated with aging, such as:

- Gaining insight or wisdom, even if physical powers are in decline
- Developing better social skills, with more same-sex friendships
- Becoming more open-minded and tolerant
- Finding an unexpectedly active and pleasurable sexual dimension
- Seeing children transform into responsible, successful adults
- Becoming a grandparent
- Holding civic and community positions of responsibility
- Achieving mastery of one's occupation or skills
- Developing new skills, hobbies, and avocations
- Renewing and deepening one's relationship with one's spouse
- Gaining new knowledge and experiences

- Accepting and adjusting to physical changes associated with aging
- Coping with aging parents, spouses, and friends

On the other hand, any older person would be challenged to find successful ways to cope with other developmental tasks of aging, such as:

- Adjusting to the death of a spouse
- Adapting to major declines in health or physical ability
- Adjusting to the loss of social role, prestige, occupation, income, or sense of usefulness
- Getting accustomed to loss of independent living
- Adjusting to any kind of loneliness or loss without boredom or depression

Research (Tanner & Lethbridge, 1998) shows that loneliness is the greatest problem among homebound elders.

It is important for the nurse to assess the nature of any developmental challenges a client may be experiencing because a client's adaptation to changes can have a profound effect on health status.

Physiological Changes

From the moment of birth, the human body begins the aging process. As a unique individual, each person ages differently; the rate of age-related changes varies from one individual to the next. However, some generalized physiological changes occur with the aging process, including:

- A decrease in the rate of cell mitosis
- A deterioration of specialized nondividing cells (such as neurons)
- Decreased elasticity and increased rigidity of connective tissue
- Decreased functional capacity

Some of the physical changes of aging, such as graying of the hair and decreased visual acuity, are readily apparent. Other changes are more subtle and may go undetected until a problem occurs.

The rate of aging is influenced by:

- genetic composition
- lifestyle (dietary and exercise patterns)
- previous experience (e.g., adaptive responses to stressors)
- presence of chronic illnesses

Neurological Changes

Aging brings about several changes in the nervous system that alter sensory and perceptual responses, as shown on the accompanying display. As a result of these changes, reaction time is usually slowed. The generalized slower response to environmental changes leads to increased risk for falls, burns, and other injuries.

AGE-RELATED NEUROLOGICAL CHANGES

- Fewer neurons
- Transmission of nerve impulses slowed
- The number of neurotransmitters (chemical messengers of the central nervous system) decreased
- Sensory threshold decreased (affects pain and tactile sensations)

(From Murray, R. B., & Zentner, J. P. [1997]. *Nursing assessment and health promotion: Strategies through the life span* [6th ed., p. 557]. Norwalk, CT: Appleton & Lange)

It is important that the nurse allow older clients time to respond to questions and instructions. Teaching safety measures is a preventive aspect of nursing that must not be overlooked when dealing with older clients.

Sensory and Perceptual Changes

Sensory changes are progressive and usually cause some limitations in later years. The resultant changes may impair the individual's ability to enjoy life to the fullest, as well as present related health problems.

Vision

The aging process causes some visual changes. For example, pupils decrease in size and are less responsive to light. Usually a loss of visual acuity occurs because of degenerative changes related to aging. By the age of approximately 42, the lens cortex becomes thicker, impairing its ability to change shape and focus. This condition, presbyopia, causes farsightedness and is corrected by the use of bifocals.

Cataracts, glaucoma, and age-related macular degeneration are the most common pathological visual problems experienced by the elderly. Cataracts (or opacity of the lens) can be surgically corrected. If untreated, glaucoma can result in blindness; thus, annual screening is recommended for all individuals over age 40. Age-related macular degeneration is the loss of central vision; magnification must be used to compensate for the changes. Diabetes, hypertension, and other systemic diseases will exacerbate macular degeneration. Fewer tears are produced by the lacrimal glands so the cornea is likely to become irritated. Most elderly people experience a decreased ability to see colors; pastels fade, and monotonous blacks, and whites are difficult to see. These changes normally occur with aging.

The nurse caring for older clients must be aware of the client's increased sensitivity to glare and allow time for the eyes to accommodate changes in lighting. The use of eyedrops or artificial tears may also be beneficial. Brighter colors compensate for the decline in color discrimination.

Hearing

Generally, hearing is diminished with age. There is a drying and wrinkling of the auricle with a noticeable increase of hair in the auditory canal. Cerumen becomes drier and can cause impaction, which blocks transmission of sounds. The hearing loss associated with old age is called **presbycusis**. In the middle ear, bony joints show some degeneration. However, the major changes occur in the inner ear, where degeneration of the vestibular system and simultaneous atrophy of the cochlea and the organ of Corti produce deficits in equilibrium and hearing.

Nurses need to be very patient in their approach to the older client. With anticipated changes in sensory perception, it is important that nurses face their clients, speak slowly and clearly, and protect them from injury. It is important when teaching clients that nurses ask for feedback and evaluate comprehension.

Taste and Smell

With aging, taste perception declines and salivation is diminished. Many older clients prefer more highly seasoned foods, with more salt and sugar to compensate for a decreased sensation of taste. Increased loss of appetite often occurs and may be medication-related in some individuals. It may be helpful for older adults to eat small portions frequently throughout the day. The nurse seeks to make food visually appealing and know the client's food preferences. It is important to teach clients about healthy eating patterns.

Olfactory nerve cells decrease in number. The nurse should instruct family members and other caregivers to be alert for safety hazards associated with decreased sense of smell, such as the inability to detect smoke, leaking gas, or spoiled food.

THINK ABOUT IT

Food Preferences

When you think about eating and preparing food for others, what are some of the things you consider? Think of a favorite meal and what you like most about it. Do you have preferences involving color, aroma, texture? Older people may experience gradual loss of taste and smell. What do you do to your food to enhance its taste appeal?

Cardiovascular Changes

As a result of aging, functioning of the cardiovascular system becomes less efficient. Reduced elasticity of the heart muscle and arteries causes a subsequent increase in systolic blood pressure. Increased fat deposits in the blood vessels lead to a reduced supply of oxygen. The arterial diameter decreases as a result of arteriosclerosis. Thickening of venous walls leads to decreased elasticity.

RESEARCH FOCUS

Title of Study

“Comprehensive Discharge Planning and Home Follow-Up of Hospitalized Elders: A Randomized Clinical Trial”

Authors

Naylor, M.D., Brooten, D., Campbell, R., Jacobsen, B.S., Mezey, M.D., Pauly, M.V., & Schwartz, J.S.

Purpose

Examine the effectiveness of an advanced practice nurse-centered discharge planning and home care follow-up intervention for elders at risk for hospital readmissions.

Methods

This was a randomized clinical trial with follow-up at 2, 6, 12, and 24 weeks after hospital discharge. Participants were 65 years or older and had been hospitalized between August 1992 and March 1996. The clients in the experimental group received a comprehensive discharge planning and follow-up protocol designed for elders at high risk for poor outcomes following discharge; the interventions were performed by advanced practice registered nurses (APRNs).

Findings

By week 24 after hospital discharge, control group clients were more likely than experimental group clients to be readmitted at least once. Fewer experimental group members had multiple readmissions. Time to first readmission was increased in the intervention group.

Implications

APRN-centered discharge planning and home care intervention for at-risk hospitalized elders reduced readmissions, lengthened the time between discharge and readmission, while reducing the cost of delivery of care to elders.

Naylor, M. D., Brooten, D., Campbell, R., Jacobsen, B. S., Mezey, M. D., Pauly, M. V., & Schwartz, J. S. (1999). Comprehensive discharge planning and home follow-up of hospitalized elders: A randomized clinical trial. *Journal of the American Medical Association*, 281(7), 613–620.

ished cardiac output is problematic when the older person becomes physically, mentally, or emotionally impaired (Ebersole & Hess, 1998).

The nurse should instruct the client about the importance of remaining physically active and the need to balance activity with adequate rest and sleep. Older clients also need information on lifestyle modifications that promote cardiovascular health. Such instruction would include the following:

- Avoid smoking and use of other forms of tobacco.
- Avoid secondary tobacco smoke.
- Eat a proper diet (low fat, low cholesterol).
- Avoid a sedentary lifestyle, which can result in impaired cardiac output and fatigue.

Respiratory Changes

Most older adults experience a decreased functional respiratory reserve capacity, with a generalized decreased elasticity and tone of muscles, including the muscles necessary for respiration. Physical changes in the lungs include fewer functioning alveoli and a decreased number of cilia. Therefore, ineffective clearing of the respiratory system occurs. Calcification of the chest wall and rib cage causes the lungs to remain hyperinflated on exhalation, thereby decreasing vital capacity. Factors contributing to respiratory problems are shown in the accompanying display.

FACTORS CONTRIBUTING TO RESPIRATORY DISEASES

- *Smoking*—the major contributing factor to respiratory problems; workload of the lungs is increased due to decreased oxygenation level.
- *Impaired functioning of immune system*—increases the risk of respiratory infections.
- *Impaired mobility*—lung expansion is decreased; secretions pool in lungs and provide a medium for growth of microorganisms; increased risk of pneumonia.
- *Obesity*—leads to decreased lung expansion and volume.
- *Surgery*—most anesthetic agents cause decreased respiratory rate and decreased tidal volume and lead to hypoventilation.

(From Johnson, A. P. [1999]. The pulmonary system and its problems in the elderly. In M. Stanley & P. G. Beare [Eds.], *Gerontological nursing* (2nd ed.). Philadelphia: Davis)

Thickening of aortic and mitral valves leads to incomplete closure; murmurs may occur in some older people. The development of varicose veins is common. As a result of decreased cardiac output, many elderly experience a decreased capacity for physical activity. A dimin-

To deal with respiratory changes, the nurse teaches the client how to breathe deeply and cough effectively. The client needs to establish a balance between exercise and activity to conserve respiratory effort while at the same time improving vital capacity. Because physical

exercise increases lung capacity, nurses encourage clients to walk.

Gastrointestinal Changes

Aging brings about several alterations in gastrointestinal functioning. The major changes are described in the following section.

Mouth

Many elderly people lose their teeth for a variety of reasons, including years of inadequate dental hygiene and extended use of medication (e.g., anticonvulsant drugs). Other physiological changes include atrophy of oral mucosa, loss of elasticity in connective tissue, and a decreased number of nerve cells that control chewing, swallowing, and taste. Saliva production is decreased, and saliva becomes more alkaline. The elderly person's ability to chew food is often impaired by loss of teeth, gum recession, and degeneration of the mandible. The nurse should instruct the client and caregivers to have foods that are easily chewed and swallowed available.

Gastrointestinal Tract

There is a decrease in peristaltic action with a relaxation of the lower esophageal sphincter. This causes a decreased emptying of the esophagus and stomach. Intestinal motility is slowed. Shrinkage of gastric mucosa leads to changes in the levels of hydrochloric acid, the reason for many older person's complaint of heartburn. Older adults have an inability to tolerate large amounts of foods containing fat.

Elimination is often impaired in elderly clients. As a result, there is decreased absorption of nutrients. Some loss of sphincter control may be noted. Nurses should instruct older clients about the importance of adequate nutrition, especially fluids and bulky foods. Keep clients well hydrated by instructing them to drink at least 8 glasses of fluid daily. Other methods to prevent constipation are physical activity and a regular time for toileting.

Genitourinary Changes

Major changes in the structure and function of the urinary system are associated with aging. The kidneys, bladder, and ureters are all affected by the aging process.

The loss of some muscle tone in the bladder and urethra can result in incomplete emptying of the bladder. Residual urine can lead to bladder infection. Decreased bladder capacity may cause subsequent nocturia and polyuria.

Renal function is the major determinant of an individual's fluid and electrolyte balance. In the elderly, renal function is often affected by diminished blood flow to the kidneys as a result of arteriosclerosis, hypertension, and other cardiovascular disorders. The glomerular filtration rate slows and there are fewer functioning nephrons.

The risk of renal failure increases with age, as does fluid retention. Dehydration is a very real threat for many older adults. The aging body loses some of its functional ability to adapt to changes in total body water, which is essential for metabolism. The composition of body water declines to about 40% of an older adult's total body weight.

Nursing measures address the underlying problems that result in a fluid and electrolyte imbalance. For example, if clients are dehydrated, they should be instructed to drink 2000 ml (10 glasses) of liquid a day. Note that the fluid intake should be limited 2 hours before bedtime to decrease the likelihood of nocturia.

Endocrine Changes

During the aging process, the following changes occur in the endocrine system:

- Slowing of metabolism
- Alteration in pancreatic activity
- Decreased blood levels of growth hormone, estrogen, and testosterone

As a person ages, the number of hormonal receptors in the adrenal and thyroid glands decreases. Thus, the person's ability to respond effectively to stress is diminished. Aging is associated with altered functioning of the pancreas; there is an increased level of insulin and circulating glucose.

The major changes affecting men are enlargement of prostate gland (benign hypertrophy) and decreased reserves of testosterone. The age-related changes for women include a loss of elasticity in breast tissue with resultant sagging of the breasts, decreased size of uterus and fallopian tubes, and decreased motility of fallopian tubes.

The nurse must provide information about the normal changes associated with aging and listen in a non-judgmental manner when clients discuss their concerns about the physical changes.

Reproductive/Sexual Changes

To promote discussion of sexuality, it is important for the nurse to adopt an understanding and accepting attitude. Sensitivity to verbal and nonverbal cues will also promote the client's expression of concerns. The nurse must not assume that the elderly client is heterosexual, sexually inactive, or uninterested in sex (Figure 18-3). "Sexual function is not normally lost with age, yet attitudes and expectations seem to imply that older adults are not interested in or capable of sex" (Eliopoulos, 1999, p. 405). It is important to recognize the elderly as sexual beings and to provide privacy to promote intimacy. See the accompanying display for a listing of sexual responses in older adults.

Figure 18-3 Elders need companionship as intimacy and sexuality remain important throughout the entire life span.

Older adults who are sexually active may need education about sexually transmitted diseases (STDs), including AIDS. This is one health education topic that is frequently overlooked in health promotion for the elderly.

When caring for clients of either gender, the nurse should teach about the effects of aging on reproduction and sexuality and should use a nonjudgmental approach when clients discuss sexual issues.

Changes in Men

As men age, the testes become softer and smaller as a result of decreased concentration of testosterone in the bloodstream. The production of sperm is inhibited or decreased, and ejaculations are less forceful. Sexual dysfunction increases in prevalence with aging; however, it is not an inevitable result of the aging process. According to Sheehy (1999), “40% of normal healthy males remain completely potent at age 70” (p. 188).

RISK FACTORS FOR ERECTILE DYSFUNCTION (ED)

- Anemia
- Anxiety
- Cigarette smoking
- Concern about sexual performance
- Depression
- Diabetes
- Hormonal imbalances
- Hyperlipidemia
- Hypertension
- Medications
- Multiple sclerosis
- Previous traumatic sexual experience
- Prostate surgery
- Renal failure
- Spinal cord injury
- Substance abuse
- Thyroid abnormalities
- Vascular bypass surgery

(From Sadovsky, R. Management of erectile dysfunction. *CNS Special Edition*, 1[1],79–83.)

Several factors contribute to the possible development of erectile dysfunction (ED), also referred to as impotence; see the accompanying display.

Changes in Women

The older woman experiences a decline in the serum levels of estrogen. As a result, the vaginal walls thin and vaginal secretions decrease. The vulva and external genitalia shrink because of loss of subcutaneous body fat. Postmenopausal changes, such as vaginal dryness, may cause the woman to experience pain during intercourse. The nurse needs to inform the older woman about using water-soluble lubricants to relieve the pain and discomfort that may occur during intercourse.

AGE-RELATED CHANGES IN SEXUAL RESPONSES

Women

- Nipple erections during sexual excitement may last several hours postorgasm.
- Orgasms are usually unchanged, except that vaginal contractions may be of shorter duration.
- Vaginal lubrication is decreased.
- Urinary frequency and urgency occur after intercourse.
- Clitoral response to stimulation is the same as in youth.
- Skin is less flushed due to superficial vasocongestive skin response.

Men

- It takes longer to achieve an erection.
- More direct physical stimulation is required for erection.
- Erection is more readily lost after interruption.
- There is an increased ability to prolong time before ejaculation.
- Ejaculation may be less forceful or may not occur.
- Orgasm is similar to that experienced in youth.
- Less flushing of skin occurs.

(From Eliopoulos, C. [1999]. *Manual of gerontologic nursing* [2nd ed.]. St. Louis: Mosby.)

Musculoskeletal Changes

Many people experience a decrease in height as they age. Long bones take on a disproportionate size, and many aged people assume a stooped posture. These postural changes occur primarily as a result of calcium loss from bone, creating osteoporosis and kyphosis. These conditions are more common in women than in men and are implicated in estrogen loss that occurs with aging.

Ligaments, tendons, and joints are also affected by age. They show results of collagen loss and become hardened, more rigid, less flexible, and predisposed to tears. Cartilage wears down around the joints, making flexion painful. Walking and a consistent exercise pattern can promote function and prevent the disabling effects of many of these changes (Ebersole & Hess, 1998).

The nurse should instruct women about the importance of calcium consumption. Foods with a high calcium content include dairy products and green leafy vegetables. Encourage exercise, especially walking, to promote flexibility and perform passive range of motion exercises for those who need it. It is essential that the nurse teach safety measures, including fall prevention measures, to clients and caregivers.

Integumentary Changes

Older adults frequently experience dry, wrinkled, flaccid skin. This is an expected condition that occurs with aging because the skin loses many of the properties that help make it appear youthful. It takes approximately 20 days for epidermal cells to be replaced in a young person, whereas in the older adult, this process takes about 30 days. Therefore, it takes longer for an elderly client's wounds to heal. Because of collagen loss, the skin of an older person loses its ability to stretch, and thus tears more easily. Loss of subcutaneous fat, moisture content of the skin, and elastic fibers causes the older person's skin to wrinkle, dry, and sag, leading to the development of elongated ears, jowls, and double chin. If the client has had years of sun exposure, skin drying is accelerated. For the aging smoker, dehydration of the skin is exacerbated even more.

The development of **lentigo senilis** (brown pigmented areas on the face, hands, and arms of older people) can cause the person concern over his appearance. Sometimes called liver spots or age spots, these colorations are benign. Some cosmetic agents may lighten or almost eliminate these spots.

Skin appendages (hair and nails) also undergo changes associated with aging. Hair loses its original color as the production of melanin decreases, turning it gray, and eventually, white. Hair also tends to thin, both on the head and elsewhere on the body. Nails thicken and become more brittle. Care of the toenails often becomes a problem for many older people because they may not have the flexibility to reach their feet easily. The nurse must take special care to assess the skin and its appendages. Referrals to a podiatrist may be necessary for an older person to receive adequate care of the toenails.

As a person ages, the number of sweat glands decreases; this decrease can result in heat exhaustion. The decreased amount of subcutaneous fat may also lead to increased susceptibility to cold.

The accompanying Client Teaching Checklist provides guidelines for dealing with integumentary changes. Some elderly clients will have body image changes as a result of these visible signs of aging. The nurse must assess for body image alterations. If the client has an altered body image, it may be appropriate to:

- Assist with grooming as necessary.
- Use photographs of client to help adjust to changing appearance.
- Use touch to help clarify body boundaries.

CLIENT TEACHING CHECKLIST

Responding to the Elderly Person's Integumentary Alterations

1. Instruct client to avoid excessive use of soap, hot water, and brisk rubbing when bathing.
2. Teach client to pat skin dry instead of briskly rubbing.
3. Inform client of the need to use tepid bathwater.
4. Use lotion for itching and dryness.
5. Use a humidifier to help reduce dryness.
6. Avoid prolonged pressure on bony prominences.
7. Protect the skin from temperature extremes.
8. Protect skin from sun exposure (wear protective clothing, hats, sunglasses, and use sunblock with a high SPF factor).
9. Soak nails in water before trimming.
10. Dress appropriately for weather and climate.

Alterations in Mental Status

Alterations in mental status that occur with aging can be mild and have little impact on a client's functioning, or they can be severe and require the older adult to have assistance in managing psychosocial and physical needs. The nurse must understand the types of cognitive deficits experienced by the elderly and what each one means to the client's health status.

Acute confusion is a state of diminished awareness and attention of typically short duration (hours to weeks). The level of confusion often varies according to the time of day, worsening at night; this may cause sleep pattern disturbances. The individual is usually unaware of the setting, time of day, or day of the week and needs frequent reorientation to reality.

An individual with *dementia* experiences chronic confusion, usually of a long duration (months to years), that impedes functioning. Individuals with dementia will exhibit personality changes, difficulty with sequential speech and thoughts, and possibly a lack of orientation to reality. *Alzheimer's disease* is a type of dementia that causes numerous deficits, including diminished intellectual abilities, confusion, and impaired judgment.

Depression is an altered state of mood that lasts at least 6 weeks. Individuals suffering from depression typically are alert and oriented to their environment but are characterized by exaggerated sadness, apathy, and preoccupation with negative thoughts. Table 18-1 offers guidelines for distinguishing among acute confusion, dementia, delirium, and depression in the elderly. Many people believe that it is normal for older adults to

TABLE 18-1
Distinguishing Acute Confusion, Delirium, Dementia, and Depression

Parameter	Acute Confusion	Delirium	Dementia	Depression
Definition	Inability to think with usual clarity, speed, and coherence	Perceptual disorder characterized by heightened awareness, hallucinations, vivid dreams, and intense emotional outbursts	Deterioration of all cognitive functions with little or no disturbance of consciousness or perception	Altered emotional state characterized by feelings of intense sadness, helplessness, and hopelessness
Onset	Variable	Sudden	Gradual	Variable
Duration	Reversible	Reversible	Irreversible	Reversible
Pathophysiology	Metabolic disorders Toxic substances Cerebrovascular accident (CVA) Trauma Febrile states	Drug intoxications Withdrawal from alcohol and other drugs Encephalitis Trauma Febrile states Hypoxia Fluid and electrolyte imbalance	Alzheimer's disease Metabolic disorders CVA Head injury	Neurochemical abnormalities Significant loss Parkinson's disease Alzheimer's disease CVA Medications
Attention	Impaired: dulled	Impaired: heightened or dull	Impaired	Intact
Memory	Short term: impaired Long term: may be impaired	Short term: impaired Long term: intact	Short term: impaired first Long term: intact until disease progresses to later stages	Variable because of concentration ability
Judgment	Impaired	Grossly impaired Impulsive Volatile	Impaired	Impaired
Insight	Impaired	Impaired	Impaired	Impaired if in bipolar (manic) phase
Spatial perception	May be impaired	Intact	Impaired	Intact
Thought process and content	Impaired, incoherent	Impaired, hallucinations	Impaired	Intact but may demonstrate flight of ideas (jumping rapidly from one unrelated topic to another)

(From Estes, M. E. Z. [2002]. *Health assessment and physical examination (2nd ed.)*. Albany, NY: Delmar Publishers.)

become sad and withdrawn; this is a false assumption, which leads to lack of diagnosis and treatment of a serious health problem. Late life depression can be successfully treated if it is not dismissed as an inevitable part of the aging process.

Psychosocial Changes

The multitude of physical changes that occur with aging are accompanied by numerous psychosocial changes. As adults age, the nature of their daily lives changes along with their bodies. Major life events such as retirement, changes in social relationships and roles, changes in living arrangements, and dealing with loss are usually experienced during the later years of life and can affect an individual's health status and outlook on life.

Retirement

An individual's view of retirement is a product of many factors, including overall life attitude, support of significant others, and personal expectations. For individuals who, during their adult years, defined themselves and their success according to their work contributions, retirement is likely to produce feelings of uneasiness and anxiety. An individual who views retirement as the end of the productive years will dread the change in life pattern and social status and may fear being a burden to others, both socially and financially.

Many adults, though, look forward to retirement as their reward for years of hard work and contributions and fill their newly freed days with activities, travel, new skills or hobbies, and interests that time constraints had prohibited them from pursuing during their earlier years (Figure 18-4). These individuals typically led more balanced lives during their working years, viewing their

Figure 18-4 Retirement often means time to develop new hobbies or interests.

value as a combination of many factors including work, family, and community involvement; they adjust more easily to the loss of employment status by balancing this change with other positive aspects of their lives. Also, individuals who have planned for retirement and made arrangements (financial, housing, social) ahead of time tend to adjust more readily to this change in work status.

Social Relationships and Roles

Relationships and roles change over time as an individual grows and develops. For the older adult, these changes may take on even more meaning because activities and involvement in other areas of life may change or diminish. Changes in relationships and roles typically occur in conjunction with major life events, such as marriage, divorce, birth, death, relocation, and change in employment status. For instance, the older adult who has been a husband for 40 years will find his life and his roles greatly changed when he becomes a widower. The birth of his children's children will bring him new status as a grandparent, and his retirement will remove him from the full-time work force and present opportunities for the development of relationships with new friends.

A key to successful aging is staying connected to others. Volz (2000) cites a definite link between social support and health: older people "do better if they continue to engage with life and maintain close relationships" (p. 27).

One type of relationship that many older adults experience is grandparenthood. This relationship may be the source of pride and happiness, or it can become a negative stressor. For many older Americans, grandparenting has become a full-time responsibility, as they are the sole caretakers of grandchildren. Over 2.4 million families in the United States were maintained by grandparents in 1998. This is a 19% increase since 1990 (Davidhizar, Bechtel, & Woodring, 2000). The changing role of grandparenthood "causes caregiver stress, adversely affects child health, and ultimately diminishes family functioning" (Davidhizar, Bechtel, & Woodring, 2000, p. 24). However, not all grandparents are overwhelmed by the role of childrearing for a second generation; many find it rewarding (Davidhizar, Bechtel, & Woodring, 2000).

Listed below are some of the factors that have contributed to the increasing numbers of grandparents who are raising their grandchildren on a full-time basis:

- Divorce
- Unemployment
- Teen pregnancy
- Death of a grandchild's parent
- Abuse and/or neglect of the child
- Substance abuse

Nurses should be knowledgeable about potential areas of stress imposed by the additional responsibilities of the new grandparenthood role. Also, knowledge of community resources is essential for appropriate referral. Some

grandparents may also need information about current childhood problems that were not as prevalent during their years of parenting their own offspring (e.g., cyberporn, school violence).

Living Arrangements

Advancing age often brings with it changes in living arrangements. The older client has many living options depending on income, health status, activity level, level of independence, and family or other support systems; see Figure 18-5. A change in living arrangements is a significant event for any individual, but for older adults, this change may mean leaving family, friends, neighbors, and routines that have been a part of life for decades. Most older adults prefer to remain in their homes or dwellings, in a familiar environment and with familiar routines. In some cases, older adults may move in with their grown children and their families or have the grown children move in with them. The degree of physical, psychological, and financial independence of the older adult, and the status of the relationship with the children, will likely determine the success of this arrangement. Larsen (1998) reports:

One of the most pressing community challenges we face is the care of elderly persons with a chronic illness. Home care for this population is provided primarily by family members who report chronic fatigue, anger, depression, stress, family conflicts, and excessive financial costs. (p. 8)

Older adults needing assistance to remain in their homes may take advantage of home care services, which provide assistance in the tasks of daily living, or day care services, which provide limited health and rehabilitation intervention. Assisted Living Facilities (ALFs) are quickly becoming the transition between living independently at home and residing in a nursing home (Kaas & Lewis, 1999). Nursing homes and ALFs are the most common types of residential treatment services used by the older adult. Other options include foster care, group living arrangements, and hospice (Fleming, 2000). “Although only 5% of the older population reside in nursing homes at any one time, about 43% of all people eventually spend some time in such a facility”

(National Institute of Aging, 2000). When health needs necessitate extensive or full-time supervision and care, a long-term care facility such as a nursing home may be the best living option. Nursing homes offer a variety of services to support the medical, personal, and psychosocial needs of the aging client. Older adults who are able to participate in the decision regarding their living arrangements generally adapt better to the change than those who are unable to participate or who are not involved in their care decisions.

NURSING TIP

Monitoring Drug Use by the Older Adult

Watch for nonspecific side effects, such as appetite disturbance, altered behavior, and falls. Many side effects of medication use are subtle and, therefore, not detected.

Coping with Loss

Loss is an inevitable part of life, and the longer a client lives, the more losses will be experienced. Losing a lifetime partner is one of the most stressful loss experiences an individual can face, and many older clients will face loss through death of a spouse at some point in their lives. As the years pass, deaths of children and friends may leave older adults grieving and feeling as if everyone they have known and loved has died before them. Feelings of isolation and hopelessness may arise; these can be compounded if the individual suffers multiple losses at once or within a short period of time. Losses are magnified in older adults who are socially isolated. Fleming (2000) states:

THINK ABOUT IT

Understanding the Meaning of Loss

Consider the perspective of an older client who has experienced the loss of loved ones, such as a spouse of 50 years, or a child. How many losses of this magnitude have you experienced? Do you feel you will be able to relate to and show empathy to an older adult whose life experiences may differ dramatically from your own? What steps can you take to ensure that you treat these clients with dignity, respect, and compassion?

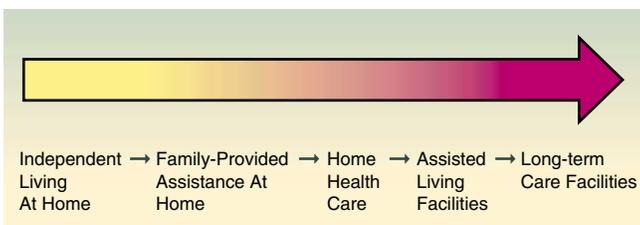

Figure 18-5 Continuum of Living Arrangements for the Elderly

We need to move away from making old people invisible. We need to care for them. We're the longest-living people planet Earth has ever seen. It's no wonder we never planned for it. We don't know how to live this long. (p. 2)

Helping older adults stay connected with others in the community is an effective intervention for those who are experiencing loss and resultant depression. Some avenues for helping elders develop a social support system are churches, senior citizen centers, neighborhood/apartment associations, and community support groups. Often, loss will lead older clients to reflect on their lives and their relationships and to review their successes and shortcomings.

Individuals who feel isolated and abandoned often feel angry and hopeless. Nursing actions that promote a sense of hope in the elderly include making time to be sure that the client is included in the discussion and asking about daily plans. It is imperative that nurses avoid expressing pity toward lonely older clients, as pity decreases hope and exacerbates the sense of loss.

MEDICATIONS AND THE OLDER ADULT

Adverse Drug Reaction

The physiological changes of aging can complicate drug therapy in the older adult. The normal effects of aging alter how the body metabolizes and excretes drugs. Therefore, older adults are more sensitive to both the toxic and therapeutic effects of medications. Another factor affecting the elderly's drug use is **polypharmacy** (the concurrent use of several medications). Older adults take more medicine than those who are young and as a result, they are at greater risk for adverse drug reactions (ADR). In addition to increased risk of an ADR, other problems associated with polypharmacy are:

- Medication errors
- Inappropriate prescribing
- Excessive drug costs
- Noncompliance

The presence of multiple diseases and the use of several medications place the elderly person at risk. The effectiveness of drug therapy in the older individual depends on the properties of the particular drug and the impact of age-related changes (Table 18-2). As reported by Aparasu (1999), one in 20 prescriptions written for older outpatients may be for medications that should not be used by older clients. "Inappropriate prescribing is the primary cause of adverse drug effects in the geriatric population" (Aparasu, 1999, p. 438).

The symptoms of many ADRs are subtle and often are confused with the changes of aging or chronic illnesses.

TABLE 18-2
Impact of Age-Related Changes on Drug Therapy

Change	Impact on Drug Therapy
Less total body fluid; body water declines by about 18%	Higher blood level of water-soluble drugs
Increased adipose tissue; decrease in lean body mass	Greater accumulation of fat-soluble drugs (e.g., diazepam, barbituates)
Decreased secretions in gastrointestinal tract, lower gastric pH	Slight reduction in absorption
Reduced liver size; functional liver tissue diminishes; decreased hepatic metabolism	Slower metabolism and longer half-life of some drugs (e.g., acetaminophen)
Reductions in number of nephrons, glomerular filtration rate, renal blood flow	Slower elimination of drugs that are predominantly eliminated in unchanged form (e.g., digitalis, kanamycin, penicillin); increased competition of protein-bound drugs
Drier oral mucosa	Difficulty swallowing tablets and capsules
Muscle mass and soft tissue decrease by 25% to 30%	Difficulty absorbing usual adult intramuscular dose at single injection site
Reduced circulation to lower bowel and vagina	Prolonged melting time for suppositories

(From Pasero, C., Reed, B., & McCaffery, M. (1998). Pain in the elderly. In M. McCaffery & C. Pasero (Eds.), *Pain: Clinical manual*. (pp. 674–710). St. Louis: Mosby.)

For example, confusion, constipation, fatigue, and dizziness are nonspecific symptoms of many conditions, including ADRs.

The older client's response to drugs is highly individualized. Therefore, the nurse must accurately monitor the client for therapeutic effectiveness and signs of adverse drug reactions.

NURSING ALERT

Use of NSAIDs by the Elderly

Older adults should take nonsteroidal anti-inflammatory drugs (NSAIDs) with caution. NSAIDs can contribute to renal disease. The elderly have renal changes that may exacerbate renal problems.

Compliance

In addition to assessing the client's responses to medications, the nurse also must assess the client's knowledge of medications being used. Knowledge about the medication, its intended effects, possible side effects, and how to reduce the side effects can increase the client's compliance with the medication regimen. Factors that may negatively affect medication compliance are as follows:

- Complicated dosing schedules and regimens
- Multiple dosing throughout the day
- Use of several medications concurrently (polypharmacy)
- Cost of drugs
- Limited mobility and range of motion (e.g., the client with arthritis who is unable to open child-proof containers)
- Impaired memory (e.g., omission—i.e., the client forgets to take the medication; overdosing as a result of not remembering whether the medicine was taken)
- Clients who need assistance and live alone

Educating elderly clients and caregivers about medication, self-administration, and ways to increase compliance is a major nursing intervention. See the accompanying Nursing Checklist.

NURSING CHECKLIST

Improving Medication Compliance

1. Provide easily understood information about the medications.
2. Schedule administration of the medication around certain activities of daily living as a reminder to the client.
3. Provide the client with a name and telephone number of a person to contact when questions arise.
4. Assess how the medications are stored and arranged in the client's home. Make sure they are accessible.
5. Perform a complete drug history to determine *all* medications being taken. Instruct the client or caregiver to provide this information to the prescribing practitioner.
6. Encourage client and caregiver to discuss any concerns regarding the medication.

MISTREATMENT OF THE OLDER ADULT

Mistreatment of the elderly (also referred to as elder abuse) is a serious and ever-increasing problem and disturbing trend. It is estimated that annually 1 million or more older Americans are victims of some form of abuse (National Institute on Aging, 1996). There are many forms of elder abuse, including:

SIGNS OF PHYSICAL MISTREATMENT IN THE ELDERLY

- Contusions
- Abrasions
- Sprains
- Burns
- Bruising
- Human bite marks
- Sexual molestation
- Untreated but previously treated conditions
- Misuse of medications
- Freezing
- Depression
- Erratic hair loss from hair pulling
- Lacerations
- Fractures
- Dislocations
- Oversedation
- Over- or undermedication
- Welts
- Scratches
- Decubiti
- Dehydration
- Malnutrition
- Poor hygiene
- Head and face injuries (especially orbital fracture, black eyes, broken teeth)

(From Pierce, A. G., Fulmer, T. T., & Edelman, C. L. [1997]. Older adult. In C. L. Edelman & C. L. Mandle [Eds.], *Health promotion throughout the lifespan* [4th ed., p. 655]. St. Louis, MO: Mosby; Stuart, G. W., & Laraia, M. T. [1998]. *Stuart & Sundeen's principles and practice of psychiatric nursing* [6th ed.]. St. Louis: Mosby. p. 834)

- *Physical abuse*—willful infliction of injury
- *Neglect*—withholding goods or services (such as food, attention) to the detriment of the elder's physical or mental health
- *Psychological abuse*—withholding affection or imposing social isolation
- *Exploitation*—dishonest or inappropriate use of the older person's property, money, or other resources

Nurses in the home, clinic, hospital emergency department, and long-term care setting are often the first to identify signs of mistreatment in elderly people; see the accompanying display on signs of physical abuse. Abused older adults may either cling to or act in a very guarded manner toward the abuser. Another indicator of possible abuse is vague explanations offered for the cause of the injuries. Psychosocial indicators of abuse may be anger and rage, depression, anxiety, and conflictual interactions between the older adult and the abuser.

When assessing for mistreatment, the nurse must be nonjudgmental and avoid any signs of disapproval that may evoke further feelings of anger and shame in the older client. A private setting should be used for interviewing to promote sharing; also, if the older victim thinks the perpetrator is able to hear the interview, the victim may withhold information or refuse to talk. It is essential that the interview findings be documented in an accurate and unbiased manner.

Nursing interventions for the abused elder are primary, secondary, and tertiary. Primary intervention strategies emphasize prevention. Secondary nursing interventions consist of early identification and prompt treatment to minimize the long-term effects of the abuse. Tertiary interventions occur after the abuse and

promote recovery and rehabilitation. Tertiary interventions are restorative in nature.

If the nurse suspects abuse or neglect, this concern should first be addressed with the client. Many abused older adults may not admit to abuse because of embarrassment and/or fear of reprisal. Most states and many local governments have Adult Protective Services program. Nurses are responsible for knowing the local statutes on mandatory reporting of elder abuse, as these laws may vary.

NURSING PROCESS AND THE OLDER ADULT

Due to the changing demographics in the United States, the elderly are currently the most frequent consumer of health care services (Sheffler, 1998). Thus, an ever-increasing number of nurses will provide care to the older client. “With advancing age, health-promoting interventions along with the management of chronic health problems become essential elements for maintaining independent living and minimizing use of costly health care services” (Tanner & Lethbridge, 1998, p. 354). Nurses are the ideal health care providers to help people change their behavior in order to take advantage of increased longevity.

According to Kamimoto, Easton, Maurice, Husten, & Macera (1999), older Americans could do more to improve their health and quality of life. Listed below are areas in which older adults need to develop health-promoting behaviors:

- Nutrition: More than 60% of older adults are not eating at least five fruits and vegetables daily.
- Exercise: Approximately 33% of those aged 55 to 74 are physically inactive; 46% of those over age 74 are not physically active.
- Use of preventive health services: Fewer than 60% of those over age 65 have received the pneumococcal vaccine.
- Use of health screenings: (1) Breast cancer screening decreases with age. (2) Fewer than 33% of people aged 55 years and older had received a screening test for colorectal cancer (Kamimoto et al., 1999).

Increasing numbers of gerontological nurses are needed to provide quality of care. As stated by the American Nurses Association (1995):

Gerontological nursing is one of the profession's most challenging practice areas. Gerontological nurses will continue to work with populations at risk for health care problems as they recognize the needs of specific groups, including frail elders over age 85, minorities, the socially and financially impoverished, the homeless, and the institutionalized. (p. 6)

Professional standards for gerontological nurses were developed by the ANA in 1995; these standards are addressed in the next section.

Assessment

The data-gathering phase of assessment begins with the first encounter with the elderly client. Overall appearance, dress, gait, presentation, and general behavior can be noted when a client first enters the room. Assessment of the older client can be a time-consuming yet rewarding process when the nurse works thoughtfully and sensitively with the client to discover strengths, resources, and limitations.

When interviewing the older client in the home, it is important to also include the client's caregivers in the assessment. The home care nurse assesses:

- Family interactions
- Caregiver motivation to participate in the rehabilitation process
- The motivational impact of the caregivers on the older person to accept some control over own care
- Feelings of caregivers toward their role (i.e., level of satisfaction or burnout)

A complete assessment includes a health history and a physical examination. The ANA Standard I of Clinical Gerontological Nursing Care (American Nurses Association, 1995) states “The gerontological nurse collects client health data” (p. 11).

Health History

Older adults are individuals not only of age and vintage, but also individuals with a long history that deserves telling. The nurse's role in conducting a health history with the older client is to draw facts and interpretations from the client that will shed light on current health status and health concerns. Eliciting these data requires time and patience on the part of both nurse and client, but it can be a rewarding and interesting process. To gather pertinent health data, the nurse may interview the client and the client's support members to determine the client's past coping strategies, strengths, and health habits. A holistic approach will include discussion of physical, emotional, psychological, spiritual, and sociocultural aspects that contribute to the client's overall health.

Older clients often feel a loss of control over their lives when decisions, including health care decisions, are made by others. The nurse respects the client's dignity and independence during the interview process by facing the client, speaking directly to the client in a clear manner, and reacting appropriately to client concerns and needs.

Physical Examination

The nurse must be knowledgeable about the normal physical changes of aging in order to conduct an efficient and informative physical examination of the older client. The physical changes must be noted: the impact these changes have on the client's quality of life and activities of daily living must also be determined. The

assessment tools will need to be adjusted to the older person's abilities and limitations. For instance, the physical examination may need to be performed in more than one session to prevent client fatigue. Client positioning may need to be adjusted according to client comfort. The client may need assistance with disrobing or position changes, and the nurse must always be alert to protect the client from potential injury, such as falls. For an explanation of special considerations necessary in assessment of elderly clients, see Table 18-3.

Nursing Diagnosis

Nursing diagnoses developed from the assessment of the older client will be as varied as the clients themselves. According to the ANA (1995), gerontological nurses are expected to “analyze the assessment data in determining diagnosis” (p. 12).

Nurses must keep in mind that older clients may present with many needs, both physical and psychosocial, and that the nursing diagnoses will need to be prioritized. Client status may change frequently, so reevaluation of nursing diagnoses on a regular basis is warranted. Selected nursing diagnoses (North American Nursing Diagnosis Association [NANDA], 2001) that are frequently seen in older clients include:

- Physical
 - Impaired Physical Mobility* related to intolerance to activity/decreased strength and endurance; pain/discomfort; perceptual/cognitive impairment; neuromuscular impairment; musculoskeletal impairment; depression/severe anxiety
 - Activity Intolerance* related to bed rest/immobility; generalized weakness; sedentary lifestyle
 - Deficient Self-Care* related to intolerance to activity; decreased strength and endurance; physical, perceptual, or cognitive impairment

TABLE 18-3
Special Considerations for Assessing Elderly Clients

Assessment Area	Essential Points
Fluid balance	Elderly are more sensitive to fluid and electrolyte imbalances. Elderly can become dehydrated quickly due to deficient volumes. Monitor closely the amount of fluid administered (including oral ingestion, IV fluids, blood products). Maintain accurate fluid intake and output record.
Body temperature	Decreased body tissue, diminished thermoregulation, and peripheral vascular changes place elderly at risk for hypothermia. Watch closely for signs of chilling (e.g., shivering). Assess environmental temperature.
Neurologic	Assess mental status. Assess for underlying causes of confusion and memory loss, if necessary.
Sensory	Assess vision. Assess hearing. Determine level of orientation.
Cardiovascular	Assessment of peripheral pulses may be difficult because of atherosclerosis. Monitor for baseline values (i.e., signs of hypoxia, hypovolemia, acidosis). Reassess frequently.
Pulmonary	Monitor respiratory rate and characteristics. Assess ability to cough productively. Reassess frequently to detect early indicators of deterioration.
Musculoskeletal	Evaluate ability to ambulate (immobility contributes to risk of pulmonary embolism and deep vein thrombosis). Determine amount of assistance needed for performing activities of daily living.
Integumentary	Less elastic, thin skin abrades easily and is vulnerable to pressure. Assess for any reddened areas or fissures. Check skin turgor.

(From Walhout, M. F., Tubergen, C. R., & Cook, K. J. [1998]. Multiple accident victims: All elderly. *Nursing98*, [November] p. 59.)

- Psychosocial
 - Social Isolation* related to absence of supportive significant others; alterations in physical appearance; alterations in mental status; inadequate personal resources
 - Risk for Loneliness*: risk factors include affectional deprivation; physical isolation; social isolation
 - Ineffective Role Performance* related to change in self-perception of role; change in physical capacity to resume role; change in usual patterns of responsibility
 - Impaired Home Maintenance* related to disease or injury; insufficient finances; impaired cognitive or emotional functioning; inadequate support systems
 - Acute Confusion* related to age; dementia; alcohol abuse; drug abuse; delirium

Outcome Identification and Planning

Outcomes identified in the plan of care must be developed in partnership with the older client and the client's support system. See the accompanying display for the ANA gerontological standards related to outcome identification and planning.

STANDARDS OF CLINICAL GERONTOLOGICAL NURSING CARE: OUTCOME IDENTIFICATION AND PLANNING

The gerontological nurse:

- Identifies expected outcomes individualized to each client
- Develops a plan of care that prescribes interventions to attain expected outcomes

(From American Nurses Association. [1995]. *Scope and standards of gerontological nursing practice*. Washington, DC: Author.)

Outcomes should be realistic for the client's current status and desired goals and should be targeted to maintaining a certain level of health or restoring the client to a former state of health. Support systems, friends, and colleagues should be involved as agreeable with the client to assist in meeting health care needs. See the accompanying Nursing Process Highlight for a discussion of a teaching plan for an older client.

Implementation

Nursing interventions for the elderly client will typically focus on the areas of maintaining physical health, supporting psychosocial well-being, promoting safety, and providing restorative care. The ANA (1995) directs

Nursing Process Highlight

OUTCOME IDENTIFICATION AND PLANNING

When developing client outcomes and a teaching plan, consider:

1. Plan for a quiet, private environment that is conducive to learning.
2. Assess the client's readiness to learn as well as previous knowledge.
3. Treat the client as a partner whose input is valuable in the planning and outcome identification process.
4. Assess sensory status, especially sight and hearing, and adjust actions according to client needs.
5. Use language that is clear and easy to understand.
6. Encourage clients to ask questions and verbalize their understanding of what is being taught. For instance, state, "I want you to feel free to ask questions; all your questions are important."
7. Plan to include the family and significant others in the teaching session, not as a substitute for the client, but for support and reinforcement.
8. Plan for active learning experiences (e.g., use examples, simulations, games, and audiovisuals when appropriate).
9. Pace the learning. Do not give too much information at one time, and progress at the individual's learning pace. Stop if you see that the client is distracted or fatigued.
10. Plan to summarize and reinforce what has been taught.

gerontological nurses to "implement the interventions identified in the care plan" (p. 16).

Three major interventions used effectively with the elderly are education, communication, and life review. See Chapter 13 for specific guidelines for teaching elderly clients. The Nursing Checklist provides information on communication effectively with older adults.

Life review (also referred to as reminiscence therapy) is a structured intervention in which the nurse guides the client through remembrance of life, stage by stage. This intervention is especially therapeutic for clients who feel alienated and depressed as it helps people develop a sense of meaning and promotes achievement of the sense of integrity identified by Erikson (1968). Brady (1999) discusses the "power and efficacy of reminiscence and life review for the elderly" (p. 178). See the accompanying display for some of the therapeutic outcomes of reminiscence.

**NURSING CHECKLIST****Communicating with Elderly Clients**

1. Get the client's attention before you speak.
2. Minimize extraneous stimuli (e.g., background noises).
3. Sit directly facing the client, keep your mouth visible, and maintain eye contact.
4. Speak slowly and clearly. Use short simple sentences. Give the client time to respond.
5. Speak loudly enough for the client to hear you, but avoid yelling.
6. Use repetition often.
7. Summarize frequently the most important elements of your message.

(From: Tips on overcoming communication breakdown with elderly patients. (1999). *Home Healthcare Nurse*, February, 1999, 17[2], 78.)

BENEFITS OF REMINISCENCE

- Enhances problem-solving
- Provides an outlet for catharsis (“getting things off one’s chest”)
- Assists in resolving conflicts
- Maximizes long-term memory when short-term memory is impaired
- Maintains identity and self-esteem
- Promotes ability to attain perspective and find meaning

(From Brady, E. M. [1999]. Stories at the hour of our death. *Home Healthcare Nurse*, 17[3], 176–180; Eliopoulos, C. [1999]. *Manual of gerontologic nursing* [2nd ed.]. St. Louis: Mosby.)

Maintain Physical Health

During the assessment phase, the nurse will identify which physical changes are the result of normal aging and which have underlying pathology. Clients will need to be educated as to what these changes mean, what impact they may have on their daily activities, and what strategies they can use to meet their needs given their new or changing abilities. It is critical to emphasize clients' assets and abilities, instead of focusing on limitations, to maintain a healthy self-concept and to show clients how much independence they still maintain.

Specific interventions related to the physical changes of aging will depend on the nature of the alterations. For instance, skin changes such as dryness, wrinkling, or flaccidity can be partially overcome through the use of oils, moisturizers, and a humidifier. If deteriorating eyesight is a prominent complaint, nurses should instruct the client to avoid reading when fatigued, to use large-print materials, and to ensure that the reading environment is well lit with an overhead and desk lamp that does not create glare. If cardiovas-

cular changes result in fatigue and shortness of breath on exertion, nurses should help the client learn the signs indicating his activity tolerance level and to adjust activity accordingly (for example: plan for frequent rest periods, sit or lie down when fatigued, avoid carrying heavy parcels when ambulating).

Support Psychosocial Well-Being

An older client's psychosocial health is as equally important as physical well-being. The use of touch and therapeutic communication helps the client overcome feelings of isolation and enhances a positive self-concept. Encouraging the older adult to be active in social groups, leisure activities, and hobbies supports a higher level of self-esteem and pleasure with life and helps the client to focus on positive traits and abilities.

The client's family or significant others can have a significant impact on maintaining the client's psychosocial functioning. They can assist the client in maintaining a relatively independent lifestyle and may even be able to help the client sustain activities of daily living outside of an institutional environment. For clients without support systems, teaching how to cope with alterations in mental status (e.g., using calendars to orient to reality, reading the daily paper to keep aware of current events) and how to work within those parameters can help clients maintain a sense of independence and dignity.

Promote a Safe Environment

Ongoing assessment includes observing the client's immediate environment for safety. This is especially critical for clients who will be remaining in their own homes or in a home situation where they, not the health care staff, are responsible for maintaining a safe environment. Family members and significant others should be included in the efforts to create a safe environment for the elderly client (see Figure 18-6). See Chapter 31 for additional information on safety and preventing falls.

Falls are a major safety issue with many older adults. The accompanying display lists some age-related factors that contribute to falls.

In order to promote a safe home environment for the elderly client, the nurse may suggest the following environmental safety actions:

- Provide adequate nonglare lighting.
- Place nightlights in bedroom, bathroom, and hall.
- Install slip-proof mats in tub/shower.
- Place a chair in tub/shower.
- Install grab bars in tub/shower and next to toilet.
- Have handrails next to stairs and in long hallways.
- Use sturdy chairs with armrests.

Each year, approximately 2 million elder Americans are victims of crime (National Institute on Aging, 1996).

Figure 18-6 Educating the older client about safety, particularly in the home, is an essential nursing function that is facilitated by the use of clear step-by-step instructions.

Older people are often easy targets for car theft, robbery, and burglary. For suggestions on preventing victimization, see Table 18-4.

Restorative Care

Restorative nursing care (also referred to as rehabilitative care) seeks to assist the client in regaining maximal functional ability. Restorative care that is provided to clients who have residual impairment as a result of disease or injury seeks to increase the client's independence and ability to perform self-care. Nurses providing restorative care understand that sometimes the impairment in functional ability will remain. In such cases, the goal is to help the client function at the maximal level

AGE-RELATED FACTORS CONTRIBUTING TO FALLS

- Decreased visual acuity
- Poor vision in dimly lit areas
- Less foot and toe lift when walking
- Altered center of gravity
- Slower reflexes
- Impaired muscle control
- Orthostatic hypotension (blood pressure related to posture)
- Urinary frequency

(From Ebersole, P., & Hess P. [1999]. *Toward healthy aging: Human needs and nursing response* [5th ed.]. St. Louis: Mosby; Eliopoulos, C. [1999]. *Manual of gerontologic nursing* [2nd ed.]. St. Louis: Mosby.)

possible. Nurses constantly balance the client's need for dependence with the need for independence. In other words, nurses provide care as needed while encouraging the client to do for self as much as possible. Restorative care is provided in home health, assisted-living facilities, and long-term care facilities (e.g., nursing homes).

Clients who might benefit from restorative care are those who:

- Are incontinent
- Have an indwelling catheter
- Are nonambulatory
- Have pressure sores (decubitus ulcers)
- Require partial or complete assistance with activities of daily living

See the Nursing Checklist for interventions most useful in providing restorative care.

TABLE 18-4
Suggestions for Decreasing the Risk of Elder Victimization

In the home	Lock doors and windows. Be sure locks cannot be easily broken. Install an alarm system. Identify the caller before opening the door. Take photographs of valuable items; mark items with an identification number.
On the street	Always be vigilant. Avoid dark alleys and dark parking areas. Walk with others instead of alone. Have monthly income checks sent to the bank via direct deposit. Vary the time you go to the bank. Avoid using isolated ATM machines. Avoid keeping a lot of cash on hand, but if threatened by an assailant, hand over all cash.
Consumer fraud	Don't take money if a stranger tells you to do so. Avoid giving credit card or bank account numbers over the phone. Beware of deals that sound "too good to be true"; check with the local Better Business Bureau. Be alert to "miracle cures" for health problems.

(From National Institute on Aging. [1996]. *Age page: Crime and older people*. Gaithersburg, MD: Author.)

NURSING CARE PLAN

An Older Adult Who Is Confused

Case Presentation

Winston Evans, an 82-year-old man, is a retired grocer who was widowed 6 years ago. Until last year, Mr. Evans lived alone in a small home, was involved with his family, went to church regularly, and enjoyed socializing with peers at the community senior center. He now lives in his daughter's home. His daughter brings him to the clinic today stating, "We can't go on like this! Last night he walked out of the house and was missing for hours. The policeman brought him home while we were looking for him." This was Mr. Evans' fourth episode of wandering within the past 3 months. The daughter also stated that Mr. Evans was unable to take care of himself. "I have to feed and bathe him every day." Mr. Evans was unable to state the date, day of week, month or year. He also did not know where he was, even though he had been treated by the nurse practitioner (NP) for several years at the clinic. He could not remember the names of his family except for his daughter. He was observed by the NP to be restless, and his speech was rambling and confused. Mr. Evans tells the NP, "Get away from me. No one's gonna hurt me." His medical diagnosis is severe arthritis, glaucoma, and congestive heart failure. He weighs 115 pounds (a weight loss of 24 pounds over the past 4 months), he "picks at his food," is constipated, sleeps most of the day, and is usually loud and restless at night. During the assessment, Mr. Evans is agitated and cries out several times, "Help me, help me!"

Assessment

- Disoriented
- Forgetful
- Restless
- Paranoid
- Wandering behavior
- Insomnia
- Decreased appetite
- Constipation

Nursing Diagnosis #1

Risk for Injury related to confused mental status.

Expected Outcome

Mr. Evans will be free from injury to self or others.

Interventions/Rationales

1. Approach in a calm, nonthreatening manner.
Decreases anxiety level, which further impairs mental status.
2. Determine the presence of personal or environmental risk factors.
Identification of safety hazards is the first step in minimizing such hazards.
3. Orient Mr. Evans regularly to his environment.
To decrease client's frustration level and better understand client needs.
4. Closely supervise Mr. Evans at night to assess safety.
To determine which risk factors are present and what safety measures should be implemented.
5. Set limits on self-destructive behavior.
To promote safety of client and others.
6. Monitor judgment, decision-making ability, and impulse control.
Impaired judgment and impulsivity increase the likelihood of unsafe behaviors.
7. Minimize specific hazards in the home (e.g., remove stove knobs, store cleaning products and medications in a locked area, clear floor and hallway of obstacles).
To make the home environment safer.
8. Provide an ID bracelet for Mr. Evans to wear at home, and participate in local police registry if available.
To increase possibility of client's quick return to home if he wanders away. *(continues)*

NURSING CARE PLAN**An Older Adult Who Is Confused (continued)**

9. Keep nightlights on at night.
Decreases the potential for falls.
10. Instruct family to install an alarm system on all exit doors.
To minimize the possibility of wandering.

Evaluation

Goal met. Mr. Evans remains free from physical injury and does not injure any one else. He has not wandered off alone in the past week.

Nursing Diagnosis #2

Disturbed Sleep Pattern related to altered mental status.

Expected Outcome

Mr. Evans will experience at least 4 hours of uninterrupted sleep at night.

Interventions/Rationales

1. Monitor and keep a record of sleep patterns.
To determine a baseline for future evaluation of progress or lack of progress.
2. Minimize daytime napping.
Older adults need less sleep, so daytime napping only subtracts from amount of sleep required at night.
3. Schedule exercise 2 hours prior to scheduled bedtime.
To provide relaxation.
4. Teach client and family simple relaxation techniques.
Keeping instructions simple helps the client who is confused to better absorb the information. Relaxation techniques can be used to promote sleep.
5. Limit caffeine intake.
Caffeine can interfere with sleep.
6. Ensure quiet environment with a soft nightlight.
Promotes relaxation and a sense of comfort.
7. Provide comfort measures and teach such measures to family.
The use of back rubs and rearranging linens can promote comfort and relaxation.

Evaluation

Goal partially met. Family reports that Mr. Evans is sleeping every night in approximately 3-hour intervals.

Nursing Diagnosis #3

Bathing/Hygiene Self-Care Deficit related to cognitive impairment.

Expected Outcome

Mr. Evans will perform activities of daily living (ADL) with optimal independence.

Interventions/Rationales

1. Monitor ability to perform ADLs.
To determine the client's level of functional ability and the amount of assistance that is needed.
2. Encourage client to perform the skills that are present.
To prevent functional disuse and to promote self-esteem.

(continues)

NURSING CARE PLAN

An Older Adult Who Is Confused (continued)

3. If necessary, give step-by-step directions in clear simple terms with only one step at a time.
Breaking a task down into small segments increases the likelihood of successful completion.
4. Instruct family to purchase clothing (or modify existing wardrobe) with Velcro fasteners instead of buttons and zippers.
Decreases amount of effort client must expend to dress self appropriately without assistance.

Evaluation

Goal partially met. Mr. Evans is able to dress himself if the clothes are laid out by someone else. He follows step-by-step directions but is unable to initiate or complete the task alone.

(From Carpenito, J. L. [1999]. *Handbook of nursing diagnosis* [8th ed.]. Philadelphia: Lippincott; Krupnick, S. L., & Wade, A. [1998]. *Psychiatric care planning*. Springhouse, PA: Springhouse; North American Nursing Diagnosis Association. [2001]. *Nursing diagnoses: Definitions & classifications, 2001–2002*. Philadelphia: Author.)

NURSING CHECKLIST

Guidelines for Providing Restorative Care

1. Encourage independence.
2. Use a positive, reassuring approach.
3. Be alert to limitations and client-expressed need for help.
4. Encourage client decision-making.
5. Communicate with words easily understood by the client. Ask client to repeat directions in order to assess their comprehension.
6. Provide positive reinforcement often.
7. Use repetition through words and actions (i.e., demonstration).
8. Provide rest periods as needed.
9. Ensure client safety by safeguarding against injury at all times.

KEY CONCEPTS

- Persons in the late adulthood years are often classified as “young old” (those between 65 and 75); “middle old” (those between 75 and 85); and the “old” (those 85 and older).
- Biological theories of aging state that the physical changes of aging are universal and inevitable.
- Psychosocial theories of aging consider factors other than genetics when describing the aging process.
- Numerous myths about aging can be viewed as ageism, which is stereotyping and discrimination based on age.
- Advances in medicine and technology have greatly improved life expectancy as well as the quality of life for the elderly.
- Developmental tasks of the elderly include enhancing skills, gaining and sharing wisdom, renewing relationships, expanding knowledge, and adjusting to losses and change.
- The multiple physical changes associated with aging can have a profound impact on an older adult’s ability to function and to perform activities of daily living.
- Retirement, changes in social relationships, changes in living arrangements, and loss may affect an older client’s self-esteem, self-concept, impression of self-worth, and feelings of isolation.
- Individuals who have had a positive outlook on the aging process over the years tend to adapt better to retirement and the many other life changes that occur in late adulthood than do individuals who fear or do not understand the aging process.
- Physical assessment of the older client will need to be tailored to the client’s functional level and activity tolerance.
- Including family and significant others in planning and implementing care for older clients enhances the chance for successful outcomes.
- Restorative nursing care (also referred to as rehabilitative care) seeks to assist the client in regaining max-

Evaluation

Evaluation is an important function of all nurses working with the elderly. The ANA standard for gerontological requires nurses to evaluate the “aging person’s progress toward attainment of expected outcomes” (ANA, 1995, p. 17). Evaluation is a major determinant of the need for continuing care of the older client. The nurse must decide whether the original assessment is still pertinent and if its accompanying diagnoses have been resolved. New diagnoses need to be established on the basis of client progress and changing needs, and new goals must be developed with the client and significant others that will foster maximum health status based on the client’s abilities and capabilities. In terms of providing for continuity of care, the nurse should consider the ongoing needs of the client and offer resources or make referrals to ensure that the health and well-being of the client will continue to be monitored and enhanced.

imal functional ability. Restorative care is provided to clients who have residual impairment as a result of disease or injury and aims to increase the client's independence and ability to perform self-care.

- Safety is a primary concern when caring for older clients; this can be addressed through thorough assessment and client and family teaching.

CRITICAL THINKING ACTIVITIES

1. Explain “old age” in terms of theories and misconceptions about aging.
2. What are the multiple physiological changes associated with aging and the impact these may have on an older adult's ability to function and to perform activities of daily living?
3. Discuss the psychosocial impact that retirement, changes in social relationships, changes in living arrangements, and loss may have on the older adult.
4. Define polypharmacy and its significance for nurses caring for older clients.
5. What are the physical and psychological signs of elder abuse?
6. What safety considerations for the elderly living at home should the nurse and caregivers evaluate?
7. Develop guidelines for teaching the older client.
8. As the nurse manager of a nursing home, you want to establish a program to encourage clients to engage in life review. You decide to conduct a weekly class for interested residents who want to share their life experiences. How would you prepare for the class? What agenda would you establish? How would you evaluate the effectiveness of the class?

Self-Concept

So much is a man worth as he esteems himself.

—Milton, 1532 (in McWilliams & McWilliams, 1991)

COMPETENCIES

1. Describe the four components of self-concept.
2. Explain the development of self-concept throughout the life span.
3. Discuss factors affecting self-concept.
4. Describe behaviors indicative of altered self-concept.
5. Discuss application of the nursing process with clients experiencing self-concept alterations.

KEY
TERMSbody image
identity
rolerole conflict
self-concept
self-esteem

Self-concept (an individual's perception of self) affects every aspect of life, including relationships, functional abilities, and health status. No two people have an identical self-concept; self-concept is what helps make each individual unique. Everyone has both positive and negative self-assessments in the physical, emotional, intellectual, and functional dimensions, which change over time and according to the context of the situation. Because self-concept is an individual's frame of reference for perceiving and interacting with the world, it exerts a powerful influence on one's life. Though neither visible nor tangible, a positive self-concept is one of the greatest strengths a person can possess.

One's view of self affects the ability to function. A person who sees self as a competent individual will behave competently and vice versa. Individuals with a positive self-concept approach new experiences and tasks with confidence; they expect to be accepted by others and to succeed. Conversely, the person with a negative self-concept tends to shy away from others and to avoid challenges. Self-concept greatly influences health status. For example, a person with a positive self-concept is more likely to care for one's self—physically, emotionally, and spiritually. The relationship of the components of self-concept and mental health are discussed in Table 19-1.

TABLE 19-1
Self-Concept and Mental Health

Component of Self-Concept	Relationship to Mental Health
Strong sense of identity	Experiences self as a unique individual.
Accurate and positive body image	A healthy awareness of one's body is based on reality testing.
Positive self-esteem	A person with a high degree of self-esteem respects self and treats self with dignity.
Satisfying role performance	The person with healthy role performance relates well with others and receives gratification from fulfilling role expectations.

COMPONENTS OF SELF-CONCEPT

Self-concept is composed of four components: **identity**, **body image**, **self-esteem**, and **role performance** (see Figure 19-1). By considering these four elements of self-concept, nurses can more effectively respond to a client.

Identity

A sense of personal **identity** is what sets one person apart as a unique individual. A well-formulated identity provides the answer to the question “Who am I?” Identity may include a person's name, gender, ethnic identity, family status, occupation, and various roles.

A person begins to develop identity during childhood and constantly reinforces and modifies it throughout life. First, parents or caretakers provide a child with elements of an emerging identity. Children may be told they are good or naughty, shy or outgoing, creative or dull, powerless or empowered. Children believe what they are told by others, and these beliefs influence the developing identity. During adolescence, conflict often arises as the teenager struggles to become independent and to establish a unique identity. Eventually, people learn to observe themselves critically, as their social environment expands. Feedback from others may support and strengthen an aspect of identity already implanted, or it may contradict an aspect and help change it.

Body Image

Body image is an attitude about one's physical attributes and characteristics, appearance, and performance.

Body image is dynamic because any change in body structure or function, including the normal changes of growth and development, can affect body image. The ado-

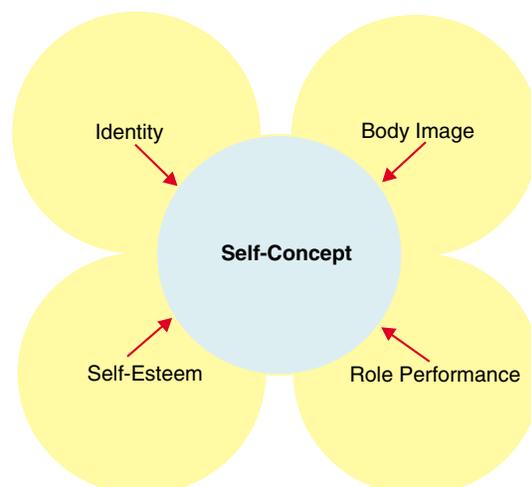

Figure 19-1 The Interrelationship of the Components of Self-Concept

lescent years are a good example of the interplay between an individual's physical changes and a developing sense of body image. Many teenagers will have harmless body image distortions. It is not at all uncommon for adolescents to feel self-conscious because they think their noses are too big, or their hips too wide, or their blemishes too prominent. Usually, these are normal concerns. Adolescents generally find that their perceptions continue to evolve as their physical development continues to mature.

Self-Esteem

Self-esteem is an individual's generalized sense of worth and value, or how a person regards self. Self-esteem refers to an individual's self-evaluation, whereas self-concept is a broader term encompassing an individual's overall self-description.

The level of self-esteem at any given moment can be influenced by many factors. Individuals will make decisions on what life factors (for example, physical attributes, skills, social accomplishments) they deem important and will calculate their self-esteem on the basis of their achievement of the factors they value most highly. These values will be based on the individual's familial and cultural background and influenced by societal standards. Self-esteem will vary over time depending on the situation (e.g., new job), the environment (e.g., cocktail party with strangers), and an individual's level of development and overall self-confidence.

THINK ABOUT IT

Self-Esteem

How do you value yourself? As a human being or as a human doing? Do you praise yourself for who you are—or for what you do?

Role Performance

Role refers to a set of expected behaviors that are determined by familial, cultural, and social norms. Individuals fulfill several roles simultaneously—parent, sibling, friend, spouse, student nurse. Each role has a set of expected behaviors, that is, a belief about how a person in that role should behave.

The nurse theorist Peplau examined roles in the context of the nurse-client relationship. The nurse may assume several different roles, such as counselor, teacher, leader, or surrogate parent. As the relationship progresses, the client feels free to express deep feelings to the nurse because the nurse has assumed the roles of listener, counselor, and expert. As teacher, the nurse may provide information to the client or correct misconceptions. As counselor, the nurse responds to the client's feelings or behavior, helping the client to gain insight or self-care or a health-affirming outlook.

Stressors Affecting Role

Roles have accompanying responsibilities. Whenever a person is unable to fulfill role responsibilities, self-concept is impaired. When an individual has too many roles to fulfill simultaneously, overload can occur. The person becomes overwhelmed by the many demands of several roles. The individual may complain of being stressed out and feeling unable to cope. In fact, the individual's coping skills are greatly taxed.

In addition to overload, another common problematic role experience is **role conflict**, which occurs when the expectations of one role compete with the expectations of other roles. The person may feel unable to establish priorities among competing role expectations. Table 19-2 describes the various types of role conflict.

THINK ABOUT IT

Personal Roles

Consider the various roles you currently fulfill. What are some of the potential conflicts inherent in your multiple roles? For example, your role of student may at times conflict with your role of friend or parent (e.g., you need to be in class at the same time you need to attend a parent-teacher conference or be available to your friend who is undergoing a crisis). Or your need to study for an examination (student role) is superseded by your need to work (role of wage earner).

TABLE 19-2
Types of Role Conflict

Type	Description	Example
Interrole conflict	Expectations of one role oppose expectations of another role.	A woman's job requires travel at the same time her child's dance recital is scheduled.
Interpersonal role conflict	Incompatible role expectations are held by one or more people.	A husband and wife disagree on parental expectations (e.g., disciplinary methods).
Role overload	Excessive demands of numerous roles have conflicting priorities.	A nurse must decide which urgent task to do first.
Person-role conflict	The individual's values are violated by demands of a role.	A nurse who believes in always telling the truth is directed by the supervisor to withhold a diagnosis from a client.

THINK ABOUT IT

Sick Role

It is difficult enough for a healthy person to manage multiple roles, conflicts, and stresses. But what happens when illness forces an individual to assume the “sick role”? What are the social expectations of a sick person, and what effect does this new and often unexpected role have on all the other roles the individual performs?

DEVELOPMENT OF SELF-CONCEPT

Self-concept evolves throughout life and depends to an extent on an individual’s developmental level. Self-concept changes during each developmental stage. According to Stuart and Laraia (1998), the ongoing process of self-concept development is facilitated by the following:

- Interpersonal and cultural experiences
- Self-perceived competence
- Self-actualization (living up to one’s potential)

Self-concept is developed primarily in response to social interactions and experiences. Sullivan (1953) stated that self-concept is developed according to perceptions mirrored by others to the individual. A person’s concept of self depends, to an extent, on what one thinks that others think about oneself.

As individuals mature, they can accept or reject the appraisals of others and change their behavior, in a way that leads to a more positive self-concept.

Childhood

Self-concept is not innate; rather, it develops throughout the life cycle as a result of social interactions. An infant whose basic needs are met in a warm, consistent manner develops positive feelings about self. Formation of self-concept occurs in the following manner: (1) during infancy, the child develops a self-perception of being separate from the environment (including parents); (2) as the child ages, perspectives (especially of the parents) are internalized; and (3) society’s norms (e.g., expectations of appropriate behavior) are then internalized by the child.

A child’s sense of self is shaped by family experiences and interactions with parents and siblings. Children learn about their individual worth and their ability to be competent in the family unit and their sense of self changes as they move through each developmental stage. Infants learn to trust based on the degree to which

their needs are met, and begin to develop a sense of self as distinct from the primary caretaker and their surroundings. As new skills are mastered, toddlers begin to develop a sense of autonomy and self-image, yet they still remain very self-centered. Preschoolers have increasing initiative and self-awareness as their expanding language and motor skills broaden their horizons, and they begin to have an awareness of emotions and the values that their families embrace. When children reach school age, they will incorporate experiences and values of their new contacts and environments into their image of self and may start to have an understanding of their strengths as well as their shortcomings (see Figure 19-2).

Positive experiences, role models, and family environment are all crucial to the healthy self-concept of the growing child. The impact of early parent-child experiences on the shaping of a child’s self-concept was emphasized by Sullivan (1953), whose interpersonal theory of psychiatry has greatly influenced nursing. The child develops a sense of self according to the type of feedback received from significant others (parental figures). Positive feedback reinforces the development of a “Good-Me” sense of self. A negative self-concept (“Bad-Me”) is reinforced by feedback that is consistently negative and anxiety-provoking.

Adolescence

The numerous changes in physical, emotional, and psychosocial status that characterize the adolescent years bring about rapid and often continuous changes in self-concept. Impressions about self from childhood may be internalized or challenged. The primary benchmark for arriving at an overall perception of self can change from family or parental values to those held by peers and friends or embodied in desired role models. Teens typically invest tremendous energies in appearances and social status and often fail to see their positive traits if they feel deficient in these areas. Adolescents often can-

Figure 19-2 For a school-aged child, praise from teachers and a feeling of accomplishment in school can boost self-esteem.

not separate their opinion of their own body image, for instance, from their overall self-concept; the teen who views herself as fat, when in fact she is emaciated, is likely to have a disturbed self-concept based on her distorted body image, regardless of what other positive qualities she may possess.

NURSING ALERT

Teens and Self-Concept

Because of their emphasis on body image, teens are at particular risk for feelings of disturbed body image, which may lead to serious health concerns, such as anorexia nervosa and bulimia nervosa. The nurse needs to learn to distinguish between what might be a normal body image distortion (“I wish I were 3 inches taller.”) and one that can have serious, even fatal, consequences (“Weighing 100 pounds is the most important thing in the world for me.”). Determining a teen’s self-concept and the importance he or she places on different aspects of self will help the nurse know which perceptions are normal reactions to the changes of adolescence and which are potentially harmful.

Adulthood

Self-concept continues to develop and change as an individual progresses through the adult years. Periods of relative stability in self-image may be interspersed with realizations of physical changes in body size, proportion, characteristics, and energy levels, all of which will influence perception of self. Involvement in family, work, and community obligations and activities often contributes significantly to an individual’s self-concept, as roles and responsibilities change and new roles are introduced. Healthy adjustment to these changes usually leads to a positive self-concept (see Figure 19-3).

Figure 19-3 The mature adult’s self-concept can be enhanced by learning new skills and enjoying new activities.

Figure 19-4 Elders need to adjust their self-concept, especially body image, in accordance with physical changes that affect appearance.

As the years pass, the older adult’s perception of self continues to develop. Learning to adapt to the numerous physical changes that normally occur with aging, such as diminished eyesight and hearing, lower stamina levels, loss and change in color of hair, can be a true challenge for many individuals; see Figure 19-4. Accompanying these changes is often the desire to look back on one’s life and evaluate its overall success. Such reminiscence is usually a critical factor in an older adult’s self-concept.

FACTORS AFFECTING SELF-CONCEPT

There is a universal need for positive self-concept, which includes a high degree of self-esteem and self-acceptance. This need develops in childhood as a result of the approval the child receives from parents and other adults. Any type of threat (real or imagined, actual or anticipated) may challenge one’s self-concept.

Altered Health Status

Illness evokes anxiety in most people; in turn, anxiety can result in illness. Every client will have some element of anxiety that influences behavioral and emotional responses. Most ill people are somewhat uneasy, especially if they are being treated in an unfamiliar environment. When anxiety level is heightened, recovery is compromised. Nurses, as professionals who focus on the human response to illness, must be aware of the anxiety level of clients to promote more effective adaptation. Table 19-3 shows common stressors experienced during illness.

By their very nature, some illnesses may impair self-concept. For example, there is a social stigma against mental illness; the reactions of other people to the mentally ill person affect the client’s self-perceptions. Many people fear cancer and isolate those affected with the disease. A diagnosis of acquired immunodeficiency syndrome (AIDS) may also carry a stigma leading to low self-esteem. Society often shuns those with AIDS, which

TABLE 19-3
Stressors Associated with Illness

Threat	Example
Threats to physical safety	Undergoing painful procedures (the thought of receiving an injection evokes anxiety in many) Fear of pain Fear of death
Threat to psychological integrity	One's image of self is threatened or challenged by new situations (such as moving to a nursing home)
Inability to exert control	Having little or no input into important decisions. Clients often feel as if they have no input into decision making regarding their treatment plan Loss of control may have a negative impact on self-concept and self-esteem which in turn evokes anxiety
Unmet biological needs	Hunger Thirst Urge to eliminate and lack of bathroom or privacy for toileting Physical pain, discomfort

may make them feel embarrassed or ashamed about their illness. To improve the client's quality of life, the nurse caring for individuals with any of these disorders must intervene to promote positive self-concept.

Compromised health status that requires surgery can also lead to several psychological alterations, including an impaired body image. Altered body image may result from loss of a body part or function; surgical procedures often threaten body image. Some procedures (e.g., mastectomy, amputation, colostomy) may leave the individual feeling mutilated or flawed. Other common sequelae of surgery—decreased independence, loss of

Title of Study

“Developmental Task Achievement and Learned Resourcefulness in Healthy Older Adults”

Authors

Zauszniewski, J. A., & Martin, M. H.

Purpose

To examine Erikson's eight developmental tasks as predictors of learned resourcefulness in healthy elders. Learned resourcefulness enables an individual to cope with adversity.

Methods

A convenience sample of 60 older adults aged 65 to 90. Two self-reported instruments were used for the analysis.

Findings

This study examined the predictive relationships between indicators of the successful resolution of Erikson's eight developmental tasks and learned resourcefulness. The study revealed the following:

- Learned resourcefulness is a collection of skills developed throughout the life span.
- The achievement of identity (which occurs during adolescence) plays an important role in the development of resourcefulness skills.
- Each of the first five developmental tasks (trust, autonomy, initiative, industry, and identity) was a significant predictor of the development of resourcefulness.

Implications

The mastery of the developmental tasks for infancy through adolescence plays an important role in determining how resourceful healthy elders are in coping with daily activities.

Zauszniewski, J. A., & Martin, M. H. (1999). Developmental task achievement and learned resourcefulness in healthy older adults. *Archives of Psychiatric Nursing*, 13(1), 41–47.

control, and disruption of routine—can also negatively affect self-concept. Self-esteem deficits related to surgery often include interference with role performance and interference with sexuality.

Bodily changes as a result of surgery have different meanings to different individuals. For example, consider a mastectomy. The woman whose feminine identity is symbolized by a voluptuous shape will likely be adversely affected by the surgery.

THINK ABOUT IT

Stigmatization of Illness

Do you believe that there is a stigma against the mentally ill? What is your rationale for your answer? How do you feel about caring for someone infected with human immunodeficiency virus? Are there thoughts of blame directed toward the person with AIDS? What about the stigma against individuals with cancer?

Developmental Transitions

Developmental processes may also affect self-concept by introducing changes or challenges to an individual's identity, body image, self-esteem, and role expectations. For example, pregnancy is a process with resultant changes in all these factors of self-concept; see Figure 19-5. In the early part of pregnancy, the woman incorporates the baby into her self-image. As the pregnancy progresses, the woman's body image adjusts to accommodate the idea that the baby is a separate individual (Edelman & Mandle, 1997). After delivery, the woman who has positive self-esteem will accept and love the baby. One who feels unlovable or unattractive may make disparaging remarks about the infant (Edelman & Mandle, 1997), and have difficulty bonding appropriately and adjusting to the life changes a new baby introduces. New roles of mother and parent need to be incorporated into a revised self-concept, and identity and self-esteem must be adjusted on the basis of new expectations.

Another example of a developmental issue that can affect the self-concept of an individual is menopause. The nurse must understand the meaning of this transitional period to the client and know that it varies with

Figure 19-5 Body-image changes with developmental events such as pregnancy. What does this client's nonverbal cues indicate about her self-concept?

each individual. This normal developmental transition in a woman's life may have a negative psychological impact on some women. Some people view the female climacteric (menopausal phase) as an indication of loss of femininity with resultant decrease in value as a person. Other women view menopause as a sign of freedom from the risk of childbearing. See the accompanying display, which lists some common misconceptions about menopause.

COMMON MISCONCEPTIONS ABOUT MENOPAUSE

- Menopause is a disease.
- The menopausal woman has decreased sex drive.
- Menopause means the end of femininity.
- A woman who has experienced menopause is "old."
- The physical symptoms of menopause are unbearable.

Experience

Self-concept is also influenced by an individual's experiences. Individuals who have experienced several failures begin to view themselves as failures; their behavior often becomes self-fulfilling, in that they perform at an unsuccessful level because they feel that is all they are capable of achieving. A negative self-concept is the result of repeated failures. On the other hand, people who achieve a task begin to see themselves in a positive manner, thus setting the foundation for a positive self-concept.

ASSESSMENT

When assessing a client's self-concept, the nurse must consider both the client's developmental level and chronological age. Clients need to be addressed at a level that reflects their current condition as well as their cognitive competence. For example, very young clients and those with low literacy skills may not be able to read; thus, the use of pictures would be helpful.

It is necessary to determine the client's perception of self-concept and the factors affecting it. For example, an adjustment to and recovery from an appendectomy may be uneventful for one person and difficult for another. The person who sees the surgery as a means to recovery will be healthier than the one who feels mutilated by a scarred abdomen.

Behavior, thoughts, and emotions are affected by self-concept. It is important to attend to the client's verbal and nonverbal clues. Self-concept is reflected in a person's behavior and conversation. Individuals who feel they are unable to accomplish goals will experience changes in eating, sleeping, and activity patterns (Edleman & Mandle, 1997).

Nursing Process Highlight

ASSESSMENT

Body Image and Self-Esteem

Body Image

- What do you like best about your body?
- What do you like least about your body?
- If you could change how you look, what would you change?

Self-Esteem

- What do you like best about yourself?
- What do you like least about yourself?
- How do you describe yourself to others?
- How would others describe you?
- What are your strengths and weaknesses?

The Nursing Process Highlight offers some questions useful in assessing body image and self-esteem. Table 19-4 lists some indicators of high and low levels of self-esteem.

To provide quality care, the nurse must determine the client's strengths. Doing so enables assessment of characteristics that can be used for coping and problem solving. The client's strengths are a foundation on which to build therapeutic interventions. Some areas to assess include the client's ability to:

- Develop and maintain appropriate relationships
- Care for self in order to meet basic needs
- Adapt to stressors in a positive manner

The nurse should encourage clients to make a list of all the positive things they have done and then review the list. Also, the nurse can help clients identify how they have handled problems in the past: "When you were in a similar situation, what did you do? Was it helpful? Are you willing to try that now? If not, what else can you do?"

The nurse should ask clients to describe their appearance and abilities. This information is an indicator of awareness of strengths as well as limitations; it is also important to assess the personal meaning of these assets and liabilities to clients.

DIAGNOSIS

Individuals experiencing self-concept disturbances usually have feelings of anxiety, hostility, guilt, and shame. Self-concept alterations affect every aspect of a person's life: emotions, relationships, and functional ability.

TABLE 19-4
Indicators of High and Low Self-Esteem

High Self-Esteem	Low Self-Esteem
Communication	
Assertive Direct and honest	Passive or aggressive Indirect, dishonest
Posture	
Erect Moves briskly	Stooped Slow movement and activity
General Appearance	
Well-groomed	Unkempt and dirty
Eye Contact	
Frequent and appropriate to context of situation	Avoidance or intrusive staring
Speech	
Well modulated Speech flows smoothly	Monotone Mumbling Hesitant
Self-Care	
Attends to own needs	Neglects own needs by always caring for others first Denies or minimizes own needs
Self-Talk	
Praises self	Puts self down Highly self-critical
Behavior	
Appropriate to situation and context of interpersonal relationship	Socially inappropriate Violates social norms Counterproductive
Measure of Worth	
Values self	Has feelings of worthlessness
Decision Making	
Makes decisions appropriately for context of situation	Indecisive Hesitant
Locus of Control	
Internal	External
Autonomy	
Self-directed	Overly dependent on others
Emotions	
Able to experience a wide range of emotions Varies appropriately according to situation	Wide range of emotions inappropriately expressed Hostile

The nurse must conduct a thorough assessment to determine the nature and extent of problems to formulate accurate nursing diagnoses. Because of the extensive impact of self-concept problems, several diagnoses may be established by the nurse. The accompanying Nursing Process Highlight shows some primary nursing diagnoses associated with self-concept disturbances as defined by the North American Nursing Diagnosis Association (NANDA, 2001).

Nursing Process Highlight

NURSING DIAGNOSIS

- Disturbed Body Image
- Parental Role Conflict
- Disturbed Personal Identity
- Ineffective Role Performance
- Chronic Low Self-Esteem
- Situational Low Self-Esteem
- Disturbed Personal Identity
- Anxiety
- Social Isolation
- Hopelessness
- Powerlessness

(From North American Nursing Diagnosis Association. [2001]. *Nursing diagnoses: Definitions & classification 2001–2002*. Philadelphia: Author.)

OUTCOME IDENTIFICATION AND PLANNING

For clients with an altered self-concept, a major nursing goal is to promote the client's sense of well-being and to facilitate growth. This involves teaching coping skills and the effective use of personal resources.

Together the nurse and client develop specific goals; mutually established goals encourage the client to assume an active role in recovery. Realistic planning involves examination of options. What is available to use in helping a client regain responsibility for self-care? Realistic goals should be stated in terms of specific behavior that is measurable and should have an appropriate time frame for evaluation of outcome achievement. See the accompanying Nursing Process Highlight on outcome identification and planning.

IMPLEMENTATION

Regardless of the setting in which they practice, nurses will inevitably encounter clients who are experiencing alterations in self-concept. Whether a client is experiencing optimal level of health or an alter-

Nursing Process Highlight

OUTCOME IDENTIFICATION AND PLANNING

For a client to have a distorted body image, the belief must be very powerful to persist in the face of obvious evidence to the contrary. How should a nurse respond to and plan care for clients who reveal that their body image is distorted? What outcomes need to be identified? Do the expected outcomes depend on the pathology behind the distortion? Should the nurse always try to comfort and support the client whose beliefs about body image are distorted?

ation in health, a high degree of self-esteem is important to a positive outcome. The nurse needs to find ways to support positive self-esteem. High self-esteem can be associated with several different dimensions of the whole person, such as success in relationships, intelligence, or in being a member who is held in high regard of an ethnic or cultural group. In attempting to support the client's high self-esteem, the nurse should try to learn sources of self-esteem for the client and reinforce them.

Initiate Therapeutic Interaction

Self-concept, or lack of it, affects the nurse-client relationship. The nurse is a role model of an individual who has self-respect and also respects others. By using a non-judgmental approach, the nurse encourages clients to feel more positive about themselves.

The use of open-ended statements facilitates open, honest communication. Active listening is essential in working with clients experiencing self-concept alterations. By thoughtfully applying therapeutic communication skills, the nurse facilitates the development of trust and rapport.

Support Healthy Defense Mechanisms

Use of defense mechanisms is a common reaction to anxiety or a perceived threat. See Chapter 20 for a discussion of defense mechanisms. When caring for a client with altered or threatened self-concept, it is wise to first identify the client's strengths and successful coping mechanisms before formulating and implementing a plan of care. It is important to not take away a client's defensive processes until another method of coping with anxiety has been developed. For example, breaking through a client's denial too

soon can result in overwhelming anxiety. On the other hand, encouraging the use of denial beyond its helpful period will result in reality distortion.

Ensure Satisfaction of Needs

The relationship between satisfaction of basic needs and psychological comfort is undeniable. When needs are unmet, anxiety increases.

Physical Needs

Self-concept stems in part from the client's perception of personal appearance, competencies, and limitations. It includes the client's self-perception as well as others' perceptions. By assisting the client to maintain personal appearance, the nurse is also assisting the client to improve self-esteem. Being unable to meet one's basic needs usually results in self-concept impairment. Self-esteem is generally decreased as a person becomes more dependent on others.

Providing for the client's well-being and comfort is the foundation of quality nursing care. When clients are treated in a caring competent manner and their physical needs are met, self-concept is positively influenced.

Psychosocial Needs

Uncertainty escalates anxiety. Explain procedures, telling the client what is expected and what is going to occur. All clients in every health care setting need clear statements of expected behavior. The following nursing actions promote the client's psychological safety:

- Respect a client's privacy. Loss of privacy triggers anxiety in most individuals. During treatment in any setting, personal probing questions must be asked; procedures often violate physical space and can be offensive; elimination activities often occur in the presence of others. Be sure to protect privacy as much as possible.
- Treat each client as an individual worthy of dignity. This means being sensitive to the feelings of others and recognizing that their feelings may differ from yours and those of other clients.
- Encourage the client to be as independent as possible while providing assistance as needed.

Promote Positive Self-Esteem Across the Life Span

Childhood

The child's self-concept continues to develop over time and is greatly influenced by interactions and experiences with others. The nurse must consider that the child needs to feel successful and competent with tasks.

Some of the changes occurring with physical growth and maturation may be anxiety-provoking for the child;

for instance, anxiety may result when the child loses baby teeth or experiences menstruation for the first time. The onset of physical changes of puberty can be frightening or unsettling to the child. The nurse is most effective by providing education and support and serving as a role model. The following Client Teaching Checklist provides information essential in helping parents promote positive self-concept development in children.

CLIENT TEACHING CHECKLIST

Actions of Parents to Promote Positive Self-Concept in Children

- Encourage expression of feelings.
- Promote mutual respect and trust by establishing and maintaining open lines of communication; demonstrate a willingness to talk about any subject.
- Listen carefully to children, and use words they understand.
- Use examples and anecdotes to promote learning.
- Teach by example. Role model problem-solving and coping skills.
- Encourage children's talents and accept their limitations. Be realistic in your expectations, and avoid comparing one child to another.
- Celebrate the child's accomplishments.
- Demonstrate confidence in their abilities.
- Provide the child with unconditional love.

Adolescence

Adolescents' sense of self is greatly influenced by how others, especially peers, view them. Acceptance and a sense of belonging to a peer group influence the adolescent's sense of worth and well-being; see Figure 19-6. Feelings about one's self intensify during puberty. Adolescents may become very self-conscious because they often "feel that others are as concerned about them as they are themselves. Thus, they're overpowered by self-consciousness and the feeling that 'everyone is looking at them.'" To blend in with peers, teenagers focus on complexion, hair, and clothing" (Muscarì, 1998, p. 28).

As adolescents' bodies change, they must keep revising their body images. A severe or deep-rooted distortion of body image may be a manifestation of a mental illness, such as anorexia nervosa or bulimia nervosa, which occur primarily during adolescence. The nurse needs to help the adolescent redirect energies and focus on positive traits and to view self as a compilation of many factors, not just one (e.g., weight).

Figure 19-6 Peers exert much influence on the adolescent's changing self-concept.

Adulthood

As adults continue to mature, self-concept changes in response to new self-perceptions and roles; see Figure 19-7. Young adults make a transition to independent living without parental assistance. The degree of ease or discomfort in making such a transition affects the young adult's self-concept by demonstrating a sense of competency.

The self-concept of an older person is the culmination of a variety of factors, including life experiences and interactions with others. Some life experiences that shape the older person's self-concept are adjusting to role loss and dealing with the loss of significant others. "Many of the realities of aging make the elderly vulnerable to self-perception problems. Older adults suffer numerous losses, have a decreased ability to protect themselves, and are confronted with many subtle messages that they are misplaced in a youth-oriented society" (Eliopoulos, 1999, pp. 362–363). Spending time with significant others may increase the older client's self-esteem by making him or her feel valued; see Figure 19-8.

Figure 19-7 Young adulthood often means assuming new roles. What role changes are this newly married couple likely to experience?

Figure 19-8 Identify some factors that may contribute positively to this older client's self-esteem.

FACTORS CONTRIBUTING TO SELF-CONCEPT ALTERATIONS IN THE OLDER CLIENT

- Changes in environment
- Ageism (social stigma against the elderly)
- Loss of significant others (including pets)
- Social isolation
- Illness, acute or chronic
- Financial change

Throughout life, the individual has developed coping resources. Because self-concept is intertwined with competency, it is important for nurses to allow older clients the time to complete tasks that are meaningful to them. Some of the many factors that may negatively affect the older adult's self-esteem are shown in the accompanying display. When caring for older clients, it is important to plan activities that promote a healthy self-concept (see the following Nursing Checklist).

EVALUATION

A client's behavior and attitudes will reflect the degree of progress toward restoring an altered self-concept. The nurse must reconsider the alignment of the

NURSING CARE PLAN

The Client with Ineffective Role Performance

Case Presentation

Todd Lloyd is a 31-year-old civil engineer who has just left his job of 10 years to care full-time for his newborn daughter, Sarah. He and his wife decided that, after their child was born, she would return to work full-time outside the home, and he would be the primary caregiver for their daughter during the day. Mr. Lloyd presents to you at the clinic stating, “I am very eager and excited about being a full-time dad, but I’m also a little nervous because I really don’t know what to expect.”

Assessment

- Lack of knowledge about new parenting role
- Concern over changes in responsibilities

Nursing Diagnosis

Ineffective Role Performance related to change in roles and usual patterns of responsibility, as evidenced by verbalization of concern over lack of knowledge about new role.

Expected Outcomes

The client will:

1. Explain specific concerns about new roles.
2. Demonstrate role competence.
3. Verbalize satisfaction with role performance.

Interventions/Rationales

1. Encourage the client to express his feelings about his new role.
Opens the door to communication and problem solving.
2. Outline with client what aspects of his role(s) will be changing and what will be the same.
Helps client identify the ways in which his role is changing, so he can face the changes from a realistic frame of mind. Also highlights similarities, not just differences, between his past and present roles, thus helping client feel less overwhelmed.
3. Assist the client in identifying specific concerns he has regarding the change in roles.
Helps the client determine exactly what his concerns are, so they can be addressed.
4. Encourage client to discuss concerns with wife and to seek help together.
Support of spouse will be critical to client’s success in overcoming concerns about changing roles.
5. Help client gain confidence and competence with new role by demonstrating new role behaviors, offering literature and resources, and providing referral to parenting courses or counselors.
Assures client that resources are available to help him meet his needs and helps lessen his anxiety and his feeling of being overwhelmed.
6. Have client return demonstrate new behaviors and offer encouragement and additional teaching.
Allows client to try out new behaviors in a “safe” environment and provides a means for immediate feedback.
7. Ask client for feedback on the new behaviors and information acquired.
Provides chance for client to evaluate progress in new role, which will increase client’s confidence.

Evaluation

Mr. Lloyd is able to identify specific concerns about his new role as parent and has demonstrated a growing competence in some of the behaviors that will support this new role. He read the literature and has ordered a videotape designed for new parents. He is also planning to subscribe to a newsletter entitled “The Full-Time Father.” Mr. Lloyd agrees that his wife’s input would be very valuable to his gaining comfort and confidence in his new role, and he agrees to visit the clinic again with her in a week.

NURSING CHECKLIST

Promoting Self-Concept in the Older Client

1. Increase socialization.
2. Encourage involvement and participation in care.
3. For clients in the home setting, urge family members to allow client to be involved with household tasks and routines as much as possible.
4. Elicit client feedback.
5. Use touch to decrease feelings of isolation and to promote feelings of security and acceptance.
6. Modesty is often important to the older client; therefore, maintain and promote privacy. For example, perform physical examinations or procedures without completely exposing the client.
7. Do not remove all personal belongings because these are often invested with symbolic meaning (for example, let the elderly woman keep her purse at her bedside).
8. Demonstrate patience; allow clients time to complete sentences and to finish one task before moving on to the next.
9. Involve family or significant others as much as possible in the provision of care.
10. Encourage the client to reminisce, especially focusing on individual strengths and accomplishments.

client's targeted self-concept with the plan of care to assess if the two are still congruent. Input from family members or significant others can be useful in seeing the client in a larger context of differing roles and expectations and may also highlight some of the similarities and differences between the client's perceived self-image and the impression of those closest to him or her.

Another crucial factor in evaluating success of attaining goals outlined in the care plan is the consideration of time. Because self-concept is based on personal attitudes, feelings, and impressions, it often requires months or even years to change. Nurses, clients, and their families all need to learn to be patient and to work together to improve or restore a client's self concept.

KEY CONCEPTS

- Self-concept (an individual's perception of self) affects every aspect of a person's life.
- A person who sees oneself as a competent individual will behave competently and vice versa.
- Self-concept consists of four interrelated components: identity, body image, self-esteem, and role performance.

- A well-formulated identity provides the answer to the question "Who am I?" and may consist of a person's name, family status, occupation, and various roles.
- Body image refers to a person's mental picture of and attitudes about his or her body. It includes physical attributes and characteristics, appearance, and performance.
- Self-esteem is the individual's generalized sense of worth and value.
- Role refers to a set of expected behaviors that are determined by social norms.
- The development of self-concept begins at birth and depends, to a degree, on interactions with others as the child grows and matures.
- The person's developmental level affects self-concept; with maturity comes a stronger self-concept.
- Illness evokes anxiety in most people; anxiety can cause illness. Any threat to self-concept arouses anxiety. When anxiety level is heightened, recovery is compromised.
- Surgery can result in body image disturbances. Altered body image results from loss of a body part or function, invasion of body space, and distortion of body image.
- Assessment of self-concept must consider both developmental level and chronological age.
- Identification of client strengths enables the nurse to determine the presence of factors the client can use for coping and problem solving.

CRITICAL THINKING ACTIVITIES

1. Consider self-concept and the four factors that comprise it. Would you consider any one of these factors more important than another in contributing to overall self-concept?
2. Outline some of the specific factors that contribute to the development of self-concept throughout the life span.
3. What are some specific nursing strategies that you could use to promote the self-concept and comfort of a hospitalized client?
4. Refer to the chapter nursing care plan. What other assessments might you expect to find in this client? How could the plan of care be modified to reflect these additional findings?

Chapter 20

Stress, Anxiety, and Adaptation

There is nothing either good or bad, but thinking makes it so.

—William Shakespeare

COMPETENCIES

1. Discuss stress, anxiety, and adaptation as they affect health.
2. Identify factors contributing to the stress response.
3. Describe the general adaptation syndrome.
4. Explain stressors inherent in the change process.
5. Discuss the role of the nurse as a change agent.
6. Explain nursing interventions that promote positive adaptation to stress.
7. Develop an individualized stress management plan for use as a nurse.

KEY
TERMS

adaptation	distress	paradigm
anxiety	endorphins	proactive
burnout	eustress	progressive muscle
catharsis	fight-or-flight response	relaxation
change	general adaptation	secondary gain
change agent	syndrome (GAS)	stress
cognitive reframing	guided imagery	stressor
crisis	homeostasis	suppression
crisis intervention	local adaptation syndrome	
defense mechanisms	(LAS)	
depersonalization	maladaptation	

Stress, a universal experience, can be the catalyst for positive change or it can be the source of discomfort and pain. How does stress affect nurses? Caring for clients who are experiencing high levels of anxiety can be stress-provoking for nurses. Nurses are involved with stress management from a teaching perspective, helping clients learn to cope with the stress imposed by illness, injury, disability, or treatment approaches. Nurses also encounter stress as a personal experience. Successful stress management is necessary for wellness of both clients and nurses. This chapter discusses the major concepts related to stress and anxiety and presents strategies for coping with stress and change.

STRESS, ANXIETY, AND ADAPTATION

Stress is the body's physiological reaction to any stimulus that evokes a change. Any situation, event, or agent that threatens a person's security is a **stressor**. A stressor is a stimulus that evokes the need to adapt and can be internal or external. For example, a headache is an internal stressor, whereas a difficult assignment is an external stressor. A stressor can be physical (such as a laceration), physiological (e.g., hypertension), or psychosocial (e.g., graduation from school). Even pleasant events can be stressful in that they evoke the need to adapt. Stressors in themselves are neutral; in other words, a stressor is neither good nor bad. The individual's *perception* of the stressor greatly determines whether the outcome is positive or negative. Any event can be stressful, depending on the person's interpretation of that event.

Anxiety is a subjective response that occurs when a person experiences a threat to well-being; it is a pervasive feeling of dread or apprehension. There is a close relationship between stress and anxiety. Stress is the person's physiological response to a stimulus, whereas anxiety is the psychological response to a threat. Anxiety can be both an activator of stress and a response to stress. It is usually activated by stress and may, in and of itself, lead to more stress.

Adaptation is an ongoing process by which individuals adjust to stressors in order to achieve **homeostasis** (equilibrium between physiological, psychological, sociocultural, intellectual, and spiritual needs). Adaptation is a holistic response that involves all dimensions of an individual. Individuals, as holistic beings, seek to maintain a *steady state* (another term for homeostasis) in all dimensions of life: physiological, psychological, cognitive, social, and spiritual. Wellness is an adaptive state; that is, the well person is one who is coping effectively with stressors to maintain a high level of well-being. The nurse's goal is to identify and support the client's positive adaptive responses.

Sources of Stress

Individuals experience stress from multiple sources, primarily their bodies, their thoughts, and the environment. A situation or event that evokes stress in one person may not affect another. Examples of factors contributing to stress are shown in Table 20-1.

RESPONSES TO STRESS

Every individual has unique responses to stress. A person's response to stress is influenced by several variables: mental attitude, lifestyle, perception, and heredity.

Physiological Response to Stress

The stress response, which can be adaptive or maladaptive, is the nonspecific response of the body to any demand (Selye, 1974). When the response is adaptive, the individual achieves and is able to maintain homeostasis. If the stress response is maladaptive, health status is altered.

General Adaptation Syndrome

Hans Selye (1976), a Canadian physiologist, introduced the concept of the **general adaptation syndrome (GAS)**, the physiological response to stress. The GAS is the same whether the stressor is actual or imagined, present or potential. In other words, the physiological reactions

TABLE 20-1
Common Stressors

Type of Stressor	Examples
Physiological	<ul style="list-style-type: none"> • Maturation (moving from one developmental stage to another) • Trauma • Illness • Poor nutrition • Sleep disturbances • Hunger • Discomfort • Pain
Psychological	<ul style="list-style-type: none"> • Worry • Fear • Anger • Happiness
Cognitive	<ul style="list-style-type: none"> • Thoughts • Perceptions • Interpretation of events
Environmental	<ul style="list-style-type: none"> • Temperature (weather) • Air pollution • Noise pollution • Crowding • Time pressures
Sociocultural	<ul style="list-style-type: none"> • Job loss or promotion • Changes in interpersonal relationships • Interpersonal conflict • Living conditions

of the body are essentially the same regardless of the source of the stress. For example, the mind can imagine a stressor, and the physiological response (GAS) will be the same as if the body had actually experienced the stressor. According to Selye (1976), all stress reactions involve similar physiological reactions. The three stages of the GAS are described in Figure 20-1.

THINK ABOUT IT

Anticipatory Stress

Consider what happens when you worry about a situation. Your thoughts are stressors that trigger the GAS. While you are reviewing these “movies of the mind,” your body responds as if you were *actually* experiencing the events in the present moment.

Fight-or-Flight Response

During the resistance stage of the GAS, an individual attempts to defend against the stressor through the **fight-or-flight response**. The body becomes physiologically

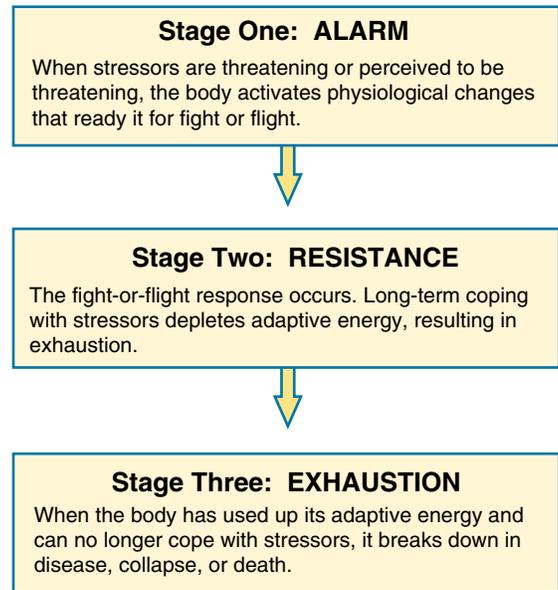

Figure 20-1 Stages of the General Adaptation Syndrome (GAS)

ready to defend itself by either fighting or running away from the danger (stressor). Hormones, such as adrenaline and norepinephrine, are secreted that cause various biological changes. Arousal of the autonomic nervous system (ANS) characterizes the fight-or-flight phenomenon (see Figure 20-2). The endocrine system is also involved in maintaining physiological homeostasis.

Local Adaptation Syndrome

The **local adaptation syndrome (LAS)** is the physiological response to a stressor (e.g., trauma, illness) affecting a specific part of the body. For example, if a person experiences a puncture wound on the foot, the LAS is initiated and leads to localized inflammation. The classic symptoms of inflammation (redness, warmth, and swelling) occur at the injured site. The LAS is usually a temporary process that is resolved when the traumatic area is restored to its steady state. However, if the inflammation is not resolved with the LAS, the individual will then experience the GAS as the entire body becomes affected.

Manifestations of Stress

The manifestations of stress are numerous and affect every dimension of a person. Common manifestations of stress are described in Table 20-2.

Outcomes of Stress

Stress is an experience that provides the individual with two possibilities: (1) an opportunity for personal growth or (2) the risk of disorganization and distress. When stressors are responded to appropriately, adaptation is successful and the body returns to its normal steady state.

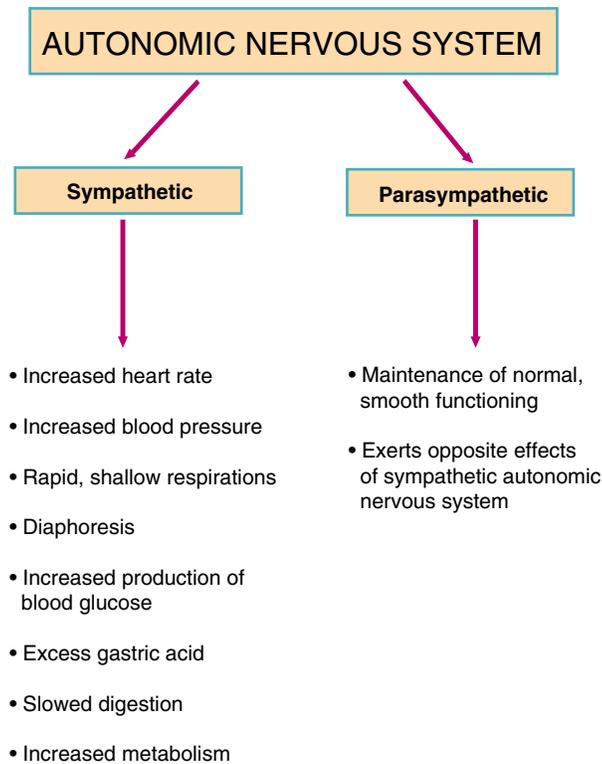

Figure 20-2 Physiology of Autonomic Nervous System: Arousal and Homeostasis (Adapted from DeLaune, S. C. [1996]. Applying the nursing process for clients with anxiety, somatoform, and dissociative disorders. In H. S. Wilson & C. R. Kneisl [Eds.], *Psychiatric nursing* [5th ed., p. 368]. Menlo Park, CA: Addison-Wesley.)

When stress is not handled within a short period of time, however, problems may occur. Individuals who experience chronic periods of stress are the ones who have the greatest risk of becoming ill. Selye (1976) refers to the effects of chronic stress as “dis-ease,” which occurs in the third stage of the GAS, exhaustion. The person becomes dis-eased when coping mechanisms are ineffective. This process of coping ineffectively with stressors is referred to as **maladaptation**. The inability to adapt to continued demands of stress can have harmful results, such as illness.

The term **eustress** is used to describe a type of stress that results in positive outcomes. Consider, for example,

THINK ABOUT IT

Maladaptation or Adaptation?

Do you remember the last time you were stuck trying to solve a problem? The process of “spinning your wheels but going nowhere” refers to maladaptation. In other words, you were using up a great deal of energy while accomplishing very little. What are some ways to use your adaptive energy in a more productive manner? How can you enhance your adaptation to stressful events?

TABLE 20-2
Manifestations of Stress

Physiological	<ul style="list-style-type: none"> • Cardiovascular/respiratory effects <ul style="list-style-type: none"> —Increased pulse —Increased blood pressure —Rapid, shallow breathing • Neurologic effects <ul style="list-style-type: none"> —Dizziness —Headaches —Dilated pupils • Gastrointestinal effects <ul style="list-style-type: none"> —Nausea —Altered appetite —Diarrhea or constipation • Genitourinary effects <ul style="list-style-type: none"> —Polyuria • Musculoskeletal effects <ul style="list-style-type: none"> —Tension —Twitching • Endocrine effects <ul style="list-style-type: none"> —Increased levels of blood glucose and cortisol
Psychological	<ul style="list-style-type: none"> • Irritability • Increased sensitivity (feelings are easily hurt) • Sadness, depression • Feeling “on edge”
Cognitive	<ul style="list-style-type: none"> • Impaired memory • Confusion • Impaired judgment • Poor decision making • Delayed response time • Altered perceptions • Inability to concentrate
Behavioral	<ul style="list-style-type: none"> • Pacing • Sweaty palms • Rapid speech • Insomnia • Withdrawal • Exaggerated startle reflex
Spiritual	<ul style="list-style-type: none"> • Alienation • Social isolation • Feeling of emptiness

students who have an examination scheduled the following week. The stress over the impending test motivates them to study early. As a result, they pass the examination.

When stressors evoke an ineffective response, **distress** is experienced. For example, consider students who have an examination scheduled for the next day. They had plenty of time to study, but because they put it off until the last minute, they take the examination unpre-

THINK ABOUT IT

Personal Stressors: Eustressful

Think about some of the stressors in your life. Identify those that are eustressful, that is, stimulating and positive.

Personal Stressors: Distressful

Think of the last time you felt “stressed-out” and anxious. How did your body respond? What did you feel? What were you thinking? How did you respond behaviorally?

pared. As a result of “cramming” all night, they are not alert, do not know the material, and fail the examination; they are experiencing distress. In general, when people say *stress* they are referring to distress, the negative outcomes of an ineffectual stress response.

Crisis

When stressors exceed the person’s ability to cope, a crisis develops. A **crisis** (an acute state of disorganization) occurs when the individual’s usual coping mechanisms are no longer effective. Crisis is characterized by extreme anxiety, inability to function, and disorganized behavior. A crisis is time-limited; that is, no one can remain in acute disequilibrium for a long period of time because of the degree of discomfort that is experienced. Owing to the time-limited nature of crisis, a client experiencing a crisis needs immediate intervention to reach a successful resolution. Crisis intervention is discussed later in this chapter.

A crisis can be a negative experience, but it also has the potential to be an opportunity for growth and learning. The outcome is unique according to each individual’s perception and coping abilities. Nurses are challenged to help clients discover the opportunity in their crises to adapt in a positive, healthy manner.

Not every person will experience a crisis as a result of stressful events. Each crisis is unique according to the individual and circumstances. However, there are some characteristics common to all crises, including the following:

- A crisis is experienced as a sudden event.
- A crisis has an identifiable precipitating event.
- The situation is perceived as overwhelming or life-threatening.
- The situation cannot be resolved with usual coping skills.
- Intervention is required for equilibrium to be achieved.

A crisis is *not* a mental illness even though it is not uncommon for a person experiencing the acute discomfort and anxiety to fear “I’m losing my mind.” There are three types of crises, which are shown in Table 20-3.

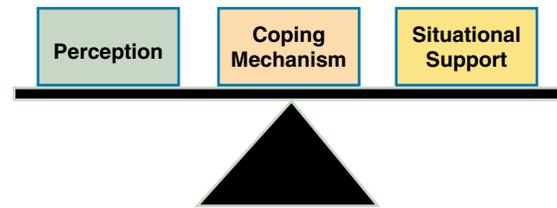

Figure 20-3 Balancing Factors of a Crisis (From Aguilera, D. C. [1997]. *Crisis intervention: Theory and methodology* [8th ed.]. St. Louis, MO: Mosby.)

Balancing Factors

Three factors that influence a person’s resolution of a crisis (Aguilera, 1997) are shown in Figure 20-3. During a crisis, one (or sometimes more) of these factors is out of balance. When the factors return to a balanced state, the individual is able to resolve the crisis effectively. Nursing interventions focus on reestablishing equilibrium among these factors.

Anxiety

Anxiety is the most common emotional (affective) response to stress. Individuals feel anxious whenever they are threatened, whether the threat is perceived or actual. Anxiety occurs on a continuum; some degree of anxiety is necessary as it serves as a motivator for adaptation. High levels of anxiety, however, can overwhelm the person and impair the ability to think and function. As the severity of anxiety increases, the person is less and less able to function. Table 20-4 describes the levels of anxiety.

Coping Behaviors

There are many ways to cope with stress. The following are frequently used coping strategies:

- Talking
- Crying
- Laughing
- Exercising

These strategies can result in successful adaptation. However, they become ineffective if they are the only coping methods used by the individual.

Defense Mechanisms

Just as the body has physiological mechanisms (e.g., the immune system, the inflammatory response) to defend against infection and disease, the mind has psychological protective mechanisms. **Defense mechanisms** are unconscious operations that protect the mind from anxiety (see Table 20-5). Defense mechanisms are employed to achieve and maintain psychological homeostasis. Zook (1998) describes defense mechanisms as “unconscious psychological processes that let us filter out intolerable realities and emotional pain during

TABLE 20-3
Types of Crises

Type	Definition	Examples
Developmental or maturational	<ul style="list-style-type: none"> • Occur as a person ages and moves from one developmental stage to another • Are universal 	<ul style="list-style-type: none"> • An adolescent attempting to gain independence from parents • A middle-aged woman experiencing menopause
Situational	<ul style="list-style-type: none"> • Can occur at any time and are not predictable • Are not experienced by everyone • Occur when there is change in role or function 	<ul style="list-style-type: none"> • Illness • Loss (death, divorce) • Graduation • Job promotion • Retirement
Adventitious	<ul style="list-style-type: none"> • Are unpredictable events that rarely occur 	<ul style="list-style-type: none"> • Being in an airplane crash • Losing one's home in a tornado • Being a victim of a school shooting • Winning a \$10 million lottery

times of crisis” (p. 16B). Illness and the resultant treatment evoke anxiety in everyone; thus, all clients use defense mechanisms (also called mental mechanisms).

Defense mechanisms are universal. Their use does not indicate psychosocial imbalance or mental illness; however, defense mechanisms are pathological when they become a stereotyped pattern, that is, the only way that an individual responds to a threat. Defense mechanisms are also considered to be pathological when they limit the individual's ability to function. People who use defensive mechanisms in a pathological way “may develop physiologic problems and psychological symptoms associated with emotional illness” (Zook, 1998, p. 26B).

Defense mechanisms operate at the unconscious level of awareness and are involuntary and automatic, that is, the individual does not consciously decide to use a defense mechanism. **Suppression** is a conscious mechanism whereby a person decides to avoid dealing with a stressor at the present time. The accompanying display gives an example of the use of suppression.

The nurse who is unfamiliar with defense mechanisms is likely to be judgmental about clients who do not respond according to the nurse's expectations. If, for example, the nurse tries to break through a client's denial too quickly by presenting reality, the client will likely be overwhelmed by anxiety and will panic.

TABLE 20-4
Levels of Anxiety

Anxiety Level	Characteristics of Anxious Person	Nursing Implications
Mild	<ul style="list-style-type: none"> • Increased degree of alertness • Increased vigilance 	<ul style="list-style-type: none"> • Optimal time for client teaching because of heightened awareness and increased perceptual field
Moderate	<ul style="list-style-type: none"> • Subjective distress • Decreased perception and attention 	<ul style="list-style-type: none"> • Help the client to determine a cause-and-effect relationship between stressor and anxiety
Severe	<ul style="list-style-type: none"> • Increased subjective distress • Selective attention • Distorted perception 	<ul style="list-style-type: none"> • Encourage verbalization • Engage in motor activity • Give specific directions
Panic	<ul style="list-style-type: none"> • Major perceptual distortion • Immobilization; inability to function • Impaired communication 	<ul style="list-style-type: none"> • Provide limits and structure • Maintain client safety (both physical and psychological)

(From Peplau, H. E. [1952]. *Interpersonal relations in nursing*. New York: Putnam; Sullivan, H. S. [1953]. *The interpersonal theory of psychiatry*. New York: Norton.)

TABLE 20-5
Common Defense Mechanisms

Mechanism	Description	Example
Denial	Negation of reality of threatening situations, despite factual evidence	The client refuses to admit to anger, even though the situation warrants it and the client's voice indicates anger.
Projection	Attribution of one's own thoughts, feelings, or impulses to others	"I'm not attracted to him. My best friend is."
Repression	Unconscious blocking from awareness material that is threatening or painful	"I never got angry at my father; our family lived in harmony and love" (when such descriptions of the family life would not fit with anyone else's interpretation of the events).
Rationalization	Intellectual explaining away of threatening circumstances	"The test had too many trick questions; I really know all the material; our instructor was out to get me."
Introjection	Incorporating, without examination or thought, the qualities or attitudes of others	The adolescent who takes on all the values and styles of an admired teacher.
Displacement	Transfer of feelings or reactions evoked by one topic or event to another that is less threatening	The husband who is angry at his wife and yells at the family dog rather than dealing directly with his anger.
Reaction formation	Expression of a feeling that is the opposite of one's authentic feeling or of feelings that would be appropriate in the situation	A client who brings gifts to the nurse at whom he is really angry.
Regression	Retreat to a previous developmental level	A child starts to suck his thumb (after 2 years of not thumb sucking) when admitted to the hospital.
Suppression	Conscious attempt to keep threatening material out of consciousness	A student nurse decides not to think about a family problem at the moment so he can study for an upcoming examination.
Sublimation	Channeling of socially unacceptable impulses into socially acceptable activities	A young man who is dealing with aggression by playing football.
Symbolization	Use of an object, idea, or act to express emotion that is not expressed directly	The client who leaves the nurse a flower rather than directly saying she cares about the nurse.

STRESS AND ILLNESS

Everyone experiences stress and accompanying anxiety; this anxiety is increased during illness and the recovery process. Illness and stress are interwoven to such a degree it is difficult to determine which precedes the other. When a person's adaptive attempts are unsuccessful, illness occurs. Also, a person who is ill has fewer adaptive resources available to cope with stressors. Even though some stressors may not directly cause illness, stress is a significant component in the onset and progression of many diseases. Table 20-6 lists some disorders commonly associated with stress.

One of the major outcomes of prolonged periods of stress is impairment of the immune system. As the body continues to fight off the threat (actual or perceived),

CLINICAL EXAMPLE: SUPPRESSION

Mrs. James, a 34-year-old mother of two small children, has just been informed by her physician that she has cervical cancer. She is also told that her prognosis is dire; she has about 3 months left to live. Mrs. James asks questions and appears to be very calm. Later, the nurse asks Mrs. James if she wants to talk. Mrs. James replies, "I can't deal with this right now. I'll wait until my family is here and then I'll want to talk to you." Mrs. James's use of suppression allows her to postpone attempting to deal with the threatening diagnosis until she has members of her support system available to help her cope.

steroid production is increased. Increased steroid production is helpful on a short-term basis because steroids speed up the healing process. However, increased

NURSING ALERT

To Prevent Panic

To prevent panic, never attempt to take away a defense mechanism until the client has learned another method of coping. Denying a client the use of a defense mechanism will cause more anxiety.

TABLE 20-6
Stress-Related Disorders

Respiratory disorders	<ul style="list-style-type: none"> • Emphysema • Chronic bronchitis • Asthma
Cardiovascular disorders	<ul style="list-style-type: none"> • Hypertension • Cardiac arrhythmias • Migraine headaches
Endocrine disorders	<ul style="list-style-type: none"> • Thyroid problems • Amenorrhea, anovulation • Diabetes • Excessive weight gain or weight loss
Musculoskeletal disorders	<ul style="list-style-type: none"> • Chronic back pain • Arthritis
Genitourinary disorders	<ul style="list-style-type: none"> • Enuresis • Urinary frequency
Sexual and reproductive disorders	<ul style="list-style-type: none"> • Low libido • Impotence (erectile dysfunction, or ED) • Menstrual irregularities
Gastrointestinal disorders	<ul style="list-style-type: none"> • Colitis • Chronic constipation • Ulcers • Gastritis
Integumentary disorders	<ul style="list-style-type: none"> • Eczema • Hives • Psoriasis

steroid production over a period of time will impair the immune system. Thus, the body is less able to protect itself from disease.

Impact of Illness and Treatment

Everyone entering the health care system experiences a change in their usual routine. For example, hospitalization, surgery, and admission to a long-term care facility are major disruptions in one's routine. Such changes evoke the stress response.

THINK ABOUT IT

Stressors Associated with Hospitalization

Think of some major changes that people experience when they are hospitalized. Can you identify at least three changes? What can you do to significantly reduce threats (real or perceived) in acute care settings? In long-term care settings?

Being in an unfamiliar environment, losing control over one's schedule, and being dependent on others for care are all issues with which hospitalized clients must cope. Each of these issues is a stressor that requires adaptation in order to maintain a steady state. Most clients do not have the energy to cope with the numerous changes simultaneously. Some cues that a person may be reacting adversely to hospitalization include:

- Increased stress response
- Higher levels of anxiety
- Increased or impaired use of coping mechanisms
- Inability to function
- Disorganized behavior

Individuals do not have to be hospitalized to experience stressors associated with the client role. Consider for example the person having "minor" surgery at an outpatient center, the employee being treated at the industrial clinic for a work-related injury, or the adolescent being treated by the school nurse. Even clients who are treated by home health agencies experience stressors associated with having a health care provider enter their personal environment.

The greater the threat (or perceived threat), the greater the level of the client's anxiety. The nurse must be sensitive to stress and anxiety stemming from the multiple changes imposed by illness on the client, family, and/or significant others. The nurse's sensitivity to clients' stress reduces the risk of depersonalizing the client.

Depersonalization describes the process in which an individual is treated as an object instead of a person. Literally, it involves taking away clients' unique aspects by treating them as nonhuman. Nurses who demonstrate caring and compassion avoid depersonalizing clients. In order to prevent depersonalization, nursing interventions focus on helping the client reduce feelings of unfamiliarity and loss of control. The following Nursing Checklist suggests some actions for promoting client control.

STRESS AND CHANGE

Change (a dynamic process in which an individual's behavior is altered in response to a stressor) is an inherent part of life. It is the process that causes individuals to adapt. Whether it is planned or unplanned, change is both inevitable and constant. Change can be construc-

**NURSING CHECKLIST****Actions to Promote Client Control**

- **Communicate clearly.** Use terms easily understood by clients and families. Avoid using medical jargon with clients.
- **Answer questions thoroughly.** Validate client's and family's level of understanding.
- **Teach the use of relaxation techniques,** such as **progressive muscle relaxation** (a stress management technique involving the tensing and relaxing of muscles) and **guided imagery** (a relaxation technique in which the individual uses the imagination to experience a pleasant, soothing image).
- **Instruct clients on the use of cognitive reframing** (a technique in which the individual changes her or his negative perception of a situation or event to a more positive, less-threatening perspective.)
- **Provide support and reassurance.** The nurse's presence ("being with" the client) can alleviate anxiety levels. The most therapeutic tool in alleviating client anxiety is the nurse's therapeutic use of self.
- **Break down the information shared with clients.** Too much information at once can make the client feel overwhelmed and less likely to listen. When clients have adequate information, they can make informed decisions and maintain some degree of control over their lives.

CHARACTERISTICS OF CHANGE

- Is an inevitable part of life.
- May be eustressful or distressful.
- Can be self-initiated or externally imposed.
- Can occur abruptly or have a gradual onset with insidious progression.
- Energy is required to effect change, as well as to resist change.

tive or destructive and is stressful to individuals because it activates the GAS. The accompanying display lists characteristics of change.

Nurses must be able to initiate and cope with change. Proficiency in critical-thinking and problem-solving skills is necessary to initiate positive change.

The pace of change is rapidly increasing in health care agencies, which have been changing and continue to change in response to consumer demands. "Change is inevitable and nurses have the qualities and a strategic position to participate actively" (Joel, 1998, p. 7). Some changes that have evolved from consumer demands and needs include:

- Sports medicine clinics
- Substance abuse treatment programs
- Day treatment programs for geriatric and psychiatric clients
- Weight control programs
- Exercise programs

Types of Change

Change is either planned or unplanned. Unplanned change is the change that "just happens"; it is unpredictable and may be imposed by others or by uncontrollable natural events (e.g., losing one's home in a flood). On the other hand, planned change results from a deliberate effort to improve a situation. In addition to planned and unplanned change, there are other types of change (see the accompanying display).

TYPES OF CHANGE

Type of Change	Description
Developmental	<ul style="list-style-type: none"> • Physical and emotional changes that occur at different stages of the life cycle • Generally predictable • Usually occur gradually
"Reactive"	<ul style="list-style-type: none"> • Adaptive responses to external stimuli • Efforts to cope with change imposed by others
Covert	<ul style="list-style-type: none"> • Occur without person's conscious awareness
Overt	<ul style="list-style-type: none"> • Person is aware of the change • Usually not under individual's direct control

Theories of Change

Nurses must have a thorough understanding of the change process in order to effectively implement change with clients and within the health care delivery system. Two major theories of change are discussed below.

Lewin's Theory of Change

A classic theory of change was developed by Lewin (1951), who stated that the change process occurs in three stages: unfreezing, moving, and refreezing (see Figure 20-4). In the unfreezing stage, the person recognizes a need for change and becomes motivated to move in a new direction. Stage two, changing, is the actual implementation of the change. In the third stage, refreezing, new changes are incorporated into behavior and these new behaviors stabilize. Because the change process is dynamic, these stages are not rigid. The

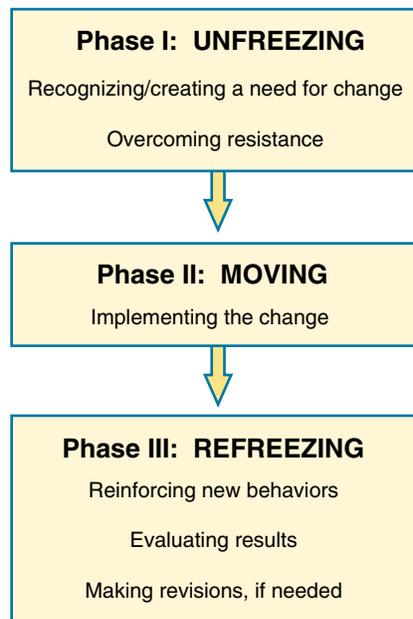

Figure 20-4 Lewin's Theory of Change (From Lewin, K. [1951]. *Field theory in social science*. New York: Harper.)

process of change may quickly move through all stages, or it may become “stuck” in one stage.

Lippitt's Theory of Change

Lippitt (Lippitt, Watson, & Westley, 1958) proposed a theory of change that consists of seven phases:

1. Diagnose the problem (need for change).
2. Assess the change target's motivation and capacity for change.
3. Assess the change agent's motivation and capacity for change.
4. Establish objectives for change.
5. Determine the role of the change agent.
6. After change has occurred, maintain it.
7. Terminate the role of the change agent.

Resistance to Change

Many people tend to resist change because of the energy required to adapt. Conversely, energy is also required to resist change, or to maintain the *status quo*. Individuals differ in their ability to tolerate (or even thrive on) change.

There are many reasons people tend to resist change (see Table 20-7). There are no absolute guarantees that the change activity will lead to positive outcomes; this uncertainty about outcomes is a major barrier to change.

Changing Paradigms

Changing involves questioning and frequently results in the development of a new **paradigm** (a pattern, model, or mindset that strongly influences one's decisions and

TABLE 20-7
Reasons People Resist Change

Conformity	Often referred to as “groupthink;” complying with the group's expectations; going along with others to avoid conflict.
Dissimilar beliefs and values	Differences in attitudes and expectations regarding health and illness behaviors; differences between client and nurse that can impede positive change.
Habits	Routine, “set” behaviors are often hard to change.
Satisfaction with <i>status quo</i>	Seeing only advantages to the present system can blind one to the possible need for change. Satisfaction with the way things are now reinforces resistance to change.
Secondary gains (outcomes other than alleviation of anxiety)	Benefits or pay-offs of the sick role (such as gaining attention and sympathy, avoiding responsibilities, and getting financial compensation or reward) often are so desirable that the client has little incentive to change.
Threats to satisfying basic needs	Change may be perceived as a threat to self-esteem, security, or survival.
Fear	Fear of failure and fear of the unknown especially block change.
Unrealistic goals	Set up the individual for failure in change efforts.

THINK ABOUT IT

Responses to Change

What is your typical response when first learning that a change is imminent? Do you feel threatened, afraid, anxious? Do you feel excited and optimistic? Perhaps you feel something in between resistance and excitement. It is important for you to be aware of your automatic thoughts that influence your response to change.

behaviors). One's paradigm greatly colors one's perceptions and behaviors. By changing paradigms, an individual can determine what is positive in the old system and use it to create a newer, better system (Alfaro-LeFevre, 1998).

It is risky to initiate change, to challenge one's own paradigms and those of others. One of the first signs of the need for change is questioning. The nurse who wonders Why? or Why not? or What if? is the nurse who will

likely take the risk to initiate change activity. The risk taker who is effective is neither reckless nor overly cautious. Successful risk takers consider possible outcomes before initiating action. “Accepting change as inevitable and taking personal control and responsibility for it needs to be acknowledged by all in the health service industry today” (Bonalumi & Fisher, 1999, p. 70).

THINK ABOUT IT

Nurses As Risk Takers

Do you think nurses are encouraged to be risk takers? What empowers you to take risks as a student? What barriers to risk taking can you identify in academic and health care settings?

Overcoming Barriers to Change

Because change is inevitable, learning how to deal with it is crucial for nurses. Resistance occurs when the individual rejects proposed new ideas without critically thinking about the proposal.

Overcoming this barrier doesn't mean embracing every new idea uncritically. It means being willing to suspend judgment long enough to make an informed decision on whether the change is worthwhile. (Alfaro-LeFevre, 1998, p. 25)

Coping with change of any type calls for flexibility, adaptability, and resilience.

Nurse As Change Agent

Initiating change is an expectation for professional nurses. The American Nurses Association (1991) calls for nurses to bring about changes in practice as well as changes in the system of delivering health care. Nurses experience stress daily as a result of changes within their immediate work environment as well as changes in the entire health care delivery system. The uncertainty over health care reform is very distressful to some nurses. Others see opportunity for positive change in the future. “Nursing staff members need to realize that change is not something that happens to them, but something that they can influence” (Bonalumi & Fisher, 1999, p. 72).

In bringing about change to promote positive adaptation, the nurse serves as a **change agent** (a person who intentionally initiates and creates change). True change agents constantly seek ways to make improvements. They use critical-thinking skills to develop creative, innovative solutions. Critical thinking is also required to determine the outcome of initiating change. Evaluating the effects of change is key to bringing about positive change.

To be most effective, change should be planned and directed by people who are **proactive** (individuals who initiate change rather than respond to change imposed by others). Proactive individuals assume responsibility for their own lives. On the other hand, a reactive person responds only to externally imposed change. Proactive nurses are change agents who affect the entire health care system as well as individual clients.

Change agents keep the change process moving toward a positive outcome. As an advocate for change, the nurse empowers the client to initiate change in order to adapt more successfully; client education is a powerful tool for initiating change. Teaching a client about a disease process, a treatment modality, or a lifestyle alteration provides the client with an opportunity to change. In fact, learning results in behavioral changes.

ASSESSMENT

When caring for an anxious client, the nurse must first determine the client's perception of the situation. This determination is done by directly asking for the client's input and carefully listening to the client's response. Because the nurse's nonverbal behavior can affect the client's anxiety level, nurses must be aware of their own body language. Anxiety is a subjective experience, thus, it cannot be directly observed. Therefore, the nurse must look for the signs indicative of anxiety (previously discussed in Table 20-2).

A thorough assessment of stress and anxiety levels includes eliciting client input to evaluate the following factors:

- Patterns of stressors
- Typical responses to stressful situations
- Cause-and-effect relationships between stressors and thoughts, feelings, and behaviors
- Past history of successful coping mechanisms

Assessing the client's coping abilities can be done in various ways. For example, use open-ended questions to determine previously used coping mechanisms. Some sample questions are:

- “What is the problem?”
- “What have you tried before?”
- “How well did it work?”
- “Who is available to help you?”

Identification of the client's coping abilities assists in establishing appropriate nursing diagnoses and developing an effective plan of care. Assessment, which relies heavily on the nurse's observation and listening skills, provides the data necessary for formulating nursing diagnoses.

NURSING DIAGNOSIS

There are several nursing diagnoses that may apply to clients experiencing anxiety. See Table 20-8 for selected diagnoses and their defining characteristics and related factors. In addition to the four diagnoses listed in Table 20-8, the following NANDA (2001) diagnoses may also be appropriate for anxious clients.

- *Impaired Adjustment*
- *Ineffective Role Performance*
- *Disturbed Thought Processes*
- *Defensive Coping*
- *Fear*
- *Post-Trauma Syndrome*
- *Impaired Social Interaction*
- *Spiritual Distress*

OUTCOME IDENTIFICATION AND PLANNING

Client involvement in planning care is essential because helping clients learn to cope successfully is part of the empowerment process. Planning means exploring with the client self-responsibility issues.

The Nursing Process Highlight shows expected outcomes appropriate for many anxious clients.

Nursing Process Highlight

OUTCOME IDENTIFICATION AND PLANNING

The client:

- Identifies situations that increase stress and anxiety levels.
- Verbalizes a plan to decrease effects of common stressors.
- Differentiates positive and negative stressors in his or her life.
- Classifies stressors into categories of those that can be eliminated, can be controlled, or cannot be controlled directly by self.
- Demonstrates the accurate use of selected stress management exercises (e.g., progressive muscle relaxation [PMR], guided imagery, thought stopping).
- Verbalizes a plan for stress management, including necessary lifestyle modifications.

IMPLEMENTATION

Teaching, a major nursing intervention for managing stress, is inherent in holistic nursing practice. Stress

management approaches can be taught to clients of every age and developmental stage in all health care settings: acute care (inpatient and outpatient), long-term care, and the home.

Teaching clients to reduce their own levels of stress is a major step in promoting self-care. Client education provides clients with options. Clients who have a thorough understanding of their options can make informed decisions about necessary lifestyle changes (see Figure 20-5). Following is a discussion of some of the many interventions that can be used with anxious clients.

Meeting Basic Needs

There is a close relationship between basic physiological needs and stress. Anything that interferes with the satisfaction of basic needs evokes the stress response and attendant anxiety. Clients who are cold, hungry, or in pain have higher anxiety levels than those who are comfortable. When anxiety levels increase, so does the perception of pain. Nurses who empower clients to meet basic needs are laying the foundation for a less stressful, more caring treatment process. By reducing anxiety, the nurse is improving the client's healing potential.

Environmental Strategies

Because an individual's immediate environment can influence stress levels, it is important for the nurse to decrease environmental stimuli that may contribute to anxiety. Some specific ways to limit environmental stimuli are listed in the accompanying display.

Verbalization

Encouraging clients to express their feelings is especially valuable in stress reduction. Freud (1959) used the term **catharsis** to describe the process of talking out

Figure 20-5 By discussing the options for care with this client, the nurse is providing him with the information he needs to plan effective lifestyle changes. What methods can the nurse use to assess whether the client fully understands the information?

TABLE 20-8
Nursing Diagnosis: Clients Experiencing Anxiety

Nursing Diagnosis: Definition	Defining Characteristics	Related Factors
<i>Anxiety</i> : Feelings of apprehension and arousal of the autonomic nervous system in response to a threat (which may be specific or vague)	<p>Note: Manifestations will vary according to the level of anxiety.</p> <ul style="list-style-type: none"> • Physiological <ul style="list-style-type: none"> –Changes in vital signs (increased pulse, respirations, blood pressure) –Diaphoresis (increased sweating) –Restlessness, tremors –Frequent urination • Emotional <ul style="list-style-type: none"> –Verbalization of feelings of helplessness, losing control, nervousness, fear –Inability to relax –Increased irritability –Withdrawal or angry outbursts • Cognitive <ul style="list-style-type: none"> –Forgetfulness –Impaired ability to concentrate –Inability to remember 	<ul style="list-style-type: none"> • Any threat, real or perceived • Unmet needs (biological, safety and security, belonging, self-esteem) • A loss (e.g., of a relationship as a result of death or divorce; a job; functional ability) • Loss of control (over one’s situation or events) • Conflict (interpersonal or intrapersonal) • Environmental changes
<i>Ineffective Coping</i> : The inability to manage stressors because problem-solving behaviors are no longer effective	<ul style="list-style-type: none"> • Inability to meet basic needs • Inability to solve problems • Altered patterns of communication • Inappropriate use of defense mechanisms • Verbalization of inability to ask for help • Destructive behavior toward self or others 	<ul style="list-style-type: none"> • Low self-esteem • Alterations in body integrity (e.g., disfigurement secondary to trauma or surgery; loss of body part) • Disruption of emotional ties • Unsatisfactory support system • Separation from home and family • Sensory overload
<i>Ineffective Denial</i> : Occurrence in which the person minimizes or negates symptoms to the point of being injurious to his or her health status	<ul style="list-style-type: none"> • Refusal of health care treatment • Delay in seeking treatment • Resistance to treatment program • Failure to perceive danger of presence of symptoms • Relinquishing of self-responsibility (frequent verbalizations of “I can’t”) • Blaming other people or circumstances (“It’s not my fault”) • Inability or unwillingness to admit impact of illness or trauma on self 	<ul style="list-style-type: none"> • Presence of chronic and/or terminal disease • Loss (e.g., of job, significant other, income) • Personal vulnerability • Fear • Difficulty handling new situations • Learned response • Cultural factors • Personal and/or family value system
<i>Powerlessness</i> : Situation in which the person perceives a lack of control over situations or events	<ul style="list-style-type: none"> • Verbalization of dissatisfaction over inability to control the situation • Passive, “giving-up” behavior or aggressive, hostile behavior • Difficulty in expressing self directly • Anxiety • Resignation • Depression 	<ul style="list-style-type: none"> • Illness (both acute and chronic) • Hospitalization or institutionalization • Expressed feelings of insecurity and/or resentment • Multiple life changes and/or losses

(From Carpenito, L. J. [1999]. *Handbook of nursing diagnosis* [8th ed.]. Philadelphia: Lippincott; Doenges, M. E., Townsend, M. C., & Moorhouse, M. F. [1998]. *Psychiatric care plans: Guidelines for planning and documenting client care* [3rd ed.]. Philadelphia: Davis. North American Nursing Diagnosis Association (2001). *Definitions and classifications 2001–2002*. Philadelphia: Author.)

Figure 20-6 Familiar objects help personalize this client's treatment environment. What else could be done to this client's living area to reduce anxiety?

REDUCING ENVIRONMENTAL STRESSORS

- Close the door to the client's room.
- Turn off the television.
- Lower the tone of the telephone ringer or take the phone off the hook if feasible.
- Turn off the lights or close the blinds.
- Limit the number of visitors (unless isolation increases the client's anxiety).
- Decrease environmental clutter
- Personalize the environment (Figure 20-6)

one's feelings. People instinctively know the value of "getting things off their chest" through verbalization. Verbalization promotes relaxation primarily in two ways. First, when a feeling is described it becomes *real*. Once the problem is identified, the person can begin to deal effectively with it. Also, the actual activity of talking uses energy and, therefore, reduces anxiety.

NURSING TIP

Reducing Anxiety

To reduce client anxiety levels, maintain an environment in which the client feels free to express emotions.

Involvement of Family and Significant Others

The client's developmental stage influences the type of intervention for stress management. Children and adolescents have varying coping skills; children of all ages rely on their parents to a varying degree for security and support. It is important to include the entire family in the care of the client whenever possible (see Figure 20-7). Such an approach is useful in decreasing the stress levels of everyone involved because families provide essential support for clients.

Family members who are extremely anxious often have a negative impact on the client's health status. Therefore, nurses often need to help family members relax; one way to accomplish this is by providing explanations and information. Thus, it is often necessary for nurses to teach stress management techniques to the client's family.

NURSING ALERT

The Client Experiencing Panic

Never leave a panic-stricken client alone. When anxiety has reached the panic level, the client may harm himself or herself. *Stay with the highly anxious client* or have someone else do so.

Stress Management Techniques

There are a variety of stress management techniques that can easily be taught to clients, families, and significant others. Many of these techniques are considered to be complementary modalities as they are used in conjunction with traditional medical treatment methods (i.e., medication, radiation therapy). Some of the most

Figure 20-7 Nurses can encourage the interaction of clients with family members and significant others in various health care settings. This involvement is helpful in easing the client's anxiety and can also serve as a method through which the family member is kept informed about the client's care.

common approaches for managing stress are discussed below.

Exercise

Physical exercise is a powerful way to reduce anxiety and can be used by clients of all ages and with varying physical abilities; see Figure 20-8. Client teaching should emphasize the need for incorporating exercise into one's lifestyle (see the accompanying display). In other words, if exercise is to reduce anxiety, it must be done on an ongoing and regular basis. The physiological benefits of regular exercise are shown in Table 20-9.

Lack of physical exercise contributes to obesity, which presents many health problems. "The increasing number of overweight Americans is accompanied by increased health risks and increased demands on the health-care system for advice and treatment" (Bray, 1998, p. 9). According to the Centers for Disease Control and Prevention (CDC), the percentage of children and adolescents who are overweight has more than doubled in the past 30 years, and most of the increase has occurred since the late 1970s. A total of 12.5% of children aged 6–17 years are overweight (CDC, 1999).

Participation in all types of physical activity declines as children get older. Adults who are less active are at greater risk of dying of heart disease and of developing diabetes, colon cancer, and high blood pressure (CDC, 1997).

Figure 20-8 Exercise provides physiological and psychological benefits to individuals of all ages with varying degrees of functional abilities. Notice that the individuals in this figure are also experiencing socialization during the physical activity.

TABLE 20-9
Physiological Benefits of Exercise

Effect of Exercise	Benefit
Promotes metabolism of adrenalin and thyroxine.	<ul style="list-style-type: none"> Decreased amounts of these substances in the bloodstream minimize autonomic arousal and hypervigilance.
Reduces musculoskeletal tension.	<ul style="list-style-type: none"> Reduction of the tension in muscles reduces feelings of being tense and "uptight."
Improves circulation, resulting in better oxygenation of bloodstream and brain.	<ul style="list-style-type: none"> Increased alertness and concentration enhance problem-solving ability.
Stimulates endorphin production.	<ul style="list-style-type: none"> Endorphins (a group of opiate-like substances produced naturally by the brain) raise the body's pain threshold, produce sedation and euphoria, and promote a sense of well-being.
Decreases cholesterol levels.	<ul style="list-style-type: none"> Reduces risk of atherosclerosis.
Decreases blood pressure.	<ul style="list-style-type: none"> Reduces risk of myocardial infarction (heart attack) and cerebral infarction (stroke).
Increases acidity of blood (lowered pH).	<ul style="list-style-type: none"> Improves digestion. Improves energy level. Improves utilization of food for energy (promotes metabolism).
Improves elimination (through lungs, skin, bowels).	<ul style="list-style-type: none"> Reduces buildup of toxins in the body.

(From Bray, G. A. (1998). *Contemporary diagnosis and management of obesity*. Newtown, PA: Handbooks in Health Care; Keegan, L. [1999]. Nutrition, exercise, and movement. In B. M. Dossey, L. Keegan, C. E. Guzzetta, & L. G. Kolkmeier [Eds.], *Holistic nursing: A handbook for practice* [3rd ed.]. Gaithersburg, MD: Aspen; Mandle, C. L., & Gruber-Wood, R. [1997]. Health promotion and the individual. In C. L. Edelman & C. L. Mandle [Eds.], *Health promotion throughout the lifespan* [4th ed.]. St. Louis, MO: Mosby.)

In addition to the physical benefits, individuals who exercise regularly also experience psychological benefits, such as the following:

- Enhanced feelings of well-being
- Improved concentration and memory
- Reduced depression
- Reduced insomnia

- Reduced dependence on external stimulants or relaxants
- Increased self-esteem
- Sense of self-control over anxiety

GUIDELINES FOR ESTABLISHING AN EXERCISE PROGRAM

- Explore the availability of different exercise programs.
- Consult with a health care provider about the safety of a specific exercise program.
- Set realistic goals.
- Plan a routine, allow for a warm-up and cool-down period using stretch exercises.
- Engage in activity that increases heart rate for a period of time and is followed by a cool-down period.

Relaxation Techniques

There are several approaches that help individuals relax. See Chapter 14 for a discussion of complementary/alternative modalities (such as aromatherapy, herbals, music, and humor) that promote relaxation. A discussion of some specific relaxation techniques that are easily learned and can be effective in a variety of stressors follows.

Progressive Muscle Relaxation

Progressive muscle relaxation (PMR) is a method of inducing relaxation by tensing and releasing various muscle groups. For example, the individual tightens her hands into a fist, holds the tension for a few seconds, then slowly relaxes her fingers and hands, paying particular attention to the different sensations of tension and relaxation (see Figure 20-9). This tense-release action

Figure 20-9 This nurse is demonstrating the technique of progressive muscle relaxation in a client education program. How does instruction in this method enhance the self-responsibility that clients need to develop in order to manage their stress?

CLIENT TEACHING CHECKLIST Progressive Muscle Relaxation

After explaining the purpose and process of progressive muscle relaxation, instruct the client to:

1. Assume a comfortable position in a quiet environment.
2. Close eyes and keep them closed until the exercise is completed.
3. Inhale deeply to a count of 4.
4. Hold breath for a count of 4.
5. Exhale to a count of 4.
6. Continue to breathe slowly and deeply.
7. Tense both feet until muscle tension is felt.

Caution the client to tighten the muscles only until the muscles are tensed, not to the point of pain. Hold a gentle state of tension in both feet for a count of 3.

NOTE: If muscle cramps occur, stop the procedure and gently massage the affected area. Then begin the cycle of slight muscle tension and relaxation again.

8. Slowly release the tension from the feet.
9. Fully experience the difference between tension and relaxation.
10. Repeat steps 3–6.

Repeat the above sequence with all the muscle groups to experience relaxation throughout your body. To be effective, this procedure requires approximately 20 to 30 minutes. Like all other relaxation exercises, progressive muscle relaxation is most effective with repetition.

is applied to all muscle groups of the body. PMR is especially helpful in promoting sleep. PMR is a technique that can successfully be taught to clients for use in any health care setting, including the home (see the Client Teaching Checklist).

Guided Imagery

Another technique for helping clients manage stress successfully is guided imagery, a process in which the person uses all the senses to experience the sensation of relaxation. During guided imagery, the client is directed to concentrate on a pleasant scene or image in order to become more relaxed. In many situations, music is a helpful adjunct to guided imagery (see Figure 20-10). The Client Teaching Checklist describes the steps involved in using this technique. See Chapter 14 for further discussion of guided imagery. Note that imagery is not recommended for individuals experiencing emotional instability.

Figure 20-10 To help relieve this client's stress, the nurse is giving him a tape recorder and a relaxation tape. In your opinion, are there any situations in which this type of intervention may be inappropriate?

CLIENT TEACHING CHECKLIST *Guided Imagery*

After explaining the purpose and process of guided imagery, instruct the client to:

- Assume a comfortable position in a quiet environment.
- Close your eyes and keep them closed until the exercise is completed.
- Inhale deeply to a count of 4.
- Hold breath for a count of 4.
- Exhale to a count of 4.
- Continue to breathe slowly and deeply.
- Think of a favorite place and prepare to take an imaginary journey there. Select a place in which you are relaxed and at peace.
- Picture in your mind's eye your favorite place. Look around you. See all the colors, the light and shadows. Look at all the pleasant sights.
- Listen to all the sounds. Pay attention to what you hear.
- Feel all the physical sensations . . . the temperature . . . the textures . . . the movement of the air.
- As you take in a deep breath, smell the aromas of your favorite place.
- Taste the foods and drinks you usually consume in your favorite place. Savor each taste fully.
- Focus all your attention totally on your favorite place.
- Inhale deeply to a count of 4.
- Hold breath for a count of 4.
- Exhale to a count of 4.
- Resume your usual breathing pattern.
- Slowly open your eyes and stretch, if desired.

This procedure works best when all five senses are used. Like all other relaxation exercises, guided imagery becomes more effective with repetition. This technique (as all imagery exercises) is not recommended for individuals with emotional instability.

Cognitive Reframing or Thought Stopping

Cognitive reframing is a technique based on a theory proposed by Aaron Beck (1976), who stated that a person's emotional response is determined by the meaning attached to an event. For example, if an event is perceived to be threatening, the client is likely to feel anxious. If the interpretation of the event can be modified, the client will be less anxious. Reframing is a technique used to alter one's perceptions and interpretations by changing one's thoughts. The accompanying display describes the thought-stopping process, a cognitive reframing technique.

THOUGHT STOPPING: A COGNITIVE REFRAMING TECHNIQUE

- Listen to self-talk (thoughts).
- Recognize when the self-talk is negative.
- When a negative thought is detected, do something physical to stop the train of thought. For example, clap your hands or snap a rubber band on your wrist. Tell yourself, "Stop!"
- Replace the negative thought with one that is both positive and realistic.

Like all other relaxation exercises, thought stopping becomes more effective with repetition

Crisis Intervention

Some clients will be in an acute crisis state and require **crisis intervention**, a specific technique that helps clients regain equilibrium. Clients are viewed as having the ability to control their own lives. The five steps of crisis intervention are illustrated in Figure 20-11.

The client is an active participant in the process of resolving the crisis in order to restore equilibrium. If the client is unable to participate in problem solving (for example, because of delayed developmental stage or altered mental status), then crisis intervention should not be attempted. However, the family can be approached with the crisis intervention method.

Sometimes clients need more assistance than the nurse is able to provide. Recognition of such situations calls for prompt consultation with and, sometimes, referral to other health care providers, such as:

- Psychiatric clinical nurse specialists
- Nurse psychotherapists
- Psychologists
- Social workers
- Psychiatrists
- Clergy and other counselors

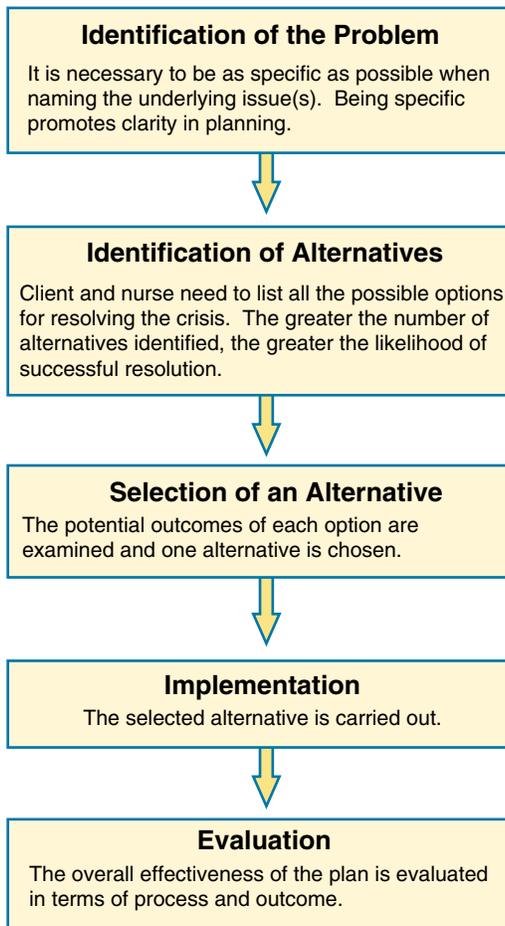

Figure 20-11 Steps of Crisis Intervention

EVALUATION

Evaluating the effectiveness of clients' coping abilities is an ongoing comprehensive process that must include client input. It is imperative that the nurse evaluate client outcomes as well as the process of delivering nursing care.

In addition to eliciting verbal input from the client and significant others, nurses also collect evaluation data by observation of client behavior. See the Nursing Process Highlight for some questions that the nurse may consider in evaluating the effectiveness of interventions to reduce anxiety.

PERSONAL STRESS MANAGEMENT APPROACHES FOR THE NURSE

"Before nurses can care for clients, they must first learn to value and care for themselves" (Fontaine, 2000, p. 18). There are many stressors inherent in nursing. Learning to cope successfully with stressors is essential for nurses.

Nursing Process Highlight

EVALUATION

Consider these questions when evaluating the effectiveness of your anxiety-reducing interventions:

- Does the client exhibit decreased fidgeting and pacing?
- Is the client's tone of voice calm?
- Is the client's problem-solving ability unimpaired?
- Is ability to concentrate intact?
- Are the vital signs within normal limits (client's baseline)?

Two major reasons nurses must cope successfully with stress are to maintain their own wellness and to model health-promoting behaviors to others. In order to help clients learn to manage stress, nurses must first be able to manage their own stress.

As Watson (1997) states, "If one is to work from a caring-healing paradigm, one must live it out in daily life" (p. 51). Caring for one's self includes the following:

- Taking time out for self
- Using effective communication skills with coworkers, family, significant others
- Managing conflict effectively

See the accompanying display for a listing of complementary/alternative methods that nurses can use to promote self-care.

Burnout and Nurses

High stress levels among nurses are associated with **burnout**, a state of physical and emotional exhaustion that occurs when caregivers deplete their adaptive

COMPLEMENTARY/ALTERNATIVE THERAPY

Modalities Useful for Promoting Nurse's Self-Care

- Imagery
- Progressive muscle relaxation
- Prayer
- Humor
- Music
- Communion with nature
- Journaling
- Meditation (Figure 20-12)

Figure 20-12 This individual is reducing her stress level by the use of meditation. What physiological effects will this woman likely experience as a result of meditation?

energy. Nurses who have experienced such an overwhelming degree of stress tend to treat clients in depersonalizing ways. Such nurses also lack feelings of personal accomplishment. Burnout exacts a high price not only on individual nurses themselves but also on the profession. Highly qualified professionals leave nursing and, as a result, the quality of care declines.

Several work-related factors can contribute to the development of nursing burnout:

- Job-related stress (for example, the stress evoked by caring for dying people)
- Workload
- Interpersonal conflict in the work environment
- Rapid restructuring of health care organizations (e.g., mergers, partnerships)

In order to avoid developing the classic symptoms of burnout—absenteeism, poor morale, and illness—nurses need to recognize “the importance of self-care in their personal and professional lives” (O’Brien, 1998, p. 16B).

Burnout prevention and recovery depend on stress management.

THINK ABOUT IT

Experiencing Burnout

A client is exhibiting panic-level anxiety and you do not want him left alone. You are experiencing severe burnout because of very long work hours and stressful situations that have occurred with clients and with other nurses recently. Your stress level is so high that you feel you cannot even be in the same room with this upset client. If you leave the room to find another nurse to stay with him, he may injure himself. If you stay, you risk your own emotional well-being. How do you deal with the situation?

THINK ABOUT IT

Self-Nurturers

Society often labels people who take care of themselves as selfish. Do you agree? Why or why not? Consider how taking care of yourself can help you be a better care provider to others. What are some *specific* things you can do now to take better care of yourself?

NURSING TIP

A stress management plan is a continuous process, not the occasional use of a technique or exercise.

There are many strategies that nurses can use to help manage professional and personal stress (see Table 20-10). In addition to the techniques listed in Table 20-10, the following Nursing Checklist provides strategies that are also helpful in managing professional stress. Guidelines that are helpful in changing from a negative to a positive outlook include:

- Expect to be successful.
- Remember the power of self-fulfilling prophecies and deliberately focus on the positive.
- Let go of the need to be perfect.
- Listen to your self-talk.
- Encourage the use of appropriate humor in the workplace.

Nurses who cultivate the hardiness factor will likely be resilient to stress. Kobasa (1979) originated the concept of hardiness in the late 1970s. Hardiness consists of a set of attitudes, beliefs, and behaviors that result in individuals being more resilient (or hardy) to the negative effects of stress. There are three components to stress hardiness:

TABLE 20-10
Strategies for Coping with Professional Stress

Strategy	Explanation
Use time management methods.	Encourages recognition of needs as priorities.
Focus on accomplishments instead of the uncompleted tasks.	Being focused on unfinished business increases anxiety; paying attention to successes boosts self-esteem.
Practice slow, focused breathing.	Alleviates muscle tension by increasing the amount of oxygenated blood. Consciously thinking about breathing serves as a diversionary tactic.
Don't assume personal responsibility for others' behaviors/problems.	Encourages avoidance of assuming rescuer role.
Know own limits.	Clarifying expectations, strengths, and limitations. Learning to differentiate what's really important. Knowing when a problem is beyond your control.
Whenever possible, distance self from stressors that have a negative impact.	Avoids exposure to needless stress and subsequent draining of adaptive resources.
Identify and change the stressors that you can directly influence.	Increases your sense of personal power. Avoids needless expenditure of energy.
Vary tasks between physical and mental activities.	Helps restore a sense of balance. Conserves energy by reducing fatigue.

- *Commitment.* Becoming involved in what one is doing
- *Challenge.* Perceiving change as an opportunity for growth rather than an obstacle or threat
- *Control.* Believing that one is influential in directing what happens to oneself rather than feeling helpless and victimized

According to studies (Kobasa, 1979; Kobasa, Maddi, & Kahn, 1982), individuals who have higher degrees of hardiness are healthier than are individuals with low degrees of hardiness. Such people develop fewer illnesses when they experience multiple stressors.

Many nurses need to relearn the value of play and to know when to stop working. Nursing students, who spend many hours a week working and studying, may need to schedule some time for play as it is a method to

NURSING CHECKLIST
Managing Professional Stress

- *Develop and maintain active support systems*, both at work and away from work. Having friends who are not health care providers helps maintain a sense of balance and separateness between personal and professional domains.
- *Develop decision-making skills.* For example, break large tasks down into small, realistic, achievable objectives. This strategy avoids your becoming overwhelmed by the seemingly “impossible” task before you.
- *Avoid consumption of noxious substances.* Practice a substance-free lifestyle to manage stress well. Do not depend on these unhealthy behaviors as avenues to relaxation: smoking, overeating, drinking alcohol and caffeine.
- *Nourish your body* with a healthy diet and adequate amounts of sleep and rest balanced with activity and exercise. Care for yourself as you would for clients.
- *Maintain a sense of humor while you work.* Humor helps a person maintain a positive outlook; therefore, it can be used to reframe situations to reduce distress (see Figure 20-13).

Figure 20-13 Humor helps nurses manage the stress created by the nature and intensity of their work. What can you do to help your fellow nursing students cope with the anxiety that is inherent in this stage of your academic experience?

NURSING TIP

Journaling

When you are feeling “stressed out,” write down your thoughts and feelings. Writing down emotions and thoughts may help clarify issues related to anxiety. Writing is also an effective method for venting pent-up feelings.

RESEARCH FOCUS

Title of Study

“Hardiness, Help-Seeking Behavior, and Social Support of Baccalaureate Nursing Students”

Authors

Hegge, M., Melcher, P., & Williams, S.

Purpose

To (1) examine the effects of hardiness, social support and help-seeking behavior on academic performance, and (2) determine the relationship among hardiness, social support, and help-seeking behavior.

Methods

This descriptive correlational study used a questionnaire with a self-selected sample. Surveys were administered to students who remained after class.

Findings

(1) Students indicated that they sometimes seek help, with more students seeking help for academic than personal situations. (2) General students were more likely to seek help than nursing students. (3) As hardiness increases, academic performance increases slightly.

Implications

The study results reinforce the importance of social support to success in any challenging life situation. Faculty should build on students’ perseverance, persistence, and hardiness.

Hegge, M., Melcher, P., & Williams, S. (1999). Hardiness, help-seeking behavior, and social support of baccalaureate nursing students. *Journal of Nursing Education, 38*(4), 178–182.

manage stress and, thereby, to become a more effective care provider.

KEY CONCEPTS

- Stress is an individual’s physiological response to stimuli.
- Individuals who experience prolonged periods of stress are at risk for developing stress-related diseases.
- Anxiety is the psychological response to a threat to the health and well-being of an individual and activates the stress response.
- An individual seeks equilibrium through the process of adaptation. When adaptation is effective, homeostasis (the body’s self-regulation of physiological processes) is maintained.
- Many factors, such as physiological, psychological, cognitive, or environmental changes, contribute to stress.
- The general adaptation syndrome (GAS), the physiological response to stress, consists of three stages: alarm, resistance, and exhaustion. The GAS is the same whether the stressor is actual or imagined, present or potential.
- Illness and hospitalization are major stressors for individuals and their families. To alleviate the stress of hospitalization, nursing interventions should reduce the client’s feelings of unfamiliarity and loss of control.
- Change can be perceived as stressful because of a fear of failure, a threat to security, a potential for loss of self-esteem, and the need to develop new paradigms.
- Nurses act as change agents by consciously empowering the client through education to initiate change in order to successfully adapt to perceived stressful situations.
- Nursing interventions that promote positive adaptation to stress are the empowerment of clients to meet basic needs; the minimization of environmental stimuli; the encouragement of verbalization of feelings; the inclusion of family members and significant others into client care; and the use of various relaxation techniques, such as progressive muscle relaxation (PMR) and guided imagery.
- Stress management techniques can be used by both clients and nurses to facilitate effective coping.
- The thought-stopping technique, a cognitive approach to stress management, involves removing or reducing anxiety by changing negative thoughts to positive and realistic thoughts.
- Burnout occurs when the nurse is overwhelmed by stress. As a result, the nurse experiences physical, emotional, and behavioral dysfunction, including decreased productivity.
- Elements of a stress management plan for professional nurses consist of maintaining support systems; developing time-management and decision-making skills; identifying and changing stressors that can be managed; and knowing personal limits.

NURSING CARE PLAN**The Client Experiencing Anxiety****Case Presentation**

Kathryn Markham is a 38-year-old female who is seeking treatment in the emergency department of a metropolitan hospital. She is tearful, pacing, and wringing her hands. She is complaining of severe chest pain, a pounding headache, and back pain. She is sweating profusely and exhibits fine hand tremors. Her blood pressure and pulse are elevated, and her respirations are rapid and shallow. She says that she hasn't slept well since her husband left her 3 months ago. She states that "I'm afraid I'm losing my mind! My heart is racing and I can't sit still. Help me! I feel like I'm going to die."

Assessment

- Autonomic hyperactivity (rapid pulse, elevated blood pressure)
- Verbalized feelings of apprehension and uneasiness
- Restlessness

Nursing Diagnosis

Anxiety related to feelings of powerlessness and lifestyle change.

Expected Outcomes

The client will:

1. Identify effective coping mechanisms.
2. Report that anxiety is reduced to a manageable level.
3. Demonstrate relaxation skills.

Interventions/Rationales

1. Establish a trusting relationship.
The client may perceive the nurse or emergency department as a threat and thus anxiety will increase.
2. Have the client identify and describe physical and emotional feelings.
The first step in coping with anxiety is to recognize the anxiety and become aware of feelings in order to link emotions with maladaptive coping responses.
3. Help the client to relate cause-and-effect relationships between stressors and anxiety.
Increases the client's sense of control and power over the situation.
4. Encourage the client to use coping mechanisms that have been successful previously.
Increases confidence in own abilities to cope.
5. Teach the client relaxation techniques (such as imagery and meditation).
The relaxation response is the opposite of the stress response and, therefore, counters the physiological effects of the stress response. The relaxation response leads to lowered blood pressure, decreased heart rate, deeper and slower respirations.
6. Administer anti-anxiety medication as indicated.
Anti-anxiety agents provide relief from the immobilizing effects of anxiety. NOTE: This is a collaborative dependent nursing action.

Evaluation

The client is visibly relaxed. Vital signs are within normal limits. The client verbalizes that she is calmer and no longer afraid.

CRITICAL THINKING ACTIVITIES

1. Identify positive and negative outcomes of an upcoming change in your life.
2. Reflect on the past 4 months. List some of the changes that you experienced during that time. What were the outcomes of the changes? Would you now respond differently in similar situations? If so, what would be altered?
3. Explain the fight-or-flight response.
4. Describe how you would explain to a client the relationship between stress and illness.
5. List some ways in which your life has changed since becoming a nursing student.
6. How can you act as a change agent in your school?
7. Identify some ways you can become a change agent for clients.
8. Select one stress management exercise described in this chapter and practice it three times a week for 4 weeks. Keep a journal reflecting your experience, including your emotions, physical responses, and behaviors.
9. What are some changes you can begin now to improve your ability to handle personal and professional stress in your life?
10. Answer the following as true or false to determine how well you care for yourself.

- | | TRUE | FALSE |
|---|-------|-------|
| 1. I exercise regularly. | _____ | _____ |
| 2. I limit my intake of salt, fat, refined sugar, and cholesterol. | _____ | _____ |
| 3. I get enough sleep and rest. | _____ | _____ |
| 4. I have specific techniques for managing stress. | _____ | _____ |
| 5. I'm healthier now than I was 5 years ago. | _____ | _____ |
| 11. Which of the following are physiological indicators of anxiety? | | |
| a. Decreased pulse rate | | |
| b. Constricted pupils | | |
| c. Increased blood pressure | | |
| d. Warm, dry skin | | |

Chapter 21

Loss and Grief

Everyone can master grief but he that has it.

—Shakespeare

COMPETENCIES

1. Discuss theoretical perspectives of loss, grief, and dying.
2. Describe various losses that affect individuals at different stages of the life cycle.
3. Describe the characteristics of an individual experiencing grief.
4. Differentiate adaptive grief and pathological grief.
5. Explain the relationship between loss and grief.
6. Discuss the holistic needs of the dying person and family.
7. Discuss use of the nursing process with a grieving individual.
8. Define the purpose of hospice care.
9. Develop a plan for end-of-life (EOL) care.
10. Discuss nursing responsibilities when a client dies.
11. Describe ways in which nurses can cope with their own grief.

uncomplicated grief

In contemporary society, individuals constantly experience loss. Frequent episodes of terrorism, natural disaster, and personal crises result in the universal experience of loss. Throughout the life cycle, people are faced with loss, without which growth would not continue. Many people consider loss only in terms of death and dying; however, loss of every type occurs daily. Nurses must be aware of the potential for loss in today's world, as well as the processes by which individuals adapt.

Every day nurses encounter clients who are responding to grief associated with losses. Thus, nurses must have an understanding of the major concepts related to loss and grieving. Grief is a response to losses of all types. However, this chapter focuses on grief as a response to death. Nurses also care for dying clients. This chapter provides information on meeting the special needs of terminally ill clients and their families.

LOSS

Loss is any situation (either actual, potential, or perceived) in which a valued object is changed or is no longer accessible to the individual. Because change is a major constant in life, everyone experiences losses. Loss can be actual (e.g., a spouse is lost through divorce) or anticipated (a person is diagnosed with a terminal illness and has only a short time to live). A loss can be tangible or intangible. For example, when a person is fired from a job, the tangible loss is income, whereas the loss of self-esteem is intangible.

Losses occur as a result of moving from one developmental stage to another. An example of such a **maturational loss** is the adolescent who loses the younger child's freedom from responsibility. Other examples of losses associated with growth and development are discussed later in this chapter. A **situational loss** occurs in response to external events, usually beyond the individual's control (such as the death of a significant other). As Bateman (1999) states:

Dealing with an actual or impending loss—whether the experience is of the magnitude of war, mass murder, and natural disasters or divorce, homelessness, or living with chronic illness—has long been part of the human experience. (p. 142)

Refer to Figure 21-1.

Figure 21-1 Loss occurs with the destruction of property. Think of the many losses that are experienced by the family whose home was destroyed in an earthquake.

Loss as Crisis

Loss precipitates anxiety and a feeling of vulnerability—which may lead to crisis. When a significant other dies, one's sense of safety and security is disrupted. Grieving is a mechanism for crisis resolution. When an individual feels overwhelmed by stress and the usual coping mechanisms are no longer effective, crisis occurs. Crisis intervention may be necessary to help the person grieve successfully. See Chapter 20 for a discussion of crisis and crisis intervention.

Types of Loss

Loss occurs when a valued object is changed or is no longer available. Not everyone responds to loss in the same way because the significance of the lost object or person is determined by individual perceptions. There are many types of loss, including:

- *Actual loss*: Death of a loved one, theft of one's property
- *Perceived loss*: Occurs when a sense of loss is felt by an individual but is not tangible to others
- *Physical loss*: Loss of an extremity in an accident, scarring from burns, permanent injury
- *Psychological loss*: Such as a woman feeling inadequate after menopause and resultant infertility

There are four major categories of loss: loss of external objects, loss of familiar environment, loss of aspects of self, and loss of significant other.

Loss of an External Object

When an object that a person highly values is damaged, changed, or disappears, loss occurs. The significance of the lost object to the individual determines the type and amount of grieving that occurs. The valued object may be a person, pet, prized possession, or one's home. The loss of a pet, especially for those who live alone, can be a devastating loss.

Loss of Familiar Environment

The loss of a familiar environment occurs when a person moves to another home or a different community, changes schools, or starts a new job. Also, a client who is hospitalized or institutionalized experiences loss when faced with new surroundings. This type of loss evokes anxiety caused by fear of the unknown.

Loss of Aspect of Self

Loss of an aspect of self can be physiological or psychological. A psychological aspect of self that may be lost is ambition, a sense of humor, or enjoyment of life. An example of physiological loss includes loss of physical function as a result of illness or injury. Loss also occurs when there is disfigurement or disappearance of a body part, such as having an amputation or mastectomy. Loss of an aspect of self can result from illness, trauma, or treatment methodologies (such as surgery).

Loss of Significant Other

The loss of a loved one is a significant loss. Such a loss can be the result of separation, divorce, running away, moving to a different area, or death. Responses to loss are highly individualized as each person perceives the meaning of loss differently. For example, the death of a spouse is different for men and women (Figure 21-2). "Men who are widowed react as if they have lost a part of themselves, whereas women react as if they have been deserted or abandoned" (Bateman, 1999, p. 140).

GRIEF

Grief is a series of intense physical and psychological responses that occur following a loss. It is a normal, natural, necessary, and adaptive response to a loss. "Grieving is a walk through unknown territory. Familiar internal and external stabilities disappear in a whirlwind of changing thoughts, feelings, and emotional flux" (Wong, 1995, p. 29). Loss leads to the adaptive process of **mourning**, the period of time during which the grief is expressed and resolution and integration of the loss occur. **Bereavement** is the period of grief following the death of a loved one.

Theories of the Grieving Process

There is no one comprehensive theory to explain the grief process, which may consist of a series of phases. Several theories have allowed us to delineate pre-

Figure 21-2 Losing a spouse or partner who has been a part of their lives for many years is common for older adults. How can nurses support elders during the grieving process?

dictable symptoms and states in response to loss. When reviewing the following theories, remember that everyone does not experience each phase in the order described. The theories of Erich Lindemann, George L. Engle, John Bowlby, and J. William Worden are discussed in the following sections.

Lindemann

In 1944, after the Coconut Grove fire in Boston, in which over 400 people died, Lindemann studied survivors of the disaster and their families. Lindemann coined the phrase **grief work**, which is still used today to describe the process experienced by the bereaved. During grief work, the person experiences freedom from attachment to the deceased, becomes reoriented to the environment in which the deceased is no longer present, and establishes new relationships (Lindemann, 1944). Lindemann's classic work is the foundation for current crisis and grief resolution theories. The accompanying display provides a description of Lindemann's concepts.

Engle

Grief is a typical reaction to loss of a valued object. There are three stages of mourning, and progression through each stage is necessary for healing. The grieving process, which may take several years for completion, cannot be accelerated. The goal of the grieving process is for the mourner to accept the loss and let go of the deceased. The accompanying display provides an overview of Engle's theory of grief.

LINDEMANN'S THEORY: REACTIONS TO NORMAL GRIEF

Somatic Distress

Episodic waves of discomfort in duration of 10–60 minutes; multiple somatic complaints, fatigue, and extreme physical or emotional pain.

Preoccupation with the Image of the Deceased

The bereaved experience a sense of unreality, emotional detachment from others, and an overwhelming preoccupation with visualizing the deceased.

Guilt

The bereaved consider the death to be a result of their own negligence or lack of attentiveness; they look for evidence of how they could have contributed to the death.

Hostile Reactions

Relationships with others become impaired owing to the bereaved's desire to be left alone, irritability, and anger.

Loss of Patterns of Conduct

The bereaved exhibit an inability to sit still, generalized restlessness and continually search for something to do.

(Data from Lindemann, E. [1944]. Symptomatology and management of acute grief. *American Journal of Psychiatry*, 101, 141–148; Roach, S. S., & Nieto, B. C. [1997]. *Healing and the grief process* [pp. 1–24]. Albany, NY: Delmar Publishers.)

Bowlby

Bowlby stated that grief results when an individual experiences a disruption in attachment to a love object. His theory proposes that grief occurs when attachment bonds are severed. There are four phases that occur during grieving:

- Numbing
- Yearning and searching
- Disorganization and despair
- Reorganization (Bowlby, 1982)

Worden

J. William Worden has identified four tasks that an individual must perform in order to successfully deal with a loss:

- Accept the fact that the loss is real.
- Experience the emotional pain of grief.
- Adjust to an environment without the deceased.
- Reinvest the emotional energy once directed at the deceased into another relationship (Worden, 1982).

Worden categorized the behavioral responses that grieving individuals experienced; these responses are listed in Table 21-1.

ENGLE'S THEORY OF GRIEF: THREE STAGES OF MOURNING

Stage I: Shock and Disbelief

- Disorientation
- Feeling of helplessness
- Denial gives protection until person is able to face reality

Stage I can last from minutes to days.

Stage II: Developing Awareness

- Emotional pain occurs with increased reality of loss
- Recognition that one is powerless to change the situation
- Feelings of helplessness
- Anger and hostility may be directed at others
- Guilt
- Sadness
- Isolation
- Loneliness

Stage II may last from 6 to 12 months.

Stage III: Restitution and Resolution

- Emergence of bodily symptoms
- May idealize the deceased
- Mourner starts to come to terms with the loss
- Establishment of new social patterns and relationships

Stage III marks the beginning of the healing process and may take up to several years.

(Data from Engle, G. L. [1961]. Is grief a disease? *Psychosomatic Medicine*, 23, 18–22; Engle, G. L. [1964]. Grief and grieving. *American Journal of Nursing*, 64(9), 93–98; Roach, S. S., & Nieto, B. C. [1997]. *Healing and the grief process* (pp. 1–24). Albany, NY: Delmar Publishers.)

Types of Grief

Grief is a universal, normal response to loss. Grief drains people, both emotionally and physically. Because grief consumes so much emotional energy, relationships may be impaired and health status may become altered. There are different types of grief including uncomplicated (“normal”), dysfunctional, and anticipatory.

Uncomplicated Grief

Many individuals use the term *normal grief*. Engle (1961) proposed use of the term **uncomplicated grief** to describe a grief reaction that normally follows a significant loss. Uncomplicated grief runs a fairly predictable course that ends with the relinquishing of the lost object and resumption of the previous life. Of course, the bereaved person's life is changed forever, but the person is able to regain the ability to function.

TABLE 21-1
Manifestations of Normal Grief (Worden)

Emotions	Physical Settings	Behaviors	Thought Processes
Sadness	Increased sensitivity to noise	Disrupted sleep patterns	Disbelief
Anxiety	Constricted feeling in throat and chest	Dreaming about the deceased	Preoccupation
Guilt	Shortness of breath	Forgetfulness	Confusion
Relief	Hollow feeling in stomach	Crying	Sense of presence of the deceased
Emancipation	Dry mouth	Avoiding reminders of the deceased	Hallucinations (such as seeing or hearing the deceased)
Self-blame	Muscular weakness	Treasuring objects belonging to the deceased	
Fatigue	Lethargy	Social withdrawal	
Numbness			
Shock			
Helplessness			
Yearning			
Loneliness			

“Expression of loss is often experienced by somatic symptoms that may range in severity from minor to incapacitating” (Bateman, 1999, p. 143). Some of the common responses experienced by grieving individuals are shown in Table 21-2. Not every mourner will experience all the reactions, but the reactions most often experienced in response to a recent loss are listed.

Many grieving people experience feelings of anger or blame; these feelings may be directed toward those perceived to have caused or contributed to the death. Often the anger associated with grief is directed at one’s self, that is, expressed as guilt or depression. Some survivors have a strong need to assign blame. If someone else can be blamed, then the survivors can rid themselves of any responsibility. Those who are experiencing grief must be provided an opportunity to express feelings—both positive and negative—in order to alleviate guilt.

Nurses play an important role in assisting mourners to develop and understand the normal grieving process

and the complex feelings exhibited when grief becomes more complicated. Nurses with a sound knowledge base of both normal grief and dysfunctional grief will be better prepared to assist the survivors than nurses who believe that all grief is the same.

Dysfunctional Grief

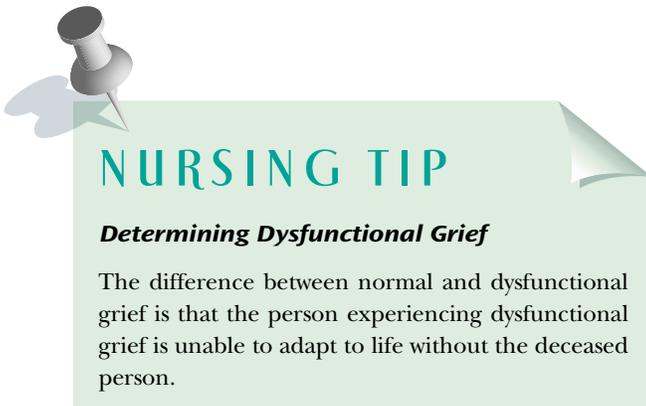

Persons experiencing **dysfunctional grief** do not progress through the stages of overwhelming emotions associated with grief, or they may fail to demonstrate any behaviors commonly associated with grief. The person experiencing pathologic grief continues to have strong emotional reactions, does not return to a normal sleep pattern or work routine, usually remains isolated, and has altered eating habits. The bereaved may have the need to endlessly tell and retell the story of loss but without subsequent healing. The pathologically grieving person is unable to reestablish a routine. Visits to the

TABLE 21-2
Reactions Commonly Experienced During Grief

Physical Reactions	Psychosocial Reactions	Cognitive Reactions	Behavioral Reactions
<ul style="list-style-type: none"> • Loss of appetite • Weight loss • Insomnia • Fatigue • Decreased libido • Decreased immune functioning (increased susceptibility to illness) • Multiple somatic complaints (e.g., headache, backache) • Restlessness 	<ul style="list-style-type: none"> • Profound sadness • Helplessness • Hopelessness • Denial • Anger • Hostility • Guilt • Nightmares • Ennui (overwhelming sense of emptiness) • Preoccupation with lost object • Loneliness 	<ul style="list-style-type: none"> • Inability to concentrate • Forgetfulness • Impaired judgment • Decreased problem-solving ability 	<ul style="list-style-type: none"> • Impulsivity • Indecisiveness • Social withdrawal • Distancing

gravesite or mausoleum may be made often or not at all. Schattner (2000) refers to a type of dysfunctional grief as unspoken grief that “can lead to a variety of unresolved grief symptoms . . . and isolation from support of friends, family, and activities” (p. 11).

Dysfunctional grief is a demonstration of a persistent pattern of intense grief that does not result in reconciliation of feelings. A person experiencing chronic grief continues to focus on the deceased, may overvalue objects that belonged to the deceased, and may engage in depressive brooding.

NURSING TIP

Determining Dysfunctional Grief

The difference between normal and dysfunctional grief is that the person experiencing dysfunctional grief is unable to adapt to life without the deceased person.

Several factors predispose a person to experience dysfunctional grieving, including:

- Uncertain, sudden, or overcomplicated circumstance surrounding the loss
- A loss that is socially unspeakable or socially negated (e.g., suicide)
- A relationship with the deceased characterized by ambivalence or excessive dependency (Worden, 1991)

Anticipatory Grief

Anticipatory grief is the occurrence of grief work before an expected loss. Anticipatory grief may be experienced by the terminally ill person as well as family. This phenomenon promotes adaptive grieving by freeing up the mourner’s emotional energy. Although anticipatory grieving may be helpful in adjusting to the loss, it may also result in some disadvantages. For example, for the dying client, anticipatory grieving may lead to family members’ distancing themselves and not being available to provide support. Also, if the family members have separated themselves emotionally from the dying client, they may seem cold and distant, thus, not meeting society’s expectations of mourning behavior. This response can prevent the mourners from receiving their own much needed support from others.

Factors Affecting Grief

The experience of grief is individual and is influenced by various factors. Factors that influence grief include the person’s developmental level, religious and cultural

beliefs, relationship to the lost object, and the cause of death.

Developmental Considerations

Depending on a client’s development level, the grief response to a loss will be experienced differently. Nurses practice in many settings in which children, adolescents, and adults, as a result of growth and development, experience changes that result in loss. For example, a pregnant woman will, to some degree, experience loss after delivery, even delivery of a normal healthy infant. See Table 21-3 for other examples of developmental losses that may precipitate grieving. Certain kinds of loss at key developmental points may have a profound effect on a person’s ability to work through grief, as well as possible inadequate achievement of the developmental task.

Childhood

Children vary in their ability to comprehend the meaning of death. It is important to understand how a child’s concept of death evolves, because it varies with developmental level and may affect mastery of developmental tasks (Table 21-4).

Well-meaning adults often try to protect children from the realities of death by excluding them from mourning rituals. However, children need to be included as appropriate to their developmental level, “or they may feel abandoned and left to face their fear alone” (Bateman, 1999, p. 144). Children who are grieving need explanations about death that are honest and in language that can be comprehended. See Table 21-5 for suggestions on talking to children about death.

Adolescence

Most adolescents value physical attractiveness and athletic abilities. Grief may occur when the adolescent suffers the loss of a body part or function. Because of the strong influence of peer groups, adolescents seek approval of their friends and fear being rejected if a loss affects their acceptance by others (e.g., grief after a disfiguring accident is usually intense in adolescents). Even though they have an intellectual understanding of death, adolescents feel they are immune to death and therefore do not accept the possibility of their own mortality. This perception is caused by the sense of invulnerability that normally occurs during adolescence.

Early Adulthood

In the young adult, grief is usually precipitated by loss of role or status. For example, unemployment or breakup of a relationship causes significant grief for the young adult. The concept of death in this age group is primarily a reflection of cultural values and spiritual beliefs.

Middle Adulthood

During middle adulthood the potential for experiencing loss increases. The death of parents begins to occur.

TABLE 21-3
Losses Associated with Developmental Stage

Developmental Stage	Related Loss	Developmental Stage	Related Loss
Infants	<ul style="list-style-type: none"> • Intrauterine environment (warmth and protection) • Comfort of sucking breast or bottle 	Young adults	<ul style="list-style-type: none"> • Friends through leaving school, moving, changing jobs • Financial support from parents when leaving home • Freedom when assuming more adult responsibilities • Sexual partner
Toddlers/Preschoolers	<ul style="list-style-type: none"> • Spontaneity of bodily function as a result of toilet training • Immediate gratification of needs as child gains independence • Familiar environment as child attends daycare or nursery school 	Middle adults	<ul style="list-style-type: none"> • Spouse, through separation, divorce, or death • Children as they leave home • Friends through job changes, moving, or death • Parents through death • “Youth” (as related to physical appearance, decreased libido, physical stamina) • Women experience loss of fertility through menopause
School-aged children	<ul style="list-style-type: none"> • Periodic loss of body function caused by normal childhood illnesses and injuries • Friends and significant others (teachers, coaches) as they progress through school 	Older adults	<ul style="list-style-type: none"> • Spouse and friends through death • Sensory perceptual acuity • Job, as a result of retirement • Body image changes related to decline in some physiological functions • Independence
Adolescents	<ul style="list-style-type: none"> • Familiar body with onset of puberty • Childhood freedoms in response to social expectation to act mature • First love (as adolescent “crushes” end) • Familiar environment when leaving home for work or education 		

As an individual ages, it can be especially threatening for peers to die because their death forces acknowledgment of one’s own vulnerability to death. Other losses frequently experienced during middle age are those associated with changes in employment and relationships (e.g., divorce), children leaving home, and decreasing functional abilities.

Older Adulthood

During late adulthood, most individuals recognize the inevitability of death. Most older adults experience numerous losses as they age. Losses commonly experienced by the elderly include loss of (Bowlby, 1961):

- Loved ones and friends
- Occupational role as a result of retirement
- Material possessions
- Dreams and hopes

In the United States, women are more likely than men to experience the death of a spouse or partner (Bateman, 1999). Regardless of gender, the bereaved may need to develop new skills in order to adapt. For example, a man who was married for 50 years may have to learn meal preparation after his wife dies.

Religious and Cultural Beliefs

Religious and cultural beliefs can have a significant effect on an individual’s grief. Every culture has certain religious beliefs about the significance of death, as well as rituals for care of the dying. See Chapters 15 and 16 for discussion of the impact of religious and cultural beliefs. Beliefs about an after-life, faith in God, redemption of the soul, and reincarnation are important aspects that often assist one in grief work.

TABLE 21-4
Perception of Death by Children and Adolescents

Developmental Stage	Perception	Potential Developmental Disruptions
Infancy, Toddler	<ul style="list-style-type: none"> • Not aware of death • Is aware of disruptions in normal routine • Can react to family's expressions of grief 	<ul style="list-style-type: none"> • If the mother or surrogate dies during the first 2 years of life, may have significant long-lasting psychosocial problems
Preschool	<ul style="list-style-type: none"> • Views death as a temporary separation • Able to react to the gravity of death in accordance with the reactions of parents or other adults 	<ul style="list-style-type: none"> • May have significant psychosocial problems if either parent is lost at this stage, especially between ages 4 and 6 (owing to <i>magical thinking</i>, in which children may believe death is their fault)
School-age	<ul style="list-style-type: none"> • Appreciates that death is final and inevitable • Fantasizes about and tends to personify death ("the boogie-man") 	<ul style="list-style-type: none"> • May have nightmares • May engage in death-avoidance behaviors (e.g., hiding under the covers, leaving the lights on, closing closet doors) • May experience intense guilt and a sense of responsibility for the death
Preadolescent and adolescent	<ul style="list-style-type: none"> • Recognizes that death is final • Understands that death is inevitable • Preadolescents: tend to worry about dying • Adolescents: tend to deny that death could happen to them 	<ul style="list-style-type: none"> • Loss of a parent may interfere with mastery of the young adulthood task of forming an intimate relationship with members of opposite sex

TABLE 21-5
Communicating with Children about Death

Therapeutic	Nontherapeutic
<ul style="list-style-type: none"> • Use simple, concrete language 	<ul style="list-style-type: none"> • Use of euphemisms (e.g. "he's gone to sleep" or "she passed away")
<ul style="list-style-type: none"> • Involve the child in mourning rituals (take to funeral home and/or cemetery); explain what is going to happen 	<ul style="list-style-type: none"> • Overexplanations
<ul style="list-style-type: none"> • Encourage the child to express feelings 	<ul style="list-style-type: none"> • Minimizing child's experience
<ul style="list-style-type: none"> • Reassure children that they will not be abandoned 	<ul style="list-style-type: none"> • Judgmental statements
<ul style="list-style-type: none"> • Answer all questions truthfully 	

Relationship with the Lost Object

It is usually more difficult to cope with the loss of an ambivalent relationship as such relationships are characterized by many "if only" and "I should have" thoughts. "Unfinished business" and regrets about the deceased make coping with their loss more problematic. "The greater the dependency on and importance of the lost object, the greater the risk for ineffective coping" (Bateman, 1999, p. 142). When individuals of stormy

relationships have time to work on issues prior to the death, grieving is usually facilitated.

In general, the more intimate the relationship with the deceased, the more intense the grief experienced by the bereaved. The death of a child poses a particular risk for dysfunctional grieving to occur.

The death of a parent or a sibling can pose a major challenge for children. The child's feelings may often go unrecognized by adults who fail to understand the child's need to mourn.

Individuals experiencing parental grief usually have intense reactions and responses. It is expected that children outlive their parents. When a child dies, the parent loses not only the child, but also experiences losses of the parental role. Bowlby (1961) describes parents who talk about losing a part of themselves as a result of their child's death. "The death of a child disrupts family homeostasis and the psychological and physiologic equilibrium of family members" (Levin, 1998, p. 70). The uniqueness of parental grief for a deceased child may be the loss of the perceived potential for that child who has died. It is the loss of the hopes of the parents for the child, for "the things that could have been." Table 21-6 provides a listing of characteristics of parents of infants and children who have died.

RESEARCH FOCUS

Title of Study

"Chronic Sorrow: The Experience of Parents with Children Who are Developmentally Disabled"

Authors

Mallow, G. E., & Bechtel, G. A.

Purpose

To compare chronic sorrow experiences of mothers with those of fathers of developmentally disabled children.

Methods

A qualitative survey design was used to identify patterns of feelings and emotions among parents residing in the same household with a developmentally disabled child.

Findings

Different patterns of chronic sorrow among mothers and fathers of developmentally disabled children were identified. Adaptation mechanisms differ between mothers and fathers. Mothers' emotions evolve into chronic sorrow, while fathers' reactions move toward resignation.

Implications

This study points out the need for continued support to parents; involvement in community support groups may be helpful in coping with chronic sorrow and resignation.

Mallow, G. E., & Bechtel, G. A. (1999). Chronic sorrow: The experience of parents with children who are developmentally disabled. *Journal of Psychosocial Nursing*, 37(7), 31–35.

Cause of Death

The intensity of the grief response changes according to the cause of death, be it unexpected, traumatic, or a suicide.

Unexpected Death

The loss occurring with an unexpected death poses particular difficulty for the bereaved in achieving closure. As Roach and Nieto (1997) stated, any death, even anticipated death, is a traumatic experience to the surviving loved ones. Unanticipated death, such as a death resulting from a natural disaster or other tragedy (e.g., airplane crash), leaves survivors shocked and bereaved. Often, the inability to say goodbye compounds the trauma of the death and may be a factor contributing to altered grieving.

Traumatic Death

Complicated grief is associated with traumatic death such as death by homicide, suicide, or an accident. Although traumatic death does not necessarily predispose the survivor to complications in mourning, survivors suffer emotions of greater intensity than those associated with normal grief.

When loved ones die violently, the griever may suffer from traumatic imagery, that is, the reliving the terror of the incident or imagining the feelings of horror felt by the victim. Traumatic imagery is a common occurrence with traumatic death. Such thoughts, coupled with intense grief, can lead to *post-traumatic stress disorder* (PTSD). Nurses must be aware of the possibility of PTSD and be alert for the presence of symptoms, which may include:

- Sleep disturbances, such as recurrent, terror-filled nightmares
- Psychological distress
- Chronic anxiety

Unless this problem is recognized and the survivors are encouraged to express the intense feelings, they will not be able to progress through the normal, adaptive grieving process.

Suicide

The loss of a loved one to suicide is frequently compounded by feelings of blame in the survivors. They feel guilty for failing to recognize clues that may have enabled the victim to receive help. These feelings of guilt and self-blame can be transformed into anger at the victim for inflicting such pain, at themselves, and at caregivers. Feelings of shame for having a suicide in the family may also be present.

Nursing Care of the Grieving Person

Resolution of a loss is a painful process and must be done by clients in their own way. Nurses can assist by providing support as the client moves through the process of mourning. Grief changes people by affecting self-esteem, triggering the development of new ways of coping, and precipitating a change in lifestyle without the deceased.

TABLE 21-6
Characteristics of Parents Whose Children Die

Death	Characteristics
Spontaneous abortion (miscarriage) and stillbirth	<p>Parents, especially the mother, may have feelings of intense sadness, anger or guilt.</p> <p>The death is often inadequately recognized by others, especially if the loss occurs in early weeks of pregnancy.</p> <p>The death may be considered a personal failure.</p> <p>Parents may dwell on details, designating blame to themselves or others.</p> <p>Grief from previous miscarriages may be relived.</p> <p>Anticipatory grief may occur if the condition of the infant is known early.</p> <p>Ambivalence experienced in early pregnancy may increase grief.</p> <p>Hopes for the future must be modified or changed.</p> <p>Despair may peak when the parents must leave the hospital without the baby.</p>
Neonatal death	<p>Feelings are similar to stillbirth.</p> <p>Parents have had the time to form a bond with the infant, intensifying the grief.</p> <p>Grief may be intense by both parents.</p>
Sudden infant death syndrome (SIDS)	<p>Death is unexplainable and totally unexpected.</p> <p>Pain is increased by lack of knowledge and misinformation.</p> <p>Parental bonding is complete.</p> <p>Death is silent, no signs of distress.</p> <p>Guilt may be present.</p> <p>Police may investigate, adding to the guilt.</p> <p>Grief is acute because there is no time to prepare.</p> <p>Parents, especially the mother, may be preoccupied with the details of the death.</p>
Abortion	<p>Shame, secrecy, and guilt may accompany grief.</p> <p>Highly ambivalent feelings may be present.</p> <p>Little support or comfort is offered by others.</p> <p>Feelings of relief are expected, but despair and depression may surface.</p> <p>No guilt may be felt, especially if the woman did not want a child.</p>

Nurses can play an active role in assisting people to grieve. Encourage clients to do their grief work, that is, to experience their feelings to the fullest in order to work through them. Provide support and explain to the bereaved that it will take time to grieve the loss and to gain some closure to the relationship.

Assessment

A thorough assessment of the grieving client and family begins with a determination of the personal meaning of the loss. Another key assessment area is deciding where the person is in terms of the grieving process. The nurse understands that the stages of grieving are not necessarily mastered sequentially, but that instead individuals may vacillate in progression through the stages of grief. Levin (1998) recommends that assessment be done to differentiate the signs of healthy grieving from at-risk behavior.

Diagnosis

The North American Nursing Diagnosis Association (NANDA) defines *Dysfunctional Grieving* as “extended, unsuccessful use of intellectual and emotional

responses by which individuals (families, communities) attempt to work through the process of modifying self-concept based upon the perception of potential loss” (NANDA, 2001). Another diagnosis that may be applicable is *Anticipatory Grieving*, defined as “intellectual and emotional responses and behavior by which individuals (families, communities) work through the process of modifying self-concept based on the perception of potential loss” (NANDA, 2001). See the accompanying Nursing Process Highlight for a discussion of the two NANDA diagnoses specifically developed to address grieving individuals.

Outcome Identification and Planning

It is important to clarify the expected outcomes when planning care for the grieving client. Listed below are some expected outcome criteria for the person experiencing grief:

- Verbalize feelings of grief
- Share grief with significant others
- Accept the loss
- Renew activities and relationships

Nursing Process Highlight

DIAGNOSIS: DYSFUNCTIONAL GRIEVING

Defining Characteristics

Major

- Unsuccessful adaptation to loss
- Prolonged denial or depression
- Inability to resume normal living patterns
- Delayed emotional response

Minor

- Failure to restructure life after the loss
- Social isolation or withdrawal from others
- Failure to develop new interests or relationships

Related Factors

- Loss of physiological function related to disease or trauma
- Surgery (colostomy, hysterectomy, mastectomy, amputation)
- Terminal illness
- Chronic pain
- Death
- Developmental life changes
- Loss of a relationship

DIAGNOSIS: ANTICIPATORY GRIEVING

Defining Characteristics

Major

- Expressed emotional pain over a potential loss

Minor

- Sorrow
- Anger
- Guilt
- Altered sleep patterns
- Changes in eating patterns
- Decreased libido
- Communication alterations

Related Factors

- Diagnosis of terminal illness (self or significant other)
- Upcoming lifestyle change (divorce, child leaving home)
- Potential job loss
- Loss associated with aging

(Data from Carpenito, L. J. [1999]. *Handbook of nursing diagnosis* [8th ed.]. Philadelphia: Lippincott; North American Nursing Diagnosis Association. [2001]. *Nursing diagnoses: Definitions & classification 2001–2002* [pp. 76–77]. Philadelphia: Author.)

Some of these expected outcomes will take a long period of time to achieve, and some must be achieved before others are mastered. For example, to accept the loss, the person must begin to share grief with others by verbalizing feelings. Two expected outcomes for mourners are discussed below.

Acceptance of the Loss

Only by going through grief work are individuals able to reach some acceptance and, ultimately, resolution of feelings about the loss. Often, people try to find some meaning in their situations. This search involves introspection in which spiritual support is of therapeutic value.

Renewal of Activities and Relationships

The very core of grief work revolves around acceptance of the fact that the needs met by key people in our lives can be met in other ways and by other people. The deceased cannot be replaced; however, enough healing must occur so that new relationships can be initiated.

How long does the process of adaptive grieving take? The length of time for grief to be resolved is as individual as the person experiencing it and its intensity. Grief work takes time. There are no definite time frames in which grief should occur. Each person grieves in his or her own way and at his or her own pace.

THINK ABOUT IT

Allowing Time to Grieve

Your coworker, who is also your friend, has just lost a loved one whose funeral was today. Tomorrow your friend must return to work because his 3-day bereavement leave is over. He is dealing with many intense emotions as well as a lack of energy. Society dictates that he return to work. How would you feel if you were in his place? How do you deal with his lack of productivity at work? How do you provide support to him?

Implementation

Therapeutic nursing care is based on an understanding of the significance of the loss to the client. To understand the client's perspective, the nurse must spend time listening. As the client expresses feelings, the nurse must demonstrate acceptance, even if the client is not responding according to the nurse's expectations or belief system. The nurse's nonjudgmental, accepting attitude is essential while the bereaved expresses anger. The nurse communicates an understanding of the

client's anger—and avoids personalizing and using defensive behaviors.

Grieving people need reassurance, counseling, and support; see Figure 21-3. One mechanism of providing support on a long-term basis is support groups. Thus, the nurse needs to be aware of the availability of such groups within the community to make appropriate referrals. When bereaved people join support groups, they will be with others who have experienced the same situation. This sharing decreases the feelings of loneliness and social isolation that are so common in grief. The accompanying Nursing Checklist lists steps for working through loss.

NURSING CHECKLIST Assisting Clients to Grieve Successfully

When working with bereaved clients, encourage them to:

- Recognize the loss by acknowledging the loss.
- Express feelings related to the loss.
- Remember the deceased in a realistic (versus idealistic) manner.
- Relinquish old attachments of the deceased (e.g., give away some of the deceased's possessions).
- Readjust to the community without the deceased.
- Reinvest the emotional energy into something else (e.g., begin to socialize).

(Data modified from Schattner, J. [2000]. A ritual to help participants grieve the loss of another member in their cardiac rehabilitation program. *Journal of Psychosocial Nursing*, 38(1), 13.)

Figure 21-3 Note the nurse's nonverbal expression of support for this couple's grief over the loss of their child. What specific actions can the nurse implement to provide emotional support?

Evaluation

People follow their own time schedule for grief work. In general, it takes months or years for resolution of grief. It is important to teach grieving individuals that resolution of the loss is generally a process of lifelong adjustment. Therefore, nurses usually do not have an opportunity to be with the bereaved family when grief work is completed. However, the nurse has a unique opportunity to lay the foundation for adaptive grieving by encouraging the bereaved to share their feelings and continue to verbalize their experience with significant others. Goals mutually established with client and family are the foundation for evaluation.

DEATH

In today's social climate, death is viewed as something to be avoided at all costs; medicine, with its technological advances, pursues immortality. These scientific advances do not change the fact that death is a part of every human existence.

End-Of-Life (EOL) Care

No one expects to die. It is something that happens to someone else and to someone else's loved ones. Yet it is one of two life events that all humans share, the other being birth. Dying was once considered to be a normal part of the life cycle. Today it is often considered to be a medical problem that should be handled by health care providers. Technologic advances in medicine have caused care of those who are dying to become depersonalized and mechanical.

In an attempt to humanize care of the dying, proponents of improved EOL care are looking to nurses. "Nurses spend more time with patients who are facing the end of life (EOL) than any other member of the health care team" (Ferrell, Grant, & Virani, 1999, p. 252). In 1997, the Institute of Medicine (IOM) made six recommendations for improving EOL care; see the accompanying display.

This highly technologic world calls for application of high-touch intervention with the dying. In other words, appropriate care of the dying is administered by compassionate nurses who are both technically competent and able to demonstrate caring.

Stages of Death and Dying

In her classic works, Elizabeth Kübler-Ross (1969, 1974) identified five possible stages of dying experienced by clients and their families (Table 21-7). Every person does not move sequentially through each stage. These stages are experienced in varying degrees and for varying lengths of time. The client may express anger and, a

IMPROVING END-OF-LIFE CARE: IOM RECOMMENDATIONS

1. Create and facilitate patient and family expectations for reliable, skillful, and supportive care.
2. Ask health care professionals to commit themselves to improving care for dying patients and using existing knowledge to prevent and relieve pain and other symptoms.
3. Address deficiencies in the health care system through improved methods for measuring quality, tools for provider accountability, revised financial systems to encourage better coordination of care, and reformed drug prescribing laws.
4. Develop medical education to ensure practitioners have relevant attitudes, knowledge, and skills to provide excellent EOL care.
5. Make palliative care a defined area of expertise, education, and research.
6. Pursue public discussion about the modern experience of dying, options available to dying patients and families, and community obligations to those nearing death.

(Data from Field, M. J., & Cassel, C. K. [Eds.]. [1997]. *Approaching death: Improving care at the end of life [report of the Institute of Medicine Task Force]*. Washington, DC: National Academy Press.)

few minutes later, express acceptance of the inevitable, then express anger again. The value in Kübler-Ross's work is that it helps increase sensitivity to the needs of the dying client.

Denial

In the first stage of dying, the initial shock can be overwhelming. Denial, which is an immediate response to loss experienced by most people, is a useful tool for coping. It is an essential and protective mechanism that may last for only a few minutes or may manifest itself for months.

Anger

The initial stage of denial is followed by anger. The client's security is being threatened by the unknown. All the normal daily routines have become disrupted. The client has no control over the situation and thus becomes angry in response to this powerlessness. The anger may be directed at self, God, and others. Often the nurse is the recipient of the anger when the client lashes out; see Figure 21-4.

Bargaining

The anticipation of the loss through death brings about bargaining through which the client attempts to postpone or reverse the inevitable. The client promises to do something (such as be a better person, change lifestyle) in exchange for a longer life.

TABLE 21-7
Kübler-Ross's Stages of Dying and Death

Stage	Example
First stage: Denial	<i>Verbal:</i> "This can't be happening to me!" <i>Behavioral:</i> Client is diagnosed with terminal lung cancer; client continues to smoke two packs of cigarettes daily.
Second stage: Anger	<i>Verbal:</i> "Why me?" <i>Behavioral:</i> Client strikes out at caregivers.
Third stage: Bargaining	<i>Verbal:</i> Client prays, "Please, God, just let me live long enough to see my grandchild graduate." <i>Behavioral:</i> Client tries to "make deals" with caregivers.
Fourth stage: Depression	<i>Verbal:</i> "Go away. I just want to lie here in bed. What's the use?" <i>Behavioral:</i> Client withdraws and isolates self.
Fifth stage: Acceptance	<i>Verbal:</i> "I feel ready. At least, I'm more at peace now." <i>Behavioral:</i> Client gets financial or legal affairs in order. Client says goodbye to significant others.

(Data from Kübler-Ross, E. [1969]. *On death and dying*. New York: Macmillan.)

Figure 21-4 Anger is a common response of grieving individuals. What is the nurse's priority action in the situation depicted with this angry client?

Depression

When the realization comes that the loss can no longer be delayed, the client moves to the stage of depression. This depression is different from dysfunctional depression in that it helps the client detach from life to be able to accept death.

Acceptance

The final stage of acceptance may not be reached by every dying client. However, “most dying persons eventually accept the inevitability of death. Many want to talk about their feelings with family members . . .” (Ward, 1999, p. 1). Verbalization of emotions facilitates acceptance. With acceptance comes growing awareness of peace and contentment. The feeling that all that could be done has been done is often expressed during this stage. Reinforcement of the client’s feelings and sense of personal worth are important during this stage.

Ethical Implications

Death is no longer considered to be a normal part of life. It is fraught with ethical dilemmas that occur almost daily in health care settings. Many health care agencies have ethics committees to develop and implement policies that deal with end-of-life issues. See Chapter 24 for a complete discussion of the ethical implications of euthanasia, assisted suicide, and refusal of treatment. One of the most difficult dilemmas is determining the difference between killing and allowing someone to die by withholding life-sustaining treatment methods.

The American Nurses Association (ANA) distinguishes relieving pain and mercy killing (euthanasia or assisted suicide). Pain relief is a central value in nursing, whereas euthanasia is unethical. Increasing doses of medication to control pain in terminally ill clients is ethically justified even at the expense of maintaining life (ANA, 1992).

Assessment

Nursing interventions are based on a thorough assessment of the client’s holistic needs. See the accompanying Nursing Process Highlight for pertinent assessment information.

Diagnosis

One NANDA-approved nursing diagnosis that is applicable for many dying clients is *Powerlessness*, that is, “the perception that one’s own actions will not significantly affect an outcome; a perceived lack of control over a current situation or immediate happening” (NANDA, 2001). Another response that is often experienced by the dying is described by the diagnosis *Helplessness*, “a subjective state in which an individual sees limited or no

Nursing Process Highlight

INFORMATION NEEDED IN ASSESSMENT OF THE DYING CLIENT

- Client’s awareness of the terminal nature of illness
- Availability of support systems
- Physical condition
- Emotional status
- Presence of advance directives for health care decisions
- History of previous positive coping skills
- Unfinished business expressed by client or family

alternatives or personal choices available and is unable to mobilize energy on own behalf” (NANDA, 2001). See the accompanying Nursing Process Highlight for discussion of these two diagnoses.

Outcome Identification and Planning

The dying client must be treated as a unique individual worthy of respect rather than as a diagnosis or a case to be cured. Essential elements to consider when planning care of the dying person, include:

- Schedule time to be available to client.
- Offer to contact clergy.
- Balance the client’s need for independence and need for assistance.
- Respect the client’s confidentiality.
- Answer all questions and provide factual information to client and family.

Nursing care promotes the optimal quality of life, which means treating the client and family in a respectful manner and providing a safe environment for the expression of feelings. Sensitive nursing care recognizes and respects the cultural, ethnic, spiritual, and religious beliefs of clients and families. Planning focuses on meeting the holistic needs of the client and family.

Implementation

Proficient nursing care during the final stage of life requires a unique knowledge base and skills. The American Association of Colleges of Nursing (1999) has developed a list of competencies necessary to provide quality EOL care; see the accompanying display.

The nurse’s first priority is to communicate a caring attitude to the client. Establishment of rapport facilitates the client’s verbalization of feelings. The nurse establishes a safe environment in which the client does

Nursing Process Highlight

DIAGNOSIS: POWERLESSNESS

Defining Characteristics

Major

- Expressions of dissatisfaction about inability to change the situation

Minor

- Reluctance or refusal to be involved in decision making
- Anxiety
- Apathy
- Depression
- Resignation

Related Factors

- Diagnosis of terminal illness
- Chronic pain
- Deficient knowledge
- Lack of explanation from care providers
- Social isolation
- Being in a threatening situation

DIAGNOSIS: HOPELESSNESS

Defining Characteristics

Major

- Expressions of overwhelming apathy in response to a situation in which there is a perception of no solution (may say something like, “What’s the use? I can’t make things change.”)
- Lack of energy
- Expression of a feeling of incompetence
- Passive, giving-up behavior
- Decreased affect
- Rigid thinking patterns

Minor

- Loss of appetite
- Weight loss
- Irritability
- Muscular tension
- Social withdrawal
- Depression
- Suicidal thoughts

Related Factors

- Diagnosis of terminal illness
- Chronic pain
- Deterioration of health status
- Altered body image
- Prolonged discomfort
- Inability to care for self

(Data from Carpenito, L. J. [1999]. *Handbook of nursing diagnosis* [8th ed.]. Philadelphia: Lippincott; North American Nursing Diagnosis Association. [2001]. *Nursing diagnoses: Definitions & classification 2001–2002* [pp. 71–72]. Philadelphia: Author.)

COMPETENCIES NECESSARY FOR NURSES TO PROVIDE HIGH-QUALITY CARE TO PATIENTS AND FAMILIES DURING THE TRANSITION TO THE END OF LIFE: AACN

1. Recognize changes (social, demographic, economic) necessitating improved EOL care.
2. Promote provision of comfort care to the dying.
3. Communicate with patient, family, and colleagues about EOL issues.
4. Recognize one’s own attitudes, feelings, values, and expectations about death; acknowledge diversity (individual, cultural and spiritual) in beliefs and customs.
5. Demonstrate respect for the patient’s view and wishes during EOL care.
6. Collaborate with interdisciplinary team members during EOL care.
7. Use scientifically based standardized tools to assess symptoms experienced by patient at the end of life.
8. Use assessment data to plan and intervene using traditional and complementary approaches.
9. Evaluate the impact of traditional, complementary, and technological therapies on patient-centered outcomes.
10. Assess and treat multiple dimensions (physical, psychological, social, and spiritual needs) to improve quality at the end of life.
11. Assist patient, family, colleagues, and one’s self in coping with suffering, grief, loss, and bereavement in EOL care.
12. Apply legal and ethical principles in the analysis of complex EOL issues.
13. Identify barriers and facilitators to patients’ and caregivers’ effective use of resources.
14. Demonstrate skill at implementing a plan for improved EOL care.
15. Apply knowledge gained from palliative care research to EOL education and care.

(From American Association of Colleges of Nursing. [1999]. *Peaceful death: Recommended competencies and curricular guidelines for end-of-life nursing care*. Washington, DC: Author.)

not feel chided or chastised for experiencing those feelings. Nonverbal communication can be used very effectively with dying individuals. “You just need to make space for patients to be themselves. You don’t always have to have conversation or be doing something for them. Just be there and hold hands and listen” (Ward, 1999, p. 3).

Physiological Needs

According to Maslow’s hierarchy of needs, physiological needs must be met before others because they are essential for existence. Areas that are often problematic for the terminally ill client are nutrition, respiration,

elimination, comfort, and mobility. Table 21-8 provides information on meeting the client's physiological needs.

THINK ABOUT IT

Communicating with the Family

Relief from pain, constipation, nausea, dry mouth, and reactions to treatments are basic needs of dying people. Being able to take nourishment, to be active, and to occupy oneself are also needs. What should the nurse tell the family as physiological changes occur? How can nurses help both the client and the family deal with these changes?

Promoting Comfort

The primary activities directed at promoting physical comfort include pain relief, keeping the client clean and dry, and providing a safe, nonthreatening environment. The nurse who demonstrates a respectful, caring attitude promotes the client's psychological comfort by establishing rapport.

Clients may experience many fears related to death. They may fear helplessness, dependence on others, loss of abilities, mutilation, or uncontrollable pain. The fear of a painful death is almost universal. Many, though certainly not all, dying clients experience pain. In its position statement on pain relief for the terminally ill, the ANA states that promotion of comfort is the major goal of nursing care (ANA, 1992). Comfort should be maximized by management of pain and other discomforting factors. The American Society of Pain Management Nurses (ASPMN) advocates "for a healthcare environment that fosters humane and dignified care. ASPMN promotes ethical and effective pain and symptom management as an integral part of palliative care" (ASPMN, 1999, p. 2). The Nursing Checklist provides a list of interventions to promote comfort. See Chapter 33 for further discussion of pain management.

Hospice Care

Hospice, a type of care for the terminally ill, is founded on the concept of allowing individuals to die with dignity and be surrounded by those who love them. Hospice care is one of the fastest growing

TABLE 21-8
Meeting the Physiological Needs of the Terminally Ill Client

Area of Need	Discussion	Nursing Implications
Nutrition	Presence of nausea and vomiting decreases appetite.	Identify the cultural, social, and ethnic practices that influence eating patterns.
	Psychological factors (such as depression) may interfere with appetite.	Use specific measures that promote food intake and retention: <ul style="list-style-type: none"> • favorite foods • easy to swallow foods • eating small amounts frequently
	Some treatment modalities (e.g., chemotherapy, radiation) impair immune functioning.	Give antiemetic drugs as needed. Recommend that client avoid: <ul style="list-style-type: none"> • fried foods • alcoholic drinks • gas-producing vegetables (corn, cauliflower, beans, broccoli) Instruct client to avoid raw meat and raw eggs.
Energy	Weakness and exhaustion may occur as a result of metabolic demands.	Schedule care activities to ensure uninterrupted times for rest.
	Fatigue and weakness may impair self-care abilities.	Encourage client to conserve energy (do strenuous tasks for the client).
Hygiene	Diaphoresis and incontinence often occur in final stages of illness.	Provide bed bath as necessary.
		Perform oral care.
		Change linens frequently to keep client dry (promotes maintenance of skin integrity).

**NURSING CHECKLIST****Meeting the Comfort Needs
of the Terminally Ill Client**

1. Encourage client to verbalize presence of pain.
2. Discuss pain relief options with client and family.
3. Administer medication on a regular schedule instead of PRN to ensure maximum pain relief.
4. Assist client and family to identify the stressors that influence pain.
5. Teach noninvasive pain relief measures:
 - Relaxation techniques such as deep breathing, imagery
 - Use of heat and cold
 - Massage
 - Topical ointments, such as soothing salves, deep-heating rubs, herbal-scented lotions

segments of the health care industry. There are currently over 1,800 hospice programs in the United States (Roach & Nieto, 1997). Clients enter hospice care when aggressive medical treatment is no longer an option or when the client refuses further aggressive medical treatment.

Hospice provides an environment that emphasizes caring instead of curing. The emphasis is on **palliative care** (control of the symptoms rather than cure).

Managing the care of a dying person requires many skills. Because of the complexity of care required by the hospice client, an interdisciplinary team is essential for delivering quality, compassionate care. The interdisciplinary team consists of nurses, physicians, social workers, psychologists, clergy, ancillary personnel, and volunteers. The health care team members meet regularly to solve problems, make decisions, and assure that care is coordinated (Down, 1984; Roach & Nieto, 1997).

Home Care

A dying person is often not given the opportunity to be surrounded by family and friends. Approximately 75% of Americans die in either hospitals or nursing homes (Merritt, Fox-Grage, & Rothouse, 1998). Home care is an alternative for the dying client, if the family members are physically and emotionally able to provide care. Hospices provide therapeutic interventions to bereaved family members. Ideally, health care providers should share the responsibility of home care of the dying with the family. This sharing could include respite time and frequent visits.

Psychosocial Needs

Death presents a threat not only to one's physical existence but also to psychological integrity. See Table 21-9 for a discussion of ways to meet the psychosocial needs of the dying client.

Spiritual Needs

In times of crisis, such as death, spirituality may be a source of comfort and support for the client and family. Spiritual and religious beliefs often determine the appropriate course of action. Nurses respect clients' reliance on spiritual support by listening and contacting clergy/spiritual guides if requested.

Nurses play a major role in promoting the dying client's spiritual comfort. Dying is a personal and, frequently, lonely process. The nurse can serve as a sounding board for the client who expresses values and beliefs related to death. The following are therapeutic nursing interventions that address the spiritual needs of the dying:

- Communicating empathy
- Playing music
- Using touch
- Praying with the client
- Contacting the clergy if requested by the client
- Reading religious literature aloud at the client's request

See Chapter 14 for a discussion of complementary/alternative treatment approaches that are therapeutic to the dying.

Support for the Family

Family members need to be involved in the care of their dying loved one. Unrealistic guilt is increased by feelings of powerlessness, thus it is important to involve family members in the caregiving. Families facing the impending death of a loved one require much support from nurses and other caregivers. The nurse's presence, just being there with the family, is extremely important.

Learning Needs of Client and Family

Bereaved families need much support and information. The nurse's role is to teach family members what they need to know. For instance, families must be assisted with acquiring the tools that will help them help their loved one. An example might be the need for the family to understand that the dying person needs to conserve energy. Some simple actions on the part of the family could be to schedule activities after a rest period or early in the morning when the client is strongest. This is not an earth-shattering revelation, but simple interventions can be overlooked during this highly charged emotional time.

TABLE 21-9
Meeting the Psychosocial Needs of the Terminally Ill Client

Problem	Discussion	Nursing Implications
Anxiety	<p>A combination of factors contribute to anxiety of the dying client and family:</p> <ul style="list-style-type: none"> • Client's fear of death (and the loss of the known world) • Caregiver's fear of loss of the loved one • Client's sense of abandonment by the family, friends, and health care providers <p>Loss of independence and social isolation increase anxiety.</p>	<p>Spend as much time as possible with the dying client.</p> <p>Encourage verbalization of feelings.</p> <p>Listen in nonjudgmental manner.</p> <p>Answer all questions in an honest, factual manner.</p> <p>Provide explanation of all procedures.</p> <p>Encourage family and friends to spend time with client.</p>
Decreased independence	<p>Independence is threatened by powerlessness.</p> <p>Independence promoted by having control over one's life.</p>	<p>Seek client's opinion on treatment issues.</p> <p>Involve client in developing plan of care.</p> <p>Encourage continued interaction of client with family and friends.</p> <p>Assist the client to develop goals that are realistic within the limitations of the illness (realistic hope).</p> <p>Avoid always emphasizing limitations.</p> <p>Allow client and family to ventilate feelings about not being able to change the course of events.</p> <p>Help the client to identify those things over which he does have power.</p>
Social interaction	<p>Loneliness is increased when others detach themselves in order to disengage from the dying person's pain.</p> <p>Health care providers tend to avoid interacting with the dying.</p> <p>Sensory deprivation (dimly lit rooms and out-of-the-way rooms) can increase feelings of abandonment.</p>	<p>Encourage family to remain with the dying person.</p> <p>Stay with the dying person as much as possible.</p> <p>Provide support through your presence and active listening.</p> <p>Be available to discuss the client's situation.</p> <p>Use touch to communicate caring.</p> <p>Provide meaningful sensory stimuli.</p>

Client and family deficient knowledge can be related to:

- Insufficient information about physical condition
- Information about the treatment regime
- Inability to anticipate medical crises
- Inexperience with personal threat of death
- Unfamiliarity with protocol to follow in case of need for emergency care when not in the hospital

The accompanying Client Teaching Checklist provides guidelines for educating families of dying people.

CARE AFTER DEATH

Caring for the deceased body and meeting the needs of the grieving family are nursing responsibilities. This

**CLIENT TEACHING CHECKLIST***Guidelines for Teaching a Family Caregiver*

1. Discuss the nature and extent of the disease process.
2. Use adult education principles.
3. Reinforce material frequently.
4. Clearly explain the purpose of palliative care while maintaining a sense of realistic hope.
5. Inform client and family of available community resources; reassure them that they are not alone.
6. Teach steps for caregiver to follow if an emergency arises at home.
7. Provide written instructions for caregiver to follow. These should include important telephone numbers and persons to be contacted.
8. Inform about the purpose of hospice.

section discusses care of the body and responding to the needs of families of the dead.

Care of the Body

The body of the deceased needs to be treated in a way that respects the sanctity of the human body. Nursing care includes maintaining privacy and preventing damage to the body.

Physiological Changes

Several physiological changes occur after death. The body temperature decreases with a resultant lack of skin elasticity (**algor mortis**). Therefore, the nurse must use caution when removing tape from the body to avoid skin breakdown. Another physiological change, **liver mortis**, is the bluish purple discoloration that is a byproduct of red blood cell destruction. This discoloration occurs in dependent areas of the body; therefore, the nurse should elevate the head to prevent discoloration from the pooling of blood. Approximately 2 to 4 hours after death, **rigor mortis** occurs; this is stiffening of the body caused by contraction of skeletal and smooth muscles. To prevent disfiguring effects of rigor mortis, as soon as possible after death the nurse should close the eyelids, insert dentures (if applicable), close the mouth, and position the body in a natural position.

In preparing the body for family viewing, the nurse seeks to make the body look comfortable and natural. This means removing all tubes and positioning the body as described. After the family has viewed the body, the nurse places identification tags on the body's toe and wrist. The body is then placed in a plastic or

fabric shroud and the shroud is tagged. Then the body is transported to the morgue according to the agency's policy. The nurse is also responsible for returning the deceased's possessions to the family. Jewelry, eyeglasses, clothing, and all other personal items are returned to the family.

Legal Aspects

In most states, the physician is legally responsible for determining the cause of death and signing the death certificate. The nurse may, in certain situations, be the person responsible for certifying the death. See Chapter 23 for a complete discussion. It is important for nurses to know their legal responsibilities, which are defined by their state or provincial board of nursing.

Autopsy

An **autopsy** (postmortem examination to determine the cause of death) is mandated in situations in which an unusual death has occurred. For example, an unexpected death and a violent death are circumstances that would necessitate an autopsy. Families must give consent for an autopsy to be performed.

Organ Donation

The donation of organs for transplantation is a matter that requires compassion and sensitivity from the caregivers. Health care institutions are required to have policies related to the referral of potential donors to organ procurement agencies. It is important that families of the deceased know the importance of and process for organ donation. There is an inadequate supply of organs and tissues to meet the demand for transplants. The following organs and tissues are used for transplantation:

- Kidneys
- Heart
- Lungs
- Liver
- Pancreas
- Skin
- Corneas
- Bones (long bones and middle ear bones)

At the time the family gives consent for donation, the nurse notifies the donor team that an organ is available for transplant. Time is of the essence because the organ or tissue must be harvested and transplanted quickly to maintain viability.

Care of the Family

At the time of death, the nurse provides invaluable support to the family of the deceased. When an individual dies, family members' anxiety is increased due to their

THINK ABOUT IT

Nurses and the Vulnerability of Grieving

Nurses need to feel as free to ask for help in dealing with feelings about a dying client as they would in asking for assistance in lifting and repositioning a client in bed. Asking for help means taking a risk to being vulnerable; some nurses fear appearing emotionally vulnerable or overwhelmed. What are some ways for nurses to support each other in dealing with the grief of caring for dying people?

uncertainties about what to do (Gaguski, 1999). Informing the family of the type and circumstances surrounding the death is extremely important. The nurse provides information about viewing the body, asks the family about donating organs, and offers to contact support people (e.g., other relatives, clergy). Sometimes, the nurse needs to help the family with decision making regarding a funeral home, transportation, and removal

of the deceased's belongings. Using sensitive and compassionate interpersonal skills is essential in providing information and support to families.

NURSE'S SELF-CARE

Working with dying clients can evoke both a personal and a professional threat in the nurse. "Death, and the process of dying, represent a personal crisis not only for the dying person but for the caregivers who share life's most profound moment" (Ward, 1999, p. 3). Because many nurses are confronted with death and loss daily, grief is a common experience for nurses. Frequent exposure to death can interfere in the nurse's effectiveness because of subsequent anxiety and denial.

Whether working in a hospice, hospital, long-term care facility, or the home, nurses are at particular risk for experiencing negative effects from caring for the dying. Often nurses do not want to confront their grief and will use some of the common defenses against grieving: keeping

NURSING CARE PLAN

Terminally Ill Client with Lung Cancer

Case Presentation

Mr. Charles Jefferson is a 57-year-old man who is terminally ill with lung cancer. He has a wife and three grown children who are married. He has two grandchildren. He was employed until 2 months ago, when the radiation, chemotherapy, and cancer (which has metastasized to his bones and other vital organs) rendered him too weak to pursue regular daily activities. He is a religious and spiritual man and considered by all to be the "heart" of his family. He has always been generous, and his friends are many. He is currently bedridden. His cognitive abilities and sense of humor remain intact. His current physical problems include pain, nausea, constipation, difficulty urinating, and dry skin. He has lost 60 pounds. He has not yet received his Social Security disability income or pension money. Tomorrow he is being discharged from the hospital; he states he is going home to die.

Assessment

- 60-pound weight loss
- Constipation
- Urinary difficulty
- Dry skin

Nursing Diagnosis #1

Imbalanced Nutrition: Less than body requirements

Expected Outcomes

1. Mr. Jefferson will identify factors that affect the consumption and retention of food and fluids.
2. Mr. Jefferson will maintain his current body weight.

Interventions/Rationales

1. Ask client to state his food preferences.
Including the client in problem solving increases the likelihood of compliance. Knowing the client's food preferences helps in planning a diet that is more likely to be appealing.

(continues)

NURSING CARE PLAN**Terminally Ill Client with Lung Cancer (continued)**

2. Discuss findings about dietary preferences with the family.
Providing information to family members is essential because they are the ones preparing meals at home.
3. Weigh the client at the same time of day while he is wearing similar clothing.
Provides an accurate reflection of weight stability and fluctuations.

Evaluation

Goal partially met. Mr. Jefferson stated his food likes and dislikes to the home health nurse. He has lost 2 more pounds because he states, “I’m just not hungry any more.”

Nursing Diagnosis #2

Acute Pain related to metastasis of cancer.

Expected Outcome

1. Mr. Jefferson will verbalize pain relief.

Interventions/Rationales

1. Communicate your acceptance of his pain.
Validation of client’s experience reduces anxiety.
2. Provide frequent opportunities to rest.
Pain is exacerbated by fatigue.
3. Provide pain medication at a level that it is effective.
For a terminally ill client, pain relief is the primary goal of care.
4. Teach the client and family noninvasive pain relief measures (massage, deep breathing, imagery).
Knowledge of noninvasive methods helps the client and family feel in control. Such methods complement the effectiveness of medication in pain relief.

Evaluation

Goal partially met. Mr. Jefferson reports being pain-free for up to 2 hours at a time.

busy, taking care of others, being strong, and suffering in silence. Nurses need to stop pretending that they do not

experience grief and subsequent suffering and to talk about the intense emotions associated with caregiving.

To cope with their own grief, nurses need support, education, and assistance in coping with the death of clients. Staff education should focus on decreasing staff anxiety about working with grieving clients and families, how to seek support, and how to provide support to coworkers.

Often, the nurse’s fears and doubts about death and its meaning surface, causing anxiety related to feelings about mortality. Even though such feelings are normal, caring for the dying client and the family can be emotionally draining. Therefore, nurses must remember to care for themselves.

**NURSING TIP****Nurse’s Grief and Self-Care**

- Set aside some time for your own grieving.
- Know when to ask for help.
- Use support from within your agency—counselors, clergy, support groups.
- Find a way to say goodbye to the deceased client—rituals bring closure, which is a necessary part of grieving.

KEY CONCEPTS

- Loss is a universal response experienced by an individual when someone (or something) of value is no longer available.

- Grief is a psychological response to loss characterized by deep mental anguish and sorrow. Grieving people experience various stages of grief.
- The difference between normal and pathologic grief is the inability of the individual to adapt to life without the loved one.
- There are five psychological stages involved in the dying process: denial, anger, bargaining, depression, and acceptance.
- Complicated grief is associated with traumatic death such as by accident, homicide, or suicide.
- Hospice care offers clients an alternative to hospitalization when aggressive medical treatment is no longer an option.
- After death, the nurse focuses on supporting the family and caring for the deceased body.
- Nurses must care for themselves in order to provide quality, compassionate care to the dying person.

CRITICAL THINKING ACTIVITIES

1. When dealing with a family and client versus just the client, how do your interactions and interventions differ? What is one of the most important roles the nurse fulfills?
2. Pain and other discomfort symptoms are deterrents to quality of life. Consider how these are interrelated with psychological, spiritual, financial, and social influences. In addition to medication therapy, what other interventions can be used to help control symptoms?

3. Does everyone advance through all the stages of grief?
4. What are some of the identifying behaviors that would indicate that the survivors and family have not progressed through the grief process?
5. What emotional reactions have you had and frustrations have you faced when caring for dying clients and their families? Have you identified the things that help you maintain your own balance? Do you practice them regularly?
6. What are some subjective indicators that a dying client is experiencing pain? What objective data support the nursing diagnosis of pain?
7. Find a classmate from a cultural background different from yours. Discuss the person's:
 - a. Perception of death
 - b. Family's rituals when a relative dies

Chapter 22

Professional Accountability and Leadership

You must pay for conformity.

—Ralph Waldo Emerson

COMPETENCIES

1. State criteria for professional nursing practice.
2. Describe the elements of professional accountability.
3. Discuss licensure of professional nurses.
4. Explain the relationship between advanced practice nursing and professional accountability.
5. Discuss the characteristics of effective leaders.
6. Describe the types of power and their sources.
7. State the actions through which nurses can increase political power.

KEY
TERMS

accountability	democratic leadership style	nurse practice act
accreditation	empowerment	nurse practitioner
advanced practice nursing	laissez-faire leadership style	organization
autocratic leadership style	leadership	politics
certification	legal regulation	power
certified nurse midwife	licensure	profession
certified registered nurse anesthetist	licensure by endorsement	professional regulation
clinical nurse specialist	licensure by examination	professional standards
competency	management	scope of practice
delegation	mandatory licensure laws	situational leadership
	networking	synergy

As nursing continues to evolve, many questions arise: Is nursing truly a profession? Are nurses really autonomous? Autonomy is related to accountability. As autonomy increases, so does the need to be accountable. To whom are nurses accountable?

This chapter addresses the above issues and, hopefully, raises awareness of the need to be involved in activities that advance the nursing profession. In addition, leadership in nursing, power, and politics of nursing are discussed in terms of their contributions to professional nursing practice.

PROFESSIONAL NURSING PRACTICE

Isabel Hampton Robb, the first president of the American Nurses Association (ANA), stated in the late 19th century that nursing lacked two elements of a profession—organization and legislation (ANA, 1976). Believing nurses were not capable of managing their own affairs, hospital authorities opposed any efforts of nurses to organize. Moreover, the lack of accepted standards for nursing education caused graduates of one nursing school to question the credentials of graduates of other nursing schools. The result of these negative responses to the autonomy of the nursing profession

THINK ABOUT IT

Indicators of Professionalism

Observe the registered nurses in the agency to which you are assigned for clinical experiences. How do the nurses interact with one another? Cite examples of behaviors that reflect collegial relationships. Interview a few of these nurses. How do they demonstrate professional commitment? Are they involved in professional activities, such as continuing education and professional association activities? How do these nurses contribute to the public's recognition of the nursing profession?

was the belief held by nurses that it was neither possible nor desirable to work collectively (ANA, 1976).

However, in the face of internal and external opposing forces, in the early 20th century, nursing did organize. The primary goal was to establish legislation that would legitimize nursing practice and gain recognition of nursing as a profession. Thus, an old art was transformed into a young profession.

Even though nursing is often referred to as a profession, there is debate as to whether nursing is a *true* profession when appraised against the criteria of a profession.

Criteria of a Profession

A **profession** is a group (vocational or occupational) that requires specialized education and intellectual knowledge. There has been much debate as to whether nursing is truly a profession rather than an occupation. Registered nurses consider nursing to be a profession similar to other professions (e.g., accounting, engineering, pharmacy, law, and medicine). However, for nursing to be recognized as a profession by the society it serves, nursing must demonstrate on an ongoing basis that it meets the criteria of a profession; see Table 22-1. Sills (2000) states:

Professions profess to know something better than the people they serve and who thus need their service. Hence the social contract is with the society. The society grants certain rights and privileges to a profession in acknowledgment of the need they have for the applied knowledge of the profession. (p. 30)

Through dedication, professional pride, and commitment, nursing has accomplished much in the way of establishing its body of knowledge, scope of practice, research base, and code of ethics. However, nursing continues to struggle with maintaining authority over its own practice. As political forces examine the health care delivery system due to the rising cost of health care, the challenge to maintain control over nursing practice will be even greater. If nursing is to maintain professional

TABLE 22-1
Comparison of Nursing to Criteria of a Profession

Criteria of a Profession	Nursing Achievements	Challenges
The work is intellectual and distinguished by a substantial body of knowledge.	Professional nursing requires knowledge, judgment, and skills based on biological, sociological, psychological, and nursing sciences.	<p>The public does not always see the knowledge and judgment required by professional nurses.</p> <p>Tasks may be delegated to more minimally prepared nursing personnel.</p> <p>Medical records do not always reflect nursing planning.</p>
Provision of a unique service to society.	<p>Since the early 20th century, the public has granted nursing the right and responsibility for self-regulation through state licensure laws.</p> <p>Historically, the public has been concerned about having an adequate number of registered nurses to provide service.</p>	<p>Traditionally, nursing has had difficulty articulating its benefits to the public. ANA's <i>Nursing: A Social Policy Statement</i> (1995), which describes nursing's unique contributions, is not widely known by members of the profession.</p> <p>Individual nurses must understand the unique contribution they bring to a specific nurse-client situation.</p>
An expanding body of knowledge.	<p>Nursing, by its nature, is expanding its knowledge base to meet the demands of health care delivery (i.e., increased technology, changing reimbursement systems, new practice settings).</p> <p>Nurse theorists and nurse researchers contribute to the knowledge base.</p>	<p>Individual nurses must be able to articulate the conceptual basis of their practice and use nursing research in the practice setting.</p> <p>There must be a commitment by all professional nurses to contribute to the development of nursing theory and research.</p>
Personal responsibility to the public for services provided.	Professional registered nurses are held individually accountable to the public through such mechanisms as legal regulations and licensure.	<p>Self-regulation is the hallmark of a profession.</p> <p>The system of professions regulating professions is being challenged by policymakers to demonstrate effectiveness in protecting the public, rather than promoting the profession.</p> <p>Registered nurses must recognize their individual accountability to provide care in accordance with nursing standards even if the standards supersede employer policy.</p>
A long period of education, including both theory and practice.	<p>Professional nursing is based on a broad knowledge base, requiring specialized knowledge, skills, and abilities.</p> <p>Nursing education is both theory and practice based.</p> <p>Nursing has successfully established its educational base away from the apprentice approach and moved into higher education.</p>	Multiple entry methods into practice (diploma, associate degree, baccalaureate degree, generic masters, and generic doctorate) are confusing to the public and members of the profession.

(continues)

TABLE 22-1 (continued)
Comparison of Nursing to Criteria of a Profession

Criteria of a Profession	Nursing Achievements	Challenges
Autonomy and the ability to develop policy about the discipline and control of the activity of one's members.	<p>Nurse practice acts generally grant authority for regulating the profession to an agency/board comprised of a majority of nurses.</p> <p>Nurse administrators have achieved positions at levels comparable with other hospital administrators.</p>	<p>New systems for health provider regulation are being explored and are resulting in diminished authority for nursing to regulate itself.</p> <p>Increased governmental regulation of practice and reimbursement arenas will affect nursing's regulation of the profession.</p> <p>Boards of nursing will need to seek methods to become regulatory partners with other agencies that regulate the practice settings (e.g., Department of Health and Human Services, Health Care Financing Administration, Office of Licensing).</p>
Members share a common identity, values, and attitudes.	<p>Registered nurses generally adhere to their dedication to care and identify their role as client advocates in the health care system.</p> <p>Professional organizations share common values.</p>	<p>Although registered nurses individually adhere to the values of the profession, they have frequently failed at collegiality and mentoring. This is reflected in the low numbers of registered nurses who belong to professional organizations. The percentage of participation increases when nurses organize within specialty areas of practice (e.g., certified registered nurse anesthetists; emergency room nurses; critical care nurses, etc.). However, this activity may further fragment the profession.</p>
Career choice of its members is motivated by altruism and reflects a long-term commitment to the public.	<p>Historically, people entered the field of nursing to care for those in need; however, few individuals (predominantly female) anticipated long-term employment. Today, more men and minorities are entering nursing. Further, more registered nurses are employed full time in nursing than ever before and anticipate continuing this practice.</p>	<p>Nursing functions in a high-tech environment. Therefore, nursing must pay particular attention to ensuring that its members are socialized into the caring role of nursing.</p>
A code of ethics to which its members adhere.	<p>The ANA has a long-standing published code of ethics. Many of the values identified within this code have been incorporated into nurse practice acts, thus establishing them as legal requirements.</p> <p>Violations of legal standards are grounds for disciplinary action against one's license.</p>	<p>It is important that the public sees nursing as a caring profession that is accountable to the public for upholding its professional standards.</p>

(continues)

TABLE 22-1 (continued)
Comparison of Nursing to Criteria of a Profession

Criteria of a Profession	Nursing Achievements	Challenges
	Traditionally, registered nurses have ascribed to and supported the professional organization's responsibility to develop a code of ethics.	
	Registered nurses have demonstrated support of boards of nursing in enforcing professional practice and participate by reporting violations.	

Data from Kelly, L. Y., & Joel, L. A. (1996). *The nursing experience: Trends, challenges, and transitions* (3rd ed.). New York: McGraw-Hill.

autonomy, it must have a strong political base that seeks to inform public policymakers about the role and scope of professional nursing.

A profession is only as good as its individual members. Every member of the profession must practice as a professional and contribute to nursing as a profession. Beginning nursing students should understand the significance of ascribing to professional attitudes and values and how their behavior can influence the public's view of the nursing profession.

As professionals, nurses are accountable for providing quality care. **Accountability** is the process in which individuals are answerable for their actions and have an obligation (or duty) to act. Accountability is demonstrated by nurses in several ways. For example, the accountable nurse is one who demonstrates caring and compassion to clients and families. By providing client-centered, holistic care, the nurse is meeting the expectations of society.

PROFESSIONAL ACCOUNTABILITY

Accountability is a term often used in nursing. How does a nurse demonstrate accountability? Nurses are accountable to many: themselves, clients and their families, the nursing profession, employers, and the general public for provision of safe, effective care established by the profession. The nursing profession is accountable for establishing and maintaining standards that promote safe, effective care. Accountability involves responsibility; that is, being able and willing to respond.

Accountability is one of the distinguishing characteristics of a profession. The professional nurse is accountable in several domains: professional, legal, and ethical. See Chapters 23 and 24 for complete discussions of legal and ethical accountability, respectively.

Elements of Professional Accountability

To appreciate one's accountability as a professional, it is important to first understand the social context of nursing. Professions arise from an identified public need for specialized knowledge and skills. The more specialized the knowledge and skills, the greater the risk to the public of an incompetent professional. Therefore, the public entrusts the profession to regulate itself on behalf of the public's best interests.

Professional nurses are held accountable by the public to possess the necessary knowledge and skills to render safe nursing care and to use proper judgment in the provision of nursing services. The profession is held accountable by the public to ensure that only qualified individuals are granted the right to practice and that those who fail to uphold the professional standards are denied the future right to practice.

THINK ABOUT IT

Accountability

Think of the following actions as ways to demonstrate accountability:

- Documenting nursing interventions
- Assuming only those responsibilities that are within one's scope of practice
- Not assuming responsibility for activities in which competency has not yet been mastered
- Evaluating the outcomes of one's own actions
- Admitting mistakes rather than blaming others

Select one day of your clinical experience and identify ways in which you demonstrated accountability.

Professional accountability within nursing is fostered through the mechanisms by which nurses obtain the right to practice. These mechanisms include rights and responsibilities, organizational accountability, legislative regulations, individual accountability, and student accountability.

Rights and Responsibilities

The nurse has responsibility to the client to be competent, to render nursing services in accordance with standards of nursing practice (discussed in the section entitled Organizational Accountability), and to adhere to the profession's ethical code.

The public trusts that an individual titled registered nurse will have appropriate knowledge and skills to render the services offered. This translates to accountability of individuals to accept assignments for which they are competent and to obtain the necessary knowledge and skills to perform such services.

When the registered nurse chooses a specific area of practice (such as emergency or home health nursing) additional knowledge, skills, and abilities will be required as the individual evolves from novice to expert. The registered nurse is accountable for acquiring and maintaining these abilities. Furthermore, the nurse is accountable to adhere to the standards of care for that specialty. This process may be accomplished by various methods such as orientation, in-service education, peer review, continuing education, journal articles, professional association activities, or formalized advanced education. Although employers may provide some of these opportunities to the registered nurse, the ultimate accountability to gain and maintain competency rests with every nurse.

Organizational Accountability

Organization is the means by which members of a profession, such as nursing, join together to promote and protect the profession. **Professional regulation** is the process by which nursing ensures that its members act in the public interest by providing a unique service that society has entrusted to them (ANA, 1995). Professional regulation is the responsibility of professional organizations. The accompanying display lists ways in which the nursing profession regulates itself.

The basis of professional regulation in nursing is the scope of nursing practice. Professional standards evolve from the scope of nursing practice and provide the framework for the development of competency statements. **Professional standards** are authoritative statements developed by the profession by which the quality of practice, service, and education can be judged (ANA, 1991a). Professional standards form the basis of educational outcomes and criteria for organized nursing services (ANA, 1995). In addition, professional standards provide the framework for accreditation and certification.

SELF-REGULATION OF NURSING PROFESSION

- Defining its practice base
- Providing for research and development of that practice base
- Establishing a system for nursing education
- Establishing the structures through which nursing services will be delivered
- Providing quality review mechanisms such as a code of ethics, standards of practice, structures for peer review, and a system of credentialing

(Data from American Nurses Association. [1995]. *Nursing: A social policy statement*. Washington, DC: Author.)

Accreditation

Accreditation is the process by which a nongovernmental agency appraises and grants status to institutions that meet predetermined criteria. The Joint Commission for Accreditation of Healthcare Organizations is one example of an accrediting body that promotes the quality of health care by evaluating agencies' achievement of performance standards. Another type of accreditation is performed by the American Nurses Credentialing Center, which develops criteria for continuing nursing education agencies and evaluates those agencies in terms of meeting the criteria.

Certification

Certification is the process by which a nongovernmental agency certifies that an individual licensed to practice a profession has met predetermined standards specified for practice (ANA, 1995). Certification is an indicator that the nurse has obtained specialized knowledge and skills. "In today's health care environment, we recognize certification as a measure of excellence and a method of consumer protection . . . By earning certifications, nurses have worked above expectations to achieve excellence in their specialties" (Gill, 1999, p. 7). Certification is a voluntary process through which nurses demonstrate their belief in the importance of ongoing education and excellence in clinical practice.

Accreditation and certification are mechanisms for promoting nursing accountability. The National League for Nursing (NLN) establishes educational standards and surveys educational programs to ensure that these standards are achieved by each accredited school of nursing. The ANA promotes the accountability of individual nurses through its certification process. The American Nurses Credentialing Center, a subsidiary of ANA, develops and administers the certification examinations. It also requires a specified amount of continuing education in each specialty area for those nurses who choose to be certified. Certification is a voluntary process that signifies a higher level of competence than is expected at the time of initial licensure.

Standards of Clinical Nursing Practice

Professional nursing is responsible for determining standards of nursing practice. Because services provided by nurses are essential to clients, the profession is accountable for the quality of care delivered.

STANDARDS OF CLINICAL NURSING PRACTICE

Standards of Care

- I. *Assessment*
The nurse collects client health data.
- II. *Diagnosis*
The nurse analyzes the assessment data in determining diagnoses.
- III. *Outcome Identification*
The nurse identifies expected outcomes individualized to the client.
- IV. *Planning*
The nurse develops a plan of care that prescribes interventions to attain expected outcomes.
- V. *Implementation*
The nurse implements the interventions identified in the plan of care.
- VI. *Evaluation*
The nurse evaluates the client's progress toward attainment of outcomes.

Standards of Professional Performance

- I. *Quality of Care*
The nurse systematically evaluates the quality and effectiveness of nursing practice.
- II. *Performance Appraisal*
The nurse evaluates his/her own nursing practice in relation to professional practice standards and relevant statutes and regulations.
- III. *Education*
The nurse acquires and maintains current knowledge of nursing practice.
- IV. *Collegiality*
The nurse contributes to the professional development of peers, colleagues, and others.
- V. *Ethics*
The nurse's decisions and actions on behalf of clients are determined in an ethical manner.
- VI. *Collaboration*
The nurse collaborates with the client, significant others, and health care providers in providing client care.
- VII. *Research*
The nurse uses research findings in practice.
- VIII. *Resource Utilization*
The nurse considers factors related to safety, effectiveness, and cost in planning and delivering client care.

From American Nurses Association. (1991a). *Standards of clinical nursing practice*. Washington, DC: Author.

CANADIAN NURSES ASSOCIATION STANDARDS FOR NURSING PRACTICE

- I. Nursing practice requires that a conceptual model(s) for nursing be the basis for that practice.
- II. Nursing practice requires the effective use of the nursing process.
- III. Nursing practice requires that the helping relationship be the nature of the client–nurse interaction.
- IV. Nursing practice requires nurses to fulfill professional responsibilities.

Reprinted with permission from Canadian Nurses Association. (1987). *CNA: A definition of nursing practice: Standards for nursing practice*. Ottawa: Author.

In 1991, the ANA revised its standards of clinical nursing practice. As the professional organization representing all registered nurses, ANA's focus was to develop a set of standards applicable to all nurses engaged in clinical practice. The ANA, as well as many specialty nursing associations, has developed standards of practice for specific areas of practice, for example, medical-surgical nursing, gerontology nursing, and perioperative nursing. Only through collaboration and commitment among nursing organizations can nursing derive professional standards that reflect the commonality of nursing practice across all areas of practice.

Nursing must be able to articulate the core of practice to which practitioners are accountable to the public regardless of clinical area of practice. The *Standards of Clinical Nursing Practice* (1991a) reflect both the caring and professional expectations of nursing (see the accompanying display).

In Canada, the Canadian Nurses Association (CNA) is the professional organization entrusted with the responsibility of developing professional standards that are listed in the accompanying display. The CNA describes nursing as “a dynamic and supportive profession guided by its code of ethics [and] is rooted in caring” (CNA, 1987, p. ii).

Legislative Accountability

For nurses to be recognized as professionals, nursing must have legislation that clearly defines the role and scope of nursing practice. **Scope of practice** refers to the legal boundaries of practice for health care providers as defined in state statutes. Legislation defines the legal rights granted to the profession by the public. It is essential to public well-being that nursing regulate its practice to assure that only those individuals qualified to practice are allowed to do so.

Legal regulation is the process by which the state attests to the public that the individual licensed to practice is at least minimally competent to do so (ANA, 1995). The **nurse practice act** (law governing the practice of nursing) defines the legal scope of practice

within a state or territory. Such laws generally authorize state boards of nursing to interpret the legal boundaries of *safe* nursing practice (ANA, 1995). Other laws may also have an impact on the scope of nursing practice, for example licensure laws of other health care providers.

Although specific duties of boards of nursing vary among states or territories, the primary purpose is to protect the public from unqualified or incompetent practitioners. Boards of nursing are authorized to:

- Approve educational programs that prepare individuals for licensure
- Grant licensure to individuals who meet minimum qualifications
- Renew licenses
- Establish legal standards of practice
- Discipline licensees as necessary to protect the public

Boards of nursing are authorized to adopt rules and regulations that establish legal standards for nursing education, practice, and licensure within the context of the nurse practice acts. Nurses are accountable for complying with the provisions of the nurse practice act and the related rules and regulations established by the board of nursing in their respective states.

Licensure

Licensure is the method by which a state holds the nurse accountable for safe practice to citizens of that state. Licensure grants the nurse permission to perform certain acts, to use a specific title that reflects one's practice rights, and to offer one's services and receive compensation for those services in the state that issues the license. Licensure is granted based on evidence that the individual has attained the minimum degree of **competency** (the ability, qualities, and capacity to function in a particular way) to ensure that one is a safe practitioner.

Mandatory licensure laws prohibit any individual from practicing as a registered nurse without a current license. Licensure laws receive authority from the U.S. Constitution that defines the protection from harm as a constitutional right of every citizen. The Constitution entrusts the individual states with the inherent power to police human activities and to protect citizens in the human needs for safety, general welfare, and health. Laws enacted under the "police power" of the state are designed to protect society from ignorance, incapacity, deception, and fraud and must benefit the public primarily, *not* the members of the profession.

Licensure Process

There are two methods by which one may become initially licensed as a registered nurse in a particular state:

- **Licensure by examination** is the process by which an individual who has completed an approved nursing program seeks initial licensure by successfully passing a standardized competency examination.

- **Licensure by endorsement** is the process by which an individual who is duly licensed as a registered nurse under the laws of one state or country has his or her credentials accepted and approved by another state or country. Individuals are licensed to practice only in the state in which they initially took the licensing examination. Endorsement allows registered nurses to practice in states other than the one of initial licensure.

The mutual recognition model for nurse licensure would allow a nurse to hold licensure in one's state of residency and practice across state lines provided the nurse follows the practice laws in the respective states. Following several years of study regarding whether there was a need for regulatory reform to meet the changing health care delivery environment, the National Council of State Boards of Nursing, Inc. (NCSBN) in August of 1997, adopted a recommendation endorsing a mutual recognition model for nursing regulation. In taking this action, the NCSBN cited the following as the driving forces for such a revolutionary change for nursing regulation:

- The increase in practice occurring across state lines
- Nurses practicing in a variety of settings using technologies that may cross state lines (i.e., telehealth)
- The need for expedient access to qualified nurses without regard to state boundaries

The vision for the future system of nurse regulation was stated as "a state nursing license recognized nationally and enforced locally" (NCSBN, 1997a).

The mutual recognition licensure system is based on states entering into an agreement, known as an interstate compact, to authorize practice by individuals licensed in one state to practice in the other state. The interstate compact defines such issues as jurisdiction, discipline and information exchange among and between party states. The individual nurse has the responsibility to be knowledgeable and abide by the practice laws of the state of practice. Utah was the first state to adopt the interstate compact. As of January 2000, six states (Arkansas, Maryland, North Carolina, Texas, Wisconsin and Utah) had enacted an interstate compact to allow practice of licensees who reside in one state to practice between party states. Four other states (Iowa, Mississippi, Nebraska and South Dakota) have introduced interstate compact legislative proposals (NCSBN, 2000).

While there seems to be movement toward the mutual recognition model as the future regulatory model for nursing practice in the United States, initial states will serve as a testing ground for the model. The party states will have the opportunity through the interstate compact to work together to resolve issues which may arise as a result of this revolutionary model. Up-to-date information regarding the mutual recognition model for nurse licensure may be accessed through the

National Council of State Boards of Nursing web site, www.ncsbn.org. For information on specific state licensure laws or how to contact a state board of nursing, contact NCSBN at www.nursingboard.org.

The state boards of nursing have the authority and responsibility to determine that only qualified individuals are granted licensure. The boards of nursing may deny licensure based on information that indicates one to be “unfit” for such licensure. Examples of such activities are:

- A criminal history (especially a criminal act that affects one’s ability to render safe nursing care)
- Chemical addiction
- Practicing without a current, proper license
- Aiding someone else who is unlicensed to pose as a nurse

Effective November 22, 1999, state boards of nursing are required to report adverse actions taken against licensees to the Healthcare Integrity and Protection Data Bank (NCSBN, 1999). Congress identified a need for a comprehensive source of adverse action information on health care providers, suppliers and practitioners out of concern about health care fraud and the competency of providers employed by health plans or federal and state programs. The Health Insurance Portability and Accountability Act (HIPDA) of 1996 directs the Secretary of the Department of Health and Human Services to create the HIPDA data bank for the purpose of combating fraud and abuse in the health care delivery system.

Types of adverse actions that must be reported to the HIPDB include:

- Health care–related civil judgments against health care practitioners, providers, and suppliers
- Health care–related criminal convictions against health care practitioners, providers, and suppliers
- Adverse actions taken by federal or state agencies responsible for licensing and certification of health care practitioners, providers, and suppliers
- Exclusions of health care practitioners, providers, and suppliers from participation in federal or state health care programs
- Any other adjudicated actions or decisions as established by regulations, such as actions taken by boards of nursing against licensees who violate state licensure laws

As of January 2000, the HIPDB information will be available only to federal and state agencies, law enforcement officials, and health plans. The general public does not have access to the HIPDB. Individual practitioners, suppliers, or providers may request information on themselves for a fee as established by the Department of Health and Human Services regulations. Current information can be obtained through the

Health Resources and Services Administration of the Bureau of Health Professions, Division of Quality Assurance at www.npdb-hipdb.com.

Licensure Examination

It is the responsibility of each state to determine the licensing requirements for an individual to practice in that state. Boards of nursing are entrusted to determine the appropriate examination to measure minimum competency for practice as a registered nurse. In the United States, through the National Council of State Boards of Nursing (NCSBN), the same examination is given nationally to qualified candidates. Known as the NCLEX-RN (National Council Licensure Examination for Registered Nurses), this examination has been adopted as the standard licensure examination by all 50 states and the U.S. territories. A separate test (National Council Licensure Examination for Practical Nurses, NCLEX-PN) is administered to practical and vocational nurses. Use of a national licensure examination ensures uniformity in testing and facilitates endorsement of licensure in other states.

The examination is designed to distinguish qualified candidates from those who do not possess the necessary competencies for safe practice. The NCLEX-RN measures the competencies expected of a new nursing graduate at the generalist level.

The NCLEX-RN is not an examination for which one prepares in the last few weeks before graduation. Nursing students successfully complete this examination through careful study and achievement of nursing courses. Activities offered during the academic experience prepare students for registered nurse practice. Clinical experiences through which students learn the practice of nursing contribute to the ability to pass the licensure examination.

The NCLEX-RN reflects the belief that the practice of nursing requires knowledge of:

- Phases of the nursing process
- Management and coordination of a safe and effective care environment
- Physiological integrity needs of clients
- Psychosocial integrity needs of clients
- Promotion and maintenance of health (NCSBN, 1997b)

The method of administering the NCLEX-RN is computerized adaptive testing (CAT). CAT is a method of administering test items in such a manner that each candidate’s examination is unique. Each of the test items in the pool of about 3,000 questions is weighed for difficulty. The candidate cues the computer to present the next item based on the response to the previous item. The computer initiates the testing with a relatively easy test item. If the candidate answers correctly, then each item becomes progressively more difficult. If the candidate misses questions, the items become easier until the candidate begins

to answer correctly. The computer continues this method until the candidate has taken at least the minimum number of items required in accordance with the test plan and is answering 50% of the items correctly. The computer compares the level of difficulty of the question being administered with the competence level required to pass. A pass/fail determination is made based on the level of difficulty of the items being answered correctly at least 50% of the time (NCSBN, 1994).

Individual Accountability

Professional nurses must understand the method by which the board of nursing adopts rules and regulations in their state of licensure so that they can be active participants in the development of such regulations. Nurses can use a variety of ways to demonstrate individual accountability; two methods are continued competency and professional development.

Continued Competency

A registered nurse has the professional responsibility to attain and maintain competency. There has been much debate within the profession and consumer advocacy groups about the roles and responsibilities of health profession licensing boards to assure that its members have maintained minimum competency to remain safe practitioners.

Once licensed, it is the responsibility of the registered nurse to maintain a current active license to practice in accordance with state requirements. Registered nurses must renew their licenses on an annual or biannual cycle before the expiration date and meet other such requirements for license renewal as required by the individual state board of nursing.

The nursing profession has traditionally used three methods of assuring accountability to the public—licensure examination, continuing education, and certifications. These three methods are currently being scrutinized by the American Nurses Association in an attempt to assure that nurses demonstrate competency. A variety of mechanisms are being considered as measures to improve accountability. Development of a professional portfolio is being considered as one avenue for demonstrating continued competence. Green and Ogden (1999) recommend that nurses “[g]et involved with groups setting the pace for the future of continued competency for the nursing profession” (p. 2).

Professional Development

Professionalism must be lived, not just learned. Content in schools of nursing relative to such topics as history and future trends, professional organizations, and regulation is not sufficient for developing an involved, committed professional. Rather, it is the participation of nursing students in extracurricular activities that enriches academic experiences and fosters professional development.

Membership and active involvement in student organizations at the school, state, and national levels enable nursing students to develop critical professional skills and participate in events that may have an impact on their careers. Table 22-2 lists some professional organizations in which nurses can participate.

Involvement with district and state nurses associations is also encouraged. Nursing students can participate in these groups through continuing education, legislative activity, or political action. In addition, students have the opportunity of making contacts with registered nurses within these associations who will

eventually be their colleagues. Such contacts are helpful when seeking guidance in employment opportunities and can develop into valuable mentoring relationships.

Student Accountability

Nursing students' accountability is directly related to their legal authority to practice. Nursing students function legally as an *exception* to the state licensure requirements *while enrolled in a nursing program* that is approved by the state board of nursing. Such exception is only granted when the student is engaged in learning activities structured within the program of studies. Performing nursing activities (other than those assigned to unlicensed individuals) outside the formalized clinical practicum of the nursing curriculum would constitute the illegal practice of nursing. Accountability for nursing care is shared by the student, faculty, educational institution in which the student is practicing, and clinical agency. The various responsibilities of each of these parties are determined by the respective state board of nursing.

For nursing students, accountability for competency begins with the first clinical day and continues throughout their careers. Therefore, students have the responsibility to:

- Be prepared for clinical practice
- Engage only in those skills for which they have gained competence
- Seek instruction as necessary

Students must not engage in client care activities without proper preparation, prior validation of competency by their instructor, and appropriate supervision (Figure 22-1). Nursing students have a responsibility to request clear information regarding the instructor's expectations, if uncertain, and to seek direct supervision when uncertain of competency.

NURSING ALERT

It is *absolutely critical* to client safety that nursing students verbalize any questions or concerns relative to their assignments before instituting care.

THINK ABOUT IT

Student Accountability

You are working as a nursing assistant (unlicensed personnel) during your school break. What would be your appropriate response if asked to perform a nursing procedure such as medication administration? Would the fact that you have performed the procedure previously as a nursing student affect your response?

ADVANCED PRACTICE NURSING

Advanced practice nursing is the practice of nursing at a level requiring an expanded knowledge base and clinical expertise in a specialty area. Advanced practice registered nurses (APRNs) have an increased level of accountability to the public, the profession, and themselves. The autonomy that is experienced by nurses in

Figure 22-1 This nursing student is being taught to measure the client's blood pressure. If the instructor were temporarily called away from the bedside and the client asked the student about the measurement and its significance, do you think the student should discuss this information with the client or wait until the instructor returns?

advanced practice roles increases the sense of responsibility for personal decisions and actions. The general public also expects a higher level of ability and skills from APRNs just as it does from specialists in the medical profession. As APRNs assume leadership roles in the nursing profession, they will promote increased accountability as a standard for the entire profession.

Currently, advanced practice nursing is one of the most debated areas of practice. A changing health care environment has brought new attention to and demand for nursing's advanced practice roles. Further, a lack of uniformity in the educational base for entry into advanced practice nursing and the method by which states regulate this area have led to confusion.

Advanced practice nursing, which represents new opportunities for registered nurses, requires specialized knowledge and clinical proficiency (ANA, 1995). Advanced practice nursing is differentiated from specialty practice in that specialization involves concentrating one's practice in one particular field of nursing and advancement involves expanded practice roles (ANA, 1995). Preparation for advanced practice has evolved

from hospital-based certificate programs to university course work. Although APRNs are prepared primarily in graduate programs, some individuals in current practice have been prepared in post-basic programs. Currently identified roles of APRNs are (ANA, 1995):

- Clinical nurse specialist (CNS)
- Nurse practitioner (NP)
- Certified nurse midwife (CNM)
- Certified registered nurse anesthetist (CRNA)

Table 22-3 provides a description of the advanced practice nursing roles.

APRNs are contributing to the dynamic health care delivery environment in numerous ways. Every state has some form of statutory or regulatory prescriptive authority privileges for APRNs. Reimbursement mechanisms for APRNs are expanding. Although the practice of APRNs is being challenged on several fronts, including physician organizations and some third-party payers, APRN "legislative autonomy is continuing to grow despite all challenges" (Pearson, 2000).

LEADERSHIP IN NURSING

Leadership is a method of modeling accountable behavior to others. Nursing has numerous leaders who demonstrate and encourage accountability. Leadership and management are terms often used interchangeably; however, some significant differences exist. **Management** is the accomplishment of tasks either by oneself or by directing others. **Leadership** is the interpersonal process that involves motivating and guiding others to achieve goals. "Management is about power, and leadership is about influence—control versus vision . . . Leaders inspire staff to contribute to the organization's mission" (Cullen, 1999, p. 28). Every nurse, regardless of title or position, is a manager; each has the potential to be a leader.

Managerial Functions

Essential functions that are performed by effective managers include:

- *Planning*: Determining objectives and identifying methods that lead to achievement of those objectives
- *Organizing*: Using resources (human and material) to achieve pre-determined outcomes
- *Directing*: Guiding and motivating others to meet the expected objectives
- *Controlling*: Using performance standards as criteria for measuring success, and taking corrective action, if necessary, to see that others comply with performance standards
- *Decision making*: Identifying a problem and deciding which alternatives can best achieve the objectives

TABLE 22-3
Advanced Practice Nursing Roles

Advanced Practice Role	Educational Preparation	Major Responsibilities
Clinical Nurse Specialist	Graduate degree in a recognized nursing specialty	Authorized to provide direct nursing care to a select population Plans, guides, and directs care provided by other nursing personnel
Nurse Practitioner	Advanced preparation in a specific area of care	Authorized to provide primary care to individuals, families, and other groups in a variety of settings, including but not limited to: <ul style="list-style-type: none"> • Homes • Institutions • Offices • Industry • Schools • Community agencies Conduct physical examinations Take medical histories Order and interpret laboratory and other diagnostic tests Diagnose Treat minor illnesses (acute or chronic) or injuries Counsel and educate clients
Certified Nurse Midwife	Advanced preparation in nursing and midwifery	Authorized to manage the care of women during all phases of pregnancy and newborns
Certified Registered Nurse Anesthetist	A registered nurse who is prepared in the science of anesthesiology	Authorized to select and administer anesthetics and ancillary services to clients

Leadership Styles

Effective leaders accomplish goals by using (in a positive sense) other people. In other words, they use the concept of **synergy** (the combined power of many) rather than attempting to achieve success alone.

The leader's behavior greatly determines the behavior of the group. There are basically three styles of leadership: autocratic, democratic, and laissez-faire (Table 22-4).

The **autocratic leadership style** is leader-focused; that is, the leader maintains strong control, makes all decisions, and solves all problems. The leader dominates the group by issuing commands rather than making suggestions or seeking input.

The **democratic leadership style** (also called participative leadership) is based on the belief that every group member should have input into development of goals and problem solving. The democratic leader acts primarily as a facilitator and resource person. Concern

for each member of the group as a unique individual is demonstrated by the leader.

In the **laissez-faire leadership style**, the leader assumes a passive, nondirective, and inactive approach. Leadership responsibilities are either assumed by the members of the group or completely abdicated. All decision making is left to the group with the leader giving little, if any, guidance, support, or feedback. Almost any behavior by the group is permissible due to the leader's lack of limit-setting and stated expectations. The tasks are unmet and the relationship needs of group members are ignored.

No single style is superior to the other. Each leadership approach has its advantages and disadvantages (Table 22-4). The effective leader will use **situational leadership**, which is a blending of styles based on current circumstances and events. The leader knows that behavior does not occur in a vacuum; thus, leadership styles are assumed according to the needs of the group and tasks to be achieved.

TABLE 22-4
Leadership Stages

Style	Description	Leader Behaviors	Potential Impact on Group Members	Advantages	Disadvantages
Autocratic	Basic premise: leader knows best. Communication flows downward.	Controlling Directive Makes all decisions and solves all problems Issues commands	Hostility Rebellion	Task oriented, high productivity Facilitates a quick response Often necessary in crisis situation	Inhibits creativity and autonomy of members Promotes mistrust and fear among followers Members may become hostile or passive
Democratic ("Participative Leadership")	Basic premise: every member should have input. Communication is open and mutual.	Acts as a facilitator Serves as resource person Encourages members' active participation	Improved productivity More opportunity for personal growth Increased cooperation and teamwork	Promotes empowerment of team members Facilitates communication Increased creativity and autonomy	Time-consuming May be less efficient (in quantifiable terms) Disagreements may happen as members express their viewpoints
Laissez-Faire	Leadership responsibilities are assumed by group. Almost any behavior by the group is permissible due to the leader's lack of limit-setting and stated expectations.	Passive, nondirective approach Provides little, if any, support, guidance, or feedback Sets no limits	Unmet tasks Relationship needs of group members ignored Apathy	Promotes autonomy and creativity in members	May evoke passivity in team members Aimless behavior often occurs Chaos common Inefficiency and low productivity

Leadership Characteristics

There is debate about the development of effective leaders; is leadership innate or acquired through experience? The characteristics of effective leaders are discussed in the following sections.

Communication

Effective leadership relies on the individual's ability to communicate. An effective nurse leader will:

- Listen actively to others
- Articulate thoughts in an intelligent, persuasive manner
- Differentiate aggressive, passive, and assertive behavior in order to communicate appropriately in a given situation

Aggressive behavior occurs when an individual meets one's needs regardless of the impact on others. *Passive behavior* is giving up one's rights and not having one's needs met. *Assertive behavior* occurs when an individual seeks to meet one's needs while respecting the rights of other people. Effective leaders communicate in an assertive manner; they speak directly and honestly to others.

Credibility

A leader motivates others by demonstrating enthusiasm and exerting influence. To be influential, the leader must be credible. Credibility, the quality or power of inspiring beliefs, is based on competence. From competence comes confidence. Individuals who know what they are doing and perform well are those who can influence others.

Delegation

The nurse leader must be able to delegate effectively to coordinate the delivery of care. **Delegation** is the process of transferring a selected task in a situation to an individual who is competent to perform that specific task. Delegation is a multifaceted process involving: communication, conflict resolution, feedback and evaluation, and knowledge of the person to whom a task is delegated (Hansten & Washburn, 1998).

Delegation is a helpful tool for nurse leaders in that it encourages team members to develop skills. When delegating, it is important to (Costello-Nickitas, 1997):

- Determine which tasks can be delegated and to whom
- Match the task to the delegatee
- Communicate a feeling of confidence to the delegatee

As health care facilities restructure to address cost-containment issues, nurses delegate tasks to unlicensed assistive personnel (UAP) (i.e., nursing assistants, care partners, nurse extenders). In addition to UAP, the reg-

THE "FOUR RIGHTS" OF DELEGATION

<i>Right task</i>	The task can be delegated.
<i>Right person</i>	The person is competent to do the task.
<i>Right communication</i>	The expectations are clearly stated
<i>Right feedback</i>	The worker is given feedback promptly after the task is performed.

Data from Hansten, R. I., & Washburn, M. J. (1998b). *The nurse manager's answer book*. (pp. 129–131). Gaithersburg, MD: Aspen

istered nurse also delegates tasks to licensed practical or licensed vocational nurses.

The nurse practice act defines which aspects of care can be delegated and which must be performed by the registered nurse. Because nurse practice acts vary among the states and provinces, it is imperative that the nurse stay current with the rules and regulations promulgated by the respective state (or provincial) board of nursing regarding the delegation of nursing tasks.

Even though a task may be delegated to someone, the nurse who delegates maintains accountability for the overall nursing care of the client. Only the task, not the ultimate accountability, may be delegated to another.

Critical Thinking

Another characteristic of an effective leader is the ability to think critically. According to Alfaro-LeFevre (1998), "Critical thinking is the key to resolving problems. Nurses who don't think critically become *part* of the problem" (p. 15). The critical thinker has an open-minded questioning attitude (Figure 22-2). This underlying curiosity leads the individual to search for answers based on rationales. The ineffective leader is one who

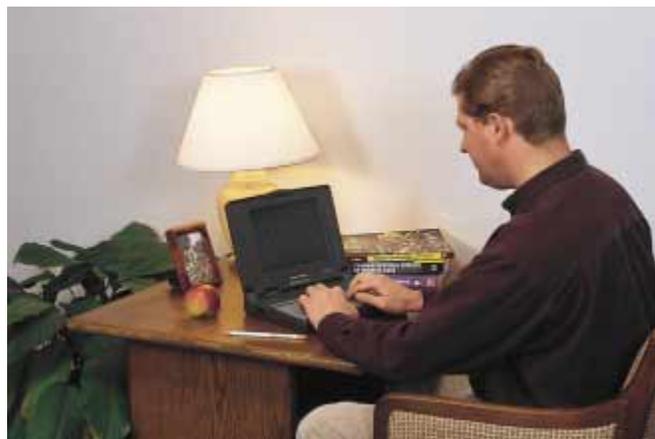

Figure 22-2 Critical thinking skills are integral to the analysis of problems and the development of leadership skills. How does critical thinking contribute to professional accountability?

falls into routine ways of thinking without even being aware of what is happening. See Chapter 5 for more information on critical thinking.

Initiating Action

In addition to thinking critically, a leader initiates action. Only by putting ideas into action does a person become a leader. A leader does not adopt a “wait-and-watch” attitude with problems. Instead, a leader initiates measures to solve problems. When taking action, the effective leader demonstrates flexibility. If one behavior is ineffective, the leader is not hesitant to try another approach. “Creating positive reinforcement for quality behaviors and results is the key to a successful quality initiative” (Daniels, 2000, p. 132). The proactive leader role models successful behaviors and encourages others to strive for quality.

Risk Taking

Taking action to solve problems (i.e., to initiate change) involves taking a risk. People who take risks are those who are not satisfied with the status quo and strive continually for improvement. Effective risk takers are not reckless or haphazard; instead, their risk-taking activities are goal directed.

People engage in risk taking every day and are not even aware of this behavior. Some common examples of risk-taking behaviors are:

- Volunteering to be in charge of a project
- Giving constructive criticism to others
- Expressing opinions even when they are unpopular

Effective leaders understand that the benefits of risk taking far outweigh the potential negative consequences and, therefore, act accordingly.

THINK ABOUT IT

Risk Taking

It is not always comfortable to assume the role of initiator. However, whether you choose to act or not to act, you have made a choice. The question that must be answered is: Can I accept the consequences of my choice(s)?

Persuasiveness and Influence

An effective leader uses influence to motivate and inspire others to achieve goals. A leader understands how to use power effectively, not to dominate but, rather, to motivate others. According to Breisch (1999), nurse managers motivate others by addressing the staff’s needs, promoting accountability, encouraging success, and communicating with the group.

THINK ABOUT IT

Leadership Characteristics

How can you, in the pre-professional role, function as a leader? Think of all the situations in which you will attempt to motivate others to change, for example:

- Encouraging clients and families
- Interacting with team members
- Collaborating with classmates and instructors

Which leadership characteristics, such as communication, credibility, delegation, critical thinking, initiating action, risk taking, and persuasiveness and influence, would be appropriate for each of the above situations?

Persuasiveness is a tool that managers can use to create enthusiasm for a project, encourage collaboration, and increase cohesiveness among team members. The persuasive leader is one who communicates effectively and demonstrates personal power.

Power

A leader is a powerful person. **Power** is the ability to do or act and results in the achievement of desired results. Power causes things to happen. Powerful people are able to modify behavior and influence others to change, even when others are resistant to change. Every person uses power to some degree to meet individual goals. Effective nurse leaders use power to improve the delivery of care and to enhance the profession.

Power that is effective is power that is shared and enables all to work toward their potential. Power involves using force, even though force is certainly not always physical. Power and influence are derived from a variety of sources, including physical strength, ability to reward and punish, financial incentives, legal actions, position within an organization, and expertise.

Types of Power

The type of power used depends on various power sources or bases. Table 22-5 provides an overview of types of power according to their sources. Personal power can be developed by building trust and gaining the confidence of coworkers. Another way to develop power is to focus on solving problems rather than complaining about them. Creating outcomes is powerful!

Principles of Power

Nurse leaders must recognize certain guiding principles when obtaining and using power. Table 22-6 lists the major principles of power.

TABLE 22-5
Types and Sources of Power

Type	Source	Example
Reward Power	Ability to provide incentives	A nurse manager can decide when to schedule vacation time for staff nurses.
Coercive Power	Ability to punish	A head nurse assigns a staff nurse who has been “insolent” to an undesirable shift.
Referent Power	Charisma; others wanting to associate with one	A unit manager is powerful because he is popular with both his superiors and subordinates.
Expert Power	An excellent knowledge base and skill level The person has expertise in an area not held by those who are to be influenced by the leader.	The instructor exerts power with students.
Legitimate Power (“positional”)	Based on one’s position within a hierarchy	The nurse executive has legitimate power over a staff nurse within the same agency or institution
Personal Power	Derives from a high degree of self-confidence that is based on positive self-esteem	A nurse with a “take charge” attitude is powerful during a crisis.
Informational Power	Based on the types and amount of information that an individual can access	A staff nurse has just learned through her experience a new way to teach a client. She tells her coworkers about the approach. Knowledge is shared and power increases.

TABLE 22-6
Principles of Power

Principle	Explanation
The degree of power experienced by a person is dynamic.	A person with power must not assume that the current level of power will remain steady. A powerful person works to maintain the power base.
Power is rarely discussed openly within health care organizations.	Resentment can occur as a result of workers’ unstated concerns about the distribution and use of power.
Power is an expendable source.	Powerful people periodically renew their source(s) of power and expand their power base.
Power requires commitment to goals (personal, professional, or organizational).	A powerful person who loses sight of goals is less influential with subordinates. The ability to share one’s vision (which is goal oriented) with others increases power.
Power occurs in degrees, from minimal to extreme.	An effective leader exerts only as much force as needed to achieve desired objectives.

Data from Gillies, D. A. (1994). *Nursing management: A systems approach* (3rd ed.). Philadelphia: Saunders.

Developing a Power Base

Power can be a positive element in nursing. For example, a nurse manager can use personal power to promote cohesiveness and teamwork with subordinates. The power of a work group can be harnessed by a leader skilled in communication and time management tech-

niques. Power is a force used by nursing leaders to accomplish goals. However, many nurses do not want to be labeled as powerful because of a perceived negative connotation of the word. In the past, many nurses have tended to abdicate their power by negating their own contributions and expertise.

Expanded practice roles have increased nursing’s power. For example, nurse practitioners are empowered legally through licensure to use advanced knowledge and skills. “[T]he Health Care Financing Administration (HCFA) has not moved to decrease the autonomy granted to NPs” (Pearson, 2000, p. 16). Expansion of the scope of nursing practice results in greater accountability to one’s self, the profession, and the public. APRNs have historically demonstrated “their competence as safe, cost-effective providers” (Pearson, 2000, p. 17). Competence of APRNs increases their power to exert a positive influence on the health care delivery system.

In addition to advanced practice nursing, other avenues for nurses to achieve power include knowledge, competence, caring, and affiliation (Ferguson, 1998). There are a variety of ways to build affiliations, including mentorship, preceptorship, and networking.

Networking

Networking (the process of building connections with others) is essential for the success of nurses because it is a way to increase power. Networking helps nurses to become more influential because it encourages sharing of information and creates a synergetic effect for all those involved. Sources for developing networks are friendships, coworker alliances, and professional organizations (Vance, 1998). Establishing and maintaining

THINK ABOUT IT

Developing Power

How do you give power away? Power is abdicated by:

- Focusing on the negative
- Failing to seize power and use it
- The way one dresses
- Body language (hesitant voice tone, slouched posture)
- Always “playing it safe” rather than taking risks

What other behaviors minimize your power? How can you increase your power?

connections with others can be accomplished in a variety of ways, including mentoring and preceptorship (Table 22-7).

A mentor is an experienced person who serves as a guide to a novice. Mentors help novices develop skills. Those seeking a mentor are looking for a person who teaches rather than issues commands (Stahl, 1999). When seeking out a mentor, it is wise for nursing students or graduate nurses to look for a person who communicates directly and focuses on the positive. In selecting a mentor, the novice nurse should choose a person who can provide criticism in a supportive, constructive manner (Zerwekh & Claborn, 1997). “A mentor listens, affirms, counsels, encourages, seeks input,

TABLE 22-7
Networking Strategies

Strategy	Activities
Mentor and Preceptor Relationships	Seek opportunities to help others develop. Role model successful behaviors. Share your “secrets” for success. Encourage others to take professional risks. Provide support. Teach those who are less experienced. Seek out others who may serve as a mentor to you.
Identification with Peers	Form working relationships with your colleagues. Express pride in others’ achievements. Respect colleagues’ judgment and work. Look for ways to be mutually beneficial. Consult with colleagues and respect their input. Develop and use collaboration.
Establishment of Professional Networks	Volunteer information to contacts. Introduce others to contacts. Acknowledge all help received from contacts. Make frequent contact with network members. Be straightforward with contacts (no hidden agendas).

Data from Barnum, B. S., & Kerfoot, K. M. (1995). *The nurse as executive* (4th ed.). Gaithersburg, MD: Aspen; Gillies, D. A. (1994). *Nursing management: A systems approach* (3rd ed.). Philadelphia: Saunders.

and helps the novice develop expert status . . .” (Shaffer, Tallarica, & Walsh, 2000, p. 33).

Empowerment

Empowerment (the process of enabling others to do for themselves) is an interpersonal process. Empowerment occurs when individuals are better able to influence what happens to them.

Many elements are necessary for creating an atmosphere conducive to empowerment. Open communication built on trusting relationships is of utmost importance; the environment must be supportive and caring. Nurses who work in a nurturing environment are more likely to be empowered than those working in settings that do not attend to employee needs. Another element for establishing empowerment is mutual goal setting and decision making; personal power increases as these become shared responsibilities. Also, a common purpose is essential for empowerment to flourish.

CLIENT TEACHING CHECKLIST *Client Empowerment*

- Determine client's learning needs, focusing on the client's perception of importance.
- Speak in terms easily understood by the client and family.
- When applicable, demonstrate the skill and ask client to perform a repeat demonstration.
- Provide feedback immediately to reinforce the learning.
- Ask the client to state in own words what has been learned about the topic.

Empowerment of Clients

Client teaching is a major tool used by nurses to empower clients. By teaching clients how to better meet their needs, nurses are promoting client independence, autonomy, and power. For clients to be truly empowered (i.e., enabled to care for themselves), many health care providers need to shift their thinking away from the paternalistic paradigm that is based on the need for control. Paternalism is the process of treating adults like children by telling them what to do. Some health care providers still use a paternalistic approach to clients (e.g., telling a client to do something “for your own good.”) Empowering nurses are those who treat clients as partners in health care. An example of client empowerment is a nurse teaching a client how to self-administer

insulin injections. The accompanying display offers suggestions for empowering clients.

Another mechanism for nurses to empower clients is advocacy. Acting as client advocates, nurses can work through the political and legislative processes to bring about positive changes for vulnerable populations. For example, nurses exert influence with policymakers regarding the health care needs of the elderly, children, the economically impoverished, and the homeless.

Empowerment of Nurses

Empowerment is not something that is given to nurses. It is encouraged by enlightened leaders who value the work of their colleagues. Nurses who are empowered are the ones who are motivated to become active problem solvers. They become more confident and competent as a result of empowerment. Nurses will continue to create environments that promote the process of empowerment. Ways to promote nurse empowerment include:

- Share power and resources (including knowledge) with others
- Admit when a mistake is made (demonstrates trustworthiness and honesty)
- Avoid power struggles
- Use persuasion
- Use accurate information in decision making

An example of empowerment is self-governance (the process of having nurses work together to develop their own schedule for unit staffing coverage).

POLITICS OF NURSING

Politics is often used to refer to governmental and legislative issues. However, politics is a much broader concept in that it refers to how things are done and not done within an organization. **Politics** is the way in which people try to influence decision making, especially decisions about the use of resources. Organizational politics determines who has the power, who controls the resources, who is rewarded, and who makes the decisions. Every nurse is affected by organizational politics. It is up to the individual nurse to decide whether to join the political “game” or whether to let others make the decisions.

Nurses who are able to advance their careers have determined where the opportunities lie and have taken advantage of these opportunities. Some specific ways that nurses can increase their political power within an organization are listed in the Nursing Checklist.

Nurses need to be involved not only in organizational politics but also in politics that affect society at large. Because nurses provide essential services, they possess

RESEARCH FOCUS

Title of Study

“Key Indicators of Nursing Care Team Performance: Insights from the Front Line”

Authors

Dreachslin, J. L., Hunt, P. L., & Spranier, E.

Purpose

To determine the effectiveness of team delivery of care by studying self-directed nurse care teams (NCTs).

Methods

The following three indicators of well-functioning teams were examined in case study hospitals: (1) occurrence of role overlap, (2) team member's expressed satisfaction with interpersonal communication, and (3) team member's expression of belief that the client is their shared purpose. Transcript-based analysis of focus group members was performed.

Findings

The results of this study emphasize the significance of the registered nurses team leader's relationship skills. Analysis reveals that role overlap generally does not occur in practice. Ineffective communication was identified as the major barrier to teamwork. The focus group members also expressed that emphasis on the client was often impaired by cost containment issues and the desire of some team leaders to maintain their hierarchical positions.

Implications

This study suggests that focused attention to the development and reinforcement of leadership and interpersonal communication, especially for registered nurse team leaders, is essential.

Dreachslin, J. L., Hunt, P. L., & Spranier, E. (1999). Key indicators of nursing care team performance: Insights from the front line. *Health Care Supervisor, 17*(4), 70–76.

great potential power. However, nurses need better organization to fully actualize that potential. When that potential is realized, nursing will become even more powerful and, therefore, better able to influence the delivery of health care. Through increased power, nursing will have greater accountability.

NURSING CHECKLIST

Building Political Power Within an Organization

- Call attention to oneself by volunteering to serve on committees.
- Know what the organization values, not just the concepts written in the mission statement, but also the “unwritten rules” of expected conduct.
- Prepare oneself by earning the credentials needed for the particular position that is being sought.
- Communicate ideas, both verbally and in writing.
- Develop an extensive network by getting to know people who work in other areas of the organization and becoming involved in professional associations.
- Seek out a mentor or preceptor (membership in professional organizations facilitates this goal).
- Project a positive image, not only in dress and posture, but also in one's behavior.

KEY CONCEPTS

- The criteria for professional nursing practice include intellectual work, provision of a unique service, an expanding body of knowledge, personal responsibility to the public, an extended period of education that includes theory and practice, autonomy, a common identity shared by members, a sense of altruism and commitment to the public, and a code of ethics upheld by its members.
- Accountability is a process that requires individuals to be answerable for their actions. Being accountable means having an obligation (or duty) to act.
- As a profession, nursing is accountable for establishing and maintaining standards that promote safe, effective care.
- Professional accountability within nursing is fostered through mechanisms by which nurses obtain the right to practice and are the basis for understanding the responsibility nurses have to the public.
- Professional standards provide the framework for the development of competency statements.
- Nurse practice acts, which vary from state to state, clearly define the role and scope of nursing practice.
- Licensure gives an individual the right to offer one's services and receive compensation as a registered nurse.
- An individual can be granted the right to practice nursing within a state or territory by licensure through examination or licensure through endorsement.

- The registered nurse has the professional responsibility to attain and maintain competency.
- Nursing students have the responsibility to be prepared for clinical practice, to perform those skills for which competency has been achieved, and to seek instruction as necessary.
- Advanced practice nursing requires specialized knowledge and clinical proficiency. Advanced practice nursing roles include clinical nurse specialist, nurse practitioner, certified nurse midwife, and certified registered nurse anesthetist.
- Leadership involves motivating and guiding others to achieve goals.
- Managerial functions can be categorized into five major areas: planning, organizing, directing, controlling, and decision making.
- Characteristics of effective leaders include communication, credibility, delegation, critical thinking ability, initiating action, risk taking, and persuasiveness and influence.
- Types of power (reward, coercive, referent, expert, legitimate, personal, and informational) are derived from sources such as ability to provide incentives, ability to punish, charisma, expertise, position within an organization, self-confidence, and information.
- Through empowerment, both nurses and clients can achieve their professional and personal goals.
- Nurses influence the delivery of health care services through participation in organizational politics.

CRITICAL THINKING ACTIVITIES

1. Contact the state nurses association of the state in which your nursing school is located. Review the bylaws and newsletters for the past year. What types of programs are offered that promote the integrity of the profession?
2. Contact the board of nursing in the state in which your school is located. Request a copy of the nurse practice act and related rules and regulations. Review the nurse practice act to answer the following questions:
 - a. What are the qualifications of the board?
 - b. How are the members appointed?
 - c. What are the duties of the board?
3. Locate the address and name of the president of the state association for nursing students in your state through your school. Interview the officers of your school association. Why do they belong to the association? What issue(s) has the association addressed in the previous calendar year? How do the activities of the national, state, and school organizations contribute to the development of the profession?
4. Review a copy of your state nurse practice act and related regulations. How is nursing defined? How does the statutory definition compare to the definition of nursing as defined by the ANA? What is the authority for advanced practice nursing? Are advanced practice nurses reflected in the statutes?
5. What are some ways you can gain competencies after becoming licensed as a registered nurse?
6. Think of a leader. What characteristics or behaviors does this person demonstrate? Select one of the identified behaviors that you will work on developing.
7. In what ways do you feel powerful in your life? In what situations do you feel powerless? How can you maximize your power base?

Chapter 23

Legal Accountability and Responsibilities

Men stumble over the truth from time to time, but most pick themselves up and hurry off as if nothing happened.

—Sir Winston Churchill (in Zerwekh and Claborn, 1994)

COMPETENCIES

1. Identify the sources of public law and their implications for nursing practice.
2. Describe the sources of civil law and their impact on the nursing profession.
3. Explain the actions that constitute unintentional and intentional torts.
4. List the legal responsibilities of nurses in delivering client care.
5. Identify areas of potential liability in nursing practice and the actions nurses can implement to avoid these problems.
6. Describe the safeguards that nurses can institute to decrease the risk of liability.
7. Explain the role of the nurse in the informed consent process.
8. Define the three types of advance directives.
9. Describe the legal considerations for nurses involved in client care situations involving abortion, pronouncement of death, do not resuscitate orders, euthanasia, care of the deceased, wills, organ donation, and autopsies.

KEY
TERMS

administrative law	duty	jurisprudence
advance care medical directive	equity	law
advance directive	euthanasia	liability
assault	expert witness	living will
battery	expressed contract	malpractice
causation	false imprisonment	misdemeanor
civil law	felony	negligence
consent	formal contract	plaintiff
constitution	fraud	public law
contract law	Good Samaritan acts	statutory law
criminal law	impaired nurse	testimony
defamation	implied contract	tort
defendant	informed consent	tort law
durable power of attorney	injury	understaffing
	invasive	unprofessional conduct

Law, like nursing, is responsive to the changing needs, roles, and relationships in society. As the nursing profession has continued to evolve, the scope of applicable law has enlarged considerably. This chapter discusses the laws affecting nursing practice and the legal responsibilities of nurses to clients.

LEGAL FOUNDATIONS OF NURSING

The word **law** is derived from an Anglo-Saxon term meaning *that which is laid down or fixed*. The two types of law are: **public law**, which deals with an individual's relationship to the state, and **civil law**, which deals with relations between individuals.

Sources of Law

The three sources of public law at the federal and state levels are constitutional, administrative, and criminal.

The three sources of civil law at the federal and state levels are contracts, torts, and protective/reporting laws.

Public Law

As shown in Table 23-1, public law governs the legal aspects of constitutional, administrative, or criminal law. The law of the United States is set forth in the Constitution. A **constitution** is a set of basic laws that defines and limits the powers of government. Laws enacted by legislative bodies are referred to as **statutory law**. State boards and professional practice acts, such as nurse practice acts, are created and governed under statutory laws.

Administrative law (regulatory law) is developed by groups who are appointed to governmental administrative agencies and who are entrusted with enforcing the statutory laws passed by the legislature. Under administrative law, state boards of nursing are given the power to further delineate the rules and regulations governing nursing as set forth in nurse practice acts. In these administrative rules, boards identify the specific processes for licensure, grounds for disciplinary proceedings, and the establishment of fees for the services

TABLE 23-1
Types of Public Law

Constitutional Law		Administrative Law		Criminal Law	
Federal	State	Federal	State	Federal	State
U.S. Constitution	State Constitutions	Food, Drug, and Cosmetic Act	Practice acts (e.g., nurse, medical, pharmacy)	Controlled Substance Act	Criminal codes (define murder, manslaughter, criminal negligence, rape, fraud, illegal possession of drugs, theft, assault, and battery)
Civil Rights Act		Social Security Act	Worker's Compensation laws	Kidnapping	
		National Labor Relations Act	State Labor Relations Act		
			Employment Security Act		

Data from Goldberg, K., Kaplan, H., & Shaw, M. (Eds.). (1996). *Nurse's legal handbook* (3rd ed.). Springhouse, PA: Springhouse.

and penalties rendered by the board. See Chapter 22 for a complete discussion of nurse practice acts.

The most common example of public law is **criminal law**, which refers to acts or offenses against the welfare or safety of the public. In criminal law there are two types of crimes: a **felony** (crime of a serious nature usually punishable by imprisonment in a state penitentiary at hard labor or by death, or a crime in violation of federal statute in which punishment is more than 1 year incarceration) and **misdemeanor** (an offense that is less serious than a felony and may be punished by a fine or sentence to a local prison for less than 1 year).

Civil Law

Civil law deals with crimes against a person or persons in such legal matters as contracts, torts, and protective/reporting law (Table 23-2). Most cases of malpractice (professional liability) fall within the civil law of torts (Flight, 1997).

Contract Law

Contract law is the enforcement of agreements among private individuals. A legal contract has three essential elements:

1. Promise(s) between two or more legally competent individuals stating what each individual must do or not do
2. Mutual understanding of the terms and obligations the contract imposes on each individual
3. Compensation for lawful actions performed

Contracts are recognized at the state level as shown in Table 23-2.

The terms of a contract may be agreed on orally or in writing; however, a written contract (**formal contract**) cannot be changed legally by an oral agreement. With an **expressed contract**, the conditions and terms of the contract are usually given in writing by the concerned parties. An **implied contract** recognizes a relationship between parties for services.

In accord with U.S. and Canadian contract law, the nurse is legally required to:

1. Adhere to the employer’s policies and standards unless they are in conflict with federal or state law
2. Fulfill the terms of contracted service with the employer
3. Respect the rights and responsibilities of other health care providers, especially in areas that promote the continuity of client care

Accompanying these legal responsibilities are the nurse’s rights to:

1. Expect adequate and qualified assistance in providing care
2. Receive reasonable and prudent conduct from the client
3. Expect from the employer compensation for services and provision of a safe environment with the necessary resources to perform the services
4. Be treated with prudent, reasonable behaviors from other health care providers

TABLE 23-2
Types of Civil Law

Contract Law		Torts		Protective/Reporting Laws	
Federal	State	Federal	State	Federal	State
None	Employment contracts Business contracts with clients Contracts with allied groups Uniform Commercial Code	Federal Torts Claims Act	State Torts Claims Act (to allow claims against the state) Negligence (common law claim) Malpractice statutes (professional liability) Assault Battery False imprisonment Invasion of privacy Libel Fraud	Child Abuse Prevention and Treatment Act Privacy Act of 1974	Age of Consent statutes (medical treatment, drugs, sexually transmitted disease) Privileged Communication Statute Abortion Statute Good Samaritan Act Abuse statutes (child, elderly, domestic violence) Involuntary Hospitalization Statute Living will legislation

Data from Goldberg, K., Kaplan, H., & Shaw, M. (Eds.). (1996). *Nurse’s legal handbook* (3rd ed.). Springhouse, PA: Springhouse.

Tort Law

Tort law is the enforcement of duties and rights among individuals independent of contractual agreements. **Tort** is a civil wrong committed on a person or property stemming from either a direct invasion of some legal right of the person, the infraction of some public duty, or the violation of some private obligation by which damages accrue to the person (Creighton, 1986). Tort liability can be classified as unintentional (negligence and malpractice) and intentional (assault and battery, false imprisonment, invasion of privacy, defamation, and fraud). Intentional torts must prove that the defendant intended to commit the act. Examples of tort law are listed in Table 23-2.

The Judicial Process

Equity acts in accordance with the spirit, not the letter, of the law. An outgrowth of English law, *equity allowed the king to hear an appeal when the application of the civil law became too harsh or when there was no adequate remedy in the common law to satisfy the needs of the petitioner*. Therefore, the appeal was made to *conscience* (the king's innate sense of justice).

Equity evolved with its own set of principles, rules, and precedents, and when these clashed with their counterparts in the common law courts, equity prevailed. Equity continues to play an important role in the operation of the American judicial system (Creighton, 1986).

Judicial Law

Courts interpret a state's laws as they apply to everyday events. Once a court in the same jurisdiction, such as state or city, interprets a law in a certain manner, other courts tend to follow the same interpretation. This is often referred to as "setting a precedent."

Additionally, lower courts in the same jurisdiction must adhere to the interpretations of higher courts in the same region. Thus, all of a state's lower courts must adhere to the interpretations and procedures specified by that state's supreme or highest court and all courts in the United States must follow the rules established by the U.S. Supreme Court.

This body of judge-made law is referred to as **jurisprudence**. A well-known and controversial example of jurisprudence is the constitutional right to an abortion recognized by the Supreme Court that limits a state's ability to restrict a woman's access to an abortion.

LEGAL LIABILITY IN NURSING

Negligence and Malpractice

When the nurse fails to meet the legal expectations of care, the client can initiate action if harm or injury is incurred by the client. **Liability** is an obligation one has

incurred or might incur through any act or failure to act. The term **malpractice** refers to the behavior of a professional person's wrongful conduct, improper discharge of professional duties, or failure to meet the standards of acceptable care, which result in harm to another person (Zerwekh & Claborn, 1997). **Negligence** (breach of duty) is the failure of an individual to provide care that a reasonable person would ordinarily use in a similar circumstance. In other words, action that is contrary to the conduct of a reasonable person and results in harm is considered to be negligent behavior. When a nurse commits a negligent act that results in injury, it is known as malpractice.

Proof of liability depends on four elements:

1. **Duty** is an obligation created either by law or contract or by any voluntary action. It is the first element that must be proved for malpractice as it arises from the nurse-client relationship.
2. Breach of duty occurs when a nurse fails to act in accord with the standard of care. An act of commission or omission of the nurse may constitute a breach of the standard of care.
3. **Injury** (physical, financial, or emotional harm) must be demonstrated by the person making the claim to prove negligence. Damages is the money or other compensation awarded by the court to the **plaintiff** (the party who initiates a lawsuit that seeks damages or other relief).
4. **Causation** is the breach of duty that must be proved to have legally caused the injury. A cause-and-effect relationship must be clearly established.

To succeed in a malpractice suit, the plaintiff must first show that the **defendant** (the person being sued) owed him a duty. The plaintiff must then show that the defendant did not meet the duty and that this breach of duty caused harm, requiring compensation. Once the plaintiff files charges, the defendant must either refute the charges by demonstrating that, if a duty was owed, the duty was fulfilled or that, if a duty was breached, the breach was not the cause of the plaintiff's complaint of injury. "Perhaps the most difficult concept in negligence is that of causation—proving that the negligent act was the cause of the injury" (Fiesta, 1997a, p. 24).

A person typically has no difficulty showing that a nurse owed a duty. All that needs to be demonstrated is that the nurse was working on the day of the injury and was responsible for the person's care as verified by the staffing schedules and assignment sheets. It is more difficult to prove that the duty owed was breached.

Courts usually apply the *reasonable person standard* that asks: "What would a reasonable nurse do in a similar situation?" To answer this question, courts look to the institution's policies and procedures to determine how client care is to be performed in that facility. When determining a breach of a duty, the actions of the nurse are also compared against the professional standards of

nursing care. This is done by using published nursing standards of specialty nursing groups or by having another nurse testify as an expert witness. An **expert witness** is a person called by parties in a malpractice suit who is a member of the same profession as the party being sued and who is qualified to testify to the expected behaviors usually performed by members of the profession in a similar situation.

When a nurse is called to testify in a malpractice lawsuit either as the defendant or as an expert witness, the **testimony** (written or verbal evidence given by a qualified expert in an area) must be based on “facts.” The jury and the court must form an opinion on their own; they are not interested in the witness’s opinions on the matter in dispute.

Nurses are expected to administer client care based on both institutional policy and procedure and the professional standards of care. The nurse defendant would use the same methods to prove that a breach of duty did not occur: showing that the facility’s policies and procedures were followed and that the actions followed accepted nursing standards. An expert witness is often asked to describe the relevant standards of care that will demonstrate that the client had the right to receive a *duty owed* from the nurse.

It is not sufficient to imply that the nurse breached a duty. The claimant must also show that this breach caused harm. A person cannot be compensated for a breach that caused no harm. Frequently, complaints against nurses are in one of the following categories: client falls, medication errors, failure to monitor a client in restraints, improper technique in giving treatment, failure to follow hospital procedures, and failure to supervise nonlicensed employees.

Informed Consent

Laws regarding informed consent protect the client’s right to self-determination. A client is able to make an informed decision about consenting to or refusing a treatment regime only if adequate information has been presented.

The law requires that clients or their representatives be given sufficient information regarding various treatment modalities so that the consent is an informed process. A **consent** is a voluntary act by which a person agrees to allow someone else to do something. **Informed consent** means that the client understands the reason for the proposed intervention, and its benefits and risks, and agrees to the treatment by signing a consent form (Figure 23-1). Consent forms must be obtained for all **invasive** (accessing body tissues, organs, or cavities through some type of instrumentation) procedures.

Legally the client must be mentally competent to give consent for medical procedures. It is the legal responsibility of the health care provider performing the procedure to obtain the client’s informed consent. Informed consent is a process consisting of information and con-

Figure 23-1 This nurse is witnessing the signing of a consent form after the physician has fully informed the client about the proposed treatment. How does the nurse’s compliance with the policy of informed consent lessen the nurse’s liability in terms of this client’s care?

sent, not merely the signing of a form (Switzer, 1995). Obtaining the informed consent requires client teaching by the health care provider.

The health care provider may not coerce the client to sign the consent. The client has the right to refuse the information and waive the informed consent and undergo treatment, but this decision must be documented in the medical record. The signing of an informed consent can also be waived for urgent medical and surgical intervention as long as institutional policy so indicates.

Parental or guardian consent should be obtained before treatment is initiated on a minor. There are three exceptions to this ruling: an emergency; situations where the consent of the minor is sufficient, such as treatment of a sexually transmitted disease; and a court order or other legal authorization has been obtained. If a client is a minor and the parents or legal guardian deny the lifesaving treatment, the court may overrule the decision. Under the laws of most states and Canadian provinces, an emancipated minor (one who is married, pregnant, a parent, or financially independent) can give a valid consent to treatment. Most states legally mandate that a client’s HIV status remain confidential (Cady, 1999). Therefore, nurses may be held liable for inappropriate disclosure, whether intentional or not, of information about a person’s HIV status.

Switzer (1995) discusses how the courts have not always been clear in defining nursing responsibilities regarding informed consent. The general rules to keep in mind are:

1. The physician cannot delegate the responsibility for obtaining informed consents. However, a nurse could be held liable on a battery claim if the nurse knows the client has not given informed consent.
2. As directed by institutional policy, the nurse may witness a client’s signing of a consent form or may be responsible for making sure the signed form is in the chart (Figure 23-2). As a witness to the client’s

TULANE MEDICAL CENTER Hospital and Clinic 1415 Tulane Avenue New Orleans, Louisiana 70112	
Consent for medical procedure and acknowledgement of receipt of information	
Date _____	
In keeping with the Louisiana State Law, you are being asked to sign a confirmation that we have discussed your contemplated operation or medical procedure. We have already discussed with you the common problems or risks. We wish to inform you as completely as possible. Please read the form carefully. Ask about anything that you do not understand and we will be pleased to explain it.	
1.] I hereby authorize and direct Dr. _____, with associates or assistants of his choice, to perform upon _____, the following surgical, diagnostic, or medical procedure _____ including any necessary or advisable anesthesia.	
2.] In general terms, the nature and purpose of this operation or medical procedure is: _____ _____	
3.] This procedure has been explained to me. Alternate methods have also been explained to me, as have the advantages and disadvantages. I am advised that though good results are expected, the possibility and nature of complications cannot be accurately anticipated and that, therefore, there can be no guarantee as expressed or implied either as to the result of surgery or as to cure. The possible risks include death, brain damage, quadriplegia, paraplegia, loss of organ, loss of an arm or leg, or disfiguring scars.	
4.] I authorize the administration of a blood transfusion and such additional transfusion as may be deemed advisable in judgement of the attending physician, or his associates or assistants. It has been fully explained that blood transfusions are not always successful in producing a desirable result and that there is a possibility of ill effects, such as the transmission of infectious hepatitis or other diseases or blood impairments. Also, it has been explained that emergencies may arise when it may not be possible to make adequate cross-matching tests, and that immediate need may make it necessary to use existing stocks of blood which may not include compatible blood types.	
5.] I further authorize the doctors to perform any other procedure that in their judgement is advisable for my well being. I hereby authorize and direct the above named physician and associates or assistants to provide such additional services as they may deem reasonable and necessary including, but not limited to, the administration of any anesthetic agent, or the services of the X-ray department or laboratories, and I hereby consent thereto.	
6.] I hereby state that I have read and understand this consent, all questions about the procedure or procedures have been answered in a satisfactory manner, and that all blanks were filled in prior to my signature.	
Witness _____	Signature _____ (patient or person authorized to consent)
Witness _____	Relationship _____ (required only for telephone consent or consents signed with an X)
I certify that all blanks in this form were filled in prior to signature and that I explained them to the patient or his representative before requesting the patient or his representative to sign it.	
Signature _____ (above named physician to sign)

| 1. Any competent adult, age 18 or older, for himself.
2. Any parent, whether an adult or minor, for his minor child.
3. Any married person, whether an adult or minor, for his/her spouse if spouse is unable to consent.
4. Any person temporarily standing in place of a parent whether formally served or not for the minor under his care and any guardian for his ward. | 5. Any female regardless of age or marital status, for herself when given in connection with pregnancy or childbirth.
6. In the absence of a parent, any adult, for his minor brother or sister.
7. In the absence of a parent, any grandparent for his minor grandchild. |
|---|---|

Figure 23-2 Example of a Consent Form (Courtesy of Tulane University Hospital and Clinic, New Orleans, LA)

signature, the nurse is confirming that the client was fully alert and aware of what was being signed.

3. When the nurse discovers circumstances that render a signed consent form invalid (such as a change in the client's condition) the nurse should notify the physician. If the client will not be harmed by a delay, the nurse is justified in refusing to assist with a procedure until the requirements for the informed consent are satisfied.

Although the law does not require staff nurses to obtain a formal informed consent for nursing procedures, the nurse has the responsibility of explaining to the client what to expect during the procedure.

Assault and Battery

Assault is a stated intent to touch a person in an offensive, insulting, or physically intimidating manner. **Battery** is the touching of another person without the person's consent. The legal issues arising from assault and battery are usually based on whether the client consented to the touching that occurred.

Because assault and battery both deal with *acts of touching*, the client's cultural values, beliefs, and practices must be respected by the nurse. If the nurse should fail to recognize cultural differences, undesired outcomes may occur in the nurse–client relationship.

False Imprisonment

False imprisonment occurs when clients are made to wrongfully believe they cannot leave a place. The most common example of this tort is telling a client not to leave the hospital until the bill is paid (Zerwekh & Claborn, 1997). Another example of false imprisonment is the use of physical or chemical restraints.

Restraints or Seclusion

The Omnibus Budget Reconciliation Act (OBRA) of 1987 outlines the rights of the client and the responsibilities of health care providers regarding the use of both physical and chemical restraints. The nurse is to use safety measures, such as keeping the client's bed in a low position and checking on the client whenever the nurse or other caregivers pass the client's room, in an effort to avoid the use of restraints. Chemical restraints, primarily psychotropic medications (such as sedatives, hypnotics, anti-anxiety agents, and neuroleptics) are used to control hyperactive behavior of agitated clients.

Restraints are legal only if they are necessary to protect the client or others from harm. If a competent client refuses to follow orders and the nurse uses restraints, the nurse can be charged with false imprisonment and/or assault and battery. In an emergency situation when a client becomes violent and is in immi-

nent danger of harming self or others, the nurse may apply restraints and then immediately obtain an order from the physician. The law mandates that the use of restraints or seclusion must have a physician order. The nurse is legally accountable for the client in restraints or seclusion. Care of clients in restraints requires documentation as prescribed in specific agency policies.

Privacy and Confidentiality

According to Badzek and Gross (1999), the concept of privacy includes the right to:

- Be left alone (i.e., freedom from intrusion)
- Determine bodily integrity (to consent to or refuse treatment)
- Control how personal information is shared

Nurses are accountable for respecting the client's right to privacy. State laws respect privilege doctrine that guarantees that no one will reveal confidential information without the client's permission. Nurses must obtain the client's permission before disclosing any information regarding the client, going through the client's personal belongings, performing procedures, and photographing the client. An essential component of nursing practice is protecting the client's confidentiality and privacy. The American Nurses Association Code for Nurses (1985) identifies privacy and confidentiality as key elements in maintaining the integrity of the nursing profession.

The Canadian Nurses' Association (CNA) has developed its own Code of Ethics. CNA's Code of Ethics has involved nurses in all provinces and territories in Canada. Within the CNA's Code of Ethics, the value that applies to confidentiality states that the nurse is responsible to hold confidential all information about a client learned in health care settings. The nurse–client relationship is based on trust. Any violation of the client's privacy or breach of confidentiality may interfere with trust.

Nurses must ensure that clients understand their privacy rights including withholding information such as their diagnoses from the family. As another example, clients with sexually transmitted diseases or who are positive for the human immunodeficiency virus (HIV) may choose to withhold this information from their family. Most states recognize 18 years as the age at which adolescents are competent to make decisions regarding themselves. Nurses must be aware of the legislation in the state of practice since issues regarding health care of children varies from state to state (Muscare, 1999).

Privacy involves more than privilege doctrine. Nursing care should be delivered with a caring attitude that provides for privacy such as keeping the door to the client's room closed, knocking before entering the client's room, closing the curtains around the bed before exposing the client, and draping the client appropriately for procedures.

A rapidly increasing problem that threatens privacy and confidentiality is access to electronic data. The technological proliferation of cellular phones, facsimile machines, and computerized medical records may jeopardize the privacy of information. In 1998, the American Nurses Association initiated a movement to regulate telecommunication technologies used in health care. “Confidentiality of client visits, client health records, and the integrity of information in our health care system is essential” (American Nurses Association, 1998, p. 4).

Defamation

Defamation occurs when information is communicated to a third party that causes damage to someone else’s reputation either in writing (libel) or verbally (slander). The most common examples of this tort are giving out inaccurate or inappropriate information from the medical record; discussing clients, families, or visitors in public areas; or speaking negatively about coworkers (Zerwekh & Claborn, 1997).

Fraud

Fraud results from a deliberate deception intended to produce unlawful gain. Examples of fraudulent claims in health care are illegal billing and deceit in obtaining or attempting to obtain a nursing license (Flight, 1997). Fraudulent billing practices include overcharging for services and billing for services that were not provided. Other examples of fraud in health care include obtaining and using false credentials and falsifying medical records.

What should nurses do when they suspect fraud is occurring in the workplace? Nursing activities to deter fraud include the following:

- Documenting facts accurately
- Reporting illegal activities
- Educating peers and the public as to what constitute fraud

The federal False Claims Act protects an employee who experiences any type of retaliation for reporting fraudulent practices (Kleinman, 1999).

Unprofessional Conduct

Conduct that could adversely affect the health and welfare of the public constitutes **unprofessional conduct**. The following actions or omissions constitute unprofessional conduct: breach in client confidentiality; failure to use sufficient knowledge, skills, or nursing judgment when practicing nursing; physically or verbally abusing a client; assuming duties without sufficient preparation; knowingly delegating nursing tasks to unlicensed personnel that places the client at risk for injury; failure to

accurately maintain a record for each client or falsifying a client’s record; and leaving a nursing assignment without properly notifying appropriate personnel.

Controlled Substances

The improper use of controlled substances may lead to criminal penalties in the United States and Canada under laws governing the distribution and use of controlled substances (narcotics, depressants, stimulants, and hallucinogens). Under law, agencies that distribute controlled substances must follow federal and state regulations regarding the security and access to these drugs. Title II of the Comprehensive Drug Abuse Prevention and Control Act of 1970 (Controlled Substances Act) requires accurate documentation of narcotic administration.

The Impaired Nurse

If a nurse suspects a coworker is abusing chemicals, the nurse has a duty to report the individual to nursing administration in a confidential manner with the goal of treatment being the priority issue. Nursing administration should then notify the board of nursing regarding the nurse’s behavior.

The ANA’s *Code for Nurses* (1985) states that the nurse acts to safeguard the client and the public when health care and safety are affected by incompetent, unethical, or illegal practice of any person. Some boards of nursing will discipline a nurse for failing to report a fellow nurse who is abusing drugs. An **impaired nurse** is habitually intemperate or is addicted to the use of alcohol or habit-forming drugs. See the accompanying display for indicators of substance abuse in nurses.

With the formation of the Task Force on Addiction and Psychological Disturbance by the ANA in 1981, many states have initiated programs to identify, treat, and assist impaired nurses. Intervention programs allow the nurse to seek and comply with a treatment regimen as an alternative to disciplinary action.

SUBSTANCE ABUSE INDICATORS

- Social isolation (e.g., requesting to work the night shift)
- Changes in personal appearance and mood
- Excessive work-related tardiness, absences, and accidents
- Excuses for being unavailable while on duty
- Resistance to change
- Defensive when questioned about client complaints and discrepancies in the narcotic control sheet
- Failure to meet schedules and deadlines
- Inaccurate and sloppy documentation

Safety

The promotion of physical safety is one of the most important responsibilities of the nurse. There are four areas regarding client safety in which nurses are at legal risk: (1) failure to monitor client status, (2) medication errors, (3) falls, and (4) use of restraints.

“Failure to monitor is a basis for liability that nurses must be particularly aware of” (Fiesta, 1997b, p. 16). The nurse must be aware of the client’s condition. This calls for frequent assessment of all clients and adherence to policy guidelines regarding assessment of clients with special needs, such as those who are immobile, critically ill, or unconscious.

It is predicted that approximately 800,000 hospitalized clients will experience an adverse drug event each year. Almost 50% of adverse drug events are preventable (Fiesta, 1997b). Nurses play a major role in the prevention of adverse drug events by careful drug administration and client assessment.

A major area for potential liability is client falls. “Numerous lawsuits have demonstrated the importance of assessing patients for fall potential and taking necessary precautions in caring for patients who are likely to fall” (Eskreis, 1998, p. 34).

Another potential problem is the use of medical equipment. The nurse has the legal duty to use reasonable care when choosing and using medical equipment (Eskreis, 1998).

Understaffing

Understaffing refers to the failure of a facility to provide a sufficient number of professional staff to meet client needs. Health care providers must have written staffing guidelines for each client population and setting to comply with the standards of the Joint Commission for the Accreditation of Healthcare Organizations. Usually staffing policies are in place to direct the decision making regarding increasing or downsizing staff numbers.

Reassignment

Questions are often raised by nurses in hospitals regarding the liabilities of “floating” (reassignment to work on an unfamiliar unit). This is an acceptable, legal practice used by hospitals to solve their understaffing problems. Legally, a nurse cannot refuse to float unless a union contract guarantees that nurses work only in a specified area or the nurse can prove the lack of knowledge for the performance of assigned tasks.

When reassignment occurs, nurses should set priorities and identify potential areas of harm to the client. Nursing experts recommend the practice of “nurses speaking out when they don’t feel competent to take care of certain patients or perform certain procedures” (Trossman, 1999, p. 2). The nurse is legally mandated to be competent before performing procedures; inexperience

is no legal excuse for errors. “When floating, it’s especially important to ask questions of the regular staff” (Ahmed & Fecik, 1999, p. 12). All pertinent facts relating to client care problems and safety issues should be documented. Nurses who are required to “float” should receive orientation prior to reassignment.

Executing Prescribed Orders

Medical practice acts of states and provinces usually define medicine as any act of diagnosis, prescription, surgery, or treatment. This definition allows for the initiation of written or verbal physician orders. In accord with nurse practice acts, nurses are obligated to follow the orders of a licensed physician or other designated health care provider *unless the orders would result in client harm*.

The nurse has a legal responsibility to the client to ensure that the order is clear and appropriate to the client’s treatment. Ahmed and Fecik (1999) state “Questioning unclear orders testifies to a nurse’s sense of responsibility” (p. 12). When the nurse questions a physician order, the physician should be contacted to obtain clarification. If, after physician clarification the nurse still questions the order, the nurse should institute agency policy; for example, notify the supervisor. Following the agency’s policy in this matter protects the nurse from employer disciplinary action.

Nurses are not encouraged to accept verbal orders from a physician because of the risks of error. See Chapter 26 for a complete discussion of how to document verbal orders.

NURSING ALERT

Remember that the nurse remains liable for incorrectly administering a medication even if it is ordered incorrectly by a physician. “You’re not exempt from liability because you were following a doctor’s order” (Eskreis, 1998, p. 36).

LEGAL RESPONSIBILITIES AND ROLES OF PROFESSIONAL NURSES

Nurses are legally responsible to practice nursing as set forth in nurse practice acts and professional standards of care. There are several roles performed by nurses related specifically to legal accountability.

Provider of Service

The nurse is legally responsible to ensure that the client receives competent, safe, and holistic care. Nurses are expected to:

- Render care based on their education, experience and circumstances (standards of “reasonable, prudent person”)
- Discuss with the client the associated risks and outcomes inherent in the plan of care as well as alternate treatment modalities
- Supervise and evaluate aspects of care that have been delegated to licensed and unlicensed caregivers
- Document the care the client receives and other significant events affecting the client
- Maintain clinical competency

The nurse is also responsible for the client’s physical safety as discussed in this chapter in the section on safety.

Expert Witness

To qualify as an expert witness, the nurse’s education and experience are presented to the court to prove the nurse is knowledgeable about current standards and practice. The credentials of an expert witness have to match or exceed a defendant’s qualifications. During the trial, the plaintiff’s and the defendant’s attorneys have the right to use the testimony of the expert witness for their respective cases.

Forensic Specialist

A relatively new role for nurses is that of forensic nurse. In 1997, the American Nurses Association published *Scope and Standards of Forensic Nursing Practice*, which describes some of the responsibilities of forensic nurses as treating incarcerated clients, investigating trauma cases, and serving as expert witness in court. As violence continues to escalate in the United States, there will be an increased demand for forensic nurses.

Reporting Responsibilities

Nurses should know which situations have to be reported because reporting statutes vary among the states and provinces; refer to Table 23-2 for protective/reporting laws. Criminal acts of rape and sexual assault must also be reported in most states and provinces.

LEGAL RESPONSIBILITIES OF STUDENTS

Nursing students must act as reasonably prudent persons, equivalent with education and experience, when performing nursing duties. When employed as caregivers, nursing students must perform only those tasks that they are competent to perform, as stated in their job description. See Chapter 22 for a complete discussion of the legal expectations of nursing students.

THINK ABOUT IT

Legal Implications for Nursing Students

When agency policy conflicts with the nurse practice act, what should you do? Remember that the state legislature empowers the board of nursing to define and monitor practice. If, as a nursing student, you willfully violate the state board’s ruling, what future implication(s) could this have on your ability to apply for licensure?

LEGAL SAFEGUARDS FOR NURSING PRACTICE

There is a common set of actions a nurse can take to protect against litigation. Although each client encountered presents unique situations that can place the nurse at legal risk, certain general nursing care activities decrease this risk (refer to the Nursing Checklist). Following the guidelines in the checklist should help protect nurses from lawsuits as well as provide defense in the event of a suit.

Institutional Policies

All health care facilities have policies. Nursing students and registered nurses are obligated to know the policies and follow the procedures/protocols that flow from policy. Although policies are not laws, courts generally rule against nurses who violate policies.

Professional Liability Insurance

Nurses should consider purchasing their own liability insurance for protection against malpractice lawsuits. Nurses may erroneously assume that they are protected by their employer’s professional liability policies. When securing liability insurance, the nurse should validate the company’s reputation. Most professional nursing organizations offer group liability insurance.

Usually when a nurse is sued, the employer is also sued for the nurse’s actions or inaction. Even though this is the norm, nurses are encouraged to have their own malpractice insurance. For example, a suit may be filed for an incident that occurred in a facility where the nurse is no longer employed. Having one’s own insurance also provides the nurse protection as an individual and allows the nurse to have an attorney who has only the nurse’s interests in mind.

Risk Management Programs

Risk management is a method of identifying, evaluating, and decreasing the agency’s risk of financial loss. Most health care facilities are required to have formal risk management programs in place by agencies such as the

**NURSING CHECKLIST****Actions to Decrease the Risk of Liability**

- Communicate with your clients by keeping them informed and listening to what they say.
- Acknowledge unfortunate incidents and express concern about these events without either taking the blame, blaming others, or reacting defensively.
- Chart and time your observations immediately, while facts are still fresh in your mind.
- Take appropriate actions to meet the client's nursing needs.
- Follow the facility's policies and procedures for administering care and reporting incidents.
- Acknowledge and document the reason for any omission or deviation from agency policy, procedure, or standard.
- Maintain clinical competency and acknowledge your limitations. If you do not know how to do something, ask for help.
- Promptly report any concern regarding the quality of care, including the lack of resources with which to provide care, to a nursing administration representative.
- Use appropriate standards of care.
- Time and document changes in conditions requiring notification of the physician and include the response of the physician.
- Delegate client care based on the documented skills of licensed and unlicensed personnel.
- Treat all clients and their families with kindness and respect

Department of Health and Human Services, accrediting bodies, and liability insurance carriers. These programs are based on systematic reporting of incidents or unusual occurrences, for example, client falls.

Incident Reports

In accord with the agency's policies, nurses are required to file incident reports when a situation arises that could or did cause client harm. When filing an incident report, the nurse should state only the *facts* surrounding the incident. The nurse's opinions or conclusions about the incident are not to be documented. Also, the client's medical record should not contain any reference to the filing of an incident report.

Client Education

Safe nursing care requires that the client has a thorough understanding of the treatment plan. Although the

physician has specific responsibilities regarding client education, the nurse must also provide client teaching and document the degree of learning. See Chapter 13 for a complete discussion of the nurse's responsibilities in client education.

LEGISLATION AFFECTING NURSING

There are legal, as well as ethical, implications inherent in nursing practice, which require nurses to know and comply with the specific existing health care laws and regulations in their state of licensure. The common legal liabilities in some nursing practice settings are discussed in the following section.

Advance Directives

The Omnibus Reconciliation Act of 1990, called the Patient Self-Determination Act (PSDA), defines an **advance directive** as a written instruction that is recognized under state law and is related to the provision of such care when the individual is incapacitated (Cate & Gill, 1991). There are three types of legal instruments that comply with the Act's definition:

1. A **living will** is a document prepared by a competent adult that provides direction regarding medical care in the event the person becomes unable to make decisions personally.
2. **Durable power of attorney** (health care proxy) is an authorization that enables any competent individual to name someone to exercise decision-making authority, under specific circumstances, on the individual's behalf.
3. **Advance care medical directive** is a document in which an individual, in consultation with the physician, relatives, or other personal advisors, provides precise instructions for the type of care the client wants or does not want in a number of scenarios.

The living will is the most widely available instrument for recording future health care-related decisions. However, it is not an enacted statute in all 50 states. Figure 23-3 presents a sample document of a living will. All states provide for a general durable power of attorney.

American Health Consultants (1995) discusses the need to provide public education about initiation of advance directives in a non-health care setting in simple, easily understood language. Follow-up systems need to be put into place on a community level to ensure that citizens are aware of the purpose and provisions of advance directives and share these documents with their primary physician and family members.

As the total number of citizens in their eighties and nineties increases (Hogstel, 2001), the numbers of those who are not able to handle their own affairs and

Declaration

Declaration made this _____ day of _____ (month, year).

I, _____, being of sound mind, willfully and voluntarily make known my desire that my dying shall not be artificially prolonged under the circumstances set forth below and do hereby declare:

If at any time I should either have a terminal and irreversible incurable injury, disease, or illness or be in continual profound comatose state with no reasonable chance of recovery, certified by two physicians who have personally examined me, one of whom shall be my attending physician, and the physicians have determined that my death will occur whether or not life-sustaining procedures are utilized and where the application of life-sustaining procedures would serve only to prolong artificially the dying process, I direct that such procedures be withheld or withdrawn and that I be permitted to die naturally with only the administration of medication or the performance of any medical procedure deemed necessary to provide me with comfort care.

In the absence of my ability to give directions regarding the use of such life-sustaining procedures, it is my intention that this declaration shall be honored by my family and physician(s) as the final expression of my legal right to refuse medical or surgical treatment and accept the consequences from such refusal.

I understand the full import of this declaration and I am emotionally and mentally competent to make this declaration.

Signed: _____

City, Parish, and State of Residence _____

The declarant has been personally known to me and I believe him or her to be of sound mind.

Witness: _____

Witness: _____

Figure 23-3 Sample of a Living Will (Courtesy of Louisiana Hospital Association, Baton Rouge, LA)

make decisions for themselves increases. This situation frequently requires the caregiver to become involved in legal affairs. Nurses who work with older clients should be aware of community resources to assist the elderly in legal matters. Local groups (e.g., the American Association of Retired Persons) are often able to refer people to agencies providing legal assistance for reasonable charges.

Abortion

The 1973 Supreme Court decision of *Roe v. Wade* increased the safety and availability of abortions in the United States. Health care agencies and practitioners in various states may be required to report abortions performed as well as other information about the client, the procedure, and any resulting complications. Some

states only require the reporting of abortions for minors.

Nurses may need to explore their own feelings or beliefs about abortion before assisting with these procedures. The nurse should also be aware of the client's feelings before the abortion so that appropriate referral can be made for postprocedure care if necessary.

The Americans with Disabilities Act

Passed by the U.S. Congress in 1990, The Americans with Disabilities Act (ADA) prohibits discrimination on the basis of disability in employment, public services, and public accommodations. The ADA defines a person with a disability as having a physical or mental impairment that substantially limits one or more of the major

IMPAIRMENTS COVERED BY THE AMERICANS WITH DISABILITIES ACT

Mental Impairments

- Learning disabilities
- Psychiatric disorders
- Organic brain syndrome
- Retardation

Physical Impairments

- Addictions
- Cancer
- Cerebral palsy
- Diabetes
- Epilepsy
- Heart disease
- HIV (symptomatic or asymptomatic)
- Multiple sclerosis
- Muscular dystrophy
- Orthopedic, visual, speech, and hearing impairments
- Tuberculosis

THINK ABOUT IT

Hearing Impaired Coworker

How would you feel about a nurse coworker who is hearing impaired and cannot hear heart, lung, and bowel sounds? What are your responsibilities in such a situation?

life activities. See the accompanying display for disabilities that are covered by the ADA.

Good Samaritan Acts

Good Samaritan acts are laws that provide protection to health care providers by ensuring immunity from civil liability when assistance is provided at the scene of an emergency when the caregiver does not intentionally or recklessly cause client injury. The caregiver will be evaluated by how a reasonable and prudent caregiver would have responded in a similar situation. Good Samaritan acts are examples of common and statutory laws as determined by the individual states. Although all 50 states and the District of Columbia have Good Samaritan acts, some of the Canadian provinces (e.g., Ontario and Quebec) do not have Good Samaritan acts.

Good Samaritan acts vary in coverage from state to state and it is the responsibility of caregivers to know the law for their own jurisdictions. Keep in mind that some states only cover nurses licensed in that state and that these acts are amended periodically by legislation. Good Samaritan acts do not provide immunity to the nurse who is providing care as an employee (Zerwekh & Claborn, 1997).

THINK ABOUT IT

Good Samaritan Acts

If, as a nurse, you charge or accept a fee for the services rendered during an emergency situation, will you still be protected by a Good Samaritan act? What are the legal implications for accepting compensation for your professional services?

Title of Study

“Elderly Patients’ Understanding of Advance Directives”

Authors

Zronek, S., Daly, B., & Lee, H.

Purpose

To determine client’s beliefs and levels of understanding about advance directives (AD).

Methods

This was a descriptive study conducted by use of medical records reviews and client interviews. During the interviews, clients were read a questionnaire and the answers were recorded by an interviewer. The questions sought information about the description of the type of AD completed, the client’s source of information about ADs, and beliefs/communications regarding the completion of the AD.

Findings

A majority of clients interviewed were able to clearly state what an AD means. Ninety percent of respondents stated that they had discussed ADs with family members. Ninety-eight percent reported that they had discussed their feelings about life-sustaining treatment measures with potential surrogate decision makers. Many of those surveyed stated the belief that ADs facilitate client choice and decrease family suffering. Generally, clients believed ADs would “make a difference” for them at the end of their lives.

Implications

The clients in this study expressed a wish to simplify end-of-life decisions. They also stated a strong belief that ADs were useful in meeting this goal.

Zronek, S., Daly, B., & Lee, H. (1999). Elderly patients' understanding of advance directives. *JONA's Healthcare Law, Ethics, and Regulation*, 1(2), 23–28.

National Practitioner Data Bank

The Health Care Quality Improvement Act was enacted in 1986 to identify unsafe health care providers and restrict their unsafe practice. The major goal of this legislation was to deter incompetent practitioners from moving to a new state without having to report on problematic care delivery in previous states. There were two major components of this law: (1) to establish a National Practitioner Data Bank, which would serve as a clearinghouse for information on unsafe practitioners; and (2) to provide immunity for reporting incompetent peers.

Occupational Safety and Health Act

In 1970, the Occupational Safety and Health Act (OSHA) was enacted to ensure safe work environments for Americans. The intent of the act was to decrease work-related injuries. The act was expanded in 1991 to develop standards for safety of those who may experience work-related exposure to blood-borne contaminants. Employers are fined if they violate OSHA rules and regulations.

LEGAL ISSUES RELATED TO DEATH

Do Not Resuscitate Orders

Sudden death from a cardiac arrest requires the initiation of cardiopulmonary resuscitation (CPR) by competent persons. In health care settings, caregivers (often a nurse) perform CPR and other lifesaving measures according to agency policy unless the primary physician has written a *do not resuscitate (DNR)* order in the client's medical record. The physician's DNR order provides an exception to the universal standing order to resuscitate.

Health care agencies are required to have policies in place that provide a mechanism for reaching a DNR decision as well as for resolving conflicts in decision making. The principles of informed consent must be respected by the physician who writes a DNR order. When the client is either comatose or near death, there should be knowledgeable concurrence by the physician and the client's family or guardian about the actions to prolong the client's life. It is the responsibility of the nurse to know and follow the client's wishes relative to resuscitation and the application of life-support systems. This information must be documented in the client's medical record.

Euthanasia

Euthanasia refers to an intentional action or lack of action causing the merciful death of someone suffering from a terminal illness or incurable condition. The issue

of euthanasia is a difficult one for society, the courts, and health care facilities (Flight, 1997). See Chapter 24 for a complete discussion of euthanasia and nursing.

Wills

The United States and Canada have laws regarding the legal requirements for written and oral wills. These laws define the format of wills, the number of witnesses needed, who can be a witness, what makes a will valid or invalid, how to invalidate a will, and how to contest a will (Goldberg et al, 1996). Nurses are usually required to notify the physician and nurse supervisor before acting as a witness and signing a will. Nurses should refrain from assisting the client with the wording of the will.

Pronouncement of Death

Medicine has yet to agree on one acceptable definition of death. The various definitions are as follows: the absence of awareness of external stimuli, lack of movement or spontaneous breathing, absent reflexes, a flat brain wave repeated twice in 24 hours, and the Uniform Definition of Brain Death, which requires irreversible cessation of all functioning of the brain (Zerwekh & Claborn, 1997).

THINK ABOUT IT

What Constitutes Death?

Considering the various definitions of death, is it absolutely clear when the moment of death occurs? Based on these definitions, when can the life-supporting machines be turned off? Although the right of the client to refuse treatment, which may lead to death, has been established, can you identify clinical circumstances where the client might be deprived of the right to die?

State regulatory boards have initiated laws to protect the public when dealing with issues of death. It is usually within the scope of practice of medicine to pronounce a client dead. However, some boards of nursing allow the nurse, in certain circumstances and with thorough documentation, to make a determination and pronouncement of death (Bosna, 1995; State of Alaska, 1994). Because state laws vary concerning this issue, it is important for the registered nurse to know the laws in the state(s) or province(s) of licensure.

Care of the Deceased

When a client dies, the nurse is obligated to treat the deceased with respect and dignity. The nurse should prepare the body for removal to the morgue in accord with

agency policies. The nurse is responsible for properly identifying the body. In *Lott v. State (1962)*, a nurse mislabeled two bodies, causing a Roman Catholic to be prepared for an Orthodox Jewish burial, and an Orthodox Jew to be prepared for a Roman Catholic burial; the court found the nurse liable (Goldberg et al, 1996).

Organ Donation

All 50 states have adopted the Uniform Anatomical Gift Act for cadaveric organ donation. In the United States and Canada, any person 18 or older may become an organ donor by written consent. In the absence of appropriate documentation, a family member or legal guardian may authorize donation of the organs. Nurses and other caregivers are expected to approach families for organ donation in the absence of documentation of the client's wishes. Consent for an organ donation requires the collaborative efforts of the nurse with physicians, social workers, and clergy to ensure timely removal of the organ(s).

Autopsies

An autopsy is performed to determine the *cause of death*. Autopsy results are used in cases of suspicious death or the presence of communicable disease. The cause of death also has implications regarding payment from insurance policies and worker's compensation.

Autopsy cases are the most frequent cause of litigation involving dead bodies and hospitals (Roach, 1994). A few states require the consent in writing, whereas other states accept telegrams or documented telephone conversations. Regardless of how the consent is obtained, the physician must document that the consent was obtained and identify in the client's record who authorized the autopsy. In some states, the consent for an autopsy is not required in unwitnessed deaths because this situation requires a mandatory autopsy. The nurse has the responsibility for ensuring that all documentation is in place before releasing the body for autopsy.

KEY CONCEPTS

- Laws define and limit relationships among individuals and the government.
- The three sources of public law at the federal and state levels are constitutional law, administrative law, and criminal law.
- Administrative law empowers state boards of nursing to protect the public by regulating the scope of nursing practice.
- The three sources of civil law at the federal and state levels are contract law, tort law, and protective/reporting laws.

- A nurse employed by a health care facility is legally responsible for the terms of a implied contract.
- The two types of tort law at the state level are unintentional torts, which include negligence and malpractice, and intentional torts, which include assault and battery, false imprisonment, invasion of privacy, defamation, and fraud.
- Protective/reporting laws such as The Americans with Disabilities Act and Good Samaritan acts protect a designated group of individuals.
- The legal responsibilities of the nurse, defined in practice acts and standards of care, include elements such as providing services to clients and acting as expert witnesses in malpractice suits.
- Incident reports are filed by the nurse when a situation arises that could or did cause client harm.
- To prevent incurring liability due to the policy of "floating," nurses should set priorities and identify potential areas of harm to the client, receive orientation and cross-training before reassignment and document all pertinent information about client care problems and safety issues.
- Legal instruments such as informed consent and advance directives uphold the right of all people to control decisions relating to their own health care.
- Nurses may witness the signing of a consent form by a client as permitted by institutional policies; however, if the nurse discovers circumstances that render a signed consent form invalid, the nurse should notify the physician and, if necessary, the nurse manager.
- In terms of specific client care issues such as abortion, pronouncement of death, do not resuscitate orders, euthanasia, care of the deceased, wills, organ donation, and autopsies, nurses must know and comply with the existing laws and regulations that pertain to these areas in their individual states and provinces of licensure.

CRITICAL THINKING ACTIVITIES

1. A nurse practice act is an example of:
 - a. Public law
 - b. Civil law
2. Which type of law authorizes state boards of nursing to regulate nursing practice?
 - a. Constitutional
 - b. Administrative
 - c. Criminal
 - d. Protective/reporting
3. List the three essential elements of a legal contract.
4. Identify the types of intentional torts.
5. What are the four elements that must be proven by the plaintiff in a malpractice case?
6. Discuss the relationship of the reasonable person standard in relation to professional standards of practice.
7. Identify common acts of commission and omission that lead to nursing malpractice complaints.

8. List the actions or omissions by the nurse that constitute unprofessional conduct.
9. What are the legal responsibilities of nursing students when employed as caregivers?
10. A competent, depressed client clearly refuses an enema. The nurse gently turns the client on his side and administers the enema. The client becomes upset and telephones his son; within 30 minutes from the telephone call, the client is transferred to the coronary care unit and is diagnosed with a heart attack. The client's son initiates malpractice action against the nurse in behalf of his father. The nurse is found liable for assault and battery. Why?

Chapter 24

Ethical Obligations and Accountability

[If] there were none who were discontented with what they have, the world would never reach for anything better.

—F. Nightingale

COMPETENCIES

1. Explain the relationship between ethics and law.
2. Discuss the ethical theories of teleology and deontology.
3. Describe the major ethical principles that affect health care.
4. Explain the link between ethics and values.
5. Relate the ethical codes developed by the International Council of Nurses, the American Nurses Association, and the Canadian Nurses Association to daily nursing practice.
6. Identify the rights of the client as established by the American Hospital Association.
7. Apply the steps identified in the framework for ethical decision making to issues such as euthanasia, refusal of treatment, and utilization of scarce resources.
8. Discuss the roles of the nurse as client advocate and whistle-blower in the delivery of ethical nursing care.

KEY
TERMS

active euthanasia
 assisted suicide
 autonomy
 beneficence
 bioethics
 categorical imperative
 client advocate
 deontology
 ethical dilemma

ethical principles
 ethical reasoning
 ethics
 euthanasia
 fidelity
 justice
 material principle of justice
 morality
 nonmaleficence

passive euthanasia
 paternalism
 teleology
 utility
 values
 values clarification
 veracity
 whistle-blowing

Every day, nurses encounter situations in which they must make decisions based on the determination of right and wrong. How do they make such decisions? Which values determine the rightness of an action?

The delivery of ethical health care is becoming an increasingly difficult and confusing issue in contemporary society. Nurses are committed to maintaining clients' rights in terms of the provision of information about health care and treatment. This desire to maintain clients' rights, however, often conflicts with professional duties and institutional policies. It is essential to balance these two perspectives so that the primary objective, delivery of quality care, is achieved.

In considering the situations presented throughout this chapter, realize that there are no absolute right answers. Dealing with the gray areas (ambiguities) causes discomfort for some nurses. Unlike mathematics or other empirical sciences, there are no apparent absolute rules governing ethics. Scientists can say for certain that two plus two always equals four—regardless of the time factors, circumstances, feelings, or beliefs of those involved in the calculations. Ethical rules are less clear, and difficult or impossible to prove (Burkhardt & Nathaniel, 1998, p. 25). Because clients and nurses are humans, no two situations can ever be exactly alike. This chapter explores the concept of ethics, ethical theories and principles, values and ethics, ethical codes, ethical decision-making, and the application of ethical guidelines to nursing practice.

CONCEPT OF ETHICS

Ethics is the branch of philosophy that examines the differences between right and wrong. Simply put, ethics is the study of the rightness of conduct. Ethics deals with one's responsibilities (duties and obligations) as defined by logical argument. Ethics looks at human behavior—what people do under what type of circumstances. But ethics is not merely a philosophical discussion; ethical persons put their beliefs into action.

Often the term *morals* is mistakenly used when ethics is meant. **Morality** is behavior in accordance with custom or tradition and usually reflects personal or religious beliefs. An example of a moral belief is a person's

desire to maintain his or her right to die. Ethics is the free, rational, and publicly stated assessment of alternative actions in relation to theories, principles, and rules. Ethics is rooted in the legal system and reflects the political values of our society. An example of an ethical belief is the practice of parents' teaching their children the importance of telling the truth.

Relationship between Legal and Ethical Concepts

There is a connection between acts that are legal and acts that are ethical. Sometimes, it is difficult to separate legalities from ethics (see Chapter 23 for discussion about the legal responsibilities of nurses). There are some legal acts that are considered to be unethical and vice versa. According to Burkhardt and Nathaniel (1998), the following contribute to the occasional discrepancies between law and ethics:

- Ethical opinions reflect individual differences.
- Human behavior and motivation are too complex to be accurately reflected in law.
- The legal system judges action rather than intention.
- Laws change according to social and political influences.

Professional nursing actions are both legal and ethical.

THINK ABOUT IT

Legal and Ethical Concepts

Which of the following behaviors is (or are) ethical and illegal? Legal and unethical? Illegal and unethical? Legal and ethical?

- Working in a clinic that performs abortions
- Honoring a terminally ill client's request to have "no heroic" actions taken
- Discontinuing a comatose client's life support at the request of the family
- Diverting medications from a client for your own use

Ethics in Health Care

The application of general ethical principles to health care is referred to as **bioethics**. Ethics affects every area of health care, including direct care of clients, allocation of finances, and utilization of staff. Ethics does not provide easy answers, but it can help provide structure by raising questions that ultimately lead to answers.

Ethics is exerting an ever-increasing influence on health care today. Several factors contribute to an increased need to provide health care in an ethical manner. Some of these factors are:

1. An increasingly technological society. The nature of advanced technology creates situations that involve complicated issues that never had to be considered before. As a result of technological advances:
 - Many newborns are surviving at earlier gestational ages, and many of them have serious health problems.
 - People are living much longer than ever before.
 - Organ transplants and the use of bionic body parts are becoming more common.
2. The changing fabric of our society. Family structure is moving from extended families to nuclear families, single-parent families, and nonrelated groups living together as families.
3. Clients are becoming more knowledgeable about their health and health-related interventions. As consumer demand for information increases, health care providers must adapt quickly. The result is a focus on the consumer-driven system.
4. The proportion of total federal funds allocated for health care is continually decreasing.

Nurses face situations in which they must make decisions that transcend technical and professional concerns. These situations may or may not be life-threatening. “Too often, the ‘smaller,’ more common conflicts, such as how to determine whether a patient’s refusal of treatment is informed or how to effectively advocate on a patient’s behalf, get less attention” (Kennedy-Schwarz, 2000, p. 71) than the life-or-death issues revolving around imminent death. Such situations raise complex problems that cannot be answered completely with technical knowledge

and professional expertise. Technological advances have created unprecedented choices, not only for society at large, but specifically for clients and nurses.

There is emphasis on ethical issues involving life-or-death situations. However, nurses daily encounter challenges about what *ought* to be done, even in the most ordinary circumstances. The accompanying display lists ethical dilemmas that commonly occur in nursing practice. The way in which nurses relate to clients, families, and other health care providers is the true demonstration of ethical behavior.

ETHICAL THEORIES

Ethical theories were debated by ancient philosophers such as Plato and Aristotle, and the debate continues today. No theory in and of itself can provide the “correct” answer to any single ethical conflict. Ethical theories can be used as a way to analyze ethical problems.

Teleology

Teleology is the ethical theory stating that the value of a situation is determined by its consequences. Thus, the outcome of an action—not the action itself—is the criterion for determining the goodness of that action. This theory (also called the consequentialist theory) was advocated by the philosopher John Stuart Mill. The principle of **utility** is a basic concept of teleology; utility states that an act must result in the greatest amount of good for the greatest number of people involved in a situation. “Good” refers to positive benefit. Any act can be ethical if it delivers “good” results. Every alternative is assessed for its potential outcomes, both positive and negative. The selected action is the one that results in the most benefits and the least amount of harm for all those involved.

Deontology

Deontology is the ethical theory that considers the intrinsic significance of the act itself as the criterion for determination of good. That is, in determining the ethics of a situation, a person must consider the motives of the actor, not the consequences of the act.

This theory (also called formalism) was postulated by the philosopher Immanuel Kant. Kant established the concept of the **categorical imperative**, which states that one should act only if the action is based on a principle that is universal (everyone would act in the same way in a similar situation). The categorical imperative also mandates that a person should never be treated as a means to an end. Adherence to this concept may pose an ethical concern to health care researchers, who sometimes may risk the well-being of a person participating in an experimental procedure

FREQUENTLY OCCURRING ETHICAL DILEMMAS

- Informed consent
- Refusal of treatment
- Use of scarce resources
- Cost-containment initiatives that negatively affect client well-being
- Incompetent health care providers

for the sake of finding a drug that will save many from suffering.

ETHICAL PRINCIPLES

Ethical principles are tenets that direct or govern actions. They are widely accepted and generally are based on the humane aspects of society. Ethical decisions are principled; that is, they reflect what is best for the client and society. Table 24-1 summarizes the major ethical principles. Each principle is discussed in detail in the following paragraphs.

By applying ethical principles, nurses become more systematic in solving ethical conflicts. Ethical principles can be used as guidelines in analyzing dilemmas; they can also serve as a justification (rationale) for the resolution of ethical problems. Remember that these principles are not absolute; there can be exceptions to each principle in any given situation.

Autonomy

The principle of **autonomy** refers to the individual's right to choose and the ability to act on that choice. The individuality of each person is respected when autonomy is maintained. This respect for personal liberty is a dominant value in American society.

Nurses must respect clients' right to decide and protect those clients who are unable to decide for themselves. The ethical principle of autonomy reflects the belief that every competent person has the right to determine his or her own course of action. The right to free choice rests on the client's competency to decide.

Informed consent is based on clients' right to decide for themselves. Upholding autonomy means that the

nurse accepts the client's choices, even when those choices are not in the client's best interests. Following are examples of clients' autonomous behavior that can impair recovery or treatment:

- Smoking after a diagnosis of emphysema or lung cancer
- Refusing to take medication
- Continuing to drink alcohol when one has cirrhosis
- Refusing to receive a blood transfusion because of religious beliefs

The Patient Self-Determination Act of 1990 was legislated to ensure that clients have the right to make their own health care decisions. Based on the principle of autonomy, this act requires that every person admitted to a health care facility be informed of the right to self-determination. The client's directives then need to be communicated and documented.

Nonmaleficence

Nonmaleficence is the duty to cause no harm to others. Harm can take many forms: physiological, psychological, social, spiritual. Nonmaleficence refers to both actual harm and the risk of harm. The principle of nonmaleficence helps guide decisions about treatment approaches; the relevant question is "Will this treatment modality cause more harm or more good to the client?" Determining whether technology is harmful to the client is not always a clear-cut decision. Factors to consider include:

- The treatment must offer a reasonable prospect of benefit.
- It must not involve excessive expense, pain, or other inconvenience.

TABLE 24-1
Overview of Ethical Principles

Principle	Explanation
Autonomy	Respect for an individual's right to self-determination; respect for individual liberty
Nonmaleficence	Obligation to do or cause no harm to another
Beneficence	Duty to do good to others and to maintain a balance between benefits and harms
Justice	Equitable distribution of potential benefits and risks
Veracity	Obligation to tell the truth
Fidelity	Duty to do what one has promised

THINK ABOUT IT

Nonmaleficence

Weighing the potential benefit and harm of treatment approaches is value-laden. At what point does pain, inconvenience, or expense become excessive? Who determines excessiveness? Is the result of a therapy that will prolong the client's life a benefit or a burden? Who determines what is an acceptable and what is an unacceptable quality of life?

Nonmaleficence requires that the nurse act thoughtfully and carefully, weighing the potential risks and benefits of research or treatment. Sometimes it is easier to weigh the risk than to measure the benefit. It is possible to violate this principle without acting maliciously and without ever being aware of the harm.

Nonmaleficence is considered a fundamental duty of health care providers. Both the Nightingale Pledge and the Hippocratic Oath state that providers are to cause no harm to clients. Some clinical examples of non-maleficence are:

- Preventing medication errors (including drug interactions)
- Being aware of potential risks of treatment modalities
- Removing hazards (e.g., obstructions that might cause a fall)

When upholding the principle of nonmaleficence, the nurse practices according to professional and legal standards of care. The question most frequently asked in court of a nurse is “Did you cause any harm?”

Beneficence

Beneficence is the ethical principle that means the duty to promote good and to prevent harm. There are two elements of beneficence:

1. Providing benefit
2. Balancing benefits and harms

One undesirable outcome of beneficence is **paternalism**, an occurrence in which health care providers decide what is “best” for clients and then attempt to coerce (or “encourage”) them to act against their own choices. Paternalistic health care providers treat competent adults as if they are children who need protection.

THINK ABOUT IT

Paternalism

Listen to the messages communicated to clients by health care professionals. What comments can you think of that would be considered paternalistic? Would you consider the following comments to be paternalistic? Why?

- “Just follow the doctor’s orders and everything will be OK.”
- “We know what’s best for you, trust us.”
- “This is for your own good.”

Paternalism is usually not considered an ethical approach. However, in some situations paternalism may be advisable. For example, when prevention of harm overrides the loss of individual freedom and when an individual’s ability to choose is limited by incompetency, paternalism may be justified.

Justice

The principle of **justice** is based on the concept of fairness. The major health-related issues of justice involve

fair treatment of individuals and allocation of resource distribution. Justice considers action from the point of view of the least fortunate in society. As a result of equal and similar treatment of people, benefits and burdens are distributed equally.

The ethical principle of justice requires that all people be treated equally unless there is a justification for unequal treatment. The **material principle of justice** is the rationale for determining when there can be unequal allocation of scarce resources. This concept specifies that resources should be allocated:

- Equally
- According to need
- According to individual effort
- According to the individual’s merit (ability)
- According to the individual’s contribution to society

An application of the material principle of justice is the Department of Veteran Affairs (VA). Individuals who gave to their country by serving in the military are eligible to receive health care through the VA in ambulatory, acute care, and psychiatric facilities.

According to the American Nurses Association (ANA) (1991), there are three types of actions considered to be unjust:

- Discrimination or arbitrarily unequal treatment in enforcing policies/rules
- Exploiting (taking unfair advantage of) another
- Making unfair (false or derogatory) remarks about others

In health care institutions, the principle of justice is being strenuously tested on the issue of allocation of one important resource: nursing personnel. Many institutions and agencies are downsizing their professional staff as a cost-containment measure. As a result, some health care facilities are so poorly staffed or have such a high ratio of underqualified personnel providing care that quality care is being sacrificed. “Some 72% of the respondents report that the quality of care at their hospital has deteriorated over the past year because of cost-containment decisions” (Wolfe, 1999, p. 28).

The principles of justice and beneficence often conflict. For example, should federal funds be spent on a costly transplant that will benefit only one Medicaid recipient, or should the funds be spent on less expensive measures that would prevent disease in many (e.g., immunizations)?

Veracity

Veracity means truthfulness, neither lying nor deceiving others. Deception can take many forms: intentional lying, nondisclosure of information, or partial disclosure of information. Veracity often is difficult to achieve. It may not be hard to tell the truth, but it can be very hard to decide how much truth to tell.

THINK ABOUT IT

Veracity

- Is honesty always the best policy?
- Is withholding information the same as lying?
- Can you ethically justify withholding information?
- Can you ethically justify telling white lies?

Fidelity

The concept of **fidelity** (which is the ethical foundation of nurse-client relationships) means faithfulness and keeping promises.

Clients have an ethical right to expect nurses to act in their best interests. As nurses function in the role of **client advocate** (a person who speaks up for or acts on behalf of the client), they are upholding the principle of fidelity. Fidelity is demonstrated when nurses:

- Represent the client's viewpoint to other members of the health care team
- Avoid letting their own personal values influence their advocacy for clients
- Support the client's decision even when it conflicts with the nurse's preferences or choices

THINK ABOUT IT

Client Advocate

A 15-year-old girl visits a family planning clinic because she suspects she is pregnant. Her suspicion is confirmed after an examination. She informs the nurse practitioner that she wants an abortion and she refuses to tell her parents about this situation. In considering this dilemma, keep in mind that the client is a minor. What are the ethical obligations of the nurse practitioner? Do the ethical obligations coincide or conflict with the legal responsibilities? How would you resolve this conflict?

VALUES AND ETHICS

The close relationship between ethics and values both illuminates and complicates the nurse's approach toward balancing the principles of health care delivery with those of the client. Nurses need to examine their own value systems in order to determine the best approach in managing the care of clients whose values differ. In order to practice ethically, nurses must understand the impact of their own values. **Values** influence the development of beliefs and attitudes and thus affect behaviors indirectly. Almost nothing in life is value-free, even though individuals often fail to consider the

impact of values on decisions and resultant behaviors. Values are similar to breathing; you don't think about it until there's a problem.

Nurses often care for clients whose value systems conflict with theirs. Determining what is meaningful to the client is based on an understanding of the client's value system. The nurse's values can become problematic when they conflict with the values of clients.

Values Clarification

Through values clarification, a nurse can increase self-awareness and become better able to care for people with different values. **Values clarification** is the process of analyzing one's own values to better understand what is truly important. In their classic work *Values and Teaching*, Raths, Harmin, and Simon (1978, p. 47) formulated a theory of values clarification and proposed a three-step process of valuing, as follows:

1. *Choosing*: Beliefs are selected freely (that is, without coercion) from among alternatives. The choosing step involves analysis of the consequences of various alternatives.
2. *Prizing*: The beliefs that are selected are cherished (prized).
3. *Acting*: The selected beliefs are demonstrated consistently through behavior.

Nurses must understand that values are individual rather than universal; therefore, nurses should not impose their own values on clients. The provision of ethical nursing care is directly related to one's values. For example, the nurse who strongly values the sanctity of life may experience an ethical conflict when caring for a terminally ill client who refuses treatment that may extend life for a short time.

ETHICAL CODES

One hallmark of a profession is the determination of ethical behavior for its members. According to Sills (2000):

... the profession has certain obligations to the society: to do no harm, to be proficient in one's work, to behave and reason with high moral and ethical standards, to control the entrance of a person to the professional ranks, to discipline professionals who fail to meet acceptable standards, and to use its knowledge to treat people in need and to teach the public what it needs to know for self-care. (p. 30)

Several nursing organizations have developed codes as guidelines for ethical conduct. In its 1973 Code for Nurses, the International Council of Nurses (ICN)

AMERICAN NURSES ASSOCIATION CODE FOR NURSES

1. The nurse provides services with respect for human dignity and the uniqueness of the client, unrestricted by considerations of social or economic status, personal attributes, or the nature of health problems.
2. The nurse safeguards the client's right to privacy by judiciously protecting information of a confidential nature.
3. The nurse acts to safeguard the client and the public when health care and safety are affected by the incompetent, unethical, or illegal practice of any person.
4. The nurse assumes responsibility and accountability for individual nursing judgments and actions.
5. The nurse maintains competence in nursing.
6. The nurse exercises informed judgment and uses individual competence and qualifications as criteria in seeking consultation, accepting responsibilities, and delegating nursing activities to others.
7. The nurse participates in activities that contribute to the ongoing development of the profession's body of knowledge.
8. The nurse participates in the profession's efforts to implement and improve standards of nursing.
9. The nurse participates in the profession's efforts to establish and maintain conditions of employment conducive to high-quality nursing care.
10. The nurse participates in the profession's effort to protect the public from misinformation and misrepresentation and to maintain the integrity of nursing.
11. The nurse collaborates with members of the health professions and other citizens in promoting community and national efforts to meet the health needs of the public.

(Reproduced with permission from the American Nurses Association. [1985]. *Code for nurses, with interpretive statements*. Kansas City, MO: Author.)

CANADIAN NURSES ASSOCIATION CODE OF ETHICS FOR NURSING*

Clients

- I. A nurse treats clients with respect for their individual needs and values.
- II. Based upon respect for clients and regard for their right to control their own care, nursing care reflects respect for the right of choice held by clients.
- III. The nurse holds confidential all information about a client learned in the health care setting.
- IV. The nurse is guided by consideration for the dignity of clients.
- V. The nurse provides competent care to clients.

Nursing Roles and Relationships

- VI. The nurse maintains trust in nurses and nursing.
- VII. The nurse recognizes the contribution and expertise of colleagues from nursing and other disciplines as essential to excellent health care.
- VIII. The nurse takes steps to ensure that the client receives competent and ethical care.
- IX. Conditions of employment should contribute in a positive way to client care and the professional satisfaction of nurses.
- X. Job action by nurses is directed toward securing conditions of employment that enable safe and appropriate care for clients and contribute to the professional satisfaction of nurses.

Nursing Ethics and Society

- XI. The nurse advocates the interests of the clients.
- XII. The nurse represents the values and ethics of nursing before colleagues and others.

The Nursing Profession

- XIII. Professional nursing organizations are responsible for clarifying, securing, and sustaining ethical nursing conduct. The fulfillment of these tasks requires that professional nurses' organizations remain responsive to the rights, needs, and legitimate interests of clients and nurses.

*This represents only one element of the code of values. For each value noted, the CNA Code of Ethics for Nursing provides obligations that provide more specific direction for conduct. In two instances, limitations are also listed that describe exceptional circumstances in which a value or obligation cannot be applied.

(Reproduced with permission from the Canadian Nurses Association. [1991]. *Code of ethics for nursing*. Ottawa: Author.)

states: “The nurse, in providing care, promotes an environment in which the values, customs, and spiritual beliefs of the individual are respected.”

The ANA has also established a code for ethical conduct (see the accompanying display). The ANA Code of Ethics spells out the nurse’s obligations to clients and society at large. “A code of ethics indicates a profession’s acceptance of the responsibility and trust with which it has been invested by society” (American Nurses Association, 1985, p. 1). The ethical code, which provides broad principles for determining and evaluating nursing care, is not legally binding for registered nurses. In most states, however, the Board of Nursing has authority to reprimand nurses for unprofessional conduct that results from violation of the ethical code.

The Canadian Nurses Association (CNA) developed a code of ethics in 1980 and revised it in 1991 (see the accompanying display). The CNA code serves as a guide for professional nursing actions.

CLIENTS’ RIGHTS

The concept of rights is often misused, overused, and abused. Our society tends to take rights for granted; rights and obligations are culturally defined. The dominant American society has an ethnocentric perspective in believing that its rights and values are shared globally.

Clients have certain rights including, but not limited to, the right to

- Make decisions regarding their care
- Be actively involved in the treatment process
- Be treated with dignity and respect

These rights apply to all clients regardless of the setting for delivery of care. For example, during the initial assessment, the home health nurse discusses these rights with the client.

When clients are admitted to short-term acute care agencies or extended care facilities, they are also entitled to certain rights. In 1972, the American Hospital Association (AHA) established a *Patient’s Bill of Rights*, which includes the rights and responsibilities of clients receiving care in hospitals. This document was revised in 1992 (see the accompanying display). The *Patient’s Bill of Rights* increases health care providers’ awareness of the need to treat clients in an ethical manner and encourages all health care providers to protect the rights of clients.

ETHICAL DILEMMAS

An **ethical dilemma** occurs when there is a conflict between two or more ethical principles. Ethical dilemmas are situations of conflicting requirements in that

there is no right or wrong option. The most beneficial decision depends on the circumstances. When an ethical dilemma occurs, the nurse must make a choice between two alternatives that are equally unsatisfactory. Ethical analysis is not an exact science. In some cases, even after a dilemma seems to have been resolved, questions remain. This ambiguity makes it emotionally painful for the persons involved. The emotional discomfort is often a result of the nurse’s trying to second-guess the decision and may lead to such self-messages as “If only I had done this” or “Maybe I should have . . .”

THINK ABOUT IT

Ethical Conflicts

As a nurse, you will often be caught in a dilemma involving what you *ought* to do (on the basis of one ethical principle) and what you *ought not* to do (on the basis of another principle). For example, should you tell a client who has been diagnosed as having breast cancer the complete truth about the diagnosis, or should you soft-pedal the bad news because it might result in loss of hope? The dilemma is a conflict between the principles of veracity and nonmaleficence. Also, the principle of autonomy is violated. Not telling denies the client the right to make an informed choice.

ETHICAL DECISION MAKING

Nurses must understand the basis on which they make their decisions. **Ethical reasoning** is the process of thinking through what one ought to do in an orderly, systematic manner to provide justification of actions based on principles. Ethical decisions cannot be based entirely on intuition or emotions. Ethical decision making is used in situations in which the right decision is not clear or in which there are conflicts of rights and duties. A framework for resolving ethical dilemmas follows.

Framework for Ethical Decision Making

Once an ethical dilemma is identified, the nurse must determine the relevant parts of the conflict in order to resolve it. When making an ethical decision, the nurse must consider the following relevant parts:

- Which theories are involved?
- Which principles are involved?
- Who will be affected?
- What will be the consequences of the alternatives (ethical options)?

A PATIENT'S BILL OF RIGHTS

Bill of Rights

1. The patient has the right to considerate and respectful care.
2. The patient has the right to and is encouraged to obtain from physicians and other direct caregivers relevant, current, and understandable information concerning diagnosis, treatment, and prognosis.
3. The patient has the right to make decisions about the plan of care prior to and during the course of treatment and to refuse a recommended treatment or plan of care to the extent permitted by law and hospital policy and to be informed of the medical consequences of this action.
4. The patient has the right to have an advance directive (such as a living will, health care proxy, or durable power of attorney for health care) concerning treatment or designating a surrogate decision maker with the expectation that the hospital will honor the intent of that directive to the extent permitted by law and hospital policy.
5. The patient has the right to every consideration of privacy.
6. The patient has the right to expect that all communications and records pertaining to his/her care will be treated as confidential by the hospital, except in cases such as suspected abuse and public health hazards when reporting is permitted or required by law.
7. The patient has the right to review the records pertaining to his/her medical care and to have the information explained or interpreted as necessary, except when restricted by law.
8. The patient has the right to expect that, within its capacity and policies, a hospital will make reasonable response to the request of a patient for appropriate and medically indicated care and services.
9. The patient has the right to ask and be informed of the existence of business relationships among the hospital, educational institutions, other health care providers, or payers that may influence the patient's treatment and care.
10. The patient has the right to consent to or decline to participate in proposed research studies or human experimentation.
11. The patient has the right to expect reasonable continuity of care when appropriate and to be informed by caregivers of available patient care options.
12. The patient has the right to be informed of hospital policies and practices that relate to patient care, treatment, and responsibilities. The patient has the right to be informed of available resources for resolving disputes, grievances, and conflicts. The patient has the right to be informed of the hospital's charges for services and available payment methods.

(Data from American Hospital Association. [1992]. *A patient's bill of rights*. Chicago: The Association.)

To resolve ethical dilemmas, the nurse must be able to make decisions in a systematic fashion. Figure 24-1 illustrates a method for making ethical judgments that uses steps similar to those of the nursing process.

The first step of ethical analysis is to gather relevant data in order to identify the problem. Determine what type of ethical problem exists: Do principles conflict with principles? Do actions conflict with actions? Do actions conflict with principles?

Next, consider all the people involved. What are their rights, responsibilities, duties, and decision-making abilities? Who is the most appropriate person to make the decision? It is important to identify several possible alternatives and predict the outcome of each. Then, and only then, select a course of action—one that, it is hoped, ends in resolution of the problem. The final step of ethical decision making is evaluation of the resolution process. Consider the following two issues: euthanasia and refusal of treatment.

Euthanasia

Most people hope to experience a peaceful gentle death when their “time comes.” The word **euthanasia** comes from the Greek word *euthanatos*, which literally means

“good, or gentle, death.” In current times, *euthanasia* refers to mercy killing (deliberate ending of life as a humane action).

Active euthanasia refers to taking deliberate action that will hasten the client's death. In contrast, **passive euthanasia** means cooperating with the client's dying process. Passive euthanasia is the omission of an action that would prolong dying.

THINK ABOUT IT

Ethical Debate: Euthanasia

What does the phrase “good death” mean to you? For some people, it means:

- Dying with dignity
- Being pain-free
- Dying in the company of loved ones and friends

To others, dying a good death means:

- Being at home
- Determining when death will occur (maintaining control)

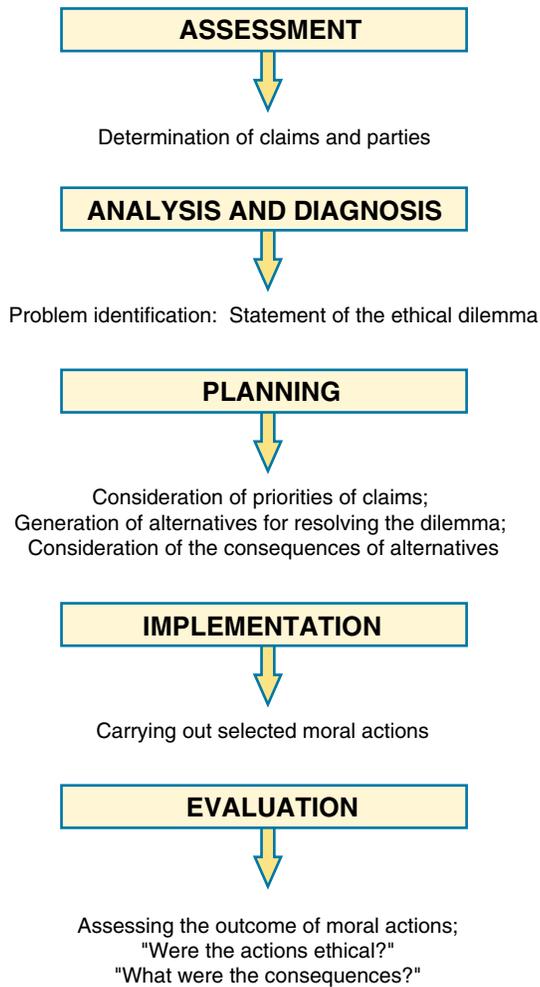

Figure 24-1 Ethical Decision-Making Model

Assisted suicide is a form of active euthanasia in which a health care professional provides a client with the means to end his or her own life. Recently, physician-assisted suicide has been the topic of much controversy. Nurses have differing opinions regarding assisted suicide. Some view it as a violation of the ethical principles upon which the practice of nursing is based: autonomy, nonmaleficence, beneficence, justice, veracity, and fidelity. Other nurses view assisted suicide as a humane act. Regardless of a nurse's personal viewpoint, assisted suicide is still illegal except in Oregon, the only state that has designated assisted suicide as a legal action. Other nurses may see assisted suicide as an ethical dilemma; they agree that it violates some ethical principles but question whether it violates others. For example, does assisted suicide violate the principle of autonomy? From one standpoint, it is *refusal* to assist a suicide that violates a client's autonomy. In its Position Statement on Active Euthanasia, the ANA (1994) states that participation in active euthanasia violates nursing's ethical code.

Refusal of Treatment

The client's right to refuse treatment is based on the principle of autonomy. In fairness, the client can refuse

only after the treatment methods and their consequences have been explained. A client's right to refuse treatment and the right to die challenge the values of most health care providers.

Consider the use of ventilators. Medical technology makes it possible for clients to continue breathing as long as they are connected to a machine; without the machine, these clients would die. But what are the costs—emotional, physical, psychological, and fiscal? And what is the quality of a life prolonged by technology?

RESEARCH FOCUS

Title of Study

"A Phenomenologic Study of the Interface of Caring and Technology in Intermediate Care: Toward a Reflexive Ethics for Clinical Practice"

Author

Ray, M. A.

Purpose

To determine the meaning of the experience of caring for technologically dependent clients.

Methods

Twelve critical care nurses participated in a phenomenologic study of the meaning of caring. Participant narratives were analyzed to determine the meaning of caring for clients in a technologically driven care unit.

Findings

The sample narratives demonstrate an ethical crisis in an intermediate care unit. Participants expressed their own suffering and vulnerability in relation to ethical conflicts. The vulnerability expressed was in relation to a feeling of being "overwhelmed to the last degree." Nurses felt disillusioned but not indifferent.

Implications

The findings of this study suggest that attention should focus on the following areas: interdisciplinary continuing education, interdisciplinary support groups for nurses and physicians, mentorship programs for staff and families, and research about reflexive ethics in health care.

Ray, M. A. (1998). A phenomenologic study of the interface of caring and technology in intermediate care: Toward a reflexive ethics for clinical practice. *Holistic Nursing Practice*, 12(4), 69–77.

Scarce Resources

With the current emphasis on containing health care costs, the use of expensive services is being examined closely. The use of specialists, organ transplants, and distribution of services is being influenced by social and political forces. For example, the length of stay in a hospital and the number of office visits allowable for individual clients are already predetermined by many third-party payers. In addition to economics, the availability of goods (such as organs) is contributing to a scarcity of resources. In many situations, clients experience extended waiting periods before receiving a donated organ. The allocation of scarce resources is emerging as a major ethical dilemma in today's health care environment. "When nursing care is viewed as a kind of commodity or resource, it must be distributed fairly and equitably to meet the needs of a population group" (American Nurses Association, 1991, p. 2).

THINK ABOUT IT

Allocation of Scarce Resources

The following two people are in desperate need of a liver transplant:

- A 62-year-old alcoholic who is destitute and has no family
- A 24-year-old mother of three young children

One liver is available. In your opinion, who should get the liver? What influenced your decision?

Our population is living longer, giving rise to increases in the demand for services. As improvements in health care technologies lead to further declines in mortality, the number of Americans with disabilities and functional restrictions will increase, as will the number with chronic, irremediable conditions. As costs increase, so too will the demand to contain costs. . . . We are spending more on health care than any other industrialized country but providing less coverage for our citizens. (Koloroutis & Thorstenson, 1999, p. 9–10)

As the above quotation illustrates, something must be done about the way in which health care resources are used.

ETHICS AND NURSING

As professionals, nurses are accountable for protecting the rights and interests of the client. Consequently, sound nursing practice involves making ethical deci-

sions. Ethics affects nurses in every health care setting, and each practice setting presents the nurse with its own set of ethical concerns. For example, consider home health nursing. With the increased acuity level of clients cared for in the home setting, home health nurses face ever-increasing ethical challenges of continuing to provide quality care under federally mandated cost-containment initiatives.

Whatever the setting, nurses need to balance their ethical responsibilities to each client with their professional obligations. Often there is an inherent conflict. The Nursing Checklist provides guidelines for promoting ethical care.

NURSING CHECKLIST

Providing Ethical Care

- Initiate dialogue concerning the client's wishes. Do more listening than talking. (For example, the following is a question you might ask to help determine the client's wishes: "If your heart stopped, would you want us to try to start it again?")
- Assess the client's understanding of the illness and available treatment options.
- Allow time for the client to explore values and to communicate.
- Facilitate communication of the client's desires to family and other health care providers

Ethics Committees

The provision of ethical health care requires self-examination of the care provider and the opportunity for dialogue with other health care providers. Many health care agencies now recognize the need for a systematic manner to discuss ethical concerns. Formation of multidisciplinary committees (also referred to as Institutional Ethics Committees) is one approach for facilitating dialogue regarding ethical dilemmas. In addition to serving as a forum where ethical issues are discussed, ethics committees can lead to the establishment of policies and procedures for prevention and resolution of dilemmas.

Nurse As Client Advocate

When acting as a client advocate, the nurse's first step is to develop a meaningful relationship with the client. The primary ethical responsibility is to protect clients' rights to make their own decisions. The nurse who functions as a client advocate is adhering to the ANA Code

of Ethics. Specific examples of advocacy behaviors include empowerment of clients through education, providing support, actively listening to client's concerns, and acting as a liaison between client and other health care providers.

Nurse As Whistle-Blower

The term **whistle-blowing** refers to calling attention to unethical, illegal, or incompetent actions of others. This behavior is based on the ethical principles of veracity and nonmaleficence. Even though nurses are expected to “blow the whistle” on incompetent health care providers, many are reluctant to do so. Why? Because there are inherent risks in whistle-blowing behavior. Haddad (1999) identified some of the questions the person has to consider when deciding to report unethical or incompetent behavior:

- Has the wrongdoing created (or is it likely to create) serious harm?
- Is the nurse competent to make a judgment about the wrongdoing?
- Has all the appropriate information been collected?
- Has the nurse consulted others to confirm the information?
- Have all internal resources been used to resolve the problem?
- Will reporting of the problem likely correct wrongdoing or prevent future harm?
- Is the harm created by the act of whistle-blowing likely to be less than the harm done by the wrongdoing?

Federal law and state laws (to varying degrees) provide protection to whistle-blowers. Unfortunately, however, the inclination to protect one's coworkers and fear of reprisal may deter a nurse from fulfilling the ethical obligation to report substandard behaviors.

THINK ABOUT IT

Whistle-Blowing

A coworker often takes Tylenol from a client's medication drawer. When you confront her about the behavior, she states: “It's only Tylenol. Besides, the patient's not taking it anymore anyway.” Should you blow the whistle? Why or why not? Would your response be different if your coworker were taking narcotics from the client?

KEY CONCEPTS

- Ethics is the study of the rightness of conduct.
- Ethics examines human behavior—what people do under what circumstances.

- Morality is not the same as ethics. Morality is behavior in accordance with custom or tradition and usually reflects personal or religious beliefs.
- There is a connection between acts that are legal and acts that are ethical. Professional nursing actions are both legal and ethical.
- Teleology is an ethical theory that states that the moral nature of a situation is determined by its consequences.
- Deontology is an ethical theory that considers the intrinsic moral significance of the act itself as the criterion for determination of good.
- Ethical decisions are based on principles such as autonomy, nonmaleficence, beneficence, justice, veracity, and fidelity.
- Because ethics and values are closely associated with each other, nurses need to explore their own values in order to acknowledge the sometimes different value systems possessed by their clients.
- Values clarification is a process through which nurses can gain knowledge of their values and apply that understanding to the care of clients.
- Ethical codes that have been developed by nursing organizations such as the International Council of Nurses, the American Nurses Association, and the Canadian Nurses Association establish guidelines for the ethical conduct of nurses with clients, coworkers, society, and the nursing profession.
- The Patient's Bill of Rights is designed to guarantee ethical care of clients in terms of their decision making about treatment choices and other aspects of their care.
- Nurses must apply the process of ethical reasoning to resolve ethical dilemmas in which conflict exists between principles and duties.
- The framework for ethical decision making consists of five steps: assessment, analysis and diagnosis, planning, implementation, and evaluation.
- The roles of client advocate and whistle-blower enable nurses to protect their clients' rights and ensure the ethical and competent actions of their peers within the nursing profession.

CRITICAL THINKING ACTIVITIES

1. Read the American Nurses Association's *Code for Nurses* in this chapter.
 - a. Determine some specific behaviors that you can perform to actualize each tenet of the code.
 - b. Identify the ethical principle(s) upon which each ethical statement is based.
2. Apply the ethical analysis framework to each of the following case situations.

Case Example 1:

Mary Washington delivers a baby with multiple congenital defects. The prognosis is poor; the infant is not expected to live longer than 12

months at most. Mary says, “We can’t afford to pay for the baby’s care.” Who should determine the degree of intervention? Should the cost of care be the foremost basis for the decision?

Case Example 2:

An 80-year-old woman is in a persistent vegetative state as a result of a cardiovascular accident. She has always talked about “someday” signing a living will requesting that heroic measures not be taken. But her family wants “everything to be done that can be done.” Whose wishes should prevail? Can her undocumented statements be legally honored?

3. Read the following situation and determine the ethical ramifications of each scenario. How do your values influence your decisions?
A married couple seek an abortion:
 - Because the wife was raped by a stranger
 - As a birth control measure
 - Because the woman has been told by her doctor that going through another pregnancy will threaten her life
 - To select a female baby because they already have a son
4. Assumption: *The client’s right to privacy and confidentiality must always be upheld by the nurse.* Do you agree? Think about a young sexually active female who is diagnosed as HIV-positive. Your conflict is the client’s right to privacy versus the public’s right to safety. What do you do?
5. Clients have a right to self-determination, even when their decisions result in self-harm.
 - Do you agree with this statement?
 - How will you support a client’s right to refuse treatment?
 - How do you respond to a client’s decision to continue self-harmful practices?

6. Our responses to clients are based on our values. How do your feelings toward people with AIDS (acquired immunodeficiency syndrome) change in the context of values? For example, will your response be the same for all of these clients?
 - A child infected through a contaminated blood transfusion
 - A homosexual male who was infected by a promiscuous partner
 - A female prostitute who became infected by sharing needles with other drug users
7. What impact does the following information have on your provision of professional care?
 - The client is a convicted rapist.
 - The client is homeless.
 - The client is a member of a very wealthy and influential family.
 - The client is a nurse.
 - The client is a physician.

Chapter 25

The Role of Quality Management in Accountability

“If you shut your door to all errors, truth will be shut out.”

—Rabindranath Tagore

COMPETENCIES

1. Discuss the historical development of the quality movement in health care.
2. Describe the nine dimensions of quality performance as identified by the Joint Commission on Accreditation of Healthcare Organizations.
3. Identify factors influencing the quality movement in health care.
4. Discuss the role of law and ethics in quality care.
5. Describe basic principles and concepts of quality improvement.
6. Explain the concept of customer perspective and its relationship to quality management.
7. Discuss the organizational structure and management factors affecting quality improvement.
8. List the steps of the scientific approach used in process improvement.
9. Identify various tools used for quality measurement.
10. Discuss the nurse’s role in quality management.

total quality management

As a result of a global economy, increased competition, and spiraling health care costs, health care organizations must work to continually improve and strive for higher performance. For health care organizations to operate successfully and instill the drive for excellence in each employee, structures must be in place to empower employees to take ownership in their work. A new style of leadership that can facilitate teamwork and process improvement must prevail.

Quality of care, cost, and access are dominant themes in health care delivery. Health care services must be delivered in a manner that increases the likelihood of desired health outcomes and they must be consistent with current knowledge (Joint Commission on Accreditation of Healthcare Organizations [JCAHO], 1999). Nurses, as well as all other health care providers, are accountable for quality care. The challenge for nursing has never been greater as political, economic, and regulatory requirements increase and the demand for quality care intensifies.

This chapter discusses the historical development of quality management in health care and describes the principles that form the basis of quality improvement. It also presents the structure on which quality management programs can be established and explains the mechanisms and tools by which process improvement can be introduced and maintained within health care organizations.

THE QUALITY MOVEMENT IN HEALTH CARE

A quality management system in health care is similar to quality management in other businesses. A brief overview of the development of the quality initiative as it relates to health care is discussed in the following sections.

Evolution

Table 25-1 provides a historical perspective on the development of the quality movement. The American College of Surgeons, established in 1913, was the first organized effort to develop quality standards in health care. This body later established the Hospital Standardization Program, which evolved into today's Joint Commission on the Accreditation of Healthcare Organizations (JCAHO).

Role of the JCAHO in the Quality Movement

Founded in 1951, JCAHO has become the largest accrediting organization in health care today. JCAHO provides standards for hospitals, mental health care facilities, ambulatory care facilities, home health care agencies, and long-term care facilities. Participation in the accreditation process is a voluntary process that is not a condition of licensure but is often a condition for reimbursement by many payers, such as the Federal Health Care Finance Administration (HCFA).

In the 1980s, *quality assurance* was introduced into JCAHO accreditation standards with emphasis on a problem-solving approach. Each department of an organization was monitored and evaluated for service delivery. The 1990s marked a significant change in quality management in health care. There was a shift from departmental review to interdisciplinary performance improvement. This subsequent transition from quality assurance to the current approach of *continuous quality improvement* was derived from quality management in industry. The section entitled Quality Improvement discusses the concepts of quality assurance and continuous quality improvement in more detail.

JCAHO has made the following modifications in their survey process (effective January 2000):

- Random unannounced surveys will be conducted.
- Health care organizations will no longer receive advance notification of impending random surveys.
- The focus and scope of the review during the survey will vary from agency to agency.
- On-site surveys will occur during evenings, nights, and weekends rather than be limited to weekdays (Gropper, 1999).

All of these changes have been made in an attempt to improve the quality of health care delivered in organizations participating in JCAHO's accreditation process.

Defining Quality

Health care has struggled for many years to define and measure quality. **Quality** is defined as meeting or exceeding requirements of the customer/client. A **customer** is anyone who uses the products, services, or processes of an organization. Quality is measured in terms of customer perspective. Clients are concerned with the following:

TABLE 25-1
Historical Development of Quality Movement

Timeframe	Method of Production	Method of Management	Impact on Quality
18th and 19th centuries	Individually built Designed and constructed to last	By example	Nonstandardized High-quality design Individually inspected
Early 20th century	Mass production (assembly line) Designed to wear well	Controller	Standardized Average quality Inspected by supervision
Mid 20th century	Planned obsolescence Automation	Goal setting	Standardized Average quality Inspected through quality control
Late 20th century	High technology Built to last	Collaboration	High quality Inspection in work groups

Fisher, K. (2000). *Leading self-directed work teams: A guide to developing new team leadership skills*. New York: McGraw-Hill.

- Accessibility and availability of service
- Timely and safe delivery of service
- Coordination and continuity of care between services
- Effectiveness of services, that is, the delivery and outcome of care

In its 1998 report, JCAHO identified nine dimensions of quality performance. These dimensions are described in the accompanying display. Basically, a health care organization must be concerned with *doing the right thing* (efficacy, appropriateness) and *doing the right things well* (availability, timeliness, effectiveness, continuity, safety, efficiency, and respect and caring). **Performance improvement** consists of those activities and behaviors that each individual does to meet customers' expectations. It is doing the right thing well and continually striving to do better (JCAHO, 1998).

In measuring quality, there are three domains to measure: structure, process, and outcome. Each of these components is interrelated. The American Nurses Association's (ANA's) *Standards of Clinical Nursing Practice* (1991) uses these three components of care to guide nursing practice within the framework of the nursing process.

Factors Influencing the Quality Movement in Health Care

Today there are many consumers of health care in addition to clients and their families. One major consumer of health care is third-party payers, such as insurance companies, managed care organizations, and federal and state governments. The diversity of needs represented by these consumers requires improvement in health care delivery systems. The major factors that have influenced the development of the quality movement in

DIMENSIONS OF QUALITY PERFORMANCE

- **Efficacy**—degree to which the intervention has been shown to accomplish the intended outcome
- **Appropriateness**—degree to which the intervention is relevant to client needs
- **Availability**—degree to which appropriate interventions are available to meet client needs
- **Timeliness**—degree to which the intervention is provided at the most beneficial time to the client
- **Effectiveness**—degree to which the intervention is provided in the correct manner to achieve the intended client outcome
- **Continuity**—degree to which the interventions are coordinated between organizations, among care providers and across time
- **Safety**—degree to which the risk of an intervention and risk in the environment are reduced for both client and health care provider
- **Efficiency**—degree to which care has the desired effect with the minimum of effort, expense, or waste
- **Respect and caring**—degree to which clients are involved in health care decisions and are treated with sensitivity and respect for their individual needs, expectations, and differences by health care providers

Data from Joint Commission on Accreditation of Healthcare Organizations. (1998). *1999 Accreditation Manual for Hospitals*. Oakbrook Terrace, IL: Author.)

health care are consumer demands, financial viability, professional accountability, regulatory requirements, progress in quality improvement techniques, and changes in health care delivery.

THINK ABOUT IT

Dimensions of Quality Performance

Which of the JCAHO dimensions of quality—efficacy, appropriateness, availability, timeliness, effectiveness, continuity, safety, efficiency, or respect and caring—would be the most important to you as a consumer of health care?

Consumer Demands

Health care consumers are sophisticated, knowledgeable, and selective. Clients no longer place blind trust in their physicians and realize that variables in practice and results occur. Today's consumers negotiate services and compare health care costs among providers.

Financial Viability

Health care has entered an era of increased competitiveness for services, staff, and customers. There is a demand to reduce spending and contain costs. Budgetary constraints continue to increase in both the private and public health sectors. Health care organizations must strive to reduce professional liability, increase reimbursement eligibility, and promote cost effectiveness through increased efficiency.

Professional Accountability

Emphasis on clinician accountability and adherence to codes of ethical practice is increasing. Health care professionals must be dedicated to reducing practice variances to protect the public.

Regulatory Requirements

The Health Care Financing Administration (HCFA) standards, JCAHO standards, and numerous laws require quality improvement programs. HCFA is a subsidiary of the Department of Health and Human Services and is the federal agency responsible for administering the Medicare and Medicaid programs. The regulations established by these organizations for accreditation and reimbursement have facilitated the quality initiative in health care. Such externally mandated regulations have promoted the development of internal monitoring and evaluation systems within health care organizations.

Progress in Quality Improvement Techniques

During the past decade, health care providers have spent valuable resources on defining and measuring quality. As a result, evaluation methodologies have

improved considerably. Information systems are available through which national and regional norms for comparative data can be obtained. Measurability methods have been upgraded and include a variety of process improvement models. **Process improvement** examines the flow of client care between departments to ensure that the processes work as they were designed and that acceptable levels of performance are achieved. Seminars, workshops, videotape training programs, and educational consultants are now available to teach process improvement in health care. Overall quality improvement methodologies enhance performance and work processes.

Changes in Health Care Delivery

Significant changes in health care delivery have occurred and unprecedented change is anticipated in the future. Clients being admitted to hospitals today are sicker, yet are being discharged more quickly. Alternative care options such as home health care, in-home intravenous therapy, and intermediate care facilities have proliferated, resulting in an even greater need to coordinate a continuum of services.

Factors that have influenced the quality movement in health care have also protected those populations most vulnerable to inadequate health care; for example, the uninsured, the elderly, and low-income families. The quality movement has promoted access to care, standards of care, cost-effective service, and a continuum of care. Thus, the quality movement in health care has served as an advocate for consumers.

THINK ABOUT IT

Factors Influencing the Quality Movement

Which factors—consumer demands, financial viability, professional accountability, regulatory requirements, progress in quality improvement techniques, or changes in health care delivery—do you think have had the greatest impact on the quality movement? Why?

Legal and Ethical Implications

Nurses, as well as other health care providers, must understand the roles that law, regulations, and ethics play in the quality movement. These aspects define professional practice. Laws define legal practice, regulations define guidelines for delivery of care, and ethics define personal performance.

Legal Considerations

Legal considerations have an impact on quality management in several ways:

- Laws and regulations create the external structure for quality management.
- Failure to provide quality health care can result in lawsuits.
- Institutions can face liability for action taken against a practitioner if objective measures are not applied to performance and due process is not provided.

Quality management programs must protect against substandard care and ultimately reduce litigation. Organizations must have clearly defined processes for professional review. These responsibilities are based on case law and federal regulations.

Case Law

Case law refers to the legal opinion rendered in court cases. Numerous legal cases have resulted in rulings that affect quality management. Several landmark cases have established the following issues within the quality management movement:

- Hospitals are liable for the care provided to clients.
- Hospitals are responsible for a department's practice.
- Limited immunity for peer review exists. See Chapter 21 for a discussion of peer review.

Federal Regulations

A number of federal agencies regulate health care standards; for example, HCFA, the Food and Drug Administration (FDA), and the Occupational Safety and Health Administration (OSHA). Specific regulations issued by these agencies that directly affect quality of care are shown in the accompanying display.

Failure to adhere to the guidelines in these legislative acts can result in sanctions for violation of standards. Federal funding and payment for services can be denied for failure to provide quality care.

Ethical Considerations

Laws establish standards of acceptable conduct; however, they often represent only a minimum acceptable standard. For example, registered nurse licensure indicates that the nurse possesses the *basic* knowledge, skills, and abilities to safely practice general nursing. Professionals are expected to adhere to a code of ethical practice that espouses a responsibility to self, profession, client, and society. Ultimately, nurses have an ethical responsibility to deliver the highest possible quality of health care. Nurses are obligated by licensure to be knowledgeable about the care they are providing and to practice according to an established code of ethics and standards of practice, as exemplified by the ANA's *Code for Nurses* (1985). See Chapter 24 for a complete discussion about ethical responsibilities.

Laws provide guidelines, and ethics provide a sense of obligation. Individual practitioners and institutions have a legal and ethical requirement to deliver quality care.

FEDERAL REGULATIONS AFFECTING QUALITY MANAGEMENT

- **Social Security Act** (1965, 1972): established Medicare and Medicaid standards for payment and professional review activities.
- **Consolidated Omnibus Budget Reconciliation Act (COBRA)** (1985, 1986): established payment denial for substandard care and developed hospital transfer policies to prevent "dumping" of indigent or uninsured clients.
- **Healthcare Quality Improvement Act (HQIA)** (1986): enacted to promote peer review by providing immunity and established a National Practitioner Data Bank that maintains a record of malpractice, mandates reporting action against physicians, and requires hospitals to check the Data Bank every 2 years for status.
- **Omnibus Budget Reconciliation Act (OBRA)** (1987, 1989, 1990): expanded scope of peer review; required notification of health care providers regarding quality issues and denials, established the Agency for Health Care Policy and Research (AHCPR) to investigate appropriateness of procedures, and added transfer guidelines to cover labor and emergency care.
- **Clinical Laboratory Improvement Act (CLIA)** (1988): established mandatory requirements for laboratories and lab personnel.
- **Patient Self-Determination Act** (1990): established advance directive requirements that prescribe care provisions for the client who is incapacitated.
- **Safe Medical Devices Act (SMDA)** (1990): established requirement to report serious injury, illness, or death resulting from specific medical device usage.
- **Occupational Safety and Health Administration (OSHA)** (1991, 1993): enacted to require employers to protect workers from occupational exposure to blood-borne pathogens and other potentially infectious material and to adhere to guidelines for control of transmission of tuberculosis.

Data from Gropper, E. I. (1999). Expect truly unannounced surveys (and more) from the Joint Commission. *Nursing Management*, 30(1), 36–38.

THINK ABOUT IT

Can You Mandate Quality?

You are working in a skilled nursing facility. Regulations require that unlicensed personnel complete training and testing for certification as nursing assistants. You discover that there has been a recent turnover in staff and many newly employed nursing assistants are not yet certified. What are the legal and ethical ramifications of this situation? What should you do?

Quality and Cost

Health care costs have skyrocketed in the past decade. The primary source of health insurance in the United States is employer coverage. Payers are becoming increasingly concerned about health care costs, and the issue of health care expenditures is being debated furiously.

Delivery of poor quality care has a negative financial impact on health care organizations. Yet, management will often argue that the quality improvement initiative is costly because of staff time involved in such activities. However, one must consider the cost of poor quality, which results in the following problems:

- Duplicated work between departments
- Loss of time due to inefficient task performance
- Loss of staff due to job dissatisfaction
- Recruitment and training of new employees
- Expenditure of energy and time in investigation of complaints and allegations
- Litigation and malpractice settlements
- Employees continually executing tasks incorrectly despite direction
- Reporting and correcting errors
- Expenses related to overutilization of diagnostic tests to avoid malpractice

Originally, the perception of quality was that of doing more, that is, the performance of more tasks that resulted in intensive intervention. Today, it is believed that efficiency can be improved without compromising quality.

Health care leaders must now look at individual and collective effectiveness of organizational management. Organizations must also begin to examine the cumulative cost associated with a less-than-optimal ability to plan, delegate, communicate, and listen. The prevailing philosophy is to do more with less. Such an approach to health care management has resulted in downsizing, cross-training, and reduction of middle management staff.

The primary cost-containment measure in health care delivery has been the proliferation of managed care systems. Ongoing debate over the effect of cost containment on quality of care continues. The Survey of Physicians and Nurses, a survey of 1,053 physicians and 768 nurses, was conducted by the Kaiser Family Foundation and the Harvard School of Public Health in 1999. The nurses in this survey (Kaiser Family Foundation, 1999) stated that managed care has led to the following:

- Decreased the amount of time they spend with clients
- Decreased clients' ability to see medical specialists
- Decreased the quality of care for individuals who are ill
- Increased the likelihood that clients would receive preventive services

QUALITY IMPROVEMENT

Quality management has its own array of terminology. Despite the similarities, there are differences in the concepts, as outlined below:

- **Quality assurance (QA)** is the traditional approach to quality management in which monitoring and evaluation focus on individual performance, deviation from standards, and problem solving.
- **Continuous quality improvement (CQI)** is the approach to quality management in which scientific, data-driven approaches are used to study work processes that lead to long-term system improvements. This concept has evolved into systems such as process improvement or performance improvement.
- **Total quality management (TQM)** is the method of management and system operation used to achieve CQI. TQM promotes an organization culture that supports customer need, empowers employees to work as teams, emphasizes self-development, and requires a new leadership style in which employees are viewed as resources.

TQM is a system of operation, whereas CQI is the desired outcome of a quality management program. It is difficult to achieve performance improvement without a TQM culture. The goal of a quality management program is to focus on process improvement, which will ultimately improve the quality of care.

Principles

Because CQI examines ways in which the entire organization can improve, the involvement of everyone, especially administration is required. CQI is based on the following principles:

1. Quality is a central theme to the organization. It is part of the organization's mission and the core of daily activities.
2. Leadership is committed to an involved in creating an **organizational culture** (commonly held beliefs, values, norms, and expectations that drive the work force) for process improvement.
3. All staff members are personally responsible for quality; therefore, decision making is done by the people doing the work.
4. Education and training must be continual to improve skills and promote self-development.
5. Processes and system operation, in addition to individual performance, are monitored.
6. Work processes that influence outcome are studied and improved, rather than relying solely on problem solving.
7. A scientific approach based on analysis of data is used.

8. Good information is available and must be used in decision making. Individuals and institutions can no longer use opinion and intuition; they must manage by facts.

Customer Perspective

Promoting customer satisfaction requires an organizational commitment from top to bottom with every employee, especially direct care workers, being sensitive to the needs, wants and expectations of customers. This commitment requires putting the customer first. Customers include those internal and external to the organization, such as clients, suppliers, third-party payers, families, visitors, employees, and the community. Managers must meet employee needs and service delivery demands. The direct care provider must meet client needs, coworker's needs, and organizational needs.

THINK ABOUT IT

Customer Orientation

Consider the service/care provided in the hospital setting. Who are the customers (all the people who participate in the service system, both internally and externally)? What does each customer expect as quality service?

Organizations rely on customer relations programs to develop strategies to keep their customers satisfied. A program of customer relations can be costly to operate. It involves staff education, cost of survey materials, public relations representation, administrative time for evaluation and follow-up, and expenses for corrective action. Corrective action may involve equipment, staffing, education, structural renovations, or new procedures. Focusing on the customer can be both time consuming and stressful because it may require change, which may evoke resistance in both employees and managers.

The reality is that health care agencies do not have unlimited resources allocated solely to keeping customers happy. Therefore, the organization and each employee must understand the implications of customer dissatisfaction from a financial perspective. The loss of one admission is relatively insignificant to a multimillion dollar budget; however, multiple losses can have a substantial effect on a health care facility's financial well-being.

There is additional potential revenue loss from related ancillary services following hospitalization, such as home health care, laboratory procedures, pharmaceutical supplies, and office follow-up. A customer's dissatisfaction with one facet of service can be generalized to all related delivery systems.

Anderson and Zemke (1998) have identified the 10 leading causes of customer dissatisfaction. As you read the accompanying display, think of how these factors

10 DEADLY SINS OF CUSTOMER SERVICE

The following are phrases that are extremely annoying to customers:

1. "I don't know."
2. "I don't care."
3. "I can't be bothered."
4. "I don't like you."
5. "I know it all."
6. "You don't know anything."
7. "We don't want your kind here."
8. "Don't come back."
9. "I'm right and you're wrong."
10. "Hurry up and wait."

Data from Anderson, K., & Zemke, R. (1998). *Delivering knock your socks off service*. New York: AMA-COM, American Management Association.

can adversely affect a client's satisfaction with health care services.

Another effect of customer dissatisfaction is a tarnished community image. There is a multiplier effect in which one bad encounter can affect the attitude and opinion of many. An unhappy client may inform the immediate family, extended family, neighbors, friends, and coworkers. Seemingly simple acts, such as those listed below, can result in client dissatisfaction despite a positive health outcome:

- A cold food tray
- Failure to respond to a call light
- Waiting for tests
- Late treatment
- Unemptied bedpan
- Delayed pain medication

Health care organizations must have a strong dispute resolution program to mediate customer complaints. In addition, strong efforts must be made to solicit customer feedback about services. Satisfaction is a subjective perception; therefore, health care providers must listen to the customer constantly to determine satisfaction and dissatisfaction. Then, improvements can be initiated.

ORGANIZATIONAL STRUCTURE FOR QUALITY MANAGEMENT

Because quality has become a central issue in health care delivery, nurses must consider the impact of organizational structure on the quality of care provided. Nurses are key in establishing a culture for excellence in most health care organizations.

Title of Study

“The Impact of Systems Redesign on Staff, Patient, and Financial Outcomes”

Author

Barry-Walker, J.

Purpose

The purpose of this study was to measure the impact of a clinical initiative using the strategies of inpatient bed consolidation on staff, patient, and financial outcomes.

Methods

This was an exploratory, single case, longitudinal field study. Both quantitative and qualitative data were collected.

Findings

Unit-level hours per patient day increased during or immediately after the merger of major patient populations on two units. There was no significant variation in medication errors or patient falls. The nursing staff was dissatisfied with many aspects of their jobs, worried about job security, had low morale, and were concerned about the quality of care provided.

Implications

Consolidation may cause an increase in hours per patient day and might also negatively affect the morale and job satisfaction of nursing staff.

Barry-Walker, J. (2000). The impact of systems redesign on staff, patient, and financial outcomes. *Journal of Nursing Administration, 30*(2), 77–89.

Several factors within an organization affect quality management: organizational culture, work force diversity, empowerment, leadership, and teamwork. To improve the quality of care, the organization should be viewed as a system that is comprised of governance, management, clinical, and support devices. Many processes within the system involve more than one group. Therefore, a framework must be established to promote collaboration.

Organizational Culture

Organizations have both formal and informal cultures. Incongruence between the formal operational style espoused by management in meetings and documents

and the style demonstrated and felt by staff members may be evident. This can result in an ineffectual organization in which achieving continual improvement is difficult. Thus, the culture of an organization can affect the quality of care. A positive culture promotes trust, information sharing, collaboration, and risk taking, whereas a negative culture produces divisiveness, resistance, and a desire to maintain the status quo. In a negative culture, inertia develops and there is a lack of creativity and self-direction by employees. Table 25-2 compares characteristics of organizational culture within traditional and high-performance organizations.

Work Force Diversity

Health care will be delivered by a more diverse work force throughout the 21st century. The organization, managers, and workers must be able to maximize diversity. Tomorrow’s work force and population will consist of more women, older Americans, people of color, and college-educated individuals. Despite increases in these groups, the overall available work force will decrease due to declining population growth. Employees can become more selective in job placement and seek new employment opportunities if dissatisfied. Employees desire self-actualization; therefore, job satisfaction will become imperative.

The slower growth in the work force will result in fewer applicants and a shortage of technical and professional staff. Rapid advances in technology will increase complexity of jobs and lead to increased competition for skilled workers. A flatter organizational structure, in which middle management is reduced, will require increased interaction and ability to work together. Groups must enhance ways of communicating to be more productive.

This change in the work force will affect methods of delivery; therefore, the organization must be able to maximize the potential of each employee. To achieve a work environment that capitalizes on diversity, the organization must implement a program that addresses individual, group, and organizational biases. Education must be provided to eliminate stereotyping. Such educational programs are aimed at:

- Identifying individual beliefs and values
- Discussing assumptions and biases based on gender, race, age, and religion
- Explaining cultural differences
- Identifying legal responsibilities
- Valuing differences of specific groups.

Management practices must build an organizational climate that values each individual’s contribution to group achievement, and the organization must develop policies to promote and support cultural needs and differences. These actions are essential in reducing the costs of employee turnover and litigation from discrimination and sexual harassment suits. The outcome of

TABLE 25-2
Organizational Culture

Dimension	Traditional Organization	High-Performance Organization
Structure	Authoritarian, hierarchical	Team focused
Decision making	Limited input, based on politics and alliances, dissonance	By consensus, based on resources, commitment to action
Cooperation	Territorial, departmentalized	Organizational success emphasized Widespread consideration
Conflict	Open discussion of issues avoided	Regarded as natural, even helpful Focuses on issues, not person
Relationships	Competitive, withholding, suspicious, partisan	Trusting, respectful, supportive, collaborative
Information and communication	Controlled at the top Hoarded, withheld, flows mainly downward Fiscal information secretive Line staff uninformed, management unaware of staff opinion	Full sharing, open, honest Flows freely up, down, sideways Fiscal information shared Information considered credible
Listening	Information from the lowest level does not reach the top Management unresponsive	Genuine listening at all levels Feedback sought
Commitment and motivation	Lack of strategic planning Resistance to change Individual interest considered over the group Fear of punishment	Commitment to vision, mission, and goals at all levels Group achievement desired
Reward and compensation	Based on subjective appraisal Longevity considered over skills and positive reinforcement for negative performance	Merit system based on ability Unacceptable behavior results in termination
Atmosphere	Intimidating, guarded, closed, political	Open, nonthreatening, noncompetitive, participative
Labor-management relationship	Adversarial “We-they” mentality Focus on grievance	Collaborative problem solving with both parties committed to organizational welfare
Role of manager	Expected to follow system Conservative approach Seniority system for promotion Dictatorial style with emphasis on disciplinary action	Managers considered important asset Emphasis placed on recruitment, selection, development, training, and compensation of managers Coaching skills essential
Attitude toward clients	They need us; we know what is best	Service attitude Client is customer Client’s opinion is valued
Measurements of success	Machines, equipment, materials Quantitative output, volume	Process improvement Customer satisfaction

Daniels, A. C. (2000). *Bringing out the best in people*. New York: McGraw-Hill; Fisher, K. (2000). *Leading self-directed work teams: A guide to developing new team leadership skills*. New York: McGraw-Hill.

such efforts can be an increase in retention, productivity, market share, creativity, flexibility, and optimism of staff while effecting a decrease in complaints, grievances, litigation, and cost. Specific advantages of having a culturally diverse work force in nursing are shown in the accompanying display. Health care providers must consider transcultural principles and human rights in managing the work force and delivering quality care. See Chapter 16 for complete discussion of cultural diversity and health care.

ADVANTAGES OF A CULTURALLY DIVERSE WORK FORCE IN NURSING

- Increased sensitivity to clients from varying cultures
- Enhanced problem-solving ability
- Increased productivity
- More creativity

Empowerment

For organizations to operate successfully and instill the drive for excellence in each employee, the staff must be empowered to take ownership of their jobs. **Empowerment** is the process of enabling others to do for themselves. Employees need responsibility and authority to solve problems and take action in their work group. Empowerment recognizes the uniqueness of employees and conveys a message of value. As a result of empowerment within a work group, an environment is created in which the collective creativity is more diverse than the ideas and knowledge of a single individual.

To survive in today's health care environment, all providers must work together to accomplish the organization's mission, vision, and goals to achieve a philosophy of continual improvement. Restructuring health care delivery requires each individual to improve work processes. Work redesign, downsizing, consortiums, managed care, and cross-functional task sharing are but a few of the many efforts underway to reorganize health care in order to reduce waste, duplication of work, and cost. All health care providers must be involved in the process of change to minimize fear, reduce resistance, promote accountability, add credibility, and produce lasting results. To accomplish change, health care organizations need to maximize employees' capabilities and motivate them toward continual improvement.

Leadership

Leadership is the interpersonal process that involves motivating and guiding others to achieve goals. Leaders in a health care organization include the governing body, chief executive officer, senior managers, leaders of the medical staff, department heads, nurse executives, and senior nursing leaders.

Effective leadership works across departmental lines to address multidisciplinary work functions and processes. Traditionally, territorial issues (the so-called turf battles) have produced divisiveness and competition among departments and disciplines. The tools for combating such divisiveness and building effective work groups are collaboration and facilitation.

Organizational leadership contributes to the creation of the culture based on CQI beliefs and practice. Leadership must create a people-oriented culture. In today's fast-paced, high-tech, cost-driven health care environment, the human factor is frequently overlooked. Although staffing incurs the greatest expense and is a primary target for cost reduction, it is the people in the health care organization who are the greatest asset, and management must focus on ensuring a return on this important resource.

Empowering employees, valuing diversity, creating organizational change, and promoting process improvement requires a new style of leadership that shifts from high manager/low employee participation. The manager becomes a coach instead of a supervisor. In this role, the manager facilitates collaboration and advocacy, serves as a consultant, and provides support.

Teamwork

Human resource management has become an essential function of health care managers. Authoritarian, hierarchical, and traditional ways of management are no longer effective; therefore, health care organizations are turning to team-based strategies for organizing labor. Improving quality requires team effort.

A **team** is a group of individuals who work together to achieve a common goal. The dynamics of team interaction are important. Teams must demonstrate commitment, cooperation, and communication. The way the team communicates and solves problems has a significant impact on outcome and delivery of service. For quality care to occur, work groups must function as teams.

For quality improvement, teams are used to study processes. There are two types of process improvement teams: functional and cross-functional. A **functional team** is a departmental or unit-specific group whose scope is limited to departmental or work area processes. A **cross-functional team** is an interdepartmental, multidisciplinary group that is assigned to study an organization-wide process (Figure 25-1). An effective team demonstrates mutual respect and trust, displays open communication, builds on skills of members, and seeks consensus.

The use of teams to restructure and improve work processes has many advantages, such as:

- Increased involvement and understanding
- More opportunities to share ideas
- Assistance in building relationships
- Involvement of staff in problem solving

Figure 25-1 Shown above are members of a cross-functional health care team. How is the quality of health care improved by the involvement of more than one discipline?

The team approach is effective for coordinating and integrating interdepartmental work processes.

PROCESS IMPROVEMENT

For years, the focus of health care quality has been on performance improvement. It was eventually recognized that no individual's performance really stands alone. Each person's action in an organization is actually a performance step that is connected to the action of others. This series of interconnected steps is known as a process; processes interconnect to form a system.

Prioritization

Quality improvement focuses on processes or systems within organizations that significantly contribute to outcome. This requires refocusing from solely departmental issues to cross-departmental lines. Prior to a process improvement philosophy, quality improvement efforts were performed within departments. However, processes operate between departments and require multidisciplinary involvement.

To continually improve, an organization must realize that it is a system of interdependent parts all with the same mission of meeting the needs and expectations of customers. Understanding interdepartmental processes is crucial to quality improvement.

In process improvement, the emphasis is on system variation, not performance of individuals. Process improvement does not just address problem solving; it also

promotes ongoing improvement of stable processes and correct establishment of new systems. Process improvement is intended to reduce variability, improve efficiency, and reduce complexity in systems.

Process improvement efforts must be directed at analyzing systems that have significant impact on the organization of care delivery. *Important aspects of care* involve activities or processes that are:

- *High volume*: occur frequently or affect large numbers of clients
- *High risk*: place clients at risk of serious consequences if not provided or provided incorrectly
- *Problem prone*: tend to produce problems for clients or staff (JCAHO, 1998)

Organizations must effectively use resources by focusing on high-priority systems that affect client outcome.

Scientific Approach

Typically, problem solutions are generated without timely analysis. A “ready, fire, aim” approach to process analysis is frequently used, in which action is taken without first thoroughly evaluating the problem. To counter this haphazard method, a scientific approach to performance improvement must be undertaken. In the scientific approach, data are used to measure process. Such an approach results in the following:

- Minimal use of intuition and opinion
- More accurate and effective problem identification
- Increased understanding of root causes of variation
- Improved evaluation of alternative solutions
- Ability to statistically measure improvement

The scientific approach to improving quality performance consists of the following steps:

1. Identify an important process to evaluate.
2. Measure the current process.
3. Assess variations.
4. Formulate improvements.
5. Implement change in the process.

Tools

A variety of tools are used to collect and analyze data so that decisions can be made about organizational performance. The accompanying display describes mechanisms frequently used to obtain and measure data.

In addition to measuring processes, data can also be used in **benchmarking** (a process that evaluates products, services, and priorities against the performance of others). Comparative data can be obtained from the literature, practice guidelines, and an increasing number of external reference databases.

MECHANISMS FOR OBTAINING QUALITY MEASUREMENT DATA

- **Audit:** Client records are reviewed for compliance to predetermined criteria that measure process and outcome of care.
- **Peer review:** Care is evaluated based on the judgment of a colleague with equal education and experience.
- **Benchmarking:** Measuring service or practice against the competition.
- **Clinical pathways:** Measuring the performance of care according to critical outcomes and key incidents that must occur within given time frames.

NURSING'S ROLE IN QUALITY MANAGEMENT

The primary purpose of nursing is to provide quality care to clients. To do so means always seeking to improve the care delivered. Nurses function as clinicians, team members, and managers. Each role has specific responsibilities for quality performance and requires certain skills to achieve the expected level of performance (Table 25-3).

There are several characteristics of quality nursing care, including the following:

- Maintenance of a current knowledge base and competencies
- Interpersonal skills (with clients and coworkers)
- Caring and compassion
- Mutual decision making with client and nurse
- Individualized treatment

Whether functioning as a clinician, team member, or manager, nurses continually strive for excellence in everything they do. By using a CQI approach, which examines structure and process instead of individual performance, nurses can move forward in the provision of quality care. Quality improvement identifies situations when nursing teams are more productive and functioning at a higher quality level.

KEY CONCEPTS

- The nine dimensions of quality performance as identified by JCAHO are efficacy, appropriateness, availability, timeliness, effectiveness, continuity, safety, efficiency, and respect and caring.
- The quality movement was initiated by consumer demands, financial viability, professional accountability, regulatory requirements, progress made in quality improvement techniques, and changes in health care delivery.

TABLE 25-3
Nursing Roles and Responsibilities:
Quality Improvement

Role	Responsibilities
<i>Clinician</i>	<ul style="list-style-type: none"> • Maintain ethical standards of practice • Seek self-development via continuing education • Be self-directed • Serve as change agent • Practice efficient time management • Achieve customer satisfaction • Be committed to reducing cost and improving performance
<i>Team Member</i>	<ul style="list-style-type: none"> • Be knowledgeable about group dynamics • Support colleagues • Promote mutual trust and respect • Build rapport with other disciplines • Practice active listening • Praise coworkers
<i>Manager</i>	<ul style="list-style-type: none"> • Develop leadership skills • Be knowledgeable about statistical analysis • Provide clear and direct communication • Delegate to and empower staff • Lead by example

- Case law and federal regulations establish guidelines for quality management.
- Health care professionals adhere to ethical codes of practice that espouse a responsibility to self, profession, client, and society.
- Continuous quality improvement focuses on studying work processes that promote system improvements.
- Total quality management is a method of organizational operation that establishes a work environment to achieve continuous improvement.
- A customer is anyone who uses the products, services, or processes within an organization. Clients, families, visitors, employees, suppliers, and the community are all considered customers within the health care system.
- Customer dissatisfaction can have significant financial implications for health care organizations.
- Quality management requires positive organizational culture, work force diversity, empowerment, leadership, and teamwork.
- A variety of tools, such as audits, peer reviews, and benchmarking are available through which data about variations in process improvement can be collected and analyzed.
- The nurse is responsible for quality improvement as a clinician, team member, and manager.

CRITICAL THINKING ACTIVITIES

1. Read the following situation to answer the questions:
Process: Timely filing of information into the client's chart.
Problem: The current process requires delivery of lab results to the unit secretary who files the results in the physician's mailbox until they are reviewed and initialed. Once initialed, the report is placed in the client's chart. This process causes a delay in chart entry.
Solution:
 - a. Who is involved in the process?
 - b. What are some possible solutions?
2. *Case Study:* Data on medication errors are monitored for the calendar year and plotted on a control chart. January, May, and July exceeded upper control limits; the remaining 9 months were within acceptable limit. On analysis, it was determined that:
 - New nursing graduates entered the system in January and May.
 - July was vacation month with staffing shortages.
 Based on the above data:
 - a. What processes would you analyze?
 - b. What would be possible solutions for each variance?
3. Using the nine dimensions of quality improvement as defined by JCAHO, explain the following phrases: "doing the right thing" and "doing the right things well."
4. What is the difference between "quality assurance" and "quality improvement"?
5. In what ways do nurses improve quality of care?

Chapter 26

Accountability: Documentation and Reporting

*Much more precise might be our observation even than this and
much more correct our conclusions.*

—Nightingale (In Skretkowicz, 1992)

COMPETENCIES

1. Explain the purposes of documentation in health care.
2. Discuss the principles of effective documentation.
3. Describe various methods of documentation.
4. Describe various types of documentation records.
5. Describe the latest advances in computerized documentation.

KEY
TERMS

advance directive
case management
charting by exception (CBE)
communication
critical pathway
documentation

(NMDS)
point-of-care charting
problem, intervention,
evaluation (PIE) charting

problem-oriented medical
record (POMR)
SOAP charting
source-oriented (S.O.)
charting
variations
walking rounds

Throughout the development of modern nursing, a variety of documentation systems have emerged in response to changes inherent in health care delivery. Changes in consumer and legal expectations, federal and state regulations, accreditation standards, and research findings direct provider accountability for the documentation of services. Systems of recording and reporting data pertinent to the care of clients have evolved primarily in response to the demand for health care practitioners to be held accountable to societal norms, professional standards of practice, legal and regulatory standards, and institutional policies and standards.

As with all facets of health care, advanced technology has affected the expectations for documentation. Benchmarking activities in quality improvement and cost containment have also increased the demands on health care practitioners to create efficient documentation systems. Efficiency is measured in terms of time, thoroughness, and the quality of the observations being recorded. The documentation systems in use today reflect the specific needs and preferences of the numerous health care agencies. Selected systems and their ramifications are discussed in this chapter.

DOCUMENTATION AS COMMUNICATION

Communication is a dynamic, continuous, and multidimensional process for sharing information as determined by standards or policies. Reporting and recording are the major communication techniques used by health care providers to direct client-based decision making and continuity of care. The medical record serves as a legal document for recording all client activities assessed and initiated by health care practitioners.

Documentation Defined

Documentation is defined as written evidence of:

1. The interactions between and among health professionals, clients, their families, and health care organizations

2. The administration of tests, procedures, treatments, and client education
3. The results or client's response to these diagnostic tests and interventions (Eggland & Heinemann, 1994)

Documentation provides written records that reflect client care provided on the basis of assessment data and the client's response to interventions.

Nurses rely on documentation tools that support the implementation of the nursing process. These tools are the charting records and systems that facilitate a logical sequencing of events. All the tools used by nurses to record their nursing care should form a system. Systematic documentation is critical because it presents the care administered by nurses in a logical fashion, as follows:

1. Assessment data (obtained by interviewing, observing, and inspecting) identifies the client's specific alterations and provides the foundation of the nursing care plan.
2. The risk factors and/or the identified alteration in the functional health pattern directs the formulation of a nursing diagnosis.
3. Identifying the nursing diagnosis promotes the development of the client's short-term goals, long-term goals, and expected outcomes, and also triggers the nursing interventions. These activities occur during the planning and implementation phases of the nursing process.
4. The plan of care identifies the actions necessary to resolve the nursing diagnosis.
5. Implementation is evidenced by actions the nurse performed to assist the client in achieving the expected outcomes.

The effectiveness of the nursing interventions in achieving the client's expected outcomes becomes the criterion for evaluation which determines the need for subsequent reassessment and revision of the plan of care.

The system becomes a vehicle for expressing each phase of the nursing process. Nurses rely on systems that provide thorough, accurate charting reflective of the nurse's decision-making ability and the client's plan of care. The nurse's critical-thinking skills, judgments, and evaluation must be clearly communicated through proper documentation.

Purposes of Health Care Documentation

Professional responsibility and accountability are two primary reasons why practitioners document. Other reasons to document include communication, education, research, meeting legal and practice standards, and reimbursement. Documentation is the professional responsibility of all health care practitioners. It provides written evidence of the practitioner's accountability to the client, the institution, the profession, and society.

Communication

Recording is a method of communication that validates the care provided to the client. It should clearly communicate all important information regarding the client. Thorough documentation provides:

- Accurate data needed to plan the client's care in order to ensure the continuity of care
- A method of communication among the health care team members responsible for the client's care
- Written evidence of what was done for the client, the client's response, and any revisions made in the plan of care
- Compliance with professional practice standards (e.g., American Nurses Association)
- Compliance with accreditation criteria (e.g., the Joint Commission on Accreditation of Healthcare Organization [JCAHO])
- A resource for review, audit, reimbursement, education, and research
- A written legal record to protect the client, institution, and practitioner

The client's medical record contains documents for record keeping. The type of document that constitutes the medical record is determined by the health care institution. References will be made to the various types of medical record documents throughout this chapter; refer to Table 26-1 for an explanation of these documents.

Education

The documentation contained within the client's medical record can be used for the purpose of education. Health care students use the medical record as a tool to learn about disease processes, complications, medical and nursing diagnoses, and interventions. The results of physical examination and laboratory and diagnostic testing provide valuable information regarding specific diagnoses and interventions.

Nursing students can enhance their critical-thinking skills by examining the records in chronological order, analyzing the results, and following the health care team's plan of care such as how it was developed, implemented, and evaluated. Students and all health care

NURSING CHECKLIST

Reviewing a Chart

- Can the assessment data that triggered the nursing diagnosis be identified?
- When the defining characteristics of a specific nursing diagnosis are compared to the client's presenting signs and symptoms, is there supporting evidence?
- Were critical questions asked during the client interview?
- Did the nurse use the data obtained from both the interview and physical assessment in establishing the diagnoses?
- Can any assumptions that might have misled the nurse's judgment be identified?
- Are the nursing data correlated with the results of the physical examination and findings from diagnostic tests?
- Are the expected outcomes realistic?

professionals need to be aware of confidentiality issues before reading any client's chart; these are discussed later in the chapter.

Clinical rounds and case conferences, which rely heavily on information contained in the medical record, have also proved to be effective teaching tools. These learning experiences usually involve several disciplines that contribute to the review and discussion of client outcomes.

Student nurses need to learn the "flow" of documenting clinical data according to institutional policy in a legible, descriptive, and time-sequenced fashion (Grulke, 1995). A good way to learn the "flow" is to review the client's condition as presented in the chart before hearing the report. The data obtained from chart review should direct the assessment of signs and symptoms on rounds.

Research

Researchers rely heavily on clients' medical records as a clinical data source to determine if clients meet the research criteria of a study. Documentation also can validate the need for research. For example, if documentation demonstrates an increased infection rate with intravenous catheters, researchers can identify and study the variables that may be associated with the increased infection rate.

Legal and Practice Standards

"Failure to document appropriately is a key factor in clinical mishaps and a pivotal issue in many malpractice cases" (Springhouse, 1995, p. 184) because the client's medical record is a legal document, and in the case of a lawsuit the record serves as the description of exactly

TABLE 26-1
Medical Record Documents

Document	Information
Face sheet	Biographical data: name, date of birth, address, phone number, Social Security number, marital status, employment, race, gender, religion, closest relative; insurance coverage; allergies; attending physician; admitting medical diagnosis; assigned diagnosis-related group; statement of whether the client has an advance directive.
Consent form	<i>Admit:</i> Gives the institution and physician the right to treat. <i>Surgery:</i> Explains the reason for the operation in lay terms, the risks for complications, and the client's level of understanding. <i>Blood transfusion:</i> Permission to administer blood or blood products.
Medical history and physical examination	Results of the client's initial history and physical assessment as performed by the health care provider.
Prescriber order sheet	Medical orders to admit and the treatment plan.
Progress notes	Evaluation of the client's response to treatment; may contain the progress recording of interdisciplinary practitioners (e.g., dietary or social services)
Consultation sheet	Initiated by the physician to request the evaluation or services of other practitioners.
Diagnostic results	Contains the results from laboratory and diagnostic tests (e.g., X-ray, hematology)
Nursing admit assessment	Recording of data obtained from the interview and physical assessment conducted by the RN.
Nursing plan of care	Contains the treatment plan (e.g., nursing diagnosis or a problem list, initiation of standards of care, or protocols)
Graphic sheet	Data recording regarding vital signs and weight.
Flow sheet	Contains all routine interventions that can be noted with a check mark or other simple code; allows for a quick comparison of measurement.
Nurses' progress notes	Additional data that do not duplicate information on the flow sheet (e.g., client's achievement of expected outcome or revision of the plan of care)
Medication administration record (MAR)	Contains all medication information for routine and prn drugs: date, time, dose, route, site (for injections).
Patient education record	Recording of the nurses' teaching of the client, family, or other caregiver and the learner's response.
Health care team record	Treatment and progress record for nonmedical and nonnursing practitioners, when the physician's progress notes are not used by other practitioners (e.g., respiratory, physical therapy, dietary)
Clinical pathway	A multidisciplinary form for each day of anticipated hospitalization that identifies the interventions and achievement of client outcomes; the practitioner's initial implementation and variances from the norm are explained in the progress notes. (See Appendix XX.)
Discharge plan and summary	A multidisciplinary form used before discharge from a health care facility containing a brief summary of care rendered and discharge instructions (e.g., food-drug interactions, referrals or follow-up appointments)
Advance directive or living will	Federal law requires that health care providers discuss with clients the use of advance directives, commonly known as the living will or durable power of attorney. Most states recognize the living will as a legal document. If the client has advance directives, they are reviewed at the time of admission and placed in the medical record.

NURSING ALERT

The Importance of Communication

Important information obtained from an assessment that warrants immediate intervention should not only be documented in the medical record but also communicated orally to the other practitioners. The element of time must direct decision making when critical information is obtained.

what happened to a client. In 80% to 85% of malpractice lawsuits involving client care, the medical record is the determining factor in providing proof of significant events (Iyer & Camp, 1999). The legal issues of documentation require:

- Legible and neat writing
- Proper use of spelling and grammar
- Use of authorized abbreviations
- Factual and time-sequenced descriptive notations

These elements of effective documentation are discussed later in this chapter.

Nurses are responsible for the care the client receives and can be held liable if appropriate interventions are not implemented in a timely manner when information is available that would dictate otherwise. The nurse is responsible for documenting on the chart when a “physician was notified” along with what significant information was orally communicated. If the nurse does not get a response from the physician that recognizes the urgency of the information, the nurse must document the physician’s response and notify the supervisor of the situation. Stephen Torsty, JD, MHA, director of risk management services for a major corporation, states that “the better the communication between the care-

givers and the patient, the less likely you will see some type of lawsuit or claim” (American Health Consultants, 1995, p. 95).

Informed Consent

Informed consent means that the client understands the reason for and the risks of the proposed intervention and agrees to the treatment by signing a consent form. Legally, the client must be mentally competent, and the physician who is to perform the procedure is responsible for obtaining the client’s informed consent (refer to Chapter 23). “Failure to provide educational opportunities for a patient to participate in decision making (i.e., failure to ensure informed consent) could open the door to litigation” (American Health Consultants, 1995, p. 105).

In order to assist the physician with proper documentation of teaching, many facilities have preprinted informed consent documents that explain procedures in lay terms and identify the risk factors and possible complications. These documents are usually duplicate copies: the original goes in the medical record, and the copy is given to the client. This procedure provides the client with a written copy of the information that can be reviewed at a later time in a more relaxed environment.

Nurses are responsible for ensuring that the client understands the procedure or intervention and has signed the informed consent. The best way to assess a client’s knowledge of an intervention is to ask him to explain, in his own words, what is going to be done and the common risks and possible complications. If the informed consent has not been signed or if the nurse assesses a lack of understanding on the client’s part, the physician should be notified and the client should not be allowed to undergo the procedure. If the intervention is a surgical procedure, the nurse should notify the operating room at the time the physician is notified.

Although most informed consents deal with medical interventions, nurses are sometimes responsible for implementing the interventions: for example, administering blood or blood products requires informed consent. It is also the responsibility of the nurse to obtain oral consent for certain nursing interventions, such as initiating intravenous therapy or inserting a nasogastric tube or urinary catheter. Remember that consents require client education with an explanation of

THINK ABOUT IT

Completeness in Charting

Is this just a cliché: “If it wasn’t charted, it wasn’t done”? Since the purpose of the medical record is to document the care administered to the client, how can a practitioner convince a jury that care was administered if it is not documented in the medical record? Consider the following. A nurse, by habit, always administers an intramuscular injection in the ventrogluteal site (although both the ventrogluteal and dorsogluteal sites are within the accepted guidelines of care). The nurse, however, fails to chart the site on the medication administration record (MAR). The client files a suit for sciatic nerve damage. Knowing that there is an identified greater risk factor for sciatic nerve injury with the dorsogluteal site, do you think it would be difficult to defend care given in this case?

NURSING ALERT

Consent from Sedated Clients

Sedated clients should never be requested or allowed to sign an informed consent; the client may not be capable of understanding the nature of and risks associated with the procedure, so the consent will be invalid, and the nurse and institution will be at legal risk. Wait instead for the client to be competent and free of sedation, or have a legally acceptable family member brought into the decision.

outcomes and documentation of the client's understanding of the procedure.

Once the client has been educated by the physician and nurse of the intervention, the informed consent needs to be signed by the client and witnessed. Witnessing the signing of the consent confirms that the person who signs the consent is in fact the client and *is competent, alert, and aware of all actions at that point in time*. Refer to Chapter 23 for further discussion of informed consent.

Advance Directives

An **advance directive** is a statement made by clients that defines care they deem acceptable if they become incapacitated. It effectively allows clients, while competent, to participate in end-of-life decisions and to choose the types of life-sustaining procedures they will permit if they become unable to make their own decisions at a later time. A **durable power of attorney** allows the client to appoint a person to make health-related decisions when the client is incapable of making them. The Patient Self-Determination Act of 1990 requires health care facilities (hospitals, skilled-nursing facilities, and home health agencies) to inform adult clients of their rights regarding advance directives and to document in the medical record whether the client has such a directive. The implementation of advance directives is discussed in Chapter 23.

American Nurses Association (ANA) Standards of Care

Standards of documentation are established by professional organizations. ANA's Standards of Clinical Nursing Practice serve as a guideline for determining safe, quality nursing care and practice. The nursing process gives structure to the standards of care, with specific measurement criteria for each phase in the process. For each of the six standards (assessment, diagnosis, outcome identification, planning, implementation, and evaluation) there is a measurement criterion that states "are documented." ANA standards make explicit the role of data collection and documentation in nursing practice and specify that data collection be systematic and continuous and that data are accessible, communicated, and recorded (ANA, 1997).

State Nurse Practice Acts

In an attempt to recognize and control the practice of nursing, nurse practice acts, on a state-by-state basis, have established guidelines to ensure safe practice and to demonstrate accountability to society. The standards of care, as set forth in the practice acts, are based on the phases of the nursing process and require evidence of compliance by documentation. Nurses should be familiar with the practice acts and rules of the state in which they work.

Joint Commission on Accreditation of Healthcare Organizations (JCAHO)

The JCAHO surveys health care facilities to measure compliance with its standards for safe health care provi-

sion. Although facilities voluntarily submit to this accreditation process, reimbursement eligibility for Medicare, Medicaid, and private funding is dependent upon JCAHO accreditation.

The JCAHO no longer requires that health care organizations have traditional nursing care plans, but documentation of an individualized plan of care must be evident for each client. JCAHO's standards require:

- The involvement of the client or family in the development of the plan, which must be documented in the medical record
- Interdisciplinary planning and implementation of all aspects of care

The use of interdisciplinary tools has proved to be an effective approach to documenting client and family education for agencies not yet using critical pathways (discussed later in the chapter) or care mapping. Compliance with JCAHO's client and family teaching standards through the use of an interdisciplinary record improved education documentation from 30% to 84% in one medical center studied (Tucker, 1995).

During the accreditation survey, the reviewer looks for evidence of an organized and systematic method of monitoring and evaluating client care that is reflected through documentation in the medical record. Documenting the steps of the nursing process ensures compliance with JCAHO's plan of care requirements.

Reimbursement

Peer review organizations (PROs), consisting of physicians and nurses, are required by the federal government to monitor and evaluate the quality and appropriateness of care given. Medical record documentation is the mechanism for the PRO review, which evaluates the intensity of services and the severity of illness on the basis of a comparison of sample medical records from different facilities against specific screening criteria.

The federal enactment of the diagnosis-related group (DRG) classification system changed the health care provider reimbursement process from a cost-per-case formula to a prospective payment system (PPS). With PPS, the medical record must provide documentation that supports the DRG and the appropriateness of care. Nursing documentation must also show evidence of client and family education and discharge planning.

From a hospital's perspective, when information in the medical record demonstrates compliance with Medicare and Medicaid standards, the reimbursement is maximized. If nurses fail to document the equipment or procedures used daily (e.g., feeding pump; daily weight, intake and output; intravenous therapy; drug additives), reimbursement to the facility can be denied.

Another federal law, the Comprehensive Omnibus Budget Reconciliation Act (COBRA) allows employees

to temporarily carry their employer-provided health insurance benefits for 90 days after termination, reduction in the work hours, or retirement. The law requires that for any COBRA client receiving care in an emergency room, the client's condition must be stabilized before the client can be transferred to another facility. If the client's condition is not stable, then the institution cannot initiate a transfer.

Facilities in violation of COBRA laws are fined and stand to lose their eligibility to Medicare and Medicaid funding. Compliance with this law is evaluated through medical record review. The documentation concerning client transfers must include:

- Chronology of the event
- Measures taken or treatment implemented
- Client's response to treatment
- Results of measures taken to prevent the client's condition from deteriorating

THINK ABOUT IT

Meeting COBRA Laws

Why would an emergency room want to transfer a COBRA client who has insurance? Do you think these clients are considered high risk? Suppose a pregnant client in the seventh month of gestation comes to the emergency room in labor. The client is assessed by the physician and nurse. Labor is in progress, but delivery is not imminent, and the client's blood pressure is 210/124. Treatment is initiated; however, the blood pressure remains high (190/110). Can this client be transferred? If not, why not? Why would this health care provider want to stabilize and transfer the client before delivery?

APPLICATION: HOME CARE

Home health agencies also keep documents: physician orders, history and physical form, home care team records, and nursing records (initial assessment form, plan of care, problem list for daily progress notes, client teaching activities, and discharge summary). Home health care providers are required to comply with state and federal regulations that affect health care, documentation, and reimbursement.

PRINCIPLES OF EFFECTIVE DOCUMENTATION

Documentation requirements will differ depending on the health care facility (hospital, nursing home, home health agency) and the setting within the facility (e.g.,

emergency room, perioperative, medical-surgical unit) and with specific client populations (e.g., obstetrics, pediatrics, geriatrics). Regardless of what client care is administered, the documentation of that care must reflect the nursing process. General documentation guidelines are listed in Table 26-2.

Nursing notes must be logical, focused, and relevant to care, and must represent each phase in the nursing process (Iyer & Camp, 1999). Nursing documentation based on the nursing process facilitates effective care because client needs can be traced from assessment, through the identification of the problems, to the care plan, implementation, and evaluation. A brief reminder of the elements of the nursing process follows:

- *Assessment:* Summarize, without duplication, assessment data that are related to an actual or potential health care need. With reassessment, highlight any new findings or any changes in the client's condition (e.g., increased pain). Table 26-3 outlines some assessment-specific documentation guidelines.
- *Diagnosis:* Identify the client's problem or need using NANDA terminology.

TABLE 26-2
General Documentation Guidelines

- Ensure that you have the correct client record or chart and that the client's name and identifying information are on every page of the record.
- Document as soon as the client encounter is concluded to ensure accurate recall of data (follow institutional guidelines on frequency of charting).
- Date and time each entry.
- Sign each entry with your full legal name and with your professional credentials, or per your institutional policy.
- Do not leave space between entries.
- If an error is made while documenting, use a single line to cross out the error, then date, time, and sign the correction (check institutional policy); avoid erasing, crossing out, or using correction fluid.
- Never change another person's entry, even if it is incorrect.
- Use quotation marks to indicate direct client responses (e.g., "I feel lousy").
- Document in chronological order (if chronological order is not used, state why).
- Write legibly.
- Use a permanent-ink pen (black is usually preferable because of its ability to photocopy well).
- Document in a complete but concise manner by using phrases and abbreviations as appropriate.
- Document all telephone calls that you make or receive that are related to a client's case.

(Adapted from Estes, M. E. Z. [2002]. *Health assessment and physical examination* [2nd ed.]. Albany, NY: Delmar Publishers.)

TABLE 26-3
Assessment-Specific Documentation Guidelines

- Record all data that contribute directly to the assessment (e.g., positive assessment findings and pertinent negatives).
- Document any parts of the assessment that are omitted or refused by the client.
- Avoid using judgmental language such as “good,” “poor,” “bad,” “normal,” “abnormal,” “decreased,” “appears to be,” and “seems.”
- Avoid evaluative statements (e.g., “client is uncooperative,” “client is lazy”); cite instead specific statements or actions that you observe (e.g., “client said ‘I hate this place’ and kicked trash can”).
- State time intervals precisely (e.g., “every 4 hours,” “bid,” instead of “seldom,” “occasionally”).
- Do not make relative statements about findings (e.g., “mass the size of an egg”); use specific measurements (e.g., “mass 3 cm × 5 cm”).
- Draw pictures when appropriate (e.g., location of scar, masses, skin lesion, decubitus, deep tendon reflex, etc.).
- Refer to findings using anatomical landmarks (e.g., left upper quadrant [of abdomen], left lower lobe [of lung], midclavicular line, etc.).
- Use the face of the clock to describe findings that are in a circular pattern (e.g., breast, tympanic membrane, rectum, vagina).
- Document any change in the client’s condition during a visit or from previous visits.
- Describe what you observed, not what you did.

(Adapted from Estes, M. E. Z. [2002]. *Health assessment and physical examination* [2nd ed.]. Albany, NY: Delmar Publishers.)

- *Outcome identification and planning:* Discuss with the client and communicate to members of the multidisciplinary team the expected outcomes or goals of client care.
- *Implementation:* After the intervention has been performed, document on the flow sheet and progress notes observations, treatments, teaching, and related clinical judgments. Client teaching should include learning needs, teaching plan content, methods of teaching, who was taught, and the client’s response.
- *Evaluation:* Evaluate and document the effectiveness of the interventions in terms of the expected outcomes: progress toward goals; client response to tests, treatments, and nursing interventions; client and family response to teaching and significant events; questions, statements, or complaints voiced by the client or family.
- *Revisions of planned care:* Document the reasons for the revisions with the supporting evidence and client and family agreement.

Charting in accordance with the nursing process ensures thorough documentation in compliance with ANA’s standards of care, practice acts, and reimbursement and accreditation criteria.

Elements of Effective Documentation

Effective documentation requires:

- Use of a common vocabulary.
- Legibility and neatness.
- Use of only authorized abbreviations and symbols.
- Factual and time-sequenced organization.
- Accurately including any errors that occurred.

The following discussion of effective charting refers to all nursing documents, such as flow sheet, progress notes, and so on. Add to the nursing documents when:

- A change occurs in the client’s condition
- Measuring the client’s response to an intervention or expected outcome
- The client or family voices a complaint

Use of Common Vocabulary

During the last decade, nurse researchers have observed inadequacies in the clinical record that prevent data collection and comparison among large groups of clients. One reason these inadequacies exist is that the documented clinical data cannot be correlated without a common vocabulary for addressing client outcomes for specific nursing interventions (McCloskey & Bulechek, 1995). Nursing practice reflects the use of multiple terms for nursing interventions, preventing cross-institutional comparisons of nursing care. The current efforts under way to establish a taxonomy for nursing interventions determined by specific nursing diagnoses will enhance the quality of documentation and support the efforts of researchers. (Refer to Chapter 9.) Use of common vocabulary will also improve intra-team communication and lessen the chance of misunderstandings.

Legibility

Whatever is charted must be easily readable, without any chance of error. If your handwriting is not readable, print. If you make a mistake, do not erase or obliterate it; draw one line through the erroneous entry and state the reason for the error, then sign and date the correction, as shown in Figure 26-1.

Abbreviations and Symbols

Facilities usually have a list of acceptable abbreviations and symbols, approved by the Medical Records Committee, to be used when documenting information in the client’s record. Always refer to the facility’s approved listing. (See Appendix A, Commonly Accepted Abbreviations and Symbols). Avoid abbreviations that can be misunderstood (refer to Figure 26-2).

12/11/01	1400	Client complains of pain (6 on a 0-to-10 pain scale) <i>mistaken entry Pt still</i> when positioned on hip hip — P. Palmer, RN

Figure 26-1 Correcting a Documentation Error

THINK ABOUT IT

Abbreviations

What does the abbreviation *Pt* mean? Does *Pt* refer to patient, prothrombin time, physical therapy, or part-time?

Organization

Start every entry with the date and time. Chart in a chronological order—assessment data, observation, intervention, and evaluation (see Figure 26-3). Comply with the time frame indicated in the facility’s guidelines for documentation: for example, the frequency of charting observations for a client with restraints or the time frame within which the admit assessment must be completed.

Percodan 5mg qd

Is the abbreviation:

q.d. - every day

or

q.i.d. - four times a day?

12/11/01 1800 administered 7 of Mylanta
— P. Palmer, RN

Is the symbol:

℥ - dram

or

℥ - ounces?

Figure 26-2 Misleading Abbreviation and Symbol

Nurses Progress Record		
Date	Hour	Progress Notes
12/11/01	1730	Client complains of a burning pain (5 on a 0- to-10 pain scale) in U&P, leaning forward; burning pain RT gastric secretion reflux; admin. Mylanta 30 cc po PRN as ordered, head of bed elevated 45° — P. Palmer, RN
12/11/01	1815	client states burning pain + 2. P. Palmer, RN

Figure 26-3 Charting a prn Medication

Chart in a timely fashion to avoid the omission of pertinent data; it is not a good practice to wait until the end of the shift to chart on all the clients. Chart medications immediately after administration to avoid errors. Sign your name after each entry.

When the nurse forgets to document significant data, it is appropriate and advisable to include these data at a later date (Fiesta, 1996). There are several reasons why a late entry might have to be made:

- The chart was not available (e.g., the chart was with the client in special procedures lab).
- Entries had to be added after notes were completed.
- Information was documented on the wrong record.

As with other aspects of documentation, follow the facility’s policy for charting a late entry. Common practice is to enter the date and time and label “Late entry” to indicate that it is out of sequence. Then record the date and time it should have been made in the body of the entry as shown in Figure 26-4.

Accuracy

Accuracy and objective data are crucial if the documentation is to be useful either clinically or for research. Use

12/11/01	2000	Late entry (8/11/97 - 1730) client stated "I received an upsetting phone call from my daughter 30" ago." — P. Palmer, RN
----------	------	--

Figure 26-4 Charting a Late Entry

factual, descriptive terms to chart exactly what was observed or done; for example:

INCORRECT	CORRECT
"Wound appears the same."	"Wound is 2.5 cm by 1.0 cm."
"Large amount of drainage."	"Foul-smelling, yellowish drainage completely saturated two 4 × 4s."

Use correct spelling and grammar, and write complete sentences.

Differentiate who does what; for example, "Dr. Smith inserted a triple-lumen, 20-gauge catheter into the right subclavian vein." Read the notes recorded by nurses on previous shifts and make further comments on their findings to maintain the continuity of care.

Documenting a Medication Error

Facilities require nurses to report medication errors on incident reports (discussed later in this chapter and Chapter 23). This information should also appear on the medication administration record (MAR) with a notation in the nurses' progress notes. Remember, the purpose of the medical record is to report any care or treatment the client receives.

When a medication error occurs, the following should be charted:

1. Chart the medication on the MAR to prevent other caregivers from giving the client additional doses of the drug, or similar drugs, or drugs that may be contraindicated.
2. Document the error in the nurses' notes as follows: name and dosage of the medication; time it was given; client's response to the medication; name of the practitioner who was notified of the error; time of the notification; nursing interventions or medical treatment to counteract the error; and client's response to treatment.

Confidentiality

Nurses are bound by ethical codes and laws to treat all client information in a confidential and professional manner; this includes the client's record. The written documentation contained in the client's chart is a legal record of care, and it should be available only to members of that client's health care team. The client's significant others, insurance companies, or other parties not directly involved in the care provided by the health care team may not have access to clients' records; it is the nurse's responsibility to protect the privacy and confidentiality of client interactions, assessments, and care. Even clients themselves must submit a written request to have their information released, and then they must specify exactly what information is to be released and to whom. In many institutions, particularly teaching hospitals, client records may be used for educational or research purposes. Members of these educational and research teams are held to the same standards of privacy protection and may not legitimately use client information for any purposes other than education or research or in any manner that would identify specific clients in any way.

METHODS OF DOCUMENTATION

Documentation must reflect the complexity of care, and it must embody accuracy, completeness, and evidence of professional practice with efficient and cost-effective systems. The clinical standards (structure, outcome, process, and evaluation) are used to develop a system that complies with legal, accreditation, and professional practice requirements of documentation.

There are many methods used for documentation, including:

- Narrative charting
- Source-oriented charting
- Problem-oriented charting
- PIE charting
- Focus charting
- Charting by exception (CBE)
- Computerized documentation
- Case management with critical paths

Narrative Charting

Narrative charting, the traditional method of nursing documentation, is a story format that describes the client's status, interventions and treatments, and the client's response to treatments. Before the advent of flow sheets, this was the only method for documenting care. About 30% of nurses' time, during an 8-hour shift, was spent on narrative charting (Miller & Pastorino, 1990).

Narrative documentation is easy to use in emergency situations, in which a simple, chronological order is needed. However, in this type of documentation it is often difficult to avoid being subjective, and there is normally a lack of analysis and critical decision making on the part of the nurse. Narrative charting is now being replaced by other formats because:

- The flow of care is disorganized. It is difficult to show a relationship between data and critical-thinking skills. Each nurse writes with a unique style, making continuity of care difficult to identify.
- It fails to reflect the nursing process. The focus is on tasks without emphasis on assessment data or progress toward achievement of outcomes.
- It is time-consuming. The paragraphs are free-flowing, so it takes more time to record accurate data and for others to read it.
- The information is difficult to retrieve. The same problems may not be addressed from shift to shift, so it is difficult to track the client's progress. Auditors often disallow charges for equipment and supplies because consistent usage cannot be identified.

Source-Oriented Charting

Source-oriented (S.O.) charting is described as a narrative recording by each member (source) of the health care team on separate records. Because each discipline has a separate record, care is often fragmented and communication between disciplines becomes time-consuming. S.O. charting has similar advantages and disadvantages to narrative charting since nurses use an unstructured approach in documenting in the progress notes.

Problem-Oriented Charting

Problem-oriented medical record (POMR) was introduced in 1969 by Lawrence Weed, a physician at Case Western Reserve University. The focus of POMR documentation is on the client's problem, with a structured, logical format to narrative charting called **SOAP**:

- S: subjective data (what the client or family states)
- O: objective data (what is observed/inspected)
- A: assessment (conclusion reached on the basis of data formulated as client problems or nursing diagnoses)
- P: plan (actions to be taken to relieve client's problem)

SOAPIE and SOAPIER refer to formats that add:

- I: intervention (measures to achieve an expected outcome)
- E: evaluation (effectiveness of interventions)
- R: revision (changes from the original plan of care)

Figure 26-5 shows a sample of SOAPIE charting. As you chart according to these systems, think about which

piece of information corresponds with each letter in the SOAP(IE) entry.

The POMR system was modified by nonmedical caregivers and is referred to as problem-oriented record (POR). The system is used by hospitals, nursing homes, and home care agencies (Egglund & Heinemann, 1994).

There are four critical components of POMR/POR:

- Database: Assessment data, representative of all disciplines (history, physical, nursing admit assessment, laboratory findings, educational and discharge needs), which become the basis for a problem list evaluation of the client's condition.
- Problem list: Derived from the database: a listing of the client's problems as identified, with each problem numbered and labeled as acute, chronic, active, or inactive. Nurses use NANDA terminology in writing client problems as nursing diagnoses; the list is revised as new problems arise and others are resolved.
- Initial plan: Based on problem identification; the starting point for care plan development with client participation in setting goals, expected outcomes, and learning needs.
- Progress notes: Charting based on the SOAP, SOAPIE, or SOAPIER format.

The POR system uses flow sheets to record routine care and a discharge summary that addresses each problem on the list and notes whether it was resolved. SOAP entries are usually made every 24 hours on any unresolved problem or whenever the client's condition changes.

PIE Charting

After SOAP charting gained in popularity, the **problem, intervention, evaluation (PIE)** system was instituted at Craven Regional Medical Center in 1984 to streamline documentation. Whereas SOAP was developed on a medical model, PIE charting has a nursing origin. PIE is an acronym for problem, intervention, and evaluation of nursing care. The key components of this system are assessment flow sheets and nurses' progress notes with an integrated plan of care that eliminates the need for a separate care plan. Each client problem is labeled and numbered for easy reference. When interventions are implemented to manage the client's problem, the problem number is identified, as shown in Figure 26-6. This system eliminates the traditional care plan by incorporating an ongoing plan of care into the daily documentation.

Focus Charting

Focus charting is a method of identifying and organizing the narrative documentation of client concerns to include data, action, and response. This method is not

Nurses Progress Record

Date	Hour	Progress Notes
12/11/01	0730	<p>Problem #2 Ketoacidosis</p> <p>S: Client states "I feel sick all over." Client claims difficulty in breathing, abdominal pain + nausea.</p> <p>O: Lungs clear, R 28/min, labored. Abdomen distended, bowel sounds underactive all 4 quadrants. 5+ abdominal pain.</p> <p>A: Alteration in nutrition + comfort R/T ketoacidosis. Blood glucose 458 mg/dl. Ketones strongly positive. pH < 7.3.</p> <p>P: Maintain IV infusion of 0.9% NS + regular insulin as ordered. NPO. Oral hygiene hourly. Maintain accurate I+O. Assess for rales, hypotension, cardiac dysrhythmias. Monitor blood glucose + electrolytes. P. Padner, RN</p>

limited to client "problems" but allows for the identification of all "concerns" such as a significant event (e.g., results of a diagnostic test). Focus charting was created in 1981 at Eitel Hospital in Minneapolis, when the results from a SOAP audit revealed weaknesses in writing care plans (18% compliance) and charting the client's response to care (12% compliance) (Iyer & Camp, 1999). Focus charting uses a columnar format within the progress notes to distinguish the entry from other recordings in the narrative notes, as shown in Figure 26-7.

Charting by Exception

Charting by exception (CBE) is a charting method that requires the nurse to document only deviations from preestablished norms. CBE was instituted in 1983 by St. Luke Medical Center in Milwaukee to overcome the recurring problem of lengthy, repetitive notes and to enable the identification of trends in client status. The CBE system has three key components:

12/11/01	0730	<p>I: Called Dr. Smith, blood glucose 458 mg/dl. IV bolus regular insulin given as ordered. 1000 ml. 0.9% NS infusing C1/H central line #1 via infusion pump. 50u regular insulin in 500 ml NS infusing C 50ml/H, central line #2 via infusion pump. EKG taken, placed on telemetry.</p>
12/11/01	0835	<p>E: Lungs clear, R 24/min, non-labored. NSR. 3+ abdominal pain. Urinary output 750 ml/hr. Blood glucose 360 mg/dl. - P. Padner RN</p>

Figure 26-5 Sample SOAPIE Charting

Nurses Progress Record		
Date	Hour	Progress Notes
12/11/01	0730	<p>P#4: nutrition R/T ketoacidosis. Blood glucose 458 mg/dl ketones strongly positive; pH 7.2.</p> <p>I#4: called Dr Smith, blood glucose 458 mg/dl IV bolus regular insulin given as ordered. 1000ml 0.9% NS infusing C1/H1 central line #1 via infusion pump. 50 u regular insulin in 500 ml N.S. infusing C 50 ml/H. central line #2 via infusion pump. EKG taken, placed on telemetry.</p>
12/11/01	0835	<p>E#4: Lung clear, ROPair non-labored. NSR. 3+ abdominal pain. Urinary output 750 ml H (0730-0830) Blood sugar 360 mg/dl. — P Jader, RN —</p>

Figure 26-6 Sample PIE Charting—The client problem is “Imbalanced Nutrition R/T Ketoacidosis”; once the problem is stated, the problem is referred to by its number only (#4) in subsequent entries.

1. Flow sheets: Highlight significant findings and define assessment parameters and findings.
2. Reference documentation: Is related to the standards of nursing practice. (All standards are met unless otherwise documented.)
3. Bedside accessibility: Is related to the documentation forms. CBE requires the nurse to document significant findings or exceptions to predefined norms.

Computerized Documentation

The contemporary health care system has directed nurse leaders to develop computerized records in response to the large demand for clinical, administrative, and regulatory information. “The health care industry has learned from other industries that computers facilitate speed in communication, accuracy in information, capability of information storage, data retrieval, and data revision” (Eggland & Heinemann, 1994, p. 54). Nursing information systems (NIS) are being developed that will complement existing hospital information systems (HIS). The NIS will collect, store, process, retrieve, display, and communicate timely information that supports:

- Administration of nursing services and resources
- Management of standardized client care information
- Linkage of research resources and educational applications to nursing practice

12/11/01	0730	<p>Assess nutrition R/T ketoacidosis</p>	<p>D: Client experiencing altered (breathing), 5+ abdominal pain, + nausea. Blood sugar 458 mg/dl; ketones strongly positive; pH 7.2 T 99.8, R 28, SpO₂ 110, BP 100/56</p> <p>A: Auscultation reveals lung clear - no adventitious bowel sounds in abd. 4 quadrants (Abdomen distended) by Smith notified of blood glucose, ketones, + pH. IV bolus of regular insulin given as ordered. IVs infusing as ordered through central lines to infusion pumps. Stat EKG done, telemetry NPO, oral hygiene admin. <u>overriding</u> J.S.O. P Jader, RN</p>
	0830		<p>R: Within 1 H (0730-0830) blood glucose 360 mg/dl. R.O. non- labored. Urinary output 750 ml/H. Client identified abdominal pain, 3+. — P Jader, RN —</p>

Figure 26-7 Sample Focus Charting

Health care facilities work in collaboration with producers of computer software to design medical record documents that complement existing documentation systems.

There are several advantages of computerized documentation. It enhances the systematic approach to client care through standardized protocols, teaching documents, data management, and communication. Computers are cost-effective and increase the quality of documentation. The practical advantages to staff nurses are:

- Saves documentation time: Data entry needs to be done only once; the system avoids duplication of effort. For example, a physician's medication order goes immediately to the pharmacy, eliminating the need to transcribe and transmit orders; the pharmacy receives the order (at preestablished computer-acceptable doses and routes), and the client's MAR is immediately updated. This system increases job satisfaction and saves more than 30% of nurses' time spent on charting.
- Increases legibility and accuracy: A computer printout is easy to read and legible. Accuracy is achieved through standardized documents that prompt the nurse for information, making the charting more complete, thorough, concise, and organized. For example, the fall-prevention standard is automatically initiated for all high-risk clients. Bedside terminals allow for client care data to be entered in a timely fashion.
- Provides clear, decisive, and concise key words: Standardized nursing terminology provides for usage of consistent key words (e.g., *alert*) and avoids ambiguous phraseology (e.g., "appears to be"). Nurses can select nursing choices on a screen that automatically builds a comprehensive record of an event.
- Facilitates statistical analysis of data.
- Enhances implementation of the nursing process: Uses documentation tools that provide an individualized plan of care: admission and nursing history data, diagnosis, goals, measurable outcomes, and interventions, inclusive of client teaching. Improved documentation of interventions has improved the PRO reimbursement.
- Enhances critical thinking and decision making: Provides access to other data, such as laboratory results, that can be correlated with the nurses' assessment data. If a trend is developing (e.g., decreasing levels of oxygenation), the nurse will recognize it quickly.
- Supports multidisciplinary networking: Information is quickly coordinated and integrated by other departments; all departments have access to the data.

Many of the disadvantages of computerized documentation are inherent in the computer and software itself: cost of installation, which limits the number of terminals at nursing stations; slow processing speed at peak

usage times; and downtime (time for routine servicing or sudden unexpected failure). Practitioners are also often reluctant to change from the comfortable "pen-and-paper" methods to a high-tech electronic system.

A series of legal issues has developed from computerized documentation: problems in protecting client confidentiality; sharing of access codes (passwords); determining who should have access to the clinical database and how it should be used. Computerized software can be designed to record all transactions, thus permitting the identification of all staff members who request sensitive information.

Point-of-Care System

Point-of-care charting allows health care providers to gain immediate access to client information. The system allows for inputting and retrieving client data at the bedside through a hand-held portable computer. At the beginning of the shift, the nurse receives a client assignment and report with all client data downloaded from the main computer into the hand-held portable computer. The nurse enters data (e.g., assessment, interventions, client's response, and evaluation) into the computer at the bedside. The information is enhanced at the bedside by interfacing the new data with other data to clarify options. At the end of the shift, or when the client's condition changes, the data from the hand-held computer are downloaded back into the main computer.

The advantages of point-of-care charting are based on the efficiency of the computer system. Since health care providers can record client data at the point of care, it:

- Controls operating costs
- Complements existing information systems
- Eliminates redundant data entry
- Allows the provider more one-on-one time for client care
- Provides crucial client information to all health care providers in a timely fashion

Point-of-care computerized documentation also facilitates the transition to a managed-care system (an integrated health care team) by focusing on the continuum of care. The focus is to provide each health care practitioner with all pertinent client data to ensure continuity of care without duplication. Because the client's status can be reviewed at the bedside, practitioners have more time for interactions with their clients.

Because it is based on focus and outcome, this type of documentation system should promote quality of care, decrease the length of stay, and foster compliance with accreditation and regulatory standards.

Case Management Process

Case management is defined as a methodology for organizing client care through an episode of illness so that specific clinical and financial outcomes are

achieved within an allotted time frame (Eggland & Heinemann, 1994). The outcome of this process is a DRG-specific case management plan that contains daily assessment documentation, care plan, outcome-oriented multidisciplinary interventions, teaching, and discharge planning.

At admission, the nurse case manager and the admitting practitioner individualize the case management plan (called a critical pathway) to meet the client's specific needs. A **critical pathway** (or critical path) is an abbreviated summary of key elements from the case management plan. The pathway is used by all health care providers as a monitoring and documentation tool to ensure that interventions are performed on time and that client outcomes are achieved on time.

Variations, sometimes referred to as a variance, are goals not met or interventions not performed within the time frame. The nurse documents on the back of the critical pathway the unexpected event (e.g., hospital-acquired decubiti), actions taken in response to the event, and appropriate discharge planning.

The advantages of case management are that it makes efficient use of time and increases the quality of care, with the expected outcomes identified on the plan. It also promotes collaboration, communication, and teamwork, which work to the advantage of the client and the facility, with discharge occurring in a timely manner. Case management also has several limitations; mainly, it is useful for clients with only one or two diagnoses. When clients have more than two diagnoses or variations, documentation becomes complicated because of limited space. This situation requires additional documentation forms to complement the pathway, such as intervention flow sheets and nurses' notes.

FORMS FOR RECORDING DATA

There are several types of forms used in record keeping: Kardex, flow sheets, nurses' progress notes, and discharge summaries. All of these forms are designed to facilitate record keeping, reduce duplicate activity, and ensure quick and easy access to information.

Kardex

A **Kardex** (client profile and client summary sheets) is a summary worksheet reference of basic client care information that traditionally is not part of the medical record. The Kardex, a concise client data source, is used as a reference throughout the shift and during change-of-shift reports. Kardexes come in various sizes, shapes, and types (and they may also be computer-generated). The Kardex is designed to complement the care delivery setting. For example, a home health Kardex would

contain information related to family contacts, practitioners (physician), other services, and emergency referrals. The Kardex usually contains the following information:

- Client data: Name, age, marital status, religious preference
- Medical diagnoses: Listed by priority
- Nursing diagnoses: Listed by priority
- Medical orders: Diet, medications, IV therapy, treatments, diagnostic tests and procedures (inclusive of dates and results), and consultations
- Activities permitted: Functional limitations, assistance needed in activities of daily living, and safety precautions

Figure 26-8 offers a brief case scenario with a sample of a computer-generated Kardex for the case.

Flow Sheets

Flow sheets have vertical or horizontal columns for recording dates and times to show assessment and interventions, making it easy to track changes in the client's condition. Client teaching, use of special equipment, and IV therapy are other aspects of the flow sheet. Because the flow sheets have small spaces for recording, these forms usually contain legends that identify the approved abbreviations to chart data (see Figure 26-9). It is important to fill out flow sheets completely because blank spaces imply that an intervention was not completed, attempted, or recognized.

The information on the flow sheet can be formatted to meet the specific needs of client populations (special needs, activity, and measurement and intervention). For example, recording assessment data may be different in pediatric clinics and pediatric hospital units than in facilities for adults. Flow sheets in critical care settings are more comprehensive than are those on a medical-surgical unit. Flow sheets can also complement other types of records of specific interventions (e.g., MAR, IV therapy).

Flow sheets are used as supplements to most documentation systems because they decrease the redundancy of charting in the nurses' progress notes. But they do not replace the progress notes. Nurses still need to document observations, client responses and teaching, detailed interventions, and other significant data in the progress notes.

Nurses' Progress Notes

The nurses' progress notes are used to document the client's condition, problems, and complaints; interventions; response to interventions; and achievement of outcomes. Progress notes include the following forms: nurses' notes, medication administration record (MAR), personal care flow sheets, teaching records, intake and

Case Presentation

Mrs. White is admitted with medical diagnoses of hyperglycemia, ketoacidosis, and a history of diabetes mellitus (DM), all diagnostic indicators of diabetic ketoacidosis (DKA). Mrs. White is having labored breathing, vomiting, and weakness. Mr. White states that his wife takes insulin for her diabetes, she doesn't follow her diet, and she has been complaining of thirst and frequent urination. On examination, the client complains of weakness and abdominal pain, and she has an acetone breath.

White, Mary	F 56
MR#: 000135039	ACCT#: 9710144268
Dr: J. Smith	2/W 402-01

CLIENT INFORMATION

10/14 ADVANCE DIRECTIVES: No. Advance directive does not exist
 10/14 ORGAN DONOR: Unknown
 10/14 ADMIT DX: Diabetic Ketoacidosis (DKA)
 10/14 ALLERGIES: None Known
 10/14 ISOLATION: Not at this time

MISC. CLIENT DATA

10/14 History of Diabetes Mellitus (DM): Insulin-Dependent Diabetic

MEDICAL DIAGNOSES

10/14 PROBLEM # 1: Hyperglycemia
 10/14 PROBLEM # 2: Ketoacidosis
 10/14 PROBLEM # 3: Hyperventilation
 10/14 PROBLEM # 4: Dehydration
 10/14 PROBLEM # 5: Hypotension
 10/14 PROBLEM # 6: Hypokalemia

NURSING DIAGNOSES

10/14 PROBLEM 1: Deficient fluid volume related to osmotic diuresis associated with hyperglycemia
 10/14 PROBLEM 2: Ineffective breathing pattern: Kussmaul respirations/air hunger related to metabolic acidosis associated with DKA
 10/14 PROBLEM 3: Decreased cardiac output related to hypokalemia associated with metabolic acidosis
 10/14 PROBLEM 4: Risk for injury: circulatory collapse, renal shutdown, and coma related to persistent, untreated hyperglycemia
 10/14 PROBLEM 5: Risk for injury: seizure susceptibility if hyperglycemia is corrected too abruptly
 10/14 PROBLEM 6: Ineffective airway clearance: aspiration related to presence of vomiting and altered level of consciousness
 10/14 PROBLEM 7: Risk for infection related to invasive procedures
 10/14 PROBLEM 8: Imbalanced nutrition: less than body requirements related to anorexia, nausea, or vomiting associated with ketoacidosis and hypokalemia
 10/14 PROBLEM 9: Deficient knowledge: prevention of DKA related to proper management of DM
 10/14 PROBLEM 10: Ineffective management of therapeutic regimen related to inadequate motivation for incorporating strategies for prevention of DKA into daily living

Figure 26-9 Assessment and Intervention Flow Sheet (Courtesy of Tulane University Medical Center New Orleans, LA)

output forms, vital sign records, and specialty forms (e.g., diabetic flow sheet and neurologic assessment form) (Egglund & Heinemann, 1994). The progress notes can be completely narrative or incorporated into a standardized flow sheet to complement SOAP(IE), PIE, focus charting, and other documentation systems.

Discharge Summary

Discharge summaries highlight the client's illness and course of care. When a narrative discharge summary is entered into the progress notes, it includes:

- The client's status at admission and discharge
- A brief summary of the client's care
- Intervention and education outcomes
- Resolved problems and continuing care needs for unresolved problems, inclusive of referrals
- Client instructions regarding medications, diet, food-drug interactions, activity, treatments, follow-up instructions, and other special needs

Many facilities have a documentation form that itemizes discharge and client instructions. The form has a duplicate copy for the client; the original goes in the medical record. Figure 26-10 shows the common elements of this tool.

TRENDS IN DOCUMENTATION

"Health care is increasingly driven by information, and consequently, patient care will demand effective management of information" (Travis & Brennan, p. 162, 1999). In the 21st century with complex clinical practice, nurses face escalating information challenges inherent in processing and communicating computerized information.

Computerized nursing documentation requires the skills of technically competent nurses to improve client care and change the delivery of health care; however, technical competence includes not only equipment competence but also skill in the efficient use of information (Travis & Brennan, 1998). "To harness innovative technologies, nurses must recognize them and know what to do with them" (Brennan, 1999, p. 128).

With the transition to managed care and the introduction of capitation by insurers, computerized charting is now prevalent in hospitals and is one of the strongest trends in documentation with home health agencies. In order for computerized nursing documentation to demonstrate the quality, effectiveness, and value of the services that nurses provide, standardized data bases have to be developed to ensure accuracy and precision in nursing information systems.

Nursing Minimum Data Set (NMDS)

In 1985, Werley and Lang convened an invitational working conference at the University of Wisconsin–Milwaukee to identify the elements that should be included in a **nursing minimum data set (NMDS)**; these are the elements that should be contained in clinical records and abstracted for studies on the effectiveness and costs of nursing care (Werley & Lang, 1988). Sixteen elements, grouped into three categories, were identified:

1. Demographics: Personal identification, date of birth, gender, race and ethnicity, and residence
2. Service: Unique facility or service agency number, episode admission or encounter date, discharge or termination date, disposition of client, expected payer, unique health record number of client,* and unique number of principal registered nurse provider*
3. Nursing care: Nursing diagnosis,* nursing intervention,* nursing outcome,* and intensity of nursing care* (Werley & Lang, 1988)

There are several challenges inherent in the development of the four nursing care categories: diagnoses, interventions, outcomes, and intensity (Hayes, Norris, Martin & Androwich, 1994). Automated information systems must be capable of supporting cost-effective nursing practice through efficient, comprehensive documentation. Basic to standardizing databases is the consistent use of a taxonomy that promotes validity and reliability. NMDS, however, does not specify taxonomy for any of the four elements, for example, NANDA (2001) diagnoses, the Omaha System, Nursing Interventions Classification (NIC) (1995), and acuity ratings. Nursing needs to achieve consensus of terminology for clinical data to be included in nursing care elements of a NMDS.

Nursing Diagnoses

A nursing diagnosis is a clinical judgment about individual, family, or community responses to actual or potential health problems or life processes (NANDA, 2001). The ANA endorsed NANDA to develop a classification for nursing diagnoses, and in 1992 the NANDA terms were accepted into the Unified Medical Language System (Ozbolt, Fruchtnight & Hayden, 1994). (Refer to Chapter 7 for a complete discussion of nursing diagnoses.)

Nursing Intervention Classification (NIC)

The **nursing intervention classification (NIC)** is a comprehensive standardized language for nursing interventions organized in a three-level taxonomy (McCloskey &

*Elements not included in the Uniform Hospital Discharge Data Set.

Bulechek, 1995). Initiated by a research team (Iowa Intervention Project) at the University of Iowa in 1987, the three-level taxonomy contains 6 domains, 26 classes, and 366 interventions. Each nursing intervention has a label, a definition, and a set of activities to carry out the interventions. *Activities are not interventions and should not be labeled as such in nursing information systems* (NIC, 1995).

The six domains are physiological–basic, physiological–complex, behavioral, family, health system, and safety. Within each domain is a set of classes (groups). An example of a class is perioperative care, which contains the nursing interventions (e.g., “Teaching Preoperative”) that contain sets of activities to carry out a specific intervention, such as, “Provide time for the patient to ask questions and discuss concerns” (Steelman, Bulechek, & McCloskey, 1994). Refer to Chapter 9 for additional discussion of NIC.

NIC interventions have been incorporated into health care data sets and the computerized client medical record. NIC has been recognized by the ANA as one of the first nursing languages to be included in the National Library of Medicine’s Metathesaurus for the Unified Medical Language System (McCloskey & Bulechek, 1995).

Grobe and colleagues at the University of Texas at Austin have been developing a lexicon and taxonomy of nursing interventions taken from home care records. Omaha Visiting Nurses Association have developed and used intervention statements to direct client care.

Nursing Outcomes

A nursing outcome is defined as the resolution status of the nursing diagnosis according to the NMDS (Ozbolt et al., 1994). Efforts are in progress with the Omaha Visiting Nurses Association and the University of Iowa to develop a taxonomy of client outcomes for nursing care. See Chapter 8 for further discussion of outcomes.

REPORTING

Reporting is the verbal communication of data regarding the client’s health status, needs, treatments, outcomes, and responses (Egglund & Heinemann, 1994). When a report is given, it needs to summarize the current critical information that facilitates clinical decision making and continuity of care. As with recording, reporting is based on the nursing process, standards of care, and legal and ethical principles. The nursing process provides structure for an organized report, a challenge inherent in verbal communications. In order to verbally communicate an efficient and well-organized report, the nurse must consider

- What needs to be said
- Why it needs to be said
- How to say it
- What the expected outcomes are

Considering these aspects of reporting before the communication will provide for a concise, organized report.

Another critical element in reporting is listening (refer to Chapter 12). Reports require participation from everyone present. When receiving a report, the nurse focuses behaviors to enhance listening skills: the nurse eliminates distractions, puts thoughts and concerns aside, concentrates on what is being said, and does not anticipate what the presenter will say next. The reporting process is an integral component of developing effective interpersonal and intrapersonal relationships that promote continuity of client care. Regardless of the type of communication, planned presentation of client data is a key to accurate, concise, effective reporting. Summary reports, walking rounds, telephone reports and orders, and incident reports are all types of reporting.

Summary Reports

Summary reports summarize pertinent client information that focuses on the client’s needs as identified by the nursing process for the new caregiver. Summary reports commonly occur at the change of shift and when the client is transferred to another area.

A summary, or end-of-shift, report should be presented as follows:

- Background data obtained from client interactions and assessment of the functional health patterns
- Primary medical and nursing diagnoses and priority problems
- Identification of client risk problems
- Recent changes in condition or in treatments (e.g., new medications, elevated temperature)
- Effective interventions or treatments of priority problems, inclusive of laboratory and diagnostic results (e.g., client’s response to pain medication)
- Progress toward expected outcomes: priority problems, teaching or discharge planning
- Adjustments in the plan of care
- Client or family complaints

This format will provide structure and organization to the data that are both logical and time-sequenced since the format follows the nursing process. The new caregiver needs to receive an accurate, concise report about

THINK ABOUT IT

Recording and Reporting

How do recording and reporting data differ? Both serve as a method of communicating information about the client’s care and other significant data. What would happen in a change-of-shift report if the two were identical?

what has happened during the previous shift in order to provide continuity of care. Client and family complaints should be addressed last for each client because these situations usually generate questions and discussion.

Walking Rounds

Walking rounds can be either nursing rounds, physician-nurse rounds, or interdisciplinary rounds. **Walking rounds** is a reporting method used when the members of the care team walk to each client's room and discuss care and progress with each other and with the client.

Nursing rounds are used most frequently by charge nurses as their method of report. During the rounds, the on-coming nurse is introduced to the client and the off-going nurse discusses with the client and the on-coming nurse changes in the plan of care. Rounds are more time-consuming than the end-of-shift report but give the nurses and the client the opportunity to evaluate the effectiveness of care together (see Figure 26-11).

Figure 26-11 Nursing rounds: What are some advantages of nursing rounds compared to traditional end-of-shift reports?

THINK ABOUT IT

Nursing Rounds

Can nursing rounds foster team building among the nurses from different shifts? Do you think nursing rounds promote client satisfaction? If your critical analysis identifies that nursing rounds have the potential for fostering team building and client satisfaction, why do you think this method of reporting is not used by all charge nurses?

Nursing rounds are also used as a teaching method. The instructor introduces the client to the student, and together they discuss the client's care. The instructor can also use this time to appraise the student's observation, communication, and decision-making skills.

Nurse-physician rounds can involve either the staff nurse or the charge nurse with the physician. These rounds usually occur daily and provide the nurse, physician, and client the opportunity to evaluate the effectiveness of care.

Interdisciplinary rounds, in which many disciplines are involved, usually occur less frequently than the other types of rounds. Continuity of care, patient satisfaction, and decreased costs are often the outcomes of daily interdisciplinary rounds (Curley, McEachern & Speroff, 1998). The interdisciplinary concept recognizes that health care providers do not work independently of one another, but address patients' needs within the context of all team members. Interdisciplinary rounds are done most commonly in place of or to supplement case conferences and to discuss discharge planning. Interdisciplinary rounds support the concept of critical pathways and are seen most frequently in teaching hospitals.

Telephone Reports and Orders

Telephone communications are another way nurses report transfers, communicate referrals, obtain client data, solve problems, and inform a physician and/or client's family members regarding a change in the client's condition. Nurses are expected to demonstrate phone courtesy and professionalism when initiating and receiving telephone reports and orders.

When initiating a phone call, organize the information to be reported or received. For example:

1. Make sure all lab results are back; if they are not, identify in advance which ones are missing and phone the lab or check the computer to determine if other results are available. Write down which tests have been performed and the results. Spell the client's name and provide the client's medical record number to avoid error in getting the results on the wrong client.
2. Review your notes, have your assessment data readily available, especially any significant client data that are related to the call. If you have not assessed the client, do an assessment before telephoning the practitioner; otherwise, the practitioner might ask you questions that you will not be able to answer.
3. Let the charge nurse or someone else at the nurses' station know that you are placing the call so that you will not be interrupted while on the phone.

When you place the call, state the reason you are calling: for example, "I am calling Dr. Smith regarding the blood sugar results for Mrs. White." Be brief and listen carefully. Repeat the test results and any orders the physician gives over the phone.

Record accurately in the medical record the date and time the phone call was placed, the client data you reported on the phone, the name of the person you spoke with, and whether an order was obtained. Do not chart "physician notified, no orders obtained." Rather, chart "Dr. Smith notified by phone, blood sugar 260 mg

Title of Study

“Interdisciplinary Rounds Reduced Hospital Stay and Costs and Improved Staff Satisfaction”

Authors

Curley, C., McEachern, J.E., & Speroff, T.

Purpose

To determine whether interdisciplinary rounds improve efficiency of patient care and staff satisfaction, and decrease costs on inpatient medical units.

Methods

A randomized controlled trial of three inpatient medical units was conducted in an acute care, tertiary referral and teaching hospital in Cleveland, Ohio. The study population consisted of 1,102 patients who were admitted to and discharged from the medical unit, with a mean age of 53 years (52% women). First admission patients were allocated to one of three inpatient medical units from which they received all care for this and subsequent admissions; each of the three units had two physician teams—567 patients were allocated to interdisciplinary rounds, and 535 were allocated to traditional rounds. Daily interdisciplinary rounds were conducted on both teams from unit 1 and one team from another unit. The interdisciplinary team, designed by a continuous quality improvement team, consisted of physicians, a nurse patient care coordinator, a pharmacist, a nutritionist, and a social worker; patient orders were written during rounds. The other units conducted traditional rounds that consisted of daily rounds by physicians only and weekly interdisciplinary rounds; orders were written throughout the day, and patient charts were left at the nursing station. The outcome measures dealt with length of hospital stay, total charges, number of hospital deaths, type of hospital disposition, and health care provider satisfaction.

Findings

Compared with traditional rounds, interdisciplinary rounds led to decreased length of hospital stay, lower costs for patients on medical units, and improved staff satisfaction. There was no difference in the rate of hospital deaths, patients discharged to home, and discharges to an interim care facility.

Implications

To decrease hospital cost and increase patient satisfaction, nurses working on adult inpatient units should consider practice changes to support more frequent formal communication among nurses, physicians, and other health care providers; and to encourage orders written once a day during rounds when all team members are present.

Curley, C., McEachern, J.E., & Speroff, T. (1998). Interdisciplinary rounds reduced hospital stay and costs and improved staff satisfaction. *Medical Care*, 36(5), 4–12.

(drawn by the lab at 1300), orders received and recorded on the physician order sheet.” Charting telephone orders and documentation in the nurses’ progress notes should be done as soon as possible after the phone call to prevent an entry by another caregiver before you chart the telephone report.

Figure 26-12 demonstrates how to write a telephone order onto the physician order sheet: date and time the entry; record the order as given by the physician; then sign the order beginning with *t.o.* (telephone order), write the physician’s name, and sign your name. If another nurse witnesses the phone order, that nurse’s signature should go after yours.

The physician needs to countersign the order within a time frame as specified by the facility’s policy. Fax machines have decreased the need for lengthy or complicated telephone orders, both saving time and avoiding error. To confirm the physician’s identity as the initiator of the fax orders, telephone the physician. The physician needs to countersign the fax orders according to agency policy.

Incident Reports

Incident reports, or occurrence reports, are used to document any unusual occurrence or accident in the delivery of client care, such as falls or medication errors. The

12/14/01	0845	Decrease IV infusion of 50u of regular insulin in 500ml of N.S. to infuse @ 5u/kg per hour.
		T.O. Smith / Pat Faber, RN.

Figure 26-12 Documenting a Telephone Order

Code for Nurses (ANA, 1985) states that nurses are expected “to protect the client when safety is affected.” Ethical practice requires that nurses file an incident report to protect the client not to punish the caregiver.

The filing of incident reports is not only an internal device for the facility but is also a requirement by federal, national, and state accrediting agencies. Nurses are often advised not to document the filing of an incident report in the nurses’ notes for legal reasons, but, as previously discussed, documenting medication errors (Fiesta, 1996) requires an incident report and documentation in the nurses’ notes to ensure that the client receives safe care.

The incident report serves two functions:

1. It informs the facility’s administration of the incident, so risk management personnel can consider changes that might prevent similar occurrences in the future.
2. It alerts the facility’s insurance company to a potential claim and the need for further investigation.

Litigation can be avoided if the facility takes prompt action by investigating an occurrence. The incident report is not part of the medical record, but it may be used later in litigation.

Each person with firsthand knowledge of the occurrence should fill out and sign a separate report. Although the incident report format varies from one facility to another, there are key elements that must be addressed when filing a report:

- Record the date, exact time, and place you discovered the occurrence.
- Identify the person(s) involved in the occurrence, including witnesses.
- Document accurately and objectively the exact occurrences that you witnessed or first saw after the incident; for example, record “found the client sitting on the floor. Client stated that . . .” rather than “client fell.”
- Record the exact details, in time sequence, what happened, and the consequences for the persons involved.

- Record your actions to provide care and results of your assessment for injuries or client complaints.
- Notify the supervisor on duty and record the time and name of the physician notified; if telephone orders were received from the physician, document as previously discussed and implement the orders.
- Do not record your opinions, judgments, conclusions, or assumptions about what occurred, point blame, or suggest how to prevent occurrence of a similar incident.
- Forward the incident report to the designated person as defined in the facility’s policy.

Iyer and Camp (1999) suggest an additional safeguard for the nurse; write a brief, accurate description of the incident and keep it at home. In the description, include the details of the incident and the names of the people who were involved, especially if they can substantiate your information. Lawsuits may take several years from the time of an incident until the case goes to court; your personal notes will help you with accurate recall of the incident. Use the same elements described above in filing an incident report because your personal notes may be read by the plaintiff’s attorney.

Special attention should be given to documenting falls, because current research shows that patient falls constitute 75% to 80% of all incident reports on clinical

Nursing Process Highlight

DOCUMENTATION OF CLIENT FALL

Assessment

- Check for bruises, lacerations, or abrasions.
- Check blood pressure, pulse, respirations.
- Perform a neurologic assessment (slurred speech, weakness, mental status).
- Check for incontinency (urinary or fecal).
- Note any pain or deformity in the extremities (arm, lumbar spine, hip, or leg).

Interview the Client

- Were there any symptoms prior to the fall (lightheadedness, impaired vision, dizziness, weakness, palpitations, shortness of breath, chest pain)?
- What were your actions prior to the fall (movements, muscle jerks, breathing pattern)?
- How did the fall occur (getting out of bed, while walking in the room)?
- Did anyone witness the fall?

Be sure to chart what you observe (“Client prone on floor”), not what you conclude (“Client fell out of bed”). Document all data in the nurses’ progress notes and on the incident report.

units (Springhouse, 1995). Client falls are the main reason nurses are sued (Iyer & Camp, 1999). (Refer to Chapter 23 for information on how to prevent client falls and their legal ramifications.) The Nursing Process Highlight identifies the required nursing documentation when a client falls.

KEY CONCEPTS

- Documentation provides a system of written records that reflect client care provided on the basis of assessment data and the client's response to interventions.
- The medical record can be used by health care students as a teaching tool and is a main source of data for clinical research.
- Nurses are responsible for assessing and documenting that the client has an understanding of the treatment prior to the intervention.
- Competent adult clients have the right, through an advance directive, to make decisions regarding life-sustaining interventions when they become incapacitated or terminally ill.
- Standards of care, as set forth by State Boards of Nursing and the American Nurses Association, require nurses to use the nursing process in their documentation.
- Accreditation and reimbursement agencies require accurate and thorough documentation of the nursing care rendered and the client's response to interventions.
- Effective documentation requires clear, concise, accurate recording of all client care and other significant events in an organized and chronological fashion, representative of each phase of the nursing process.
- Client safety requires appropriate reporting and recording of medication errors and other occurrences in compliance with the facility's policy.
- Narrative charting requires an organized presentation of the client's problems and response to interventions in chronological order.
- Problem-oriented charting provides structure when documenting the client's problems and responses in the nurses' progress notes.
- Computerized documentation saves time, increases legibility and accuracy, provides standardized nursing terminology, enhances the nursing process and decision-making skills, and supports continuity of care.
- Managed care incorporates client participation in planning the care while focusing on the quality of care provided in a timely fashion.
- Critical pathways document the key interventions of managed care plans.
- Kardexes are concise documents used to direct the daily activities of client care.
- Flow sheets are used to document assessment findings, activity, measurements, treatments, and equipment.

- The discharge summary is used to highlight the client's illness, course of care, and aftercare instructions.
- Incident reports are used to document any unusual occurrence in the delivery of client care.

CRITICAL THINKING ACTIVITIES

1. During your clinical laboratory, review the documentation tools:
 - Do they form a system?
 - Is the nursing process evident?
 - Do you have to chart the same data on more than one form?
2. Read a client's medical record. Can you identify what was done for the client and the client's responses? If you cannot, what significant data are missing?
3. When planning the care for your clients, identify the critical elements of assessment that you will need to document. Analyze these data in relation to the documentation system of your assigned clinical facility and the types of forms for charting.
4. Given a flow sheet from the clinical facility you are assigned and Mrs. White's Kardex, Figure 26-8, what critical elements must be documented to maximize reimbursement?
5. Mrs. White's (Figure 26-8) blood sugar has been within normal limits for 48 hours, and she has been discharged by Dr. Smith. Write a narrative discharge summary that highlights her illness and course of treatment. Does she need any special instruction or a referral to a home health care agency?
6. Given the information on the computer-generated Kardex (Figure 26-8), give a change-of-shift report on Mrs. White to a classmate.
7. What information must be documented in the nurses' progress notes when using an assessment and intervention flow sheet?
8. Label each of the following statements that describes the acronym components of problem-oriented charting (SOAP):
 - ___ Abdomen distended; on auscultation, bowel sounds absent in all 4 quadrants
 - ___ Imbalanced nutrition: less than body requirements related to inability to digest or absorb nutrients; first day postop. Risk for deficient fluid volume.
 - ___ "I'm nauseated, I think I'm going to vomit."
 - ___ Notified Dr. James of symptoms and client's complaints. Placed NPO; increase intravenous fluids of normal saline to 150 ml/hr; measure I&O; keep environment quiet; reassure client.
9. Describe the format for focus charting.
10. What are the advantages and disadvantages of computerized documentation?

of the Perioperative Client

Chapter 27

Vital Signs and Physical Assessment

Nurses (need) to have technical skills and a strong knowledge base, (yet) it is especially important to be fully present with patients, and listen to the story they have to tell . . .

—Dossey (in Gray, 1995)

COMPETENCIES

1. Describe the physiological mechanisms governing temperature, pulse, respiration, and blood pressure.
2. Identify the normal age-related variations for vital sign measurements.
3. Select the appropriate equipment used to take the vital signs and perform a physical examination.
4. Describe the correct positioning of the client for performing a physical examination.
5. Demonstrate the psychomotor techniques used in conducting a physical examination.
6. Describe the assessment alterations obtained from a physical examination.
7. Document the normal findings of a physical examination.

KEY
TERMS

adventitious breath sounds	dyspnea	pleural friction rub
aneurysm	dysrhythmia	pulse
angina	eupnea	pulse deficit
aphasia	evaporation	pulse pressure
apnea monitor	expiration	pulse quality
arthritis	external respiration	pulse rate
ascites	extinction	pulse rhythm
atherosclerosis	Glasgow Coma Scale	pulse volume
atrophy	goniometer	pyrexia
auscultatory gap	graphesthesia	pyrogens
basal metabolic rate (BMR)	heaves	radiation
baseline values	hemodynamic regulation	regurgitation
blood pressure	hypertension	respiration
bradycardia	hypertonicity	rhonchi
bradypnea	hypertrophy	Snellen chart
bronchial sounds	hyperventilation	stenosis
bronchovesicular sounds	hypotension	stereognosis
bruits	hypotonicity	striae
cachexia	hypoventilation	stridor
cardiac output	insensible heat loss	stroke volume
conduction	inspiration	systole
convection	integumentary system	tachycardia
costal breathing	internal respiration	tachypnea
crackles	ischemia	tactile fremitus
crepitus	murmur	thermoregulation
cyanosis	myocardial infarction	thrills
cystocele	nystagmus	tympany
degree	orthostatic hypotension	vasoconstriction
dermatome map	osteoarthritis	vasodilation
diaphoresis	osteoporosis	vesicular sounds
diaphragmatic breathing	oximeter	vital capacity
diastole	piloerection	vital signs
dullness	pleura	wheezes

 Physical assessment, an essential nursing function, is performed on every client. The measurement of vital signs and the execution of the physical examination as part of the assessment process are done to gather information regarding the physiological functioning of the body. This chapter discusses the normal physiological functioning of the body and the common deviations from normal, measurement and evaluation of these functions, preparation of the client for the physical examination, and the techniques used to perform a physical examination.

VITAL SIGNS

The “taking of **vital signs**” refers to measurement of the client’s body temperature (T), pulse (P) and respiratory (R) rates, and blood pressure (BP). Vital signs are fundamental to physical assessment (the first step in the physical examination) to establish baseline values of the

client’s cardiorespiratory integrity. **Baseline values** establish the norm against which subsequent measurements can be compared. Variations from normal findings may indicate potential problems with the client’s health status. Nurses should confirm “normal” measurements with clients because the perception of what is normal may vary among clients.

Vital signs are taken whenever the client is admitted to a health care facility or service, for example, home health care, clinic, or other ambulatory setting, and on a routine basis in the hospital. The frequency of vital sign measurements for the hospitalized client is determined by the client’s health status, physician orders, and the established standards of care for the particular clinical setting or service. Whenever a change is suspected in the client’s status, the nurse should measure the vital signs, regardless of the setting.

The sequence for recording vital signs measurement in the nurses’ notes is T-P-R and BP. Agencies usually have special graphic forms used to record vital signs findings. These forms facilitate data comparison at a glance because the data are plotted on a graph.

Physiological Function

Healthy people have the ability to meet their own needs; however, during illness, people need assistance (in proportion to the degree of dysfunction) in meeting their basic needs. The assessment of physiological functioning provides specific data regarding the client's current condition. Data analysis allows the nurse to plan nursing care that is responsive to the preventive and restorative needs of the client. See Chapters 5 through 10 for a complete discussion of the steps of the nursing process.

Thermoregulation

Thermoregulation is the body's physiological function of heat regulation to maintain a constant internal body temperature. The heat of the body is measured in units called **degrees**. The "core" internal temperature of 98.6° Fahrenheit (F) (37° centigrade [C]) does not vary more than 1.4°F (0.77°C) and is higher than the skin and external temperature. In contrast, the skin temperature rises and falls in accordance with changes in environmental temperature.

Heat Production

Heat is produced in the body's cells through food metabolism that results in the release of energy. The body converts energy supplied by metabolized nutrients to energy forms that can be used directly by the body. One form of this energy is thermal energy for regulation of body temperature. Energy is measured in terms of heat. A kilocalorie is an energy value (heat measure) of a given food; 1 kilocalorie equals 1000 calories (the amount of heat required to raise the temperature of 1 kilogram of water 1°C). This type of heat liberation is usually expressed as the metabolic rate and measured as the **basal metabolic rate**, or **BMR** (the rate of energy use in the body needed to maintain essential activities). See Chapter 38 for a complete discussion of calories, kilocalories, and metabolic rate.

Factors that affect the metabolic rate of heat liberation, such as age and exercise, are discussed later in this chapter. The thyroid hormones thyroxine and triiodothyronine increase basal metabolism by breaking down glucose and fat. Muscular activity also produces heat from the breakdown of carbohydrates and fats and through shivering.

Body temperature is controlled by balancing metabolic heat production with heat loss. Most heat production comes from the deep tissue organs (brain, liver, and heart) and the skeletal muscles. The skin, subcutaneous tissues, and fat of the subcutaneous tissues serve as heat insulators for the body. Sweat glands in the dermis are innervated by sympathetic nerves of the autonomic nervous system and are controlled by the anterior hypothalamus to regulate sweating.

When body heat rises, the hypothalamus transmits impulses to reduce body heat by triggering perspiring, **vasodilation** (the widening of blood vessels), and the

inhibition of heat production. The opposite physiological functioning occurs in response to a decrease in body heat. In this situation the hypothalamus transmits impulses to stimulate heat production through **vasoconstriction** (the narrowing of blood vessels), muscle shivering, and **piloerection** (hairs standing on end).

Heat Loss

Most body heat is lost from the skin's surface to the environment by the processes of radiation, conduction, convection, and evaporation as presented in Table 27-1. **Insensible heat loss** is the heat that is lost through the continuous, unnoticed water loss that occurs with vaporization, accounting for 10% of basal heat production. Evaporation accounts for the greatest heat loss when body heat increases.

Behavioral Control of Body Temperature

In addition to the heat production and heat loss mechanisms described above, the body has another potent mechanism for temperature control, known as behavioral control. In response to the body's signaling conditions of either being overheated or too cold, the person makes appropriate environmental adjustments to reestablish comfort. Guyton, Hall, & Schmitt (1997) recognize this mechanism as the most effective mechanism for body heat control in severely cold environments.

Respiration

Respiration is the act of breathing. Respiration is defined by physiological functioning as:

- **External respiration**—the exchange of oxygen and carbon dioxide between the alveoli of the lungs and the pulmonary blood system
- **Internal respiration**—the interchange of oxygen and carbon dioxide between the circulating blood and cells throughout the body
- **Inspiration** (inhalation)—the intake of air into the lungs
- **Expiration** (exhalation)—the movement of gases from the lungs to the atmosphere
- **Vital capacity**—the amount of air exhaled from the lungs after a minimal full inspiration

The following five major physiological pulmonary functions provide oxygen to the tissues and remove carbon dioxide:

1. **Ventilation**—the inflow and outflow of air between the atmosphere and the lung alveoli.
2. **Circulation**—the quantity of blood flowing through the lungs is approximately 4 to 6 L/min.
3. **Diffusion**—the exchange of oxygen and carbon dioxide between the alveoli and the blood.
4. **Transport**—the carrying of oxygen and carbon dioxide in the blood and body fluids to and from the cells.

TABLE 27-1
Methods of Heat Loss

Method	Characteristics	Example
Radiation: Loss of heat in the form of infrared rays	All objects that are not at absolute zero radiate heat rays from the surface of one object to the surface of another object that is not in physical contact with the first object.	If the temperature of the body is greater than the surroundings, heat is lost from the body to the environment. A nude person in a room with normal temperature will lose about 60% of total heat loss by radiation.
Conduction: Loss of heat to an object in contact with the body	Heat is lost to other objects that are cooler than the skin. As much as 15% of the body's total heat loss is transferred to the air. Once the temperature of the air adjacent to the skin equals the skin temperature, there is no further loss of body heat.	Bathing a client in cool or tepid water will lower the client's temperature.
Convection: Movement of heat away from the body's surface	Convection accompanies conduction when the warmed air or water is replaced with cooler elements.	The use of fans enhances convected heat loss by air. Water adjacent to the skin can absorb far greater quantities of heat than can air. Clothing entraps air next to the skin, decreasing heat loss from the body by conduction and convection.
Evaporation: Continuous insensible water loss from the skin and lungs when water is converted from a liquid to a gas	It takes approximately 0.58 calories of heat for a gram of water to evaporate.	Insensible water loss is continuous. Insensible loss occurs regardless of body temperature; thus, it is not a major regulator of temperature.

5. Regulation—the neurogenic system that adjusts the rate of alveolar ventilation to meet the demands of the body. The arterial blood oxygen pressure (P_{O_2}) and arterial blood carbon dioxide pressure (P_{CO_2}) may be altered during times of strenuous exercise and other types of respiratory stress. See Chapter 32 for a complete discussion about oxygenation.

The mechanics of pulmonary ventilation depend on abdominal recti and internal intercostal muscles that cause lung expansion and contraction. Normal breathing is accomplished by:

1. The downward and upward movement of the diaphragm to lengthen or shorten the chest cavity
2. The elevation and depression of the ribs to increase and decrease the anteroposterior diameter of the chest cavity

Children and men normally breathe with their diaphragm muscles; adult women generally breathe with their upper chest muscles (Firth & Watanabe, 1996).

Hemodynamic Regulation

Hemodynamic regulation is the physiological function of blood circulating to maintain an appropriate environment in tissue fluids. Circulation transports nutri-

ents to the tissues, removes waste products, and carries hormones from one part of the body to another. When the body's circulatory needs change, the heart rate either accelerates or decelerates. This is a compensatory mechanism under the control of the cardiac centers that are located in the medulla of the brain stem. The sensory receptors in the tissues transmit impulses to the cardiac centers, which in turn trigger a change in the heart rate through the sympathetic and parasympathetic nervous systems that innervate the heart. When the physiological needs of the tissues are met, the heart rate returns to normal.

Systemic circulation supplies blood to all the tissues of the body except the lungs (which is accomplished through pulmonary circulation). Approximately 84% of the entire blood volume is in the systemic circulation, with the heart containing 7% and the pulmonary vessels containing 9%. The circulatory system is composed of:

- Arteries—large vessels that transport systemic blood under high pressure to the tissues
- Arterioles—the smallest branches of the arterial system that act as control valves to release blood into the capillaries
- Capillaries—thin-walled vessels permeable to small molecular substances that exchange fluids, nutrients, electrolytes, hormones, and other substances between the blood and interstitial fluid

- Venules—vessels that collect blood from the capillaries and gradually coalesce into progressively larger veins
- Veins—vessels that transport systemic blood from the tissues back to the heart and serve as a reservoir for extra blood

The normal physiological function of the cells requires continuous blood flow and appropriate volume and distribution of blood to the cells that need nutrients. This is accomplished through the heart's contraction and ejection of blood into the aorta and the distensibility of the arterial system. The combination of the arterial distensibility and resistance reduces the pressure pulsations, allowing continuous blood flow to the tissues. The dynamics of distensibility and resistance maintain a constant blood flow; otherwise, blood would flow to the tissues only during **systole** (phase in which the ventricles contract to eject blood) with an absence of blood flow during **diastole** (phase in which ventricles are relaxed and no blood is being ejected).

The cardiac cycle has two phases: systole and diastole. At the onset of systole there is an increase in ventricular pressure that causes the mitral and tricuspid valves to close. The closing of these valves produces the first heart sound (S_1). Ventricular pressure continues to increase until it exceeds the pressure in the pulmonary artery and the aorta, causing the aortic and pulmonic valves to open and allowing the ventricles to eject blood into these arteries. Ventricular emptying and relaxation cause a decrease in the ventricular pressure and closure of the aortic and pulmonic valves. Closure of these valves produces the second heart sound (S_2). During diastole the pressure in the ventricles is less than that in the atria, causing the mitral and tricuspid valves to open and allowing blood to flow from the atria into the ventricles until the end of diastole, when the atria contract to send the rest of the blood into the ventricles. Ventricular filling causes an increase in pressure that closes the mitral and tricuspid valves (the beginning of systole) and starts another cardiac cycle.

Stroke volume is the measurement of blood that enters the aorta with each ventricular contraction. With each ventricular contraction, the heart ejects 60 to 70 ml of blood into the aorta. **Cardiac output** is the volume of blood pumped by the heart in 1 minute and is measured by multiplying the heart rate by the ventricle's stroke volume. For example, a client with a heart rate of 80 beats per minute times a stroke volume of 60 ml of blood would have a cardiac output of 4800 ml. **Pulse pressure** is a measurement of the ratio of stroke volume to compliance (total distensibility) of the arterial system.

Pulse

The **pulse** is the bounding of blood flow in an artery that is palpable at various points on the body. The pulse is caused by the stroke volume ejection and distension of the walls of the aorta, which creates a pulse wave as it

travels rapidly toward the distal ends of the arteries. As the pulse wave reaches a superficial peripheral artery and travels over an underlying bone or muscle, the pulse can be palpated by applying gentle pressure over a pulse point (a specific area where the peripheral pulses can be palpated). Figure 27-1 shows the location of pulse points throughout the body.

Blood Pressure

Both the blood pressure and pulse are measurements that determine the volume of ejected blood into the arterial system with each ventricular contraction. **Blood pressure** is the measurement of pressure pulsations exerted against the blood vessel walls during systole and diastole. It is measured in terms of millimeters of mercury (mm Hg). In a healthy young adult, the pressure at the height of each pulse (the systolic pressure) is approximately 120 mm Hg, and the pressure at the lowest point of each pulse (diastolic pressure) is approximately 80 mm Hg. The pulse pressure is the difference between these pressures, which is 40 mm Hg. If 1 mm Hg caused a vessel originally containing 10 ml of blood to increase its volume by 1 ml, the distensibility would be 0.1/mm Hg, or 10%/mm Hg (Guyton, Hall, & Schmitt, 1997).

The body has four hemodynamic regulators for blood pressure control:

1. **Blood volume**—the volume of blood in the circulatory system. Blood pressure is proportional to the blood volume. Hemorrhage causes a loss in blood volume that, in turn, lowers the blood pressure. Rapid infusion of intravenous fluids causes an increase in volume and subsequent rise in pressure.

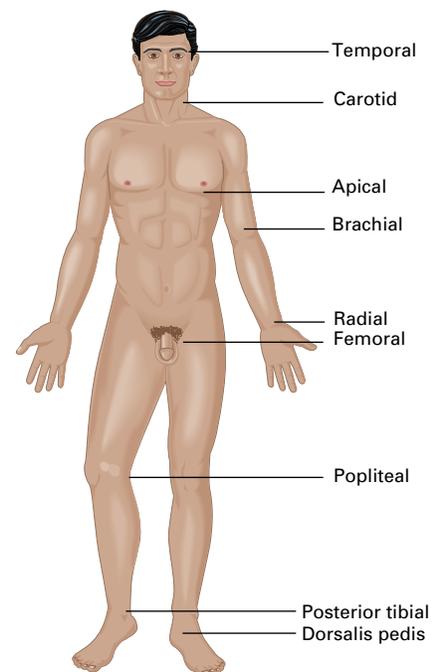

Figure 27-1 Pulse Points

2. Cardiac output—the major factor that influences systolic pressure.
3. Peripheral vascular resistance—the size and distensibility of the arteries, which is the most important determinant of diastolic pressure. Arterial resistance (decreased distensibility) is encountered when the left ventricle pumps blood from the heart under pressure during the systolic phase. The arteries contain smooth muscles that allow them to contract, which decreases their compliance (tone) and causes resistance. The varying degrees of tone allow some of the arterioles to remain constricted while others dilate to protect the body's circulatory system from accommodating a greater blood capacity than the actual blood volume. If all of the arterioles were to dilate at one time, there would not be enough blood to fill them.
4. Viscosity—the thickness of the blood based on the ratio of proteins and cells to the liquid portion of blood. The greater the viscosity, the harder the heart must work to pump blood, with a resultant increase in blood pressure.

These regulators work in unison to create a constant blood pressure. For instance, when the blood volume decreases, the body compensates with an increased heart rate and vasoconstriction that increases peripheral resistance to maintain normal pressure and functions of the vital organs.

Blood pressure is a result of the cardiac output and peripheral vascular resistance. Normal arteries expand during systole and contract during diastole, creating two distinct pressure phases:

- Systolic blood pressure is a measurement of the maximal pressure exerted against arterial walls during systole (when myocardial fibers contract and tighten to eject blood from the ventricles), primarily a reflection of cardiac output.
- Diastolic blood pressure is a measurement of pressure remaining in the arterial system during diastole (period of relaxation that reflects the pressure remaining in the blood vessels after the heart has pumped), primarily a reflection of peripheral vascular resistance.

Serial blood pressure readings provide significant clinical data relative to the client's cardiovascular and fluid volume status. See Chapter 37 for a complete discussion of maintenance of fluid volume.

FACTORS INFLUENCING VITAL SIGNS

Several factors can cause changes in one or more of the vital signs: age, gender, heredity, race, lifestyle, environment, medications, pain, and other factors such as exercise and metabolism, anxiety and stress, postural changes, diurnal variations, and hormones.

Age

The normal values and variations in vital sign measurement are usually based on age (see the accompanying displays that present age-related changes in temperature, pulse, and respiration). In newborns, thermoregulation and the respiratory center are immature. The newborn's temperature fluctuates with the environment. Clothing must be adequate to maintain body heat. For example, the newborn's head should be covered because up to 30% of body heat can be lost through the head. The newborn's respiratory rate is from 30 to 50 breaths per minute with a slightly irregular rhythm.

NORMAL AGE-RELATED VARIATIONS IN BODY TEMPERATURE

Age	Normal Range	Celsius	Fahrenheit
		Newborn	Axillary
1 yr	Oral	37.7°C	99.7°F
3 yr	Oral	37.2°C	99.0°F
5 yr	Oral	37.0°C	98.6°F
Adult	Oral	37.0°C	98.6°F
	Axillary	36.4°C	97.6°F
	Rectal	37.6°C	99.6°F
70+ yr	Oral	36.0°C	96.8°F

NORMAL AGE-RELATED VARIATIONS IN RESTING PULSE

Age	Normal Range	Average Rate/Minute
Newborn	100–170	140
1 yr	80–170	120
3 yr	80–130	110
6 yr	75–120	100
10 yr	70–110	90
14 yr	60–110	90
Adult	60–100	80

NORMAL AGE-RELATED VARIATIONS IN RESTING RESPIRATION

Age	Normal Range	Average Rate/Minute
Newborn	30–50	40
1 yr	20–40	30
3 yr	20–30	25
6 yr	16–22	19
14 yr	14–20	17
Adult	12–20	18

In the elderly, the efficiency of thermoregulation is reduced by the physiological changes of aging, including loss of subcutaneous fat, decreased sweat gland activity, reduced metabolism, and poor vasomotor control. Financial status and environmental conditions experienced by the elderly may also affect diet, activity, and ability to control the external temperature.

The normal aging process causes changes in the elderly person's respiratory functions. Major physiological alterations include:

- **Ventilation**—Bony changes in the thorax and vertebrae and the decline in respiratory and abdominal musculature reduce the ability of the lungs to distend.
- **Circulation and diffusion**—The increase in dead air space in the respiratory tree decreases the quantity of blood flowing through the lungs and gaseous exchange.
- **Transport**—**Atherosclerosis** (plaques in the inner walls of arteries) and **dysrhythmia** (irregular heartbeat) reduce the amount of blood flow available to tissues.
- **Regulation**—The inability of lung function to perform maximal breathing for extended periods of time reduces the rate of alveolar ventilation to meet the demands of the body.

See Chapter 18 for a complete discussion of the physiological changes that occur in the elderly.

Blood pressure varies throughout life (see the accompanying display). From early childhood throughout adolescence, the blood pressure varies according to body size. An adult's blood pressure continues to increase with age.

NORMAL AGE-RELATED VARIATIONS IN BLOOD PRESSURE

Age	Systolic (mm Hg)	Diastolic (mm Hg)	Average
Newborn	65–95	30–60	80/60
Infant	65–115	42–80	90/61
3 Years	76–122	46–84	99/65
6 Years	85–115	48–64	100/56
10 Years	93–125	46–68	109/58
14 Years	99–137	51–71	118/61
Adult	100–140	60–90	120/80
Elderly	100–160	60–90	130/80

Gender

Women usually experience greater temperature fluctuations than men because of hormonal changes. Temperature variations occur during the menstrual cycle

mainly in response to the progesterone level. As the progesterone level increases during ovulation, temperature gradually rises. During menopause, the instability of the vasomotor controls may cause periods (30 seconds to 5 minutes) of intense body heat and sweating. Males in general have higher blood pressure than do females of the same age.

Heredity

Although many studies have been conducted to relate hereditary factors to specific cardiovascular disease occurrence, the results are often inconclusive regarding the influence of heredity versus environmental factors. For example, studies have been conducted to relate elevated blood cholesterol levels to a single gene. Giger and Davidhizar (1995) describe studies of Jews and non-Jews and compare Ashkenazi Jews with Oriental Jews based on the theory that elevated blood cholesterol levels may be caused by a single gene. These studies indicate a higher occurrence of elevated blood cholesterol levels among Jews than among non-Jews and that Ashkenazi Jews may have a higher frequency of the gene than Oriental Jews. The conclusions of these studies indicate a need for further studies to be done to determine the frequency of heart disease among Jews, as well as the interplay between heredity and environment (Giger & Davidhizar, 1995).

Race

Some ethnic groups are more susceptible than others to hemodynamic alterations. The incidence of hypertension is higher in African-Americans than in European Americans. For example, African-American men over the age of 35 have higher blood pressure than do European American men of the same age.

Lifestyle

Lifestyle factors, such as cigarette smoking, cause chronic changes in the lungs as manifested by impaired ventilation. Stimulants such as caffeinated beverages and tobacco elevate heart rate. The effects of exercise and stress are discussed below.

Environment

Environmental factors such as temperature and noise level can alter heart rate. Acid rain and industrialized areas are often associated with a high occurrence of respiratory conditions, such as infections and chronic lung diseases.

Primary prevention is a major role of occupational (industrial) health nurses. A health screening examination relies heavily on vital sign measurements and

physical examination findings. The occupational health nurse should perform health screening examinations that focus on the short-term results of certain environmental conditions (diseases) and monitor for the development of chronic trends; see the accompanying display for screening criteria.

Medications

Some medications can directly or indirectly alter the pulse, respirations, or blood pressure. Digitalis preparations (cardiac glycosides) decrease the pulse rate. Narcotic analgesics (pain medications) can depress the rate and depth of respirations and lower the blood pressure.

HEALTH SCREENING CRITERIA

The performance of a health screening examination is justified when the disease being screened for has:

- A significant effect on the longevity or the quality of life
- A sufficiently high prevalence rate to justify the cost of the screening program
- Been shown to have better therapeutic results if detected in the early stage and worse results with delayed detection and treatment
- A significant asymptomatic period allowing an opportunity for detection and treatment that will reduce the rate of morbidity and mortality
- An acceptable method of treatment

(Data from Edelman, C. L., & Mandel, C. L. [1997]. *Health promotion throughout the lifespan* [4th ed., p. 231]. St. Louis, MO: Mosby Yearbook.

NURSING ALERT

Vital Signs and Medications

Always ask clients what medications they are currently taking and be aware of the side effects of any medications you administer. Certain drugs may either increase or decrease pulse rate and blood pressure. If the drug alters the client's pulse, respiration, or blood pressure, provide appropriate client teaching so that the client is able to compensate for the variations in these functions.

Pain

Each person reacts to pain in varying degrees. With acute pain, sympathetic stimulation increases the heart rate, which increases the cardiac output and vasoconstriction, causing an increased peripheral vascular resistance. These changes result in increased pulse and respiratory rates, depth of respirations, and blood pressure. Chronic pain causes parasympathetic stimulation and decreases

the pulse rate. See Chapter 33 for a complete discussion about pain and measures to promote comfort.

Other Factors

Table 27–2 discusses the effects of exercise and metabolism, anxiety and stress, postural changes, and diurnal (daily) variations (also called circadian) on the vital sign measurements. Routine exercise increases metabolism and heat production and strengthens the cardiac muscles. The normal untrained person can increase cardiac output fourfold with exercise, and the trained athlete can increase cardiac output about sixfold (Guyton, Hall, & Schmitt, 1997).

Anxiety and stress stimulate the sympathetic nervous system to:

- Increase the production of epinephrine and norepinephrine, with a resultant increase in metabolic activity and heat production
- Increase the heart rate, which, in turn, increases the cardiac output and causes vasoconstriction with a subsequent increase in peripheral vascular resistance

Sympathetic stimulation causes an increase in the pulse rate and blood pressure. See Chapter 20 for a complete discussion about stress, anxiety, and adaptation.

Postural changes occur in response to stimulation of the baroreceptors (spray-type nerve endings of the autonomic nervous system) that are located in the walls of the arteries. The baroreceptor reflex is the primary mechanism for maintaining a relatively constant arterial pressure. When a person stands up after lying down, the arterial pressure in the head and upper part of the body immediately tends to fall. This falling pressure elicits an immediate baroreceptor reflex, resulting in strong sympathetic discharges throughout the body. This response minimizes the decrease in pressure in the head and upper body (Guyton, Hall, & Schmitt, 1997). The person's blood pressure decreases when a person goes from a lying to a sitting or standing position. However, the pulse is lower in a lying position and increases in a sitting or standing position.

Each person has a different temperature pattern, with a normal variance ranging from 0.5° to 1°C (0.9°–1.8°F) for a 24-hour period. Table 27–2 identifies when the lowest temperature and pulse variances occur.

The skin temperature rises and falls with a change in environmental temperature. Infants and older adults are most susceptible to environmental changes because their temperature-regulating mechanisms are less effective. Warm environments decrease conduction and increase body temperature, which, in turn, increases the metabolic rate, resulting in an increased pulse rate. Improper clothing in cold climates may lead to a decrease in body temperature through radiation and conductive heat loss that results in shivering to raise the body temperature.

TABLE 27-2
Factors Influencing Vital Signs

Factor	Temperature	Pulse	Respiration	Blood Pressure
Exercise and metabolism	Increases	Short-term: increases Long-term: lowers the resting rate and return time to the resting rate postexercise	Rate and depth increase	Increases
Anxiety and stress	Increases	Increases	Increases	Increases
Postural changes	No change	Increases with sitting or standing; decreases when lying down	Decreases with stooped or slumped positions due to decreased chest expansion	Decreases with sitting or standing
Diurnal variations (Circadian rhythm)	Lowest level: 0400–0600 h Highest level: 2000–2400 h	Decreases during sleep	None	Lowest level: early morning Highest level: late afternoon or early evening

Other factors can contribute to the vital signs' being above or below the established normal limits. Review of the client's health history data will reveal pertinent information regarding the factors that influence the vital signs.

MEASURING VITAL SIGNS

Measuring a client's vital signs is a routine yet important nursing function that all nurses must master and execute skillfully.

Equipment

The measurement of the client's vital signs requires the appropriate instruments. All pieces of equipment should be maintained to function accurately. Table 27-3 describes the common types of equipment used to assess the vital signs.

Equipment should be gathered before entering the client's room. However, certain pieces of equipment, such as the sphygmomanometer, may be permanently installed in the examination and inpatient rooms. The nurse should observe what equipment is in the client's room during the first visit with the client. The necessary equipment for clients who are maintained on isolation precautions should be kept inside the room because items should not be taken in and out of isolation rooms.

Measurement of Height and Weight

Measuring height and weight is as important as assessing the client's vital signs. Routine measurement provides data related to growth and development in infants and

children and signals the possible onset of alterations that may indicate illness in all age groups. The client's height and weight are routinely taken on admission to acute care facilities and on visits to physicians' offices, clinics, and in other health care settings.

Height

Measurement of height is expressed in inches (in.), feet (ft), centimeters (cm), or meters (m). See the accompanying display for conversion equivalents from one system to another.

CONVERSION EQUIVALENTS FOR HEIGHT MEASUREMENT

1 in. = 2.5 cm	1 cm = 0.4 in.
1 ft = 30.5 cm or 0.3 m	1 m = 39.4 in. or 3.28 ft

A scale for measuring height, calibrated in either inches or centimeters, is usually attached to a standing weight scale. This type of scale is used for measuring the height of children and adults. The nurse should ask the client to stand erect on the scale's platform. The metal rod attached to the back of the scale should be extended to gently rest on the top of the client's head, and the measurement should be read at eye level.

When measuring an infant's length, the nurse should place the child on a firm surface. Extend the knees, with the feet at right angles to the table. Measure the distance from the vertex (top) of the head to the soles of the feet with a measuring tape. The procedure usually requires two nurses: one to hold the infant still and the other to measure the length. If the nurse needs to

TABLE 27-3
Equipment Used for Vital Sign Measurement

Instrument	Description
Thermometer Glass	Mercury in glass, calibrated with Centigrade or Fahrenheit measurements
Oral	Slim tip
	
Rectal	Stubby, pear-shaped tip
	
Electronic	Battery-powered display unit with a sensitive probe (blue for oral and red for rectal) covered with a disposable plastic sheath for individual use
	
Disposable (chemical), single-use	Thin strips of plastic with chemically impregnated dots that change color to reflect temperature
	
Tympanic	Battery-powered display unit with disposable speculums and infrared-sensing electronics. (Courtesy, The Gillette Company.)
	

(continues)

TABLE 27-3 (continued)
Equipment Used for Vital Sign Measurement

Instrument	Description
Stethoscope Acoustic	Closed cylinder that prevents dissipation of sound waves and amplifies the sound through a diaphragm. Flat-disc diaphragm transmits high-pitched sounds, and the bell-shaped diaphragm transmits low-pitched sounds.
Ultrasound (Doppler)	Battery-operated headset with earpieces attached to a volume-controlled audio unit and ultrasound transducer that detects movement of red blood cells through a vessel.
Sphygmomanometer Mercury manometer	Wall or portable unit that contains a mercury-filled glass column, calibrated in millimeters; the mercury rises and falls in response to pressure created when the cuff is inflated. (Courtesy of Omron Marshall Products, Inc.)

(continues)

TABLE 27-3 (continued)
Equipment Used for Vital Sign Measurement

Instrument	Description
Aneroid manometer	Portable unit with a glass-enclosed gauge containing a needle to register millimeter calibration and a metal bellows within the gauge that expands and collapses in response to pressure variations from the inflated cuff.

perform the measurement without assistance, an object should be placed at the infant's head, the infant's knees should be extended, and a second object should be placed at the infant's feet. Lift the infant and measure the distance between the two objects.

Height increases gradually from birth to the prepubertal growth spurt. Girls usually reach their adult height between the ages of 16 and 17 years, whereas boys usually continue to grow until the ages of 18 to 20 years. The older adult usually decreases in height as a result of a gradual loss of muscle mass and changes in the vertebrae that occur in conditions such as **osteoporosis** (a process in which reabsorption exceeds accretion of bone).

Weight

Measurement of weight is expressed in ounces (oz), pounds (lb), grams (g), or kilograms (kg); see the accompanying display for conversion equivalents. Weight increases gradually from birth until the prepubertal growth spurt. Height and weight changes occur in the adolescent's torso. The resulting redistribution of body fat gives the body an adult appearance (see the accompanying display for the normal ranges of body height and weight according to age). The loss of muscle mass and changes in dietary habits usually cause weight loss in the elderly.

CONVERSION EQUIVALENTS FOR WEIGHT MEASUREMENT

1 lb = 0.45 kg	1 kg = 2.2 lb
1 oz = 28.4 g	1 g = 0.35 oz

When a client has an order for "daily weight," the weight should be obtained at the same time of the day on the same scale, with the client wearing the same type of clothing. Standing scales are used for clients who can bear their own weight (Figure 27-2). The Nursing Checklist describes the procedure for calibrating a scale and measuring the weight for children and adults (Figure 27-3).

NORMAL AGE-RELATED VARIATIONS IN HEIGHT AND WEIGHT

Age	Height	Weight
Newborn	50 cm (20 in.)	3.38 kg (7.5 lb)
1–6 mo	63 cm (25 in.)	2 × birth weight
6–12 mo	71 cm (28 in.)	3 × birth weight
Toddler	75–83 cm (30–33 in.)	15 kg (33 lb)
Preschooler	100 cm (40 in.)	18.2–20.5 kg (40–45 lb)
School-age	115–140 cm (46–56 in.)	35.5–38.6 kg (75–85 lb)
<i>Growth Spurt</i>		
Girls 8–14 yr	120–160 cm (48–64 in.)	40.9–63.6 kg (90–140 lb)
Boys 10–16 yr	125–170 cm (50–68 in.)	40.9–68.2 kg (90–150 lb)

Several types of scales, such as stretcher, chair, and bed scales, are available for clients who are unable to bear weight or are confined to a bed. Figure 27-4 shows a scale that is equipped with a mechanical lift. A sheet should be placed between the client's skin and the surfaces of the belts.

Infants can be weighed on platform or cradle scales. Before weighing the infant, the nurse should make sure the room is warm. The infant's clothing and diaper should then be removed and the nurse should place a light blanket on the scale's surface. The nurse should face the infant, keeping one hand over the top of the infant to prevent accidental injury while adjusting the scale with the other hand. The reading should be noted as quickly as possible and the nurse should return the infant to the crib and dress the child.

Nursing Considerations

Accurate recordings of weight are imperative because they are used in drug dosage calculations and to evaluate the effectiveness of drug, fluid, and nutritional therapy.

Figure 27-2 Weighing a Client on a Standing Scale

Weights above the normal range may indicate obesity or fluid retention. Weights below the normal range may indicate malnutrition, delayed growth and development, or **cachexia** (weight loss marked by weakness and emaciation that usually occurs with a chronic illness such as tuberculosis or cancer). Height is compared with weight to evaluate growth of infants and children.

NURSING CHECKLIST

Calibrating the Scale and Measuring Weight of Children and Adults

1. Calibrate the standing scale by setting both weight indicators to zero. The balance beam will be at the top (Figure 27-3A). When calibrated the balance beam will be at the midway point.
2. Digital display scales should read zero. If they do not, follow the manufacturer's instructions to recalibrate the scale.
3. Assist the client to a standing position. Have the client empty his or her bladder before the weight measurement.
4. Make sure the scale is sitting evenly on the floor and assist the client onto the scale. Instruct the client to remain still. Avoid touching the client.
5. Slowly move the standing scale's weight indicators on the balance beam until the tip of the beam registers in the middle of the mark (Figure 27-3B). Digital scales will automatically display the weight.
6. Read and record the weight.
7. Assist the client back to the former position.

NURSING ALERT

Measuring Weight

When standing on a scale, the client should wear some type of light foot covering, such as disposable operating room slippers, to prevent the transmission of infection and to enhance comfort.

A.

B.

Figure 27-3 Calibrating the Scale and Weighing the Client. A. Set both weight indicators to zero. B. With the client standing on the scale, move the weight indicators on the balance beam until the tip of the beam registers in the middle of the mark.

Figure 27-4 Scales equipped with mechanical lifts are used for clients who are either unable to bear their weight on standing scales or who are confined to bed. (Photo courtesy of Healthometer®)

Documentation

The height and weight measurements are recorded on the appropriate form, such as the admit assessment form. Daily weights are usually recorded on the vital signs record. If the weight is taken at a different time or on a different scale, the variation should be recorded.

Body Temperature

Body temperature is measured during the routine physical examination by using one of the instruments described in Table 27–3. Frequent monitoring is required for clients who have or are at risk for infection; for example, postoperative clients or those with suppressed white blood cell count. Accuracy of temperature measurement is essential because it guides nursing and medical decision making and interventions.

Temperature Scales

The nurse should consistently measure and record the temperature using either the centigrade or Fahrenheit scale as defined in specific health care agency policies. A centigrade-calibrated scale ranges from 34° to 42°C, and a Fahrenheit-calibrated scale ranges from 94° to 108°F. Conversions from one scale to another are based on the formula that 0°C is equal to 32°F (see the accompanying display).

CENTIGRADE AND FAHRENHEIT CONVERSION FORMULAS

- Centigrade to Fahrenheit conversion: multiply the centigrade reading by 9/5 and add 32: $^{\circ}\text{F} = (^{\circ}\text{C} \times 9/5) + 32$
- Fahrenheit to centigrade conversion: deduct 32 from the Fahrenheit reading and multiply by 5/9: $^{\circ}\text{C} = (^{\circ}\text{F} - 32) \times 5/9$

Sites

Although the physician may order a specific site to measure the temperature, nursing judgment usually determines the best site based on the client's age and physical and mental condition. Traditional sites for measuring the body's internal (core) temperature are oral (OT), rectal (RT), and axillary (AT), using either glass or electronic thermometers.

Advances in clinical thermometry provide other devices and sites, such as thermistors for pulmonary artery temperature (PAT) and infrared thermometers for ear canal temperature (ET). ET is the most common site used for temperature measurements in adults because it is a safe and efficient method; however, it is less sensitive in detecting fever in infants and young children. ET should not be used in infected or draining ears or if adjacent lesions or incisions exist. The most reliable measure of core temperature is PAT. Since PAT requires placement of a thermodilution pulmonary artery catheter, it is impractical for routine care.

Oral and rectal temperature measurements are higher than axillary because the measuring device is in contact with the mucous membrane. Rectal measurements are higher than oral because of the seal created by the anal sphincter, which decreases contact with environmental air. With the availability of electronic measuring devices, a glass thermometer should never be used for oral readings if there is danger that the client will bite and break the thermometer.

The axilla is commonly used as a site for infants and children with disabilities because it is the safest, even though least accurate, method. Axillary or rectal sites are used for clients who are uncooperative, comatose, or who have a nasogastric or feeding tube in place.

NURSING ALERT

Temperature Measurement Sites

Rectal temperature measurement is contraindicated in clients with cardiovascular alterations because the thermometer may stimulate the vagus nerve and cause an irregular cardiac rhythm. It is also contraindicated in leukemia and rectal surgery clients because the insertion of the thermometer may traumatize the mucosa or incision line, causing bleeding.

Assessing Body Temperature

Assess the client for the most appropriate site and gather the necessary equipment. When checking the client's oral temperature, the nurse should confirm that the client has neither consumed hot or cold food or beverage nor smoked for 15 to 30 minutes before the measurement. Mouth breathing and tachypnea may also cause an inaccurate oral reading. The nurse should wear nonsterile gloves when assessing oral temperature in clients with herpetic lesions (Crow, 1997). Herpes viruses are extremely contagious and require implementation of Standard Precautions of the Centers for Disease Control and Prevention. Clients with herpetic lesions should have their own glass thermometer to prevent transmission to others.

When using a glass thermometer stored in a disinfectant solution, the nurse should rinse it under cold water to remove the solution. Hot water should not be used on the thermometer because it will cause the mercury to expand and could break the thermometer. Procedure 27-1 describes the actions involved in measuring body temperature according to site.

Alterations in Thermoregulation

When heat production exceeds heat loss and body temperature rises above the normal range **pyrexia** occurs. This condition is caused by an elevation of the body's set-point in the hypothalamus. When the body's temperature rises above 37.4°C (101°F) orally or 38°C (100.4°F) rectally, the client is said to be febrile.

PROCEDURE 27-1

Measuring Body Temperature

Equipment

- Thermometer: glass (client's bedside); electronic and disposable protective sheath; disposable (chemical); tympanic
- Lubricant (rectal, glass thermometer)
- Two pairs of nonsterile gloves
- Tissues

Action

1. Review medical record for baseline data and factors that influence vital signs.
2. Explain to the client that vital signs will be assessed. Encourage client to remain still and refrain from drinking, eating, or smoking.
3. Assess client's toileting needs and proceed as appropriate.
4. Gather equipment as indicated above.
5. Provide for privacy.
6. Wash hands and don gloves.
7. Position the client in a sitting or lying position with the head of the bed elevated 45° to 60° for measurement of all vital signs except those designated otherwise.
8. *Oral Temperature: Glass Thermometer*

Rationale

1. Establishes parameters for client's normal measurements, provides direction in device selection, and determines site to use for measurement. Vital signs are measured in the order of TP-R and BP, usually without interruptions, so as to provide the nurse with an objective clinical database to direct decision making.
2. Encourages participation, allays anxiety, and ensures accurate measurements. Cold or hot liquids and smoking alter circulation and body temperature.
3. Prevents interruptions during measurements, communicates caring, and promotes client comfort.
4. Facilitates organized assessment and measurement.
5. Decreases embarrassment.
6. Hands are washed before and after every contact with a client. Gloves are worn to avoid contact with all bodily secretions and to reduce transmission of microorganisms.
7. Promotes comfort and site access for all measurements. Activity and movement can elevate heart and respiratory rates.

(continues)

PROCEDURE 27-1

Measuring Body Temperature (continued)

Action

- a. Select correct color tip of thermometer from client's bedside container.
 - b. Remove thermometer from storage container and cleanse under cool water.
 - c. Wipe thermometer dry with a tissue from bulb's end toward fingertips.
 - d. Read thermometer by locating mercury level. It should read 35.5°C (96°F).
 - e. If thermometer is not below a normal body temperature reading, grasp thermometer with thumb and forefinger and shake vigorously by snapping the wrist in a downward motion to move mercury to a level below normal.
 - f. Place thermometer in mouth under the tongue and along the gumline to the posterior sublingual pocket. Instruct client to hold lips closed.
 - g. Leave in place as specified by agency policy, usually 3–5 minutes.
 - h. Remove thermometer and wipe with a tissue away from fingers toward the bulb's end.
 - i. Read at eye level and rotate slowly until mercury level is visualized.
 - j. Shake thermometer down, and cleanse glass thermometer with soapy water, rinse under cold water, and return to storage container.
 - k. Remove and dispose of gloves in receptacle. Wash hands.
 - l. Record reading and indicate site as "OT."
9. *Oral Temperature: Electronic Thermometer*
- a. Place disposable protective sheath over probe.
 - b. Grasp top of the probe's stem. Avoid placing pressure on the ejection button.
 - c. Place tip of thermometer under the client's tongue and along the gumline to the posterior sublingual pocket lateral to center of lower jaw (Figure 27-5).
 - d. Instruct client to keep the mouth closed around thermometer.

Rationale

- a. Identifies correct device; a blue color tip usually denotes an oral thermometer.
 - b. Cleansing removes disinfectant that can cause irritation to oral mucosa. Cool water prevents expansion of the mercury.
 - c. Wipe from area of least contamination to most contaminated area.
 - d. Thermometer must be below normal body temperature to ensure an accurate reading.
 - e. Shaking briskly lowers level of mercury in the column. Because glass thermometers break easily, make sure that nothing in the environment comes in contact with the thermometer when shaking it.
 - f. Ensures contact with large blood vessels under the tongue. Prevents environmental air from coming in contact with the bulb.
 - g. Thermometer must stay in place long enough to ensure an accurate reading.
 - h. Mucus on thermometer may interfere with disinfectant solution's effectiveness. Wipe from area of least contamination to most contaminated area.
 - i. Ensure an accurate reading.
 - j. Mechanical cleansing removes secretions that promote growth of microorganisms. Hot water may cause coagulation of secretions and cause expansion of mercury in thermometer.
 - k. Reduces transmission of microorganisms.
 - l. Accurate documentation by site allows for comparison of data.
- a. Prevents transmission of microorganisms.
 - b. Pressure on the ejection button releases the sheath from the probe.
 - c. Sublingual pocket contains superficial blood vessels.
 - d. Maintains thermometer in proper place and decreases amount of time for an accurate reading.

(continues)

Color reflects temperature reading (refer to the manufacturer’s instructions). c. Promotes accurate documentation for data comparison.
13. Tympanic Temperature: Infrared Thermometer	
<ul style="list-style-type: none"> a. Position client in Sims’ position. b. Remove probe from container and attach probe cover to tympanic thermometer unit. c. Turn client’s head to one side. For an adult, pull pinna upward and back; for a child, pull down and back. Gently insert probe with firm pressure into ear canal. d. Remove probe after the reading is displayed on digital unit (usually 2 seconds). e. Remove probe cover and replace in storage container. f. Return tympanic thermometer to storage unit. g. Record reading and indicate site as “ET.” 	<ul style="list-style-type: none"> a. Promotes access to ear. b. Prevents contamination. c. Provides access to ear canal. Gentle insertion prevents trauma to external canal. Firm pressure is needed to ensure probe contact against tympanic membrane. d. Reading is displayed within seconds. e. Protects damage to the reusable probe. f. Recharges batteries of unit. g. Promotes accurate documentation for data comparison.

Pyrogens (bacteria, viruses, fungi, and some antigens) are endogenous or exogenous substances that cause fever. When a pyrogen enters the body, it causes an increased production of white blood cells and raises the set-point of the hypothalamus. It takes the body several hours to generate and conserve sufficient heat to achieve the new set-point. It is during this time that the person experiences the clinical symptoms of chills and shivering. When the temperature and set-point are equal, chills subside and fever is manifested clinically. The fever cycle continues until the body overcomes the pyrogen either naturally or through clinical intervention (e.g., administration of antibiotics). See Chapter 31 for a nursing care plan for the febrile client.

Age, gender, and hormonal levels can influence “normal” physiological function. These factors account for the differences in individual temperature measure-

ments relative to fever. When a person is exposed to extreme environmental conditions, several alterations in thermoregulation can occur. Table 27-4 discusses the alterations that can occur in thermoregulation.

Nursing Considerations

The nurse should place the client experiencing heat exhaustion in a cool environment. The goal of nursing care is to stop diaphoresis by administering fluid and electrolytes as prescribed by a physician. See Chapter 37 for a complete discussion of fluid and electrolyte therapy.

Victims of heat stroke do not perspire because of severe electrolyte loss and impaired hypothalamic function as discussed in Table 27-4. Heat stroke victims are usually discovered outdoors, with emergency measures instituted to lower the temperature during transport to

TABLE 27-4
Alterations in Thermoregulation

Alteration	Definition	Characteristics
Heat exhaustion	An increase in body temperature (38°–40°C; 100.4°–104.0°F) in response to environmental conditions that, in turn, causes diaphoresis (profuse perspiration)	Loss of excessive amounts of water and sodium from perspiring leads to thirst, nausea, vomiting, weakness, and disorientation.
Heat stroke	A critical increase in body temperature (41°–44°C) resulting from exposure to high environmental temperatures	Dry, hot skin is the most important sign. The person becomes confused, or delirious, and experiences thirst, abdominal distress, muscle cramps, and visual disturbances. Loss of consciousness occurs if untreated.
Hypothermia	A body temperature of 35°C or lower resulting from cold weather exposure or artificial induction	Decrease in metabolism leads to impaired mental functioning and depressed pulse, respirations, and blood pressure; can result in cardiac arrest if untreated.
Frostbite	Freezing of the body's surface areas (earlobes, fingers, and toes) in extremely low temperatures	Circulatory impairment may be followed by gangrene.

an emergency center. Nursing's primary role relative to heat stroke is prevention. The nurse is usually involved in teaching preventive measures, such as drinking liquids before, during, and after exercise; avoiding strenuous exercise in humid, hot weather; and wearing light-colored, loose-fitting clothing and covering the head when working outdoors in hot climates.

Hypothermia and frostbite victims found injured in cold weather or who were immersed in cold water are treated while in transit to an emergency center with heating blankets and instillation of warm fluids into the stomach. Nursing's role is to teach preventive measures to groups at risk, such as the homeless, and to parents or guardians of mentally ill or handicapped clients who live in cold environments.

Documentation

Record the temperature measurement and the site on the designated medical record form. Schmitz and colleagues (1995) identify the importance of both consistency in the measurement process for the purpose of establishing a client's temperature trend and awareness of the method used when interpreting clinical data. Temperature measurements are usually plotted on a graph to identify alteration patterns, such as sharp elevations and declines in temperature (a condition known as spiking).

Pulse

Pulse assessment is the measurement of a pressure pulsation created when the heart contracts and ejects blood into the aorta. Assessment of pulse characteristics pro-

vides clinical data regarding the heart's pumping action and the adequacy of peripheral artery blood flow.

Sites

There are multiple pulse points. The most accessible peripheral pulses are the radial and carotid sites. Because the body shunts blood to the brain whenever a cardiac emergency such as hemorrhage occurs, the carotid site should always be used to assess the pulse in these situations.

Variances exist among health care agencies regarding which pulse sites to assess. The common sites for each type of assessment are:

- Complete physical assessment—apical and all bilateral peripheral pulses
- Initial assessment—apical and bilateral peripheral radial and dorsalis pedis pulses
- Routine vital sign assessment—apical and radial pulses in adults and apical and temporal pulses in infants and children

Disorders that alter the client's cardiovascular status require different pulse point assessments (Table 27-5). Whenever circulation is compromised, the corresponding pulse point should be assessed.

Assessing Pulse Rate

The nurse should begin the assessment by speaking with the client about the normal pulse rate. The client's medical record should be reviewed for baseline data, if

TABLE 27-5
Pulse Point Assessment

Pulse Point	Assessment Criteria
Temporal: over temporal bone, superior and lateral to eye	Accessible; used routinely for infants and when radial is inaccessible
Carotid: bilateral, under lower jaw in neck along medial edge of sternocleidomastoid muscle	Accessible; used routinely for infants and during shock or cardiac arrest when other peripheral pulses are too weak to palpate; also used to assess cranial circulation
Apical: left midclavicular line at fourth to fifth intercostal space	Used to auscultate heart sounds and assess apical-radial deficit
Brachial: inner aspect between groove of biceps and triceps muscles at antecubital fossa	Used in cardiac arrest for infants, to assess lower arm circulation, and to auscultate blood pressure
Radial: inner aspect of forearm on thumb side of wrist	Accessible; used routinely in adults to assess character of peripheral pulse
Ulnar: outer aspect of forearm on finger side of wrist	Used to assess circulation to ulnar side of hand and to perform the Allen's test
Femoral: in groin, below inguinal ligament (midpoint between symphysis pubis and anterosuperior iliac spine)	Used to assess circulation to legs and during cardiac arrest
Popliteal: behind knee, at center in popliteal fossa	Used to assess circulation to legs and to auscultate leg blood pressure
Posterior tibial: inner aspect of ankle between Achilles tendon and tibia (below medial malleolus)	Used to assess circulation to feet
Dorsalis pedis: over instep, midpoint between extension tendons of great and second toe	Used to assess circulation to feet

available, and any medications that could affect the heart rate should be noted. Because physical activity increases the heart rate, ensure that the client rests 5 to 10 minutes before the pulse is assessed.

Clinical data regarding the efficacy of blood circulation to an extremity are obtained by assessing the characteristics (quality, rate, rhythm, and volume) of the peripheral pulses. These attributes are described in the section enti-

NURSING ALERT

Carotid Pulse Assessment

When assessing a carotid pulse, apply light pressure to only one carotid artery to avoid disruption of cerebral blood flow.

ted Pulse Characteristics. Palpate a peripheral pulse by placing the first two fingers on the pulse point with moderate pressure. A firm pressure will obliterate the pulse; if the pressure is too light, the pulse cannot be felt.

A Doppler ultrasound stethoscope (DUS) is used on superficial pulse points to detect and magnify heart sounds and pulse waves when the peripheral pulse cannot be palpated. The DUS, which has an earpiece similar to that of a stethoscope, is connected by a cord to a volume-control audio unit with an ultrasound transducer. See Chapter 32 for a complete discussion about other devices to monitor the heart rate.

Normal radial and apical pulses are identical in rate. The stethoscope is used to auscultate the heart's rate and rhythm. The stethoscope should be placed on the fifth intercostal space at the midclavicular line, as described in Procedure 27-2. Count the rate for a full minute, noting the regularity (rhythm).

When an irregular peripheral pulse is present, the nurse needs to assess for a **pulse deficit** (condition in which the apical pulse rate is greater than the radial pulse rate). A pulse deficit results from the ejection of a volume of blood that is too small to initiate a peripheral pulse wave. When a discrepancy exists between the apical and radial pulses, the deficit is assessed by simultaneously measuring the apical and radial pulses for a minute. This procedure is usually performed by two nurses; however, it can be performed by one nurse if necessary.

Pulse Characteristics

A normal pulse has defined characteristics: quality, rate, rhythm, and volume (strength or amplitude). **Pulse quality** refers to the "feel" of the pulse, its rhythm and forcefulness.

Pulse rate is an indirect measurement of cardiac output obtained by counting the number of apical or peripheral pulse waves over a pulse point. A normal pulse rate for adults is between 60 and 100 beats per minute. **Bradycardia** is a heart rate less than 60 beats per minute in an adult. **Tachycardia** is a heart rate in excess of 100 beats per minute in an adult.

Pulse rhythm is the regularity of the heartbeat. It describes how evenly the heart is beating: regular (the beats are evenly spaced) or irregular (the beats are not evenly spaced). Dysrhythmia (arrhythmia) is an irregular rhythm caused by an early, late, or missed heartbeat.

Pulse volume is a measurement of the strength or amplitude of force exerted by the ejected blood against the arterial wall with each contraction. It is described as normal (full, easily palpable), weak (thready and usually

PULSE VOLUME SCALE

Scale	Description of Pulse
0	Absent pulse
1+	Weak and thready pulse
2+	Normal pulse
3+	Bounding pulse

rapid), or strong (bounding). To facilitate data comparison of this measurement, a standard pulse volume scale should be used in documenting findings (see the accompanying display). Procedure 27-2 describes the actions involved in assessing the pulse rate.

Nursing Considerations

An irregular pulse rate, if not previously documented in the medical record, should be reported immediately. The following equipment is used to identify the type of dysrhythmia causing the irregular heartbeat:

- Electrocardiogram (ECG or EKG) provides an electrical representation of the heart's activity. The primary pacemaker of the heart is the sinoatrial (SA) node. If another site within the heart initiates the electrical activity, the ECG tracing will identify the area serving as the pacemaker.

PROCEDURE 27-2**Assessing Pulse Rate****Equipment**

- Watch with a second hand
- Alcohol swab

- Stethoscope

Action**Rationale****1. Radial Pulse**

- | | |
|--|--|
| <ul style="list-style-type: none"> a. Inform client of the site(s) at which you will measure pulse. b. Flex client's elbow and place lower part of arm across chest. c. Support client's wrist by grasping outer aspect with thumb. d. Place your index and middle finger on inner aspect of client's wrist over the radial artery and apply light but firm pressure until pulse is palpated (Figure 27-8). e. Identify pulse rhythm. f. Determine pulse volume. g. Count pulse rate by using second hand on a watch: <ul style="list-style-type: none"> • For a regular rhythm, count number of beats for 30 seconds and multiply by 2. • For an irregular rhythm, count number of beats for a full minute, noting number of irregular beats. | <ul style="list-style-type: none"> a. Encourages participation and allays anxiety. b. Maintains wrist in full extension and exposes artery for palpation. Placing client's hand over chest will facilitate later respiratory assessment without undue attention to your action. (It is difficult for any person to maintain a normal breathing pattern when someone is observing and measuring.) c. Stabilizes wrist and allows for pressure to be exerted. d. Fingertips are sensitive, facilitating palpation of pulsating pulse. The nurse may feel own pulse if palpating with thumb. Applying light pressure prevents occlusion of blood flow and pulsation. e. Palpate pulse until rhythm is determined. Describe as regular or irregular. f. Quality of pulse strength is an indication of stroke volume. Describe as normal, weak, strong, or bounding. g. An irregular rhythm requires a full minute of assessment to identify the number of inefficient cardiac contractions that fail to transmit a pulsation, referred to as a "skipped" or irregular beat. |
|--|--|

(continues)

PROCEDURE 27-2

Assessing Pulse Rate (continued)

Action

Figure 27-8 Place index and middle finger on inner aspect of client's wrist over the radial artery.

2. Apical Pulse

- a. Raise client's gown to expose sternum and left side of chest.
- b. Cleanse earpiece and diaphragm of stethoscope with an alcohol swab.
- c. Put stethoscope around your neck.
- d. Apex of heart:
 - With client lying on left side, locate suprasternal notch.
 - Palpate second intercostal space to left of sternum.
 - Place index finger in intercostal space, counting downward until fifth intercostal space is located.
 - Move index finger along fourth intercostal space left of the sternal border and to the fifth intercostal space, left of the midclavicular line to palpate the point of maximal impulse (PMI) (Figure 27-9).
 - Keep index finger of nondominant hand on the PMI.
- e. Inform client that you are going to listen to his heart. Instruct client to remain silent.
- f. With dominant hand, put earpiece of the stethoscope in your ears and grasp diaphragm of the stethoscope in palm of your hand for 5 to 10 seconds.

Rationale

- a. Allows access to client's chest for proper placement of stethoscope.
- b. Decreases transmission of microorganisms from one practitioner to another (earpiece) and from one client to another (diaphragm).
 - Identification of landmarks facilitates correct placement of the stethoscope at the fifth intercostal space in order to hear point of maximal impulse. See Chapter 32 for discussion about placement of stethoscope in clients with a barrel chest.
 - Ensures correct placement of stethoscope.
- e. Elicits client support. Stethoscope amplifies noise.
- f. Dominant hand facilitates psychomotor dexterity for placement of earpiece with one hand. Heat warms metal or plastic diaphragm and prevents startling client.

(continues)

PROCEDURE 27-2

Assessing Pulse Rate (continued)

Action

Figure 27-9 Palpating the Apical Pulse

- g. Place diaphragm of stethoscope over the PMI and auscultate for sounds S_1 and S_2 to hear lub-dub sound (Figure 27-10).

Figure 27-10 Place diaphragm of stethoscope over the PMI to auscultate for sounds.

- h. Note regularity of rhythm.
- i. Start to count while looking at second hand of watch. Count lub-dub sound as one beat:
 - For a regular rhythm, count rate for 60 seconds.
 - For an irregular rhythm, count rate for a full minute, noting number of irregular beats.
- j. Share your findings with client.
- k. Record by site the rate, rhythm, and, if applicable, number of irregular beats.

Rationale

- g. Movement of blood through the heart valves creates S_1 and S_2 sounds. Listen for a regular rhythm (heartbeats are evenly spaced) before counting.

- h. Establishment of a rhythm pattern determines length of time to count the heartbeats to ensure accurate measurement.
- i. Ensures sufficient time to count irregular beats.
- j. Supports client participation in care.
- k. Record rate and characteristics at bedside to ensure accurate documentation.

- A Holter monitor is a portable device worn for a 24-hour interval to identify the dysrhythmia pattern.
- Cardiac telemetry transmits the heart's electrical activity to a site for continuous monitoring.

See Chapter 32 for additional information regarding these cardiac monitoring devices.

Clients on certain cardiac medications, such as cardiovascular agents and cardiac glycosides, need to monitor their pulse rate. Clients receiving cardiovascular agents (verapamil hydrochloride) and cardiac glycosides (digoxin) may experience an irregular pulse or pulse rate change that should be reported to their physician. In addition, clients who follow an exercise regimen should assess their pulse rate to measure their heart's response to the exercise. Routine or regular exercise lowers the resting and activity pulses. When teaching clients how to monitor their own heart rate, nurses should show them the procedure in assessing the radial or carotid pulse points.

Documentation

All pulse measurements are documented by recording in the client's medical record on the appropriate forms (e.g., the vital sign flow sheet). The nurse should report and document an irregular pulse.

Respirations

Respiratory assessment is the measurement of the breathing pattern. Assessment of respirations provides clinical data regarding the pH of arterial blood.

Sites

Normal breathing is slightly observable, effortless, quiet, automatic, and regular. It can be assessed by observing chest wall expansion and bilateral symmetrical movement of the thorax. Another method the nurse can use to assess breathing is to place the back of the hand next to the client's nose and mouth to feel the expired air.

Assessing Respirations

When assessing respirations ascertain the rate, depth, and rhythm of ventilatory movement. The nurse should assess the rate by counting the number of breaths taken per minute. Note the depth and rhythm of ventilatory movements by observing for the normal thoracic and abdominal movements and symmetry in chest wall movement. Normal respirations are characterized by a rate ranging from 12 to 20 breaths per minute. Procedure 27-3 describes the actions involved in assessing respirations.

One inspiration and expiration cycle is counted as one breath. The nurse should observe the rise and fall of the chest wall and count the rate by placing the hand lightly on the chest to feel its rise and fall. Count the number of respirations as explained in Procedure 27-3.

Movement of the Diaphragm

When the chest wall moves, so do the lungs, because the lungs are attached to the inner wall of the thoracic cavity by the outer layer of the **pleura** (lining of the chest cavity). The movement of the chest wall should be even and regular, without noise and effort. On inspiration the chest changes shape and expands as the rib cage is raised and the diaphragm is lowered. Before inspiration, the pressure inside the chest cavity is negative (−4.5 to −9.0 mm Hg below atmospheric pressure). Air flows along the concentration gradient from a higher atmospheric pressure to the lower intrathoracic pressure.

The opposite action occurs with expiration. The muscles relax, causing the rib cage to lower, and the diaphragm to rise, compressing the chest. Intrathoracic pressure decreases to −3 to −6 mm Hg to allow the air to escape into the atmosphere.

Characteristics of Normal and Abnormal Breath Sounds

Different respiratory wave patterns are characterized by their rate, rhythm, and depth. See Chapter 32 for a complete discussion of wave patterns. **Eupnea** refers to easy respirations with a normal rate of breaths per minute that are age-specific. **Bradypnea** is a respiratory rate of 10 or fewer breaths per minute. **Hypoventilation** is characterized by shallow respirations. **Tachypnea** is a respiratory rate greater than 24 breaths per minute. **Hyperventilation** is characterized by deep, rapid respirations.

The nurse can also observe alterations in the movement of the chest wall: **costal** (thoracic) **breathing** occurs when the external intercostal muscles and the other accessory muscles are used to move the chest upward and outward; **diaphragmatic** (abdominal) **breathing** occurs when the diaphragm contracts and relaxes as observed by movement of the abdomen. **Dyspnea** refers to difficulty in breathing as observed by labored or forced respirations through the use of accessory muscles in the chest and neck to breathe. Dyspneic clients are acutely aware of their respirations and complain of shortness of breath.

Nursing Considerations

Respiratory alterations may cause changes in skin color as observed by a bluish appearance in the nail beds, lips, and skin. The bluish color (**cyanosis**) results from reduced oxygen levels in the arterial blood. Changes in the level of

NURSING ALERT

Positioning for Dyspneic Clients

Dyspneic clients should never be placed flat in bed; maintain them in a semi-Fowler's or Fowler's position. To facilitate maximal lung expansion place the client in a forward-leaning position over a padded, raised overbed table with arms and head resting on the table.

PROCEDURE 27-3

Assessing Respirations

Equipment

- Watch with a second hand

Action

1. Before replacing client's gown from auscultating heart sounds, assess respirations.
2. Place your hand over client's wrist and observe one complete respiratory cycle.
3. Start to count with first inspiration while looking at second hand sweep of watch.
 - Infants and children: count a full minute.
 - Adults: count for 30 seconds and multiply by 2. If an irregular rate or rhythm is present, count for a full minute.
4. Observe depth of respirations by degree of chest wall movement and rhythm of cycle (regular or interrupted).
5. Replace client's gown.
6. Record rate and character of respirations.

Rationale

1. Facilitates observation of chest wall and abdominal movements.
2. Hand rises and falls with inspiration and expiration.
3. Respiratory rate is one complete cycle (inspiration and expiration).
 - Infants and children usually have an irregular rate.
 - Respiratory rate reflects number of breaths per minute.
4. Reveals volume of air movement into and out of the lungs. Describe as shallow, normal, or deep.
5. Prevents embarrassment and chilling.
6. Record rate and characteristics at bedside to ensure accurate documentation

consciousness may also occur with decreased oxygen levels. Dyspneic clients will assume a forward-leaning position to increase the expansion capacity of the lungs.

Clients with respiratory alterations require additional nursing assessment. Noninvasive oxygen assessment can be performed with an **oximeter** (a machine that measures the oxygen saturation of the blood through a probe clipped to the fingernail or earlobe) or an **apnea monitor** (a machine with chest leads that monitors the movement of the chest). Both noninvasive machines have alarm features that are set to specific parameters. For example, if the client's respirations fall below 6 breaths per minute, the apnea monitor alarm will sound. The apnea monitor is used in the home environment for apneic clients; when the alarm sounds, it wakes the person and causes him to breathe.

Documentation

Document the assessment findings for the respiratory rate, depth, rhythm, and character on the appropriate form (e.g., the vital sign flow sheet). Report a respiratory rate outside the normal age range, an irregular rhythm, inadequate depth, or any abnormal characteristics such as dyspnea.

Blood Pressure

Blood pressure measurement is performed during a physical examination, at initial assessment, and as part of routine vital signs assessment. Depending on the client's condition, the blood pressure is measured by

either a direct or an indirect technique. The direct method requires an invasive procedure in which an intravenous catheter with an electronic sensor is inserted into an artery and the artery-transmitted pressure on an electronic display unit is read. The indirect method requires use of the sphygmomanometer and stethoscope for auscultation and palpation as needed.

Sites

The most common site for indirect blood pressure measurement is the client's arm over the brachial artery. When the client's condition prevents auscultation of the brachial artery, the nurse should assess the blood pressure in the forearm or leg sites (see the accompanying display).

CONTRAINDICATIONS FOR BRACHIAL ARTERY BLOOD PRESSURE MEASUREMENT

When the client has any of the following, *do not* measure blood pressure on the involved side:

- Venous access devices, such as an intravenous infusion or arteriovenous fistula for renal dialysis
- Surgery involving the breast, axilla, shoulder, arm, or hand
- Injury or disease to the shoulder, arm, or hand, such as trauma, burns, or application of a cast or bandage

When pressure measurements in the upper extremities are not accessible, the popliteal artery, located behind the knee, becomes the site of choice. The nurse can also assess the blood pressure in other sites, such as the radial artery in the forearm and the posterior tibial or dorsalis pedis artery in the lower leg. Because it is difficult to auscultate sounds over the radial, tibial, and dorsalis pedis arteries, these sites are usually palpated to obtain a systolic reading.

Assessing Blood Pressure

Selecting the proper equipment and following procedural technique are basic to ensuring an accurate reading. Psychomotor skills, acquired with practice, are needed to manipulate the blood pressure equipment. Procedure 27-4 describes the actions involved in assessing blood pressure.

As shown in Table 27-3, a sphygmomanometer is a device used to measure indirect blood pressure. A sphygmomanometer consists of a mercury or aneroid manometer and a cuff that contains an inflatable rubber bladder connected to two pieces of rubber tubing. One

piece of tubing connects the bladder to the manometer or gauge, and the second tubing is attached to a pressure bulb with a release valve to inflate and deflate the cuff. When pressure is applied to the bulb, air enters the bladder and inflates the cuff.

The sphygmomanometer wears with usage. If there is a defect in any part of the system, the blood pressure reading will be inaccurate. The aneroid gauge needle or mercury in the manometer column should be at a zero reading when the cuff is deflated and should rise evenly when pressure is applied to the bulb. The valve should turn freely and all tubing should be intact, with secured connections to prevent air from leaking out of the system.

An accurate reading also requires the correct width of the blood pressure cuff as determined by the circumference of the client's extremity. The bladder cuff must encircle the width and length of the site. According to the American Heart Association (1987), the bladder width should be approximately 40% of the circumference or 20% wider than the diameter of the midpoint of the extremity. To measure the width of the bladder, the nurse should place the cuff lengthwise on the client's extremity and extend the width to cover 40% of the

PROCEDURE 27-4

Assessing Blood Pressure

Equipment

- Alcohol swabs
- Stethoscope

- Sphygmomanometer with proper size cuff

Action

1. Determine which extremity is most appropriate for reading. Do not take a pressure reading on an injured or painful extremity or one in which an intravenous line is running.
2. Select a cuff size that completely encircles upper arm without overlapping (Figure 27-11).

Figure 27-11 Wrap the blood pressure cuff on the arm 1 inch above client's brachial pulsation, with bladder centered over brachial artery.

Rationale

1. Cuff inflation can temporarily interrupt blood flow and compromise circulation in an extremity already impaired or a vein receiving intravenous fluids.
2. Provides equalization of pressure on the artery to ensure accurate measurement.

(continues)

PROCEDURE 27-4

Assessing Blood Pressure (continued)

Action

3. Move clothing away from upper aspect of arm.
4. Position arm at heart level, extend elbow with palm turned upward.
5. Make sure bladder cuff is fully deflated and pump valve moves freely.
6. Locate brachial artery in the antecubital space.
7. Apply cuff snugly and smoothly over upper arm, 2.5 cm (1 in.) above antecubital space with center of cuff over brachial artery.
8. Connect bladder tubing to manometer tubing. If using a portable mercury-filled manometer, position vertically at eye level.
9. Palpate brachial artery (Figure 27-12), turn valve clockwise to close and compress bulb to inflate cuff to 30 mm Hg above point where palpated pulse disappears, then slowly release valve (deflating cuff), noting reading when pulse is felt again.

Figure 27-12 Palpate the brachial artery with fingertips below the pressure cuff.

Rationale

3. Ensures accurate measurement.
 4. Blood pressure increases when arm is below level of heart and decreases when arm is above level of heart.
 5. Equipment must function properly to obtain an accurate reading.
 6. Designates placement of stethoscope.
 7. Ensures even pressure distribution over brachial artery. Prevents tubing from being constricted and allows visualization of aneroid manometer dial.
 8. Maintains closed system; supports accurate reading of mercury level in manometer.
 9. Inflates the cuff's bladder with pressure and temporarily impairs flow of blood through artery. Provides an estimate of maximum pressure required to measure systolic pressure.
10. Inserts earpiece of stethoscope in ears with a forward tilt, ensuring diaphragm hangs freely.
 11. Relocates brachial pulse with your nondominant hand and places bell or diaphragm chestpiece directly over pulse. Chestpiece should be in direct contact with skin and not touch cuff (Figure 27-13).

10. Enhances sound transmission from chestpiece to ears.
11. Sound heard best directly over artery; decreases muffled sounds that cause inaccurate reading. Bell chestpiece is more sensitive to low-frequency sound that occurs with pressure release.

(continues)

PROCEDURE 27-4

Assessing Blood Pressure (continued)

Action

Figure 27-13 Place bell chestpiece over brachial artery below blood pressure cuff.

Rationale

- | | |
|---|--|
| <p>12. With dominant hand, turn valve clockwise to close. Compress pump to inflate cuff until manometer registers 30 mm Hg above diminished pulse point identified in step 9.</p> <p>13. Slowly turn valve counterclockwise so that mercury falls at a rate of 2–3 mm Hg per second. Listen for five phases of Korotkoff's sounds while noting manometer reading:</p> <ul style="list-style-type: none"> • A faint, clear tapping sound appears and increases in intensity (phase I). • Swishing sound (phase II). • Intense sound (phase III). • Abrupt, distinctive muffled sounds (phase IV).
 • Sound disappears (phase V). <p>14. Deflate cuff rapidly and completely.</p> <p>15. Remove cuff or wait 2 minutes before taking a second reading.</p> <p>16. Inform client of reading.</p> <p>17. Record reading.</p> <p>18. Lower bed, raise side rails, place call light in easy reach.</p> | <p>12. Prevents air leak during inflation. Ensures the cuff is inflated to a pressure greater than the client's systolic pressure.</p> <p>13. Maintains constant release of pressure to ensure hearing first systolic sound. Identify manometer readings for each of the five phases.</p> <ul style="list-style-type: none"> • Identify two consecutive tapping sounds to confirm systolic reading.
 • Phase IV is regarded by the American Heart Association (AHA) as the best indicator of diastolic pressure in children (AHA, 1987). • Phase V is regarded by the AHA as the best index of diastolic blood pressure in clients over age 13 (AHA, 1987). <p>14. Prevents arterial occlusion and client discomfort of numbness or tingling.</p> <p>15. Releases trapped blood in the vessels.</p> <p>16. Promotes client participation in care.</p> <p>17. Ensures accuracy.</p> <p>18. Promotes client safety.</p> |
|---|--|

(continues)

PROCEDURE 27-4

Assessing Blood Pressure (continued)

Action

19. Put all equipment in proper place.
20. Wash hands.
21. Document measurements in client's medical record on appropriate form, usually vital signs flow sheet.
22. Compare data with client's baseline and normal range for age group.
23. If any measurements are abnormal, measure again and report abnormal findings to instructor or charge nurse.

Rationale

19. Fosters maintenance of equipment.
20. Prevents transmission of microorganisms.
21. Vital sign measurements are usually charted on the graphic section of the vital signs form.
22. Provides for comparative data analysis.
23. Reporting abnormal measurements alerts staff to possible problems requiring intervention.
