IV Compatibilities

The IV compatibility table provides data when 2 or more medications are given in a Y-site of administration. The data in this table largely represent physical incompatibilities (e.g., haze, precipitate, change in color). Therapeutic incompatibilities have not been included, so when using the table, professional judgement should be exercised.

C Physically compatible via Y-site administration.

I Physically incompatible.

N Information on compatibility not available or conflicting

Dextrose 5%	Sodium Chloride	Acyclovir	Amikacin	Amiodarone	Anidulafungin	Argatroban	Azithro

Newly Approved Medications

Abaloparatide (Tymlos)	Treatment of postmenopausal women with osteoporosis at high risk for fracture
Avelumab (Bavencio)	A monoclonal antibody for metastatic Merkel cell carcinoma
Betrixaban (Bevyxxa)	Factor Xa inhibitor for prophylaxis of venous thromboembolism
*Bezlotoxumab (Zinplava)	A monoclonal antibody to reduce recurrence of <i>C. difficile</i> infection
Brigatinib (Alunbrig)	Treatment on NSCLC who have progressed or are intolerant to crizotinib
Brodalumab (Sililq)	An IL-17RA antagonist for moderate to severe plaque psoriasis
*Cerliponase alfa (Brineura)	Slow loss of ambulation tripeptidyl peptidase 1 deficiency
Clevidipine (Cleviprex)	Management of hypertension when oral therapy not feasible
*Deflazacort (Emflaza)	An oral corticosteroid for Duchenne muscular dystrophy
Delafloxacin (Baxdela)	A fluoroquinolone for treatment of skin and skin structure infections
*Deutetrabenazine (Austedo)	A VMAT2 inhibitor for chorea associated with Huntington's disease
*Dupilumab (Dupixent)	An IL-4RA antagonist for moderate to severe eczema (atopic dermatitis)
Durvalumab (Imfinzi)	Treatment of locally advanced or metastatic urothelial carcinoma
*Etelcalcetide (Parsabiv)	A calcium sensing receptor agonist for secondary hyperparathyroidism in patients with chronic kidney disease on hemodialysis
Guselkumab (Tremfya)	Interleukin blocker for treatment of adult with moderate to severe plaque psoriasis
Ledipasvir/sofosbuvir (Harvoni)	Treatment of chronic hepatitis C genotypes 1,4,5,6
Midostaurin (Rydapt)	Kinase inhibitor for treatment of newly diagnosed acute myeloid leukemia
Naldemedine (Symproic)	An opioid antagonist for opioid-induced constipation
Naloxegol (Movantik)	Treatment of opioid induced constipation for chronic pain
Neratinib (Nerlynx)	Kinase inhibitor for extended adjuvant treatment of breast cancer
Niraparib (Zejula)	A PARP inhibitor for recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer
Ocrelizumab (Ocrevus)	A monoclonal antibody for relapsing or primary progressive forms of multiple sclerosis
Olaratumab (Lartruvo)	A PDGFR-alpha blocking antibody for soft tissue sarcoma
Plecanatide (Trulance)	A guanylate cyclase-C agonist for chronic idiopathic constipation
Ponatinib (Iclusig)	Kinase inhibitor for treatment of acute lymphoblastic and chronic myeloid leukemia
Ribociclib (Kisqali)	A kinase inhibitor for postmenopausal women with advanced breast cancer
Rucaparib (Rubraca)	An oral PARP inhibitor for certain types of advanced ovarian cancer

Safinamide (Xadago)	An MAO-B inhibitor for Parkinson's patients experiencing "off" episodes
Sarilumab (Kevzara)	Treatment of moderate to severe active rheumatoid arthritis
Sofosbuvir/velpatasvir/voxilaprevir (Vosevi)	Fixed combination for treatment of chronic HCV genotypes 1, 2, 3, 4, 5 or 6
*Telotristat (Xermelo)	An oral tryptophan hydroxylase inhibitor for carcinoid syndrome diarrhea
Valbemazine (Ingrezza)	A selective VMATZ inhibitor for the treatment of tardive dyskinesia
Ziv-Aflibercept (Zaltrap)	Treatment of colorectal cancer, metastatic

Author Biographies

Robert (Bob) J. Kizior, BS, RPh

Bob graduated from the University of Illinois School of Pharmacy and is licensed to practice in the state of Illinois. He has worked as a hospital pharmacist for more than 40 years at Alexian Brothers Medical Center in Elk Grove Village, Illinois—a suburb of Chicago. Bob is the Pharmacy Surgery Coordinator for the Department of Pharmacy, where he participates in educational programs for pharmacists, nurses, physicians, and patients. He plays a major role in coordinating pharmacy services in the OR satellite. Bob is a former adjunct faculty member at William Rainey Harper Community College in Palatine, Illinois.

An avid sports fan, Bob also has eclectic tastes in music that range from classical, big band, rock ‘n’ roll, and jazz to country and western. Bob spends much of his free time reviewing the professional literature to stay current on new drug information.

Keith J. Hodgson, RN, BSN, CCRN

Keith was born into a loving family in Chicago, Illinois. His mother, Barbara B. Hodgson, was an author and publisher of several medication products, and her work has been a part of his life since he was a child. By the time he was 4 years old, Keith was already helping his mother with the drug cards by stacking the draft pages that were piled up throughout their home.

Because of his mother’s influence, Keith contemplated becoming a nurse in college, but his mind was fully made up after he shadowed his sister in the Emergency Department. Keith received his Associates Degree in Nursing from Hillsborough Community College and his Bachelor of Science in Nursing from the University of South Florida in Tampa, Florida. Keith started his career in the Emergency Department and now works in the Trauma/Neurological/Surgical Intensive Care Unit at St. Joseph’s Hospital in Tampa, Florida.

Keith's favorite interests include music, reading, Kentucky basketball, and, if he gets the chance, watching every minute of the Olympic Games.

Acknowledgments

I would like to thank my co-author Bob Kizior for his knowledge, experience, support, and friendship. We would like to give special thanks to Sonya Seigafuse, Charlene Ketchum, Julie Eddy, Mike Sheets, and the entire Elsevier team for their superior dedication, hard work, and belief in us. Without this wonderful team, none of this would be possible.

Keith J.Hodgson, RN, BSN, CCRN

Dedication

I dedicate my work to the practicing nurse, those aspiring to become nurses, and to all health care professionals who are dedicated to the art and science of healing.

Bob Kizior, BS, RPh

I dedicate this work to my sister, Lauren, a foundation for our family; my sister, Kathryn, for her love and support; my father, David Hodgson, the best father a son could have; my brothers-in-law, Andy and Jim, great additions to the family; the grandchildren, Paige Olivia, Logan James, Ryan James, and Dylan Boyd; to Jen Nicely for always being there; and to my band of brothers, Peter, Jamie, Miguel, Ritch, George, Jon, Domingo, Ben, Craig, Pat, and Shay.

We also make a special dedication to Barbara B. Hodgson, RN, OCN. She truly was a piece of something wonderful. Barbara often gave her love and support without needing any in return, and would do anything for a smile. Not only was she a colleague and a friend, she was also a small business owner, an artist, a dreamer, and an innovator. We hope the pride we offer in her honor comes close to what she always gave us. Her dedication and perseverance lives on.

Keith J. Hodgson, RN, BSN, CCRN

Preface

Nurses are faced with the ever-challenging responsibility of ensuring safe and effective drug therapy for their patients. Not surprisingly, the greatest challenge for nurses is keeping up with the overwhelming amount of new drug information, including the latest FDA-approved drugs and changes to already approved drugs, such as new uses, dosage forms, warnings, and much more. Nurses must integrate this information into their patient care quickly and in an informed manner.

Saunders Nursing Drug Handbook 2019 is designed as an easy-to-use source of current drug information to help the busy nurse meet these challenges. What separates this book from others is that it guides the nurse through patient care to better practice and better care.

This handbook contains the following:

1. **An IV compatibility chart.** This handy chart is bound into the handbook to prevent accidental loss.
2. **The Drug Classifications section.** The action and uses for some of the most common clinical and pharmacotherapeutic classes are presented. Unique to this handbook, each class provides an at-a-glance table that compares all the generic drugs within the classification according to product availability, dosages, side effects, and other characteristics. Its half-page color tab ensures you can't miss it!
3. **An alphabetical listing of drug entries by generic name.** Red letter thumb tabs help you page through this section quickly. Information on medications that contain a Black Box Alert is an added feature of the drug entries. This alert identifies those medications for which the FDA has issued a warning that the drugs may cause serious adverse effects. Tall Man lettering, with emphasis on certain syllables to avoid confusing similar sounding/looking medications, is shown in slim red capitalized letters (e.g., *aceta**ZOLAMIDE**). High Alert drugs with a color icon 

are considered dangerous by The Joint Commission and the Institute for Safe Medication Practices (ISMP) because if they are administered incorrectly, they may cause life-threatening or permanent harm to the patient. The entire High Alert generic drug entry sits on a red-shaded background so that it's easy to spot! To make scanning pages easier, each new entry begins with a shaded box containing the generic name, pronunciation, trade name(s), fixed combination(s), and classification(s).

4. **A comprehensive reference section.** Appendixes include vital information on calculation of doses; controlled drugs; chronic wound care; drugs of abuse; equi- analgesic dosing; herbals: common natural medicines; lifespan, cultural aspects, and pharmacogenomics of drug therapy; normal laboratory values; cytochrome P450 enzymes; antidotes or reversal agents; preventing medication errors; parenteral fluid administration; and Common Terminology Criteria for Adverse Events (CTCAE).
5. **Drugs by Disorder.** You'll find Drugs by Disorder in the front of the book for easy reference. It lists common disorders and the drugs most often used for treatment.
6. **The index.** The comprehensive index is located at the back of the book on light red pages. Undoubtedly the best tool to help you navigate the handbook, the comprehensive index is organized by showing generic drug names in **bold**, trade names in regular type, classifications in *italics*, and the page number of the main drug entry listed first and in **bold**.

A Detailed Guide to the Saunders Nursing Drug Handbook

An intensive review by consultants and reviewers helped us to revise the **Saunders Nursing Drug Handbook** so that it is most useful in both educational and clinical practice. The main objective of the handbook is to provide essential drug information in a user-friendly format. The bulk of the handbook contains an alphabetical listing of drug entries by generic name.

To maintain the portability of this handbook and meet the challenge of keeping content current, we have also included additional information for some medications on the Evolve® Internet site. Users can also choose from 100 monographs for the most commonly used medications and customize and print drug cards. Evolve® also includes drug alerts (e.g., medications removed from the market) and drug updates (e.g., new drugs, updates on existing entries). Information is periodically added, allowing the nurse to keep abreast of current drug information.

We have incorporated the IV Incompatibilities/Compatibilities  heading. The drugs listed in this section are compatible or incompatible with the generic drug when administered directly by IV push, via a Y-site, or via IV piggyback. We have highlighted the intravenous drug administration and handling information with a special heading icon  and have broken it down by Reconstitution, Rate of Administration, and Storage.

We present entries in an order that follows the logical thought process the nurse undergoes whenever a drug is ordered for a patient:

- What is the drug?
- How is the drug classified?
- What does the drug do?
- What is the drug used for?
- Under what conditions should you **not** use the drug?
- How do you administer the drug?
- How do you store the drug?
- What is the dose of the drug?
- What should you monitor the patient for once he or she has received the drug?
- What do you assess the patient for?
- What interventions should you perform?
- What should you teach the patient?

The following are included within the drug entries:

Generic Name, Pronunciation, Trade Names. Each entry begins with the generic name and pronunciation, followed by the U.S. and Canadian trade names. Exclusively Canadian trade names are followed by a red maple leaf . Trade names that were most prescribed in the year 2016 are underlined in this section.

Black Box Alert. This feature highlights drugs that carry a significant risk of serious or life-threatening adverse effects. Black Box Alerts are ordered by the FDA.

Do Not Confuse With. Drug names that sound similar to the generic and/or trade names are listed under this heading to help you avoid potential medication errors.

Fixed-Combination Drugs. Where appropriate, fixed-combinations, or drugs made up of two or more generic medications, are listed with the generic drug.

Pharmacotherapeutic and Clinical Classification Names. Each entry includes both the pharmacotherapeutic and clinical classifications for the generic drug.

Action/Therapeutic Effect. This section describes how the drug is predicted to behave, with the expected therapeutic effect(s) under a separate heading.

Pharmacokinetics. This section includes the absorption, distribution, metabolism, excretion, and half-life of the medication. The half-life is bolded in red for easy access.

Uses/Off-Label. The listing of uses for each drug includes both the FDA uses and the off-label uses. The off-label heading is shown in bold red for emphasis.

Precautions. This heading incorporates a discussion about when the generic drug is contraindicated or should be used with caution. The cautions warn the nurse of specific situations in which a drug should be closely monitored.

Lifespan Considerations ⌚. This section includes pregnancy/lactation data and age-specific information concerning children and elderly people.

Interactions. This heading enumerates drug, food, and herbal interactions with the generic drug. As the number of medications a patient receives increases, awareness of drug interactions becomes more important. Also included is information about therapeutic and toxic blood levels in addition to the altered lab values that show what effects the drug may have on lab results.

Product Availability. Each drug monograph gives the form and availability of the drug. The icon 🚫 identifies noncrushable drug forms.

Administration/Handling. Instructions for administration are given for each route of administration (e.g., IV, IM, PO, rectal). Special handling, such as refrigeration, is also included where applicable. The routes in this section are always presented in the order IV, IM, SQ, and PO, with subsequent routes in alphabetical order (e.g., Ophthalmic, Otic, Topical). **IV administration** 🏠 is broken down by reconstitution, rate of administration (how fast the IV should be given), and storage (including how long the medication is stable once reconstituted).

IV Incompatibilities/IV Compatibilities 🏠. These sections give the nurse the most comprehensive compatibility information possible when administering medications by direct IV push, via a Y-site, or via IV piggyback.

Indications/Routes/Dosage. Each entry provides specific dosing guidelines for

adults, elderly, children, and patients with renal and/or hepatic impairment. Dose modification for toxicity has been added where applicable. Dosages are clearly indicated for each approved indication and route.

Side Effects. Side effects are defined as those responses that are usually predictable with the drug, are **not** life-threatening, and may or may not require discontinuation of the drug. Unique to this handbook, side effects are grouped by frequency listed from highest occurrence percentage to lowest so that the nurse can focus on patient care without wading through myriad signs and symptoms of side effects.

Adverse Effects/Toxic Reactions. Adverse effects and toxic reactions are very serious and often life-threatening undesirable responses that require prompt intervention from a health care provider.

Nursing Considerations. Nursing considerations are organized as care is organized. That is:

- What needs to be assessed or done before the first dose is administered?
(Baseline Assessment)
- What interventions and evaluations are needed during drug therapy?
(Intervention/Evaluation)
- What explicit teaching is needed for the patient and family? (Patient/Family Teaching)

Saunders Nursing Drug Handbook is an easy-to-use source of current drug information for nurses, students, and other health care providers. It is our hope that this handbook will help you provide quality care to your patients.

We welcome any comments you may have that would help us to improve future editions of the handbook. Please contact us via the publisher at <http://evolve.elsevier.com/SaundersNDH>

Robert J. Kizior, BS, RPh

Keith J. Hodgson, RN, BSN, CCRN

Drug Classification Contents

allergic rhinitis nasal preparations	beta-adrenergic blockers
Alzheimer's disease agents	bronchodilators
angiotensin-converting enzyme (ACE) inhibitors	calcium channel blockers
angiotensin II receptor antagonists	chemotherapeutic agents
antianxiety agents	contraception
antiarrhythmics	corticosteroids
antibiotics	corticosteroids: topical
antibiotic: aminoglycosides	diuretics
antibiotic: cephalosporins	H2 antagonists
antibiotic: fluoroquinolones	hepatitis C virus
antibiotic: macrolides	hormones
antibiotic: penicillins	human immunodeficiency virus (HIV) infection
anticoagulants/antiplatelets/thrombolytics	immunosuppressive agents
anticonvulsants	laxatives
antidepressants	multiple sclerosis agents
antidiabetics	nonsteroidal anti-inflammatory drugs (NSAIDs)
antidiarrheals	nutrition: enteral
antifungals: systemic mycoses	nutrition: parenteral
antiglaucoma agents	obesity management
antihistamines	osteoporosis
antihyperlipidemics	Parkinson's disease treatment
antihypertensives	proton pump inhibitors
antimigraine (triptans)	rheumatoid arthritis
antipsychotics	sedative-hypnotics
antivirals	skeletal muscle relaxants
	smoking cessation agents
	vitamins

Allergic Rhinitis Preparations

Uses

Relieve symptoms associated with allergic rhinitis. These symptoms include rhinorrhea, nasal congestion, pruritus, sneezing, postnasal drip, nasal pain.

Allergic rhinitis or hay fever is an inflammation of the nasal airways occurring when an allergen (e.g., pollen) is inhaled. This triggers antibody production. The antibodies bind to mast cells, which contain histamine. Histamine is released, causing symptoms of allergic rhinitis.

Action

Intranasal corticosteroids: Depress migration of polymorphonuclear leucocytes and fibroblasts, reverse capillary permeability, and stabilize nasal membranes to prevent/control inflammation. First-line therapy for moderate to severe symptoms or where nasal congestion is the dominant complaint.

Intranasal antihistamines: Reduce histamine-mediated symptoms of allergic rhinitis, including pruritus, sneezing, rhinorrhea, watery eyes. Second-line therapy for intermittent nasal symptoms where congestion is not dominant.

Intranasal mast cell stabilizers: Inhibit the mast cell release of histamine and other inflammatory mediators.

Intranasal anticholinergics: Block acetylcholine in the nasal mucosa. Effective in treating rhinorrhea associated with allergic rhinitis.

Intranasal decongestants: Vasoconstrict the respiratory mucosa, provide short-term relief of nasal congestion. Used only as adjuvant therapy for 3–5 days.

Oral antihistamines: First line therapy for mild symptoms or where sneezing/itching is primary complaint.

Oral decongestants: For primary complaint of nasal congestion.

Corticosteroids—Intranasal

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects
Beclomethasone (Beconase AQ) (Qnasl)	Beconase AQ: 1–2 sprays in each nostril 2 times/day Qnasl: 80 mcg/spray: 2 sprays in each nostril once daily	Beconase AQ: 6–11 yrs: 1–2 sprays in each nostril 2 times/day Qnasl: 4–11 yrs: 40 mcg/spray: 1 spray in each nostril once daily	Altered taste and smell, epistaxis, burning, stinging, headache, nasal septum perforation
Budesonide (Rhinocort Allergy Spray, Rhinocort Aqua)	Rhinocort Aqua: 1–4 sprays in each nostril daily Rhinocort Allergy Spray: 1–2 sprays in each nostril once daily	Rhinocort Allergy Spray, Rhinocort Aqua: 6–11 yrs: 1–2 sprays in each nostril daily	Bronchospasm, cough, epistaxis, nasal/throat irritation
Ciclesonide (Omnaris, Zetonna)	Omnaris: 2 sprays in each nostril daily Zetonna: 1 spray in each nostril daily	Omnaris: 6–11 yrs: 2 sprays in each nostril daily (seasonal allergic rhinitis only)	Fever, headache, nausea, cough, epistaxis, nasal septum disorder
Flunisolide (Nasalide)	2 sprays in each nostril 2 or 3 times/day (maximum: 8 sprays in each nostril daily)	6–14 yrs: 2 sprays in each nostril 2 times/day or 1 spray in each nostril 3 times/day (maximum: 4 sprays in each nostril daily)	Nasal burning/stinging, nasal dryness/irritation
Fluticasone (Flonase Sensimist, Flonase Allergy Relief)	Flonase, Flonase Allergy Relief, Flonase Sensimist: 1–2 sprays in each nostril once daily	Flonase Sensimist: 2–11 yrs: 1 spray in each nostril daily Flonase Allergy Relief: 4–11 yrs: 1 spray in each nostril once daily	Dizziness, fever, headache, nausea, cough, epistaxis
Fluticasone/Azelastine (Dymista)	1 spray in each nostril 2 times/day	Not indicated in children younger than 6 yrs	Same as fluticasone and azelastine
Mometasone (Nasonex)	2 sprays in each nostril daily	2–11 yrs: 1 spray in each nostril daily	Headache, nasopharyngitis, sinusitis
Triamcinolone (Nasacort Allergy 24 HR, Nasacort AQ)	1–2 sprays in each nostril daily	2–5 yrs: 1 spray in each nostril once daily 6–11 yrs: 1–2 sprays in each nostril daily	Bronchitis, chest congestion, cough, epistaxis, pharyngitis, sinusitis

Antihistamines—Intranasal

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects
Azelastine Astepro 0.1%,	Azelastine: 1–2 sprays in each nostril 2	Azelastine: 5–11 yrs: 1	Sedation,

0.15%	times/day Astepro 0.1%, 0.15%: 1–2 sprays in each nostril two times/day or 2 sprays each nostril once daily (for seasonal allergic rhinitis)	spray in each nostril 2 times/day Astepro 0.1%: 2–5 yrs: 1 spray 2 times/day. Astepro 0.1% or 0.15%: 6–11 yrs: 1 spray 2 times/day.	epistaxis, nasal irritation
Azelastine/Fluticasone (Dymista)	1 spray in each nostril 2 times/day	Not approved for children younger than 6 yrs	Same as azelastine and fluticasone
Olopatadine (Patanase)	2 sprays in each nostril 2 times/day	6–11 yrs: 1 spray in each nostril 2 times/day	Same as azelastine

Mast Cell Stabilizers

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects
Cromolyn (Nasal crom)	1 spray in each nostril 3–6 times/day	2–11 yrs: 1 spray in each nostril 3–6 times/day	Nasal irritation, unpleasant taste

Anticholinergics

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects
Ipratropium (Atrovent) 0.03%	2 sprays in each nostril 2–3 times/day	6–12 yrs: 2 sprays in each nostril 2–3 times/day	Nasal irritation, epistaxis, dizziness, headache, blurry vision
Ipratropium (Atrovent) 0.06%	2 sprays in each nostril 3–4 times/day	5–12 yrs: 2 sprays in each nostril 3–4 times/day	Same as ipratropium 0.03%

Decongestants

Generic (Brand)	Adult Dose	Pediatric Dose	Side Effects
Oxymetazoline (Afrin, Neo-Synephrine 12 HR)	2–3 sprays 2 times/day	6–11 yrs: 2–3 sprays 2 times/day	Insomnia, tachycardia, nervousness, nausea, vomiting, transient burning, headache, rebound congestion if used longer than 72 hrs
Phenylephrine (Neo-Synephrine Cold and Sinus, Vicks Sinus)	2–3 drops/sprays q4h as needed (0.25% or 0.5%)	6–11 yrs: 2–3 drops/sprays (0.25%) q4h as needed 1–5 yrs: 2–3 drops/sprays (0.125%) q4h as needed	Restlessness, nervousness, headache, rebound nasal congestion, burning, stinging, dryness

Alzheimer's Disease

Dementia is a general term used describing a decline in mental ability that is severe enough to interfere with the function of daily living. Alzheimer's disease (AD) is the most common cause of dementia. Cognitive loss in AD is associated with depletion of acetylcholine (involved with learning and memory). AD is confirmed only at autopsy and is characterized by the presence of beta-amyloid plaques on the outer portions of neurons.

Currently, two classes of medications are used as therapies for AD, **acetylcholinesterase inhibitors (AChEIs)** and an **N-methyl-D-aspartate (NMDA) receptor antagonist**.

AChEIs increase the concentration of acetylcholine and may have beneficial effects on dementia. NMDA receptor antagonist mechanism of action is unclear, but may reduce glutamatergic overstimulation at the NMDA receptor, which may have symptomatic benefits on dementia.

Acetylcholinesterase Inhibitors

Name	Uses	Availability	Dose/Titration	Adverse Effects
Donepezil (Aricept, Aricept ODT)	Mild, moderate, severe AD	T: 5 mg, 10 mg, 23 mg ODT: 5 mg, 10 mg	Initially, 5 mg once/d, may increase to 10 mg once/d after 4-6 wks. After 3 months, if sub-optimal response, may increase to 23 mg once/d	Nausea, vomiting, abdominal cramping, diarrhea, bradycardia, syncope
Galantamine (Razadyne, Razadyne ER)	Mild, moderate AD	T: 4 mg, 8 mg, 12 mg OS: 4 mg/ml ER: 8 mg, 16 mg, 24 mg	T, OS: Initially, 4 mg bid; may increase to 8 mg bid after 4 wks, then to 12 mg bid after additional 4 wks ER: Initially, 8 mg once/d, may increase to 16 mg once/d after 4 wks, then to 24 mg once/d after additional 4 wks	Nausea, vomiting, diarrhea, weight loss, decreased appetite, syncope
Rivastigmine (Exelon, Exelon Patch)	Mild, moderate AD Patch also approved for severe AD	C: 1.5 mg, 3 mg, 4.5 mg, 6 mg OS: 2 mg/ml PATCH: 4.6 mg/24 hrs, 9.5 mg/24 hrs, 13.3 mg/24 hrs	C, OS: Initially, 1.5 mg bid, may increase in increments of 1.5 mg bid every 2 wks up to 6 mg bid	Nausea, vomiting, abdominal cramping, diarrhea, bradycardia, syncope, loss of appetite, weight loss

NMDA Receptor Antagonist

Memantine (Namenda, Namenda XR)	Moderate, severe AD	T: 5 mg, 10 mg OS: 2 mg/ml XR: 7 mg, 14 mg, 21 mg, 28 mg	T, OS: Initially, 5 mg once/d, may increase in increments of 5 mg/wk up to 10 mg bid	Dizziness, headache, diarrhea, constipation, confusion
--	---------------------------	--	---	---

NMDA Receptor Antagonist/ Acetylcholinesterase Inhibitor

Memantine/donepezil (Namzaric)	Moderate, severe AD	ER: 14/10 mg, 28/10 mg	14/10 mg: Once/d in evening in patients previously stabilized on memantine 5 mg bid or 14 mg once/d and donepezil 10 mg once/d 28/10 mg: Once/d in evening in patients previously stabilized on memantine 10 mg bid or 28 mg once/d and donepezil 10 mg once/d	Refer to individual agents for adverse effects
---	---------------------------	---	---	--

C: capsule, **ER:** extended release, **OS:** oral solution, **T:** tablet, **XR:** extended release

Angiotensin-Converting Enzyme (ACE) Inhibitors

Uses

Treatment of hypertension (HTN), adjunctive therapy for heart failure (HF).

Action

Antihypertensive: Inhibits angiotensin-converting enzyme (ACE). ACE catalyzes conversion of angiotensin I to angiotensin II, a potent vasoconstrictor that also stimulates aldosterone secretion by adrenal cortex. Beneficial effects in HTN/HF appear to be suppression of the renin-angiotensin-aldosterone system. Reduces peripheral arterial resistance.

HF: Decreases peripheral vascular resistance (afterload), pulmonary capillary wedge pressure (preload); improves cardiac output, exercise tolerance.

Ace Inhibitors

Name	Availability	Uses	Dosage Range (per day)	Frequent or Severe Side Effects
Benazepril (Lotensin)	T: 5 mg, 10 mg, 20 mg, 40 mg	HTN	HTN: Initially, 10 mg/day. Usual dose: 20–80 mg once/d or divided bid.	Class Effects Cough, hypotension, rash, acute renal failure (in pts with renal artery stenosis), angioedema, hyperkalemia, mild-moderate loss of taste, hepatotoxicity, pancreatitis, blood dyscrasias, renal damage
Captopril (Capoten)	T: 12.5 mg, 25 mg, 50 mg, 100 mg	HTN HF	HTN: Initially, 12.5–25 mg 2–3 times/day. Usual dose: 50–100 mg 2 times/day. HF: Initially, 6.25 mg 3 times/day. Target: 50 mg 3 times/day.	
Enalapril (Vasotec)	T: 2.5 mg, 5 mg, 10 mg, 20 mg IV: 1.25 mg/ml	HTN HF	HTN: Initially, 2.5–5 mg/day; may increase at 1–2 wk intervals. Usual dose: 5–40 mg once/d or divided bid. HF: Initially, 2.5 mg 2 times/day, may increase at 1–2 wk intervals. Target: 20 mg/day in 1–2 divided doses.	
Fosinopril (Monopril)	T: 10 mg, 20 mg, 40 mg	HTN HF	HTN: Initially, 10 mg/day. Usual dose: 10–80 mg once/d. HF: Initially, 5–10 mg/day. Target: 10–40 mg/day.	
Lisinopril (Prinivil, Zestril)	T: 2.5 mg, 5 mg, 10 mg, 20 mg, 40 mg	HTN HF	HTN: Initially, 5–10 mg/day. Usual dose: 10–40 mg/once/d. HF: Initially, 2.5–5 mg/day. Target: 20–40 mg/day.	
Moexipril (Univasc)	T: 7.5 mg, 15 mg	HTN	HTN: Initially, 3.75–7.5 mg/day. Usual dose: 7.5–30 mg/day in 1–2 divided doses.	
Perindopril (Aceon)	T: 2 mg, 4 mg, 6 mg	HTN	HTN: Initially, 4 mg/day. May increase at 1–2 wk intervals. Usual dose: 4–8 mg once/d or divided bid.	
Quinapril (Accupril)	T: 5 mg, 10 mg, 20 mg, 40 mg	HTN HF	HTN: Initially, 10–20 mg once daily. Usual dose: 10–40 mg once/d or divided bid. HF: Initially, 5 mg 2 times/day. Titrate to 20–40 mg/day in 2 divided doses.	

Ramipril (Altace)	C: 1.25 mg, 2.5 mg, 5 mg, 10 mg	HTN HF	HTN: Initially, 2.5 mg once daily. Usual dose: 2.5–20 mg once/d or divided bid. HF: Initially, 1.25–2.5 mg once daily. Target: 10 mg once daily.
Trandolapril (Mavik)	T: 1 mg, 2 mg, 4 mg	HTN HF	HTN: Initially, 1–2 mg once daily. Usual dose: 2–8 mg once/d or divided bid. HF: Initially, 1 mg once daily. Target: 4 mg once daily.

C, Capsules; **HF**, heart failure; **HTN**, hypertension; **T**, tablets.

Angiotensin II Receptor Antagonists

Uses

Treatment of hypertension (HTN) alone or in combination with other antihypertensives. Treatment of heart failure (HF).

Action

Angiotensin II receptor antagonists (AIIRA) block vasoconstrictor and aldosterone-secreting effects on angiotensin II by selectively blocking the binding of angiotensin II to AT₁ receptors in vascular smooth muscle and the adrenal gland, causing vasodilation and a decrease in aldosterone effects.

Angiotensin II Receptor Antagonists

Name	Availability	Uses	Dosage Range (per day)	Frequent or Severe Side Effects
Azilsartan (Edarbi)	T: 40 mg, 80 mg	HTN	40–80 mg once daily	Class Effects Hypotension, rash, acute renal failure (in pts with renal artery stenosis), hyperkalemia, mild-moderate loss of taste, hepatotoxicity, pancreatitis, blood dyscrasias, renal damage
Candesartan (Atacand)	T: 4 mg, 8 mg, 16 mg, 32 mg	HTN HF	Initially, 16 mg once daily. Usual dose: 8–32 mg in 1–2 divided doses Initially 4–8 mg once daily. Double dose at 2 wk intervals. Target: 32 mg once daily.	
Eprosartan (Teveten)	T: 400 mg, 600 mg	HTN	Initially, 600 mg/day. Usual dose: 600-once/d	

Irbesartan (Avapro)	T: 75 mg, 150 mg, 300 mg	HTN Nephropathy	150–300 mg once daily 300 mg once daily
Losartan (Cozaar)	T: 25 mg, 50 mg, 100 mg	HTN Nephropathy	Initially, 50 mg once daily. Usual dose: 25–100 mg/once/d or divided bid. Initially, 50 mg/day; may increase to 100 mg/day.
Olmesartan (Benicar)	T: 5 mg, 20 mg, 40 mg	HTN	Initially, 20 mg once daily. May increase to 40 mg once daily after 2 wks.
Telmisartan (Micardis)	T: 40 mg, 80 mg	HTN CV risk reduction	Initially 40 mg once daily. Usual dose: 40–80 mg once daily. 80 mg once daily
Valsartan (Diovan)	T: 80 mg, 160 mg	HTN HF Post MI	Initially, 80 or 160 mg once daily. Usual dose: 80–320 mg once daily Initially 20–40 mg 2 times/day. Titrate to 80–160 mg 2 times/day. Initially, 20 mg 2 times/day. Titrate to target of 160 mg 2 times/day

CV, Cardiovascular; **HF**, heart failure; **HTN**, hypertension; **MI**, myocardial Infarction; **T**, tablets.

Antianxiety Agents

Uses

Treatment of anxiety including generalized anxiety disorder (GAD), panic disorder, obsessive-compulsive disorder (OCD), social anxiety disorder (SAD), post-traumatic stress disorder (PTSD), and acute stress disorder. In addition, some benzodiazepines are used as hypnotics, anticonvulsants to prevent delirium tremors during alcohol withdrawal, and as adjunctive therapy for relaxation of skeletal muscle spasms. Midazolam, a short-acting benzodiazepine, is used for preop sedation and relief of anxiety for short diagnostic/endoscopic procedures (see individual monograph for midazolam).

Action

Benzodiazepines are the largest and most frequently prescribed group of antianxiety agents. The exact mechanism is unknown, but they may increase the inhibiting effect of gamma-aminobutyric acid (GABA), which inhibits nerve

impulse transmission by binding to specific benzodiazepine receptors in various areas of the central nervous system (CNS).

◀ALERT▶ Refer to individual entries of nonbenzodiazepine drugs for more information on uses and actions.

Antianxiety Agents

Name	Availability	Uses	Dosage	Side Effects
Benzodiazepine				
Alprazolam (Xanax)	T: 0.25 mg, 0.5 mg, 1 mg, 2 mg S: 1 mg/ml ER: 0.5 mg, 1 mg, 2 mg, 3 mg ODT: 0.25 mg, 0.5 mg, 1 mg, 2 mg	Anxiety, panic disorder	Initially, 0.25–0.5 mg 3 times/day. May increase every 3–4 days. Maximum: 4 mg/day.	Drowsiness, weakness, fatigue, ataxia, slurred speech, confusion, lack of coordination, impaired memory, paradoxical agitation, dizziness, nausea
Chlordiazepoxide (Librium)	C: 5 mg, 10 mg, 25 mg T: 10 mg, 25 mg I: 100 mg	Anxiety, alcohol withdrawal	Anxiety: 5–10 mg 3–4 times/day up to 20–25 mg 3–4 times/day. Alcohol withdrawal: Initially, 50–100 mg. May increase to 300 mg/24 hrs.	Drowsiness, fatigue, ataxia, memory impairment
Clorazepate (Tranxene)	T: 3.75 mg, 7.5 mg, 15 mg SD: 11.25 mg, 22.5 mg	Anxiety, alcohol withdrawal, anticonvulsant	7.5–15 mg 2–4 times/day.	Hypotension, drowsiness, fatigue, ataxia, memory impairment, headache, nausea
Diazepam (Valium)	T: 2 mg, 5 mg, 10 mg S: 5 mg/5 ml I: 5 mg/ml	Anxiety, alcohol withdrawal, anticonvulsant, muscle relaxant	2–10 mg, 2–4 times/day.	Hypotension, ataxia, drowsiness, fatigue, vertigo
Lorazepam (Ativan)	T: 0.5 mg, 1 mg, 2 mg	Anxiety, alcohol withdrawal	Initially, 2–3 mg/day in 2–3 divided doses. Usual dose: 2–6	Sedation, respiratory depression, ataxia, dizziness, headache

	S: 2 mg/ml I: 2 mg/ml, 4 mg/ml		mg/day in divided doses.	
Nonbenzodiazepine				
Buspirone (BuSpar)	T: 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg	Anxiety	Initially, 7.5 mg 2 times/day. May increase every 2–3 days by 2.5 mg bid. Maximum: 30 mg 2 times/day.	Dizziness, light-headedness, headaches, nausea, restlessness
Hydroxyzine (Atarax, Vistaril)	T: 10 mg, 25 mg, 50 mg C: 25 mg, 50 mg, 100 mg S: 10 mg/5 ml	Anxiety	50–100 mg 4 times/day	Drowsiness; dry mouth, nose, and throat
Paroxetine (Paxil)	S: 10 mg/5 ml T: 10 mg, 20 mg, 30 mg, 40 mg T (CR): 12.5 mg, 25 mg, 37.5 mg	Anxiety, depression, obsessive-compulsive disorder, panic disorder	Initially, 20 mg once daily. May increase by 10 mg/ day at 1 wk intervals up to 50 mg/day. CR: Initially, 12.5 mg/day. May increase by 12.5 mg/ day at 1 wk intervals up to 37.5 mg/day.	Drowsiness; dry mouth, nose, and throat; dizziness, diarrhea, diaphoresis, constipation, vomiting, tremors
Venlafaxine (Effexor)	C (ER): 37.5 mg, 75 mg, 150 mg T (ER): 37.5 mg, 75 mg, 150 mg	Anxiety, depression	Initially 37.5–75 mg once daily. May increase by 75 mg/day at least every 4 days up to 225 mg/day.	Drowsiness, nausea, headaches, dry mouth

C, Capsules; **CR**, controlled-release; **ER**, extended-release; **I**, Injection; **ODT**, orally disintegrating tablet; **S**, solution; **SD**, single dose; **T**, tablets.

Antiarrhythmics

Uses

Prevention and treatment of cardiac arrhythmias, such as premature ventricular

contractions, ventricular tachycardia, premature atrial contractions, paroxysmal atrial tachycardia, atrial fibrillation and flutter.

Action

The antiarrhythmics are divided into four classes based on their' effects on certain ion channels and/or receptors located on the myocardial cell membrane. Class I is further divided into three subclasses (IA, IB, IC) based on electrophysiologic effects.

Class I: Blocks cardiac sodium channels and slows conduction velocity, prolonging refractory period and decreasing automaticity of sodium-dependent tissue.

Class IA: Blocks sodium and potassium channels.

Class IB: Shortens the repolarization phase.

Class IC: Slows conduction velocity; no effect on repolarization phase.

Class II: Slows sinus and atrioventricular (AV) nodal conduction.

Class III: Blocks cardiac potassium channels, prolonging the repolarization phase of electrical cells.

Class IV: Inhibits the influx of calcium through its channels, causing slower conduction through the sinus and AV nodes; decreases contractility.

Antiarrhythmics

Name	Availability	Uses	Dosage Range	Side Effects
Class IA				
Disopyramide (Norpace, Norpace CR)	C: 100 mg, 150 mg C (ER): 100 mg, 150 mg	AF, WPW, PSVT, PVCs, VT	C: 100–200 mg q6h. ER: 200–400 mg q12h.	Dry mouth, blurred vision, urinary retention, HF, proarrhythmia, heart block, nausea, vomiting, diarrhea, hypoglycemia, nervousness
Procainamide (Procan-SR, Pronestyl)	I: 100 mg/ml, 500 mg/ml	AF, WPW, PVCs, VT	Loading dose: 15– 18 mg/kg over 20–30 min. Maintenance dose: 1–4 mg/min as a continuous infusion.	Hypotension, fever, agranulocytosis, SLE, headaches, proarrhythmia, confusion, disorientation, GI symptoms, hypotension
Quinidine (Quinaglute, Quinidex)	T: 200 mg, 300 mg T (ER): 300 mg, 324 mg	AF, WPW, PVCs, VT	A (PO): 400 mg q6h (ER): 300–q8– 12h or 648 mg q8h.	Diarrhea, hypotension, nausea, vomiting, cinchonism, fever, bitter taste, heart block, thrombocytopenia, proarrhythmia

	I: 80 mg/ml			
Class IB				
Lidocaine (Xylocaine)	I: 300 mg for IM IV Infusion: 2 mg/ml, 4 mg/ml	PVCs, VT, VF	IV: Initially, 1–1.5 mg/kg. May repeat 0.5–0.75 mg/kg q5–10 min. Maximum cumulative dose: 3 mg/kg, then 1–4 mg/min infusion	Drowsiness, agitation, muscle twitching, seizures, paresthesia, proarrhythmia, slurred speech, tinnitus, cardiac depression, bradycardia, asystole
Mexiletine (Mexitol)	C: 150 mg, 200 mg, 250 mg	PVCs, VT, VF	A: Initially, 200 mg q8h. Adjust every 2–3 days in 50–100 mg increments. Maximum: 1,200 mg/day.	Drowsiness, agitation, muscle twitching, seizures, paresthesia, proarrhythmia, nausea, vomiting, blood dyscrasias, hepatitis, fever
Class IC				
Flecainide (Tambocor)	T: 50 mg, 100 mg, 150 mg	AF, PSVT, life-threatening ventricular arrhythmias	A: Initially, 100 mg q12h. May increase by 50 mg q12h at 4 day intervals. Maximum: 400 mg/day.	Dizziness, tremors, bradycardia, heart block, HF, GI upset, neutropenia, flushing, blurred vision, metallic taste, proarrhythmia
Propafenone (Ryth mol)	T: 150 mg, 225 mg, 300 mg ER: 225 mg, 325 mg, 425 mg	PAF, WPW, life-threatening ventricular arrhythmias	A: T: Initially, 150 mg q8h. May increase at 3–4 day intervals up to 300 mg q8h. ER: Initially, 225 mg q12h. May increase at a minimum of 5 days up to 425 mg q12h.	Dizziness, blurred vision, altered taste, nausea, exacerbation of asthma, proarrhythmia, bradycardia, heart block, HF, GI upset, bronchospasm, hepatotoxicity
Class II (Beta-Blockers)				
Acebutolol (Sectral)	C: 100 mg, 200 mg, 400mg	Ventricular arrhythmias	A: Initially, 200 mg 2 times/day. Maintenance: 600–1200 mg/day in divided doses.	Bradycardia, hypotension, depression, nightmares, fatigue, sexual dysfunction, SLE, arthritis, myalgia
Esmolol (Brevibloc)	I: 10 mg/ml	Supraventricular tachycardia	A: 50–200 mcg/kg/min	Hypotension, heart block, HF, bronchospasm

Propranolol (Inderal)	T: 10 mg, 20 mg, 40 mg	Tachyarrhythmias	A: Initially, 10–30 mg 3–4 times/day Maintenance: 10–40 mg 3–4 times/day	Bradycardia, hypotension, depression, nightmares, fatigue, sexual dysfunction, heart block, bronchospasm
Class III				
Amiodarone (Cordarone, Pacerone)	T: 100 mg, 200 mg, 400 mg I: 50 mg/ml	AF, PAF, PSVT, life-threatening ventricular arrhythmias	A (PO): 800–1,600 mg/day in divided doses for 1–3 wks, then 600–800 mg/day in divided doses (IV): 150 mg bolus, then 900 mg over 18 hrs	Blurred vision, photophobia, constipation, ataxia, proarrhythmia, pulmonary fibrosis, bradycardia, heart block, hyperthyroidism or hypothyroidism, peripheral neuropathy, GI upset, blue-gray skin, optic neuritis, hypotension
Dofetilide (Tikosyn)	C: 125 mcg, 250 mcg, 500 mcg	AF, A flutter	A: Individualized	Torsades de pointes, hypotension
Dronedaronone (Multaq)	T: 400 mg	AF, A flutter	A (PO): 400 mg 2 times/day	Diarrhea, nausea, abdominal pain, vomiting, asthenia
Ibutilide (Corvert)	I: 0.1 mg/ml	AF, A flutter	A (greater than 60 kg): 1 mg over 10 min; (less than 60 kg): 0.01 mg/kg over 10 min	Torsades de pointes
Sotalol (Betapace)	T: 80 mg, 120 mg, 160 mg	AF, PAF, PSVT, life-threatening ventricular arrhythmias	A: Initially, 80 mg 2 times/day. May increase at 3 day intervals up to 160 mg 2 times/day.	Fatigue, dizziness, dyspnea, bradycardia, proarrhythmia, heart block, hypotension, bronchospasm
Class IV (Calcium Channel Blockers)				
Diltiazem (Cardizem)	I: 25 mg/ml vials Infusion: 1 mg/ml	AF, A flutter, PSVT	A (IV): 20–25 mg bolus, then infusion of 5–15 mg/hr	Hypotension, bradycardia, dizziness, headaches, heart block, asystole, HF
Verapamil (Calan, Isoptin)	I: 5 mg/2 ml	AF, A flutter, PSVT	A (IV): 5–10 mg	Hypotension, bradycardia, dizziness, headaches, constipation, heart block, HF, asystole, fatigue, edema, nausea

A, Adults; **AF**, atrial fibrillation; **A flutter**, atrial flutter; **C**, capsules; **HF**, heart failure; **ER**, extended-release; **I**, Injection; **PAF**, paroxysmal atrial fibrillation; **PSVT**, paroxysmal supraventricular tachycardia; **PVCs**, premature ventricular contractions; **SLE**, systemic lupus erythematosus; **SR**, sustained-release; **T**, tablets; **VT**, ventricular tachycardia; **WPW**, Wolff-Parkinson-White syndrome.

Antibiotics

Uses

Treatment of wide range of gram-positive or gram-negative bacterial infections, suppression of intestinal flora before surgery, control of acne, prophylactically to prevent rheumatic fever, prophylactically in high-risk situations (e.g., some surgical procedures or medical conditions) to prevent bacterial infection.

Action

Antibiotics are natural or synthetic compounds that have the ability to kill or suppress the growth of microorganisms.

One means of classifying antibiotics is by their anti-microbial spectrum. Narrow-spectrum agents are effective against few microorganisms (e.g., aminoglycosides are effective against gram-negative aerobes), whereas broad-spectrum agents are effective against a wide variety of microorganisms (e.g., fluoroquinolones are effective against gram-positive cocci and gram-negative bacilli).

Antimicrobial agents may also be classified based on their mechanism of action.

- Agents that inhibit cell wall synthesis or activate enzymes that disrupt the cell wall, causing a weakening in the cell, cell lysis, and death. Include penicillins, cephalosporins, vancomycin, imidazole antifungal agents.
- Agents that act directly on the cell wall, affecting permeability of cell membranes, causing leakage of intracellular substances. Include antifungal agents amphotericin and nystatin, polymyxin, colistin.
- Agents that bind to ribosomal subunits, altering protein synthesis and eventually causing cell death. Include aminoglycosides.
- Agents that affect bacterial ribosome function, altering protein synthesis and causing slow microbial growth. Do not cause cell death. Include chloramphenicol, clindamycin, erythromycin, tetracyclines.
- Agents that inhibit nucleic acid metabolism by binding to nucleic acid or interacting with enzymes necessary for nucleic acid synthesis. Inhibit DNA or RNA synthesis. Include rifampin, metronidazole, fluoroquinolones (e.g., ciprofloxacin).
- Agents that inhibit specific metabolic steps necessary for microbial growth, causing a decrease in essential cell components or synthesis of nonfunctional analogues of normal metabolites. Include trimethoprim, sulfonamides.
- Agents that inhibit viral DNA synthesis by binding to viral enzymes necessary

for DNA synthesis, preventing viral replication. Include acyclovir, vidarabine.

Selection of Antimicrobial Agents

The goal of therapy is to achieve antimicrobial action at the site of infection sufficient to inhibit the growth of the microorganism. The agent selected should be the most active against the most likely infecting organism, least likely to cause toxicity or allergic reaction. Factors to consider in selection of an antimicrobial agent include the following:

- Sensitivity pattern of the infecting microorganism
- Location and severity of infection (may determine route of administration)
- Pt's ability to eliminate the drug (status of renal and hepatic function)
- Pt's defense mechanisms (includes both cellular and humoral immunity)
- Pt's age, pregnancy status, genetic factors, allergies, CNS disorder, preexisting medical problems

Categorization of Organisms by Gram Staining

Gram-Positive Cocci	Gram-Negative Cocci	Gram-Positive Bacilli	Gram-Negative Bacilli
Aerobic <i>Staphylococcus aureus</i> <i>Staphylococcus epidermidis</i> <i>Streptococcus pneumoniae</i> <i>Streptococcus pyogenes</i> <i>Viridans streptococci</i> <i>Enterococcus faecalis</i> <i>Enterococcus faecium</i> Anaerobic <i>Peptostreptococcus spp.</i> <i>Peptococcus spp.</i>	Aerobic <i>Neisseria gonorrhoeae</i> <i>Neisseria meningitidis</i> <i>Moraxella catarrhalis</i>	Aerobic <i>Listeria monocytogenes</i> <i>Bacillus anthracis</i> <i>Corynebacterium diphtheriae</i> Anaerobic <i>Clostridium difficile</i> <i>Clostridium perfringens</i> <i>Clostridium tetani</i> <i>Actinomyces spp.</i>	Aerobic <i>Escherichia coli</i> <i>Klebsiella pneumoniae</i> <i>Proteus mirabilis</i> <i>Serratia marcescens</i> <i>Acinetobacter spp.</i> <i>Pseudomonas aeruginosa</i> <i>Enterobacter spp.</i> <i>Haemophilus influenzae</i> <i>Legionella pneumophila</i> Anaerobic <i>Bacteroides fragilis</i> <i>Fusobacterium spp.</i>

Antibiotic: Aminoglycosides

Uses

Treatment of serious infections when other less-toxic agents are not effective, are contraindicated, or require adjunctive therapy (e.g., with penicillins or cephalosporins). Used primarily in the treatment of infections caused by gram-

negative microorganisms, such as those caused by *Proteus*, *Klebsiella*, *Pseudomonas*, *Escherichia coli*, *Serratia*, and *Enterobacter*. Inactive against most gram-positive microorganisms. Not well absorbed systemically from GI tract (must be administered parenterally for systemic infections). Oral agents are given to suppress intestinal bacteria.

Action

Bactericidal. Transported across bacterial cell membrane; irreversibly bind to specific receptor proteins of bacterial ribosomes. Interfere with protein synthesis, preventing cell reproduction and eventually causing cell death.

Antibiotic: Aminoglycosides

Name	Availability	Dosage Range	Side Effects
Amikacin	I: 50 mg/ml, 250 mg/ml	A: 5–7.5 mg/kg q8h or 15–20 mg/kg once daily C: 5–7.5 mg/kg q8h	Nephrotoxicity, neurotoxicity, ototoxicity (both auditory and vestibular), hypersensitivity (skin itching, redness, rash, swelling)
Gentamicin	I: 10 mg/ml, 40 mg/ml	A: 4–7 mg/kg once daily or 1–2.5 mg/kg q8–12h C: 2–2.5 mg/kg q8h	Same as amikacin
Tobramycin	I: 10 mg/ml, 40 mg/ml	A: 5–7 mg/kg once daily or 1–2.5 mg/kg q8h C: 2–2.5 mg/kg q8h	Same as amikacin

A, Adults; **C** (*dosage*), children; **I**, Injection; **T**, tablets.

Antibiotic: Cephalosporins

Uses

Broad-spectrum antibiotics, which, like penicillins, may be used in a number of diseases, including respiratory diseases, skin and soft tissue infection, bone/joint infections, genitourinary infections, prophylactically in some surgical procedures.

First-generation cephalosporins have activity against gram-positive organisms (e.g., streptococci and most staphylococci) and activity against most gram-negative organisms, including *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus*

mirabilis, *Salmonella*, and *Shigella*.

Action

Second-generation cephalosporins have same effectiveness as first-generation and increased activity against gram-negative organisms, including *Haemophilus influenzae*, *Neisseria*, *Enterobacter*, and several anaerobic organisms.

Third-generation cephalosporins are less active against gram-positive organisms but more active against the Enterobacteriaceae with some activity against *Pseudomonas aeruginosa*, *Serratia* spp., and *Acinetobacter* spp.

Fourth-generation cephalosporins have good activity against gram-positive organisms (e.g., *Staphylococcus aureus*) and gram-negative organisms (e.g., *Pseudomonas aeruginosa*, *E. coli*, *Klebsiella*, and *Proteus*).

Fifth-generation cephalosporins have good activity against gram-positive organisms (e.g., *Staphylococcus aureus*, *Streptococcus* spp.) and gram-negative organisms (e.g., *E. coli*, *Klebsiella* spp.).

Cephalosporins inhibit cell wall synthesis or activate enzymes that disrupt the cell wall, causing cell lysis and cell death. May be bacteriostatic or bactericidal. Most effective against rapidly dividing cells.

Antibiotic: Cephalosporins

Name	Availability	Dosage Range	Side Effects
First-Generation			
Cefadroxil (Duricef)	C: 500 mg T: 1 g S: 125 mg/5 ml, 250 mg/5 ml, 500 mg/5 ml	A: 500 mg–1 g C: 15 mg/kg q12h	Abdominal cramps/pain, fever, nausea, vomiting, diarrhea, headaches, oral/vaginal candidiasis
Cefazolin (Ancef)	I: 500 mg, 1 g, 2 g	A: 500 mg–2 g q6–8h C: 25–100 mg/kg/day divided q6–8h	Fever, rash, diarrhea, nausea, pain at injection site
Cephalexin (Keflex, Keftab)	C: 250 mg, 500 mg T: 250 mg, 500 mg, 1 g	A: 250 mg–1 g q6–12h C: 25–100 mg/kg/day divided q6–8h	Headache, abdominal pain, diarrhea, nausea, dyspepsia
Second-Generation			
Cefaclor (Ceclor)	C: 250 mg, 500 mg T (ER): 500 mg S: 125 mg/5 ml, 187	A: 250–500 mg q8h ER: 500 mg	Rash, diarrhea, increased transaminases May have serum sickness-like reaction

	mg/5 ml, 250 mg/5 ml, 375 mg/5 ml	q12h C: 20–40 mg/kg/day q8–12h	
Cefotetan	I: 1g, 2g	A: 500 mg–3 g q12h C: 20–40 mg/kg q12h	Diarrhea, increased AST, ALT, hypersensitivity reactions
Cefoxitin (Mefoxin)	I: 1g, 2g	A: 1–2 g q6–8h C: 80–160 mg/kg/day divided q6h	Diarrhea
Cefprozil (Cefzil)	T: 250 mg, 500 mg S: 125 mg/5 ml, 250 mg/5 ml	A: 500 mg q12–24h C: 7.5–15 mg/kg q12h	Dizziness, abdominal pain, diarrhea, nausea, increased AST, ALT
Cefuroxime (Ceftin, Kefurox, Zinacef)	T: 125 mg, 250 mg, 500 mg S: 125 mg/5 ml, 250 mg/5 ml I: 750 mg, 1.5 g	A (PO): 125–500 mg q12h (IM/IV): 750 mg–1.5 g q8–12h C (PO): 10–15 mg/kg q12h (IM/IV): 75–150 mg/kg/day divided q8h	Diarrhea, nausea, vomiting, thrombophlebitis, increased AST, ALT
Third-Generation			
Cefdinir (Omnicef)	C: 300 mg S: 125 mg/5 ml	A: 300 mg q12h or 600 mg once daily C: 7 mg/kg q12h or 14 mg/kg once daily	Headache, hyperglycemia, abdominal pain, diarrhea, nausea
Cefditoren (Spectracef)	T: 200 mg, 400 mg	A: 200–400 mg q12h C: (>11 yrs): 200–400 mg q12h	Diarrhea, nausea
Cefotaxime (Claforan)	I: 500 mg, 1 g, 2 g	A: 1–2 g q4–12h C: 50–300 mg/kg/day divided q4–6h	Rash, diarrhea, nausea, pain at injection site
Cefpodoxime (Vantin)	T: 100 mg, 200 mg S: 50 mg/5 ml, 100 mg/5 ml	A: 100–400 mg q12h C: 5 mg/kg q12h	Rash, diarrhea, nausea
Ceftazidime (Fortaz, Tazicef, Tazidime)	I: 500 mg, 1 g, 2 g	A: 500 mg–2 g q8–12h C: 30–50 mg/kg q8h	Diarrhea, pain at injection site
Ceftibuten (Cedax)	C: 400 mg S: 90 mg/5 ml, 180	A: 400 mg once daily	Headache, nausea, diarrhea

	mg/5 ml	C: 4.5 mg/kg bid or 9 mg/kg once daily	
Ceftriaxone (Rocephin)	I: 250 mg, 500 mg, 1 g, 2 g	A: 1–2 g q12–24h C: 50–100 mg/kg/day divided q12–24h	Rash, diarrhea, eosinophilia, increased AST, ALT
Fourth-Generation			
Cefepime (Maxipime)	I: 1g, 2g	A: 1–2 g q8–12h C: 50 mg/kg q8–12h	Rash, diarrhea, nausea; increased AST, ALT
Fifth-Generation			
Ceftaroline (Teflaro)	I: 400 mg, 600 mg	A: 600 mg q12h	Headache, insomnia, rash, pruritus, diarrhea, nausea
Fixed-Combinations			
Ceftazidime/avibactam (Avycaz)	I: 2 g ceftazidime/0.5 g avibactam	A: 2.5 g q8h	Nausea, vomiting, constipation, anxiety
Ceftolozane/tazobactam (Zerbaxa)	I: 1 g ceftolozane/0.5 g tazobactam	A: 1.5 g q8h	Nausea, diarrhea, headache, pyrexia

A, Adults; C, capsules; C (*dosage*), children; ER, extended-release; I, Injection; S, suspension; T, tablets.

Antibiotic: Fluoroquinolones

Uses

Fluoroquinolones act against a wide range of gram-negative and gram-positive organisms. They are used primarily in the treatment of lower respiratory infections, skin/skin structure infections, urinary tract infections, and sexually transmitted diseases.

Action

Bactericidal. Inhibit DNA gyrase in susceptible microorganisms, interfering with bacterial DNA replication and repair.

Antibiotic: Fluoroquinolones

Name	Availability	Dosage Range	Side Effects
Ciprofloxacin	T: 100 mg, 250	A (PO): 250–750 mg	Dizziness, headaches, anxiety, drowsiness, insomnia,

(Cipro)	mg, 500 mg, 750 mg S: 250 mg/5 ml, 500 mg/5 ml I: 200 mg, 400 mg	q12h; (IV): 200– 400 mg q12h	abdominal pain, nausea, diarrhea, vomiting, phlebitis (parenteral)
Delafloxacin (Baxdela)	T: 450 mg I: 300 mg	A (PO): 450 mg q12h; (IV): 300 mg q12h	Nausea, diarrhea, headache, elevation of transaminases, vomiting
Gemifloxacin (Factive)	T: 320 mg	A: 320 mg once daily	Headache, dizziness, rash, diarrhea, nausea
Levofloxacin (Levaquin)	T: 250 mg, 500 mg, 750 mg I: 250 mg, 500 mg, 750 mg OS: 250 mg/10 ml	A (PO/IV): 250–750 mg/day as single dose	Headache, insomnia, dizziness, rash, nausea, diarrhea, constipation
Moxifloxacin (Avelox)	T: 400 mg I: 400 mg	A: 400 mg/day	Headache, dizziness, insomnia, nausea, diarrhea
Ofloxacin	T: 300 mg, 400 mg	A: 200–400 mg q12h	Dizziness, headache, insomnia, abdominal cramps, diarrhea, nausea

A, Adults; **I,** Injection; **OS,** oral solution; **PO,** oral; **S,** suspension; **T,** tablets.

Antibiotic: Macrolides

Uses

Macrolides act primarily against most gram-positive microorganisms and some gram-negative cocci. Azithromycin and clarithromycin appear to be more potent than erythromycin. Macrolides are used in the treatment of pharyngitis/tonsillitis, sinusitis, chronic bronchitis, pneumonia, uncomplicated skin/skin structure infections.

Action

Bacteriostatic or bactericidal. Reversibly binds to the P site of the 50S ribosomal subunit of susceptible organisms, inhibiting RNA-dependent protein synthesis.

Antibiotic: Macrolides

Name	Availability	Dosage Range	Side Effects
Azithromycin	T: 250 mg, 600 mg	A (PO): 500 mg	PO: Nausea, diarrhea, vomiting,

(Zithromax)	S: 100 mg/5 ml, 200 mg/5 ml, 1-g packet I: 500 mg	once, then 250 mg once daily (IV): 500 mg/day C (PO/IV): 5–10 mg/kg once daily	abdominal pain IV: Pain, redness, swelling at injection site
Clarithromycin (Biaxin)	T: 250 mg, 500 mg T (XL): 500 mg S: 125 mg/5 ml	A: 250–500 mg q12h (or XL 1,000 mg once daily) C: 7.5 mg/kg q12h	Headaches, loss of taste, nausea, vomiting, diarrhea, abdominal pain/ discomfort
Erythromycin (EES, Eryc, EryPed, Ery-Tab, Erythrocin, PCE)	T: 200 mg, 250 mg, 333 mg, 400 mg, 500 mg C: 250 mg S: 100 mg/2.5 ml, 125 mg/5 ml, 200 mg/5 ml, 250 mg/5 ml, 400 mg/5 ml	A (PO): 250–500 mg q6h (IV): 500 mg–1 g q6h C (PO): 7.5 mg/kg q6h (IV): 15–20 mg/kg/day in divided doses q6h	PO: Nausea, vomiting, diarrhea, abdominal pain IV: Inflammation, phlebitis at injection site

A, Adults; C, capsules; C (*dosage*), children; I, Injection; S, suspension; T, tablets; XL, long-acting.

Antibiotic: Penicillins

Uses

Penicillins (also referred to as beta-lactam antibiotics) may be used to treat a large number of infections, including pneumonia and other respiratory diseases, urinary tract infections, septicemia, meningitis, intra-abdominal infections, gonorrhea and syphilis, bone/joint infection.

Penicillins are classified based on an antimicrobial spectrum:

Natural penicillins are very active against gram-positive cocci but ineffective against most strains of *Staphylococcus aureus* (inactivated by enzyme penicillinase).

Penicillinase-resistant penicillins are effective against penicillinase-producing *Staphylococcus aureus* but are less effective against gram-positive cocci than the natural penicillins.

Broad-spectrum penicillins are effective against gram-positive cocci and some gram-negative bacteria (e.g., *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Salmonella*, and *Shigella*).

Extended-spectrum penicillins are effective against gram-negative organisms, including *Pseudomonas aeruginosa*, *Enterobacter*, *Proteus* spp., *Klebsiella*,

Serratia spp., and *Acinetobacter* spp.

Action

Penicillins inhibit cell wall synthesis or activate enzymes, which disrupt the bacterial cell wall, causing cell lysis and cell death. May be bacteriostatic or bactericidal. Most effective against bacteria undergoing active growth and division.

Antibiotic: Penicillins

Name	Availability	Dosage Range	Side Effects
Natural			
Penicillin G benzathine (Bicillin, Bicillin LA)	I: 600,000 units, 1.2 million units, 2.4 million units	A: 1.2–2.4 million units as single dose C: 25,000–50,000 units/kg as single dose	Mild diarrhea, nausea, vomiting, headaches, sore mouth/tongue, vaginal itching/discharge, allergic reaction (including anaphylaxis, skin rash, urticaria, pruritus)
Penicillin G potassium (Pfizerpen)	I: 1, 2, 3, 5 million-unit vials	A: 2–4 million units q4h C: 100,000–400,000 units/kg/day divided q4–6h	Rash, injection site reaction, phlebitis
Penicillin V potassium (Apo-Pen-VK)	T: 250 mg, 500 mg S: 125 mg/5 ml, 250 mg/5 ml	A: 250–500 mg q6–8h C: 25–50 mg/kg/day in divided doses q6–8h	Diarrhea, nausea, vomiting
Penicillinase-Resistant			
Dicloxacillin (Dynapen, Pathocil)	C: 125 mg, 250 mg, 500 mg S: 62.5 mg/5 ml	A: 125–500 mg q6h C: 25–50 mg/kg/day divided q6h	Abdominal pain, diarrhea, nausea
Nafcillin (Unipen)	I: 500 mg, 1 g, 2g	A (IV): 500 mg–2 g q4–6h C (IV): 50–200 mg/kg/day in divided doses q4–6h	Inflammation, pain, phlebitis Increased risk of interstitial nephritis

Oxacillin (Bactocill)	C: 250 mg, 500 mg S: 250 mg/5 ml I: 250 mg, 500 mg, 1 g, 2 g	A (IV): 1–2 g q4–6h C (IV): 25–50 mg/kg q6h	Diarrhea, nausea, vomiting Increased risk of hepatotoxicity, interstitial nephritis
Broad-Spectrum			
Amoxicillin (Amoxil, Trimox)	T: 125 mg, 250 mg, 500 mg, 875 mg C: 250 mg, 500 mg S: 200 mg/5 ml, 400 mg/5 ml, 125 mg/5 ml, 250 mg/5 ml	A: 250–500 mg q8h or 500–875 mg q12h C: 20–90 mg/kg/day divided q8–12h	Diarrhea, colitis, nausea
Amoxicillin/clavulanate (Augmentin)	T: 250 mg, 500 mg, 875 mg T (chewable): 125 mg, 200 mg, 250 mg, 400 mg S: 125 mg/5 ml, 200 mg/5 ml, 250 mg/5 ml, 400 mg/5 ml	A: 875 mg q12h or 250–500 mg q8h C: 25–90 mg/kg/day divided q12h	Diarrhea, rash, nausea, vomiting
Ampicillin (Principen)	C: 250 mg, 500 mg S: 125 mg/5 ml, 250 mg/5 ml I: 125 mg, 250 mg, 500 mg, 1 g, 2 g	A (PO): 250–500 mg q6h (IV): 500 mg–2 g q6h C (PO): 12.5–50 mg/kg q6h (IV): 25–50 mg/kg q6h	Nausea, vomiting, diarrhea
Ampicillin/sulbactam (Unasyn)	I: 1.5 g, 3 g	A: 1.5–3 g q6h C: 25–50 mg/kg q6h	Local pain at injection site, rash, diarrhea
Extended-Spectrum			
Piperacillin/tazobactam (Zosyn)	I: 2.25 g, 3.375 g, 4.5 g	A: 3.375 g q6h or 4.5 g q6–8h C: 240–300 mg/kg/day divided q8h	Diarrhea, insomnia, headache, fever, rash

A, Adults; **C**, capsules; **C** (*dosage*), children; **I**, Injection; **PO**, oral; **S**, suspension; **T**, tablets.

Anticoagulants/Antiplatelets/Thrombolytics

Uses

Treatment and prevention of venous thromboembolism, acute MI, acute cerebral embolism; reduce risk of acute MI; reduction of total mortality in pts with unstable angina; prevent occlusion of saphenous grafts following open heart surgery; prevent embolism in select pts with atrial fibrillation, prosthetic heart valves, valvular heart disease, cardiomyopathy. Heparin also used for acute/chronic consumption coagulopathies (disseminated intravascular coagulation).

Action

Anticoagulants: Inhibit blood coagulation by preventing the formation of new clots and extension of existing ones *but do not dissolve formed clots*. Anticoagulants are subdivided. *Heparin* (including low molecular weight heparin): Indirectly interferes with blood coagulation by blocking the conversion of prothrombin to thrombin and fibrinogen to fibrin. *Coumarin:* Acts indirectly to prevent synthesis in the liver of vitamin K–dependent clotting factors. *Direct Thrombin Inhibitors:* Inhibit thrombin from converting fibrinogen to fibrin. *Factor Xa Inhibitors:* Inhibits platelet activation and fibrin clot formation.

Antiplatelets: Interfere with platelet aggregation. Effects are irreversible for life of platelet. Medications in this group act by different mechanisms. Aspirin irreversibly inhibits cyclo-oxygenase and formation of thromboxane A_2 . Clopidogrel, dipyridamole, prasugrel, and ticlopidine have similar effects as aspirin and are known as adenosine diphosphate (ADP) inhibitors. Abciximab, eptifibatide, and tirofiban block binding of fibrinogen to the glycoprotein IIb/IIIa receptor on platelet surface (known as platelet glycoprotein IIb/IIIa receptor antagonists).

Thrombolytics: Act directly or indirectly on fibrinolytic system to dissolve clots (converting plasminogen to plasmin, an enzyme that digests fibrin clot).

Anticoagulants/Antiplatelets/Thrombolytics

Name	Availability	Uses	Side Effects
Anticoagulants			
Direct Thrombin Inhibitors			
Argatroban	I: 100 mg/ml	Prevent/treat VTE in pts with HIT or at risk for HIT undergoing PCI	Bleeding, hypotension, hematuria

Bivalirudin (Angiomax)	I: 250-mg vials	Pts with unstable angina undergoing PTCA	Bleeding, hypotension, pain, headache, nausea, back pain
Dabigatran (Pradaxa)	C: 75 mg, 110 mg, 150 mg	Reduce risk for stroke/embolism with nonvalvular atrial fibrillation, prevent/treat DVT/PE, postoperative prophylaxis of DVT/ PE following hip replacement	Bleeding, gastritis, dyspepsia
Desirudin (Iprivask)	I: 15 mg	Prophylaxis of DVT following hip surgery	Bleeding
Heparin, Low Molecular Weight Heparins			
Dalteparin (Fragmin)	I: 2,500 units, 5,000 units, 7,500 units, 10,000 units	Prevent DVT following hip surgery, abdominal surgery, unstable angina or non-Q-wave MI	Bleeding, hematoma, increased ALT, AST, pain at injection site, bruising
Enoxaparin (Lovenox)	I: 30 mg, 40 mg, 60 mg, 80 mg, 100 mg, 120 mg, 150 mg	Prevent DVT following hip surgery, knee surgery, abdominal surgery, unstable angina or non-Q-wave MI, acute illness	Bleeding, thrombocytopenia, hematoma, increased ALT, AST, nausea, bruising
Heparin	I: 1,000 units/ml, 2,500 units/ml, 5,000 units/ml, 7,500 units/ml, 10,000 units/ml, 20,000 units/ml	Prevent/treat VTE	Bleeding, thrombocytopenia, skin rash, itching, burning
Tinzaparin (Innohep)	I: 10,000 units/ml, 20,000 units/ ml vials	Treat DVT/PE, prevent VTE following surgery	Bleeding, thrombocytopenia, increased ALT, injection site hematoma
Factor Xa Inhibitor			
Apixaban (Eliquis)	T: 2.5 mg, 5 mg	Reduce risk of stroke/embolism in nonvalvular atrial fibrillation Prevent VTE post hip/knee replacement surgery, prevent/treat recurrence	Bleeding, nausea, anemia
Betrixaban (Bevyxxa)	C: 40 mg, 80 mg	Prophylaxis of VTE in adults with acute medical illness at risk for thromboembolic complications due to restricted mobility, other VTE risk factors	Bleeding
Edoxaban(Savaysa)	T: 15 mg, 30 mg, 60 mg	Prevent thromboembolism in nonvalvular atrial fibrillation, treat DVT/PT	Bleeding, anemia, rash, abnormal liver function tests
Fondaparinux (Arixtra)	I: 2.5 mg, 5 mg, 7.5 mg, 10 mg	Prophylaxis of DVT following hip fracture, abdominal surgery, hip surgery, knee surgery, treat DVT/PE	Bleeding, thrombocytopenia, hematoma, fever, nausea, anemia
Rivaroxaban (Xarelto)	T: 10 mg	Prevent DVT post knee, hip replacement Prevent thromboembolism in atrial fibrillation. Prevent/treat DVT/PE	Bleeding
Coumarin			
Warfarin (Coumadin)	PO: 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg,	Prevent/treat VTE in pts; prevent systemic embolism in pts with heart	Bleeding, skin necrosis, anorexia, nausea, vomiting,

	5 mg, 6 mg, 7.5 mg, 10 mg I: 5 mg	valve replacement, valve heart disease, MI, atrial fibrillation	diarrhea, rash, abdominal cramps, purple toe syndrome, drug interactions (see individual monograph)
Antiplatelets			
Abciximab (ReoPro)	I: 2 mg/ml	Adjunct to PCI to prevent acute cardiac ischemic complications (with heparin and aspirin)	Bleeding, hypotension, nausea, vomiting, back pain, allergic reactions, thrombocytopenia
Aspirin	PO: 81 mg, 165 mg, 325 mg, 500 mg, 650 mg	TIA acute MI, chronic stable/unstable angina, revascularization procedures Prevent reinfarction and thromboembolism post MI	Tinnitus, dizziness, hypersensitivity, dyspepsia, minor bleeding, GI ulceration
Clopidogrel (Plavix)	PO: 75 mg	Reduce risk of stroke, MI, or vascular death in pts with recent MI, noncardioembolic stroke, peripheral artery disease. Reduce CV death, MI, stroke, reinfarction in pts with non-STEMI/STEMI	Bleeding, rash, pruritus, bruising, epistaxis
Cangrelor (Kengreal)	I: 50 mg	Adjunct to PCI to reduce risk of MI, repeat coronary revascularization, stent thrombosis	Bleeding
Eptifibatide (Integrilin)	I: 0.75 mg/ml, 2 mg/ml	Treat acute coronary syndrome	Bleeding, hypotension
Prasugrel (Effient)	PO: 5 mg, 10 mg	Reduce thrombotic cardiovascular events in pts with ACS to be managed with PCI (including stenting)	Bleeding, hypotension
Ticagrelor (Brilinta)	PO: 60 mg, 90 mg	Reduce thrombotic cardiovascular events in pts with ACS	Bleeding, dyspnea
Tirofiban (Aggrastat)	I: 50 mcg/ml, 250 mcg/ml	Treat acute coronary syndrome	Bleeding, thrombocytopenia, bradycardia, pelvic pain
Vorapaxar (Zontivity)	T: 2.08 mg	Reduce thrombotic cardiovascular events (e.g., MI, stroke) in pts with history of MI or peripheral arterial disease	Bleeding
Thrombolytics			
Alteplase (Activase)	I: 50 mg, 100 mg	Acute MI, acute ischemic stroke, pulmonary embolism	Bleeding, epistaxis
Tenecteplase (TNKase)	I: 50 mg	Acute MI	Bleeding, hematuria

ACS, Acute coronary syndrome; **DTV**, deep vein thrombosis; **HIT**, heparin-induced thrombocytopenia; **I**, injection; **MI**, myocardial infarction; **PCI**, percutaneous coronary intervention; **PO**, oral; **PTCA**, percutaneous transluminal coronary angioplasty; **STEMI**, ST segment elevation MI; **T**, tablet; **TIA**, transient ischemic attack; **VTE**, venous thromboembolism.

Anticonvulsants

Uses

Anticonvulsants are used to treat seizures. Seizures can be divided into two broad categories: partial seizures and generalized seizures. *Partial seizures* begin locally in the cerebral cortex, undergoing limited spread. Simple partial seizures do not involve loss of consciousness but may evolve secondarily into generalized seizures. Complex partial seizures involve impairment of consciousness.

Generalized seizures may be convulsive or nonconvulsive and usually produce immediate loss of consciousness.

Action

Anticonvulsants can prevent or reduce excessive discharge of neurons with seizure foci or decrease the spread of excitation from seizure foci to normal neurons. The exact mechanism is unknown but may be due to (1) suppressing sodium influx, (2) suppressing calcium influx, or (3) increasing the action of gamma-aminobutyric acid (GABA), which inhibits neurotransmitters throughout the brain

Anticonvulsants

Name	Availability	Uses	Dosage Range	Side Effects
Brivaracetam (Briviact)	I: 10 mg/ml S: 10 mg/ml T: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg	Partial-onset seizure	A: Initially, 50 mg bid. (May decrease to 25 mg bid or increase to 100 mg bid)	Nausea, vomiting, dizziness, fatigue, angioedema, psychiatric symptoms
Carbamazepine (Carbatrol, Carnexiv, Epitol, Tegretol, Tegretol XR)	S: 100 mg/5 ml T (chewable): 100 mg T: 200 mg T (ER): 100 mg, 200 mg, 400 mg C (ER): 100 mg, 200 mg, 300 mg I: 10 mg/ml	Complex partial, tonic-clonic, mixed seizures; trigeminal neuralgia	Note: Refer to monograph for IV dosage A: Initially, 400 mg/day in 2 divided doses. May increase up to 200 mg/day at weekly intervals up to 800–1,600 mg/day in 2–3 doses. C: Initially, 200 mg/day in 2 divided doses. May increase by 100 mg/day at weekly intervals up to 400–800 mg/day in 3–4 doses.	Dizziness, diplopia, leukopenia, drowsiness, blurred vision, headache, ataxia, nausea, vomiting, hyponatremia, rash, pruritus
Clonazepam (Klonopin)	T: 0.5 mg, 1 mg, 2 mg	Petit mal, akinetic, myoclonic, absence	A: Initially, not to exceed 1.5 mg in 3 divided doses. May increase q3days up to 2–8 mg/ day in 1–2 divided doses.	CNS depression, sedation, ataxia, confusion, depression,

		seizures		behavior disorders, respiratory depression
Ezogabine (Potiga)	T: 50 mg, 200 mg, 300 mg, 400 mg	Partial onset seizures	A: Initially, 100 mg 3 times/day. May increase at weekly intervals up to 150 mg/day. Usual dose: 200–400 mg 3 times/day.	Dizziness, somnolence, fatigue, confusion, vertigo, tremor, balance disorder, urinary retention
Fosphenytoin (Cerebyx)	I: 50 mg PE/ml	Status epilepticus, seizures occurring during neurosurgery	A: 15–20 mg PE/kg bolus, then 4–6 mg PE/kg/day maintenance.	Burning, itching, paresthesia, nystagmus, ataxia
Gabapentin (Neurontin)	C: 100 mg, 300 mg, 400 mg S: 250 mg/5 ml	Partial and generalized seizures	A: 300 mg 3 times/day. Usual dose: 900–1,800 mg/day in 3 doses.	CNS depression, fatigue, drowsiness, dizziness, ataxia, nystagmus, blurred vision, confusion; may cause weight gain
Lacosamide (Vimpat)	T: 50 mg, 100 mg, 150 mg, 200 mg S: 10 mg/ml I: 10 mg/ml	Adjunctive therapy, partial seizures	A: Monotherapy: Initially, 100 mg 2 times/day. May increase at weekly intervals by 50 mg 2 times/day. Maintenance: 150–200 mg 2 times/day. Adjunctive: Initially, 50 mg 2 times/day. May increase by 50 mg 2 times/day. Maintenance: 100–200 mg 2 times/day.	Diplopia, headache, dizziness, nausea
Lamotrigine (Lamictal)	T: 25 mg, 100 mg, 150 mg, 200 mg T (ER): 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 300 mg T (ODT): 25 mg, 50 mg, 100 mg, 200 mg T (Chew): 5 mg, 25 mg	Partial seizures, primary generalized tonic-clonic seizures, generalized seizures of Lennox-Gastaut syndrome	A: Refer to individual monograph.	Dizziness, ataxia, drowsiness, diplopia, nausea, rash, headache, vomiting, insomnia, incoordination
Levetiracetam (Keppra)	T: 250 mg, 500 mg, 750 mg, 1,000 mg S: 100 mg/ml T(ER): 500 mg, 750 mg	Adjunctive therapy, partial seizures, primary tonic-clonic seizures, myoclonic	A: T: Initially, 500 mg 2 times/day. May increase q2wks by 500mg/dose. Usual dose: 1,500 mg 2 times/day. ER: Initially, 1,000 mg once daily. May increase q2wks by 1,000 mg/day up to 3,000 mg once daily.	Dizziness, drowsiness, weakness, irritability, hallucinations, psychosis

		seizures		
Oxcarbazepine (Trileptal)	T: 150 mg, 300 mg, 600 mg T(ER): 150 mg, 300 mg, 600 mg	Partial seizures	A: T: 600 mg/day in 2 divided doses. May increase by 600 mg/day at weekly intervals up to 1,200 mg/day in 2 divided doses. ER: 600 mg once daily. May increase by 600 mg/day at weekly intervals up to 1,200–2,400 mg/day.	Drowsiness, dizziness, headaches, diplopia, ataxia, nausea, vomiting, hyponatremia, skin reactions
Perampanel (Fycompa)	S: 0.5 mg/ml T: 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg	Partial onset seizure, primary generalized tonic clonic seizure	A, C (12 yrs or older): Initially, 2 mg daily at hs. May increase by 2 mg/d at weekly intervals. Usual dose: 8–12 mg qhs	Weight gain, abnormal gait, dizziness, headache, somnolence, serious psychiatric reactions.
Phenobarbital	T: 30 mg, 60 mg, 100 mg I: 65 mg, 130 mg	Tonic-clonic, partial seizures; status epilepticus	A(PO): 100–300 mg/day; (IM/IV): 200–600 mg. C (PO): 3–5 mg/kg/day; (IM/IV): 100–400 mg.	CNS depression, sedation, paradoxical excitement and hyperactivity, rash, hypotension
Phenytoin (Dilantin)	C: 30 mg, 100 mg T (chewable): 50 mg S: 125 mg/5 ml I: 50 mg/ml	Tonic-clonic, psychomotor seizures	A: Initially, 100 mg 3 times/day. May increase at 7–10 days intervals. Usual dose: 400 mg/day. C: Initially, 5 mg/kg/day in 2–3 divided doses. May increase at 7–10 day intervals. Usual dose: 4–8 mg/kg/day in 1–3 doses.	Nystagmus, ataxia, hypertrichosis, gingival hyperplasia, rash, osteomalacia, lymphadenopathy
Pregabalin (Lyrica)	C: 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg	Adjunctive therapy, partial seizures	A: Initially 150 mg/day (75 mg 2 times/day or 50 mg 3 times/day) up to 600 mg/day in 2 or 3 doses.	Confusion, drowsiness, dizziness, ataxia, weight gain, dry mouth, blurred vision, peripheral edema, myopathy, angioedema, decreased platelet count
Primidone (Mysoline)	T: 50 mg, 250 mg	Complex partial, akinetic, tonic-clonic seizures	A: 750–1250 mg/day in 3–4 doses C: 10–25 mg/kg/day	CNS depression, sedation, paradoxical excitement and hyperactivity, rash, dizziness, ataxia
Rufinamide (Banzel)	S: 40 mg/ml T: 200 mg, 400 mg	Lennox-Gastaut syndrome (adjunct)	A: Initially, 400–800 mg/day in 2 divided doses. May increase by 400–800 mg/day every other day C: Initially, 10 mg/kg/day in 2 divided doses. May increase by 10 mg/kg/day every other day up to 45 mg/kg/day. Maximum: 3,200 mg/day.	Fatigue, dizziness, headache, nausea, drowsiness

Tiagabine (Gabitril)	T: 4 mg, 12 mg, 16 mg, 20 mg	Partial seizures	A: Initially, 4 mg up to 56 mg/day in 2–4 doses. May increase by 4–8 mg/day at weekly intervals C: Initially, 4 mg up to 32 mg/day in 2–4 doses. May increase by 4–8 mg/day at weekly intervals.	Dizziness, asthenia, nervousness, anxiety, tremors, abdominal pain
Topiramate (Topamax)	T: 25 mg, 100 mg, 200 mg C (Sprinkle): 15 mg, 25 mg C (ER 24HR Sprinkle): (Qudexy XR): 25 mg, 50 mg, 100 mg, 150 mg C XR (Trokendi XR); 25 mg, 50 mg, 100 mg, 200 mg	Partial seizures, Lennox-Gastaut syndrome	See individual monograph.	Drowsiness, dizziness, headache, ataxia, confusion, weight loss, diplopia
Valproic acid (Depakene, Depakote)	C: 250 mg S: 250 mg/5 ml Sprinkles: 125 mg T: 125 mg, 250 mg, 500 mg T (ER): 500 mg I: 100 mg/ml	Complex partial, absence seizures	A, C: Initially, 15 mg/kg/day. May increase by 5–10 mg/kg/day at weekly intervals up to 60 mg/kg/day.	Nausea, vomiting, tremors, thrombocytopenia, hair loss, hepatic dysfunction, weight gain, decreased platelet function
Vigabatrin (Sabril)	T: 500 mg PS: 500 mg	Infantile spasms, refractory complex partial seizures	A: Initially, 500 mg 2 times/day. May increase by 500 mg increments at weekly intervals up to 1,500 mg 2 times/day. C: Initially, 250 mg 2 times/day. May increase by 500 mg/day at weekly intervals up to 1,000 mg 2 times/day.	Vision changes, eye pain, abdominal pain, agitation, confusion, mood/mental changes, abnormal coordination, weight gain
Zonisamide (Zonegran)	C: 100 mg	Partial seizures	A: Initially, 100 mg/day. May increase to 200 mg/day after 2 wks, then 300 mg/day up to 400 mg/day at 2 wk intervals.	Drowsiness, dizziness, anorexia, diarrhea, weight loss, agitation, irritability, rash, nausea, cognitive side effects, kidney stones

A, Adults; **C**, capsules; **C (dosage)**, children; **ER**, extended-release; **I**, Injection; **ODT**, orally disintegrating tablets; **PE**, phenytoin equivalent; **PO**, oral; **PS**, powder sachet; **S**, suspension; **T**, tablets.

Antidepressants

Uses

Used primarily for the treatment of depression. Depression can be a chronic or recurrent mental disorder presenting with symptoms such as depressed mood, loss of interest or pleasure, guilt feelings, disturbed sleep/appetite, low energy, and difficulty in thinking. Depression can also lead to suicide.

Action

Antidepressants include tricyclics, monoamine oxidase inhibitors (MAOIs), selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), and other antidepressants. Depression may be due to reduced functioning of monoamine neurotransmitters (e.g., norepinephrine, serotonin [5-HT], dopamine) in the CNS (decreased amount and/or decreased effects at the receptor sites). Antidepressants block metabolism, increase amount/effects of monoamine neurotransmitters, and act at receptor sites (change responsiveness/ sensitivities of both presynaptic and postsynaptic receptor sites).

Antidepressants

Name	Availability	Uses	Dosage Range (per day)	Side Effects
Tricyclics				
Amitriptyline (Elavil)	T: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg	Depression, neuropathic pain	Initially, 25–100 mg at bedtime or in divided doses. Usual dose: 100–300 mg/day.	Drowsiness, blurred vision, constipation, confusion, postural hypotension, cardiac conduction defects, weight gain, seizures, dry mouth
Desipramine (Norpramin)	T: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg	Depression, neuropathic pain	Initially, 25–100 mg at bedtime or in divided doses. Usual dose: 100–300 mg/day.	Dizziness, drowsiness, fatigue, headache, anorexia, diarrhea, nausea

Imipramine (Tofranil)	T: 10 mg, 25 mg, 50 mg C: 75 mg, 100 mg, 125 mg, 150 mg	Depression, enuresis, neuropathic pain, panic disorder, ADHD	Initially, 25–100 mg at bedtime or in divided doses. Usual dose: 100–300 mg/day.	Dizziness, fatigue, headache, vomiting, xerostomia
Nortriptyline (Aventyl, Pamelor)	C: 10 mg, 25 mg, 50 mg, 75 mg S: 10 mg/5 ml	Depression, neuropathic pain, smoking cessation	Initially, 50–100 mg once daily. Usual dose: 50–150 mg once daily.	Dizziness, fatigue, headache, anorexia, xerostomia
Selective Serotonin Reuptake Inhibitors				
Citalopram (Celexa)	T: 10 mg, 20 mg, 40 mg ODT: 40 mg S: 10 mg/5 ml	Depression, OCD, panic disorder	20–40 mg	Insomnia or sedation, nausea, agitation, headaches
Escitalopram (Lexapro)	T: 5 mg, 10 mg, 20 mg S: 5 mg/5 ml	Depression, GAD	10–20 mg	Insomnia or sedation, nausea, agitation, headaches
Fluoxetine (Prozac)	C: 10 mg, 20 mg, 40 mg C (DR): 90 mg T: 10 mg, 20 mg S: 20 mg/5 ml	Depression, OCD, bulimia, panic disorder, anorexia, bipolar disorder, premenstrual syndrome	Initially, 10–20 mg once daily. Usual dose: 20 mg once daily. DR: 90 mg once weekly.	Akathisia, sexual dysfunction, skin rash, urticaria, pruritus, decreased appetite, asthenia, diarrhea, drowsiness, headaches, diaphoresis, insomnia, nausea, tremors
Paroxetine (Paxil)	T: 10 mg, 20 mg, 30 mg, 40 mg S: 10 mg/5 ml ER: 12.5 mg, 25 mg, 37.5 mg	Depression, OCD, panic attack, SAD	Initially/usual dose: 20 mg once daily. ER: Initially, 12.5–25 mg once daily. Usual dose: 25 mg once daily.	Asthenia, constipation, diarrhea, diaphoresis, insomnia, nausea, sexual dysfunction, tremors, vomiting, urinary frequency or retention
Sertraline (Zoloft)	T: 25 mg, 50 mg, 100 mg S: 20 mg/ml	Depression, OCD, panic attack	50–200 mg	Sexual dysfunction, dizziness, drowsiness, anorexia, diarrhea, nausea, dry mouth, abdominal cramps, decreased weight, headaches, increased diaphoresis, tremors, insomnia
Vortioxetine (Trintellix)	T: 5 mg, 10 mg, 15 mg	Depression	Initially, 10 mg once daily.	Nausea, constipation

	mg, 20 mg		Usual dose: 10– 20 mg once daily.	
Serotonin-Norepinephrine Reuptake Inhibitors				
Desvenlafaxine (Pristiq)	T: 25 mg, 50 mg, 100 mg	Depression	50–100 mg	Nausea, dizziness, insomnia, hyperhidrosis, constipation, drowsiness, decreased appetite, anxiety, male sexual function disorders
Duloxetine (Cymbalta)	C: 20 mg, 30 mg, 60 mg	Depression, fibromyalgia, neuropathic pain	Initially, 30–60 mg once daily. Usual dose: 60 mg once daily or 2 divided doses.	Nausea, dry mouth, constipation, decreased appetite, fatigue, diaphoresis, hyperglycemia
Venlafaxine (Effexor)	T: 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg, 150 mg, 225 mg T(ER): 37.5 mg, 75 mg, 150 mg	Depression, anxiety	Initially, 25 mg 3 times or (ER): 37.5 mg once daily. Usual dose: 75 mg 3 times/day or (ER) 75–225 mg once daily.	Increased blood pressure, agitation, sedation, insomnia, nausea
Other				
Brexpiprazole (Rexulti)	T: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg	Depression	Initially, 0.5–1 mg/day. May increase at weekly interval to 1 mg/day. Maximum: 3 mg/day.	Weight gain, akathisia
Bupropion (Wellbutrin)	T: 75 mg, 100 mg SR: 100 mg, 150 mg, 200 mg	Depression, smoking cessation, ADHD, bipolar disorder	Initially, 100 mg 2 times/day. Usual dose: 100 mg 3 times/day. SR: Initially, 150 mg once daily. Usual dose: 150 mg 2 times/day.	Insomnia, irritability, seizures
Mirtazapine (Remeron)	T: 7.5 mg, 15 mg, 30 mg, 45 mg	Depression	Initially, 15 mg once at bedtime. Usual dose: 30– 45 mg once daily.	Sedation, dry mouth, weight gain, agranulocytosis, hepatic toxicity
Trazodone (Desyrel)	T: 50 mg, 100 mg, 150 mg, 300 mg ER: 150 mg, 300	Depression	Initially, 75 mg 2 times/day or (ER): 150 mg once daily. Usual dose: 150 mg bid or (ER):	Sedation, orthostatic hypotension, priapism

	mg		150–375 mg once daily.	
Vilazodone (Viibryd)	T: 10 mg, 20 mg, 40 mg	Depression	Initially, 10 mg once daily. Usual dose: 40 mg once daily.	Diarrhea, nausea, dizziness, dry mouth, insomnia, vomiting, decreased libido

ADHD, Attention-deficit hyperactivity disorder; **C**, capsules; **DR**, delayed-release; **ER**, extended-release; **GAD**, generalized anxiety disorder; **OC**, oral concentrate; **OCD**, obsessive-compulsive disorder; **ODT**, orally disintegrating tablets; **S**, suspension; **SAD**, social anxiety disorder; **SR**, sustained-release; **T**, tablets.

Antidiabetics

Uses

Insulin: Treatment of insulin-dependent diabetes (type 1) and non-insulin-dependent diabetes (type 2). Also used in acute situations such as ketoacidosis, severe infections, major surgery in otherwise non-insulin-dependent diabetics. Administered to pts receiving parenteral nutrition. Drug of choice during pregnancy. All insulins, including long-acting insulins, can cause hypoglycemia and weight gain.

Alpha-glucosidase inhibitors: Adjunct to diet and exercise for management of type 2 diabetes mellitus.

Biguanides: Adjunct to diet and exercise for management of type 2 diabetes mellitus.

Dipeptidyl peptidase 4 inhibitors (DPP-4): Adjunct to diet and exercise for management of type 2 diabetes mellitus.

Meglitinide: Adjunct to diet and exercise for management of type 2 diabetes mellitus.

Sulfonylureas: Adjunct to diet and exercise for management of type 2 diabetes mellitus.

Thiazolidinediones: Adjunct to diet and exercise for management of type 2 diabetes mellitus.

Sodium-glucose co-transporter 2 (SGLT2): Adjunct to diet and exercise for management of type 2 diabetes mellitus.

Action

Insulin: A hormone synthesized and secreted by beta cells of Langerhans' islet in the pancreas. Controls storage and utilization of glucose, amino acids, and fatty

acids by activated transport systems/enzymes. Inhibits breakdown of glycogen, fat, protein. Insulin lowers blood glucose by inhibiting glycogenolysis and gluconeogenesis in liver; stimulates glucose uptake by muscle, adipose tissue. Activity of insulin is initiated by binding to cell surface receptors.

Alpha-glucosidase inhibitors: Work locally in small intestine, slowing carbohydrate breakdown and glucose absorption.

Biguanides: Inhibit hepatic gluconeogenesis, glycogenolysis; enhance insulin sensitivity in muscle and fat.

DPP-4: Inhibit degradation of endogenous incretins, which increases insulin secretion, decreases glucagon secretion.

Meglitinide: Stimulates pancreatic insulin secretion.

Sulfonylureas: Stimulate release of insulin from beta cells of the pancreas.

Thiazolidinediones: Enhance insulin sensitivity in muscle and fat.

SGLT2: Blocks glucose reabsorption in proximal tubule in the kidney, increases urinary glucose excretion.

Antidiabetics

Insulin

Type	Onset	Peak	Duration	Comments
Rapid-Acting				
Apidra, glulisine	10–15 min	1–1.5 hrs	3–5 hrs	Stable at room temp for 28 days Can mix with NPH
Humalog, lispro	15–30 min	0.5–2.5 hrs	6–8 hrs	Stable at room temp for 28 days Can mix with NPH
Novolog, aspart	10–20 min	1–3 hrs	3–5 hrs	Stable at room temp for 28 days Can mix with NPH
Short-Acting				
Humulin R, Novolin R, regular	30–60 min	1–5 hrs	6–10 hrs	Stable at room temp for 28 days Can mix with NPH
Intermediate-Acting				
Humulin N, Novolin N, NPH	1–2 hrs	6–14 hrs	16–24 hrs	Stable at room temp for 28 days Can mix with aspart, lispro, glulisine
Long-Acting				
Basaglar, glargine	1–4 hrs	No significant peak	24 hrs	Do NOT mix with other insulins Stable at room temp for 28 days

Lantus, glargine	1–4 hrs	No significant peak	24 hrs	Do NOT mix with other insulins Stable at room temp for 28 days
Levemir, detemir	0.8–2 hrs	No significant peak	12–24 hrs (dose dependent)	Do NOT mix with other insulins Stable at room temp for 42 days
Toujeo, glargine	1–6 hrs	No significant peak	Longer than 24 hrs	Do NOT mix with other insulins Stable at room temp for 28 days
Tresiba, degludec	0.5–1.5 hrs	12 hrs	42 hrs	Do NOT mix with other insulins Stable at room temp for 56 days

oral agents

Name	Availability	Dosage Range	Side Effects
Sulfonylureas			
Glimepiride (Amaryl)	T: 1 mg, 2 mg, 4 mg	Initially, 1–2 mg/day. May increase by 1–2 mg q1–2 weeks. Maximum: 8 mg/day	Hypoglycemia, dizziness, headache, nausea, flu-like syndrome
Glipizide (Glucotrol)	T: 5 mg, 10 mg T (XL): 5 mg	T: Initially, 5 mg/day. May increase by 2.5–5 mg q3–4 days. (XL): Initially, 5 mg/day. Maximum: 20 mg/day	Dizziness, nervousness, anxiety, diarrhea, tremor
Glyburide (DiaBeta, Micronase)	T: 1.25 mg, 2.5 mg, 5 mg PT: 1.5 mg, 3 mg	T: Initially, 2.5–5 mg/day. May increase by 2.5 mg/day at weekly intervals up to 20 mg/day PT: Initially, 1.5–3 mg/day. May increase by 1.5 mg at weekly intervals up to 12 mg/day	Dizziness, headache, nausea
Alpha-Glucosidase Inhibitors			
Acarbose (Precose)	T: 25 mg, 50 mg, 100 mg	Initially, 25 mg 3 times/day. May increase at 4–8 wk intervals. Usual dose: 50–100 mg 3 times/day	Flatulence, diarrhea, abdominal pain, increased risk of hypoglycemia when used with insulin or sulfonylureas
Miglitol (Glyset)	T: 25 mg, 50 mg, 100 mg	Initially, 25 mg 3 times/day. May increase at 4–8 wk intervals to 50 mg 3 times/day, then 100 mg 3 times/day	Flatulence, diarrhea, abdominal pain, rash
Dipeptidyl Peptidase Inhibitors			
Alogliptin (Nesina)	T: 6.25 mg, 12.5 mg, 25 mg	6.25–25 mg/day	Nasopharyngitis, cough, headache, upper respiratory tract infections

Linagliptin (Tradjenta)	T: 5 mg	5 mg/day	Arthralgia, back pain, headache
Saxagliptin (Onglyza)	T: 2.5 mg, 5 mg	2.5–5 mg/day	Upper respiratory tract infection, urinary tract infection, headache
Sitagliptin (Januvia)	T: 25 mg, 50 mg, 100 mg	25–100 mg/day	Nasopharyngitis, upper respiratory infection, headaches, modest weight gain, increased incidence of hypoglycemia when added to a sulfonylurea
Biguanides			
Metformin (Glucophage)	T: 500 mg, 850 mg, 1,000 mg XR: 500 mg, 750 mg, 1,000 mg	T: Initially, 500 mg 2 times/day or 850 mg once daily. May increase by 500 mg/day at weekly intervals up to 2,550 mg/day (XR): Initially, 500–1,000 mg/day. May increase by 500 mg/day at weekly intervals up to 2,500 mg/day	Nausea, vomiting, diarrhea, loss of appetite, metallic taste, lactic acidosis (rare but potentially fatal complication)
Glucagon-Like Peptide-1 (GLP-1)			
Albiglutide (Tanzeum)	I: 30 mg, 50 mg	30–50 mg once weekly	Diarrhea, nausea, upper respiratory tract infection, injection site reaction
Exenatide (Byetta)	I: 5 mcg, 10 mcg	5–10 mcg 2 times/day	Diarrhea, dizziness, dyspnea, headaches, nausea, vomiting
Exenatide extended-release (Bydureon)	I: 2 mg	2 mg once weekly	Diarrhea, nausea, headache
Liraglutide (Victoza)	I: 0.6 mg, 1.2 mg, 1.8 mg (6 mg/ml)	Initially, 0.6 mg/day. May increase at weekly intervals up to 1.2 mg/day, then 1.8 mg/day	Headache, nausea, diarrhea
Lixisenatide (Adlyxin)	I: 50 mcg/ml, 100 mcg/ml	20 mcg SC once/d	Nausea, vomiting, headache, dizziness
Meglitinides			
Nateglinide (Starlix)	T: 60 mg, 120 mg	60–120 mg 3 times/day	Hypoglycemia, upper respiratory infection, dizziness, back pain, flu-like syndrome
Repaglinide (Prandin)	T: 0.5 mg, 1 mg, 2 mg	0.5–1 mg with each meal. Usual dose: 0.5–4 mg/day (Maximum: 16 mg/day)	Headache, hypoglycemia, upper respiratory infection
SGLT2			
Canagliflozin (Invokana)	T: 100 mg, 300 mg	100–300 mg/day before first meal of day	Genital mycotic infections, recurrent urinary tract infections, increased urinary frequency, hypotension, increased serum creatinine, LDL, Hgb, Hct. Hyperkalemia, hypermagnesemia, hyperphosphatemia, fractures

Dapagliflozin (Farxiga)	T: 5 mg, 10 mg	5–10 mg/day in morning	Genital mycotic infections, recurrent urinary tract infections, increased urinary frequency, hypotension, increased serum creatinine, LDL, Hgb, Hct. Hyperphosphatemia, fractures
Empagliflozin (Jardiance)	T: 10 mg, 25 mg	10–25 mg/day in morning	Genital mycotic infections, recurrent urinary tract infections, increased urinary frequency, hypotension, increased serum creatinine, LDL, Hgb, Hct
Thiazolidinediones			
Pioglitazone (Actos)	T: 15 mg, 30 mg, 45 mg	15–30 mg/day	Mild to moderate peripheral edema, weight gain, increased risk of HF, associated with reduced bone mineral density and increased incidence of fractures
Rosiglitazone (Avandia)	T: 2 mg, 4 mg, 8 mg	Initially, 4 mg/day. May increase at 8–12 weeks to 8 mg/day as a single or 2 divided doses	Increased cholesterol, weight gain, back pain, upper respiratory tract infection
Miscellaneous			
Bromocriptine (Cycloset)	T: 0.8 mg	1.6–4.8 mg/day	Nausea, fatigue, dizziness, vomiting
Colesevelam (Welchol)	T: 625 mg S: 1.875 g, 3.75 g packet	3.75 g/day	Constipation, dyspepsia, nausea
Pramlintide (Symlin)	I: 1,500 mcg/1.5 ml, 2,700 mcg/2.7 ml	Type 1: 15–60 mcg immediately prior to meals Type 2: 60–120 mcg immediately prior to meals	Abdominal pain, anorexia, headaches, nausea, vomiting, severe hypoglycemia may occur when used in combination with insulin (reduction in dosages of short-acting, including premixed, insulins recommended)

HF, Heart failure; **I**, Injection; **PT**, prestab; **S**: suspension; **T**, tablets; **XL**, extended-release; **XR**, extended-release.

Antidiarrheals

Uses

Acute diarrhea, chronic diarrhea of inflammatory bowel disease, reduction of fluid from ileostomies.

Action

Systemic agents: Act as smooth muscle receptors (enteric) disrupting peristaltic movements, decreasing GI motility, increasing transit time of intestinal contents.

Local agents: Adsorb toxic substances and fluids to large surface areas of particles in the preparation. Some of these agents coat and protect irritated intestinal walls. May have local anti-inflammatory action.

Antidiarrheals

Name	Availability	Type	Dosage Range
Bismuth (Pepto-Bismol)	T: 262 mg C: 262 mg L: 130 mg/15 ml, 262 mg/15ml, 524 mg/15 ml	Local	A: 2 T or 30 ml C (9–12 yrs): 1 T or 15 ml C (6–8 yrs): 2/3 T or 10 ml C (3–5 yrs): 1/3 T or 5 ml
Diphenoxylate with atropine (Lomotil)	T: 2.5 mg L: 2.5 mg/5 ml	Systemic	A: 5 mg 4 times/day C: 0.3–0.4 mg/kg/day in 4 divided doses (L)
Loperamide (Imodium)	C: 2 mg T: 2mg L: 1 mg/5 ml, 1 mg/ml	Systemic	A: Initially, 4 mg (Maximum: 16 mg/day) C (9–12 yrs): 2 mg 3 times/day C (6–8 yrs): 2 mg 2 times/day C (2–5 yrs): 1 mg 3 times/day (L)

A, Adults; *C*, capsules; *C (dosage)*, children; *L*, liquid; *S*, suspension; *T*, tablets.

Antifungals: Systemic Mycoses

Systemic mycoses are subdivided into opportunistic infections (candidiasis, aspergillosis, cryptococcosis, and mucormycosis) that are seen primarily in debilitated or immunocompromised hosts and nonopportunistic infections (blastomycosis, histoplasmosis, and coccidioidomycosis) that occur in any host. Treatment can be difficult because these infections often resist treatment and may require prolonged therapy.

Antifungals: Systemic Mycoses

Name	Indications	Side Effects
Amphotericin B	Potentially life-threatening fungal infections, including aspergillosis, blastomycosis, coccidioidomycosis, cryptococcosis, histoplasmosis, systemic candidiasis	Fever, chills, headache, nausea, vomiting, nephrotoxicity, hypokalemia, hypomagnesemia, hypotension, dyspnea, arrhythmias, abdominal pain, diarrhea, increased hepatic function tests
Amphotericin B lipid complex (Abelcet)	Invasive fungal infections	Chills, fever, hypotension, headache, nausea, vomiting

Amphotericin B liposomal (AmBisome)	Empiric therapy for presumed fungal infections in febrile neutropenic pts, treatment of cryptococcal meningitis in HIV-infected pts, treatment of <i>Aspergillus</i> , <i>Candida</i> , <i>Cryptococcus</i> infections, treatment of visceral leishmaniasis	Peripheral edema, tachycardia, hypotension, chills, insomnia, headache
Amphotericin colloidal dispersion (Amphotec)	Invasive <i>Aspergillus</i>	Hypotension, tachycardia, chills, fever, vomiting
Anidulafungin (Eraxis)	Candidemia, esophageal candidiasis	Diarrhea, hypokalemia, increased hepatic function tests, headache
Caspofungin (Cancidas)	Candidemia, invasive aspergillosis, empiric therapy for presumed fungal infections in febrile neutropenic pts	Headache, nausea, vomiting, diarrhea, increased hepatic function tests
Fluconazole (Diflucan)	Treatment of vaginal candidiasis; oropharyngeal, esophageal candidiasis; and cryptococcal meningitis. Prophylaxis to decrease incidence of candidiasis in pts undergoing bone marrow transplant receiving cytotoxic chemotherapy and/or radiation	Nausea, vomiting, abdominal pain, diarrhea, dysgeusia, increased hepatic function tests, liver necrosis, hepatitis, cholestasis, headache, rash, pruritus, eosinophilia, alopecia
Isavuconazonium (Cresemba)	Treatment of invasive aspergillosis, invasive mucormycosis	Nausea, vomiting, diarrhea, increased hepatic enzymes, hypokalemia, constipation, dyspnea, cough, peripheral edema, back pain
Itraconazole (Sporanox)	Blastomycosis, histoplasmosis, aspergillosis, onychomycosis, empiric therapy of febrile neutropenic pts with suspected fungal infections, treatment of oropharyngeal and esophageal candidiasis	Congestive heart failure, peripheral edema, nausea, vomiting, abdominal pain, diarrhea, increased hepatic function tests, liver necrosis, hepatitis, cholestasis, headache, rash, pruritus, eosinophilia
Ketoconazole (Nizoral)	Candidiasis, chronic mucocutaneous candidiasis, oral thrush, candiduria, blastomycosis, coccidioidomycosis	Nausea, vomiting, abdominal pain, diarrhea, gynecomastia, increased LFT, liver necrosis, hepatitis, cholestasis, headache, rash, pruritus, eosinophilia
Micafungin (Mycamine)	Esophageal candidiasis, <i>Candida</i> infections, prophylaxis in pts undergoing hematopoietin stem cell transplantation	Fever, chills, hypokalemia, hypomagnesemia, hypocalcemia, myelosuppression, thrombocytopenia, nausea, vomiting, abdominal pain, diarrhea, increased LFT, dizziness, headache, rash, pruritus, pain or inflammation at injection site, fever
Posaconazole (Noxafil)	Prevent invasive aspergillosis and <i>Candida</i> infections in pts 13 yrs and older who are immunocompromised, treatment of oropharyngeal candidiasis	Fever, headaches, nausea, vomiting, diarrhea, abdominal pain, hypokalemia, cough, dyspnea
Voriconazole (Vfend)	Invasive aspergillosis, candidemia, esophageal candidiasis, serious fungal infections	Visual disturbances, nausea, vomiting, abdominal pain, diarrhea, increased LFT, liver necrosis, hepatitis, cholestasis, headache, rash, pruritus, eosinophilia

Antiglaucoma Agents

Uses

Reduction of elevated intraocular pressure (IOP) in pts with open-angle glaucoma and ocular hypertension.

Action

Medications decrease IOP by two primary mechanisms: decreasing aqueous humor (AH) production or increasing AH outflow.

- *Miotics (direct acting and indirect acting)*: Constrict pupils, opening channels in the trabecular meshwork, reducing resistance to outflow of AH.
- *Alpha₂ agonists*: Activate receptors in ciliary body, inhibiting aqueous secretion and increasing uveoscleral aqueous outflow.
- *Beta blockers*: Reduce production of aqueous humor.
- *Carbonic anhydrase inhibitors*: Decrease production of AH by inhibiting enzyme carbonic anhydrase.
- *Prostaglandins*: Increase outflow of aqueous fluid through uveoscleral route.

Antiglaucoma Agents

Name	Availability	Dosage Range	Side Effects
Miotics			
Carbachol (Isopto-Carbachol)	S: 1.5%, 3%	1 drop qid	Brow ache, corneal toxicity, conjunctival inflammation, transient myopia, blurred vision, retinal detachment
Pilocarpine (Isopto Carpine Pilopine HS [Gel])	G: 4% S: 1%, 2%, 4%	S: 1 drop qid G: 1 drop HS	Same as carbachol
Alpha ₂ Agonists			
Apraclonidine (Iopidine)	S: 0.5%, 1%	1 drop tid	Fatigue, somnolence, local allergic reaction, dry eyes, stinging
Brimonidine (Alphagan HP)	S: 0.1%, 0.15%, 0.2%	1 drop tid	Same as apraclonidine
Prostaglandins			
Bimatoprost (Lumigan)	S: 0.01%	1 drop daily in evening	Conjunctival hyperemia; darkening of iris, eyelids; increase in length, thickness, and number of eyelashes; local irritation; itching; dryness; blurred vision
Latanoprost (Xalatan)	S: 0.005%	1 drop daily in evening	See bimatoprost

Tafluprost (Zioptan)	S: 0.0015%	1 drop daily in evening	See bimatoprost
Travoprost (Travatan)	S: 0.004%	1 drop daily in evening	See bimatoprost
Beta Blockers			
Betaxolol (Betoptic, Betoptic-S)	Suspension (Betoptic-S): 0.25% S (Betoptic): 0.5%	Betoptic-S: 1 drop 2 times/day Betoptic: 1–2 drops 2 times/day	Fatigue, dizziness, bradycardia, respiratory depression, mask symptoms of hypoglycemia, block effects of beta agonists in treatment of asthma
Carteolol (Ocupress)	S: 1%	1 drop 2 times/day	Same as betaxolol
Levobunolol (Betagan)	S: 0.25%, 0.5%	1 drop 1–2 times/day	Same as betaxolol
Metipranolol (OptiPranolol)	S: 0.3%	1 drop 2 times/day	Same as betaxolol
Timolol (Betimol, Istalol, Timoptic, Timoptic XE)	S: 0.25%, 0.5% G, Timoptic XE: 0.25%, 0.5%	S: 1 drop 2 times/day (Istalol): 1 drop daily G: 1 drop daily	Same as betaxolol
Carbonic Anhydrase Inhibitors			
Brinzolamide (Azopt)	Suspension: 1%	1 drop 3 times/day	Bitter taste, stinging, redness, burning, conjunctivitis, dry eyes, blurred vision
Dorzolamide (Trusopt)	S: 2%	1 drop 3 times/day	Same as brinzolamide
Combinations			
Brimonidine/timolol (Combigan)	0.2%/0.5%	1 drop bid	See individual agents
Brinzolamide/Brimonidine (Simbrinza)	1%/0.2%	1 drop tid	See individual agents
Timolol/dorzolamide (Cosopt)	0.5%/2%	1 drop bid	See individual agents

C, Capsules; G, gel; O, ointment; S, solution; T, tablets.

Antihistamines

Uses

Symptomatic relief of upper respiratory allergic disorders. Allergic reactions associated with other drugs respond to antihistamines, as do blood transfusion reactions. Used as a second-choice drug in treatment of angioneurotic edema. Effective in treatment of acute urticaria and other dermatologic conditions. May also be used for preop sedation, Parkinson's disease, and motion sickness.

Action

Antihistamines (H₁ antagonists) inhibit vasoconstrictor effects and vasodilator effects on endothelial cells of histamine. They block increased capillary permeability, formation of edema/wheal caused by histamine. Many antihistamines can bind to receptors in CNS, causing primarily depression (decreased alertness, slowed reaction times, drowsiness) but also stimulation (restlessness, nervousness, inability to sleep). Some may counter motion sickness.

Antihistamines

Name	Availability	Dosage Range	Side Effects
Cetirizine (Zyrtec)	T: 5 mg, 10 mg C: 5 mg, 10 mg T (chew): 5 mg/10 mg S: 5 mg/5 ml	A: 5–10 mg/day C (6–12 yrs): 5–10 mg/day C (2–5 yrs): 2.5–5 mg/day	Headache, somnolence, fatigue, abdominal pain, dry mouth
Desloratadine (Clarinet)	T: 5 mg ODT: 2.5 mg, 5 mg S: 0.5 mg/ml	A, C (12 yrs and older): 5 mg/day C (6–11 yrs): 2.5 mg/day C (1–5 yrs): 1.25 mg/day C (6–11 mos): 1 mg/day	Dizziness, fatigue, headache, nausea
Dimenhydrinate (Dramamine)	T: 50 mg T (chew): 25 mg, 50 mg	A: 50–100 mg q4–6h C: 12.5–50 mg q6–8h	Dizziness, drowsiness, headache, nausea
Diphenhydramine (Benadryl)	T: 25 mg, 50 mg C: 25 mg, 50 mg L: 12.5 mg/5 ml	A: 25–50 mg q6–8h C (6–11 yrs): 12.5–25 mg q4–6h C (2–5 yrs): 6.25 mg q4–6h	Chills, confusion, dizziness, fatigue, headache, sedation, nausea
Fexofenadine (Allegra)	T: 30 mg, 60 mg, 180 mg ODT: 30 mg S: 30 mg/5 ml	A: 60 mg q12h or 180 mg/day C (2–11 yrs): 30 mg q12h, (6–23 mos): 15 mg bid	Headache, vomiting, fatigue, diarrhea
Hydroxyzine (Atarax)	T: 10 mg, 25 mg, 50 mg C: 25 mg,	A: 25 mg q6–8h C: 2 mg/kg/day in divided doses q6–8h	Dizziness, drowsiness, fatigue, headache

	50 mg, 100 mg S: 10 mg/5 ml		
Levocetirizine (Xyzal)	T: 5 mg S: 2.5 mg/ml	A, C (12 yrs and older): 5 mg once daily in evening C (6–11 yrs): 2.5 mg once daily in evening (6 mos–5 yrs): 1.25 mg once daily	Fatigue, fever, somnolence, vomiting
Loratadine (Claritin)	ODT: 10 mg T(chew): 5 mg T: 10 mg S: 1 mg/ml	A: 10 mg/day C (6–12 yrs): 10 mg/day (2–5 yrs): 5 mg/day	Fatigue, headache, malaise, somnolence, abdominal pain
Promethazine (Phenergan)	T: 12.5 mg, 25 mg, 50 mg S: 6.25 mg/5 ml	A: 25 mg at bedtime or 12.5 mg q8h C: 0.5 mg/kg at bedtime or 0.1 mg/kg q6–8h	Confusion, dizziness, drowsiness, fatigue, constipation, nausea, vomiting

A, Adults; **C**, capsules; **C (dosage)**, children; **L**, liquid; **ODT**, orally disintegrating tablet; **S**, syrup; **SR**, sustained-release; **T**, tablets.

Antihyperlipidemics

Uses

Cholesterol management.

Action

Bile acid sequestrants: Bind bile acids in the intestine; prevent active transport and reabsorption and enhance bile acid excretion. Depletion of hepatic bile acid results in the increased conversion of cholesterol to bile acids.

HMG-CoA reductase inhibitors (statins): Inhibit HMG-CoA reductase, the last regulated step in the synthesis of cholesterol. Cholesterol synthesis in the liver is reduced.

Niacin (nicotinic acid): Reduces hepatic synthesis of triglycerides and secretion of very low density lipoprotein (VLDL) by inhibiting the mobilization of free fatty acids from peripheral tissues.

Fibric acid: Increases the oxidation of fatty acids in the liver, resulting in reduced secretion of triglyceride-rich lipoproteins, and increases lipoprotein lipase activity and fatty acid uptake.

Cholesterol absorption inhibitor: Acts in the gut wall to prevent cholesterol absorption through the intestinal villi.

Omega fatty acids: Exact mechanism unknown. Mechanisms may include inhibition of acyl-CoA, decreased lipogenesis in liver, increased lipoprotein lipase activity.

PCSK9 inhibitors: Binds with high-affinity and specificity to LDL cholesterol receptors, promoting their degradation.

Antihyperlipidemics

Name	Primary Effect	Dosage	Comments/Side Effects
Bile Acid Sequestrants			
Cholestyramine (Prevalite, Questran)	Decreases LDL Increases HDL, TG	4 g 1–2 times/day May increase over 1 mo interval. Usual dose: 8–16 g/day in 2 divided doses	May bind drugs given concurrently. Take at least 1 hr before or 4–6 hrs after cholestyramine. Side Effects: Constipation, heartburn, nausea, vomiting, stomach pain
Colesevelam (Welchol)	Decreases LDL Increases HDL, TG	3.75 g once daily or 1.875 g 2 times/day	Take with food. Side Effects: Constipation, dyspepsia, weakness, myalgia, pharyngitis
Colestipol (Colestid)	Decreases LDL Increases TG	G: Initially, 5 g once or twice daily. May increase by 5 g/ day q1–2 mos. Maintenance: 5–30 g/day. T: Initially, 2 g once or twice daily. May increase by 2 g 2 times/day at 1–2 mo intervals. Maintenance: 2–16 g/day	Do not crush tablets. May bind drugs given concurrently. Take at least 1 hr before or 4–6 hrs after colestipol. Side Effects: Constipation, headache, dizziness, anxiety, vertigo, drowsiness, nausea, vomiting, diarrhea, flatulence
Cholesterol Absorption Inhibitor			
Ezetimibe (Zetia)	Decreases LDL Increases HDL Decreases TG	10 mg once daily	Administer at least 2 hrs before or 4 hrs after bile acid sequestrants. Side Effects: Dizziness, headache, fatigue, diarrhea, abdominal pain, arthralgia, sinusitis, pharyngitis
Fibric Acid			
Fenofibrate (Antara, Lofibra, Tricor, Triglide)	Decreases TG Decreases LDL Increases	Antara: 43–130 mg/day Lofibra: 67–200 mg/day Tricor: 48–145 mg/day	May increase levels of ezetimibe. Concomitant use of statins may increase rhabdomyolysis, elevate CPK levels, and cause myoglobinuria. Side Effects: Abdominal pain, constipation, diarrhea, respiratory complaints, headache, fever,

	HDL	Triglide: 50–160 mg/day Fenoglide: 40–120 mg/day Lipofen: 50–150 mg/day	flu-like syndrome, asthenia
Fenofibric acid (Fibricor, Trilipix)	Decreases TG, LDL Increases HDL	Trilipix: 45–135 mg/day Fibricor: 35–105 mg/day	May give without regard to meals. Concomitant use of statins may increase rhabdomyolysis. Side Effects: Headache, upper respiratory tract infection, pain, nausea, dizziness, nasopharyngitis
Gemfibrozil (Lopid)	Decreases TG Increases HDL	600 mg 2 times/day	Give 30 min before breakfast and dinner. Concomitant use of statins may increase rhabdomyolysis, elevate CPK levels, and cause myoglobinuria. Side Effects: Fatigue, vertigo, headache, rash, eczema, diarrhea, abdominal pain, nausea, vomiting, constipation
Niacin			
Niacin, nicotinic acid (Niacor, Niaspan)	Decreases LDL, TG Increases HDL	Regular-release (Niacor): 1 g tid Extended-release (Niaspan): 1 g at bedtime	Diabetics may experience a dose-related elevation in glucose. Side Effects: Increased LFT, hyperglycemia, dyspepsia, itching, flushing, dizziness, insomnia
Statins			
Atorvastatin (Lipitor)	Decreases LDL, TG Increases HDL	Initially, 10–20 mg/day. Range: 10–80 mg/day	May interact with CYP3A4 inhibitors (e.g., amiodarone, diltiazem, cyclosporine, grapefruit juice) increasing risk of myopathy. Side Effects: Myalgia, myopathy, rhabdomyolysis, headache, chest pain, peripheral edema, dizziness, rash, abdominal pain, constipation, diarrhea, dyspepsia, nausea, flatulence, increased LFT, back pain, sinusitis
Fluvastatin (Lescol)	Decreases LDL, TG Increases HDL	40–80 mg/day	Primarily metabolized by CYP2C9 enzyme system. May increase levels of phenytoin, rifampin. May lower fluvastatin levels. Side Effects: Headache, fatigue, dyspepsia, diarrhea, nausea, abdominal pain, myalgia, myopathy, rhabdomyolysis
Lovastatin (Mevacor)	Decreases LDL, TG Increases HDL	Initially, 20 mg/day. Adjust at 4 wk intervals. Maximum: 80 mg/day	May interact with CYP3A4 inhibitors (e.g., amiodarone, diltiazem, cyclosporine, grapefruit products) increasing risk of myopathy. Side Effects: Increased CPK levels, headache, dizziness, rash, constipation, diarrhea, abdominal pain, dyspepsia, nausea, flatulence, myalgia, myopathy, rhabdomyolysis
Pitavastatin (Livalo)	Decreases LDL, TG Increases HDL	Initially, 2 mg/day. May increase at 4 wk intervals to 4 mg/day	Erythromycin, rifampin may increase concentration. Side Effects: Myalgia, back pain, diarrhea, constipation, pain in extremities
Pravastatin (Pravachol)	Decreases LDL, TG Increases HDL	Initially, 40 mg/day. Titrate to response. Range: 10–80 mg/day	May be less likely to be involved in drug interactions. Cyclosporine may increase pravastatin levels. Side Effects: Chest pain, headache, dizziness, rash, nausea, vomiting, diarrhea, increased LFTs, cough, flu-like symptoms, myalgia, myopathy, rhabdomyolysis

Rosuvastatin (Crestor)	Decreases LDL, TG Increases HDL	Initially, 10–20 mg/day. Titrate to response. Range: 5–40 mg/day	May be less likely to be involved in drug interactions. Cyclosporine may increase rosuvastatin levels. Side Effects: Chest pain, peripheral edema, headache, rash, dizziness, vertigo, pharyngitis, diarrhea, nausea, constipation, abdominal pain, dyspepsia, sinusitis, flu-like symptoms, myalgia, myopathy, rhabdomyolysis
Simvastatin (Zocor)	Decreases LDL, TG Increases HDL	5–40 mg/day	May interact with CYP3A4 inhibitors (e.g., amiodarone, diltiazem, cyclosporine, grapefruit products) increasing risk of myopathy. Side Effects: Constipation, flatulence, dyspepsia, increased LFTs, increased CPK, upper respiratory tract infection
Omega Fatty Acids			
Icosapent (Vascepa)	Decreases TG	2 g 2 times/day	Side Effects: Arthralgia
Lovaza	Decreases TG Increases LDL, HDL	2 g 2 times/day or 4 g once daily	Use with caution with fish or shellfish allergy. Side Effects: Eructation, dyspepsia, taste perversion
PCSK9 Inhibitors			
Alirocumab (Praluent)	Decreases LDL	SQ: 75 mg q2wks	Side Effects: Hypersensitivity reactions (e.g., rash), nasopharyngitis, injection site reactions, influenza
Evolcumab (Repatha)	Decreases LDL	SQ: 140 mg q2wks or 420 mg qmo	Side Effects: Nasopharyngitis, upper respiratory tract infection, influenza, back pain, injection site reactions

CPK, Creatine Phosphokinase; **G**, granules; **HDL**, high-density lipoprotein; **LDL**, low-density lipoprotein; **SO**, subcutaneous; **T**, tablets; **TG**, triglycerides.

Antihypertensives

Uses

Treatment of mild to severe hypertension.

Action

Many groups of medications are used in the treatment of hypertension.

ACE inhibitors: Decrease conversion of angiotensin I to angiotensin II, a potent vasoconstrictor, reducing peripheral vascular resistance and B/P.

Alpha agonists (central action): Stimulate alpha₂-adrenergic receptors in the cardiovascular centers of the CNS, reducing sympathetic outflow and producing an antihypertensive effect.

Alpha antagonists (peripheral action): Block α_1 adrenergic receptors in arterioles and veins, inhibiting vasoconstriction and decreasing peripheral vascular resistance, causing a fall in B/P.

Angiotensin receptor blockers: Block vasoconstrictor effects of angiotensin II by blocking the binding of angiotensin II to AT1 receptors in vascular smooth muscle, helping blood vessels to relax and reduce B/P.

Beta blockers: Decrease B/P by inhibiting β_1 adrenergic receptors, which lowers heart rate, heart workload, and the heart's output of blood.

Calcium channel blockers: Reduce B/P by inhibiting flow of extracellular calcium across cell membranes of vascular tissue, relaxing arterial smooth muscle.

Diuretics: Inhibit sodium (Na) reabsorption, increasing excretion of Na and water. Reduce plasma, extracellular fluid volume, and peripheral vascular resistance.

Renin inhibitors: Directly inhibit renin, decreasing plasma renin activity (PRA), inhibiting conversion of angiotensinogen to angiotensin, producing antihypertensive effect.

Vasodilators: Directly relax arteriolar smooth muscle, decreasing vascular resistance. Exact mechanism unknown.

Antihypertensives

Name	Availability	Dosage Range	Side Effects
(ACE) Inhibitors			
Benazepril (Lotensin)	T: 5 mg, 10 mg, 20 mg, 40 mg	20–80 mg/day as single or 2 divided doses	Postural dizziness, headache, cough
Captopril	T: 12.5 mg, 25 mg, 50 mg, 100 mg	50–100 mg 2 times/day	Rash, cough, hyperkalemia
Enalapril (Vasotec)	T: 2.5 mg, 5 mg, 10 mg, 20 mg	5–40 mg/day in 1–2 divided doses	Hypotension, chest pain, syncope, headache, dizziness, fatigue
Fosinopril	T: 10 mg, 20 mg, 40 mg	10–80 mg once/d or divided bid	Dizziness, cough, hyperkalemia
Lisinopril (Prinivil, Zestril)	T: 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg	10–40 mg once/d	Hypotension, headache, fatigue, dizziness, hyperkalemia, cough
Quinapril	T: 5 mg, 10 mg, 20 mg, 40 mg	10–80 mg once/d or divided bid	Hypotension, dizziness, fatigue, headache, myalgia, hyperkalemia
Ramipril (Altace)	T or C: 1.25 mg, 2.5 mg, 5 mg, 10 mg	2.5–20 mg once/d or divided bid	Cough, hypotension, angina, headache, dizziness, hyperkalemia

Alpha Agonists: Central Action			
Clonidine (Catapres)	T: 0.1 mg, 0.2 mg, 0.3 mg P: 0.1 mg/hr, 0.2 mg/hr, 0.3 mg/hr	PO: 0.1–0.8 mg divided bid or tid Topical: 0.1–0.6 mg/wk	Sedation, dry mouth, heart block, rebound hypertension, contact dermatitis with patch, bradycardia, drowsiness
Alpha Agonists: Peripheral Action			
Doxazosin (Cardura)	T: 1 mg, 2 mg, 4 mg, 8 mg	PO: 2–16 mg/day	Dizziness, vertigo, headaches
Prazosin (Minipress)	C: 1 mg, 2 mg, 5 mg	PO: 6–20 mg/day	Dizziness, light-headedness, headaches, drowsiness, palpitations, fluid retention
Terazosin (Hytrin)	C: 1 mg, 2 mg, 5 mg, 10 mg	PO: 1–20 mg/day	Dizziness, headaches, asthenia (loss of strength, energy)
Angiotensin Receptor Blockers			
Azilsartan (Edarbi)	T: 40 mg, 80 mg	40–80 mg once/d	Diarrhea, hypotension, nausea, cough
Candesartan (Atacand)	T: 4 mg, 8 mg, 16 mg, 32 mg	8–32 mg once/d or divided bid	Hypotension, dizziness, headache, hyperkalemia
Eprosartan (Teveten)	T: 400 mg, 600 mg	600 mg once/d	Headache, cough, dizziness
Irbesartan (Avapro)	T: 75 mg, 150 mg, 300 mg	150–300 mg once/d	Fatigue, diarrhea, cough
Losartan (Cozaar)	T: 25 mg, 50 mg, 100 mg	25–100 mg once/d or divided bid	Chest pain, fatigue, hypoglycemia, weakness, cough, hypotension
Olmesartan (Benicar)	T: 5 mg, 20 mg, 40 mg	20–40 mg once/d	Dizziness, headache, diarrhea, flu-like symptoms
Valsartan (Diovan)	T: 80 mg, 160 mg, 320 mg	80–320 mg once/d	Dizziness, fatigue, increased BUN
Beta Blockers			
Atenolol (Tenormin)	T: 25 mg, 50 mg, 100 mg	50–100 mg once/d	Fatigue, bradycardia, reduced exercise tolerance, increased triglycerides, bronchospasm, sexual dysfunction, masked hypoglycemia
Bisoprolol (Zebeta)	T: 5 mg, 10 mg	5–20 mg once/d	Fatigue, insomnia, diarrhea, arthralgia, upper respiratory infections
Carvedilol (Coreg, Coreg CR)	T: 3.125 mg, 6.25 mg, 12.5 mg, 25 mg CR: 10 mg, 20 mg, 40 mg, 80 mg	T: 12.5–50 mg divided bid CR: 20–80 mg once/d	Orthostatic hypotension, fatigue, dizziness
Metoprolol (Lopressor)	T: 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg	100–450 mg bid or tid	Hypotension, bradycardia, fatigue, 1st degree heart block, dizziness
Metoprolol XL (Toprol XL)	T: 25 mg, 50 mg, 100 mg, 200 mg	25–400 mg once/d	Same as metoprolol
nebivolol (Bystolic)	T: 2.5 mg, 5 mg, 10 mg, 20 mg	5–40 mg once/d	Upper respiratory tract infection, dizziness, fatigue
Calcium Channel Blockers			
Amlodipine (Norvasc)	T: 2.5 mg, 5 mg, 10 mg	2.5–10 mg once/d	Headache, fatigue, peripheral edema, flushing, worsening heart failure, rash,

			gingival hyperplasia, tachycardia
Diltiazem CD (Cardizem CD)	C: 120 mg, 180 mg, 240 mg, 300 mg	240–360 mg once/d	Dizziness, headache, bradycardia, heart block, worsening heart failure, edema, constipation
Felodipine (Plendil)	T: 2.5 mg, 5 mg, 10 mg	2.5–10 mg once/d	Headache, flushing, peripheral edema, rash, gingival hyperplasia, tachycardia
Nifedipine XL (Adalat CC, Procardia XL)	T: 30 mg, 60 mg, 90 mg	30–90 mg once/d	Flushing, peripheral edema, headache, dizziness, nausea
Verapamil SR (Calan SR)	T: 120 mg, 180 mg, 240 mg T (Sustained-Release): 120 mg, 180 mg	T (Immediate-Release): 80–160 mg tid T (Sustained-Release): 240–480 mg once/d or divided bid	Headache, gingival hyperplasia, constipation
Diuretics			
Chlorthalidone (Hygroton)	T: 25 mg, 50 mg	12.5–25 mg/day	Same as hydrochlorothiazide
Hydrochlorothiazide (Hydrodiuril)	T: 25 mg, 50 mg	12.5–50 mg/day	Hypokalemia, hyperuricemia, hypomagnesemia, hyperglycemia Pancreatitis, rash, photosensitivity, hyponatremia, hypercalcemia, hypercholesterolemia, hypertriglyceridemia
Renin Inhibitor			
Aliskiren (Tekturna)	T: 150 mg, 300 mg	PO: 150–300 mg/day	Diarrhea, dyspepsia, headache, dizziness, fatigue, upper respiratory tract infection
Vasodilators			
Hydralazine (Apresoline)	T: 10 mg, 25 mg, 50 mg, 100 mg	PO: 40–300 mg/day	Headaches, palpitations aggravation of angina, dizziness, fluid retention, nasal congestion
Minoxidil (Loniten)	T: 2.5 mg, 10 mg	PO: 10–40 mg/day	Rapid/irregular heartbeat, hypertrichosis, peripheral edema aggravation of angina, fluid retention

C, Capsules; **P**, patch; **T**, tablets.

Antimigraine (Triptans)

Uses

Treatment of migraine headaches with or without aura in adults 18 yrs and older.

Action

Triptans are selective agonists of the serotonin (5-HT) receptor in cranial

arteries, which cause vasoconstriction and reduce inflammation associated with antidromic neuronal transmission correlating with relief of migraine headache.

Triptans

Name	Availability	Dosage Range	Contraindications	Common Side Effects
Almotriptan (Axert)	T: 6.25 mg, 12.5 mg	6.25–12.5 mg; may repeat after 2 hrs (Maximum: 25 mg/day)	Ischemic heart disease, angina pectoris, arrhythmias, previous MI, uncontrolled hypertension, hemiplegic or basilar migraine, peripheral vascular disease	Drowsiness, dizziness, paresthesia, nausea, vomiting, headache, xerostomia
Eletriptan (Relpax)	T: 20 mg, 40 mg	A: 20–40 mg; may repeat after 2 hrs (Maximum: 80 mg/day)	Same as almotriptan	Chest pain, dizziness, drowsiness, headache, paresthesia, nausea, xerostomia, weakness
Frovatriptan (Frova)	T: 2.5 mg	2.5 mg; may repeat after 2 hrs; no more than 3 T/day (Maximum: 7.5 mg/day)	Same as almotriptan	Hot/cold sensations, dizziness, fatigue, headaches, skeletal pain, dyspepsia, flushing, paresthesia, drowsiness, xerostomia, nausea
Naratriptan (Amerge)	T: 1 mg, 2.5 mg	1–2.5 mg; may repeat once after 4 hrs (Maximum: 5 mg/day)	Same as almotriptan plus severe renal/hepatic disease	Neck pain, pain, nausea, fatigue
Rizatriptan (Maxalt, Maxalt-MLT)	T: 5 mg, 10 mg DT: 5 mg, 10 mg	5 or 10 mg; may repeat after 2 hrs (Maximum: 30 mg/day)	Same as almotriptan	Chest pain, drowsiness, xerostomia, weakness, paresthesia, nausea, dizziness, drowsiness, fatigue
Sumatriptan (Imitrex, Sumavel DosePro, Onzetra, Xsail, Zecuity)	T: 25 mg, 50 mg, 100 mg NS: 5 mg, 10 mg, 20 mg I: 4 mg, 6 mg NP: 8 pouches of 2 nose pieces each 11	PO: 25–100 mg; may repeat after 2 hrs (Maximum: 200 mg/day) NS: 5–20 mg; may repeat after 2 hrs (Maximum: 40 mg/day) Subcutaneous: 3–6 mg; may repeat after 1 hr (Maximum: 12 mg/day)	Same as almotriptan plus severe hepatic dysfunction	<i>Oral:</i> Hot/cold flashes, paresthesia, malaise, fatigue <i>Injection:</i> Atypical sensations, flushing, chest pain/discomfort, injection site reaction, dizziness, vertigo, paresthesia, dizziness; bleeding, bruising, swelling, erythema at injection site <i>Nasal:</i> Discomfort, nausea, vomiting, altered taste <i>Transdermal:</i> Localized pain, skin discoloration, allergic contact dermatitis, pruritus, local irritation

	mg/ piece	NP: 22 mg; may repeat after 2 hrs (Maximum: 44 mg/day)		
Zolmitriptan (Zomig, Zomig- ZMT)	T: 2.5 mg, 5 mg DT: 2.5 mg, 5 mg NS: 2.5 mg/0.1 ml, 5 mg/0.1 ml	PO: 2.5–5 mg; may repeat after 2 hrs (Maximum: 10 mg/day) NS: 1 spray (2.5 or 5 mg) at onset of migraine headache; may repeat after 2 hrs (Maximum: 10 mg/day)	Same as almotriptan plus symptomatic Wolff-Parkinson- White syndrome	Atypical sensations, pain, nausea, dizziness, asthenia, drowsiness

A, Adults; **DT**, disintegrating tablets; **I**, Injection; **NP**, nasal powder; **NS**, nasal spray; **T**, tablets.

Antipsychotics

Uses

Antipsychotics are primarily used in managing schizophrenia. They may also be used in treatment of bipolar disorder, schizoaffective disorder, and irritability associated with autism. The goals in treating schizophrenia include targeting symptoms, preventing relapse, and increasing adaptive functioning. Use of antipsychotic medications is the mainstay of schizophrenia management.

Action

The precise mechanism of action of antipsychotic medications is unknown, but they have been categorized into two groups:

Typical (traditional): Associated with high dopamine antagonism and low serotonin antagonism.

Atypical: Those having moderate to high dopamine antagonism and high serotonin antagonism and those having low dopamine antagonism and high serotonin antagonism.

Side Effects (Please refer to individual

monographs)

Typical versus atypical: Typical antipsychotics are associated with a greater risk of extrapyramidal side effects, and atypicals are associated with a greater risk of weight gain.

Endocrine: Hyperprolactinemia, weight gain, increased risk of diabetes.

Cardiovascular: Orthostatic hypotension, electrocardiographic changes.

Lipids: Increased triglycerides, cholesterol.

Central nervous system: Dystonic reactions, akathisia. pseudo-parkinsonism. tardive dyskinesia, sedation, risk of seizures.

Typical Antipsychotics

Name	Uses	Dosage (Oral)
Fluphenazine	Adult psychosis	1–5 mg/day
Haloperidol (Haldol)	Adult and child psychosis	1–15 mg/day
Thioridazine	Adult, adolescent, child schizophrenia and psychosis	200–800 mg/day
Thiothixene (Navane)	Adult and adolescent schizophrenia	Moderate: 15 mg/day Severe: 20–30 mg/day

Atypical Antipsychotics

Name	Uses	Dosage
Aripiprazole (Abilify)	Adult and adolescent schizophrenia; adult and child bipolar 1 disorder; adult major depressive disorder; irritability with adolescent autism	10–15 mg/day
Brexipiprazole (Rexulti)	Adult schizophrenia; adult major depressive disorder	2–4 mg/day
Cariprazine (Vraylar)	Adult schizophrenia, bipolar I disorder (manic or mixed episodes)	1.5–6 mg/day
Clozapine (Clozaril)	Schizophrenia; suicidal behavior in adult schizophrenia and schizoaffective disorder	300–450 mg/day
Iloperidone (Fanapt)	Adult schizophrenia	12–24 mg/day
Lurasidone (Latuda)	Adult schizophrenia, bipolar I disorder (manic or mixed episodes)	40–160 mg/day
Olanzapine (Zyprexa)	Adult, adolescent, and child schizophrenia; adult, adolescent mania in bipolar I disorder	10–20 mg/day
Paliperidone (Invega)	Adult and adolescent schizophrenia; adult schizoaffective disorder	3–12 mg/day

Quetiapine (Seroquel)	Adult and adolescent schizophrenia; adult, adolescent, and child bipolar I disorder	400–800 mg/day
Risperidone (Risperdal)	Adult and adolescent schizophrenia; adult, adolescent, and child bipolar I disorder; irritability with adolescent and child autism	4–8 mg/day
Ziprasidone (Geodon)	Adult schizophrenia; manic or mixed episodes associated with adult bipolar I disorder	40–160 mg/day

Antivirals

Uses

Treatment of HIV infection. Treatment of cytomegalovirus (CMV) retinitis in pts with AIDS, acute herpes zoster (shingles), genital herpes (recurrent), mucosal and cutaneous herpes simplex virus (HSV), chickenpox, and influenza A viral illness.

Action

Effective antivirals must inhibit virus-specific nucleic acid/ protein synthesis. Possible mechanisms of action of antivirals used for non-HIV infection may include interference with viral DNA synthesis and viral replication, inactivation of viral DNA polymerases, incorporation and termination of the growing viral DNA chain, prevention of release of viral nucleic acid into the host cell, or interference with viral penetration into cells.

Antivirals

Name	Availability	Uses	Side Effects
Abacavir (Ziagen)	T: 300 mg OS: 20 mg/ml	HIV infection	Nausea, vomiting, loss of appetite, diarrhea, headaches, fatigue, hypersensitivity reactions
Acyclovir (Zovirax)	T: 400 mg, 800 mg C: 200 mg I: 50 mg/ml	Mucosal/cutaneous HSV-1 and HSV-2, varicella-zoster (shingles), genital herpes, herpes simplex, encephalitis, chickenpox	Malaise, anorexia, nausea, vomiting, light-headedness
Adefovir (Hepsera)	T: 10 mg	Chronic hepatitis B	Asthenia, headaches, abdominal pain, nausea, diarrhea, flatulence, dyspepsia
Amantadine (Symmetrel)	T: 100 mg C: 100 mg S: 50 mg/5 ml	Influenza A	Anxiety, dizziness, headaches, nausea, loss of appetite

Cidofovir (Vistide)	I: 75 mg/ml	CMV retinitis	Decreased urination, fever, chills, diarrhea, nausea, vomiting, headaches, loss of appetite
Darunavir (Prezista)	T: 75 mg, 150 mg, 400 mg, 600 mg, 800 mg	HIV infection	Diarrhea, nausea, vomiting, headaches, skin rash, constipation
Delavirdine (Rescriptor)	T: 100 mg, 200 mg	HIV infection	Diarrhea, fatigue, rash, headaches, nausea
Didanosine (Videx)	C: 125 mg, 200 mg, 250 mg, 400 mg Powder for suspension: 2 g, 4 g	HIV infection	Peripheral neuropathy, anxiety, headaches, rash, nausea, diarrhea, dry mouth
Efavirenz (Sustiva)	C: 50 mg, 200 mg T: 600 mg	HIV infection	Diarrhea, dizziness, headaches, insomnia, nausea, vomiting, drowsiness
Etravirine (Intelence)	T: 25 mg, 100 mg, 200 mg	HIV infection	Rash, nausea, abdominal pain, vomiting
Famciclovir (Famvir)	T: 125 mg, 250 mg, 500 mg	Herpes zoster, genital herpes, herpes labialis, mucosal/cutaneous herpes simplex	Headaches, nausea
Foscarnet (Foscavir)	I: 24 mg/ml	CMV retinitis, HSV infections	Decreased urination, abdominal pain, nausea, vomiting, dizziness, fatigue, headaches
Ganciclovir (Cytovene)	I: 500 mg	CMV retinitis, CMV disease	Sore throat, fever, unusual bleeding/bruising
Indinavir (Crixivan)	C: 200 mg, 400 mg	HIV infection	Blood in urine, weakness, nausea, vomiting, diarrhea, headaches, insomnia, altered taste
Lamivudine (EpiVir)	T: 100 mg, 150 mg, 300 mg OS: 5 mg/ml, 10 mg/ml	HIV infection, chronic hepatitis B	Nausea, vomiting, abdominal pain, paresthesia
Lopinavir/ritonavir (Kaletra)	T: 100 mg/25 mg, 200 mg/50 mg OS: 80 mg/20 mg per ml	HIV infection	Diarrhea, nausea
Maraviroc (Selzentry)	T: 150 mg, 300 mg	HIV infection	Cough, pyrexia, upper respiratory tract infection, rash, musculoskeletal symptoms, abdominal pain, dizziness
Nelfinavir (Viracept)	T: 250 mg, 625 mg	HIV infection	Diarrhea
Oseltamivir (Tamiflu)	C: 30 mg, 45 mg, 75 mg S: 6 mg/ml	Influenza A or B	Diarrhea, nausea, vomiting
Raltegravir (Isentress)	T: 400 mg T (chew): 25	HIV infection	Nausea, headache, diarrhea, pyrexia

	mg, 100 mg		
Ribavirin (Virazole)	Aerosol: 6 g OS: 40 mg/ml T: 200 mg, 400 mg, 600 mg	Lowers respiratory infections in infants, children due to respiratory syncytial virus (RSV), chronic hepatitis C	Anemia
Ritonavir (Norvir)	C: 100 mg T: 100 mg OS: 80 mg/ml	HIV infection	Weakness, diarrhea, nausea, decreased appetite, vomiting, altered taste
Saquinavir (Invirase)	C: 200 mg T: 500 mg	HIV infection	Weakness, diarrhea, nausea, oral ulcers, abdominal pain
Stavudine (Zerit)	C: 15 mg, 20 mg, 30 mg, 40 mg OS: 1 mg/ml	HIV infection	Paresthesia, decreased appetite, chills, fever, rash
Tenofovir (Viread)	T: 150 mg, 200 mg, 250 mg, 300 mg Powder (oral): 40 mg/g	HIV infection	Diarrhea, nausea, pharyngitis, headaches
Valacyclovir (Valtrex)	T: 500 mg, 1 g	Herpes zoster, genital herpes, herpes labialis, chickenpox	Headaches, nausea
Valganciclovir (Valcyte)	T: 450 mg OS: 50 mg/ml	CMV retinitis	Anemia, abdominal pain, diarrhea, headaches, nausea, vomiting, paresthesia
Zanamivir (Relenza)	Inhalation: 5 mg	Influenza A and B	Cough, diarrhea, dizziness, headaches, nausea, vomiting
Zidovudine (Retrovir)	C: 100 mg S: 50 mg/5 ml I: 10 mg/ml	HIV infection	Fatigue, fever, chills, headaches, nausea, muscle pain

C, Capsules; **I**, Injection; **OS**, oral solution; **S**, syrup; **T**, tablets.

Beta-Adrenergic Blockers

Uses

Management of hypertension, angina pectoris, arrhythmias, hypertrophic subaortic stenosis, migraine headaches, MI (prevention), glaucoma.

Action

Beta-adrenergic blockers competitively block beta adrenergic receptors, located primarily in myocardium, and beta₂-adrenergic receptor's, located primarily in bronchial and vascular smooth muscle. By occupying beta-receptor sites, these agents prevent naturally occurring or administered epinephrine/norepinephrine from exerting their' effects. The results are basically opposite to those of sympathetic stimulation.

Effects of beta₁ blockade include slowing heart rate, decreasing cardiac output and contractility; effects of beta₂ blockade include bronchoconstriction, increased airway resistance in pts with asthma or COPD. Beta blockers can affect cardiac rhythm/automaticity (decrease sinus rate, SA/AV conduction; increase refractory period in AV node); decrease systolic and diastolic B/P; exact mechanism unknown but may block peripheral receptors, decrease sympathetic outflow from CNS, or decrease renin release from kidney. All beta blockers mask tachycardia that occurs with hypoglycemia. When applied to the eye, reduce intraocular pressure and aqueous production.

Beta-Adrenergic Blockers

Name	Availability	Indication	Dosage Range	Frequent or Severe Side Effects
Acebutolol (Sectral)	C: 200 mg, 400 mg	HTN, ventricular arrhythmia	HTN: Initially, 400 mg once daily or 2 divided doses. Usual dose: 200–1200 mg once/d or	CLASS: Fatigue, depression, bradycardia, decreased exercise tolerance, erectile dysfunction, heart failure, may aggravate hypoglycemia, increase incidence of diabetes, insomnia, increase

			divided bid Arrhythmia: Initially, 200 mg 2 times/day. Gradually increase to 300–600 mg 2 times/day	triglycerides, decrease cholesterol. Sudden withdrawal may exacerbate angina and myocardial infarction.
Atenolol (Tenormin)	T: 25 mg, 50 mg, 100 mg	HTN, angina, MI	Angina: Initially, 50 mg once daily. May increase to 100 mg once daily after one wk HTN: Initially, 50 mg once daily. May increase to 100 mg once daily after 2 wks MI: 50 mg bid or 100 mg once daily	
Bisoprolol (Zebeta)	T: 5 mg, 10 mg	HTN	Initially, 5 mg once daily. May increase to 10 mg/day, then 20 mg/day. Usual dose: 5-10 mg/day	
Carvedilol (Coreg)	T: 3.125 mg, 6.25 mg, 12.5 mg, 25 mg C (SR): 10 mg, 20 mg, 40 mg, 80 mg	HF, LVD after MI, HTN	Immediate-Release HF: Initially, 3.25 mg 2 times/day. May increase at 2 wk intervals to 6.25 mg 2 times/day, then 12.5 mg 2 times/day, then 25 mg 2 times/day LVD after MI: Initially, 6.25 mg 2 times/day. May increase q3—10 days to 12.5 mg 2 times/day, then 25 mg 2 times/day HTN: Initially, 6.25 mg 2 times/day. May increase q7—14 days to 12.5 mg 2 times/day, then 25 mg 2 times/day Extended-Release HF: 10—80 mg once daily LVD after MI: 10-80 mg once daily HTN: 20-80 mg once daily	
Labetalol (Trandate)	T: 100 mg, 200 mg,	HTN	Initially, 100 mg 2 times/day. May	

	300 mg		increase q2-3 days in 100 mg 2 times/day increments. Usual dose: 200–1200 mg 2 times/day
Metoprolol (Lopressor [IR], Toprol XL [SR])	T (IR): 50 mg, 100 mg T (SR): 25 mg, 50 mg	HTN, angina, HF, MI	IR: Angina: Initially, 50 mg 2 times/day. May increase up to 400 mg/day HTN: Initially, 100 mg once daily. May increase at weekly intervals up to 450 mg/divided bid or tid Post-MI: 100 mg bid SR: Angina: 100–400 mg once daily HF: 12.5–200 mg once daily HTN: 25–400 mg once daily
Nadolol (Corgard)	T: 20 mg, 40 mg, 80 mg	HTN, angina	Angina, HTN: Initially, 40 mg once/day. Usual dose: 40–320 mg once daily
Nebivolol (Bystolic)	T: 2.5 mg, 5 mg, 10 mg, 20 mg	HTN	Initially, 5 mg once daily. May increase at 2 wk intervals up to 40 mg/once/d
Pindolol (Visken)	T: 5 mg, 10 mg	HTN	Initially, 5 mg 2 times/day. May increase to 10–40 mg/day. Maximum: 60 mg/day divided bid
Propranolol (Inderal)	T (IR): 10 mg, 20 mg, 40 mg, 60 mg, 80 mg C (SR): 60 mg, 80 mg, 120 mg, 160 mg S: 4 mg/ml, 8 mg/ml I: 1	HTN, angina, MI, arrhythmias, migraine, essential tremor, hypertrophic subaortic stenosis	IR: Angina: 80–320 mg/day in 2–4 divided doses Arrhythmias: 10–30 mg 3–4 times/day HTN: 40 mg bid up to 240 mg/day in 2–3 divided doses Hypertrophic subaortic stenosis: 20–40 mg 3–4 times/day

	mg/ml		<p>Post-MI: 180-240 mg/day in 2–4 divided doses</p> <p>Migraine: Initially, 80 mg/day. May increase gradually up to 240 mg/day in divided doses</p> <p>Tremor: Initially, 40 mg 2 times/day. Usual dose: 120–320 mg/day</p> <p>SR:</p> <p>Angina: Initially, 80 mg once daily. May increase q3-7days up to 320 mg/day</p> <p>HTN: 80–120 mg once daily at bedtime</p> <p>Migraine: Initially, 80 mg once daily. Gradually increase up to 240 mg once daily</p> <p>Hypertrophic subaortic stenosis: 80–160 mg once daily</p>

C, Capsules; *HF*, heart failure; *HTN*, hypertension; *I*, Injection; *LVD*, left ventricular dysfunction; *S*, solution; *SR*, sustained-release; *T*, tablets.

Bronchodilators

Uses

Relief of bronchospasm occurring during anesthesia and in bronchial asthma, bronchitis, emphysema.

Action

Inhaled corticosteroids: Exact mechanism unknown. May act as anti-inflammatories, decrease mucus secretion.

Beta₂-adrenergic agonists: Stimulate beta receptors in lung, relax bronchial smooth muscle, increase vital capacity, decrease airway resistance.

Anticholinergics: Inhibit cholinergic receptors on bronchial smooth muscle (block acetylcholine action).

Leukotriene modifiers: Decrease effect of leukotrienes, which increase migration of eosinophils, producing mucus/edema of airway wall, causing bronchoconstriction.

Methylxanthines: Directly relax smooth muscle of bronchial airway, pulmonary blood vessels (relieve bronchospasm, increase vital capacity). Increase cyclic 3,5-adenosine monophosphate.

Bronchodilators

Name	Availability	Dosage Range	Side Effects
Anticholinergics			
Acclidinium (Tudorza)	Inhalation powder: 400 mcg/actuation	A: 400 mcg 2 times/day	Headache, nasopharyngitis, cough
Glycopyrrolate (Seebri Neohaler)	Inhalation Capsule: 15.6 mcg/cap	A: One inhalation 2 times/day	Fatigue, diarrhea, nausea, arthralgia, nasopharyngitis, upper respiratory tract infection, wheezing
Ipratropium (Atrovent)	NEB: 0.02% (500 mcg) MDI: 17 mcg/actuation	A (NEB): 500 mcg q6-8h A (MDI): 2 puffs 4 times/day	Upper respiratory tract infection, bronchitis, sinusitis, headache, dyspnea
Tiotropium (Spiriva, Spiriva Respimat)	Inhalation powder: 18 mcg/capsule Aerosol Solution: 1.25 mcg/inhalation	A: Once/day (inhaled twice) Aerosol Solution: 2 inhalations once daily	Xerostomia, upper respiratory tract infection, sinusitis, pharyngitis
Umeclidinium (Incruse Ellipta)	Inhalation powder: 62.5 mcg/blister	A: One inhalation once daily	Nasopharyngitis, upper respiratory tract infection, cough, arthralgia
Bronchodilators			
Arformoterol (Brovanna)	NEB: 15 mcg/2 ml	Neb: 15 mcg 2 times/day	Pain, diarrhea, sinusitis, leg cramps, dyspnea, rash, flu syndrome, peripheral edema
Albuterol (ProAir HFA, ProAir Respiclick Proventil HFA, Ventolin HFA)	DPI: 90 mcg/actuation MDI: 90 mcg/actuation NEB: 2.5 mg/3 ml, 2.5 mg/0.5 ml, 0.63-1.25 mg/3 ml	DPI: 1-2 inhalations q4-6h as needed MDI: 2 inhalations q4-6h as needed NEB: 1.25-5 mg q4-6h as needed	Tachycardia, skeletal muscle tremors, muscle cramping, palpitations, insomnia, hypokalemia, increased serum glucose
Albuterol/ipratropium (Combivent Respimat, DuoNeb)	MDI: 90 mcg albuterol/ 18 mcg ipratropium/actuation NEB: 2.5 mg albuterol/	MDI: 1 inhalation 4 times/day as needed NEB: 2.5	Same as individual listing for albuterol and ipratropium

	0.5 mg ipratropium/3 ml	mg/0.5 mg 4 times/day as needed	
Formoterol (Foradil, Perforomist)	NEB: 20 mcg/2 ml	NEB: 20 mcg q12h	Diarrhea, nausea, asthma exacerbation, bronchitis, infection
Formoterol/budesonide (Symbicort)	MDI: 80,160 mcg/ 4.5 mcg/inhalation	MDI: 2 inhalations 2 times/day	Same as individual listing for formoterol and budesonide
Formoterol/mometasone (Dulera)	MDI: 5 mcg/100 mcg, 5 mcg/200 mcg	MDI: 2 inhalations 2 times/day	Same as individual listing for formoterol and beclomethasone
Indacaterol (Arcapta)	DPI: 75 mcg/capsule	DPI: 75 mcg once daily	Cough, oropharyngeal pain, nasopharyngitis, headache, nausea
Levalbuterol (Xopenex)	MDI: 45 mcg/actuation NEB: 0.31, 0.63, 1.25 mg/ 3 ml, 1.25 mg/0.5 ml	MDI: 2 inhalations q4–6h as needed NEB: 0.31–1.25 mg q6–8h	Tremor, rhinitis, viral infection, headache, nervousness, asthma, pharyngitis, rash
Olodaterol (Striverdi Respimat)	MDI: 2.5 mcg/actuation	MDI: 2 inhalations once daily	Nasopharyngitis, rash, dizziness, cough, bronchitis, upper respiratory tract infections
Olodaterol/tiotropium (Stiolto Respimat)	MDI: 2.5 mcg/2.5 mcg	MDI: 2 inhalations once daily	Nasopharyngitis, cough, back pain
Salmeterol (Serevent Diskus)	DPI: 50 mcg/blister	DPI: 50 mcg q12h	Headache, pain, throat irritation, nasal congestion, bronchitis, pharyngitis
Salmeterol/fluticasone (Advair Diskus, Advair HFA)	DPI: 100, 250, 500 mcg/ 50 mcg/blister MDI: 45, 115, 230 mcg/21 mcg/inhalation	DPI: 1 inhalation 2 times/day MDI: 2 inhalations 2 times/day	Same as individual listing for salmeterol and fluticasone
Vilanterol/umeclidinium (Anoro Ellipta)	DPI: 25 mcg/62.5 mcg	DPI: Once daily	Pharyngitis, sinusitis, lower respiratory tract infections, constipation, diarrhea, muscle spasms, neck/chest pain
Inhaled Corticosteroids			
Beclomethasone (Qvar)	MDI: 40, 80 mcg/inhalation	MDI: 40-320 mcg 2 times/day	Cough, hoarseness, headache, pharyngitis
Budesonide (Pulmicort Flexhaler, Pulmicort Respules)	DPI: (Flexhaler): 90,180 mcg/inhalation DPI: (Turbuhaler): 200 mcg/inhalation NEB: (Respules): 0.25, 0.5 mg/2 ml	DPI: (Flexhaler): 180–720 mcg 2 times/day DPI: (Turbuhaler): 400–2,400 mcg/day in 2–4 divided doses NEB: (Respules): 250–500 mcg 1–2 times/day or 1 mg once daily	Headache, nausea, respiratory infection, rhinitis

Ciclesonide (Alvesco HFA)	HFA: 80, 160 mcg/inhalation	HFA: 80–320 mcg 2 times/day	Headache, nasopharyngitis, upper respiratory infection, epistaxis, nasal congestion, sinusitis
Fluticasone (Arnuity Ellipta, Flovent Diskus, Flovent HFA)	DPI: (Flovent Diskus): 50, 100, 250 mcg/blister (Arnuity Ellipta): 100 mcg, 200 mcg/activation MDI: (Flovent HFA): 44, 110, 220 mcg/inhalation	DPI: (Flovent Diskus): 100–1,000 mcg 2 times/day (Arnuity Ellipta): 100–200 mcg once daily MDI: (Flovent HFA): 88–880 mcg 2 times/day	Headache, nasal congestion, pharyngitis, sinusitis, respiratory infections
Formoterol/budesonide (Symbicort)	MDI: 80,160 mcg/4.5 mcg/inhalation	MDI: 2 inhalations 2 times/day	Same as individual listing for formoterol and budesonide
Mometasone (Asmanex Twisthaler)	DPI: 110–220 mcg/inhalation	DPI: 220–880 mcg once daily in evening or 220 mcg bid	Same as beclomethasone
Salmeterol/fluticasone (Advair Diskus, Advair HFA)	DPI: 100, 250, 500 mcg/ 50 mcg/blister MDI: 45,115, 230 mcg/ 21 mcg/inhalation	DPI: 1 inhalation 2 times/day MDI: 2 inhalations 2 times/day	Same as individual listing for salmeterol and fluticasone
Vilanterol/fluticasone (Breo Ellipta)	DPI: 25 mcg/100 mcg; 25 mcg/200 mcg	DPI: 1 inhalation once daily	Nasopharyngitis, upper respiratory infection, headache, oral candidiasis
Leukotriene Modifiers			
Montelukast (Singulair)	T: 4 mg, 5 mg, 10 mg	A: 10 mg/day C (6–14 yrs): 5 mg/day C (2–5 yrs): 4 mg/day	Dyspepsia, increased LFT, cough, nasal congestion, headache, dizziness, fatigue
Zafirlukast (Accolate)	T: 10 mg, 20 mg	A, C (12 yrs and older): 20 mg 2 times/day C (5–11 yrs): 10 mg 2 times/day	Headache, nausea, diarrhea, infection
PDE-4 Inhibitor			
Roflumilast (Daliresp)	T: 500 mcg	A: 500 mcg once daily	Headache, dizziness, insomnia

A, Adults; **C (dosage)**, children; **DPI**, dry powder Inhaler; **HFA**, hydrofluoroalkane; **MDI**, metered dose Inhaler; **NEB**, nebulzation; **T**, tablets.

Calcium Channel Blockers

Uses

Treatment of essential hypertension, treatment of and prophylaxis of angina pectoris (including vasospastic, chronic stable, unstable), prevention/control of supraventricular tachyarrhythmias, prevention of neurologic damage due to subarachnoid hemorrhage.

Action

Calcium channel blockers inhibit the flow of extracellular Ca^{2+} ions across cell membranes of cardiac cells, vascular tissue. They relax arterial smooth muscle, depress the rate of sinus node pacemaker, slow AV conduction, decrease heart rate, produce negative inotropic effect (rarely seen clinically due to reflex response). Calcium channel blockers decrease coronary vascular resistance, increase coronary blood flow, reduce myocardial oxygen demand. Degree of action varies with individual agent.

Calcium Channel Blockers

Name	Availability	Indications	Dosage Range	Side Effects
Amlodipine (Norvasc)	T: 2.5 mg, 5 mg, 10 mg	HTN, angina	HTN: Initially, 2.5–5 mg once daily. May titrate q7–14 days up to 10 mg/day Angina: 5–10 mg once daily	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
Diltiazem (Cardizem)	T: 30 mg, 60 mg, 90 mg, 120 mg (ER): 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg C (SR-12HR): 60	PO: HTN, angina IV: Arrhythmias	See monograph HTN: 120–540 mg/day Angina: 120–480 mg/day I: 20–25 mg IV bolus, then 5–15 mg/hr infusion	Constipation, flushing, hypotension, dizziness, AV block, bradycardia,

	mg, 90 mg, 120 mg, (ER-24HR): 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg I: 5 mg/ml			headache, edema, HF
Felodipine (Plendil)	T: 2.5 mg, 5 mg, 10 mg	HTN	Initially, 5 mg/day. May increase q2wks. Usual dose: 5–10 mg/day	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
Isradipine	C: 2.5 mg, 5 mg	HTN	Initially, 2.5 mg 2 times/day. May increase at 2–4 wk intervals at 2.5–5 mg increments. Usual dose: 5–10 mg 2 times/day	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
Nicardipine (Cardene)	C (IR): 20 mg, 30 mg C (ER): 30 mg, 45 mg, 60 mg I: 2.5 mg/ml	HTN, angina	Angina/HTN: Initially, 20–30 mg 3 times/day. May increase q3days. Usual dose: 20–40 mg 3 times/day	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
Nifedipine (Adalat, Procardia)	C (IR): 10 mg, 20 mg T (ER): 30 mg, 60 mg, 90 mg	HTN, angina	HTN (ER): Initially, 30–60 mg once daily. Usual dose: 90–120 mg once daily Angina (IR): 10–20 mg tid or (ER): Initially, 30–60 mg once daily. Titrate up to 90 mg daily. Maximum: 120 mg	Headache, peripheral edema, dizziness, flushing, rash, gingival hyperplasia, tachycardia
Nimodipine (Nimotop, Nymalize)	C: 30 mg S: 60 mg/20 ml	Prevent neurologic damage following subarachnoid hemorrhage	60 mg q4h for 21 days	Nausea, reduced B/P, headache, rash, diarrhea
Verapamil (Calan, Isoptin)	T (IR): 40 mg, 80 mg, 120 mg T (SR): 120 mg, 180 mg, 240 mg	HTN, angina	Angina (IR): Initially, 40–120 mg 3 times/day. Usual dose: 80–160 mg tid or (SR): Initially, 180 mg at HS. May increase at weekly intervals up to 480 mg/day HTN (IR): Initially, 80 mg 3 times/day. Usual dose: 240–480 mg/day in divided doses (SR): Initially, 120–180 mg/day. May increase at weekly intervals to 240 mg/day, then 180 mg 2 times/day. Maximum: 240 mg 2 times/day	Constipation, dizziness, tachycardia, AV block, bradycardia, headache, edema, HF

C, Capsules; **CR**, controlled-release; **ER**, extended-release; **HTN**, hypertension; **I**, injection; **S**, solution; **SR**, sustained-release; **T**, tablets.

Chemotherapeutic Agents

Uses

Treatment of a variety of cancers; may be palliative or curative. Treatment of choice in hematologic cancers. Often used as adjunctive therapy (e.g., with surgery or irradiation); most effective when tumor mass has been removed or reduced by radiation. Often used in combinations to increase therapeutic results, decrease toxic effects. Certain agents may be used in nonmalignant conditions: polycythemia vera, psoriasis, rheumatoid arthritis, or immunosuppression in organ transplantation (used only in select cases that are severe and unresponsive to other forms of therapy). Refer to individual monographs.

Action

Most antineoplastics can be divided into alkylating agents, antimetabolites, anthracyclines, plant alkaloids, and topoisomerase inhibitors. These agents affect cell division or DNA synthesis. Newer agents (monoclonal antibodies and tyrosine kinase inhibitors) directly target a molecular abnormality in certain types of cancer. Hormones modulate tumor cell behavior without directly attacking those cells. Some agents are classified as miscellaneous.

Chemotherapeutic Agents

Name	Uses	Category	Side Effects
Abiraterone (Zytiga)	Prostate Cancer	Antiandrogen	Joint swelling, hypokalemia, edema, muscle discomfort, flashes, diarrhea, UTI, c, hypertension, arrhythmia, dyspepsia, upper respiratory tract infection
Aldesleukin (Proleukin)	Melanoma (metastatic), Renal Cell (metastatic)	Biologic response modifier	Hypotension, sinus tachycardia, nausea, vomiting, diarrhea, renal impairment, anemia, fatigue, agitation, pulmonary congestion, dyspnea, fevers, chills, oliguria, weight gain, dizziness

Alectinib (Alecensa)	Non-small cell lung cancer (NSCLC), metastatic	Kinase inhibitor	Constipation, fatigue, edema myalgia
Anastrozole (Arimidex)	Breast cancer	Aromatase inhibitor	Peripheral edema, chest pain, nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, pharyngitis, vaginal hemorrhage, anemia, leukopenia, rash, weight loss, diaphoresis, increased risk of pain, headaches, dizziness, depression, paresthesia, hot flashes, increased cough, mouth, asthenia, dyspnea, phlebitis
Arsenic trioxide (Trisenox)	Acute promyelocytic leukemia (APL)	Miscellaneous	AV block, GI hemorrhage, hypertension, hypoglycemia, hypokalemia, hypomagnesemia, neutropenia, oliguria, prolonged QT interval, seizures, severe thrombocytopenia
Asparaginase (Elspar)	Acute lymphoblastic leukemia (ALL)	Miscellaneous	Anorexia, nausea, vomiting, toxicity, pancreatitis, nephrotoxicity, clotting factor abnormalities, malaise, confusion, lethargy, ECG changes, respiratory distress, fever, hyperglycemia, depression, stomatitis, allergic reactions, drowsiness
Atezolizumab (Tecentriq)	NSCLC, metastatic, urothelial carcinoma, locally advanced or metastatic	Miscellaneous	Fatigue, decreased appetite, urinary tract infections, constipation, pyrexia
Avelumab (Bavencio)	Merkel cell carcinoma	PD-L1 blocking antibody	Fatigue, musculoskeletal pain, diarrhea, nausea, infusion related reactions, rash, decreased appetite, peripheral edema
Axitinib (Inlyta)	Renal cell carcinoma, advanced	Kinase inhibitor	Diarrhea, hypertension, fatigue, decreased appetite, nausea, dysphoria, vomiting, asymptomatic constipation
Azacitidine (Vidaza)	Myelodysplastic (MDS) syndrome	DNA methylation inhibitor	Edema, hypokalemia, weight loss, myalgia, cough, dyspnea, respiratory tract infection, pain, pyrexia, weakness
BCG (TheraCys, Tice BCG)	Bladder cancer	Biologic response modulator	Nausea, vomiting, anorexia, diarrhea, dysuria, hematuria, cystitis, urinary urgency, anemia, malaise, fever, chills
Belinostat (Beleodaq)	Peripheral T-cell lymphoma	Miscellaneous	Nausea, fatigue, pyrexia, anorexia, vomiting
Bendamustine (Treanda)	Chronic lymphocytic leukemia (CLL), Non-Hodgkin lymphoma (NHL)	Alkylating agent	Neutropenia, pyrexia, thrombocytopenia, nausea

			anemia, leukopenia, von
Bevacizumab (Avastin)	Cervical cancer, persistent/recurrent/metastatic, colorectal cancer, metastatic, glioblastoma, NSCLC, nonsquamous	Monoclonal antibody	Increased B/P, fatigue, blood diarrhea, decreased WBC, headaches, decreased appetite, stomatitis
Bexarotene (Targretin)	Cutaneous T-cell lymphoma	Miscellaneous	Anemia, dermatitis, fever, hypercholesterolemia, leukopenia, peripheral edema
Bicalutamide (Casodex)	Prostate cancer, metastatic	Antiandrogen	Gynecomastia, hot flashes, bone pain, nausea, diarrhea, constipation, nocturia, impotence, pain, muscle asthenia, abdominal pain
Bleomycin (Blenoxane)	Head/neck cancers, Hodgkin lymphoma, malignant pleural effusion, testicular cancer	Antibiotic	Nausea, vomiting, anorexia, stomatitis, hyperpigmentation, alopecia, pruritus, hyperkeratosis, urticaria, pneumonitis, progression fibrosis, weight loss, rash
Blinatumomab (Blincyto)	Acute lymphoblastic leukemia (ALL)	Miscellaneous	Pyrexia, headache, peripheral edema, febrile neutropenia, nausea, hypokalemia, tremor, rash, constipation
Bortezomib (Velcade)	Mantle cell lymphoma, multiple myeloma	Proteasomeinhibitor	Anxiety, dizziness, headache, insomnia, peripheral neuropathy, pruritus, rash, abdominal pain, decreased appetite, constipation, dyspepsia, nausea, vomiting, arthralgia, dyspnea, asthenia, edema, pain
Bosutinib (Bosulif)	Chronic myelogenous leukemia (CML)	Kinase inhibitor	Nausea, diarrhea, thrombocytopenia, vomiting, abdominal pain, anemia, fatigue
Brentuximab (Adcetris)	Anaplastic large cell lymphoma, Hodgkin lymphoma (relapsed, refractory, post-autologous hematopoietic stem cell transplant)	Miscellaneous	Neutropenia, peripheral sensory neuropathy, fatigue, nausea, anemia, upper respiratory infection, diarrhea, pyrexia, thrombocytopenia, cough, vomiting
Brigatinib (Alunbrig)	NSCLC, metastatic	Kinase inhibitor	Nausea, diarrhea, fatigue, cough, headache
Busulfan (Myleran)	Chronic myeloid leukemia (CML)	Alkylating agent	Nausea, vomiting, hyperuricemia, myelosuppression, skin hyperpigmentation, alopecia, anorexia, weight loss, diarrhea, stomatitis
Cabazitaxel (Jevtana)	Prostate cancer, metastatic	Microtubule inhibitor	Neutropenia, anemia, leukopenia, thrombocytopenia, diarrhea, fatigue, nausea, vomiting, constipation, asthenia,

			abdominal pain, hematuria, anorexia, peripheral neuropathy, dyspnea, etc.
Capecitabine (Xeloda)	Breast cancer, metastatic, colorectal cancer	Antimetabolite	Nausea, vomiting, diarrhea, stomatitis, myelosuppression, palmar-plantar erythrodysesthesia syndrome, dermatitis, fatigue, anorexia
Carboplatin (Paraplatin)	Ovarian cancer, advanced	Alkylating agent	Nausea, vomiting, nephrotoxicity, myelosuppression, alopecia, peripheral neuropathy, hypersensitivity, ototoxicity, asthenia, diarrhea, constipation
Carfilzomib (Kyprolis)	Multiple myeloma, relapsed/refractory	Proteasome inhibitor	Anemia, fatigue, nausea, thrombocytopenia, dyspnea, diarrhea, pyrexia
Carmustine (BiCNU)	Brain tumors, multiple myeloma, Hodgkin lymphoma, relapsed/refractory, NHL, relapsed/refractory	Alkylating agent	Anorexia, nausea, vomiting, myelosuppression, pulmonary fibrosis, pain at injection site, diarrhea, skin discoloration
Ceritinib (Zykadia)	NSCLC, metastatic	Kinase inhibitor	Diarrhea, nausea, increased vomiting, abdominal pain, fatigue, decreased appetite, constipation
Cetuximab (Erbix)	Colorectal cancer, metastatic, head/neck cancer, squamous cell	Monoclonal antibody	Dyspnea, hypotension, acne, rash, dry skin, weakness, fatigue, fever, constipation, abdominal pain
Chlorambucil (Leukeran)	Lymphomas, chronic lymphocytic leukemia (CLL)	Alkylating agent	Myelosuppression, dermatitis, nausea, vomiting, hepatotoxicity, anorexia, diarrhea, abdominal discomfort, etc.
Cisplatin (Platinol-AQ)	Bladder cancer, advanced, ovarian cancer, metastatic, testicular cancer, metastatic	Alkylating agent	Nausea, vomiting, nephrotoxicity, myelosuppression, neuropathies, ototoxicity, anaphylactic-like reactions, hyperuricemia, hypomagnesemia, hypophosphatemia, hypokalemia, hypocalcemia, pain at injection site
Cladribine (Leustatin)	Hairy cell leukemia	Antimetabolite	Nausea, vomiting, diarrhea, myelosuppression, chills, fatigue, rash, fever, headache, anorexia, diaphoresis
Cobimetinib (Cotellic)	Melanoma, unresectable or metastatic	Kinase inhibitor	Diarrhea, photosensitivity reactions, nausea, vomiting, pyrexia, increased ALT, AST, alkaline phosphatase
Crizotinib (Xalkori)	NSCLC, metastatic	Tyrosine kinase inhibitor	Vision disorders, nausea, vomiting, diarrhea, edema, constipation
Cyclophosphamide	ALL, AML, breast cancer, CML,	Alkylating agent	Nausea, vomiting, hemorrhage

(Cytoxan)	Hodgkin lymphoma, multiple myeloma, NHL, ovarian carcinoma		cystitis, myelosuppression, alopecia, interstitial pulmonary fibrosis, amenorrhea, azoospermia, diarrhea, darkening skin/fingernails, headaches, diaphoresis
Cytarabine (Ara-C, Cytosar)	AML, ALL, CML, meningeal leukemia	Antimetabolite	Anorexia, nausea, vomiting, stomatitis, esophagitis, diarrhea, myelosuppression, alopecia, rash, fever, neuropathies, abdominal pain
Dabrafenib (Tafinlar)	Melanoma, metastatic or unresectable	Kinase inhibitor	Hyperkeratosis, headache, peripheral arthralgia, constipation, alopecia, rash, cough, palmar-plantar erythrodysesthesia syndrome, papilloma
Dacarbazine (DTIC)	Hodgkin lymphoma, metastatic malignant melanoma	Alkylating agent	Nausea, vomiting, anorexia, necrosis, myelosuppression, alopecia, rash, facial flushing, photosensitivity, flu-like symptoms, confusion, blurred vision
Daratumumab (Darzalex)	Multiple myeloma, relapsed/refractory	Monoclonal antibody	Fatigue, nausea, infusion reaction, back pain, pyrexia, nasopharyngitis, upper respiratory tract infections
Dasatinib (Sprycel)	ALL, CML	Tyrosine kinase inhibitor	Pyrexia, pleural effusion, febrile neutropenia, GI bleeding, pneumonia, thrombocytopenia, dyspnea, anemia, cardiac failure, diarrhea
Daunorubicin (Cerubidine)	ALL, AML	Anthracycline	HF, nausea, vomiting, stomatitis, mucositis, diarrhea, hematuria, myelosuppression, alopecia, fever, chills, abdominal pain
Daunorubicin liposomal (DaunoXome)	Kaposi sarcoma	Anthracycline	Nausea, diarrhea, abdominal pain, anorexia, vomiting, stomatitis, myelosuppression, rigors, pain, headaches, neuropathy, depression, dyspnea, fatigue, fever, cough, allergic reactions, diaphoresis
Dinutuximab (Unituxin)	Neuroblastoma	Monoclonal antibody	Pain, arthralgia, myalgia, neutropenia, pyrexia, hypotension, vomiting, diarrhea, urticaria, hypotension
Docetaxel (Taxotere)	Breast cancer, NSCLC, prostate, gastric, head/neck cancers	Antimicrotubular	Hypotension, nausea, vomiting, diarrhea, mucositis, myelosuppression, rash, paresthesia, hypersensitivity, fluid retention, alopecia, asthenia, stomatitis, fever
Doxorubicin (Adriamycin)	Breast cancer, metastatic cancers	Anthracycline	Cardiotoxicity, including HF, arrhythmias, nausea, vomiting, stomatitis, esophagitis, C

			ulceration, diarrhea, ano hematuria, myelosuppre: alopecia, hyperpigmenta nail beds and skin, local inflammation at injection rash, fever, chills, urtica lacrimation, conjunctivit
Doxorubicin liposomal (Doxil)	AIDS-related Kaposi sarcoma, multiple myeloma, ovarian cancer, advanced	Anthracycline	Neutropenia, palmar-plantar erythrodysesthesia syndi cardiomyopathy, HF
Durvalumab (Imfinzi)	Urothelial carcinoma, advanced or metastatic	PD-L1 blocking antibody	Fatigue, musculoskeletal pai constipation, decreased appetite, nausea, periphe edema, UTI
Elotuzumab (Empliciti)	Multiple myeloma, relapsed/refractory	Immunostimulatory antibody	Fatigue, diarrhea, pyrexia, constipation, cough, peri neuropathy, nasopharyng decreased appetite, uppe respiratory tract infectio pneumonia
Enasidenib (Idhifa)	AML, refractory	Isocitrate dehydrogenase-2 inhibitor	Nausea, vomiting, diarrhea, elevated bilirubin, decre appetite
Enzalutamide (Xtandi)	Prostate cancer, metastatic	Antiandrogen	Fatigue, weakness, back pai diarrhea, tissue swelling, musculoskeletal pain, he upper respiratory tract infections, blood in urine spinal cord compression
Epirubicin (Ellence)	Breast cancer, adjuvant	Anthracycline	Anemia, leukopenia, neutro infection, mucositis
Erlotinib (Tarceva)	NSCLC, pancreatic cancer	Tyrosine kinase inhibitor	Diarrhea, rash, nausea, vomi
Etoposide (VePesid)	Small cell lung cancer, testicular cancer	Podophyllotoxin derivative	Nausea, vomiting, anorexia, myelosuppression, alope diarrhea, drowsiness, pei neuropathies
Everolimus (Afinitor)	Breast cancer, advanced, neuroendocrine tumors, renal cell carcinoma, advanced, subependymal giant cell astrocytoma	mTOR kinase inhibitor	Stomatitis, infections, asther fatigue, cough, diarrhea
Exemestane (Aromasin)	Breast cancer	Aromatase inactivator	Dyspnea, edema, hypertensi mental depression
Fludarabine (Fludara)	CLL	Antimetabolite	Nausea, diarrhea, stomatitis, bleeding, anemia, myelosuppression, skin weakness, confusion, vis disturbances, peripheral neuropathy, coma, pneur peripheral edema, anore:
Fluorouracil (Adrucil,	Breast, colon, gastric, pancreatic, rectal	Antimetabolite	Nausea, vomiting, stomatitis

Efudex)	cancers, basal cell carcinoma		ulceration, diarrhea, ano myelosuppression, alope skin hyperpigmentation, changes, headaches, drowsiness, blurred visio fever
Flutamide (Eulexin)	Prostate cancer	Antiandrogen	Hot flashes, nausea, vomitin diarrhea, hepatitis, impo decreased libido, rash, a
Fulvestrant (Faslodex)	Breast cancer, metastatic or advanced	Estrogen receptor antagonist	Asthenia, pain, headaches, i site pain, flu-like symptc fever, nausea, vomiting, constipation, anorexia, d peripheral edema, dizzin depression, anxiety, rash increased cough, UTI
Gefitinib (Iressa)	NSCLC	Tyrosine kinase inhibitor	Diarrhea, rash, acne, nausea, skin, vomiting, pruritus, anorexia
Gemcitabine (Gemzar)	Breast, NSCLC, ovarian, pancreatic cancers	Antimetabolite	Increased LFT, nausea, vom diarrhea, stomatitis, hem myelosuppression, rash, paresthesia, dyspnea, fev edema, flu-like symptom constipation
Goserelin (Zoladex)	Breast cancer, prostate cancer	Hormone agonist	Hot flashes, sexual dysfunct erectile dysfunction, gynecomastia, lethargy, lower urinary tract symp headaches, nausea, depre diaphoresis
Hydroxyurea (Hydrea)	CML, head/neck cancers	Antimetabolite	Anorexia, nausea, vomiting, stomatitis, diarrhea, constipation, myelosupp fever, chills, malaise
Ibrutinib (Imbruvica)	CLL, small lymphocytic lymphoma, mantle cell lymphoma, Waldenstrom macroglobulinemia	Kinase inhibitor	Neutropenia, thrombocyte diarrhea, anemia, musculoskeletal pain, ra nausea, bruising, fatigue hemorrhage, pyrexia
Idarubicin (Idamycin PFS)	Acuter myeloid leukemia (AML)	Anthracycline	HF, arrhythmias, nausea, voi stomatitis, myelosuppres alopecia, rash, urticaria, hyperuricemia, abdomin diarrhea, esophagitis, an
Idelalisib (Zydelig)	CLL, follicular B-cell non-Hodgkin lymphoma, small lymphocytic lymphoma	Kinase inhibitor	Diarrhea, pyrexia, fatigue, n cough, abdominal pain, pneumonia, increased ALT/AST
Ifosfamide (Ifex)	Testicular cancer	Alkylating agent	Nausea, vomiting, hemorrha cystitis, myelosuppressio alopecia, lethargy, drows confusion, hallucination: hematuria

Imatinib (Gleevec)	ALL, CML, dermatofibrosarcoma protuberans, GIST, chronic eosinophilic leukemias, myelodysplastic/myeloproliferative disease	Tyrosine kinase inhibitor	Nausea, fluid retention, hemorrhage, musculoskeletal pain, arthralgia, weight loss, pyrexia, abdominal pain, dyspnea, pneumonia
Interferon alfa-2b (Intron-A)	AIDS-related Kaposi sarcoma, follicular lymphoma, hairy cell leukemia, malignant melanoma	Miscellaneous	Mild hypotension, hypertension, tachycardia with high fever, nausea, diarrhea, altered weight loss, thrombocytopenia, myelosuppression, rash, pruritus, myalgia, arthralgia associated with flu-like symptoms
Ipilimumab (Yervoy)	Melanoma, unresectable or metastatic, melanoma, adjuvant	Miscellaneous	Fatigue, diarrhea, pruritus, rash, colitis
Irinotecan (Camptosar)	Colorectal cancer, metastatic, pancreatic adenocarcinoma, metastatic	Camptothecin	Diarrhea, nausea, vomiting, abdominal cramps, anorexia, stomatitis, increased AST, severe myelosuppression, alopecia, diaphoresis, rash, weight loss, dehydration, increased serum alkaline phosphatase, headaches, insomnia, dizziness, dyspnea, cough, asthenia, rhinitis, back pain, chills
Ixabepilone (Ixempra)	Breast cancer	Antimicrotubular	Peripheral sensory neuropathy, fatigue, myalgia, alopecia, nausea, vomiting, stomatitis, diarrhea, anorexia, abdominal pain
Ixazomib (Ninlaro)	Multiple myeloma	Proteasome inhibitor	Diarrhea, constipation, thrombocytopenia, peripheral neuropathy, nausea, peripheral edema, back pain, vomiting
Lapatinib (Tykerb)	Breast cancer	Tyrosine kinase inhibitor	Diarrhea, palmar-plantar erythrodysesthesia, nausea, rash, vomiting, fatigue
Lenalidomide (Revlimid)	Mantle cell lymphoma, multiple myeloma, myelodysplastic syndromes	Immunomodulator	Diarrhea, pruritus, rash, fatigue, DVT, pulmonary emboli, thrombocytopenia, neutropenia, upper respiratory tract infection, cellulitis, hypertension, peripheral neuropathy
Lenvatinib (Lenvima)	Renal cell carcinoma, advanced, thyroid cancer, differentiated	Kinase inhibitor	Hypertension, fatigue, diarrhea, arthralgia, decreased weight, nausea, stomatitis, headache, vomiting, proteinuria, abdominal pain
Letrozole (Femara)	Breast cancer in post-menopausal women	Aromatase inhibitor	Hypertension, nausea, vomiting, constipation, diarrhea, abdominal pain, anorexia, pruritus, musculoskeletal

			arthralgia, fatigue, headache, dyspnea, coughing, hot flashes
Leuprolide (Lupron)	Prostate cancer, advanced	Hormone agonist	Hot flashes, gynecomastia, irritable bowel syndrome, vomiting, constipation, anorexia, dizziness, headache, insomnia, paresthesia, bone pain
Lomustine (CeeNU)	Brain tumors, Hodgkin lymphoma	Alkylating agent	Anorexia, nausea, vomiting, stomatitis, hepatotoxicity, nephrotoxicity, myelosuppression, alopecia, confusion, slurred speech
Megestrol (Megace)	Breast cancer, endometrial cancer	Hormone	Deep vein thrombosis, Cushing syndrome, alopecia, carpal tunnel syndrome, weight gain, nausea
Melphalan (Alkeran)	Multiple myeloma, ovarian cancer	Alkylating agent	Anorexia, nausea, vomiting, myelosuppression, diarrhea, stomatitis
Mercaptopurine (Purinethol)	ALL	Antimetabolite	Anorexia, nausea, vomiting, stomatitis, hepatic toxicity, myelosuppression, hyperuricemia, diarrhea,
Methotrexate (Rheumatrex)	ALL, trophoblastic neoplasms, breast cancer, head and neck cancer, cutaneous T-cell lymphoma, lung cancer, advanced NHL, osteosarcoma	Antimetabolite	Nausea, vomiting, stomatitis, ulceration, diarrhea, hepatotoxicity, renal failure, cyclophosphamide-induced myelosuppression, alopecia, urticaria, acne, photosensitivity, interstitial pneumonitis, malaise, chills, anorexia
Midostaurin (Rhydapt)	AML, aggressive systemic mastocytosis (ASM)	Kinase inhibitor	Febrile neutropenia, nausea, mucositis, vomiting, headache, petechiae, musculoskeletal pain, epistaxis, hyperglycemia, upper respiratory tract infections
Mitomycin (Mutamycin)	Gastric cancer, pancreatic cancer	Antibiotic	Anorexia, nausea, vomiting, stomatitis, diarrhea, renal toxicity, myelosuppression, alopecia, pruritus, fever, hemolytic uremic syndrome, weakness
Mitotane (Lysodren)	Adrenocortical carcinoma	Miscellaneous	Anorexia, nausea, vomiting, diarrhea, skin rashes, depression, lethargy, drowsiness, dizziness, adrenal insufficiency, blurred vision, impaired hearing
Mitoxantrone (Novantrone)	Acute nonlymphocytic leukemias, prostate cancer, advanced hormone refractory	Anthracenedione	HF, tachycardia, EKG changes, chest pain, nausea, vomiting, stomatitis, mucositis, myelosuppression, rash, alopecia, urine discoloration (bluish green), phlebitis,

			diarrhea, cough, headach fever
Necitumumab (Portrazza)	NSCLC (squamous) metastatic	Epidermal growth factor receptor (EGFR) antagonist	Rash, hypomagnesemia
Nelarabine (Arranon)	T-cell acute lymphoblastic leukemia/lymphoma	Antimetabolite	Anemia, neutropenia, thrombocytopenia, nausea, vomiting, diarrhea, fatigue, fever, dyspnea, severe neurologic events (convulsions, peripheral neuropathy)
Neratinib (Nerlynx)	Breast cancer	Kinase inhibitor	Diarrhea, nausea, abdominal fatigue, vomiting, stomach muscle spasms increase AST/ALT UTI
Nilotinib (Tasigna)	CML	Tyrosine kinase inhibitor	Rash, pruritus, nausea, fatigue, headache, constipation, diarrhea, vomiting, thrombocytopenia, neutropenia
Nilutamide (Nilandron)	Prostate cancer, metastatic	Antiandrogen	Hypertension, angina, hot flashes, nausea, anorexia, increased hepatic enzymes, dizziness, dyspnea, visual disturbances, impaired adaptation to dryness, constipation, decreased libido
Niraparib (Zejula)	Epithelial carcinoma, fallopian tube or peritoneal cancer	PARP inhibitor	Thrombocytopenia, anemia, neutropenia, leukopenia, palpitations, nausea, vomiting, stomatitis, UTI, elevated AST/ALT, dyspnea, hypertension
Nivolumab (Opdivo)	Melanoma, unresectable or metastatic, head and neck cancer, squamous cell (recurrent or metastatic), Hodgkin lymphoma, NSCLC, metastatic, renal cell cancer, advanced	Miscellaneous	Fatigue, dyspnea, musculoskeletal pain, decreased appetite, nausea, constipation
Obinutuzumab (Gazyva)	CLL, follicular lymphoma	Monoclonal antibody	Infusion reactions, thrombocytopenia, febrile neutropenia, lymphopenia, marrow failure, tumor lysis syndrome
Ofatumumab (Arzerra)	CLL	Monoclonal antibody	Fever, cough, diarrhea, fatigue, rash, infections, septic shock, neutropenia, thrombocytopenia, infusion reactions
Olaparib (Lynparza)	Ovarian cancer, advanced	Miscellaneous	Anemia, fatigue, nausea, vomiting, diarrhea, dysgeusia, dizziness, headache, decreased appetite
Olaratumab (Lartruvo)	Soft tissue sarcoma	PDGFR-alpha blocking antibody	Nausea, fatigue, musculoskeletal pain, mucositis, alopecia, vomiting, neuropathy, headache

Omacetaxine (Synribo)	CML	Protein synthesis inhibitor	Diarrhea, nausea, fatigue, pyasthenia, vomiting, anorexia, headache, thrombocytopenia, neutropenia, leukopenia, lymphopenia
Osimertinib (Tagrisso)	NSCLC, metastatic	Kinase inhibitor	Diarrhea, rash, dry skin, nail toxicity
Oxaliplatin (Eloxatin)	Colon cancer	Alkylating agent	Fatigue, neuropathy, abdominal pain, dyspnea, diarrhea, vomiting, anorexia, febrile edema, chest pain, anemia, thrombocytopenia, thromboembolism, altered hepatic function tests
Paclitaxel (Taxol)	Breast cancer, Kaposi sarcoma, NSCLC, ovarian cancer	Antimicrotubular	Hypertension, bradycardia, lightheadedness, nausea, vomiting, diarrhea, mucositis, myelosuppression, alopecia, peripheral neuropathies, hypersensitivity reaction, arthralgia, myalgia
Palbociclib (Ibrance)	Breast cancer, advanced	Kinase inhibitor	Neutropenia, leukopenia, fatigue, anemia, upper respiratory tract infection, nausea, stomatitis, alopecia, diarrhea, thrombocytopenia, decreased appetite, vomiting, asthenia, peripheral neuropathy, edema
Panitumumab (Vectibix)	Colorectal cancer metastatic	Monoclonal antibody	Pulmonary fibrosis, severe dermatologic toxicity, infusion reactions, abdominal pain, nausea, vomiting, constipation, skin rash, fatigue
Panobinostat (Farydak)	Multiple myeloma	Miscellaneous	Diarrhea, fatigue, nausea, peripheral edema, decreased appetite, pyrexia, vomiting
Pazopanib (Votrient)	Renal cell carcinoma, soft tissue sarcoma	Kinase inhibitor	Diarrhea, hypertension, nausea, fatigue, vomiting, hepatotoxicity, hemorrhagic events
Pegaspargase (Oncaspar)	ALL	Miscellaneous	Hypotension, anorexia, nausea, vomiting, hepatotoxicity, pancreatitis, depression, decreased clotting factors, malaise, confusion, lethargy, ECG changes, respiratory distress, hypersensitivity reaction, hyperglycemia, stomatitis
Pemetrexed (Alimta)	NSCLC, nonsquamous, mesothelioma	Antimetabolite	Anorexia, constipation, diarrhea, neuropathy, anemia, chest pain, dyspnea, rash, fatigue
Pentostatin (Nipent)	Hairy cell leukemia	Antibiotic	Nausea, vomiting, hepatic

			disorders, elevated hepat function tests, leukopenia, thrombocytopenia, rash, fever, upper respiratory infection, fatigue, headache, myalgia, arthralgia, diarrhea, anorexia
Pertuzumab (Perjeta)	Breast cancer, metastatic	HER2/neu receptor antagonist	Alopecia, diarrhea, nausea, neutropenia, rash, fatigue, peripheral neuropathy
Pomalidomide (Pomalyst)	Multiple myeloma, relapsed/refractory	Immunomodulator	Dyspnea, fatigue, peripheral neuropathy, anorexia, rash, neutropenia, leukopenia, thrombocytopenia
Ponatinib (Iclusig)	ALL, CML	Kinase inhibitor	Abdominal pain, rash, fatigue, hypertension, pyrexia, myelosuppression, arthralgia, vomiting
Procarbazine (Matulane)	Hodgkin lymphoma, non-Hodgkin lymphomas, CNS tumors	Alkylating agent	Nausea, vomiting, stomatitis, diarrhea, constipation, myelosuppression, pruritus, hyperpigmentation, alopecia, myalgia, paresthesia, lethargy, mental depression, fever, hepatic toxicity, arthralgia, respiratory distress
Ramucirumab (Cyramza)	Colorectal cancer, metastatic, gastric cancer, advanced or metastatic, NSCLC, metastatic	Miscellaneous	Diarrhea, hypertension
Regorafenib (Stivarga)	Colorectal cancer, GIST	VEGF inhibitor	Asthenia, fatigue, mucositis, weight loss, fever, GI perforation, hemorrhage, infections, diarrhea
Ribociclib (Kisqali)	Breast cancer, metastatic or advanced	Kinase inhibitor	Neutropenia, nausea, fatigue, diarrhea, leukopenia, alopecia, vomiting, headache
Rituximab (Rituxan)	CLL, non-Hodgkin lymphoma	Monoclonal antibody	Hypotension, arrhythmias, peripheral edema, nausea, vomiting, abdominal pain, leukopenia, thrombocytopenia, neutropenia, rash, pruritus, urticaria, angioedema, myalgia, headaches, dizziness, throat irritation, rhinitis, bronchospasm, hypersensitivity reaction
Rucaparib (Rubraca)	Ovarian cancer, advanced	PARP inhibitor	Nausea, fatigue, vomiting, decreased appetite, diarrhea, thrombocytopenia, dyspnea, increased AST/ALT, decreased Hgb, platelets, ANC
Sipuleucel-T (Provenge)	Prostate cancer, metastatic	Miscellaneous	Chills, fatigue, fever, back pain, nausea, headache, joint pain
Sonidegib (Odomzo)	Basal cell carcinoma, locally advanced	Hedgehog pathway inhibitor	Muscle spasms, alopecia, dysgeusia, fatigue, nausea

			diarrhea, decreased weight, musculoskeletal pain, myalgia, headache, abdominal pain, vomiting, pruritus
Sorafenib (Nexavar)	Hepatocellular cancer, renal cell cancer, advanced, thyroid cancer	Tyrosine kinase inhibitor	Fatigue, alopecia, nausea, vomiting, anorexia, constipation, diarrhea, neuropathy, dyspnea, cough, asthenia, pain
Sunitinib (Sutent)	GIST, pancreatic neuroendocrine tumors, advanced, renal cell carcinoma, advanced	Tyrosine kinase inhibitor	Hypotension, edema, fatigue, headache, fever, dizziness, hyperpigmentation, diarrhea, nausea, dyspepsia, altered taste, vomiting, neutropenia, thrombocytopenia, increased ALT/AST
Tamoxifen (Nolvadex-D)	Breast cancer	Estrogen receptor antagonist	Skin rash, nausea, vomiting, anorexia, menstrual irregularities, hot flashes, pruritus, vaginal discharge, bleeding, myelosuppression, headaches, tumor flare or bone pain, ophthalmic changes, weight gain, cough
Temozolomide (Temodar)	Anaplastic astrocytoma, glioblastoma multiforme	Alkylating agent	Amnesia, fever, infection, leukopenia, neutropenia, peripheral edema, seizures, thrombocytopenia
Temsirolimus (Torisel)	Renal cell carcinoma, advanced	mTOR kinase inhibitor	Rash, asthenia, mucositis, nasal edema, anorexia, thrombocytopenia, leukopenia
Thioguanine (Tabloid)	AML	Antimetabolite	Anorexia, stomatitis, myelosuppression, hyperuricemia, nausea, vomiting, diarrhea
Thiotepa (Thioplex)	Bladder cancer, papillary, breast cancer	Alkylating agent	Anorexia, nausea, vomiting, mucositis, myelosuppression, amenorrhea, reduced spermatogenesis, hypersensitivity reaction at injection site, headaches, dizziness, alopecia
Tipiracil/trifluridine (Lonsurf)	Colorectal cancer, metastatic	Miscellaneous	Asthenia, fatigue, nausea, diarrhea, vomiting, decreased appetite, pyrexia, abdominal pain
Topotecan (Hycamtin)	Cervical cancer, recurrent or resistant, ovarian cancer, metastatic, SCLC, relapsed	Camptothecin	Nausea, vomiting, diarrhea, constipation, abdominal pain, stomatitis, anorexia, neutropenia, leukopenia, thrombocytopenia, anemia, alopecia, headaches, dyspnea, paresthesia
Toremifene (Fareston)	Breast cancer	Estrogen receptor	Elevated hepatic function tests

		antagonist	nausea, vomiting, constipation, skin discoloration, dermatitis, dizziness, hot flashes, diaphoresis, vaginal discharge or bleeding, ocular changes, cataracts, anxiety
Trabectedin (Yondelis)	Soft tissue sarcoma	Alkylating agent	Nausea, vomiting, fatigue, decreased appetite, peripheral edema, dyspnea, headache, increased ALT, AST, alkaline phosphatase; neutropenia, thrombocytopenia, anemia
Trametinib (Mekinist)	Melanoma, metastatic or unresectable	MEK inhibitor	Rash, peripheral edema, pyrexia, malignancies, fatigue, hemorrhagic events, HF
Trastuzumab (Herceptin)	Gastric cancer, metastatic, breast cancer, metastatic	Monoclonal antibody	HF, heart murmur (S ₃ gallop), nausea, vomiting, diarrhea, abdominal pain, anorexia, peripheral edema, back pain, asthenia (loss of strength/energy), headaches, insomnia, dizziness, cough, dyspnea, rhinitis, pharyngitis
Tretinoin (Vesanoid)	Acute promyelocytic leukemia	Miscellaneous	Flushing, nausea, vomiting, diarrhea, constipation, dyspepsia, mucositis, leukocytosis, dry skin/mucous membranes, rash, pruritus, alopecia, dizziness, anxiety, insomnia, headaches, depression, confusion, intracranial hypertension, agitation, dyspnea, shivering, fever, visual changes, ear hearing loss, bone pain, myalgia, arthralgia
Valrubicin (Valstar)	Bladder cancer	Anthracycline	Dysuria, hematuria, urinary frequency/incontinence/vaginal discharge
Vandetanib (Caprelsa)	Thyroid cancer, medullary	Tyrosine kinase inhibitor	Diarrhea, rash, acne, nausea, hypertension, headache, decreased appetite, abdominal pain
Vemurafenib (Zelboraf)	Melanoma, metastatic or unresectable	Kinase inhibitor	Arthralgia, alopecia, fatigue, malignancies, dermatologic reactions
Venetoclax (Vencelexa)	CLL	BCL-2 inhibitor	Diarrhea, neutropenia, anemia, nausea, upper respiratory infections, thrombocytopenia, fatigue
Vinblastine (Velban)	Mycosis fungoides, Hodgkin lymphoma, lymphocytic lymphoma, testicular cancer, Kaposi sarcoma	Vinca alkaloid	Nausea, vomiting, stomatitis, constipation, myelosuppression, alopecia, peripheral neuropathy, loss of deep tendon reflexes

			paresthesia, diarrhea
Vincristine (Oncovin)	ALL, Hodgkin lymphoma, non-Hodgkin lymphomas, Wilm's tumor, neuroblastoma, rhabdomyosarcoma	Vinca alkaloid	Nausea, vomiting, stomatitis constipation, pharyngitis polyuria, myelosuppress alopecia, numbness, paresthesia, peripheral neuropathy, loss of deep reflexes, headaches, abd pain
Vincristine liposomal (Marqibo)	ALL	Vinca alkaloid	Constipation, nausea, pyrexia fatigue, peripheral neuro febrile neutropenia, diarrhea, anemia, reduce appetite, insomnia
Vinorelbine (Navelbine)	NSCLC	Vinca alkaloid	Elevated LFT, nausea, vomit constipation, ileus, anore stomatitis, myelosuppress alopecia, vein discolorat venous pain, phlebitis, interstitial pulmonary ch asthenia, fatigue, diarrhe peripheral neuropathy, lc deep tendon reflexes
Vismodegib (Erivedge)	Basal cell carcinoma, metastatic or locally advanced	Hedgehog pathway inhibitor	Alopecia, muscle spasms, dysgenesia, weight loss, fatigue, nausea, diarrhea reduced appetite, vomiti arthralgia
Vorinostat (Zolinza)	Cutaneous T-cell lymphoma	Histone deacetylase inhibitor	Diarrhea, fatigue, nausea, thrombocytopenia, anore dysgeusia
ziv-aflibercept (Zaltrap)	Colorectal cancer, metastatic	Miscellaneous	Leukopenia, neutropenia, di proteinuria, increased ALT/AST, stomatitis, thrombocytopenia, hypertension, epistaxis, headache, abdominal pai

AV, Atrioventricular; **C**, capsules; **EEG**, electroencephalogram; **EKG**, electrocardiogram; **GI**, gastrointestinal; **HF**, heart failure; **I**, Injection; **LFT**, liver function test; **T**, tablets; **UTI**, urinary tract Infection.

Contraception

Action

Combination oral contraceptives decrease fertility primarily by inhibition of ovulation. In addition, they can promote thickening of the cervical mucus, thereby creating a physical barrier for the passage of sperm. Also, they can

modify the endometrium, making it less favorable for nidation.

Classification

Oral contraceptives either contain both an estrogen and a progestin (combination oral contraceptives) or contain only a progestin (progestin-only oral contraceptives). The combination oral contraceptives have three subgroups: *Monophasic*: Daily estrogen and progestin dosage remains constant.

Biphasic: Estrogen remains constant, but the progestin dosage increases during the second half of the cycle.

Triphasic: Progestin changes for each phase of the cycle.

Four-phasic: Contains four progestin/estrogen dosing combinations during the 20-day cycle.

Over the past several years, options have expanded to include a combined hormonal patch (Ortho Evra), vaginal ring (NuvaRing), and extended cycle contraceptives (e.g., Loestrin-24 FE, Seasonale, Seasonique, Yaz). The latest oral contraceptive, Natazia, is a four-phase dosing regimen (estradiol steps down and dienogest, a progestin, steps up during the cycle to help avoid breakthrough bleeding).

Common Complaints With Oral Contraceptives

Too much estrogen	Nausea, bloating, breast tenderness, increased B/P, melasma, headache
Too little estrogen	Early or midcycle breakthrough bleeding, increased spotting, hypomenorrhea
Too much progestin	Breast tenderness, headache, fatigue, changes in mood
Too little progestin	Late breakthrough bleeding
Too much androgen	Increased appetite, weight gain, acne, oily skin, hirsutism, decreased libido, increased breast size, breast tenderness, increased LDL cholesterol, decreased HDL cholesterol

B/P, Blood pressure; *HDL*, high-density lipoprotein; *LDL*, low-density lipoprotein.

Contraceptives

Name	Estrogen Content	Progestin Content

Hormonal Alternative to Oral Contraception		
Depo-Provera CI Medroxyprogesterone Acetate	None	Medroxyprogesterone 150 mg
Depo-SubQ Provera 104	None	Medroxyprogesterone 104 mg
Implanon	None	Etonogestrel (release rate varies overtime)
Kyleena	None	19.5 mg for 5 yrs
Liletta	None	52 mg for 3 yrs
Mirena	None	Levonorgestrel 20 mcg/day for 5 yrs
NuvaRing	Ethinyl estradiol 15 mcg/day	Etonogestrel 0.12 mg/day
Ortho Evra	Ethinyl estradiol 20 mcg/day	Norelgestromin 200 mcg/day
Skyla	None	13.5 mg for 3 yrs

Corticosteroids

Uses

Replacement therapy in adrenal insufficiency, including Addison's disease. Symptomatic treatment of multiorgan disease/conditions. Rheumatoid arthritis (RA), osteoarthritis, severe psoriasis, ulcerative colitis, lupus erythematosus, anaphylactic shock, acute exacerbation of asthma, status asthmaticus, organ transplant.

Action

Suppress migration of polymorphonuclear leukocytes (PML) and reverse increased capillary permeability by their anti-inflammatory effect. Suppress immune system by decreasing activity of lymphatic system.

Corticosteroids

Name	Availability	Route of Administration	Side Effects
Beclomethasone (Beconase, Qnasl, QVAR)	Aerosol (oral inhalation), QVAR: 40 mcg/inhalation, 80 mcg/inhalation Aerosol (spray, intranasal), Qnasl: 80 mcg/inhalation Suspension (intranasal), Beconase: 42 mcg/inhalation	Inhalation, intranasal	I: Cough, dry mouth/throat, headaches, throat irritation, increased blood glucose Nasal: Headaches, sore throat, intranasal ulceration, increased blood glucose
Betamethasone (Celestone)	I: 6 mg/ml	IV, intralesional, intra-articular	Nausea, vomiting, increased appetite, weight gain, insomnia, increased blood glucose
Budesonide (Pulmicort, Rhinocort)	Nasal: 32 mcg/spray Suspension for nebulization: 250 mcg, 500 mcg	Intranasal	Headaches, sore throat, intranasal ulceration, increased blood glucose
Cortisone (Cortone)	T: 5 mg, 10 mg, 25 mg	PO	Insomnia, nervousness, increased appetite, indigestion, increased blood glucose
Dexamethasone (Decadron)	T: 0.5 mg, 1 mg, 4 mg, 6 mg OS: 0.5 mg/5 ml I: 4 mg/ml, 10 mg/ml	PO, parenteral	Insomnia, weight gain, increased appetite, increased blood glucose
Fludrocortisone (Florinef)	T: 0.1 mg	PO	Edema, headache, peptic ulcer, increased blood glucose
Flunisolide (Nasalide)	Nasal: 25 mcg/spray	Inhalation, intranasal	Headache, nasal congestion, pharyngitis, upper respiratory infections, altered taste/smell, increased blood glucose
Fluticasone (Flonase, Flovent)	Inhalation: 44 mcg, 110 mg, 220 mcg Nasal: 50 mg, 100 mcg	Inhalation, intranasal	Headache, burning/stinging, nasal congestion, upper respiratory infections, increased blood glucose
Hydrocortisone (Solu-Cortef)	T: 5 mg, 10 mg, 25 mg I: 100 mg, 250 mg, 500 mg, 1 g	PO, parenteral	Insomnia, headache, nausea, vomiting, increased blood glucose
Methylprednisolone (Solu-Medrol)	T: 4 mg I: 40 mg, 125 mg, 500 mg, 1 g, 2 g	PO, parenteral	Headache, insomnia, nervousness, increased appetite, nausea, vomiting, increased blood glucose
Prednisolone (Prelone)	T: 5 mg OS: 5 mg/5 ml, 15 mg/5 ml	PO	Headache, insomnia, weight gain, nausea, vomiting, increased blood glucose
Prednisone	T: 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg	PO	Headache, insomnia, weight gain, nausea, vomiting, increased blood glucose

Triamcinolone (Kenalog, Nasacort AQ)	Injection, suspension: 10 mg/ml, 40 mg/ml Intranasal, suspension: 55 mcg/inhalation	IM, inhalation (nasal)	PO: Insomnia, increased appetite, nausea, vomiting, increased blood glucose I: Cough, dry mouth/throat, headaches, throat irritation, increased blood glucose
--	---	------------------------	--

I, Injection; *OS*, oral suspension; *T*, tablets.

Corticosteroids: Topical

Uses

Provide relief of inflammation/pruritus associated with corticosteroid-responsive disorders (e.g., contact dermatitis, eczema, insect bite reactions, first- and second- degree localized burns/sunburn).

Action

Diffuse across cell membranes, form complexes with cytoplasm. Complexes stimulate protein synthesis of inhibitory enzymes responsible for anti-inflammatory effects (e.g., inhibit edema, erythema, pruritus, capillary dilation, phagocytic activity).

Topical corticosteroids can be classified based on potency:

May use for facial and intertriginous application for only limited time.

High potency: For more severe inflammatory conditions (e.g., lichen simplex chronicus, psoriasis). May use for facial and intertriginous application for short time only. Used in areas of thickened skin due to chronic conditions.

Low potency: Modest anti-inflammatory effect, safest for chronic application, facial and intertriginous application, with occlusion, for infants/young children.

Medium potency: For moderate inflammatory conditions (e.g., chronic eczematous dermatoses).

Very high potency: Alternative to systemic therapy for local effect (e.g., chronic lesions caused by psoriasis). Increased risk of skin atrophy. Used for short periods on small areas. Avoid occlusive dressings.

Corticosteroids: Topical

Name	Availability	Potency	Side Effects
Alclometasone	C, O: 0.05%	Low	Skin atrophy, contact dermatitis, stretch marks on skin, enlarged

(Aclovate)			blood vessels in the skin, hair loss, pigment changes, secondary infections
Amcinonide (Cyclocort)	C, O, L: 0.1%	High	Same as alclometasone
Betamethasone dipropionate	C, O, G, L: 0.05%	High	Same as alclometasone
Betamethasone valerate	C: 0.01%, 0.05%, 0.1% O: 0.1% L: 0.1%	High	Same as alclometasone
Clobetasol (Temovate)	C, O: 0.05%	High	Same as alclometasone
Desonide (Tridesilon)	C, O, L: 0.05%	Low	Same as alclometasone
Desoximetasone (Topicort)	C: 0.25%, 0.5% O: 0.25% G: 0.05%	High	Same as alclometasone
Fluocinolone (Synalar)	C: 0.01%, 0.025%, 0.2% O: 0.025%	High	Same as alclometasone
Fluocinonide (Lidex)	C, O, G: 0.05%	High	Same as alclometasone
Flurandrenolide (Cordran)	C, O, L: 0.025%, 0.05%	Medium	Same as alclometasone
Fluticasone (Cutivate)	C: 0.05% O: 0.005%	Medium	Same as alclometasone
Halobetasol (Ultravate)	C, O: 0.05%	High	Same as alclometasone
Hydrocortisone (Hytone)	C, O: 0.5%, 1%, 2.5%	Medium	Same as alclometasone
Mometasone (Elocon)	C, O, L: 0.1%	Medium	Same as alclometasone
Prednicarbate (Dermatop)	C: 0.1%	Medium	Same as alclometasone
Triamcinolone (Aristocort, Kenalog)	C, O, L: 0.025%, 0.1%, 0.5%	Medium	Same as alclometasone

C, Cream; G, gel; L, lotion; O, ointment.

Diuretics

Uses

Thiazides: Management of edema resulting from a number of causes (e.g., HF, hepatic cirrhosis); hypertension either alone or in combination with other antihypertensives.

Loop: Management of edema associated with HF, cirrhosis of the liver, and renal disease. Furosemide used in treatment of hypertension alone or in combination with other antihypertensives.

Potassium-sparing: Adjunctive treatment with thiazides, loop diuretics in treatment of HF and hypertension.

Action

Increase the excretion of water/sodium and other electrolytes via the kidneys. Exact mechanism of antihypertensive effect unknown; may be due to reduced plasma volume or decreased peripheral vascular resistance. Subclassifications of diuretics are based on their mechanism and site of action.

Thiazides: Act at cortical diluting segment of nephron, block reabsorption of Na, Cl, and water; promote excretion of Na, Cl, K, and water. *Loop:* Act primarily at the thick ascending limb of Henle's loop to inhibit Na, Cl, and water absorption.

Potassium-sparing: Spironolactone blocks aldosterone action on distal nephron (causes K retention, Na excretion). Triamterene, amiloride act on distal nephron, decreasing Na reuptake, reducing K secretion.

Diuretics

Name	Availability	Dosage Range	Side Effects
Thiazide, Thiazide-related			
Chlorothiazide (Diuril)	T: 250 mg, 500 mg	Edema: 500–1,000 mg 1–2 times/day HTN: 500–2,000	CLASS Hyperuricemia, hypokalemia,

	S: 250 mg/5 ml I: 500 mg	mg/day in 1–2 divided doses	hypomagnesemia, hyperglycemia, hyponatremia, hypercalcemia, hypercholesterolemia, hypertriglyceridemia, pancreatitis, rash, photosensitivity
Chlorthalidone	Hygroton: 25 mg, 50 mg, 100 mg	Edema: Initially, 50–100 mg once daily or 100 mg every other day. Maximum: 200 mg/day	
Hydrochlorothiazide	T: 12.5 mg, 25 mg, 50 mg C: 12.5 mg	Edema: 25–100 mg/day in 1–2 divided doses HTN: Initially, 12.5–25 mg once daily. May increase up to 50 mg/day in 1 or 2 divided doses	
Indapamide (Lozol)	T: 1.25 mg, 2.5 mg	Edema: Initially, 2.5 mg/day. May increase after 1 wk to 5 mg/day HTN: Initially, 2.5 mg/day. May increase q4wks to 2.5 mg, then to 5 mg/day	
Metolazone (Zaroxolyn)	T: 2.5 mg, 5 mg, 10 mg	Edema: 2.5–20 mg once daily HTN: 2.5–5 mg once daily	
Loop			
Bumetanide (Bumex)	T: 0.5 mg, 1 mg, 2 mg I: 0.25 mg/ml	Edema: Initially, 0.5–2 mg/dose 1–2 times/day. Maximum: 10 mg/day	CLASS Dehydration, hypokalemia, hyponatremia, hypomagnesemia, hyperglycemia, metabolic alkalosis, hyperuricemia, blood dyscrasias, rash, hypercholesterolemia, hypertriglyceridemia
Furosemide (Lasix)	T: 20 mg, 40 mg, 80 mg OS: 10 mg/ml, 40 mg/5 ml I: 10 mg/ml	HTN: 20–80 mg/day in 2 divided doses Edema: PO: 20–80 mg/dose. May increase by 20–40 mg/dose up to 600 mg/day. IV: 20–40 mg/dose. May increase by 20 mg/dose. Maximum: 200 mg/dose	
Torsemide (Demadex)	T: 5 mg, 10 mg, 20 mg, 100 mg I: 10 mg/ml	Edema: 10–200 mg/day HTN: Initially, 5 mg/day. May increase after 4–6 wks to 10 mg/day	
Potassium-sparing			
Amiloride (Midamor)	T: 5 mg	HF/Edema: Initially, 5 mg/day. May increase to 10 mg/day	Hyperkalemia, nausea, abdominal pain, diarrhea, rash, headache
Eplerenone (Inspra)	T: 25 mg, 50 mg	HF: Initially, 25 mg/day, titrate to 50 mg once daily HTN: Initially, 50 mg/day. May increase to 50 mg 2 times/day	Hyperkalemia, hyponatremia
Spirolactone (Aldactone)	T: 25 mg, 50 mg, 100 mg	Edema: 25–200 mg/day in 1 or 2 divided doses HTN: 50–100 mg/day in 1 or 2	Hyperkalemia, nausea, vomiting, abdominal cramps, diarrhea, hyponatremia, gynecomastia, menstrual

		divided doses Hypokalemia: 25–100 mg/day HF: Initially, 12.5–25 mg once daily. Maximum: 50 mg/day	abnormalities, rash
Triamterene (Dyrenium)	C: 50 mg, 100 mg	Edema, HTN: 100–300 mg/day in 1–2 divided doses	Hyperkalemia, nausea, abdominal pain, nephrolithiasis

C, Capsules; **HF**, heart failure; **HTN**, hypertension; **I**, Injection; **OS**, oral solution; **S**, suspension; **T**, tablets.

H₂ Antagonists

Uses

Short-term treatment of duodenal ulcer (DU), active benign gastric ulcer (GU), maintenance therapy of DU, pathologic hypersecretory conditions (e.g., Zollinger-Ellison syndrome), gastroesophageal reflux disease (GERD), and prevention of upper GI bleeding in critically ill pts.

Action

Inhibit gastric acid secretion by interfering with histamine at the histamine H₂ receptors in parietal cells. Also inhibit acid secretion caused by gastrin. Inhibition occurs with basal (fasting), nocturnal, food-stimulated, or fundic distention secretion. H₂ antagonists decrease both the volume and H₂ concentration of gastric juices.

h₂ antagonists

Name	Availability	Dosage Range	Side Effects
Cimetidine (Tagamet)	T: 200 mg, 300 mg, 400 mg, 800 mg L: 300 mg/5 ml	Treatment of DU: 800 mg at bedtime, 400 mg 2 times/day or 300 mg 4 times/day Maintenance of DU: 400 mg at bedtime Treatment of GU: 800 mg at bedtime or 300 mg 4 times/day GERD: 400 mg 4 times/day or 800 mg 2 times/day Hypersecretory: 300 mg 4 times/day. Maximum: 2,400 mg/day	Headaches, fatigue, dizziness, confusion, diarrhea, gynecomastia
Famotidine (Pepcid)	T: 10 mg, 20 mg, 40 mg OS: 40 mg/5 ml I: 10 mg/ml	Treatment of DU: 40 mg/day in 1 or 2 divided doses Maintenance of DU: 20 mg/day Treatment of GU: 40 mg/day at bedtime GERD: 20 mg 2 times/day for 6 wks Hypersecretory: Initially, 20 mg q6h. May increase up to 160 mg q6h	Headaches, dizziness, diarrhea, constipation, abdominal pain, tinnitus

Nizatidine (Axid)	OS: 15 mg/ml C: 75 mg, 150 mg, 300 mg	Treatment of GU: 300 mg at hs or 150 mg 2 times/day GERD: 150 mg 2 times/day Treatment of DU: 300 mg at hs or 150 mg 2 times/day Maintenance of DU: 150 mg/day at bedtime	Fatigue, urticaria, abdominal pain, constipation, nausea
Ranitidine (Zantac)	T: 75 mg, 150 mg, 300 mg C: 150 mg, 300 mg Syrup: 15 mg/ml I: 25 mg/ml	Treatment of DU: 300 mg at hs or 150 mg 2 times/day Maintenance of DU: 150 mg/day at bedtime Treatment of GU: 150 mg 2 times/day GERD: 150 mg 2 times/day Hypersecretory: 150 mg 2 times/day. Maximum: 6 g/day Erosive Esophagitis: Treatment: 150 mg 4 times/day. Maintenance: 150 mg 2 times/day	Blurred vision, constipation, nausea, abdominal pain

C, Capsules; **DT**, disintegrating tablets; **DU**, duodenal ulcer; **GERD**, gastroesophageal reflux disease; **GU**, gastric ulcer; **I**, Injection; **L**, liquid; **OS**, oral suspension; **T**, tablets.

Hepatitis C Virus

Hepatitis C virus (HCV) is the leading blood borne infection in the US. HCV is transmitted by exposure to infected blood products. Risk factors for acquiring HCV include injection drug use, receiving contaminated blood products, needle sticks, and vertical transmission. If untreated, HCV may progress to chronic HCV and long-term sequelae including cirrhosis and hepatocellular carcinoma. There are seven known genotypes of HCV (genotypes 1–7) which impact the selection of initial therapy and treatment response. Genotype 1 is the most common and is further subtyped into genotypes 1a and 1b.

Currently, there are two indirect-acting antivirals and seven direct-acting antivirals approved for the treatment of chronic HCV

Action

Indirect Acting Antivirals (IAA)

Alpha Interferons (peg-interferons): Induces immune response against HCV, inhibiting viral replication

Ribavirin: Exact mechanism unknown but has activity against several RNA and DNA viruses

Direct Acting Antivirals (DAA)

NS3/4A Protease Inhibitors (PIs): Targets the serine protease NS3/NS4 that is responsible for processing HCV polyprotein and producing new viruses.

Nonstructural Protein 5A (NS5A) Inhibitors: Suppress the NS5A protein, that is essential for viral assembly and replication.

Nonstructural Protein 5B (NS5B) Inhibitors: Suppress the NS5B RNA-dependent RNA polymerase that is responsible for HCV replication.

Anti-Hepatitis C Virus Preparations

Name	Type	Genotype	Dosage	Side Effect
Elbasvir, grazoprevir (Zepatier)	DAA NS5A/NS3/4A protease inhibitor	1, 4	Genotype 1a: One tablet daily for 12 wks (16 wks with baseline NS5A polymorphisms) Genotype 1b: One tablet daily for 12 wks Genotype 4: One tablet daily for 12 wks (16 wks peginterferon/ribavirin experienced)	Fatigue, headache
Glecaprevir, pibrentasvir (Mavyret)	DAA NS5A/NS3/4A protease inhibitor	1, 2, 3, 4, 5, 6	Genotypes 1, 2, 3, 4, 5, 6: Three tablets once daily. Treatment duration 8-16 wks based on patients that are mono-infected, and coinfecting with compensated liver disease (with or without cirrhosis) and with or without renal impairment	Headache
Simeprevir (Olysio)	DAA (NS3/4A-PI)	1, 4	150 mg once daily plus peginterferon and ribavirin for 12 wks, then additional 12–36 wks of peginterferon and ribavirin 150 mg once daily plus sofosbuvir for 12 wks without cirrhosis or 24 wks with cirrhosis	(With peginterferon, ribavirin, itching, photosensitivity) (With sofosbuvir, fatigue, headache, nausea, insomnia, pruritus, dizziness, diarrhea)
Sofosbuvir (Sovaldi)	DAA	1, 2, 3, 4	Genotypes 1, 4:	(With

	(NS5B)		400 mg once daily plus peginterferon and ribavirin for 12 wks 400 mg once daily plus simeprevir for 12 wks without cirrhosis or 24 wks with cirrhosis Genotypes 2, 3: 400 mg once daily plus ribavirin for 12 wks for genotype 2 or 24 wks for genotype 3	peginterferon ribavirin Fatigue headache nausea insomnia anemia (With simeprevir) fatigue headache nausea insomnia pruritus dizziness diarrhea
Ledipasvir, Sofosbuvir (Harvoni)	DAA (NS5A/NS5B)	1, 4, 5, 6	Genotype 1: One tablet (90 mg/400 mg) for 12 wks in treatment-naïve pt with or without cirrhosis and treatment-experienced pt without cirrhosis; for 24 wks for treatment-experienced pts with cirrhosis Genotypes 4, 5, 6: One tablet daily for 12 wks	Fatigue, headache nausea diarrhea insomnia elevated bilirubin lipase creatinine
Ombitasvir, Paritaprevir, Ritonavir, Dasabuvir (Viekira Pak)	DAA (NS5A/protease inhibitor/CYP3A inhibitor/polymerase inhibitor)	1	Two ombitasvir, paritaprevir, ritonavir tablets (12.5 mg, 75 mg, 50 mg) once daily in the morning plus one dasabuvir 250 mg tablet 2 times/day Patients with genotype 1a or 1b with cirrhosis will also receive ribavirin for 12 wks (genotype 1a with cirrhosis: 12–24 wks based on treatment history; liver transplant pts: 24 wks)	(With ribavirin) fatigue itching insomnia (With ribavirin) nausea insomnia
Peginterferon alfa 2a (Pegasys)	IAA (Interferon)	1, 2, 3, 4	180 mcg SQ weekly for 12–48 wks based on antiviral regimen, pt history, response	(With ribavirin) fatigue weakness fever, headache
Peginterferon alfa 2b (PegIntron)	IAA (Interferon)	1, 2, 3, 4	1.5 mcg/kg SQ weekly for 12–48 wks based on antiviral regimen, pt history, response	(With ribavirin) injection reaction fatigue weakness

				heada rigors nause myalg insom instab loss
Ribavirin (Copegus, Ribasphere)	IAA (Nucleoside analogue)	1, 2, 3, 4	Genotypes 2, 3 400 mg 2 times/day (with peginterferon) Genotypes 1, 4 < 75 kg: 400 mg qam and 600 mg qpm 75kg or greater: 600 mg 2 times/day	(With pegin fatigu weak heada rigors nause myalg insom instab loss
Daclatasvir (Daklinza)	DAA (NS5A)	3	60 mg once daily with sofosbuvir for 12 wks	Headache
Ombitasvir, paritaprevir, ritonavir (Technivie)	DAA (NS5A/protease Inhibitor/CYP3A inhibitor)	4	Two tablets once daily with ribavirin for 12 wks	Asthenia, nause insom
Sofosbuvir/velpatasvir (Epclusa)	DAA (NS5B/NS5A)	1, 2, 3, 4, 5, 6	One tablet daily for 12 wks	Insomnia, heada fatigu diarrh
Sofosbuvir/velpatasvir/voxilaprevir (VOSEVI)	DAA (NS5B/NS5A/protease inhibitor)	1, 2, 3, 4, 5, 6	One tablet daily for 12 wks	Headache diarrh nause

Hormones

Uses

Functions of the body are regulated by two major control systems: the nervous system and the endocrine (hormone) system. Together they maintain homeostasis and control different metabolic functions in the body.

Hormones are concerned with control of different metabolic functions in the body (e.g., rates of chemical reactions in cells, transporting substances through cell membranes, cellular metabolism [growth/secretions]). By definition, a hormone is a chemical substance secreted into body fluids by cells and has control over other cells in the body.

Hormones can be local or general:

- *Local hormones* have specific local effects (e.g., acetylcholine, which is

secreted at parasympathetic and skeletal nerve endings).

- *General hormones* are mostly secreted by specific endocrine glands (e.g., epinephrine/norepinephrine are secreted by the adrenal medulla in response to sympathetic stimulation), transported in the blood to all parts of the body, causing many different reactions.

Some general hormones affect all or almost all cells of the body (e.g., thyroid hormone from the thyroid gland increases the rate of most chemical reactions in almost all cells of the body); other general hormones affect only specific tissue (e.g., ovarian hormones are specific to female sex organs and secondary sexual characteristics of the female).

Action

Endocrine hormones almost never directly act intracellularly affecting chemical reactions. They first combine with hormone receptors either on the cell surface or inside the cell (cell cytoplasm or nucleus). The combination of hormone and receptors alters the function of the receptor, and the receptor is the direct cause of the hormone effects. Altered receptor function may include the following:

Altered cell permeability, which causes a change in protein structure of the receptor, usually opening or closing a channel for one or more ions. The movement of these ions causes the effect of the hormone.

Activation of intracellular enzymes immediately inside the cell membrane (e.g., hormone combines with receptor that then becomes the activated enzyme adenyl cyclase, which causes formation of cAMP).

◀ALERT▶ cAMP has effects inside the cell. It is not the hormone but cAMP that causes these effects.

Regulation of hormone secretion is controlled by an internal control system, the negative feedback system:

- Endocrine gland oversecreted.
- Hormone exerts more and more of its effect.
- Target organ performs its function.
- Too much function in turn feeds back to endocrine gland to decrease secretory rate.

The endocrine system contains many glands and hormones. A summary of the important glands and their hormones secreted are as follows:

The pituitary gland (hypophysis) is a small gland found in the sella turcica at the base of the brain. The pituitary is divided into two portions physiologically: the

anterior pituitary (adenohypophysis) and the posterior pituitary (neurohypophysis). Six important hormones are secreted from the anterior pituitary and two from the posterior pituitary.

Anterior pituitary hormones:

- Growth hormone (GH)
- Adrenocorticotropin (corticotropin)
- Thyroid-stimulating hormone (thyrotropin) (TSH)
- Follicle-stimulating hormone (FSH)
- Luteinizing hormone (LH)
- Prolactin

Posterior pituitary hormones:

- Antidiuretic hormone (vasopressin)
- Oxytocin

Almost all secretions of the pituitary hormones are controlled by hormonal or nervous signals from the hypothalamus. The hypothalamus is a center of information concerned with the well-being of the body, which in turn is used to control secretions of the important pituitary hormones just listed. Secretions from the posterior pituitary are controlled by nerve signals originating in the hypothalamus; anterior pituitary hormones are controlled by hormones secreted within the hypothalamus. These hormones are as follows:

- Thyrotropin-releasing hormone (TRH) releasing thyroid-stimulating hormone
- Corticotropin-releasing hormone (CRH) releasing adrenocorticotropin
- Growth hormone-releasing hormone (GHRH) releasing growth hormone and growth hormone inhibitory hormone (GHIH) (same as somatostatin)
- Gonadotropin-releasing hormone (GnRH) releasing the two gonadotropic hormones LH and FSH
- Prolactin inhibitory factor (PIF) causing inhibition of prolactin and prolactin-releasing factor

Anterior Pituitary Hormones

All anterior pituitary hormones (except growth hormone) have as their principal effect stimulating target glands.

Growth Hormone (gh)

Growth hormone affects almost all tissues of the body. GH (somatotropin) causes growth in almost all tissues of the body (increases cell size, increases mitosis with increased number of cells, and differentiates certain types of cells). Metabolic effects include increased rate of protein synthesis, mobilization of fatty acids from adipose tissue, decreased rate of glucose utilization.

Thyroid-Stimulating Hormone (tsh)

Thyroid-stimulating hormone controls secretion of the thyroid hormones. The thyroid gland is located immediately below the larynx on either side of and anterior to the trachea and secretes two significant hormones, thyroxine (T_4) and triiodothyroxine (T_3), which have a profound effect on increasing the metabolic rate of the body. The thyroid gland also secretes calcitonin, an important hormone for calcium metabolism. Calcitonin promotes deposition of calcium in the bones, which decreases calcium concentration in the extracellular fluid.

Adrenocorticotropin

Adrenocorticotropin causes the adrenal cortex to secrete adrenocortical hormones. The adrenal glands lie at the superior poles of the two kidneys. Each gland is composed of two distinct parts: the adrenal medulla and the cortex. The adrenal medulla, related to the sympathetic nervous system, secretes the hormones epinephrine and norepinephrine. When stimulated, they cause constriction of blood vessels, increased activity of the heart inhibitory effects on the GI tract, and dilation of the pupils. The adrenal cortex secretes corticosteroids, of which there are two major types: mineralocorticoids and glucocorticoids. Aldosterone, the principal mineralocorticoid, primarily affects electrolytes of the extracellular fluids. Cortisol, the principal glucocorticoid, affects glucose, protein, and fat metabolism.

Luteinizing Hormone (lh)

Luteinizing hormone plays an important role in ovulation and causes secretion of female sex hormones by the ovaries and testosterone by the testes.

Follicle-Stimulating Hormone (fsh)

Follicle-stimulating hormone causes growth of follicles in the ovaries before ovulation and promotes formation of sperm in the testes.

Ovarian sex hormones are estrogens and progestins. Estradiol is the most important estrogen; progesterone is the most important progestin.

Estrogens mainly promote proliferation and growth of specific cells in the body and are responsible for development of most of the secondary sex characteristics. Primarily cause cellular proliferation and growth of tissues of sex organs/other tissue related to reproduction. Ovaries, fallopian tubes, uterus, vagina increase in size. Estrogen initiates growth of breast and milk-producing apparatus, external appearance.

Progesterone stimulates secretion of the uterine endometrium during the latter half of the female sexual cycle, preparing the uterus for implantation of the fertilized ovum. Decreases the frequency of uterine contractions (helps prevent expulsion of the implanted ovum). Progesterone promotes development of breasts, causing alveolar cells to proliferate, enlarge, and become secretory in

nature.

Testosterone is secreted by the testes and formed by the interstitial cells of Leydig. Testosterone production increases under the stimulus of the anterior pituitary gonadotropic hormones. It is responsible for distinguishing characteristics of the masculine body (stimulates the growth of male sex organs and promotes the development of male secondary sex characteristics, e.g., distribution of body hair; effect on voice, protein formation, and muscular development).

Prolactin

Prolactin promotes the development of breasts and secretion of milk

Posterior Pituitary Hormones

Antidiuretic Hormone (adh) (Vasopressin)

ADH can cause antidiuresis (decreased excretion of water by the kidneys). In the presence of ADH, the permeability of the renal-collecting ducts and tubules to water increases, which allows water to be absorbed, conserving water in the body. ADH in higher concentrations is a very potent vasoconstrictor, constricting arterioles everywhere in the body, increasing B/P.

Oxytocin

Oxytocin contracts the uterus during the birthing process, esp. toward the end of the pregnancy, helping expel the baby. Oxytocin also contracts myoepithelial cells in the breasts, causing milk to be expressed from the alveoli into the ducts so that the baby can obtain it by suckling.

Pancreas

The pancreas is composed of two tissue types: *acini* (secrete digestive juices in the duodenum) and islets of *Langerhans* (secrete insulin/glucagons directly into the blood). The islets of Langerhans contain three cells: alpha, beta, and delta. Alpha cells secrete glucagon, beta cells secrete insulin, and delta cells secrete somatostatin.

Insulin promotes glucose entry into most cells, thus controlling the rate of metabolism of most carbohydrates. Insulin also affects fat metabolism.

Glucagon effects are opposite those of insulin, the most important of which is increasing blood glucose concentration by releasing it from the liver into the circulating body fluids.

Somatostatin (same chemical as secreted by the hypothalamus) has multiple

inhibitory effects: depresses secretion of insulin and glucagon, decreases GI motility decreases secretions/absorption of the GI tract.

Human Immunodeficiency Virus (HIV) Infection

Uses

Antiretroviral agents are used in the treatment of HIV infection.

Action

Nucleoside reverse transcriptase inhibitors (NRTIs) compete with natural substrates for formation of proviral DNA by reverse transcriptase inhibiting viral replication.

Nucleotide reverse transcriptase inhibitors (NtRTIs) inhibit reverse transcriptase by competing with the natural substrate deoxyadenosine triphosphate and by DNA chain termination.

Non-nucleoside reverse transcriptase inhibitors (NNRTIs) directly bind to reverse transcriptase and block RNA-dependent and DNA-dependent DNA polymerase activities by disrupting the enzyme's catalytic site.

Protease inhibitors (PIs) bind to the active site of HIV-1 protease and prevent the processing of viral gag and gag-pol polyprotein precursors resulting in immature, noninfectious mal particles.

Fusion inhibitors interfere with the entry of HIV-1 into cells by inhibiting fusion of viral and cellular membranes.

CCR5 co-receptor antagonist selectively binds to human chemokine receptor CCR5 present on cell membrane preventing HIV-1 from entering cells.

Integrase inhibitor inhibits catalytic activity of HIV-1 integrase, an HIV-1 encoded enzyme required for viral replication.

Antiretroviral Agents for Treatment of HIV Infection

Name	Availability	Dosage Range	Side Effects
Nucleoside Analogues			
Abacavir (Ziagen)	T: 300 mg OS: 20 mg/ml	A: 300 mg 2 times/day or 600 mg once daily	Nausea, vomiting, malaise, rash, fever, headaches, asthenia, fatigue, hypersensitivity reactions

Didanosine (Videx EC)	DR: 125 mg, 200 mg, 250 mg, 400 mg OS: 2 g/bottle, 4 g/bottle	DR (weighing 60 kg or more): 400 mg once daily; (weighing 25-59 kg): 250 mg once daily; (weighing 20-24 kg): 200 mg once daily OS (weighing more than 60 kg): 200 mg q12h or 400 mg once daily; (weighing less than 60 kg): 125 mg q12h or 250 mg once daily	Peripheral neuropathy, pancreatitis, diarrhea, nausea, vomiting, headaches, insomnia, rash, hepatitis, seizures
Emtricitabine (Emtriva)	C: 200 mg OS: 10 mg/ml	A: 200 mg/day (C) 240 mg/day (OS)	Headaches, insomnia, depression, diarrhea, nausea, vomiting, rhinitis, asthenia, rash
Lamivudine (Epivir)	T: 100 mg, 150 mg, 300 mg OS: 5 mg/ml, 10 mg/ml	A: 150 mg 2 times/day or 300 mg once daily C: 4 mg/kg 2 times/day	Diarrhea, malaise, fatigue, headaches, nausea, vomiting, abdominal pain, peripheral neuropathy, arthralgia, myalgia, skin rash
Stavudine (Zerit)	C: 15 mg, 20 mg, 30 mg, 40 mg OS: 1 mg/ml	A (weighing more than 60 kg): 40 mg 2 times/day (20 mg 2 times/day if peripheral neuropathy occurs); (weighing 60 kg or less): 30 mg 2 times/day (15 mg 2 times/day if peripheral neuropathy occurs)	Peripheral neuropathy, anemia, leukopenia, neutropenia
Zidovudine (Retrovir)	C: 100 mg T: 300 mg Syrup: 50 mg/5 ml, 10 mg/ml	A: 300 mg 2 times/day	Anemia, granulocytopenia, myopathy, nausea, malaise, fatigue, insomnia
Nucleotide Analogues			
Tenofovir TAF (Vemlidy)	T: 25 mg	A: 25 mg once daily	Headache, abdominal pain, fatigue, cough, nausea, back pain
Tenofovir TDF (Viread)	T: 300 mg	A: 300 mg once daily	Nausea, vomiting, diarrhea, headache, fatigue
Non-nucleoside Analogues			
Delavirdine (Rescriptor)	T: 100 mg, 200 mg	A: 200 mg 3 times/day for 14 days, then 400 mg 3 times/day	Rash, nausea, headaches, elevated hepatic function tests
Efavirenz (Sustiva)	C: 50 mg, 200 mg T: 600 mg	A: 600 mg/day C: 200-600 mg/day based on weight	Headaches, dizziness, insomnia, fatigue, rash, nightmares
Etravirine (Intelence)	T: 100 mg, 200 mg	A: 200 mg 2 times/day	Skin reactions (e.g., Stevens-Johnson syndrome, erythema multiforme), nausea, abdominal pain, vomiting
Nevirapine (Viramune, Viramune XR)	T: 200 mg T (ER): 400 mg S: 50 mg/ml	A: 200 mg/day for 14 days, then (if no rash) 200 mg 2 times/day	Rash, nausea, fatigue, fever, headaches, abnormal hepatic function tests

Rilpivirine (Edurant)	T: 25 mg	A: 25 mg once daily with a meal	Depression, insomnia, headache, rash
Protease Inhibitors			
Atazanavir (Reyataz)	C: 100 mg, 150 mg, 200 mg, 300 mg	A: 400 mg/day or 300 mg (with 100 mg ritonavir) once daily	Headaches, diarrhea, abdominal pain, nausea, rash
Darunavir (Prezista)	T: 400 mg, 600 mg	A: 600 mg 2 times/day (with ritonavir 100 mg) or 800 mg once daily with ritonavir 100 mg	Diarrhea, nausea, vomiting, headaches, skin rash, constipation
Fosamprenavir (Lexiva)	T: 700 mg OS: 50 mg/ml	A: 1,400-2,800 mg/day with 100 mg ritonavir	Headaches, fatigue, rash, nausea, diarrhea, vomiting, abdominal pain
Indinavir (Crixivan)	C: 200 mg, 400 mg	A: 800 mg q8h or 800 mg 2 times/day with ritonavir 100 mg	Nephrolithiasis, hyperbilirubinemia, abdominal pain, asthenia, fatigue, flank pain, nausea, vomiting, diarrhea, headaches, insomnia, dizziness, altered taste
Lopinavir/ritonavir (Kaletra)	C: 133/33 mg OS: 80/20 mg	A: 400 mg/100 mg 2 times/day or 800 mg/200 mg once daily C (4-12 yrs): 10-13 mg/kg 2 times/day	Diarrhea, nausea, vomiting, abdominal pain, headaches, rash
Nelfinavir (Viracept)	T: 250 mg Oral Powder: 50 mg/g	A: 750 mg q8h or 1,250 mg 2times/day C: 20-25 mg/kg q8h	Diarrhea, fatigue, asthenia, headaches, hypertension, impaired concentration
Ritonavir (Norvir)	C: 100 mg OS: 80 mg/ml	A: Titrate up to 800 mg/day based on protease inhibitor	Nausea, vomiting, diarrhea, altered taste, fatigue, elevated LFT and triglyceride levels
Saquinavir (Invirase)	C: 200 mg T: 500 mg	A: 1,000 mg 2 times/day with ritonavir 100 mg	Diarrhea, elevated LFTs, hypertriglycerides, cholesterol, abnormal fat accumulation, hyperglycemia
Tipranavir (Aptivus)	C: 250 mg OS: 100 mg/ml	A: 500 mg (with 200 mg ritonavir) 2 times/day	Diarrhea, nausea, fatigue, headaches, vomiting
Fusion Inhibitors			
Enfuvirtide (Fuzeon)	I: 108 mg (90 mg when reconstituted)	Subcutaneous: 90 mg 2 times/day	Insomnia, depression, peripheral neuropathy, decreased appetite, constipation, asthenia, cough
CCR5 Antagonists			
Maraviroc (Selzentry)	T: 150 mg, 300 mg	A: 300 mg 2 times/day CYP3A4 inducers: 600 mg 2 times/day CYP3A4 inhibitors: 150 mg 2 times/day	Cough, pyrexia, upper respiratory tract infections, rash, musculoskeletal symptoms, abdominal pain, dizziness

Integrase Inhibitor			
Raltegravir (Isentress)	T: 400 mg	A: 400 mg 2 times/day	Nausea, headache, diarrhea, pyrexia
Dolutegravir (Tivicay)	T: 50 mg	A: 50 mg once daily or 50 mg bid (with CYP3A inducers or resistance)	Insomnia, headache

A, Adults; **C**, capsules; **C** (dosage), children; **DR**, delayed-release; **ER**, extended-release; **I**, Injection; **OS**, oral solution; **S**, suspension; **T**, tablets; **TAF**, tenofovir alafenamide; **TDF**, tenofovir dlsoproxil fumarate.

Fixed-Combination Therapies

Brand Name	Generic Name	Dosage
Atripla	Efavirenz 600 mg Emtricitabine 200 mg Tenofovir (TDF) 300 mg	1 tablet once daily
Combivir	Lamivudine 150 mg Zidovudine 300 mg	1 tablet twice daily
Complera	Emtricitabine 200 mg Rilpivirine 27.5 mg Tenofovir (TDF) 300 mg	1 tablet once daily
Descovy	Emtricitabine 200 mg Tenofovir (TAF) 25 mg	1 tablet once daily
Epzicom	Abacavir 600 mg Lamivudine 300 mg	1 tablet once daily
Evotaz	Atazanavir 300 mg Cobicistat 150 mg	1 tablet once daily
Genvoya	Cobicistat 150 mg Elvitegravir 150 mg Emtricitabine 200 mg Tenofovir (TAF) 10 mg	1 tablet once daily
Odefsey	Emtricitabine 200 mg Rilpivirine 25 mg Tenofovir (TAF) 25 mg	1 tablet once daily
Prezcobix	Cobicistat 150 mg Darunavir 800 mg	1 tablet once daily
Stribild	Cobicistat 150 mg Elvitegravir 150 mg Emtricitabine 200 mg Tenofovir (TDF) 300 mg	1 tablet once daily
Triumeq	Abacavir 600 mg Dolutegravir 50 mg Lamivudine 300 mg	1 tablet once daily
Trizivir	Abacavir 300 mg Lamivudine 150 mg Zidovudine 300 mg	1 tablet twice daily
Truvada	Emtricitabine 200 mg Tenofovir (TDF) 300 mg	1 tablet once daily

TAF, tenofovir alafenamide; **TDF**, tenofovir disoproxil fumarate.

Immunosuppressive Agents

Uses

Improvement of both short- and long-term allograft survivals

Action

Basiliximab: An interleukin-2 (IL-2) receptor antagonist inhibiting IL-2 binding. This prevents activation of lymphocytes, and the response of the immune system to antigens is impaired.

Cyclosporine: Inhibits production and release of IL-2.

Daclizumab: An IL-2 receptor antagonist inhibiting IL-2 binding.

Mycophenolate: A prodrug that reversibly binds and inhibits inosine monophosphate dehydrogenase (IMPD), resulting in inhibition of purine nucleotide synthesis, inhibiting DNA and RNA synthesis and subsequent synthesis of T and B cells.

Sirolimus: Inhibits IL-2–stimulated T-lymphocyte activation and proliferation, which may occur through formation of a complex.

Tacrolimus: Inhibits IL-2–stimulated T-lymphocyte activation and proliferation, which may occur through formation of a complex.

Immunosuppressive Agents

Name	Availability	Dosage	Side Effects
Basiliximab (Simulect)	I: 10 mg, 20 mg	20 mg for 2 doses (on day of transplant, then 4 days after transplantation)	Abdominal pain, asthenia, cough, dizziness, dyspnea, dysuria, edema, hypertension, infection, tremors
Cyclosporine (Neoral, Sandimmune)	C: 25 mg, 50 mg, 100 mg S: 100 mg/ml	Dose dependent on type of transplant and formulation	Hypertension, hyperkalemia, nephrotoxicity, coarsening of facial features, hirsutism, gingival hyperplasia, nausea, vomiting, diarrhea, hepatotoxicity, hyperuricemia, hypertriglyceridemia, hypercholesterolemia, tremors, paresthesia, seizures, risk of infection/malignancy

	I: 50 mg/ml		
Mycophenolate (CellCept, Myfortic)	Cellcept: C: 250 mg I: 500 mg S: 200 mg/ml T: 500 mg Myfortic: T(DR): 180 mg, 320 mg	Cellcept: 1–1.5 g 2 times/day based on type of transplant Myfortic: Renal: 720 mg 2 times/day	Diarrhea, vomiting, leukopenia, neutropenia, infections
Sirolimus (Rapamune)	S: 1 mg/ml T: 0.5 mg, 1 mg, 2 mg	2–6 mg/day	Dyspnea, leukopenia, thrombocytopenia, hyperlipidemia, abdominal pain, acne, arthralgia, fever, diarrhea, constipation, headaches, vomiting, weight gain
Tacrolimus (Prograf)	C: 0.5 mg, 1 mg, 5 mg I: 5 mg/ml C(ER): 0.5 mg, 1 mg, 5 mg T(ER): 0.75 mg, 1 mg, 4 mg	Heart: 0.075 mg/kg/day in 2 divided doses q12h Kidney: 0.1–0.2 mg/kg/day in 2 divided doses q12h Liver: 0.1–0.15 mg/kg/day in 2 divided doses q12h	Nephrotoxicity, neurotoxicity, hyperglycemia, nausea, vomiting, photophobia, infections, hypertension, hyperlipidemia

C, Capsules; **DR**, Delayed release; **ER**, extended release; **I**, Injection; **S**, oral solution or suspension; **T**, tablets.

Laxatives

Uses

Short-term treatment of constipation; colon evacuation before rectal/bowel examination; prevention of straining (e.g., after anorectal surgery, MI); to reduce painful elimination (e.g., episiotomy, hemorrhoids, anorectal lesions); modification of effluent from ileostomy, colostomy; prevention of fecal impaction; removal of ingested poisons.

Action

Laxatives ease or stimulate defecation. Mechanisms by which this is accomplished include (1) attracting, retaining fluid in colonic contents due to hydrophilic or osmotic properties; (2) acting directly or indirectly on mucosa to decrease absorption of water and NaCl; or (3) increasing intestinal motility, decreasing absorption of water and NaCl by virtue of decreased transit time.

Bulk-forming: Act primarily in small/large intestine. Retain water in stool, may bind water, ions in colonic lumen (soften feces, increase bulk); may increase colonic bacteria growth (increases fecal mass). Produce soft stool in 1–3 days.

Osmotic agents: Act in colon. Similar to saline laxatives. Osmotic action may be enhanced in distal ileum/colon by bacterial metabolism to lactate, other organic acids. This decrease in pH increases motility, secretion. Produce soft stool in 1–3 days.

Saline: Acts in small/large intestine, colon (sodium phosphate). Poorly, slowly absorbed; causes hormone cholecystokinin release from duodenum (stimulates fluid secretion, motility); possesses osmotic properties; produces watery stool in 2–6 hrs (small doses produce semifluid stool in 6–12 hrs).

Stimulant: Acts in colon. Enhances accumulation of water/electrolytes in colonic lumen, enhances intestinal motility. May act directly on intestinal mucosa. Produces semifluid stool in 6–12 hrs.

◀ALERT▶ Bisacodyl suppository acts in 15–60 min.

Stool softener: Acts in small/large intestine. Hydrates and softens stools by its surfactant action, facilitating penetration of fat and water into stool. Produces soft stool in 1–3 days.

Laxatives

Name	Onset of Action	Uses	Side Effects/Precautions
Bulk-forming			
Methylcellulose (Citrucel)	12–24 hrs up to 3 days	Treatment of constipation for postpartum women, elderly, pts with diverticulosis, irritable bowel syndrome, hemorrhoids	Gas, bloating, esophageal obstruction, colonic obstruction, calcium and iron malabsorption
Psyllium (Metamucil)	Same as methylcellulose	Treatment of chronic constipation and constipation associated with rectal disorders; management of irritable bowel syndrome	Diarrhea, constipation, abdominal cramps, esophageal/colon obstruction, bronchospasm
Stool Softener			
Docusate (Colace, Surfak)	1–3 days	Treatment of constipation due to hard stools, in painful anorectal conditions, and for those who need to avoid straining during bowel movements	Stomachache, mild nausea, cramping, diarrhea, irritated throat (with liquid and syrup dose forms)
Saline			
Magnesium citrate (Citrate of Magnesia, Citro-Mag)	30 min–3 hrs	Bowel evacuation prior to certain surgical and diagnostic procedures	Hypotension, abdominal cramping, diarrhea, gas formation, electrolyte abnormalities
Magnesium hydroxide	30 min–3 hrs	Short-term treatment of occasional constipation	Electrolyte abnormalities can occur; use caution in pts with renal or cardiac impairment; diarrhea, abdominal cramps, hypotension
Sodium phosphate (Fleet Phospho-Soda)	2–15 min	Relief of occasional constipation; bowel evacuation prior to certain surgical and diagnostic procedures	Electrolyte abnormalities; do not use for pts with HF, severe renal impairment, ascites, GI obstruction, active inflammatory bowel disease
Osmotic			
Lactulose (Kristalose)	24–48 hrs	Short-term relief of constipation	Nausea, vomiting, diarrhea, abdominal cramping, bloating, gas
Polyethylene glycol (MiraLax)	24–48 hrs	Short-term relief of constipation	Bitter taste, diarrhea
Stimulant			
Bisacodyl (Dulcolax)	PO: 6–12 hrs Rectal: 15–60 min	Short-term relief of constipation	Electrolyte imbalance, abdominal discomfort, gas, potential for overuse/abuse

Senna (Senokot)	6–12 hrs	Short-term relief of constipation	Abdominal discomfort, cramps
------------------------	----------	-----------------------------------	------------------------------

GI, Gastrointestinal; **HF**, heart failure.

Multiple Sclerosis

Multiple sclerosis (MS) is the most common autoimmune disorder affecting central nervous system. MS is a demyelinating disease where insulating covers of nerve cells in the brain and spinal cord are damaged which disrupts the ability of parts of the nervous system to communicate. Symptoms may include double vision, blindness in one eye, muscle weakness, trouble with sensation or coordination.

Presently, there is no cure for MS. Treatment attempts to improve function and prevent new attacks.

Medications for Multiple Sclerosis

Name	Dosage	Side Effects
Alemtuzumab (Lemtrada)	12 mg IV once/day x 5 days followed 1 year later by 12 mg IV once/day x 3 days	Rigors, tremors, nausea, vomiting, rash, fatigue, hypotension, urticarial, pruritus, skeletal pain, headache, diarrhea, neutropenia, anemia, thrombocytopenia, respiratory toxicity (dyspnea, cough, pneumonitis, infections).
Daclizumab (Zinbryta)	150 mg SQ once/month	Autoimmune disorders (hepatitis, lymphadenopathy, noninfectious colitis), depression, severe hypersensitivity reactions, infections
Dimethyl fumarate (Tecfidera)	240 mg PO bid	Flushing, abdominal pain, diarrhea, nausea, vomiting, dyspepsia, lymphopenia, hepatotoxicity, PML
Fingolimod (Gilenya)	0.5 mg PO once daily	Headache, back pain, cough, infections, hypersensitivity reactions, elevated LFTs, bradycardia, AV block, macular edema, decreased pulmonary function
Glatiramer (Copaxone, Glatopa)	Copaxone: 20 mg SQ once/day or 40 mg 3 x/wk Glatopa: 20 mg SQ once/day	Pain, erythema, inflammation, pruritus at injection site, arthralgia, transient chest pain, post-injection reactions (chest pain, palpitations, dyspnea)
Interferon beta 1a (Avonex, Rebif)	Avonex: 30 mcg IM weekly Rebif: 44 mcg 3 times/week	Headache, flu-like symptoms, myalgia, depression with suicidal ideation, generalized pain, asthenia, chills, injection site reaction, hypersensitivity reactions, anemia, hepatotoxicity.
Interferon beta 1b (Betaseron, Extavia)	250 mcg SQ every other day	Headache, flu-like symptoms, myalgia, upper respiratory tract infection, depression with suicidal ideation, generalized pain, asthenia, chills, fever, injection site reaction, hypersensitivity reactions, anemia, hepatotoxicity, seizures.
Mitoxantrone	12 mg/m ² iv q3 months	Nausea, vomiting, diarrhea, cough, headache, stomatitis, abdominal

		discomfort, fever, alopecia, cardiotoxicity, myelosuppression , acute/chronic myeloid leukemia
Natalizumab (Tysabri)	300 mg IV q4 wks	Headache, fatigue, depression, arthralgia, infections, hypersensitivity reactions, hepatotoxicity, progressive multifocal leukoencephalopathy (PML)
Ocrelizumab (Ocrevus)	600 mg IV q6 months	Infusion reactions (Pruritus, rash, urticaria, erythema), respiratory tract infections, skin infections, malignancies, PML
Pegylated interferon beta 1a (Plegridy)	125 mcg SQ q2 weeks	Headache, flu-like symptoms, myalgia, depression with suicidal ideation, generalized pain, asthenia, chills, injection site reaction, hypersensitivity reactions, anemia, hepatotoxicity, elevated LFT, seizures.
Teriflunomide (Aubagio)	7 or 14 mg PO once/day	Headache, diarrhea, nausea, alopecia, paresthesia, abdominal pain, elevated LFTs, neutropenia, leukopenia, hepatic failure, acute renal failure, toxic epidermal necrolysis

Nonsteroidal Anti-Inflammatory Drugs (NSAIDs)

Uses

Provide symptomatic relief from *pain/inflammation* in the treatment of musculoskeletal disorders (e.g., rheumatoid arthritis [RA], osteoarthritis, ankylosing spondylitis), *analgesic* for low to moderate pain, *reduction in fever* (many agents not suited for routine/prolonged therapy due to toxicity). By virtue of its action on platelet function, aspirin is used in treatment or prophylaxis of diseases associated with hypercoagulability (reduces risk of stroke/heart attack).

Action

Exact mechanism for anti-inflammatory, analgesic, antipyretic effects unknown. Inhibition of enzyme cyclo-oxygenase, the enzyme responsible for prostaglandin synthesis, appears to be a major mechanism of action. May inhibit other mediators of inflammation (e.g., leukotrienes). Direct action on hypothalamus heat-regulating center may contribute to antipyretic effect.

NSAIDs

Name	Availability	Dosage Range	Side Effects
Aspirin	Caplet: 500 mg Suppository: 300 mg, 600 mg T: 325 mg	Analgesic/antipyretic: 325–650 mg q4–6h prn or 975 mg q6h prn or 500–1000 mg q4–6h prn	GI discomfort, dizziness, headaches, increased risk of bleeding

	T (EC): 81 mg, 325 mg T (chew): 81 mg		
Celecoxib (Celebrex)	C: 50 mg, 100 mg, 200 mg, 400 mg	200 mg q12h (Maximum: 600 mg day 1, then 400 mg/day)	Diarrhea, back pain, dizziness, heartburn, headaches, nausea, abdominal pain
Diclofenac (Voltaren, Zipsor, Zorvolex)	T: 25 mg, 50 mg, 75 mg C (Zipsor): 25 mg C (Zorvolex): 18 mg, 35 mg	50 mg tid (Zipsor): 25 mg 4 times/day (Zorvolex): 18–35 mg 3 times/day	Indigestion, constipation, diarrhea, nausea, headaches, fluid retention, abdominal cramps
Diflunisal (Dolobid)	T: 500 mg	Arthritis: 0.5–1 g/day in 2 divided doses Maximum: 1.5 g/day P: 500 mg once, then 250 mg q8–12h	Headaches, abdominal cramps, indigestion, diarrhea, nausea
Etodolac (Lodine)	T: 400 mg, 500 mg T (ER): 400 mg, 500 mg, 600 mg C: 200 mg, 300 mg	Arthritis: 400 mg 2 times/day or 300 mg 2–3 times/day or 500 mg 2 times/day. (ER): 400 mg up to 1,000 mg once daily P: 200–400 mg q6–8h as needed	Indigestion, dizziness, headaches, bloated feeling, diarrhea, nausea, weakness, abdominal cramps
Fenoprofen (Nalfon)	C: 200 mg, 400 mg T: 600 mg	Arthritis: 400–600 mg 3–4 times/day P: 200 mg q4–6h as needed	Nausea, indigestion, anxiety, constipation, shortness of breath, heartburn
Ibuprofen (Advil, Caldolor, Motrin)	l: 100 mg/ml T: 100 mg, 200 mg, 400 mg, 600 mg, 800 mg T (chewable): 50 mg, 100 mg C: 200 mg S: 100 mg/5 ml	Inflammatory disease: 400–800 mg/dose 3–4 times/day P: 200–400 mg/dose q4–6h as needed	Dizziness, abdominal cramps, abdominal pain, heartburn, nausea
Indomethacin (Indocin, Tivorbex)	(Tivorbex): 20 mg, 40 mg C: 25 mg, 50 mg C (SR): 75 mg S: 25 mg/5 ml	Arthritis: 25–50 mg/dose 2–3 times/day Maximum: 200 mg/day P: (Tivorbex only): 20 mg 3 times/day or 40 mg 2–3 times/day	Fluid retention, dizziness, headaches, abdominal pain, indigestion, nausea
Ketoprofen (Orudis KT)	C: 25 mg, 50 mg C (ER): 200 mg	Arthritis: 50 mg 4 times/day or 75 mg 3 times/day ER: 200 mg once daily P: 25–50 mg q6–8h as needed	Headaches, anxiety, abdominal pain, bloated feeling, constipation, diarrhea, nausea

Ketorolac (Toradol)	T: 10 mg I: 15 mg/ml, 30 mg/ml	P: (PO): 10 mg q4–6h as needed; (IM/IV): 60–120 mg/day in divided doses	Fluid retention, abdominal pain, diarrhea, dizziness, headaches, nausea
Meloxicam (Mobic, Vivlodex)	C: (Vivlodex): 5 mg, 10 mg T: (Mobic): 7.5 mg, 15 mg S: 7.5 mg/5 ml	Arthritis: (Mobic): 7.5–15 mg once daily (Vivlodex): 5–10 mg once daily	Heartburn, indigestion, nausea, diarrhea, headaches
Nabumetone (Relafen)	T: 500 mg, 750 mg	Arthritis: 1–2 g/day in 1–2 divided doses	Fluid retention, dizziness, headaches, abdominal pain, constipation, diarrhea, nausea
Naproxen (Anaprox, Naprosyn)	T: 250 mg, 375 mg, 500 mg T (CR): 375 mg, 500 mg S: 125 mg/5 ml	Arthritis: 500–1,000 mg/day in 2 divided doses Maximum: 1,500 mg/day P: 500 mg once, then 500 mg q12h or 250 mg q6–8h as needed	Tinnitus, fluid retention, shortness of breath, dizziness, drowsiness, headaches, abdominal pain, constipation, heartburn, nausea
Oxaprozin (Daypro)	C: 600 mg T: 600 mg	Arthritis: 600–1,200 mg once daily	Constipation, diarrhea, nausea, indigestion
Piroxicam (Feldene)	C: 10 mg, 20 mg	Arthritis: 10–20 mg/day in 1–2 divided doses	Abdominal pain, stomach pain, nausea
Sulindac (Clinoril)	T: 150 mg, 200 mg	Arthritis: 150 mg bid	Dizziness, abdominal pain, constipation, diarrhea, nausea

Nutrition: Enteral

Enteral nutrition (EN), also known as *tube feedings*, provides food/nutrients via the GI tract using special formulas, delivery techniques, and equipment. All routes of EN consist of a tube through which liquid formula is infused.

Indications

Tube feedings are used in pts with major trauma, burns; those undergoing radiation and/or chemotherapy; pts with hepatic failure, severe renal impairment, physical or neurologic impairment; preop and postop to promote anabolism; prevention of cachexia, malnutrition; dysphagia, pts requiring mechanical ventilation.

Routes of Enteral Nutrition Delivery

Nasogastric (NG):

INDICATIONS: Most common for short-term feeding in pts unable or unwilling to consume adequate nutrition by mouth. Requires at least a partially functioning GI tract.

ADVANTAGES: Does not require surgical intervention and is fairly easily inserted. Allows full use of digestive tract. Decreases abdominal distention, nausea, vomiting that may be caused by hyperosmolar solutions.

DISADVANTAGES: Temporary. May be easily pulled out during routine nursing care. Has potential for pulmonary aspiration of gastric contents, risk of reflux esophagitis, regurgitation.

Nasoduodenal (ND), Nasojejunal (NJ):

INDICATIONS: Pts unable or unwilling to consume adequate nutrition by mouth. Requires at least a partially functioning GI tract.

ADVANTAGES: Does not require surgical intervention and is fairly easily inserted. Preferred for pts at risk for aspiration. Valuable for pts with gastroparesis.

DISADVANTAGES: Temporary. May be pulled out during routine nursing care. May be dislodged by coughing, vomiting. Small lumen size increases risk of clogging when medication is administered via tube, more susceptible to rupturing when using infusion device. Must be radiographed for placement, frequently extubated.

Gastrostomy:

INDICATIONS: Pts with esophageal obstruction or impaired swallowing; pts in whom NG, ND, or NJ not feasible; when long-term feeding indicated.

ADVANTAGES: Permanent feeding access. Tubing has larger bore, allowing noncontinuous (bolus) feeding (300–400 ml over 30–60 min q3–6h). May be inserted endoscopically using local anesthetic (procedure called *percutaneous endoscopic gastrostomy* [PEG]).

DISADVANTAGES: Requires surgery; may be inserted in conjunction with other surgery or endoscopically (see **ADVANTAGES**). Stoma care required. Tube may be inadvertently dislodged. Risk of aspiration, peritonitis, cellulitis, leakage of gastric contents.

Jejunostomy:

INDICATIONS: Pts with stomach or duodenal obstruction, impaired gastric motility; pts in whom NG, ND, or NJ not feasible; when long-term feeding indicated.

ADVANTAGES: Allows early postop feeding (small bowel function is least affected by surgery). Risk of aspiration reduced. Rarely pulled out inadvertently.

DISADVANTAGES: Requires surgery (laparotomy). Stoma care required. Risk of intraperitoneal leakage. Can be dislodged easily.

Initiating Enteral Nutrition

With continuous feeding, initiation of isotonic (about 300 mOsm/L) or moderately hypertonic feeding (up to 495 mOsm/L) can be given full strength, usually at a slow rate (30–50 ml/hr) and gradually increased (25 ml/hr q6–24h). Formulas with osmolality greater than 500 mOsm/L are generally started at half strength and gradually increased in rate, then concentration. Tolerance is increased if the rate and concentration are not increased simultaneously.

Selection of Formulas

Protein: Has many important physiologic roles and is the primary source of nitrogen in the body. Provides 4 kcal/g protein. Sources of protein in enteral feedings: sodium caseinate, calcium caseinate, soy protein, dipeptides.

Carbohydrate (CHO): Provides energy for the body and heat to maintain body temperature. Provides 3.4 kcal/g carbohydrate. Sources of CHO in enteral feedings: corn syrup, cornstarch, maltodextrin, lactose, sucrose, glucose.

Fat: Provides concentrated source of energy. Referred to as *kilocalorie dense* or *protein sparing*. Provides 9 kcal/g fat. Sources of fat in enteral feedings: corn oil, safflower oil, medium-chain triglycerides.

Electrolytes, vitamins, trace elements: Contained in formulas (not found in specialized products for renal/hepatic insufficiency).

All products containing protein, fat, carbohydrate, vitamin, electrolytes, trace elements are nutritionally complete and designed to be used by pts for long periods.

Complications

MECHANICAL: Usually associated with some aspect of the feeding tube.

Aspiration pneumonia: Caused by delayed gastric emptying, gastroparesis, gastroesophageal reflux, or decreased gag reflex. May be prevented or treated by reducing infusion rate, using lower-fat formula, feeding beyond pylorus, checking residuals, using small-bore feeding tubes, elevating head of bed 30–45 degrees during and for 30–60 min after intermittent feeding, and regularly

checking tube placement.

Esophageal, mucosal, pharyngeal irritation, otitis: Caused by using large-bore NG tube. Prevented by use of small bore whenever possible.

Irritation, leakage at ostomy site: Caused by drainage of digestive juices from site. Prevented by close attention to skin/stoma care.

Tube, lumen obstruction: Caused by thickened formula residue, formation of formula-medication complexes. Prevented by frequently irrigating tube with clear water (also before and after giving formulas/medication), avoiding instilling medication if possible.

GASTROINTESTINAL: Usually associated with formula, rate of delivery, unsanitary handling of solutions or delivery system.

Diarrhea: Caused by low-residue formulas, rapid delivery, use of hyperosmolar formula, hypoalbuminemia, malabsorption, microbial contamination, or rapid GI transit time. Prevented by using fiber supplemented formulas, decreasing rate of delivery, using dilute formula, and gradually increasing strength.

Cramps, gas, abdominal distention: Caused by nutrient malabsorption, rapid delivery of refrigerated formula. Prevented by delivering formula by continuous methods, giving formulas at room temperature, decreasing rate of delivery.

Nausea, vomiting: Caused by rapid delivery of formula, gastric retention. Prevented by reducing rate of delivery, using dilute formulas, selecting low-fat formulas.

Constipation: Caused by inadequate fluid intake, reduced bulk, inactivity. Prevented by supplementing fluid intake, using fiber-supplemented formula, encouraging ambulation.

METABOLIC: Fluid/serum electrolyte status should be monitored. Refer to monitoring section. In addition, the very young and very old are at greater risk of developing complications such as dehydration or overhydration.

Monitoring

Daily: Estimate nutrient intake, fluid intake/output, weight of pt, clinical observations.

Weekly: Serum electrolytes (potassium, sodium, magnesium, calcium, phosphorus), blood glucose, BUN, creatinine, hepatic function tests (e.g., AST, ALT, alkaline phosphatase), 24-hr urea and creatinine excretion, total iron-binding capacity (TIBC) or serum transferrin, triglycerides, cholesterol.

Monthly: Serum albumin.

Other: Urine glucose, acetone (when blood glucose is greater than 250), vital signs (temperature, respirations, pulse, B/P) q8h.

DRUG THERAPY: DOSAGE FOR SELECTION/ADMINISTRATION:

Drug therapy should not have to be compromised in pts receiving enteral nutrition:

- Temporarily discontinue medications not immediately necessary.
- Consider an alternate route for administering medications (e.g., transdermal, rectal, intravenous).
- Consider alternate medications when current medication is not available in alternate dosage forms.

ENTERAL ADMINISTRATION OF MEDICATIONS:

Medications may be given via feeding tube with several considerations:

- Tube type
- Tube location in the GI tract
- Site of drug action
- Site of drug absorption
- Effects of food on drug absorption
- Use of liquid dosage forms is preferred whenever possible; many tablets may be crushed; contents of many capsules may be emptied and given through large-bore feeding tubes.
- Many oral products should not be crushed (e.g., sustained-release, enteric coated, capsule granules).
- Some medications should not be given with enteral formulas because they form precipitates that may clog the feeding tube and reduce drug absorption.
- Feeding tube should be flushed with water before and after administration of medications to clear any residual medication.

Nutrition: Parenteral

Parenteral nutrition (PN), also known as *total parenteral nutrition* (TPN) or *hyperalimentation* (HAL), provides required nutrients to pts by IV route of administration. The goal of PN is to maintain or restore nutritional status caused by disease, injury, or inability to consume nutrients by other means.

Indications

Conditions when pt is unable to use alimentary tract via oral, gastrostomy, or

jejunostomy route. Impaired absorption of protein caused by obstruction, inflammation, or antineoplastic therapy. Bowel rest necessary because of GI surgery or ileus, fistulas, or anastomotic leaks. Conditions with increased metabolic requirements (e.g., burns, infection, trauma). Preserve tissue reserves (e.g., acute renal failure). Inadequate nutrition from tube feeding methods.

Components of PN

To meet IV nutritional requirements, six essential categories in PN are needed for tissue synthesis and energy balance.

Protein: In the form of crystalline amino acids (CAA), primarily used for protein synthesis. Several products are designed to meet specific needs for pts with renal failure (e.g., NephroAmine), hepatic disease (e.g., Hepat Amine), stress/trauma (e.g., Aminosyn HBC), use in neonates and pediatrics (e.g., Aminosyn PF, TrophAmine). Calories: 4 kcal/g protein.

Energy: In the form of dextrose, available in concentrations of 5%–70%. Dextrose less than 10% may be given peripherally; concentrations greater than 10% must be given centrally. Calories: 3.4 kcal/g dextrose.

IV fat emulsion: Available in 10% and 20% concentrations. Provides a concentrated source of energy/calories (9 kcal/g fat) and is a source of essential fatty acids. May be administered peripherally or centrally.

Electrolytes: Major electrolytes (calcium, magnesium, potassium, sodium; also acetate, chloride, phosphate). Doses of electrolytes are individualized, based on many factors (e.g., renal/hepatic function, fluid status).

Vitamins: Essential components in maintaining metabolism and cellular function; widely used in PN.

Trace elements: Necessary in long-term PN administration. Trace elements include zinc, copper, chromium, manganese, selenium, molybdenum, iodine.

Miscellaneous: Additives include insulin, albumin, heparin, and H₂ blockers (e.g., cimetidine, ranitidine, famotidine). Other medication may be included, but compatibility for admixture should be checked on an individual basis.

Route of Administration

PN is administered via either peripheral or central vein.

Peripheral: Usually involves 2–3 L/day of 5%–10% dextrose with 3%–5% amino acid solution along with IV fat emulsion. Electrolytes, vitamins, trace

elements are added according to pt needs. Peripheral solutions provide about 2,000 kcal/day and 60–90 g protein/day.

ADVANTAGES: Lower risks vs. central mode of administration.

DISADVANTAGES: Peripheral veins may not be suitable (esp. in pts with illness of long duration); more susceptible to phlebitis (due to osmolalities greater than 600 mOsm/L); veins may be viable only 1–2 wks; large volumes of fluid are needed to meet nutritional requirements, which may be contraindicated in many pts.

Central: Usually utilizes hypertonic dextrose (concentration range of 15%–35%) and amino acid solution of 3%–7% with IV fat emulsion. Electrolytes, vitamins, trace elements are added according to pt needs. Central solutions provide 2,000–4,000 kcal/day. Must be given through large central vein with high blood flow, allowing rapid dilution, avoiding phlebitis/thrombosis (usually through percutaneous insertion of catheter into subclavian vein, then advancement of catheter to superior vena cava).

ADVANTAGES: Allows more alternatives/flexibility in establishing regimens; allows ability to provide full nutritional requirements without need of daily fat emulsion; useful in pts who are fluid restricted (increased concentration), those needing large nutritional requirements (e.g., trauma, malignancy), or those for whom PN indicated more than 7–10 days.

DISADVANTAGES: Risk with insertion, use, maintenance of central line; increased risk of infection, catheter-induced trauma, and metabolic changes.

Monitoring

May vary slightly from institution to institution.

Baseline: CBC, platelet count, prothrombin time (PT), weight, body length/head circumference (in infants), serum electrolytes, glucose, BUN, creatinine, uric acid, total protein, cholesterol, triglycerides, bilirubin, alkaline phosphatase, lactate dehydrogenase (LDH), AST, albumin, prealbumin, other tests as needed.

Daily: Weight, vital signs (temperature, pulse, respirations [TPR]), nutritional intake (kcal, protein, fat), serum electrolytes (potassium, sodium chloride), glucose (serum, urine), acetone, BUN, osmolarity, other tests as needed.

2–3 times/wk: CBC, coagulation studies (PT, partial thromboplastin time [PTT]), serum creatinine, calcium, magnesium, phosphorus, acid-base status, other tests as needed.

Weekly: Nitrogen balance, total protein, albumin, prealbumin, transferrin, hepatic

function tests (AST, ALT), serum alkaline phosphatase, LDH, bilirubin, Hgb, uric acid, cholesterol, triglycerides, other tests as needed.

Mechanical: Malfunction in system for IV delivery (e.g., pump failure; problems with lines, tubing, administration sets, catheter). Pneumothorax, catheter misdirection, arterial puncture, bleeding, hematoma formation may occur with catheter placement.

Infectious: Infections (pts often more susceptible to infections), catheter sepsis (e.g., fever, shaking, chills, glucose intolerance where no other site of infection is identified).

Metabolic: Includes hyperglycemia, elevated serum cholesterol and triglycerides, abnormal serum hepatic function tests.

Fluid, electrolyte, acid-base disturbances: May alter serum potassium, sodium, phosphate, magnesium levels.

Nutritional: Clinical effects seen may be due to lack of adequate vitamins, trace elements, essential fatty acids.

DRUG THERAPY/ADMINISTRATION METHODS:

Compatibility of other intravenous medications pts may be administered while receiving parenteral nutrition is an important concern.

Intravenous medications usually are given as a separate admixture via piggyback to the parenteral nutrition line, but in some instances may be added directly to the parenteral nutrition solution. Because of the possibility of incompatibility when adding medication directly to the parenteral nutrition solution, specific criteria should be considered:

- Stability of the medication in the parenteral nutrition solution
- Properties of the medication, including pharmacokinetics that determine if the medication is appropriate for continuous infusion
- Documented chemical and physical compatibility with the parenteral nutrition solution

In addition, when medication is given via piggyback using the parenteral nutrition line, important criteria should include the following:

- Stability of the medication in the parenteral nutrition solution
- Documented chemical and physical compatibility with the parenteral nutrition solution

Obesity Management

Uses

Adjunct to diet and physical activity in the treatment of chronic, relapsing obesity.

Actions

Two categories of medications are used for weight control. *Appetite suppressants*: Block neuronal uptake of norepinephrine, serotonin, dopamine, causing a feeling of fullness or satiety.

Digestion inhibitors: Reversible lipase inhibitors that block the breakdown and absorption of fats, decreasing appetite and reducing calorie intake.

AnorexiaNTS

Name	Availability	Dosage	Side Effects
Diethylpropion (Tenuate, Tenuate Dospan)	T: 25 mg, T (CR): 75 mg	25 mg 3-4 times/day or 75 mg once daily in midmorning	Headaches, euphoria, palpitations, hypertension, pulmonary hypertension, valvular heart disease, seizures, bone marrow depression, dependence, withdrawal psychosis
Liraglutide (Victoza)	I: 18 mg/3 ml	SQ : Initially, 0.6 mg/day. May increase by 0.6 mg/day weekly up to 3 mg/day	Diarrhea, constipation, dyspepsia, fatigue, vomiting, increased heart rate, renal impairment
Lorcaserin (BelViq, Belviq XR)	C: 10 mg T: 20 mg	(Belviq) 10 mg 2 times/day (Belviq XR): 20 mg once daily	Nausea, headache, dizziness, fatigue, dry mouth, diarrhea, constipation, hypoglycemia, hallucinations, decreased white/red blood cells, euphoria, cognitive impairment
Naltrexone/ bupropion (Contrave)	T: 8 mg/90 mg	Titrate weekly up to 2 tablets 2 times/day (1 tablet once daily, then 1 tablet 2 times/day, then 2 tablets in am and 1 in pm, then 2 tablets 2 times/day)	Suicidal ideation, mood changes, seizures, increased HR with or without B/P, allergic reactions, hepatic toxicity, nausea, vomiting, headache, dizziness, dry mouth, angle closure glaucoma
Orlistat (Alii,	C: 60 mg,	Alii : 60 mg up to tid with meals	Flatulence, rectal incontinence, oily stools,

Xenical)	120 mg	Xenical: 120 mg tid with each meal containing fat	cholelithiasis, abdominal/ rectal pain, hepatitis, pancreatitis, nausea
Phentermine (Apidex-P, Suprenza)	C: 15 mg, 30 mg, 37.5 mg T: 37.5 mg T (ODT): 15 mg, 30 mg, 37.5 mg	15-37.5 mg/day in 1 or 2 divided doses ODT: 15-37.5 mg once daily in morning	Headaches, euphoria, palpitations, hypertension, pulmonary hypertension, valvular heart disease, tremor, dependence, withdrawal psychosis, CNS stimulation, GI complaints
Phentermine/topiramate (Qsymia)	C: 13.75 mg/ 23 mg	3.75 mg/23 mg to 15 mg/92 mg once daily in the morning	Paresthesia, dizziness, insomnia, depression, tachycardia, cognitive impairment, angle-closure glaucoma, hypokalemia, metabolic acidosis, constipation, dry mouth, suicidal ideation, kidney stones

AS, Appetite suppressant; **B/P**, blood pressure; **C**, capsules; **CNS**, central nervous system; **CR**, controlled-release; **DI**, digestion Inhibitor; **GI**, gastrointestinal; **HR**, heart rate; **I**, Injection; **ODT**, orally disintegrating tablets; **SQ**, subcutaneously; **T**, tablets.

Osteoporosis

History

Osteoporosis is a bone disease that can lead to fractures. Bone mineral density (BMD) is reduced, bone microarchitecture is disrupted, and the amount and variety of proteins in bone are altered. Osteoporosis primarily affects women after menopause (postmenopausal osteoporosis) but may develop in men, in anyone in the presence of particular hormonal disorders (e.g., parathyroid glands), after overconsumption of dietary proteins, or as a result of medications (e.g., glucocorticoids). Several pharmacologic options, along with lifestyle changes, that can be used to prevent and/or treat osteoporotic fractures include bisphosphonates, selective estrogen receptor modulator (SERM), parathyroid hormone (PTH), calcitonin, and monoclonal antibodies.

Action

Bisphosphonates: Inhibit bone resorption via actions on osteoclasts or osteoclast precursors, decrease rate of bone resorption, leading to an indirect increase in BMD.

Selective estrogen receptor modulator (SERM): Decreases bone resorption, increasing BMD and decreasing the incidence of fractures.

Parathyroid hormone: Stimulates osteoblast function, increasing gastrointestinal calcium absorption and increasing renal tubular reabsorption of calcium. This increases BMD, bone mass, and strength, resulting in a decrease in osteoporosis-related fractures.

Calcitonin: Inhibitor of bone resorption. Efficacy not observed in early postmenopausal women and is used only in women with osteoporosis who are at least 5 yrs beyond menopause.

Monoclonal antibody: Inhibits the RANK ligand (RANKL), a cytokine member of the tumor necrosis factor family. This inhibits osteoclast formation, function, and survival, which decreases bone resorption and increases bone mass and strength in cortical and trabecular bone.

Bisphosphonates

Name	Availability	Dosage	Side Effects
Alendronate (Binosto, Fosamax)	T: 5 mg, 10 mg, 35 mg, 40 mg, 70 mg S: 70 mg/75ml	Prevention: 5 mg/day or 35 mg/wk Treatment: 10 mg/day or 70 mg/wk	Transient, mild hypocalcemia, hypophosphatemia, dysphagia, esophagitis, esophageal and gastric ulcer, abdominal pain, diarrhea, musculoskeletal pain. May cause jaw osteonecrosis (up to 0.04%)
Ibandronate (Boniva)	T: 150 mg I: 1 mg/ml	Prevention and treatment: 150 mg/mo IV Injection: Treatment: 3 mg/3 mos	Dyspepsia, back pain, dysphagia, esophagitis, esophageal and gastric ulcer, abdominal pain, diarrhea, musculoskeletal pain. May cause jaw osteonecrosis (up to 0.04%)
Risedronate (Actonel)	T: 5 mg, 30 mg, 35 mg, 150 mg T (DR): 35 mg	Prevention and treatment: 5 mg/day, 35 mg/wk, or 150 mg/mo	Hypertension, headache, rash, dysphagia, esophagitis, esophageal and gastric ulcer, abdominal pain, diarrhea, musculoskeletal pain. May cause jaw osteonecrosis (up to 0.04%)
Zoledronic acid (Reclast)	I: 5 mg	Prevention: IV: 5 mg every 2 yrs Treatment: IV: 5 mg every yr	Hypertension, pain, fever, headache, chills, fatigue, nausea, musculoskeletal pain

Serm

Name	Availability	Dosage	Side Effects
Raloxifene (Evista)	T: 60 mg	Prevention and	Peripheral edema, arthralgia, leg cramps, muscle spasms, flu syndrome, infection. Avoid use in patients with hot flashes, history of VTE,

		treatment: 60 mg/day	where hip fracture is primary concern
--	--	--------------------------------	---------------------------------------

Parathyroid Hormone

Name	Availability	Dosage	Side Effects
Abaloparatide (Tymos)	I: 2000 mcg/ml prefilled pen delivers 80 mcg/dose	Treatment: 80 mcg subcutaneously once daily	Hypercalciuria, dizziness, nausea, headache, fatigue, palpitations, vertigo, abdominal pain. Avoid use with pre-existing hypercalcemia
Teriparatide (Forteo)	I: 250 mcg/ml syringe delivers 20 mcg/dose	Treatment: 20 mcg subcutaneously once daily	Hypercalcemia, muscle cramps, nausea, dizziness, headache. Avoid use with metabolic bone disease, Paget's disease, previous skeletal irradiation, elevated alkaline phosphatase, severe renal impairment

Calcitonin

Name	Availability	Dosage	Side Effects
Calcitonin (Fortical, Miacalcin)	1 (Miacalcin): 200 units/ml Nasal (Fortical, Miacalcin): 200 units/activation	Treatment: IM/Subcutaneous (Miacalcin): 100 units every other day Nasal: 200 units in 1 nostril daily	Rhinitis, local nasal irritation. Injection: nausea, local inflammation, flushing of face, hands

Monoclonal Antibody Rankl Inhibitor

Name	Availability	Dosage	Side Effects
Denosumab (Prolia)	I: 60 mg/ml	Subcutaneous: 60 mg once every 6 mos	Back pain, pain in extremity, hypercholesterolemia, musculoskeletal pain, fatigue, headache, peripheral edema, dermatitis. May cause jaw osteonecrosis (up to 1.7%). Avoid use in patient with hypocalcemia, stage 5 kidney disease, dialysis

DR, Delayed-release; **I**, injection; **S**, solution (oral); **T**, tablet.

Parkinson's Disease Treatment

Uses

To slow or stop clinical progression of Parkinson's disease and to improve function and quality of life in pts with Parkinson's disease, a progressive neurodegenerative disorder.

Action

Normal motor function is dependent on the synthesis and release of dopamine by neurons projecting from the substantia nigra to the corpus striatum. In Parkinson's disease, disruption of this pathway results in diminished levels of the neurotransmitter dopamine. Medication is aimed at providing improved function using the lowest effective dose.

Types of Medications for Parkinson's Disease Dopamine

Precursor

Levodopa/carbidopa:

Levodopa: Dopamine precursor supplementation to enhance dopaminergic neurotransmission. A small amount of levodopa crosses the blood-brain barrier and is decarboxylated to dopamine, which is then available to stimulate dopaminergic receptors.

Carbidopa: Inhibits peripheral decarboxylation of levodopa, decreasing its conversion to dopamine in peripheral tissues, which results in an increased availability of levodopa for transport across the blood-brain barrier.

Comt Inhibitors

Entacapone, tolcapone: Reversible inhibitor of catechol-O-methyltransferase (COMT). COMT is responsible for catalyzing levodopa. In the presence of a decarboxylase inhibitor (carbidopa), COMT becomes the major metabolizing

enzyme for levodopa in the brain and periphery. By inhibiting COMT, higher plasma levels of levodopa are attained, resulting in more dopaminergic stimulation in the brain and lessening the symptoms of Parkinson's disease.

Dopamine Receptor Agonists

Bromocriptine: Stimulates postsynaptic dopamine type 2 receptors in the neostriatum of the CNS.

Pramipexole: Stimulates dopamine receptors in the striatum of the CNS.

Ropinirole: Stimulates postsynaptic dopamine D2 type receptors within the caudate putamen in the brain.

Monoamine Oxidase B Inhibitors

Rasagiline, Safinamide, Selegiline: Increase dopaminergic activity due to inhibition of monoamine oxidase type B (MAO B). MAO B is involved in the oxidative deamination of dopamine in the brain.

Parkinson's Disease Treatment

Medications for Treatment of Parkinson's Disease

Name	Type	Availability	Dosage	Side Effects
Amantadine	Dopamine agonist	C: 100 mg Syrup: 10 mg/ml T: 100 mg	100 mg 2 times/day. May increase up to 400 mg/day in divided doses	Cognitive impairment, confusion, insomnia, hallucinations, levodopa reticularis
Carbidopa/levodopa (Rytary, Sinemet, Sinemet CR)	Dopamine precursor	OD: 10/100 mg, 25/100 mg, 25/250 mg Immediate-release (Sinemet): 10/100 mg, 25/100 mg, 25/250 mg Extended-release (Sinemet CR): 25/100 mg, 50/200 mg	300–1,500 mg levodopa in divided doses Sinemet: 300–1,500 mg levodopa in divided doses Sinemet CR: Initially, 400 mg/day in 2 divided doses. May increase up to 1,600 mg levodopa in divided doses Rytary: Initially, 23.75 mg/95 mg 3 times/day. May increase up to 612.5 mg/2,450 mg per day in divided doses	Anorexia, nausea, orthostatic hypotension initially; hallucinations, confusion, sleep disturbances with chronic use, constipation, dry mouth, headache, dyskinesia

		(Rytary): 23.75 mg/95 mg, 36.25 mg/145 mg, 48.75 mg/195 mg, 61.25 mg/245 mg		
Entacapone (Comtan)	COMT inhibitor	T: 200 mg	200 mg 3–4 times/day up to maximum of 8 times/day (1,600 mg)	Dyskinesias, nausea, diarrhea, urine discoloration
Pramipexole (Mirapex, Mirapex ER)	Dopamine agonist	T: 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg ER: 0.375 mg, 0.75 mg, 1.5 mg, 2.25 mg, 3 mg, 3.75 mg, 4.5 mg	T: Initially, 0.125 mg 3 times/day. May increase q5–7 days. Usual dose: 0.5–1.5 mg 3 times/day ER: Initially, 0.375 mg once daily. May increase q5–7 days by 0.75 mg/dose up to 4.5 mg once daily	Side effects similar to carbidopa/levodopa. Lower risk of dyskinesias, higher risk of hallucinations, sleepiness, edema. May cause excessive daytime sleepiness, impair impulse control (e.g., gambling)
Rasagiline (Azilect)	MAO B inhibitor	T: 0.5 mg, 1 mg	0.5–1 mg once daily	Nausea, orthostatic hypotension, hallucinations, insomnia, dry mouth, constipation, vivid dreams. Many potential drug interactions.
Ropinirole (Requip, Requip XL)	Dopamine agonist	T: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg XL: 2 mg, 4 mg, 6 mg, 8 mg, 12 mg	T: Initially, 0.25 mg 3 times/day. May increase at weekly intervals to 0.5 mg 3 times/day, then 0.75 mg 3 times/day, then 1 mg 3 times/day. May then increase by 1.5 mg/day up to 9 mg/day, then by 3 mg/day up to total dose of 24 mg/day in divided doses XL: Initially, 2 mg/day for 1–2 wks, then increase by 2 mg/day at weekly intervals	Side effects similar to carbidopa/levodopa. Lower risk of dyskinesias, higher risk of hallucinations, sleepiness, edema. May cause excessive daytime sleepiness, impair impulse control (e.g., gambling)
Rotigotine (Neupro)	Dopamine agonist	Transdermal patch: 1 mg/24 hrs, 2 mg/24 hrs, 3 mg/24 hrs, 4 mg/24 hrs, 6 mg/24 hrs, 8 mg/24 hrs	Early stage: Initially, 2 mg/24 hrs up to 6 mg/24 hrs Advanced stage: Initially, 4 mg/24 hrs up to 8 mg/24 hrs	Side effects similar to carbidopa/levodopa. Lower risk of dyskinesias, higher risk of hallucinations, sleepiness, edema. May cause excessive daytime sleepiness, impair impulse control (e.g., gambling)

Safinamide (Xadago)	MAO B inhibitor	T: 50 mg, 100 mg	Initially, 50 mg once daily. May increase after two wks to 100 mg once daily	Dyskinesia, falls, hallucinations, nausea, insomnia. Many potential drug interactions
Selegiline (Eldepryl, Zelapar)	MAO B inhibitor	C (Eldepryl): 5 mg OD (Zelapar): 1.25 mg	C: 5 mg with breakfast and lunch OD: 1.25–2.5 mg daily in the morning	Nausea, orthostatic hypotension, hallucinations, insomnia, dry mouth, constipation, vivid dreams. Many potential drug interactions.
Tolcapone (Tasmar)	COMT inhibitor	T: 100 mg	Initially, 100 mg 3 times/day. May increase to 200 mg 3 times/day	Dyskinesias, nausea, diarrhea, urine discoloration

C, Capsules; **COMT**, catechol-*O*-methyltransferase; **ER**, extended-release; **I**, Injection; **MAO B**, monoamine oxidase B; **OD**, orally disintegrating; **T**, tablets; **XL**, extended-release.

Proton Pump Inhibitors

Uses

Treatment of various gastric disorders, including gastric and duodenal ulcers, gastroesophageal reflux disease (GERD), pathologic hypersecretory conditions.

Action

Suppresses gastric acid secretion by specific inhibition of the hydrogen-potassium-adenosine triphosphatase (H^+/K^+ ATPase) enzyme system, which transports the acid at the gastric parietal cells. These agents do not have anticholinergic or histamine receptor antagonistic properties.

Proton Pump Inhibitors

Name	Availability	Indications	Usual Dosage	Side Effects
Dexlansoprazole (Dexilant)	C: 30 mg, 60 mg	Erosive esophagitis, heartburn associated with nonerosive GERD	30–60 mg/day	Diarrhea, abdominal pain, nausea, upper respiratory tract infection, vomiting, flatulence
Esomeprazole	C: 20 mg,	<i>Helicobacter pylori</i> eradication, GERD,	20–40	Headaches, diarrhea,

(Nexium)	40 mg I: 20 mg, 40 mg	erosive esophagitis	mg/day	abdominal pain, nausea
Lansoprazole (Prevacid)	C: 15 mg, 30 mg T (ODT): 15 mg, 30 mg	Duodenal ulcer, gastric ulcer, NSAID-associated gastric ulcer, hypersecretory conditions, <i>H. pylori</i> eradication, GERD, erosive esophagitis	15–30 mg/day	Diarrhea, skin rash, pruritus, headaches
Omeprazole (Prilosec)	C: 10 mg, 20 mg, 40 mg	Duodenal ulcer, gastric ulcer, hypersecretory conditions, <i>H. pylori</i> eradication, GERD, erosive esophagitis	20–40 mg/day	Headaches, diarrhea, abdominal pain, nausea
Omeprazole and Sodium Bicarbonate (Zegerid)	P: 20 mg, 40 mg	Duodenal ulcer, benign gastric ulcer, GERD, erosive esophagitis	20–40 mg/day	Headaches, abdominal pain, diarrhea, nausea
Pantoprazole (Protonix)	T: 20 mg, 40 mg I: 40 mg	Erosive esophagitis, hypersecretory conditions	40 mg/day	Diarrhea, headaches
Rabeprazole (Aciphex)	T: 20 mg S: 5 mg, 10 mg	Duodenal ulcer, hypersecretory conditions, <i>H. pylori</i> eradication, GERD, erosive esophagitis	20 mg/day	Headaches

C, Capsules; **GERD**, gastroesophageal reflux disease; **I**, Injection; **NSAID**, nonsteroidal anti-inflammatory drug; **ODT**, orally disintegrating tablets; **P**, powder for suspension; **S**, sprinkles; **T**, tablets.

Rheumatoid Arthritis

Rheumatoid arthritis (RA) is an autoimmune disease associated with progressive disability, systemic complications, early death, and socioeconomic costs. RA affects most joints and their surrounding tissues. RA is characterized by synovial inflammation and hyperplasia, autoantibody production (e.g., rheumatoid factor), cartilage and bone destruction, and systemic features (e.g., cardiovascular, pulmonary, psychological, skeletal disorders). The clinical hallmark of RA is polyarticular synovial inflammation of peripheral joints (typically in the hands, resulting in pain, stiffness, and some degree of irreversible joint damage; deformity; and disability).

Medications used in RA include disease-modifying antirheumatic drugs (DMARDs) and biologic agents, including tumor necrosis factor (TNF) inhibitors.

DMARDs

Name	Dosage	Side Effects/Comments
Hydroxychloroquine (Plaquenil)	Induction: 400–600 mg/day for 4–12 wks Maintenance: 200–400 mg/day	Side Effects: nausea, epigastric pain, hemolysis may occur in pts with G6PD deficiency, retinal toxicity with long-term use
Leflunomide (Arava)	Induction: 100 mg/day X 3 days Maintenance: 10–20 mg/day	Side Effects: diarrhea, respiratory tract infection, hypertension, headache, reversible alopecia, rash, myelosuppression, and/or elevated hepatic enzymes Comments: contraindicated for use during pregnancy
Methotrexate (oral) (Rheumatrex, Trexall) Methotrexate (injectable) Otrexup, Rasuvo)	Induction: 7.5–10 mg PO once/wk Maintenance: 7.5–25 mg PO once wkly Induction: 7.5 PO once wkly Maintenance: 10–25 mg IM or SQ once wkly	Side Effects: stomatitis, anorexia, nausea, vomiting, diarrhea, abdominal cramps, hepatic enzyme elevations, thrombocytopenia Comments: not recommended in pts with CrCl <30 ml/min; should not be prescribed for women who are or may become pregnant
Sulfasalazine (Azulfidine)	Induction: 3–4 g/day in divided doses Maintenance: 2 g/day in divided doses	Side Effects: headache, nausea, anorexia, rash, hemolysis may occur in pts with G6PD deficiency

Biologic Agents

TNF Inhibitors		
Name	Dosage	Side Effects/Comments
Adalimumab (Humira)	40 mg SQ once wkly or q2wks	Side Effects: headache, skin rash, positive ANA titer, antibody development, injection site reaction (erythema, itching, pain, swelling), upper respiratory tract infection Comments: increased risk for serious infections (e.g., tuberculosis, invasive fungal infections), avoid use in pts with recent history of malignancy or pre-existing demyelinating disorders
Certolizumab (Cimzia)	Induction: 400 mg SQ at 0, 2,4 wks Maintenance: 200 mg SQ every other week or 400 mg q4wks	Side Effects: nausea, infection, upper respiratory tract infection, skin rash Comments: see adalimumab
Etanercept (Enbrel)	25 mg SQ 2 times/wk or 50 mg SQ once/wk	Side Effects: headache, skin rash, diarrhea, injection site reactions (e.g., erythema, swelling), upper respiratory tract infection, rhinitis Comments: see adalimumab
Golimumab (Simponi)	Simponi: 50 mg SQ once monthly Simponi Aria:	Side Effects: positive ANA titer, upper respiratory tract infection (e.g., nasopharyngitis, rhinitis)

Simponi Aria)	Induction: 2 mg/kg IV at 0 and 4 wks Maintenance: 2 mg/kg IV q8wks	Comments: see adalimumab
Infliximab (Remicade)	Induction: 3 mg/kg IV at 0, 2, and 6 wks Maintenance: 3 mg/kg IV q8wks	Side Effects: nausea, diarrhea, abdominal pain, increased ANA titer, upper respiratory tract infection, sinusitis, cough, pharyngitis Comments: see adalimumab

Other Biologic Agents

Name	Dosage	Side Effects/Comments
Abatacept (Orencia)	IV: 500 mg, 750 mg, or 1,000 mg IV at 0,2, and 4 wks, then q4wks SQ: 125 mg SQ once/wk	Side Effects: nausea, UTIs, acute exacerbation of COPD, hypertension, headache, dizziness Comments: may increase risk of serious infections (e.g., pneumonia, pyelonephritis, cellulitis, diverticulitis)
Rituximab (Rituxan)	1,000 mg IV twice, 2 wks apart	Side Effects: hypotension, peripheral edema, abdominal pain anemia, arthralgia, infusion site reactions Comments: Pts at high risk for hepatitis B virus infection should be screened before beginning therapy
Sarilumab (Kevzara)	SQ: 200 mg q2wks	Side Effects: neutropenia, increased ALT, injection site reactions (e.g., erythema), upper respiratory tract infections, UTI Comments: screening for tuberculosis recommended
Tocilizumab (Actemra)	IV: Induction: 4 mg/kg IV q4wks Maintenance: 8 mg/kg q4 wks SQ: Induction: 162 mg SQ every other week Maintenance: 162 mg once wkly	Side Effects: hypertension, upper abdominal pain, increased ALT/ AST, injection site reactions, neutropenia, dyslipidemia Comments: severe complications including GI perforation and hypersensitivity with anaphylaxis have been reported
Tofacitinib (Xeljanz)	5 mg PO bid	Side Effects: diarrhea, nasopharyngitis, upper respiratory infections, headache hypertension, increased LFT, dyslipidemia, cytopenias have been reported Comments: screening for tuberculosis recommended, increased incidence of solid cancers detected

ANA, Antinuclear antibodies; **CNS**, central nervous system; **COPD**, chronic obstructive pulmonary disease; **GI**, gastrointestinal; **UTI**, urinary tract Infection.

Sedative-Hypnotics

Uses

Treatment of insomnia (i.e., difficulty falling asleep initially, frequent awakening, awakening too early).

Action

Benzodiazepines are the most widely used agents and largely replace barbiturates due to greater safety, lower incidence of drug dependence. Benzodiazepines nonselective bind to at least three receptor subtypes accounting for sedative, anxiolytic, relaxant, and anticonvulsant properties. Benzodiazepines enhance the effect of the inhibitory neurotransmitter gamma-aminobutyric acid (GABA), which inhibits impulse transmission in the CNS reticular formation in brain. Benzodiazepines decrease sleep latency, number of nocturnal awakenings, and time spent in awake stage of sleep; increase total sleep time. The *nonbenzodiazepines* zaleplon and Zolpidem preferentially bind with one receptor subtype, reducing sleep latency and nocturnal awakenings and increasing total sleep time. Ramelteon is a selective agonist of melatonin receptors (responsible for determining circadian rhythms and synchronizing sleep-wake cycles).

Sedative-Hypnotics

Name	Availability	Dosage Range	Side Effects
Benzodiazepines			
Estazolam	T: 1 mg, 2 mg	A: 1–2 mg E: 0.5–1 mg	Daytime sedation, memory and psychomotor impairment, -tolerance, withdrawal reactions, rebound insomnia, dependence
Flurazepam	C: 15 mg, 30 mg	A/E: 15–30 mg E: 15 mg	Headaches, unpleasant taste, dry mouth, dizziness, anxiety, nausea
Temazepam	C: 7.5 mg, 15 mg,	A: 15–30 mg	Same as flurazepam

(Restoril)	30 mg	E: 7.5–15 mg	
Nonbenzodiazepines			
Doxepin (Silenor)	T: 3 mg, 6 mg	A, E: 3–6 mg	Somnolence, dizziness, nausea, upper respiratory tract infections, nasopharyngitis, hypertension, headache
Eszopiclone (Lunesta)	T: 1 mg, 2 mg, 3 mg	A: 1–3 mg E: 1–2 mg	Headaches, unpleasant taste, dry mouth, dizziness, anxiety, nausea
Ramelteon (Rozerem)	T: 8 mg	A, E: 8 mg	Headaches, dizziness, fatigue, nausea
Suvorexant (Belsomra)	T: 5 mg, 10 mg, 15 mg, 20 mg	A, E: 10–20 mg	Next day somnolence, leg weakness
Zaleplon (Sonata)	C: 5 mg, 10 mg	A: 10–20 mg E: 5 mg	Headaches, dizziness, myalgia, drowsiness, asthenia, abdominal pain
Zolpidem (Ambien, Ambien CR, Edluar, Intermezzo, Zolpimist)	T: 5 mg, 10 mg CR: 6.25 mg, 12.5 mg SL (Edluar): 5 mg, 10 mg (Intermezzo): 1.75 mg, 3.5 mg OS: 5 mg/actuation	OS, T, SL (Edluar): 5 mg (females, elderly); 5–10 mg (males) (Intermezzo): 1.75 mg (females, elderly); 3.5 mg (males) CR: 6.25 mg (females, elderly); 6.25–12.5 mg (males)	Dizziness, daytime drowsiness, headaches, confusion, depression, hangover, asthenia

A, Adults; **C**, capsules; **CR**, controlled-release; **E**, elderly; **OS**, oral solution; **SL**, sublingual; **T**, tablets.

Skeletal Muscle Relaxants

Uses

Central acting muscle relaxants: Adjunct to rest, physical therapy for relief of discomfort associated with acute, painful musculoskeletal disorders (i.e., local spasms from muscle injury).

Baclofen, dantrolene, diazepam: Treatment of spasticity characterized by heightened muscle tone, spasm, loss of dexterity caused by multiple sclerosis, cerebral palsy, spinal cord lesions, CVA.

Action

Central acting muscle relaxants: Exact mechanism unknown. May act in CNS at various levels to depress polysynaptic reflexes; sedative effect may be responsible for relaxation of muscle spasm.

Baclofen, diazepam: May mimic actions of gamma-aminobutyric acid on spinal neurons; do not directly affect skeletal muscles.

Dantrolene: Acts directly on skeletal muscle, relieving spasticity.

Skeletal Muscle Relaxants

Name	Indication	Dosage Range	Side Effects/Comments
Baclofen (Lioresal)	Spasticity associated with multiple sclerosis, spinal cord injury	Initially 5 mg 3 times/day Increase by 5 mg 3 times/day q3days Maximum: 20 mg 4 times/day	Drowsiness, dizziness, GI effects Caution with renal impairment, seizure disorders Withdrawal syndrome (e.g., hallucinations, psychosis, seizures)
Carisoprodol (Rela)	Discomfort due to acute, painful, musculoskeletal conditions	250–350 mg 4 times/day	Drowsiness, dizziness, GI effects Hypomania at higher than recommended doses Withdrawal syndrome Hypersensitivity reaction (skin reaction, bronchospasm, weakness, burning eyes, fever) or idiosyncratic reaction (weakness, visual or motor disturbances, confusion) usually occurring within first 4 doses
Chlorzoxazone (Lorzone)	Discomfort due to acute, painful, musculoskeletal conditions	Initially 250–500 mg 3–4 times/day Maximum: 750 mg 3–4 times/day	Drowsiness, dizziness, GI effects, rare hepatotoxicity Hypersensitivity reaction (urticaria, itching) Urine discoloration to orange, red, or purple
Cyclobenzaprine (Flexeril)	Muscle spasm, pain, tenderness, restricted movement due to acute, painful, musculoskeletal conditions	Initially 5–10 mg 3 times/day	Drowsiness, dizziness, GI effects Anticholinergic effects (dry mouth, urinary retention) Quinidine-like effects on heart (QT prolongation) Long half-life
Dantrolene - (Dantrium)	Spasticity associated with multiple sclerosis, cerebral palsy, spinal cord injury	Initially 25 mg/day for 1 wk, then 25 mg 3 times/day for 1 wk, then 50 mg 3 times/day for 1 wk, then 100 mg 3 times/day Maximum: 100 mg 4 times/day	Drowsiness, dizziness, GI effects Contraindicated with hepatic disease Dose-dependent hepatotoxicity Diarrhea that is dose dependent and may be severe, requiring discontinuation
Diazepam (Valium)	Spasticity associated with cerebral palsy, spinal cord injury; reflex spasm due to muscle, joint trauma or inflammation	2–10 mg 3–4 times/day	Drowsiness, dizziness, GI effects Abuse potential

Metaxalone - (Skelaxin)	Discomfort due to acute, painful, musculoskeletal conditions	800 mg 3–4 times/day	Drowsiness (low risk), dizziness, GI effects Paradoxical muscle cramps Mild withdrawal syndrome Contraindicated in serious hepatic or renal disease
Methocarbamol (Robaxin)	Discomfort due to acute, painful, musculoskeletal conditions	Initially 1,500 mg 4 times/day Maintenance: 1,000 mg 4 times/ day	Drowsiness, dizziness, GI effects Urine discoloration to brown, brown-black, or green
Orphenadrine - (Norflex)	Discomfort due to acute, painful, musculoskeletal conditions	100 mg 2 times/day	Drowsiness, dizziness, GI effects Long half-life Anticholinergic effects (dry mouth, urinary retention) Rare aplastic anemia Some products may contain sulfites
Tizanidine - (Zanaflex)	Spasticity	Initially 4 mg q6–8h (maximum 3 times/day), may increase by 2–4 mg as needed/tolerated Maximum: 36 mg (limited information on doses greater than 24 mg)	Drowsiness, dizziness, GI effects Hypotension (20% decrease in B/P) Hepatotoxicity (usually reversible) Withdrawal syndrome (hypertension, tachycardia, hypertonia) Effect is short lived (3–6 hrs) Dose cautiously with creatinine clearance less than 25 ml/min

B/P, Blood pressure; *GI*, gastrointestinal.

Smoking Cessation Agents

Tobacco smoking is associated with the development of lung cancer and chronic obstructive pulmonary disease. Smoking is harmful not just to the smoker but also to family members, coworkers, and others breathing cigarette smoke.

Quitting smoking decreases the risk of developing lung cancer, other cancers, heart disease, stroke, and respiratory illnesses. Several medications have proved useful as smoking cessation aids. Nausea and light-headedness are possible signs of overdose of nicotine warranting a reduction in dosage.

Smoking Cessation Agents

Name	Availability	Dose Duration	Cautions/Side Effects	Comments
Bupropion (Zyban)	T: 150 mg	150 mg every morning for 3 days, then 150 mg 2 times/day Start 1–2 wks before quit date Duration: 7–12 wks up to 6 mos for	History of seizure, eating disorder, use of MAOI within previous 14 days, bipolar disorder Side Effects: Insomnia, dry mouth, tremor, rash	Stop smoking during second wk of treatment and use counseling support services along with medication

		maintenance		
Clonidine - (Catapres, - Catapres-TTS)	T: 0.1 mg, 0.2 mg Patch: 0.1 mg/24 hrs, 0.2 mg/24 hrs, 0.3 mg/24 hrs	Oral: 0.15–0.75 mg/day Patch: 0.1–0.2 mg daily Duration: 3–10 wks	Rebound hypertension. Side Effects: Dry mouth, drowsiness, dizziness, sedation, constipation	Abrupt discontinuation can result in anxiety, agitation, headaches, tremors accompanied or followed by rapid rise in B/P
Nicotine gum - (Nicorette)	Squares: 2 mg, 4 mg	1 gum q1–2h for 6 wks, then q2–4h for 3 wks then q4–8h for 3 wks Maximum: 24 pieces/day Duration: up to 12 wks	Recent MI (within 2 wks), - serious arrhythmias, serious or worsening angina pectoris Side Effects: Dyspepsia, mouth soreness, hiccups	2 mg recommended for pts smoking less than 25 cigarettes/day, 4 mg for pts smoking 25 or more cigarettes/day Chew until a peppery or minty taste emerges and then “park” between cheek and gums to facilitate nicotine absorption through oral mucosa Chew slowly and intermittently to avoid jaw ache and achieve maximum benefit Only water should be taken 15 min before and during chewing
Nicotine inhaler (Nicotrol)	Cartridge: 10 mg (delivers 4 mg - nicotine)	4–16 cartridges daily; taper frequency of use over the last 6–12 wks Duration: up to 6 mos	Recent MI (within 2 wks), - serious arrhythmias, serious or worsening angina pectoris Side Effects: Local irritation of mouth and throat, coughing, rhinitis	Use at or above room temperature (cold temperatures decrease amount of nicotine inhaled)
Nicotine lozenge (Nicorette Lozenges)	Lozenges: 2 mg, 4 mg	One lozenge q 1–2h for 6 wks, then q2–4h for 3 wks, then q4–8h for 3 wks Duration: 12 wks Maximum: 5 lozenges in 6 hrs; 20 lozenges in 1 day	Recent MI (within 2 wks), - serious arrhythmias, serious or worsening angina pectoris Side Effects: Local skin reaction, insomnia, nausea, sore throat	First cigarette smoked within 30 min of waking, use 4 mg; after 30 min of waking, use 2 mg Use at least 9 lozenges/day first 6 wks Only 1 lozenge at a time, 5 per 6 hrs and 20 per 24 hrs Do not chew or swallow
Nicotine nasal spray (Nicotrol NS)	10 mg/ml (delivers 0.5 mg/spray)	8–40 doses/day A dose consists of one 0.5 mg delivery to each nostril; initial dose is 1–2 sprays/hr, increasing as needed	Recent MI (within 2 wks), - serious arrhythmias, serious or worsening angina pectoris Side Effects: Nasal irritation	Do not sniff, swallow, or inhale through nose while administering nicotine doses (may increase irritation) Tilt head back

		Duration: 3-6 mos		slightly for best results
Nicotine patch (NicoDerm CQ)	Nicoderm CQ: 7 mg/24 hrs, 14 mg/24 hrs, 21 mg/24 hrs Nicotrol: 5 mg/16 hrs, 10 mg/16 hrs, 15 mg/16 hrs	Apply upon waking on quit date: Nicoderm CQ (greater than 10 cigarettes/day): 21 mg/24 hrs for 4 wks, then 14 mg/24 hrs for 2 wks, then 7 mg/24 hrs for 2 wks (10 or fewer cigarettes/day): 14 mg/24 hrs for 6 wks, then 7 mg/24 hrs for 2 wks	Recent MI (within 2 wks), serious arrhythmias, serious or worsening angina pectoris Side Effects: Local skin reaction, insomnia	The 16- and 24-hr patches are of comparable efficacy Begin with a lower-dose patch in pts smoking 10 or fewer cigarettes/day Place new patch on relatively hair-free location, usually between neck and waist, in the morning If insomnia occurs, remove the 24-hr patch prior to bedtime or use the 16-hr patch Rotate patch site to diminish skin irritation
Nortriptyline (Pamelor)	T: 25 mg, 50 mg, 75 mg, 100 mg	Initially 25 mg/day, increasing gradually to target dose of 75–100 mg/day 10–28 days prior to selected “quit” date, continue for 12 wks or more after “quit” day Duration: up to 12 wks	Risk of arrhythmias Side Effects: Sedation, dry mouth, blurred vision, urinary retention, light-headedness, shaky hands	Initiate therapy 10–28 days before the quit date to allow steady state of nortriptyline at target dose
Varenicline (Chantix)	T: 0.5 mg, 1 mg	Days 1–3: 0.5 mg daily; days 4–7: 0.5 mg 2 times/day; day 8 to end of treatment: 1 mg 2 times/day Duration: begin 1 wk before set quit date, continue for 12 wks. May use additional 12 wks if failed to quit after first 12 wks	Side Effects: Nausea; sleep disturbances; headaches; may impair ability to drive, operate machinery; depressed mood; altered behavior; suicidal ideation reported	Use lower dosage if not able to tolerate nausea and vomiting Use counseling support services along with medication

B/P, Blood pressure; **MAOI**, monoamine oxidase inhibitor; **MI**, myocardial infarction; **T**, tablets.

Vitamins

Introduction

Vitamins are organic substances required for growth, reproduction, and maintenance of health and are obtained from food or supplementation in small quantities (vitamins cannot be synthesized by the body or the rate of synthesis is too slow/inadequate to meet metabolic needs). Vitamins are essential for energy transformation and regulation of metabolic processes. They are catalysts for all reactions using proteins, fats, carbohydrates for energy, growth, and cell maintenance.

Water Soluble

Water-soluble vitamins include vitamin C (ascorbic acid), B₁ (thiamine), B₂ (riboflavin), B₃ (niacin), B₅ (pantothenic acid), B₆ (pyridoxine), folic acid, B₁₂ (cyanocobalamin). Water-soluble vitamins act as coenzymes for almost every cellular reaction in the body. B-complex vitamins differ from one another in both structure and function but are grouped together because they first were isolated from the same source (yeast and liver).

Fat Soluble

Fat-soluble vitamins include vitamins A, D, E, and K. They are soluble in lipids and are usually absorbed into the lymphatic system of the small intestine and then into the general circulation. Absorption is facilitated by bile. These vitamins are stored in the body tissue when excessive quantities are consumed. May be toxic when taken in large doses (see sections on individual vitamins).

Vitamins

--	--	--	--

Name	Uses	Deficiency	Side Effects
Vitamin A (Aquasol A)	Required for normal growth, bone development, vision, reproduction, maintenance of epithelial tissue	Dry skin, poor tooth development, night blindness	High dosages: Hepatotoxicity, cheilitis, facial dermatitis, photosensitivity, mucosal dryness
Vitamin B₁ (thiamine)	Important in red blood cell formation, carbohydrate metabolism, neurologic function, myocardial contractility, growth, energy production	Fatigue, anorexia, growth retardation	Large parenteral doses: May cause pain on injection
Vitamin B₂ (riboflavin)	Necessary for function of coenzymes in oxidation-reduction reactions, essential for normal cellular growth, assists in absorption of iron and pyridoxine	Numbness in extremities, blurred vision, photophobia, cheilosis	Orange-yellow discoloration in urine
Vitamin B₃ (niacin)	Coenzyme for many oxidation-reduction reactions	Pellegra, headache, anorexia, memory loss, insomnia	High dosages (more than 500 mg): Nausea, vomiting, diarrhea, gastritis, hepatotoxicity, skin rash, facial flushing, headaches
Vitamin B₅ (pantothenic acid)	Precursor to coenzyme A, important in synthesis of cholesterol, hormones, fatty acids	Natural deficiency unknown	Occasional GI disturbances (e.g., diarrhea)
Vitamin B₆ (pyridoxine)	Enzyme cofactor for amino acid metabolism, essential for erythrocyte production, Hgb synthesis	Neuritis, anemia, lymphopenia	High dosages: May cause sensory neuropathy
Vitamin B₁₂ (cyanocobalamin)	Coenzyme in cells, including bone marrow, CNS, and GI tract, necessary for lipid metabolism, formation of myelin	Gastrointestinal disorders, anemias, poor growth	Skin rash, diarrhea, pain at injection site
Vitamin C (ascorbic acid)	Cofactor in various physiologic reactions, necessary for collagen formation, acts as antioxidant	Poor wound healing, bleeding gums, scurvy	High dosages: May cause calcium oxalate crystalluria, esophagitis, diarrhea
Vitamin D (Calciferol)	Necessary for proper formation of bone, calcium, mineral homeostasis, regulation of parathyroid hormone, calcitonin, phosphate	Rickets, osteomalacia	Hypercalcemia, kidney stones, renal failure, hypertension, psychosis, diarrhea, nausea, vomiting, anorexia, fatigue, headaches, altered mental status
Vitamin E (Aquasol E)	Antioxidant, promotes formation, functioning of red blood cells, muscle, other tissues	Red blood cell breakdown	High dosages: GI disturbances, malaise, headaches

CNS, Central nervous system; *F*, females; *GI*, gastrointestinal; *M*, males.

A

abacavir

a-**bak**-a-veer

Ziagen

Fixed-Combination(s)

Epzicom: abacavir/lamiVUDine (antiretroviral): 600 mg/300 mg. **Triumeq:** abacavir/dolutegravir (integrase inhibitor)/lamiVUDine (antiretroviral): 600 mg/50 mg/300 mg. **Trizivir:** abacavir/lamiVUDine (antiretroviral)/zidovudine (antiretroviral): 300 mg/150 mg/300 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antiretroviral agent.

CLINICAL: Antiviral.

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal hypersensitivity reactions, lactic acidosis, severe hepatomegaly with steatosis (fatty liver) have occurred.

Uses

Treatment of HIV-1 infection, in combination with at least two other antiretroviral agents.

Precautions

Contraindications: Hypersensitivity to abacavir (do **not** rechallenge). Pts testing positive for the HLA-B *5701 allele are at increased risk for hypersensitivity reaction. Moderate or severe hepatic impairment. **Cautions:**

Mild hepatic disease. Pts at risk for coronary heart disease (e.g., hypertension, hyperlipidemia, diabetes, smoking). Pts at risk for hepatotoxicity (e.g., female gender, obesity), pts with plasma HIV RNA levels greater than 100,000 copies/mL.

Action

Interferes with HIV viral RNA-dependent DNA polymerase. **Therapeutic Effect:** Inhibits/prevents HIV replication in infected cells.

Pharmacokinetics

Rapidly absorbed after PO administration. Widely distributed, including to cerebrospinal fluid (CSF) and erythrocytes. Metabolized in liver. Protein binding: 50%. Primarily excreted in urine. Unknown if removed by hemodialysis. **Half-life:** 1.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if excreted in breast milk. Breastfeeding not recommended (may increase potential for HIV transmission, adverse effects). **Children:** Safety and efficacy not established in pts less than 3 mos of age. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Alcohol may increase concentration, risk of toxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, ALT, AST, CPK, GGT, blood glucose, triglycerides. May decrease Hgb, leukocytes, lymphocytes.

Availability (Rx)

Solution, Oral: 20 mg/mL. **Tablets:** 300 mg.

Administration/handling

PO

- May give without regard to food.
- Oral solution may be refrigerated. Do not freeze.

Indications/routes/dosage

HIV Infection (in Combination with Other Antiretrovirals)

PO: ADULTS, ELDERLY: 300 mg twice daily or 600 mg once daily. **CHILDREN 3 MOS–16 YRS:** Oral solution (weight-based dosing): 8 mg/kg twice daily or 16 mg/kg once daily. **Maximum:** 300 mg twice daily. (Alternative dosing) **CHILDREN 14 KG OR GREATER:** Tablets, oral solution (weight-based dosing): **14–19 kg:** 150 mg (1/2 tab) twice daily or 300 mg once daily. **20–24 kg:** 150 mg (1/2 tab) in am, 300 mg (1 tab) in pm or 450 mg once daily. **25 kg or greater:** 300 mg (1 tab) twice daily or 600 mg once daily.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild Impairment: 200 mg twice daily (oral solution recommended). **Moderate to Severe Impairment:** Not recommended (contraindicated by manufacturer).

Side effects

ADULT:Frequent (47%–11%): Nausea, nausea with vomiting, diarrhea, decreased appetite. **Occasional (39%–11%):** Insomnia. **CHILDREN:** **Frequent:** Nausea with vomiting, fever, headache, diarrhea, rash. **Occasional (9%):** Decreased appetite.

Adverse effects/toxic reactions

Hypersensitivity reaction may be life-threatening. Signs and symptoms include fever, rash, fatigue, intractable nausea/vomiting, severe diarrhea, abdominal pain, cough, pharyngitis, dyspnea. Life-threatening hypotension may occur. Lactic acidosis, severe hepatomegaly with steatosis may occur.

Nursing considerations

Baseline assessment

Obtain CBC, LFT before beginning therapy and at periodic intervals during therapy. Question history of hypersensitivity reaction. Question for possibility of pregnancy. Increased risk of sensitivity (cutaneous, GI, pulmonary) in those with positive HLA-B*5701 genotype status. Offer emotional support.

Intervention/evaluation

Stop abacavir if 3 or more of the following occur: rash, fever, GI disturbances (diarrhea, nausea, vomiting), flu-like symptoms, respiratory difficulty. Assess for nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Assess dietary pattern; monitor for weight loss. Monitor lab values, hepatic function.

Patient/family teaching

- Immediately report allergic reactions of any kind.
- Do not take any medications, including OTC drugs, without consulting physician.
- Avoid alcohol.
- Small, frequent meals may offset anorexia, nausea.
- Abacavir is not a cure for HIV infection, nor does it reduce risk of transmission to others.
- Pt must continue practices to prevent HIV transmission.

abaloparatide

a-bal-oh-par-a-tide

Tymlos

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Parathyroid hormone receptor agonist.

CLINICAL: Osteoporosis agent.

■ **BLACK BOX ALERT** ■ May cause a dose-dependent increase in the incidence of osteosarcoma. It is unknown whether abaloparatide will cause osteosarcoma in humans. Avoid use in pts at risk for osteosarcoma (e.g., pts

with Paget's disease of bone or unexplained elevations of alkaline phosphatase, pediatric and young adults with open epiphyses, pts with bone metastasis or skeletal malignancies, hereditary disorders predisposing to osteosarcoma, or prior history of external beam or implant radiation involving the skeleton. Cumulative use of parathyroid analogs (e.g., teriparatide) for more than 2 yrs during a pt's lifetime is not recommended.

Do not confuse abaloparatide with teriparatide.

Uses

Treatment of postmenopausal women with osteoporosis at high risk for fracture, defined as history of osteoporotic fracture, multiple risk factors for fracture, or pts who have failed or are intolerant to other osteoporosis therapy.

Precautions

Contraindications: Hypersensitivity to abaloparatide. **Cautions:** Pts at risk for hypercalcemia (e.g., hyperparathyroidism, renal impairment, severe dehydration; history of hypercalciuria, urolithiasis). Avoid use in pts at increased risk for osteosarcoma (e.g., pts with Paget's disease of bone or unexplained elevations of alkaline phosphatase, open epiphyses, bone or skeletal malignancies, hereditary disorders predisposing to osteosarcoma, prior radiation therapy involving the skeleton). Not recommended in pts with cumulative use of parathyroid analogs greater than 2 yrs during lifetime.

Action

Bone formation predominates at low dose. **Therapeutic Effect:** Increases bone mineral density and bone formation markers, decreasing risk of vertebral and nonvertebral fractures.

Pharmacokinetics

Widely distributed. Metabolism not specified. Degraded into small peptides via proteolytic enzymes. Protein binding: 70%. Peak plasma concentration: 0.51 hrs. Excreted primarily in urine. Not expected to be removed by dialysis. **Half-life:**

1.7 hrs.

Lifespan considerations

Pregnancy/Lactation: Not indicated in females of reproductive potential. Unknown if distributed in breast milk or crosses the placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum calcium, uric acid; urine calcium.

Availability (Rx)

Prefilled Injector Pens: 3120 mcg/1.56 mL (2000 mcg/mL). Delivers 30 doses of 80 mcg.

Administration/handling

Subcutaneous

- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless.
- Do not use if solution is cloudy, discolored, or if visible particles are observed.
- Insert needle subcutaneously into the periumbilical region of the abdomen (avoid a 2-inch area around the navel) and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Do not administer IV or intramuscularly.
- Rotate injection sites.

Storage

- Refrigerate unused injector pens.
- After first use, store at room temperature for up to 30 days.
- Do not freeze or expose to heating sources.

Indications/Routes/Dosage

Postmenopausal Osteoporosis

SQ: ADULTS, ELDERLY: 80 mcg once daily. Give with supplemental calcium and vitamin D if dietary intake is inadequate.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Not specified; use caution.

Side Effects

Frequent (58%): Injection site reactions (edema, pain, redness). **Occasional (10%–5%):** Dizziness, nausea, headache, palpitations. **Rare (3%–2%):** Fatigue, upper abdominal pain, vertigo.

Adverse Effects/Toxic Reactions

May increase risk of osteosarcoma. Hypercalcemia reported in 3% of pts. Tachycardia occurred in 2% of pts (usually within 15 min after injection). Orthostatic hypotension reported in 4% of pts (usually within 4 hrs after injection). Hypercalciuria and urolithiasis reported in 20% and 2% of pts, respectively. Immunogenicity (auto-antibodies) occurred in 49% of pts.

Nursing Considerations

Baseline Assessment

Obtain baseline parathyroid hormone level. Screen for risk of osteosarcoma, hypercalcemia (as listed in Precautions); prior use of parathyroid analogs. Assess pt's willingness to self-inject medication.

Intervention/Evaluation

Monitor bone mineral density, parathyroid hormone level; serum calcium. Monitor urinary calcium levels, esp. in pts with preexisting hypercalciuria or

active urolithiasis. Due to risk of orthostatic hypotension, administer the first several doses with the pt in the lying or sitting position. Monitor for orthostatic hypotension (dizziness, palpitations, tachycardia, nausea, syncope). If orthostatic hypotension occurs, place pt in supine position. Assess need for calcium, vitamin D supplementation.

Patient/Family Teaching

- Receive the first several injections while lying or sitting down. Slowly go from lying to standing to avoid an unusual drop in blood pressure. Immediately sit or lie down if dizziness, near-fainting, palpitations occur.
- Report symptoms of high calcium levels (e.g., constipation, lethargy, nausea, vomiting, weakness); severe bone pain.
- An increased heart rate may occur after injection and will usually subside within 6 hrs.
- A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Vitamin D and calcium supplementation may be required if dietary intake is inadequate.

abatacept

a-bay-ta-sept

Orencia

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Selective T-cell costimulation modulator.

CLINICAL: Rheumatoid arthritis agent.

Do not confuse Orencia with Oracea.

TOP
100

Uses

Reduction of signs and symptoms, progression of structural damage in adults with moderate to severe rheumatoid arthritis (RA) alone or in combination with other disease-modifying antirheumatic medications. Treatment of active adult psoriatic arthritis. Treatment of moderate to severe active polyarticular juvenile idiopathic arthritis in pts 2 yrs and older. May use alone or in combination with methotrexate. Note: Do not use with anakinra or tumor necrosis factor [TNF]

antagonists.

Precautions

Contraindications: Hypersensitivity to abatacept. **Cautions:** Chronic, latent, or localized infection; conditions predisposing to infections (diabetes, indwelling catheters, renal failure, open wounds); COPD (higher incidence of adverse effects); elderly, hx recurrent infections.

Action

Inhibits T-lymphocyte activation, necessary in the inflammatory cascade leading to joint inflammation and destruction. Blocks production of inflammatory mediators. **Therapeutic Effect:** Induces positive clinical response in adult pts with moderate to severely active RA or juvenile idiopathic arthritis.

Pharmacokinetics

Higher clearance with increasing body weight. Age, gender do not affect clearance. **Half-life:** 8–25 days.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. **Elderly:** Cautious use due to increased risk of serious infection and malignancy.

Interactions

DRUG: May increase risk of infection, decrease efficacy of immune response associated with **live vaccines** (do not give concurrently or within 2 mos of stopping abatacept). **Tumor necrosis factor (TNF) antagonists (adalimumab, etanercept, inFLIXimab)** may increase risk of infection. **HERBAL:** **Echinacea** may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

IV Injection, Powder for Reconstitution: 250 mg. **Subcutaneous Injection, Solution:** 50 mg/0.4 mL, 87.5 mg/0.7 mL, 125 mg/mL single-dose prefilled syringe.

Administration/handling

IV

Reconstitution

- Reconstitute each vial with 10 mL Sterile Water for Injection using the silicone-free syringe provided with each vial and an 18- to 21-gauge needle.
- Rotate solution gently to prevent foaming until powder is completely dissolved.
- From a 100-mL 0.9% NaCl infusion bag, withdraw and discard an amount equal to the volume of the reconstituted vials (for 2 vials remove 20 mL, for 3 vials remove 30 mL, for 4 vials remove 40 mL), resulting in final volume of 100 mL.
- Slowly add the reconstituted solution from each vial into the infusion bag using the same syringe provided with each vial.
- Concentration in the infusion bag will be 10 mg/mL or less abatacept.

Rate of Administration

- Infuse over 30 min using a 0.2 to 1.2 micron low protein-binding filter.

Storage

- Store vials, prefilled syringes in refrigerator.
- Any reconstitution that has been prepared by using siliconized syringes will develop translucent particles and must be discarded.
- Solution should appear clear and colorless to pale yellow. Discard if solution is discolored or contains precipitate.
- Solution is stable for up to 24 hrs after reconstitution.
- Reconstituted solution may be stored at room temperature or refrigerated.

Subcutaneous

- Allow syringe to warm to room temperature (30–60 min).
- Inject in front of thigh, outer areas of upper arms, or abdomen.
- Avoid areas that are tender, bruised, red, scaly, or hard.
- Do not rub injection site.
- Rotate injection sites.

■ IV incompatibility

Do not infuse concurrently in same IV line as other agents.

Indications/routes/dosage

Note: Discontinue in pts developing serious infection.

Rheumatoid Arthritis (RA), Psoriatic Arthritis

IV: BODY WEIGHT 101 KG OR MORE: 1 g (4 vials) given as a 30-min infusion. Following initial therapy, give at 2 wks and 4 wks after first infusion, then q4wks thereafter. **BODY WEIGHT 60–100 KG:** 750 mg (3 vials) given as a 30-min infusion. Following initial therapy, give at 2 wks and 4 wks after first infusion, then q4wks thereafter. **BODY WEIGHT 59 KG OR LESS:** 500 mg (2 vials) given as a 30-min infusion. Following initial therapy, give at 2 wks and 4 wks after first infusion, then q4wks thereafter.

Subcutaneous: Following a single IV infusion, 125 mg given within 24 hrs of infusion, then 125 mg once a week (subcutaneous administration may be initiated without an IV loading dose). **Transitioning from IV to SQ:** Give 1st SQ dose instead of next scheduled IV dose.

Juvenile Idiopathic Arthritis

Note: Dose based on body weight at each administration. **IV:CHILDREN 6 YRS AND OLDER, WEIGHING LESS THAN 75 KG:** 10 mg/kg. **CHILDREN WEIGHING 75–100 KG:** 750 mg. **GREATER THAN 100 KG:** 1,000 mg. Following initial therapy, give 2 wks and 4 wks after first infusion, then q4wks thereafter.

Dosage Adjustment for Toxicity

Discontinue in pts developing a serious infection.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (18%): Headache. **Occasional (9%–6%):** Dizziness, cough, back pain, hypertension, nausea.

Adverse effects/toxic reactions

Upper respiratory tract infection, nasopharyngitis, sinusitis, UTI, influenza, bronchitis occur in 5% of pts. Serious infections, including pneumonia, cellulitis, diverticulitis, acute pyelonephritis, occur in 3% of pts. Hypersensitivity reaction (rash, urticaria, hypotension, dyspnea) occurs rarely. May increase risk of malignancies.

Nursing considerations

Baseline assessment

Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joint for immobility, deformities, skin condition. Screen for latent TB infection prior to initiating therapy.

Intervention/evaluation

Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor for hypersensitivity reaction. Diligently screen for infection.

Patient/family teaching

- Notify physician if infection, hypersensitivity reaction, infusion-related reaction occurs.
- Do not receive live vaccines during treatment or within 3 mos of its discontinuation.
- COPD pts must report worsening of respiratory symptoms.

abciximab

ab-sik-si-mab

HIGH
ALERT

ReoPro

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Glycoprotein IIb/IIIa receptor inhibitor.

CLINICAL: Antiplatelet; antithrombotic.

Uses

Adjunct to aspirin and heparin therapy to prevent cardiac ischemic complications in pts undergoing percutaneous coronary intervention (PCI) and those with unstable angina not responding to conventional medical therapy when PCI is planned within 24 hrs. **OFF-LABEL:** Support PCI during ST-segment elevation myocardial infarction (STEMI).

Precautions

Contraindications: Hypersensitivity to abciximab. Active internal bleeding, arteriovenous malformation or aneurysm, CVA with residual neurologic deficit, history of CVA (within the past 2 yrs) or oral anticoagulant use within the past 7 days unless PT is less than 1.2 times control, history of vasculitis, hypersensitivity to murine proteins, intracranial neoplasm, prior IV dextran use before or during percutaneous transluminal coronary angioplasty (PTCA), recent surgery or trauma (within the past 6 wks), recent GI or GU bleeding (within the past 6 wks), thrombocytopenia (less than 100,000/mm³), and severe uncontrolled hypertension. Concomitant use of another glycoprotein IIb/IIIa inhibitor. **Cautions:** Increased risk of bleeding in pts who weigh less than 75 kg; pts older than 65 yrs; pts with history of GI disease; pts receiving thrombolytics; PTCA in less than 12 hrs of onset of symptoms for acute MI; prolonged PTCA (longer than 70 min); failed PTCA.

Action

Binds to GP IIb/IIIa receptor sites on platelets. **Therapeutic Effect:** Inhibits platelet aggregation.

Pharmacokinetics

Rapidly cleared from plasma. Initial-phase half-life is less than 10 min; second-phase half-life is 30 min.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety

and efficacy not established. **Elderly:** Increased risk of major bleeding.

Interactions

DRUG: Alteplase, apixaban, argatroban, aspirin, clopidogrel, dipyridamole, ibuprofen, naproxen, rivaroxaban, warfarin may increase risk of bleeding.

HERBAL: Glucosamine, herbals with anticoagulant/antiplatelet activity (e.g., ginseng, ginkgo) may increase risk of bleeding. **FOOD:** None known.

LAB VALUES: Increases activated clotting time (ACT), prothrombin time (PT), activated partial thromboplastin time (aPTT); decreases platelet count.

Availability (Rx)

Injection Solution: 2 mg/mL (5-mL vial).

Administration/handling

IV

Reconstitution

- **Bolus dose:** Withdraw bolus dose into syringe using a 0.2 or 0.5 micron low protein-binding filter.
- **Continuous infusion:** Withdraw dose through a 0.2 or 0.5 micron low protein-binding filter and further dilute into 250 mL D₅W or 0.9% NaCl.

Rate of Administration

- Bolus given over 1 min.

Administration Precautions

- Give in separate IV line; do not add any other medication to infusion.
- For bolus injection and continuous infusion, use sterile, nonpyrogenic, low protein-binding 0.2 or 0.22 micron filter.

Storage

- Store vials in refrigerator.
- Solution appears clear, colorless.
- Do not shake.
- Prepared solution is stable for 12 hrs. Discard any unused portion left in vial or if preparation contains opaque particles.

■ IV incompatibility

Administer in separate line; no other medication should be added to infusion solution.

■ IV Compatibilities

Adenosine (Adenocard), argatroban, atropine sulfate, bivalirudin (Angiomax), diphenhydrAMINE (Benadryl), fentaNYL (Sublimaze), metoprolol (Lopressor), midazolam (Versed).

Indications/routes/dosage

Percutaneous Coronary Intervention (PCI)

IV Bolus: ADULTS: 0.25 mg/kg 10–60 min before PCI, then 12-hr IV infusion of 0.125 mcg/kg/min. **Maximum:** 10 mcg/min.

PCI (Unstable Angina)

IV Bolus: ADULTS: 0.25 mg/kg, followed by 18- to 24-hr infusion of 10 mcg/min, ending 1 hr after procedure.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (16%–12%): Nausea, hypotension. **Occasional (9%):** Vomiting. **Rare (3%):** Bradycardia, confusion, dizziness, pain, peripheral edema, UTI.

Adverse effects/toxic reactions

Major bleeding complications may occur. Hypersensitivity reaction may occur. Atrial fibrillation or flutter, pulmonary edema, complete AV block occur occasionally.

Nursing considerations

Baseline assessment

Concomitant heparin gtt should be discontinued 4 hrs before arterial sheath removal (or per facility protocol). Maintain pt on bed rest for 6–8 hrs following sheath removal or drug discontinuation, whichever is later. Check platelet count, PT, aPTT, PFA before infusion (assess for preexisting blood abnormalities), 2–4 hrs following treatment, and at 24 hrs or before discharge, whichever is first. Check insertion site, distal pulse of affected limb while femoral artery sheath is in place, and then routinely for 6 hrs following femoral artery sheath removal. Minimize need for injections, blood draws, catheters, other invasive procedures.

Intervention/evaluation

Monitor ACT, PT, aPTT, platelet count, Hgb, Hct. Stop abciximab and/or heparin infusion if serious bleeding occurs that is uncontrolled by pressure. Observe for mental status changes, headache, stroke-like symptoms, evidence of intracranial hemorrhage. Assess skin for ecchymosis, petechiae, particularly at femoral arterial access, also at catheter insertion, arterial and venous puncture, cutdown, needle sites. Handle pt carefully and as infrequently as possible to prevent bleeding. Do not obtain B/P in lower extremities (possible deep vein thrombi). Assess for decrease in B/P, increase in pulse rate, complaint of abdominal or back pain, evidence of GI hemorrhage. Question for increase in discharge during menses. Assess urinary output for hematuria. Monitor for hematoma. Use care in removing any dressing, tape.

Patient/family teaching

- Assess skin for bruising up to 3 days after infusion.
- Report signs of bleeding such as bloody stool or urine, nosebleeds. Immediately report symptoms of bleeding into the brain such as confusion, difficulty speaking, headache, one-sided weakness, seizures, vision loss.
- Do not take herbal supplements unless approved by physician who originally started therapy.

abiraterone

a-bir-a-ter-one

Zytiga

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Androgen biosynthesis inhibitor.

TOP
100

CLINICAL: Antineoplastic.

Do not confuse Zytiga with Zetia or ZyrTEC.

Uses

Treatment of metastatic castration-resistant prostate cancer in combination with predniSONE.

Precautions

Contraindications: Hypersensitivity to abiraterone. Use in women who are pregnant or may become pregnant. **Cautions:** History of cardiovascular disease (especially HF, recent MI, or ventricular arrhythmia) due to potential for hypertension, hypokalemia, fluid retention; moderate hepatic impairment; adrenal insufficiency. Avoid use with strong CYP3A4 inducers.

Action

Inhibits androgen production in adrenal gland, testes, and prostate tumors. Inhibits formation of testosterone precursors. **Therapeutic Effect:** Lowers serum testosterone to castrate levels.

Pharmacokinetics

Protein binding: 99%. Primarily excreted in feces. **Peak plasma concentration:** 2 hrs. **Half-life:** 12 hrs (up to 19 hrs with hepatic impairment).

Lifespan considerations

Pregnancy/Lactation: Contraindicated in women who are or may become pregnant. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May increase concentration/toxicity of **silodosin, tamoxifen, thioridazine, topotecan**. May decrease effect of **clopidogrel, traMADol**. **CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole)** may increase

concentration. **CYP3A4 inducers (e.g., carbamazepine)** may decrease concentration. **HERBAL: St. John's wort** may decrease levels/effects. **FOOD:** Do not give with **food** (no **food** should be consumed for at least 2 hrs before or 1 hr after dose). **LAB VALUES:** May increase serum ALT, AST, bilirubin, triglycerides. May decrease serum potassium, phosphate.

Availability (Rx)

 **Tablets:** 250 mg, 500 mg.

Administration/handling

PO

- Give on empty stomach only (at least 1 hr before or 2 hrs after food).
- Give with water.
- Administer whole. Do not break, crush, dissolve, or divide tablets. Women who are or may become pregnant should wear gloves if handling the tablets.

Indications/routes/dosage

Consider increased dosage of predniSONE during unusual stress or infection. Interrupting predniSONE therapy may induce adrenocorticoid insufficiency.

Metastatic Castration-Resistant Prostate Cancer

PO: ADULTS, ELDERLY: 1,000 mg once daily (with predniSONE 5 mg 2 times/day).

Dosage Modification

Hepatic enzymes greater than upper limit of normal (ULN) (during treatment)

Lab Values	Recommendation
ALT, AST elevations greater than $5 \times$ ULN or bilirubin greater than $3 \times$ ULN with 1,000 mg	Interrupt treatment and restart at 750 mg once ALT, AST less than $2.5 \times$ ULN or bilirubin less than $1.5 \times$ ULN.
ALT, AST elevations greater than $5 \times$ ULN or bilirubin greater than $3 \times$ ULN with 750 mg	Interrupt treatment and restart at 500 mg once ALT, AST less than $2.5 \times$ ULN or bilirubin less than $1.5 \times$ ULN.

If hepatotoxicity occurs at reduced dose of 500 mg daily, discontinue treatment.

Dosage Adjustment for Concomitant Strong CYP3A4 Inducers

Increase abiraterone dose to 1,000 mg twice daily.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild Impairment: No dosage adjustment necessary. **Moderate Impairment:** Reduce dose to 250 mg daily. Discontinue if serum ALT, AST greater than 5 times ULN or serum bilirubin greater than 3 times ULN. **Severe Impairment:** Avoid use.

Side effects

Frequent (30%–26%): Joint swelling/discomfort, peripheral edema, muscle spasm, musculoskeletal pain, hypokalemia. **Occasional (19%–6%):** Hot flashes, diarrhea, UTI, cough, hypertension, urinary frequency, nocturia. **Rare (less than 6%):** Heartburn, upper respiratory tract infection.

Adverse effects/toxic reactions

Mineralocorticoid excess (severe fluid retention, hypokalemia, hypertension) may compromise pts with prior cardiovascular history. Safety not established in pts with left ventricular ejection fraction less than 50%. Tachycardia, atrial fibrillation, supraventricular tachycardia, atrial flutter, complete AV block, bradyarrhythmia reported in 7% of pts. Chest pain, unstable angina, HF reported in less than 4% of pts. Stress, infection, or interruption of daily steroids may cause adrenocortical insufficiency. Hepatotoxicity (serum ALT, AST greater than 5 times ULN) reported in 2% of pts. Pts with hepatic impairment are more likely to develop hepatotoxicity.

Nursing considerations

Baseline assessment

Obtain baseline BMP, LFT. Evaluate history of HF, myocardial infarction, arrhythmias, angina pectoris, peripheral edema, hepatic impairment, adrenal or pituitary abnormalities, left ventricular ejection fraction (if applicable). Question possibility of pregnancy before treatment. Question history of corticosteroid intolerance if applicable.

Intervention/evaluation

Assess for peripheral edema behind medial malleolus (sacral area in bedridden patients). Monitor BMP, LFT. Monitor for mineralocorticoid excess (hypokalemia, hypertension, fluid retention) at least once monthly. Assess for cardiac arrhythmia if hypokalemia occurs. Obtain EKG for palpitations, dyspnea, dizziness. Monitor for signs and symptoms of adrenocortical insufficiency during predniSONE interruption, periods of stress, infection. Measure serum ALT, AST, alkaline phosphatase, bilirubin every 2 wks for 3 mos, then monthly. If hepatotoxicity occurs, dosage modification will be necessary. Pts with moderate hepatic impairment must have LFT every wk for first month, then every 2 wks for 2 mos, then monthly. If serum ALT, AST above 5 times ULN or serum bilirubin above 3 times ULN, treatment should be discontinued.

Patient/family teaching

- Must be taken on empty stomach (no food 2 hrs before and 1 hr after dose).
 - If taken with food, toxic levels may result.
 - Sexually active men must wear condoms during treatment and for 1 wk after treatment.
 - Women who are pregnant or are planning pregnancy may not touch medication without gloves.
 - Dizziness, palpitations, headache, confusion, muscle weakness, leg swelling/discomfort may become more apparent during periods of unusual stress, infection, or interruption of predniSONE therapy.
 - Blood tests will be performed routinely.
 - Report signs of liver problems (yellowing of skin, bruising, light-colored stool, right upper quadrant pain), chest pain, palpitations.
 - An increase in urinary frequency or nocturia is expected as treatment becomes therapeutic.
 - Do not chew, crush, dissolve, or divide tablets.
-

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Central analgesic.

CLINICAL: Non-narcotic analgesic, antipyretic.

- **BLACK BOX ALERT** ■ Potential for severe liver injury. Acetaminophen injection associated with acute liver failure.

Do not confuse Acephen with Aciphex, Feverall with Fiberall, Fioricet with Fiorinal, Percocet with Percodan, Tylenol with atenolol, timolol, Tylenol PM, or Tylox, or Vicodin with Hycodan.

Uses

PO, Rectal: Temporary relief of mild to moderate pain, headache, fever.

IV: (Additional) Management of moderate to severe pain when combined with opioid analgesia.

Precautions

Contraindications: Hypersensitivity to acetaminophen. (Ofirmev): severe hepatic impairment or severe active liver disease. **Cautions:** Sensitivity to acetaminophen; severe renal impairment; alcohol dependency, hepatic impairment, or active hepatic disease; chronic malnutrition and hypovolemia (Ofirmev); G6PD deficiency (hemolysis may occur). Limit dose to less than 4 g/day.

Action

Appears to inhibit prostaglandin synthesis in the CNS and, to a lesser extent, block pain impulses through peripheral action. Acts centrally on hypothalamic heat-regulating center, producing peripheral vasodilation (heat loss, skin erythema, diaphoresis). **Therapeutic Effect:** Results in antipyresis. Produces analgesic effect.

Pharmacokinetics

--	--	--	--	--

Route	Onset	Peak	Duration
PO	Less than 60 min	1–3 hrs	4–6 hrs

Rapidly, completely absorbed from GI tract; rectal absorption variable. Protein binding: 20%–50%. Widely distributed to most body tissues. Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 1–4 hrs (increased in pts with hepatic disease, elderly, neonates; decreased in children).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. Routinely used in all stages of pregnancy; appears safe for short-term use. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: **Alcohol** (chronic use), **hepatotoxic medications (e.g., phenytoin), hepatic enzyme inducers (e.g., phenytoin, rifAMPin)** may increase risk of hepatotoxicity with prolonged high dose or single toxic dose. May increase risk of bleeding with **warfarin** with chronic, high-dose use. **HERBAL:** **St. John's wort** may decrease blood levels. **FOOD:** **Food** may decrease rate of absorption. **LAB VALUES:** May increase serum ALT, AST, bilirubin; prothrombin levels (may indicate hepatotoxicity).

Availability (OTC)

Caplets: 325 mg, 500 mg, 650 mg. **Elixir:** 160 mg/5 mL. **Injection, Solution (Ofirmev):** 1,000 mg/100 mL glass vial. **Liquid (Oral):** 160 mg/5 mL, 500 mg/5 mL, 500 mg/15 mL. **Solution (Oral Drops):** 80 mg/0.8 mL. **Suppository:** 80 mg, 120 mg, 325 mg, 650 mg. **Suspension:** 160 mg/5 mL. **Tablets:** 325 mg, 500 mg. **Tablets (Chewable):** 80 mg. **Tablets (Orally Disintegrating):** 80 mg, 160 mg.

 **Caplets:(Extended-Release [Tylenol Arthritis Pain]):** 650 mg.

Administration/handling

IV

Reconstitution

- Does not require further dilution.

- Store at room temperature.
- Withdraw doses less than 1,000 mg.
- Place in separate empty, sterile container.

Rate of Administration

- Infuse over 15 min.

Stability

- Once opened or transferred, stable for 6 hrs at room temperature.

PO

- Give without regard to meals.
- Tablets may be crushed.
- Do not crush extended-release caplets.
- Suspension: Shake well before use.
- Take with full glass of water.

Rectal

- Moisten suppository with cold water before inserting well up into rectum.
- Do not freeze suppositories.

Indications/routes/dosage

Note: Over-the-counter (OTC) use of acetaminophen should be limited to 3,000 mg/day.

Analgesia and Antipyresis

IV: ADULTS, ADOLESCENTS WEIGHING 50 KG OR MORE: 1,000 mg q6h or 650 mg q4h. **Maximum single dose:** 1,000 mg; **maximum total daily dose:** 4,000 mg. **ADULTS, ADOLESCENTS WEIGHING LESS THAN 50 KG:** 15 mg/kg q6h or 12.5 mg/kg q4h. **Maximum single dose:** 750 mg; **maximum total daily dose:** 75 mg/kg/day (3,750 mg). **CHILDREN 2–12 YRS:** 15 mg/kg q6h or 12.5 mg/kg q4h. **Maximum single dose:** 750 mg. **Maximum:** 75 mg/kg/day, not to exceed 3,750 mg/day. **INFANTS AND CHILDREN LESS THAN 2 YRS:** 7.5–15 mg/kg q6h. **Maximum:** 60 mg/kg/day. **NEONATES:** (Limited data available) Loading dose: 20 mg/kg. **PMA 37 or greater than 37 wks:** 10 mg/kg/dose q6h. **Maximum:** 40 mg/kg/day. **PMA 33–36 wks:** 10 mg/kg/dose q8h. **Maximum:** 40 mg/kg/day.

PMA 28–32 wks: 10 mg/kg/dose q12h. **Maximum:** 22.5 mg/kg/day.

PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER: (Regular Strength) 325–650 mg q4–6h. **Maximum:** 3,250 mg/day unless directed by health care provider. (Extra Strength) 1000 mg q6h. **Maximum:** 3,000 mg/day unless directed by health care provider. **CHILDREN 12 YRS AND YOUNGER:** (Weight dosing preferred; if not available, use age. Doses may be repeated q4h. **Maximum:** 5 doses/day.)

Age	Weight (Kg)	Dose
11–12 yrs	32.7–43.2	480 mg
9–10 yrs	27.3–32.6	400 mg
6–8 yrs	21.8–27.2	320 mg
4–5 yrs	16.4–21.7	240 mg
2–3 yrs	10.9–16.3	160 mg
1–<2 yrs	8.2–10.8	120 mg
4–11 mos	5.4–8.1	80 mg
0–3 mos	2.7–5.3	40 mg

NEONATES: Term: 10–15 mg/kg/dose q4–6h. **Maximum:** 75 mg/kg/day. **GA 33–37 wks or term less than 10 days:** 10–15 mg/kg/dose q6h. **Maximum:** 60 mg/kg/day. **GA: 28–32 wks:** 10–12 mg/kg/dose q6–8h. **Maximum:** 40 mg/kg/day.

Rectal: ADULTS: 325–650 mg q4–6h. **Maximum:** 4 g/24 hrs. **CHILDREN:** 10–20 mg/kg/dose q4–6h as needed. **Maximum:** 5 doses/24 hrs. **NEONATES: Term:** Initially, 30 mg/kg/once, then 20 mg/kg/dose q6–8h. **Maximum:** 90 mg/kg/day. **GA 33–37 wks or term less than 10 days:** Initially, 30 mg/kg once, then 15 mg/kg/dose q8h. **Maximum:** 60 mg/kg/day. **GA: 28–32 wks:** 20 mg/kg/dose q12h. **Maximum:** 40 mg/kg/day.

Dosage in Renal Impairment

Creatinine Clearance	Frequency
Oral	
10–50 mL/min	q6h
Less than 10 mL/min	q8h
Continuous renal replacement therapy	q6h
IV	

30 mL/min or less (use caution, decrease daily dose, extend dosing interval)

Dosage in Hepatic Impairment

Use with caution. IV contraindicated with severe impairment.

Side effects

 **Rare:** Hypersensitivity reaction.

Adverse effects/toxic reactions

Early Signs of Acetaminophen Toxicity: Anorexia, nausea, diaphoresis, fatigue within first 12–24 hrs. **Later Signs of Toxicity:** Vomiting, right upper quadrant tenderness, elevated LFTs within 48–72 hrs after ingestion. **Antidote:** Acetylcysteine (see [Appendix J](#) for dosage).

Nursing considerations

Baseline assessment

If given for analgesia, assess onset, type, location, duration of pain. Effect of medication is reduced if full pain response recurs prior to next dose. Assess for fever. Assess LFT in pts with chronic usage or history of hepatic impairment, alcohol abuse.

Intervention/evaluation

Assess for clinical improvement and relief of pain, fever. **Therapeutic serum level:** 10–30 mcg/mL; **toxic serum level:** greater than 200 mcg/mL. Do not exceed maximum daily recommended dose: 4 g/day.

Patient/family teaching

- Consult physician for use in children younger than 2 yrs, oral use longer than 5 days (children) or longer than 10 days (adults), or fever lasting longer than 3 days.
- Severe/recurrent pain or high/continuous fever may indicate serious illness.
- Do not take more than 4 g/day (3 g/day if using OTC [over-the-counter]). Actual OTC dosing recommendations may vary by product and/or manufacturer.

Many nonprescription combination products contain acetaminophen. Avoid alcohol.

acetylcysteine

a-seet-il-sis-teen

Acetadote

Cetylev

Mucomyst 

Parvolex 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Respiratory inhalant, intratracheal.

CLINICAL: Mucolytic, antidote.

Do not confuse acetylcysteine with acetylcholine, or Mucomyst with Mucinex.

Uses

Inhalation: Adjunctive treatment for abnormally viscid mucous secretions present in acute and chronic bronchopulmonary disease and in pulmonary complications of cystic fibrosis and surgery, diagnostic bronchial studies.

Injection, PO: Antidote in acute acetaminophen toxicity.

Precautions

Contraindications: Hypersensitivity to acetylcysteine. **Cautions:** Pts with bronchial asthma; debilitated pts with severe respiratory insufficiency (increases risk of anaphylactoid reaction).

Action

Mucolytic splits linkage of mucoproteins, reducing viscosity of pulmonary secretions. Acetaminophen toxicity: Hepatoprotective by restoring hepatic glutathione and enhancing nontoxic conjugation of acetaminophen. **Therapeutic Effect:** Facilitates removal of pulmonary secretions by coughing, postural drainage, mechanical means. Protects against acetaminophen overdose-induced

hepatotoxicity.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk.

Children/Elderly: No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known.

LAB VALUES: None significant.

Availability (Rx)

Inhalation Solution (Mucomyst): 10% (100 mg/mL), 20% (200 mg/mL).

Injection Solution (Acetadote): 20% (200 mg/mL). **Tablets, Effervescent:** 500 mg, 2.5 g.

Administration/handling

IV

The total dose is 300 mg/kg administered over 21 hrs. Dose preparation is based on pt weight. Total volume administered should be adjusted for pts less than 40 kg and for pts requiring fluid restriction. Store unopened vials at room temperature. Following dilution in D₅W, solution is stable for 24 hrs at room temperature. Color change of opened vials may occur (does not affect potency).

Three-Bag Method (as Antidote): Loading, Second, and Third Doses, Pts Greater Than or Equal to 40 kg:

Loading dose: 150 mg/kg in 200 mL of diluent administered over 60 min.

Second dose: 50 mg/kg in 500 mL of diluent administered over 4 hrs.

Third dose: 100 mg/kg in 1,000 mL of diluent administered over 16 hrs.

Pts Greater Than 20 kg but Less Than 40 kg:

Loading dose: 150 mg/kg in 100 mL of diluent administered over 60 min.

Second dose: 50 mg/kg in 250 mL of diluent administered over 4 hrs.

Third dose: 100 mg/kg in 500 mL of diluent administered over 16 hrs.

Pts Less Than or Equal to 20 kg:

Loading dose: 150 mg/kg in 3 mL/kg of body weight of diluent administered over 60 min.

Second dose: 50 mg/kg in 7 mL/kg of body weight of diluent administered over 4 hrs.

Third dose: 100 mg/kg in 14 mL/kg of body weight of diluent administered over 16 hrs.

PO

- For treatment of acetaminophen overdose.
- Give as 5% solution.
- Dilute 20% solution 1:3 with cola, orange juice, other soft drink.
- Give within 1 hr of preparation.

Inhalation, Nebulization

- 20% solution may be diluted with 0.9% NaCl or sterile water; 10% solution may be used undiluted.

■ IV Compatibilities

Cefepime (Maxipime), cefTAZidime (Fortaz).

Indications/routes/dosage

Bronchopulmonary Disease

Inhalation, Nebulization

◀ALERT▶ Bronchodilators should be given 10–15 min before acetylcysteine. **ADULTS, ELDERLY, CHILDREN:** 3–5 mL (20% solution) 3–4 times/day or 6–10 mL (10% solution) 3–4 times/day. Range: 1–10 mL (20% solution) q2–6h or 2–20 mL (10% solution) q2–6h. **INFANTS:** 1–2 mL (20%) or 2–4 mL (10%) 3–4 times/day.

Intratracheal: ADULTS, CHILDREN: 1–2 mL of 10% or 20% solution instilled into tracheostomy q1–4h.

Acetaminophen Overdose

◀ALERT▶ It is essential to initiate treatment as soon as possible after overdose and, in any case, within 24 hrs of ingestion.

PO (Effervescent Tablets, Oral Solution 5%): ADULTS, ELDERLY, CHILDREN: Loading dose of 140 mg/kg, followed in 4 hrs by maintenance dose of 70 mg/kg q4h for 17 additional doses (or until acetaminophen assay reveals nontoxic level). Repeat dose if emesis occurs within 1 hr of administration.

IV:ADULTS, ELDERLY, CHILDREN: (Consists of 3 doses. Total Dose: 300 mg/kg.) 150 mg/kg infused over 60 min, then 50 mg/kg infused over 4 hrs, then 100 mg/kg infused over 16 hrs (see Administration/Handling for dilution).

GREATER THAN 100 KG: (Consists of 3 doses. Total Dose: 30 g.) 15 g over 60 min; 5 g over 4 hrs; 10 g over 16 hrs. Duration of administration may vary depending on acetaminophen levels and LFTs obtained during treatment. Pts who still have detectable levels of acetaminophen or elevated LFT results continue to benefit from additional acetylcysteine administration beyond 24 hrs.

Diagnostic Bronchial Studies

Inhalation, Nebulization: ADULTS: 1–2 mL of 20% solution or 2–4 mL of 10% solution 2–3 times before the procedure.

Side effects

IV: (10%): Nausea, vomiting. **(7%–6%):** Acute flushing, erythema. **(4%):** Pruritus. **Frequent: Inhalation:** Stickiness on face, transient unpleasant odor. **Occasional: Inhalation:** Increased bronchial secretions, throat irritation, nausea, vomiting, rhinorrhea. **Rare: Inhalation:** Rash. **PO:** Facial edema, bronchospasm, wheezing, nausea, vomiting.

Adverse effects/toxic reactions

Large doses may produce severe nausea/vomiting. **(Less than 2%):** Serious anaphylactoid reactions including cough, wheezing, stridor, respiratory distress, bronchospasm, hypotension, and death have been known to occur with IV administration.

Nursing considerations

Baseline assessment

Mucolytic: Assess pretreatment respirations for rate, depth, rhythm. **IV antidote:** Obtain baseline LFT, PT/INR and drug screen. For use as antidote, obtain acetaminophen level to determine need for treatment with acetylcysteine.

Intervention/evaluation

If bronchospasm occurs, discontinue treatment, notify physician; bronchodilator may be added to therapy. Monitor rate, depth, rhythm, type of respiration (abdominal, thoracic). Observe sputum for color, consistency, amount. **IV antidote:** Administer within 8 hrs of acetaminophen ingestion for maximal hepatic protection; ideally, within 4 hrs after immediate-release and 2 hrs after liquid acetaminophen formulations.

Patient/family teaching

- Slight, disagreeable sulfuric odor from solution may be noticed during initial administration but disappears quickly.
- Adequate hydration is important part of therapy.
- Follow guidelines for proper coughing and deep breathing techniques.
- Auscultate lung sounds.

acyclovir

a-sye-klo-veer

Apo-Acyclovir , Zovirax

Fixed-Combination(s)

Lipsovir: acyclovir/hydrocortisone (a steroid): 5%/1%.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Synthetic nucleoside.

CLINICAL: Antiviral.

Do not confuse acyclovir with ganciclovir, Retrovir, or valACYclovir, or Zovirax with Doribax, Valtrex, Zithromax, Zostrix, Zylprim, or Zyvox.

Uses

Parenteral

Treatment of initial and prophylaxis of recurrent mucosal and cutaneous herpes simplex virus (HSV-1 and HSV-2) in immunocompromised pts. Treatment of severe initial episodes of herpes genitalis in immunocompetent pts. Treatment of herpes simplex encephalitis including neonatal herpes simplex virus. Treatment of herpes zoster (shingles) in immunocompromised pts.

Oral

Treatment of initial episodes and prophylaxis of recurrent herpes simplex (HSV-2 genital herpes). Treatment of chickenpox (varicella). Acute treatment of herpes zoster (shingles).

OFF-LABEL: (Parenteral/Oral): Prevention of HSV reactivation in HIV-positive pts; hematopoietic stem cell transplant (HSCT); during periods of neutropenia in pts with cancer; prevention of VZV reactivation in allogenic HSCT; treatment of disseminated HSC or VZV in immunocompromised pts with cancer; empiric treatment of suspected encephalitis in immunocompromised pts with cancer; treatment of initial and prophylaxis of recurrent mucosal and cutaneous herpes simplex infections in immunocompromised pts.

Topical

Cream: Treatment of recurrent herpes labialis (cold sores) in immunocompetent pts. **Ointment:** Management of initial genital herpes. Treatment of mucocutaneous HSV in immunocompromised pts.

Precautions

Contraindications: Use in neonates when acyclovir is reconstituted with Bacteriostatic Water for Injection containing benzyl alcohol. Hypersensitivity to acyclovir, valACYclovir. **Cautions:** Immunocompromised pts (thrombocytopenic purpura/hemolytic uremic syndrome reported); elderly, renal impairment, use of other nephrotoxic medications. IV Use: Pts with underlying neurologic abnormalities, serious hepatic/electrolyte abnormalities, substantial hypoxia.

Action

Converts to acyclovir triphosphate, which competes for viral DNA polymerase, becoming part of DNA chain. **Therapeutic Effect:** Interferes with DNA synthesis and viral replication. Virustatic.

Pharmacokinetics

15%–30% absorbed from GI tract. Bioavailability: 10%–20%; minimal absorption following topical application. Protein binding: 9%–36%. Widely distributed. Partially metabolized in liver. Excreted primarily in urine. Removed by hemodialysis. **Half-life:** 2.5 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 yrs (younger than 1 yr for IV use). **Elderly:** Age-related renal impairment may require decreased dosage. May experience more neurologic effects (e.g., agitation, confusion, hallucinations).

Interactions

DRUG: Nephrotoxic medications may increase risk of nephrotoxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, BUN, creatinine.

Availability (Rx)

Cream: 5%. **Injection, Powder for Reconstitution:** 500 mg. **Injection, Solution:** 50 mg/mL. **Ointment:** 5%. **Suspension, Oral:** 200 mg/5 mL. **Tablets:** 400 mg, 800 mg. **Tablet (buccal):** 50 mg.
 **Capsules:** 200 mg.

Administration/handling

IV

Reconstitution

- Add 10 mL Sterile Water for Injection to each 500-mg vial (50 mg/mL). Do not use Bacteriostatic Water for Injection containing benzyl alcohol or parabens

(will cause precipitate).

- Shake well until solution is clear.
- Further dilute with at least 100 mL D₅W or 0.9 NaCl. Final concentration should be 7 mg/mL or less. (Concentrations greater than 10 mg/mL increase risk of phlebitis.)

Rate of Administration

- Infuse over at least 1 hr (nephrotoxicity due to crystalluria and renal tubular damage may occur with too-rapid rate).
- Maintain adequate hydration during infusion and for 2 hrs following IV administration.

Storage

- Store vials at room temperature.
- Solutions of 50 mg/mL stable for 12 hrs at room temperature; may form precipitate if refrigerated.
- IV infusion (piggyback) stable for 24 hrs at room temperature.

PO

- May give without regard to food.
- Do not crush/break capsules.
- Store capsules at room temperature.

Topical

(Ointment):

- Avoid contact with eye.
- Use finger cot/rubber glove to prevent autoinoculation.

(Cream):

- Apply to cover only cold sores or area with symptoms.
- Rub until it disappears.

■ IV incompatibilities

Aztreonam (Azactam), diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), levoFLOxacIn (Levaquin), meropenem (Merrem IV), ondansetron (Zofran), piperacillin and tazobactam (Zosyn).

■ IV Compatibilities

Allopurinol (Alloprim), amikacin (Amikin), ampicillin, ceFAZolin (Ancef), cefotaxime (Claforan), ceftAZidime (Fortaz), ceftRIAOne (Rocephin), cimetidine (Tagamet), clindamycin (Cleocin), diphenhydrAMINE (Benadryl), famotidine (Pepcid), fluconazole (Diflucan), gentamicin, heparin, HYDROmorphine (Dilaudid), imipenem (Primaxin), LORazepam (Ativan), magnesium sulfate, methylPREDNISolone (SOLU), metoclopramide (Reglan), metroNIDAZOLE (Flagyl), morphine, multivitamins, potassium chloride, propofol (Diprivan), raNITidine (Zantac), vancomycin.

Indications/routes/dosage

Genital Herpes (Initial Episode)

IV: ADULTS, ELDERLY: 5–10 mg/kg q8h for 2–7 days. Followed with oral therapy to complete at least 10 days of therapy.

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 200 mg q4h 5 times/day for 10 days or 400 mg 3 times/day for 7–10 days. **CHILDREN YOUNGER THAN 12 YRS:** 40–80 mg/kg/day in 3–4 divided doses for 5–10 days. **Maximum:** 1,200 mg/day.

Topical: ADULTS: (Ointment) 1/2 inch for 4-inch square surface q3h (6 times/day) for 7 days.

Genital Herpes (Recurrent)

Intermittent Therapy

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 200 mg q4h 5 times/day for 5 days or 400 mg 3 times/day for 5–10 days or 800 mg 2 times/day for 5 days or 800 mg 3 times/day for 2 days.

CHILDREN YOUNGER THAN 12 YRS: 20 mg/kg 3 times/day for 5 days. **Maximum:** 400 mg/dose.

Chronic Suppressive Therapy

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 400 mg 2 times/day for up to 12 mos. **CHILDREN YOUNGER THAN 12 YRS:** 20 mg/kg twice daily. **Maximum:** 400 mg/dose.

Herpes Simplex Mucocutaneous

PO: ADULTS, ELDERLY: 400 mg 5 times/day for 5–10 days. **CHILDREN:** 20 mg/kg 4 times/day for 5–7 days. **Maximum:** 800 mg/dose.

IV: ADULTS, ELDERLY, CHILDREN: 5–10 mg/kg/dose q8h for 7 days.

Topical: ADULTS: (Ointment) 1/2 inch for 4-inch square surface q3h (6 times/day) for 7 days.

Herpes Simplex Encephalitis

IV: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 10 mg/kg q8h for 14–21 days. **CHILDREN 3 MOS–YOUNGER THAN 12 YRS:** 15–20 mg/kg q8h for 14–21 days.

Herpes Zoster (Shingles)

IV: ADULTS, CHILDREN 12 YRS AND OLDER: (immunocompromised) 10 mg/kg/dose q8h for 7–10 days. **CHILDREN YOUNGER THAN 12 YRS:** (immunocompromised) 10 mg/kg/dose q8h for 7–10 days.

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 800 mg q4h 5 times/day for 7–10 days.

Herpes Labialis (Cold Sores)

Topical: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Apply to affected area 5 times/day for 4 days. **Buccal Tablet:** 50 mg as a single dose to upper gum region.

Varicella-Zoster (Chickenpox)

Begin treatment within 24 hrs of onset of rash.

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS AND CHILDREN 2–12 YRS, WEIGHING 40 KG OR MORE: 800 mg 4 times/day for 5 days. **CHILDREN 2–12 YRS, WEIGHING LESS THAN 40 KG:** 20 mg/kg 4 times/day for 5 days. **Maximum:** 800 mg/dose.

Usual Neonatal Dosage

HSV (treatment) (IV): 20 mg/kg/dose q8–12h for 14–21 days.

HSV (chronic suppression) (PO): 300 mg/m²/dose q8h following IV therapy for 6 mos.

Varicella-Zoster (IV): 10 mg/kg/dose q8h for 5–10 days.

Dosage in Renal Impairment

Dosage and frequency are modified based on severity of infection and degree of renal impairment.

PO: Normal dose 200 mg q4h, 200 mg q8h, or 400 mg q12h.

Creatinine clearance 10 mL/min and less: 200 mg q12h.

PO: Normal dose 800 mg q4h.

Creatinine clearance greater than 25 mL/min: Give usual dose and at normal interval, 800 mg q4h. **Creatinine clearance 10–25 mL/min:** 800 mg q8h.

Creatinine clearance less than 10 mL/min: 800 mg q12h.

IV:

Creatinine Clearance	Dosage
Greater than 50 mL/min	100% of normal q8h
25–50 mL/min	100% of normal q12h
10–24 mL/min	100% of normal q24h
Less than 10 mL/min	50% of normal q24h
Hemodialysis (HD)	2.5–5 mg/kg q24h (give after HD)
Peritoneal dialysis (PD)	50% normal dose q24h
Continuous renal replacement therapy (CRRT)	5–10 mg/kg q12–24h (q12h for viral meningoencephalitis/VZV infection)

Dosage in Hepatic Impairment

Mild to Moderate Impairment: No dose adjustment. **Severe Impairment:** Use caution.

Side effects

Frequent: Parenteral (9%–7%): Phlebitis or inflammation at IV site, nausea, vomiting. **Topical (28%):** Burning, stinging. **Occasional: Parenteral (3%):** Pruritus, rash, urticaria. **PO (12%–6%):** Malaise, nausea. **Topical (4%):** Pruritus. **Rare: PO (3%–1%):** Vomiting, rash, diarrhea, headache. **Parenteral (2%–1%):** Confusion, hallucinations, seizures, tremors. **Topical (less than 1%):** Rash.

Adverse effects/toxic reactions

Rapid parenteral administration, excessively high doses, or fluid and electrolyte imbalance may produce renal failure. Toxicity not reported with oral or topical use.

Nursing considerations

Baseline assessment

Question for history of allergies, esp. to acyclovir. Assess herpes simplex lesions before treatment to compare baseline with treatment effect.

Intervention/evaluation

Assess IV site for phlebitis (heat, pain, red streaking over vein). Evaluate cutaneous lesions. Ensure adequate ventilation. Manage chickenpox and disseminated herpes zoster with strict isolation. Encourage fluid intake.

Patient/family teaching

- Drink adequate fluids.
- Do not touch lesions with bare fingers to prevent spreading infection to new site.
- Continue therapy for full length of treatment.
- Space doses evenly.
- Use finger cot/rubber glove to apply topical ointment.
- Avoid sexual intercourse during duration of lesions to prevent infecting partner.
- Acyclovir does not cure herpes infections.
- Pap smear should be done at least annually due to increased risk of cervical cancer in women with genital herpes.

adalimumab

a-da-**lim**-ue-mab

TOP
100

Cyltezo

Humira

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Rheumatoid arthritis agent.

■ **BLACK BOX ALERT** ■ Increased risk for serious infections. Tuberculosis, invasive fungal infections, bacterial and viral opportunistic infections have occurred. Test for tuberculosis prior to and during treatment. Lymphoma, other malignancies reported in children/adolescents.

Hepatosplenic T-cell lymphoma reported primarily in pts with Crohn's disease or ulcerative colitis and concomitant azaTHIOprine or mercaptopurine.

Do not confuse Humira with HumaLOG or HumuLIN, or adalimumab with belimumab or ipilimumab.

Uses

Reduces signs/symptoms, progression of structural damage and improves physical function in adults with moderate to severe RA. May be used alone or in combination with other disease-modifying antirheumatic drugs. First-line treatment of moderate to severe RA, treatment of psoriatic arthritis, treatment of ankylosing spondylitis, to induce/maintain remission of moderate to severe active Crohn's disease, moderate to severe plaque psoriasis in pts 6 yrs of age and older. Reduces signs and symptoms of moderate to severe active polyarticular juvenile rheumatoid arthritis in pts 2 yrs and older. Treatment of active ulcerative colitis in pts unresponsive to immunosuppressants. Treatment of moderate to severe hidradenitis suppurativa. Treatment of uveitis (non-infectious intermediate, posterior and panuveitis) in adults.

Precautions

Contraindications: Hypersensitivity to adalimumab. Severe infections (e.g., sepsis, TB). **Cautions:** Pts with chronic infections or pts at risk for infections (e.g., diabetes, indwelling catheters, renal failure, open wounds), elderly, decreased left ventricular function, HF, demyelinating disorders, invasive fungal infections, history of malignancies.

Action

Binds specifically to tumor necrosis factor (TNF) alpha cell, blocking its interaction with cell surface TNF receptors. **Therapeutic Effect:** Decreases signs/symptoms of RA, psoriatic arthritis, ankylosing spondylitis, Crohn's disease, ulcerative colitis. Inhibits progression of rheumatoid and psoriatic arthritis. Reduces epidermal thickness, inflammation of plaque psoriasis.

Pharmacokinetics

Metabolism not specified. Elimination not specified. **Half-life:** 10–20 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Cautious use due to increased risk of serious infection and malignancy.

Interactions

DRUG: Abatacept, anakinra, immunosuppressive therapy may increase risk of infections. May decrease efficacy of immune response with **live vaccines** (should not give concurrently). **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum cholesterol, other lipids, alkaline phosphatase.

Availability (Rx)

Injection Solution: 10 mg/0.2 mL, 20 mg/0.4 mL, 40 mg/0.8 mL in prefilled syringes.

Administration/handling

Subcutaneous

- Refrigerate; do not freeze.
- Discard unused portion.
- Rotate injection sites. Give new injection at least 1 inch from an old site and never into area where skin is tender, bruised, red, or hard.
- Give in thigh or lower abdomen.
- Avoid areas within 2 inches of navel.

Indications/routes/dosage

Rheumatoid Arthritis (RA)

Subcutaneous: **ADULTS, ELDERLY:** 40 mg every other wk. Dose may be

increased to 40 mg/wk in pts not taking methotrexate.

Ankylosing Spondylitis, Psoriatic Arthritis

Subcutaneous: ADULTS, ELDERLY: 40 mg every other wk.

Crohn's Disease

Subcutaneous: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER WEIGHING 40 KG OR MORE: Initially, 160 mg given as 4 injections on day 1 or 2 injections/day over 2 days, then 80 mg 2 wks later (day 15). **Maintenance:** 40 mg every other wk beginning at day 29. **CHILDREN 6 YRS AND OLDER WEIGHING 17–39 KG:** 80 mg (2 40-mg injections on day 1), then 40 mg 2 wks later. **Maintenance:** 20 mg every other wk beginning at day 29.

Plaque Psoriasis, Uveitis

Subcutaneous: ADULTS, ELDERLY: Initially, 80 mg as a single dose, then 40 mg every other wk starting 1 wk after initial dose.

Juvenile Rheumatoid Arthritis

Subcutaneous: CHILDREN 2 YRS AND OLDER, WEIGHING 10–14 KG: 10 mg every other wk. **WEIGHING 15–29 KG:** 20 mg every other wk. **WEIGHING 30 KG OR MORE:** 40 mg every other wk.

Ulcerative Colitis

Subcutaneous: ADULTS, ELDERLY: Initially, 160 mg (4 injections in 1 day or 2 injections over 2 days) then 80 mg 2 wks later (day 15), then 40 mg every other wk beginning on day 29.

Hidradenitis Suppurativa

Subcutaneous: ADULTS, ELDERLY: Initially, 160 mg (4 injections day 1) or 80 mg (2 injections on days 1 and 2), then 80 mg 2 wks later (day 15), then 40 mg weekly beginning day 29.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (20%): Injection site erythema, pruritus, pain, swelling. **Occasional (12%–9%):** Headache, rash, sinusitis, nausea. **Rare (7%–5%):** Abdominal or back pain, hypertension.

Adverse effects/toxic reactions

Hypersensitivity reactions (rash, urticaria, hypotension, dyspnea), infections (primarily upper respiratory tract, bronchitis, urinary tract) occur rarely. May increase risk of serious infections (pneumonia, tuberculosis, cellulitis, pyelonephritis, septic arthritis). May increase risk of reactivation of hepatitis B virus in pts who are chronic carriers. May cause new-onset or exacerbation of central nervous demyelinating disease; worsening and new-onset HF. May increase risk of malignancies. Immunogenicity (anti-adalimumab autoantibodies) occurred in 12% of pts.

Nursing considerations

Baseline assessment

Assess onset, type, location, duration of pain or inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Review immunization status/screening for TB. If pt is to self-administer, instruct on subcutaneous injection technique, including areas of the body acceptable for injection sites.

Intervention/evaluation

Monitor lab values, particularly CBC. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

Patient/family teaching

- Injection site reaction generally occurs in first month of treatment and decreases in frequency during continued therapy.
- Do not receive live vaccines during treatment.
- Report rash, nausea.

- A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication.

adefovir

a-def-o-veer

Hepsera

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antiviral.

CLINICAL: Hepatitis B agent.

■ **BLACK BOX ALERT** ■ May cause HIV resistance in unrecognized or untreated HIV infection. Lactic acidosis, severe hepatomegaly with steatosis (fatty liver), acute exacerbation of hepatitis have occurred. Use with caution in pts with renal dysfunction or in pts at risk for renal toxicity.

Uses

Treatment of chronic hepatitis B virus infection in adults with evidence of active viral replication based on persistent elevations of serum ALT or AST or histologic evidence.

Precautions

Contraindications: Hypersensitivity to adefovir. **Cautions:** Pts with known risk factors for hepatic disease (female gender, obesity, prolonged treatment), renal impairment, elderly. Concurrent administration with tenofovir-containing products.

Action

Interferes with hepatitis B viral RNA-dependent DNA polymerase, an enzyme, causing DNA chain termination after its incorporation into viral DNA. **Therapeutic Effect:** Prevents viral cell replication.

Pharmacokinetics

Rapidly converted to adefovir in intestine. Binds to proteins after PO administration. Protein binding: less than 4%. Excreted in urine. **Half-life:** 7 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment, decreased cardiac function require cautious use.

Interactions

DRUG: Nephrotoxic agents (e.g., IV contrast dye, cyclosporine, gentamicin, vancomycin), NSAIDs may increase risk of renal toxicity. May alter effects of **tenofovir** (avoid concomitant use). **HERBAL:** None significant. **FOOD:** Alcohol may increase risk of hepatotoxicity. **LAB VALUES:** May increase serum ALT, AST, amylase.

Availability (Rx)

Tablets: 10 mg.

Administration/handling

PO

- Give without regard to food.

Indications/routes/dosage

Note: Continue for 6 months or longer after HBeAg seroconversion.

Chronic Hepatitis B (Normal Renal Function)

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 10 mg once daily.

Chronic Hepatitis B (Impaired Renal Function)

PO: ADULTS, ELDERLY WITH CREATININE CLEARANCE 20–49 ML/MIN: 10 mg q48h. **ADULTS, ELDERLY WITH CREATININE CLEARANCE 10–19 ML/MIN:** 10 mg q72h. **ADULTS, ELDERLY ON HEMODIALYSIS:** 10 mg every 7 days following dialysis.

Dosage in Hepatic Impairment

No adjustment needed.

Side effects

Frequent (13%): Asthenia. **Occasional (9%–4%):** Headache, abdominal pain, nausea, flatulence. **Rare (3%):** Diarrhea, dyspepsia.

Adverse effects/toxic reactions

Nephrotoxicity, characterized by increased serum creatinine and decreased glomerular filtration rate (GFR), is treatment-limiting toxicity of adefovir therapy. Lactic acidosis, severe hepatomegaly occur rarely, particularly in female pts.

Nursing considerations

Baseline assessment

Obtain baseline renal function lab values before therapy begins and routinely thereafter. Pts with renal insufficiency, preexisting or during treatment, may require dose adjustment. HIV antibody testing should be performed before therapy begins (unrecognized or untreated HIV infection may result in emergence of HIV resistance).

Intervention/evaluation

Monitor I&O. Closely monitor for adverse reactions in those taking other medications that are excreted renally or with other drugs known to affect renal function.

Patient/family teaching

- Report nausea, vomiting, abdominal pain.

- Avoid alcohol.
- Do not take over-the-counter anti-inflammatory drugs.
- Report decreased urinary output, dark-colored urine.

adenosine

ah-**den**-oh-seen

Adenocard

Adenoscan

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Cardiac agent, diagnostic aid.

CLINICAL: Antiarrhythmic.

Uses

Adenocard: Treatment of paroxysmal supraventricular tachycardia (PSVT), including pts associated with accessory bypass tracts (Wolff-Parkinson-White syndrome). **Adenoscan:** Adjunct in diagnosis in myocardial perfusion imaging or stress echocardiography. **OFF-LABEL:** Acute vasodilator testing in pulmonary artery hypertension.

Precautions

Contraindications: Hypersensitivity to adenosine. Second- or third-degree AV block, symptomatic bradycardia, sick sinus syndrome (except in pts with functioning pacemaker). Bronchoconstrictive or bronchospastic lung disease, asthma. **Cautions:** Pts with first-degree AV block, bundle branch block; concurrent use of drugs that slow AV conduction (e.g., digoxin, verapamil); autonomic dysfunction, pericarditis, pleural effusion, carotid stenosis, uncorrected hypovolemia; elderly, pts with bronchoconstriction.

Action

Slows impulse formation in SA node and conduction time through AV node. Acts as a diagnostic aid in myocardial perfusion imaging or stress echocardiography by causing coronary vasodilation and increased blood flow. **Therapeutic Effect:** Restores normal sinus rhythm.

Pharmacokinetics

Rapidly cleared from circulation via cellular uptake. Metabolized via phosphorylation or deamination. **Half-life:** Less than 10 secs.

Lifespan Considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Do not breastfeed until approved by physician. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: Methylxanthines (e.g., theophylline) may decrease effect. Dipyridamole, nicotine may increase effect. CarBAMazepine may increase degree of heart block caused by adenosine. **HERBAL:** None significant. **FOOD:** Avoid caffeine (may decrease effect). **LAB VALUES:** None significant.

Availability (Rx)

Injection Solution (Adenocard): 3 mg/mL in 2-mL, 4-mL vials. **Injection Solution (Adenoscan):** 3 mg/mL in 20-mL, 30-mL vials.

Administration/handling

IV

Rate of Administration

- Administer very rapidly (over 1–2 sec) undiluted directly into vein, or if using IV line, use closest port to insertion site. If IV line is infusing any fluid other than 0.9% NaCl, flush line first.
- After rapid bolus injection, follow with 0.9% NaCl rapid flush, B/P.

Storage

- Store at room temperature. Solution appears clear.
- Crystallization occurs if refrigerated; if crystallization occurs, dissolve crystals by warming to room temperature.
- Discard unused portion.

■ IV incompatibilities

Any drug or solution other than 0.9% NaCl, D₅W, Ringer's lactate, or abciximab.

Indications/routes/dosage

Paroxysmal Supraventricular Tachycardia (PSVT) (Adenocard)

Rapid IV Bolus: ADULTS, ELDERLY, CHILDREN WEIGHING 50 KG OR MORE: Initially, 6 mg given over 1–2 sec. If first dose does not convert within 1–2 min, give 12 mg; may repeat 12-mg dose in 1–2 min if no response has occurred. Follow each dose with 20 mL 0.9% NaCl by rapid IV push. **CHILDREN WEIGHING LESS THAN 50 KG:** Initially 0.05–0.1 mg/kg. (**Maximum:** 6 mg). If first dose does not convert within 1–2 min, may increase dose by 0.05–0.1 mg/kg. May repeat until sinus rhythm is established or up to a maximum single dose of 0.3 mg/kg or 12 mg. Follow each dose with 5–10 mL 0.9% NaCl by rapid IV push.

Diagnostic Testing (Adenoscan)

IV Infusion: ADULTS: 140 mcg/kg/min for 6 min using syringe or infusion pump. Total dose: 840 mcg/kg. Thallium is injected at midpoint (3 min) of infusion.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (18%–12%): Facial flushing, dyspnea. **Occasional (7%–2%):** Headache, nausea, light-headedness, chest pressure. **Rare (1% or less):** Paresthesia, dizziness, diaphoresis, hypotension, palpitations; chest, jaw, or neck pain.

Adverse effects/toxic reactions

Frequently produces transient, short-lasting heart block.

Nursing considerations

Baseline assessment

Identify arrhythmia per cardiac monitor, 12-lead EKG, and assess apical pulse, B/P.

Intervention/evaluation

Assess cardiac performance per continuous EKG. Monitor B/P, apical pulse (rate, rhythm, quality). Monitor respiratory rate. Monitor serum electrolytes.

Patient/family teaching

- May induce feelings of impending doom, which resolves quickly.
- Flushing/headache may occur temporarily following administration.
- Report continued chest pain, light-headedness, head or neck pain, difficulty breathing.

ado-trastuzumab emtansine

ado-tras-**tooz**-oo-mab

Kadcyla

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: HER2-targeted antibody and microtubule inhibitor conjugate.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Do not substitute ado-trastuzumab for trastuzumab. Hepatotoxicity, hepatic failure may lead to death. Monitor hepatic function prior to each dose. May decrease left ventricular ejection fraction (LVEF). Embryo-fetal toxicity may result in birth defects and/or fetal demise.

Do not confuse ado-trastuzumab with trastuzumab.

Uses

Treatment of HER2-positive, metastatic breast cancer in pts who have previously

received trastuzumab and a taxane agent separately or in combination, or pts who have developed recurrence within 6 mos of completing adjuvant therapy.

Precautions

Contraindications: Hypersensitivity to trastuzumab. **Cautions:** History of cardiomyopathy, HF, MI, arrhythmias, hepatic disease, thrombocytopenia, pulmonary disease, peripheral neuropathy, pregnancy.

Action

Inhibits proliferation of tumor cells that overexpress human epidermal growth factor receptor 2 (HER2). Promotes cellular death (apoptosis) by mediating release of cytotoxic catabolytes. Disrupts cellular microtubule networks. **Therapeutic Effect:** Inhibits tumor cell survival in HER2-positive breast cancer.

Pharmacokinetics

Metabolized in liver. Protein binding: 93%. Peak plasma concentration: 30–90 min. **Half-life:** 4 days.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Use contraception during treatment and up to 6 mos after discontinuation. Unknown if distributed in breast milk. Do not breastfeed. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease platelets, serum potassium.

Availability (Rx)

Lyophilized Powder for Injection: 100-mg vial, 160-mg vial.

Administration/handling

Use 0.22-micron in-line filter. Do not administer IV push or bolus.

IV

Reconstitution

- Use proper chemotherapy precautions.
- Slowly inject 5 mL of Sterile Water for Injection into 100-mg vial or 8 mL Sterile Water for Injection for 160-mg vial.
- Final concentration: 20 mg/mL.
- Gently swirl until completely dissolved.
- Do not shake.
- Inspect for particulate matter/discoloration.
- Calculate dose from 20 mg/mL vial.
- Further dilute in 250 mL of 0.9% NaCl only.
- Invert bag to mix (do not shake).

Rate of Administration

- Infuse using 0.22-micron in-line filter.
- Infuse initial dose over 90 min.
- Infuse subsequent doses over 30 min.
- Slow or interrupt infusion rate if hypersensitivity reaction occurs.

Storage

- Refrigerate unused vials.
- Reconstituted vials, diluted solutions should be used immediately (may be refrigerated for up to 24 hrs).

IV incompatibilities

Do not use dextrose-containing solutions.

Indications/routes/dosage

Note: Do not substitute with conventional trastuzumab (Herceptin).

Metastatic Breast Cancer

IV Infusion: ADULTS/ELDERLY: 3.6 mg/kg every 3 wks until disease progression or unacceptable toxicity.

Dose Modification

Reduction Schedule for Adverse Effects: Initial dose: 3.6 mg/kg. First reduction: 3 mg/kg. Second reduction: 2.4 mg/kg.

Elevated Serum ALT, AST: If less than 5 times upper limit of normal (ULN), continue same dose. If 5–20 times ULN, hold until less than 5 times ULN and reduce by one dose level. If greater than 20 times ULN, discontinue. **Elevated Serum Bilirubin:** Hold until less than 1.5 times ULN, then continue same dose. If 3–10 times ULN, hold until less than 1.5 times ULN, then reduce by one dose level. If greater than 10 times ULN, discontinue. **Left Ventricular Dysfunction:** If LVEF greater than 45%, continue same dose. If LVEF 40%–45% with a decrease less than 10% from baseline, continue dose (or reduce) and repeat LVEF in 3 wks. If LVEF 40%–45% with decrease greater than 10% from baseline, hold and repeat assessment in 3 wks. Discontinue therapy if no recovery within 10% of baseline, LVEF less than 40%, or symptomatic HF. **Thrombocytopenia:** If platelet count is 25,000–50,000 cells/mm³, hold until level greater than 75,000 cells/mm³ and then continue same dose. If platelet count is less than 25,000 cells/mm³, hold until level greater than 75,000 cells/mm³ and reduce one dose level.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (40%–21%): Nausea, fatigue, musculoskeletal pain, headache, constipation, diarrhea. **Occasional (19%–7%):** Abdominal pain, vomiting, pyrexia, arthralgia, asthenia, cough, dry mouth, stomatitis, myalgia, insomnia, rash, dizziness, dyspepsia, chills, dysgeusia, peripheral edema. **Rare (6%–3%):** Pruritus, blurry vision, dry eye, conjunctivitis, lacrimation.

Adverse effects/toxic reactions

Hepatotoxicity may include elevated transaminase, nodular regenerative hyperplasia, portal hypertension. Left ventricular dysfunction reported in 1.8% of pts. Interstitial lung disease (ILD), including pneumonitis, may lead to ARDS. Hypersensitivity reactions reported in 1.4% of pts. Thrombocytopenia (34% of pts) may increase risk of bleeding. Peripheral neuropathy observed rarely.

Approx. 5.3% of pts tested positive for anti-ado-trastuzumab antibodies (immunogenicity).

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP; PT/INR if on anticoagulants. Confirm HER2-positive titer. Screen for baseline HF, hepatic impairment, peripheral edema, pulmonary disease, thrombocytopenia. Obtain negative pregnancy test before initiating treatment. Question current breastfeeding status. Obtain baseline echocardiogram for LVEF status.

Intervention/evaluation

Observe for hypersensitivity reactions during infusion. Monitor LFT, potassium levels before and during treatment. Obtain LVEF q3mos or with any dose reduction regarding LVEF status. Assess for bruising, jaundice, right upper quadrant (RUQ) abdominal pain. Obtain anti-ado-trastuzumab antibody titer if immunogenicity suspected. Obtain stat EKG for palpitations or irregular pulse, chest X-ray for difficulty breathing, cough, fever. Monitor for neurotoxicity (peripheral neuropathy).

Patient/family teaching

- Blood levels will be monitored routinely.
- Avoid pregnancy.
- Contraception should be used during treatment and up to 6 mos after discontinuation.
- Report black/tarry stools, RUQ abdominal pain, nausea, bruising, yellowing of skin or eyes, difficulty breathing, palpitations, bleeding.
- Avoid alcohol.
- Treatment may reduce the heart's ability to pump; expect routine echocardiograms.
- Report bleeding of any kind or extremity numbness, tingling, weakness, pain.

afatinib

a-fa-ti-nib

Gilotrif

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse afatinib with ibrutinib, dasatinib, gefitinib, or SUNItinib.

Uses

First-line treatment of metastatic non–small cell lung cancer (NSCLC) in pts with epidermal growth factor (EDGF) exon 19 deletions or exon 21 (L858R) substitution mutations. Treatment of metastatic, squamous NSCLC progressing after platinum-based chemotherapy.

Precautions

Contraindications: Hypersensitivity to afatinib. **Cautions:** Hepatic impairment; severe renal impairment; pts with hx of keratitis, severe dry eye, ulcerative keratitis, or use of contact lenses; hypovolemia; pulmonary disease; ulcerative lesions. Patients with GI disorders associated with diarrhea (e.g., Crohn’s disease), cardiac risk factors, and/or decreased left ventricular ejection fraction.

Action

Highly selective blocker of ErbB family (e.g., HER2); irreversibly binds to intracellular tyrosine kinase domain. **Therapeutic Effect:** Inhibits tumor growth, causes tumor regression.

Pharmacokinetics

Readily absorbed following PO administration. Enzymatic metabolism is minimal. Protein binding: 95%. Peak plasma concentration: 2–5 hrs. Excreted in feces (85%), urine (4%). **Half-life:** 37 hrs.

⌚ Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. Contraception recommended during treatment and up to 2 wks after discontinuation. **Children:**

Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: P-glycoprotein inhibitors (e.g., amiodarone, cycloSPORINE, ketoconazole) may increase concentration/effect. P-glycoprotein inducers (e.g., carBAMazepine, rifAMPin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** High-fat meals may decrease absorption. **LAB VALUES:** May increase serum ALT, AST. May decrease serum potassium.

Availability (Rx)

Tablets: 20 mg, 30 mg, 40 mg.

Administration/handling

PO

- Give at least 1 hr before or 2 hrs after meal. Do not take missed dose within 12 hrs of next dose.

Indications/routes/dosage

Non–Small Cell Lung Cancer

PO: ADULTS/ELDERLY: Initially, 40 mg once daily until disease progression or no longer tolerated. Do not take missed dose within 12 hrs of next dose.

Dose Modification

Chronic Use of P-glycoprotein (P-gp) Inhibitors: Reduce daily dose by 10 mg if tolerated. Resume previous dose after discontinuation of inhibitor if tolerated.

Chronic Use of P-glycoprotein Inducers: Increase daily dose by 10 mg if tolerated. May resume initial dose 2–3 days after discontinuation of P-gp inducer. **Moderate to Severe Diarrhea (more than 48 hrs):** Withhold dose until resolution to mild diarrhea.

Moderate Cutaneous Skin Reaction (more than 7 days): Withhold dose until reaction resolves, then reduce dose appropriately.

Suspected Keratitis: Withhold until appropriately ruled out. If keratitis confirmed, continue only if benefits outweigh risks.

Permanent Discontinuation

Discontinue if persistent severe diarrhea, respiratory distress, severe dry eye, or life-threatening bullous, blistering, exfoliating lesions, persistent ulcerative keratitis, interstitial lung disease, symptomatic left ventricular dysfunction occurs.

Dosage in Renal/Hepatic Impairment

eGFR 15–29 mL/min: Decrease dose to 30 mg. **Severe Impairment:** Avoid use.

Side effects

Frequent (96%–58%): Diarrhea, rash, dermatitis, stomatitis, paronychia (nail infection). **Occasional (31%–11%):** Dry skin, decreased appetite, pruritus, epistaxis, weight loss, cystitis, pyrexia, cheilitis (lip inflammation), rhinorrhea, conjunctivitis.

Adverse effects/toxic reactions

Diarrhea may lead to severe, sometimes fatal, dehydration or renal impairment. Bullous and exfoliative skin lesions occur rarely. Rash, erythema, acneiform lesions occur in 90% of pts. Palmar-plantar erythrodysesthesia syndrome (PPES), a chemotherapy-induced skin condition that presents with redness, swelling, numbness, skin sloughing of the hands and feet, has been reported. Interstitial lung disease (ILD), including pulmonary infiltration, pneumonitis, ARDS, allergic alveolitis, reported in 2% of pts. Hepatotoxicity reported in 10% of pts. Keratitis symptoms, such as eye inflammation, lacrimation, light sensitivity, blurred vision, red eye, occurred in 1% of pts.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, visual acuity. Obtain negative pregnancy test before initiating therapy. Question current breastfeeding status. Screen for history/comorbidities, contact lens use. Receive full medication history, including herbal products. Assess skin for lesions, ulcers, open wounds.

Intervention/evaluation

Monitor renal/hepatic function tests, urine output. Encourage PO intake. Assess for hydration status. Offer antidiarrheal medication for loose stool. Report oliguria, dark or concentrated urine. Immediately report skin lesions, vision changes, dry eye, severe diarrhea. Obtain chest X-ray if ILD suspected.

Patient/family teaching

- Most pts experience diarrhea, and severe cases may lead to dehydration or kidney failure; maintain adequate hydration.
- Avoid pregnancy; contraception should be used during treatment and up to 2 wks after discontinuation.
- Report any yellowing of skin or eyes, abdominal pain, bruising, black/tarry stools, dark urine, decreased urine output.
- Minimize exposure to sunlight.
- Immediately report eye problems (pain, swelling, blurred vision, vision changes) or skin blistering/redness.
- Do not eat 1 hr before or 2 hrs after dose.
- Do not wear contact lenses (may increase risk of keratitis).

albiglutide

al-bi-gloo-tide

Tanzeum

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Glucagon-like peptide-1 (GLP-1) receptor agonist.

CLINICAL: Antidiabetic.

■ **BLACK BOX ALERT** ■ Thyroid C-cell tumors have occurred in animal studies with glucagon-like peptide-1 (GLP-1) receptor agonists; unknown if relevant in humans.

Do not confuse albiglutide with exenatide, dulaglutide, or liraglutide.

Uses

Adjunct to diet and exercise to improve glycemic control in pts with type 2

diabetes mellitus.

Precautions

Contraindications: Personal/family history of medullary thyroid carcinoma (MTC). Pts with multiple endocrine neoplasia syndrome type 2 (MEN2). Hypersensitivity to albiglutide. **Cautions:** Pts with hx pancreatitis, renal impairment. Not recommended in pts with preexisting severe GI disease, diabetic ketoacidosis; type 1 diabetes mellitus; pancreatitis; or as a first-line treatment regimen.

Action

Agonist of human glucagon-like peptide-1 (GLP-1). Increases glucose-dependent insulin secretion, decreases inappropriate glucagon secretion. Slows gastric emptying. **Therapeutic Effect:** Augments glucose-dependent insulin secretion.

Pharmacokinetics

Metabolized by protein degradation into small peptides, amino acids by proteolytic enzymes. Protein binding: Not specified. Peak plasma concentration: 3–5 days. Steady state reached in 4–5 wks. **Half-life:** 5 days.

Lifespan considerations

Pregnancy/Lactation: Likely distributed in breast milk; drug is albumin-based protein therapeutic. Must either discontinue drug or discontinue breastfeeding. Due to extended clearance period, recommend discontinuation of therapy at least 1 mo before planned pregnancy. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Insulin, metFORMIN, sulfonylureas may increase hypoglycemic effect. May decrease effect of **PO drugs requiring rapid onset** due to delayed gastric emptying. **HERBAL:** Fenugreek, flaxseed, ginseng, gotu kola may increase risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** Expected

to decrease serum glucose, Hgb A1c. May increase serum ALT, GGT.

Availability (Rx)

Prefilled Injector Pens: 30 mg, 50 mg.

Administration/handling

Subcutaneous

- Administer any time of day, without regard to meals, on same day each week. May change administration day if last dose was given more than 4 days ago. If dose is missed, administer within 3 days of missed dose. If more than 3 days pass after missed dose, wait until next regularly scheduled dose.
- If refrigerated, allow pen to sit at room temperature for 15 min before using.

Reconstitution

- See manufacturer guidelines.

Administration

- Subcutaneously insert needle into abdomen, thigh, or upper arm region.
- Press injection button until "click" is heard, then hold button for additional 5 sec to deliver full dose.
- Do not reuse needle.
- Rotate injection sites.

Storage

- Mixed solution should appear yellow, free of all particles.
- Use within 8 hrs of reconstitution.
- Once needle is attached, use immediately; product can clog needle if allowed to dry after priming.
- Refrigerate unused pens; do not freeze.
- Once dispensed, may store pen at room temperature up to 4 wks.

Indications/routes/dosage

Type 2 Diabetes Mellitus

Subcutaneous: ADULTS/ELDERLY: 30 mg once weekly into abdomen, thigh, or upper arm region. May increase to 50 mg once weekly if glycemic response inadequate. **Missed Dose:** Administer within 3 days after missed dose, then resume on usual day of administration. If longer than 3 days, skip missed dose

and resume administration on next regular weekly dose.

Dose Modification

Concomitant Use with Insulin Secretagogue (e.g., Sulfonylurea) or Insulin: Consider reduced dose based on glycemic goal.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional (14%–5%): Upper respiratory tract infection, diarrhea, nausea, injection site reactions (hematoma, erythema, rash), cough, back pain, arthralgia, sinusitis, influenza. **Rare (3%–2%):** Dyspepsia, vomiting, gastric reflux.

Adverse effects/toxic reactions

May increase risk of acute renal failure or worsening of chronic renal impairment (esp. with dehydration), severe gastroparesis, thyroid C-cell tumors. May increase risk of hypoglycemia when used with other hypoglycemic agents or insulin. Dyspnea, pruritus, rash may indicate hypersensitivity reaction. Other adverse events include appendicitis (0.3% of pts), atrial fibrillation/flutter (1% of pts), pancreatitis (0.3% of pts), pneumonia (1.8% of pts). Immunogenicity (anti-alglutide antibody formation) reported in 5.5% of pts. Some pts with antibody formation also tested positive for antibodies to GLP-1 and human albumin. May cause increased risk of hepatic injury.

Nursing considerations

Baseline assessment

Obtain baseline fasting glucose level, Hgb A1c; BMP, LFT if applicable. Question history of medullary thyroid carcinoma, multiple neoplasia syndrome type 2, pancreatitis. Receive full medication history, including herbal products. Screen for use of other hypoglycemic agents or insulin. Assess pt's understanding of diabetes management, routine home glucose monitoring. Assess hydration status.

Intervention/evaluation

Monitor capillary blood glucose levels, Hgb A1c; hepatic/renal function in pts with renal impairment reporting severe gastrointestinal reactions including gastroparesis, vomiting, diarrhea. Screen for thyroid tumors (dysphagia, dyspnea, persistent hoarseness, neck mass). If tumor is suspected, consider endocrinologist consultation. Clinical significance of serum calcitonin level or thyroid ultrasound with GLP-1-associated thyroid tumors is debated/unknown. Assess for hypoglycemia, hyperglycemia, hypersensitivity/allergic reaction. Screen for glucose-altering conditions: fever, stress, surgical procedures, trauma. Obtain dietary consult for nutritional education. Encourage PO intake.

Patient/family teaching

- A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication.
- Diabetes mellitus requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly.
- When taking additional medications to lower blood sugar or when glucose demands are altered (fever, infection, stress, trauma), have low blood sugar treatment available (glucagon, oral dextrose).
- Monitor daily calorie intake.
- Report suspected pregnancy or plans of breastfeeding.
- Therapy may increase risk of thyroid cancer; report lumps or swelling of the neck, hoarseness, trouble swallowing, shortness of breath.
- Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute pancreatitis.
- Rash, itching, hives may indicate allergic reaction.

albumin

al-**bue**-min

Albiked-5

Albiked-25

Albuminar-5

Albuminar-25

AlbuRx

Albutein

Buminate

Flexbumin

Plasbumin-5

Plasbumin-25

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Plasma protein fraction.

CLINICAL: Blood derivative.

Dp not confuse albumin with albuterol, or Buminate with bumetanide.

Uses

Hypovolemia plasma volume expansion, maintenance of cardiac output in treatment of shock or impending shock. May be useful in treatment of ovarian hyperstimulation syndrome, acute/severe nephrosis, cirrhotic ascites, adult respiratory distress syndrome (ARDS), cardiopulmonary bypass, hemodialysis.

OFF-LABEL: Large-volume paracentesis. In cirrhotics, with diuretics to help facilitate diuresis.

Precautions

Contraindications: Hypersensitivity to albumin. Pts at risk for volume overload (e.g., severe anemia, HF, renal insufficiency). Dilution with Sterile Water for Injection may cause hemolysis or acute renal failure. **Cautions:** Pts for whom sodium restriction is necessary, hepatic/renal failure (added protein load). Avoid 25% concentration in preterm infants (risk of intraventricular hemorrhage).

Action

Blood volume expander. **Therapeutic Effect:** Provides increase in intravascular oncotic pressure, mobilizes fluids into intravascular space.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	15 min (in well-hydrated pt)	N/A	Dependent on initial blood volume

Distributed throughout extracellular fluid. **Half-life:** 15–20 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase.

Availability (Rx)

Injection Solution: (5%): 50 mL, 250 mL, 500 mL. **(25%):** 20 mL, 50 mL, 100 mL.

Administration/handling

IV

Reconstitution

- A 5% solution may be made from 25% solution by adding 1 volume 25% to 4 volumes 0.9% NaCl (NaCl preferred). Do not use Sterile Water for Injection (life-threatening hemolysis, acute renal failure can result).

Rate of Administration

- Give by IV infusion. Rate is variable, depending on use, blood volume, concentration of solute. 5%: Do not exceed 2–4 mL/min in pts with normal plasma volume, 5–10 mL/min in pts with hypoproteinemia. 25%: Do not exceed 1 mL/min in pts with normal plasma volume, 2–3 mL/min in pts with hypoproteinemia. 5% is administered undiluted; 25% may be administered undiluted or diluted in 0.9% NaCl.
- May give without regard to pt blood group or Rh factor.

Storage

- Store at room temperature. Appears as clear brownish, odorless, moderately viscous fluid.
- Do not use if solution has been frozen, appears turbid, contains sediment, or if

not used within 4 hrs of opening vial.

■ IV incompatibilities

Lipids, micafungin (Mycamine), midazolam (Versed), vancomycin (Vancocin), verapamil (Isoptin).

■ IV Compatibilities

Diltiazem (Cardizem), Lorazepam (Ativan).

Indications/routes/dosage

5% should be used in hypovolemic or intravascularly depleted pts. 25% should be used in pts in whom fluid and sodium intake must be minimized.

Usual Dosage

IV: ADULTS, ELDERLY: Initially, 25 g; may repeat in 15–30 min.

Hypovolemia

IV: ADULTS, ELDERLY, ADOLESCENTS: 5% albumin: 12.5–25 g (250–500 mL), repeat after 15–30 min, as needed. **CHILDREN:** 0.5–1 g/kg/dose (10–20 mL/kg/dose of 5% albumin). Repeat in 30-min intervals as needed.

Hemodialysis

IV: ADULTS, ELDERLY: 50–100 mL (12.5–25 g) of 25% albumin as needed.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Hypotension. **Rare:** High dose in repeated therapy: altered vital signs, chills, fever, increased salivation, nausea, vomiting, urticaria, tachycardia.

Adverse effects/toxic reactions

Fluid overload may occur, marked by increased B/P, distended neck veins. Pulmonary edema may occur, evidenced by labored respirations, dyspnea, rales, wheezing, coughing. Neurologic changes, including headache, weakness, blurred vision, behavioral changes, incoordination, isolated muscle twitching, may occur.

Nursing considerations

Baseline assessment

Obtain B/P, pulse, respirations immediately before administration. Adequate hydration required before albumin is administered.

Intervention/evaluation

Monitor B/P for hypotension/hypertension. Assess frequently for evidence of fluid overload, pulmonary edema (see [Adverse Effects/Toxic Reactions](#)). Check skin for flushing, urticaria. Monitor I&O ratio (watch for decreased output). Assess for therapeutic response (increased B/P, decreased edema).

albuterol

al-**bue**-ter-ol

TOP
100

Airomir 

Apo-Salvent 

PMS-Salbutamol 

ProAir HFA

ProAir RespiClick

Proventil HFA

Ventolin HFA

VoSpire ER

Fixed-Combination(s)

Combivent Respimat: albuterol/ipratropium (a bronchodilator): 100 mcg/20 mcg per actuation. **DuoNeb:** albuterol/ipratropium 3 mg/0.5 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Sympathomimetic (adrenergic agonist).

CLINICAL: Bronchodilator.

Do not confuse albuterol with albumin or atenolol, Proventil with Bentyl, PriLOSEC, or Prinivil, or Ventolin with Benylin or Vantin.

Uses

Treatment or prevention of bronchospasm due to reversible obstructive airway disease, prevention of exercise-induced bronchospasm.

Precautions

Contraindications: Hypersensitivity to albuterol. Severe hypersensitivity to milk protein (powder for inhalation). **Cautions:** Hypertension, cardiovascular disease, hyperthyroidism, diabetes, HF, convulsive disorders, glaucoma, hypokalemia, arrhythmias.

Action

Stimulates beta₂-adrenergic receptors in lungs, resulting in relaxation of bronchial smooth muscle. **Therapeutic Effect:** Relieves bronchospasm and reduces airway resistance.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	15–30 min	2–3 hrs	4–6 hrs
PO (extended-release)	30 min	2–4 hrs	12 hrs
Inhalation	5–15 min	0.5–2 hrs	2–5 hrs

Rapidly, well absorbed from GI tract; rapidly absorbed from bronchi after inhalation. Metabolized in liver. Primarily excreted in urine. **Half-life:** 3.8–6 hrs.

🕒 Lifespan considerations

Pregnancy/Lactation: Appears to cross placenta; unknown if distributed in breast milk. May inhibit uterine contractility. **Children:** Safety and efficacy not

established in pts younger than 2 yrs (syrup) or younger than 6 yrs (tablets). **Elderly:** May be more sensitive to tremor or tachycardia due to age-related increased sympathetic sensitivity.

Interactions

DRUG: **Beta-blockers** (e.g., carvedilol, labetalol, metoprolol) antagonize effects. May produce bronchospasm. **Atomoxetine, MAOIs, tricyclic antidepressants** (e.g., amitriptyline, doxepin) may potentiate cardiovascular effects. May increase effects of **loop diuretics** (e.g., furosemide) (produce hypokalemia), **sympathomimetics** (increase CNS stimulation). **HERBAL:** **St. John's wort** may decrease level/effects. **Ephedra, yohimbe** may cause CNS stimulation. **FOOD:** None known. **LAB VALUES:** May increase blood glucose level. May decrease serum potassium level.

Availability (Rx)

Aerosol, Powder Breath Activated Inhalation (ProAir RespiClick): 90 mcg/actuation. **Aerosol Solution, Inhalation (ProAir HFA, Proventil HFA, Ventolin HFA):** 90 mcg/spray. **Solution for Nebulization:** 0.63 mg/3 mL (0.021%), 1.25 mg/3 mL (0.042%), 2.5 mg/3 mL (0.084%), 5 mg/mL (0.5%). **Syrup:** 2 mg/5 mL. **Tablets:** 2 mg, 4 mg.

 **Tablets (Extended-Release [VoSpire ER]):** 4 mg, 8 mg.

Administration/handling

PO

- Do not break, crush, dissolve, or divide extended-release tablets.
- Administer with food.

Inhalation Aerosol

- Shake container well before inhalation.
- Prime prior to first use. A spacer is recommended for use with MDI.
- Wait 2 min before inhaling second dose (allows for deeper bronchial penetration).
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness).

Inhalation Powder

- Device is breath activated.
- Do not use with spacer.
- Do not wash or put any part of inhaler to water.

Nebulization

- Administer over 5–15 min.

Indications/routes/dosage

Acute Bronchospasm, Exacerbation of Asthma

Inhalation: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: (Acute, Severe): 4–8 puffs q20min up to 4 hrs, then q1–4h as needed. **CHILDREN 12 YRS AND YOUNGER: (Acute, Severe):** 4–8 puffs q20min for 3 doses, then q1–4h as needed.

Nebulization: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: (Acute, Severe): 2.5–5 mg q20min for 3 doses, then 2.5–10 mg q1–4h or 10–15 mg/hr continuously. **CHILDREN 12 YRS AND YOUNGER:** 0.15 mg/kg q20min for 3 doses (minimum: 2.5 mg), then 0.15–0.3 mg/kg q1–4h as needed. **Maximum:** 10 mg q1–4h as needed or 0.5 mg/kg/hr by continuous inhalation.

Chronic Bronchospasm

PO: ADULTS, CHILDREN OLDER THAN 12 YRS: 2–4 mg 3–4 times/day. **Maximum:** 8 mg 4 times/day. **ELDERLY:** 2 mg 3–4 times/day. **Maximum:** 8 mg 4 times/day. **CHILDREN 6–12 YRS:** 2 mg 3–4 times/day. **Maximum:** 24 mg/day. **CHILDREN 2–5 YRS:** 0.1–0.2 mg/kg/dose 3 times/day. **Maximum:** 4 mg 3 times/day.

PO: (Extended-Release): ADULTS, CHILDREN OLDER THAN 12 YRS: 4–8 mg q12h. **Maximum:** 32 mg/day. **CHILDREN 6–12 YRS:** 4 mg q12h. **Maximum:** 24 mg/day.

Nebulization: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 2.5 mg 3–4 times/day as needed. Children 2–11 yrs: 0.63–1.25 mg 3–4 times/day as needed.

Inhalation: ADULTS, ELDERLY, CHILDREN: 2 puffs q4–6h as needed.

Exercise-Induced Bronchospasm

Inhalation: ADULTS, ELDERLY, CHILDREN 5 YRS AND OLDER: 2 puffs 5 min before exercise. **CHILDREN 4 YRS AND YOUNGER:** 1–2 puffs 5 min before exercise.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (27%–4%): Headache, restlessness, nervousness, tremors, nausea, dizziness, throat dryness and irritation, pharyngitis, B/P changes including hypertension, heartburn, transient wheezing. **Occasional (3%–2%):** Insomnia, asthenia, altered taste. **Inhalation:** Dry, irritated mouth or throat; cough, bronchial irritation. **Rare:** Drowsiness, diarrhea, dry mouth, flushing, diaphoresis, anorexia.

Adverse effects/toxic reactions

Excessive sympathomimetic stimulation may produce palpitations, ectopy, tachycardia, chest pain, slight increase in B/P followed by substantial decrease, chills, diaphoresis, blanching of skin. Too-frequent or excessive use may lead to decreased bronchodilating effectiveness and severe, paradoxical bronchoconstriction.

Nursing considerations

Baseline assessment

Assess lung sounds, pulse, B/P, color, characteristics of sputum noted. Offer emotional support (high incidence of anxiety due to difficulty in breathing and sympathomimetic response to drug).

Intervention/evaluation

Monitor rate, depth, rhythm, type of respiration; quality and rate of pulse; EKG; serum potassium, glucose; ABG determinations. Assess lung sounds for

wheezing (bronchoconstriction), rales.

Patient/family teaching

- Follow guidelines for proper use of inhaler.
- A health care provider will show you how to properly prepare and use your medication. You must demonstrate correct preparation and injection techniques before using medication.
- Increase fluid intake (decreases lung secretion viscosity).
- Do not take more than 2 inhalations at any one time (excessive use may produce paradoxical bronchoconstriction or decreased bronchodilating effect).
- Rinsing mouth with water immediately after inhalation may prevent mouth/throat dryness.
- Avoid excessive use of caffeine derivatives (chocolate, coffee, tea, cola, cocoa).

alectinib

al-ek-ti-nib

Alecensa

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse alectinib with afatinib, ibrutinib, imatinib, or gefitinib.

Uses

First line treatment of pts with anaplastic lymphoma kinase (ALK)-positive metastatic non-small cell lung cancer (NSCLC).

Precautions

Contraindications: Hypersensitivity to alectinib. **Cautions:** Baseline anemia, leukopenia; bradycardia, bradyarrhythmias, chronic edema, diabetes, dehydration, electrolyte imbalance, hepatic/renal impairment, HF, ocular disease, pulmonary disease, history of thromboembolism.

Action

Inhibits tyrosine kinase activity and tumor cell proliferation. Inhibits autophosphorylation of ALK and ALK-dependent signaling proteins. **Therapeutic Effect:** Inhibits lung cancer growth and metastasis.

Pharmacokinetics

Metabolized in liver. Protein binding: Greater than 99%. Peak plasma concentration: 4 hrs. Steady state reached in 7 days. Excreted in feces (98%), urine (less than 0.5%). **Half-life:** 33 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 1 wk after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. Males with female partners of reproductive potential must use barrier methods during treatment and up to 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** **High-fat, high-calorie meals** increase absorption/exposure. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, CPK, creatinine, glucose. May decrease serum calcium, potassium, phosphate, sodium; Hgb, Hct, lymphocytes, RBCs.

Availability (Rx)

 **Capsules:** 150 mg.

Administration/handling

PO

- Give with food.
- Administer whole; do not break, crush, cut, or open capsules.

- If a dose is missed or vomiting occurs during administration, give next dose at regularly scheduled time.

Indications/routes/dosage

Non–Small Cell Lung Cancer

PO:ADULTS, ELDERLY: 600 mg twice daily until disease progression or unacceptable toxicity.

Dose Reduction Schedule

First dose reduction: 450 mg twice daily. **Second dose reduction:** 300 mg twice daily. Permanently discontinue if unable to tolerate 300 mg twice daily.

Dose Modification

Bradycardia

Symptomatic bradycardia: Withhold treatment until recovery to asymptomatic bradycardia or to a heart rate of 60 bpm or greater, then resume at reduced dose level (if pt not taking concomitant medications known to cause bradycardia).

Symptomatic bradycardia in pts taking concomitant medications known to cause bradycardia: Withhold treatment until recovery to asymptomatic bradycardia or heart rate of 60 bpm or greater. If concomitant medication can be adjusted or discontinued, then resume at same dose. If concomitant medication cannot be adjusted or discontinued, then resume at reduced dose level.

Life-threatening bradycardia in pts who are not taking concomitant medications known to cause bradycardia: Permanently discontinue. **Life-threatening bradycardia in pts who are taking concomitant medications known to cause bradycardia:** Withhold treatment until recovery to asymptomatic bradycardia or heart rate of 60 bpm or greater. If concomitant medication can be adjusted or discontinued, then resume at reduced dose level with frequent monitoring. Permanently discontinue if bradycardia recurs despite dose reduction.

CPK Elevation

CPK elevation greater than 5 times upper limit of normal (ULN): Withhold treatment until recovery to baseline or less than or equal to 2.5 times ULN, then

resume at same dose. **CPK elevation greater than 10 times ULN or second occurrence of CPK elevation greater than 5 times ULN:** Withhold treatment until recovery to baseline or less than or equal to 2.5 times ULN, then resume at reduced dose level.

Hepatotoxicity

Serum ALT or AST elevation greater than 5 times ULN with total bilirubin less than or equal to 2 times ULN: Withhold treatment until serum ALT or AST recovers to baseline or less than or equal to 3 times ULN, then resume at reduced dose level. **Serum ALT or AST elevation greater than 3 times ULN with total serum bilirubin greater than 2 times ULN in the absence of cholestasis or hemolysis:** Permanently discontinue. **Total bilirubin elevation greater than 3 times ULN:** Withhold treatment until recovery to baseline or less than or equal to 1.5 times ULN, then resume at reduced dose level.

Pulmonary

Any grade treatment-related interstitial lung disease/pneumonitis: Permanently discontinue.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Not specified; use caution.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

Side effects

Frequent (41%–19%): Fatigue, asthenia, constipation, edema (peripheral, generalized, eyelid, periorbital), myalgia, musculoskeletal pain, cough, generalized rash, papular rash, pruritus, macular rash, maculopapular rash, acneiform dermatitis, erythema, nausea. **Occasional (18%–10%):** Headache, diarrhea, dyspnea, back pain, vomiting, increased weight, blurred vision, vitreous floaters, visual impairment, reduced visual acuity, asthenopia, diplopia, photosensitivity.

Adverse effects/toxic reactions

Approx. 23% of pts required at least one dose reduction. Median time to first dose reduction was 48 days. Decreased Hgb levels were reported in 56% of pts. Drug-induced hepatotoxicity with elevations of serum ALT/AST greater than 5 times ULN reported in 4%–5% of pts. Most reported cases of hepatotoxicity occurred during first 2 mos of therapy. Grade 3 interstitial lung disease occurred in less than 1% of pts. Symptomatic bradycardia reported in 7.5% of pts. Severe myalgia, musculoskeletal pain occurred in 29% of pts. CPK elevation occurred in 43% of pts. Other serious adverse effects may include endocarditis, hemorrhage (unspecified), intestinal perforation, pulmonary embolism.

Nursing considerations

Baseline assessment

Obtain baseline CBC, CPK, BMP, LFT; serum ionized calcium, phosphate; capillary blood glucose, urine pregnancy, vital signs. Obtain baseline EKG in pts with history of arrhythmias, HF, concurrent use of medications known to bradycardia. Question possibility of pregnancy or plans of breastfeeding. Question history of hepatic/renal impairment, pulmonary embolism, diabetes, cardiac/pulmonary disease. Screen for medication known to cause bradycardia. Assess visual acuity. Verify ALK-positive NSCLC test prior to initiation.

Intervention/evaluation

Monitor CBC routinely; LFTs q2wks during first 2 mos of treatment, then periodically thereafter (or more frequently in pts with hepatic impairment). Obtain BMP, serum ionized calcium, magnesium if arrhythmia or severe dehydration occurs. Monitor vital signs (esp. heart rate). Obtain EKG for bradycardia, chest pain, dyspnea. Worsening cough, fever, dyspnea may indicate interstitial lung disease/pneumonitis. Monitor for hepatotoxicity, hyperglycemia, vision changes, myalgia, musculoskeletal pain.

Patient/family teaching

- Blood levels, EKGs will be monitored routinely.
- Report history of heart problems including extremity swelling, HF, slow heart rate. Therapy may decrease your heart rate; report dizziness, chest pain,

palpitations, or fainting.

- Worsening cough, fever, or shortness of breath may indicate severe lung inflammation.
- Avoid pregnancy; contraception recommended during treatment and for up to 7 days after final dose. Do not breastfeed. Males with female partners of reproductive potential should use condoms during sexual activity during treatment and up to 3 mos after final dose.
- Blurry vision, confusion, frequent urination, increased thirst, fruity breath may indicate high blood sugar levels.
- Report any yellowing of skin or eyes, upper abdominal pain, bruising, black/tarry stools, dark urine.
- Do not take newly prescribed medication unless approved by doctor who originally started treatment.
- Avoid prolonged sun exposure/tanning beds. Use high SPF sunscreen and lip balm to protect against sunburn.
- Take with food.
- Avoid alcohol.

alendronate

a-**len**-dro-nate

Apo-Alendronate 

Binosto

Fosamax

Fixed-Combination(s)

Fosamax Plus D: alendronate/cholecalciferol (vitamin D analogue): 70 mg/2,800 international units, 70 mg/5,600 international units.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Bisphosphonate.

CLINICAL: Bone resorption inhibitor, calcium regulator.

Do not confuse alendronate with risedronate, or Fosamax with Flomax.

Uses

Fosamax: Treatment of osteoporosis in men. Treatment of glucocorticoid-induced osteoporosis in men and women with low bone mineral density who are receiving at least 7.5 mg predniSONE (or equivalent). Treatment and prevention of osteoporosis in males and postmenopausal women. Treatment of Paget's disease of the bone in pts who are symptomatic, at risk for future complications, or with alkaline phosphatase equal to or greater than 2 times ULN. **Binosto:** Treatment of osteoporosis in males and postmenopausal women.

Precautions

Contraindications: Hypocalcemia, abnormalities of the esophagus, inability to stand or sit upright for at least 30 min, sensitivity to alendronate or other bisphosphonates; oral solution or effervescent tablet should not be used in pts at risk for aspiration. **Cautions:** Renal impairment, dysphagia, esophageal disease, gastritis, ulcers, or duodenitis.

Action

Inhibits bone resorption via actions on osteoclasts or osteoclast precursors. **Therapeutic Effect:** Leads to increased bone mineral density. **Paget's disease:** Decreases bone formation, but bone has a more normal architecture.

Pharmacokinetics

Poorly absorbed after PO administration. Protein binding: 78%. After PO administration, rapidly taken into bone, with uptake greatest at sites of active bone turnover. Excreted in urine, feces (as unabsorbed drug). **Terminal half-life:** Greater than 10 yrs (reflects release from skeleton as bone is resorbed).

Lifespan considerations

Pregnancy/Lactation: Possible incomplete fetal ossification, decreased maternal weight gain, delay in delivery. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Calcium, antacids may decrease absorption. Aspirin, NSAIDs may increase risk of ulcers, upper GI adverse effects. **HERBAL:** None significant. **FOOD:** Concurrent beverages, dietary supplements, food may interfere with absorption. Caffeine may reduce efficacy. **LAB VALUES:** Reduces serum calcium, phosphate. Significant decrease in serum alkaline phosphatase noted in pts with Paget's disease.

Availability (Rx)

Solution, Oral: 70 mg/75 mL. **Tablets:** 5 mg, 10 mg, 35 mg, 40 mg, 70 mg. **Tablets, Effervescent: (Binosto):** 70 mg.

Administration/handling

PO

- Give at least 30 min before first food, beverage, or medication of the day.
- **Tablets, Effervescent:** Dissolve in 4 oz water. Wait at least 5 min after effervescence stops. Stir for 10 sec and drink. **Oral Solution:** Follow with at least 2 oz of water.

Indications/routes/dosage

Note: Consider discontinuing after 3–5 yrs for osteoporosis in pts at low risk for fractures.

Osteoporosis (in Men)

PO: ADULTS, ELDERLY: 10 mg once daily in the morning or 70 mg weekly.

Glucocorticoid-Induced Osteoporosis

PO: ADULTS, ELDERLY: 5 mg once daily in the morning.
POSTMENOPAUSAL WOMEN NOT RECEIVING ESTROGEN: 10 mg once daily in the morning.

Postmenopausal Osteoporosis

PO: (Treatment): ADULTS, ELDERLY: 10 mg once daily in the morning or 70 mg weekly.

PO: (Prevention): ADULTS, ELDERLY: 5 mg once daily in the morning or 35 mg weekly.

Paget's Disease

PO: ADULTS, ELDERLY: 40 mg once daily in the morning for 6 mos.

Dosage in Renal Impairment

Not recommended in pts with creatinine clearance less than 35 mL/min.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (8%–7%): Back pain, abdominal pain. **Occasional (3%–2%):** Nausea, abdominal distention, constipation, diarrhea, flatulence. **Rare (less than 2%):** Rash; severe bone, joint, muscle pain.

Adverse effects/toxic reactions

Overdose produces hypocalcemia, hypophosphatemia, significant GI disturbances. Esophageal irritation occurs if not given with 6–8 oz of plain water or if pt lies down within 30 min of administration. May increase risk of osteonecrosis of the jaw.

Nursing considerations

Baseline assessment

Obtain baseline serum calcium, phosphate, alkaline phosphatase. Hypocalcemia, vitamin D deficiency must be corrected before beginning therapy. Assess pt's ability to remain upright for at least 30 minutes.

Intervention/evaluation

Monitor chemistries (esp. serum calcium, phosphorus, alkaline phosphatase levels).

Patient/family teaching

- Expected benefits occur only when medication is taken with full glass (6–8 oz) of plain water, first thing in the morning and at least 30 min before first food, beverage, or medication of the day is taken. Any other beverage (mineral water, orange juice, coffee) significantly reduces absorption of medication.
- Do not lie down for at least 30 min after taking medication (potentiates delivery to stomach, reducing risk of esophageal irritation).
- Report new swallowing difficulties, pain when swallowing, chest pain, new/worsening heartburn.
- Consider weight-bearing exercises, modify behavioral factors (e.g., cigarette smoking, alcohol consumption).
- Supplemental calcium and vitamin D should be taken if dietary intake inadequate.

alfuzosin

al-fue-zoe-sin

Apo-Alfuzosin 

Uroxatral

Xatral 

CLASSIFICATION

PHARMACOTHERAPEUTIC: Alpha₁-adrenergic blocker.

CLINICAL: Benign prostatic hyperplasia agent.

Uses

Treatment of signs and symptoms of benign prostatic hyperplasia (BPH). **OFF-LABEL:** Facilitates expulsion of ureteral stones.

Precautions

Contraindications: Hypersensitivity to alfuzosin. Moderate to severe hepatic impairment; concurrent use of strong CYP3A4 inhibitors (e.g., ketoconazole) or other alpha-adrenergic blockers. **Cautions:** Pts with known QT interval prolongation (congenital or acquired). Severe renal or mild hepatic impairment.

Action

Blocks adrenoreceptors of lower urinary tract (e.g., prostate, bladder neck). **Therapeutic Effect:** Relaxes smooth muscle; improves urinary flow, symptoms of prostatic hyperplasia.

Pharmacokinetics

Readily absorbed (decreased under fasting conditions). Protein binding: 90%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 10 hrs.

Lifespan considerations

Pregnancy/Lactation: Not indicated for use in this pt population. **Children:** Not indicated for use in this pt population. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Other alpha-blocking agents (e.g., doxazosin, prazosin, tamsulosin, terazosin) may have additive effect. **CYP3A4 inhibitors** (e.g., ritonavir, ketoconazole), **PDE5 inhibitors** (e.g., sildenafil) may increase level/effects. **HERBAL:** St. John's wort may decrease level/effects. **FOOD:** Food increases absorption. **LAB VALUES:** None significant.

Availability (Rx)

 **Tablets (Extended-Release):** 10 mg.

Administration/handling

PO

- Give immediately after the same meal each day.
- Swallow whole; do not break, crush, dissolve, or divide extended-release tablets.

Indications/routes/dosage

Benign Prostatic Hyperplasia

PO: ADULTS: 10 mg once daily, after same meal each day.

Dosage in Renal/Hepatic Impairment

See Precautions.

Side effects

Frequent (7%–6%): Dizziness, headache, malaise. **Occasional (4%):** Dry mouth. **Rare (3%–2%):** Nausea, dyspepsia (heartburn, epigastric discomfort), diarrhea, orthostatic hypotension, tachycardia, drowsiness.

Adverse effects/toxic reactions

Ischemia-related chest pain reported in 2% of pts. Priapism has been reported.

Nursing considerations

Baseline assessment

Question for sensitivity to alfuzosin, use of other alpha-blocking agents (doxazosin, prazosin, tamsulosin, terazosin). Obtain B/P.

Intervention/evaluation

Assist with ambulation if dizziness occurs. Report headache. Monitor for hypotension. Question for improvement in urine flow, hesitancy.

Patient/family teaching

- Take after the same meal each day.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not chew, crush, dissolve, or divide extended-release tablets.

alirocumab

al-i-rok-ue-mab

Praluent

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Proprotein convertase subtilisin kexin 9 (PCSK9) inhibitor, monoclonal antibody.

CLINICAL: Antihyperlipidemic.

Do not confuse alirocumab with adalimumab or raxibacumab.

Uses

Treatment of hyperlipidemia. Adjunct to diet and maximally tolerated statin therapy for the treatment of adults with heterozygous familial hypercholesterolemia or clinical atherosclerotic cardiovascular disease who require additional lowering of low-density lipoprotein cholesterol (LDL-C).

Precautions

Contraindications: Severe hypersensitivity to alirocumab. **Cautions:** Hepatic impairment.

Action

Prevents binding of PCSK9 to LDL receptors on hepatocytes. Increases hepatic uptake of LDL. **Therapeutic Effect:** Decreases serum cholesterol levels.

Pharmacokinetics

Distributed primarily in circulatory system. Metabolized by protein degradation into small peptides, amino acids. Peak plasma concentration: 3–7 days. Steady state reached by 2–3 doses. **Half-life:** 17–20 days.

⌚ Lifespan considerations

Pregnancy/Lactation: May cross placental barrier, esp. during second and third trimesters. Unknown if distributed in breast milk. Human immunoglobulin G is present in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum LDL-C levels. May increase serum ALT, AST.

Availability (Rx)

Injection Solution: 75 mg/mL, 150 mg/mL in single-dose, prefilled syringe or pen.

Administration/handling

Subcutaneous

- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to pale yellow.
- Allow pen/syringe to warm to room temperature for 30–40 min prior to use.
- Subcutaneously insert needle into abdomen, thigh, or upper arm region and inject solution. It may take up to 20 sec to fully inject dose.
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, or skin infections.
- Rotate injection sites.

Storage

- Refrigerate unused pens/syringes in outer carton.
- Do not freeze.
- Discard if pen/syringe has been at room temperature more than 24 hrs or longer.
- Protect from light.

Indications/routes/dosage

Hyperlipidemia

SQ:ADULTS, ELDERLY: 75 mg once every 2 wks. May increase to maximum dose of 150 mg once every 2 wks if response inadequate. If a dose is missed, administer within 7 days of scheduled dose, then resume normal schedule. If missed dose is not within 7 days, wait until next scheduled dose. Less frequent

dosing: 300 mg q4wks.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild to Moderate Impairment: No dose adjustment. **Severe Impairment:** Use caution.

Side effects

Occasional (11%–7%): Nasopharyngitis, injection site reactions (e.g., erythema, itching, swelling, pain/tenderness, bruising/contusion). **Rare (5%–2%):** Diarrhea, bronchitis, myalgia, muscle spasm, sinusitis, cough, musculoskeletal pain.

Adverse effects/toxic reactions

Serious hypersensitivity reactions (e.g., pruritus, rash, urticaria), including some serious events (e.g., hypersensitivity vasculitis, hypersensitivity reactions requiring hospitalization), have been reported. Infections such as UTI (5% of pts) and influenza (6% of pts) have occurred. Neurologic events such as confusion, memory impairment reported in less than 1% of pts. Immunogenicity (anti-alirocumab antibodies) reported in 5% of pts. Pts who developed neutralizing antibodies had a higher incidence of injection site reactions.

Nursing considerations

Baseline assessment

Obtain baseline LDL-C level, LFT. Question history of hypersensitivity reaction, hepatic impairment. Assess skin for sunburns, skin rashes, inflammation, or skin infections.

Intervention/evaluation

Obtain LDL-C level within 4–8 wks after treatment initiation or with any dose titration. Monitor for hypersensitivity reactions. If hypersensitivity reaction

occurs, discontinue therapy and treat symptoms accordingly; monitor until symptoms resolve. Monitor for infections including UTI, influenza.

Patient/family teaching

- A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication.
- Treatment may cause serious allergic reactions such as itching, hives, rash, or more serious reactions requiring hospitalization. If allergic reaction occurs, immediately seek medical attention.
- Do not reuse prefilled pens/syringes.

aliskiren

a-lis-kye-ren

Rasilez 

Tekturna

HIGH
ALERT

Fixed-Combination(s)

Amturnide: aliskiren/amLODIPine (a calcium channel blocker)/hydroCHLOROthiazide (a diuretic): 150 mg/5 mg/12.5 mg, 300 mg/5 mg/12.5 mg, 300 mg/5 mg/25 mg, 300 mg/10 mg/12.5 mg, 300 mg/10 mg/25 mg. **Tekamlo:** aliskiren/amLODIPine (a calcium channel blocker): 150 mg/5 mg, 150 mg/10 mg, 300 mg/5 mg, 300 mg/10 mg. **Tekturna HCT:** aliskiren/hydroCHLOROthiazide (a diuretic): 150 mg/12.5 mg, 150 mg/25 mg, 300 mg/12.5 mg, 300 mg/25 mg. **Valturna:** aliskiren/valsartan (an angiotensin II receptor antagonist): 150 mg/160 mg, 300 mg/320 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Renin-inhibitor.

CLINICAL: Antihypertensive.

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy detected.

Do not confuse Tekturna with Valturna.

Uses

Treatment of hypertension (not recommended as initial treatment). May be used alone or in combination with other antihypertensives.

Precautions

Contraindications: Hypersensitivity to aliskiren. Concurrent use with ACE inhibitor or Angiotensin II Receptor Blockers in pts with diabetes. **Cautions:** Severe renal impairment. History of angioedema, dialysis, nephrotic syndrome, renovascular hypertension. Concurrent use with P-glycoprotein inhibitors (e.g., cycloSPORINE).

Action

Direct renin inhibitor. Decreases plasma renin activity (PRA), inhibiting the conversion of angiotensinogen to angiotensin I, decreasing the formation of angiotensin II. **Therapeutic Effect:** Reduces B/P.

Pharmacokinetics

Peak plasma concentration reached within 1–3 hrs. Protein binding: 49%. Metabolized in liver. Minimally excreted in urine. Peak plasma steady-state levels reached in 7–8 days. **Half-life:** 24 hrs.

Lifespan considerations

Pregnancy/Lactation: Carcinogenic potential to fetus. May cause fetal/neonatal morbidity, mortality. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CycloSPORINE, itraconazole may increase concentration/effect. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic, black cohosh** may increase antihypertensive effect. **FOOD:** High-fat meals substantially decrease absorption. **Grapefruit products** may reduce antihypertensive effects. Separate by 4 hrs. **LAB VALUES:** May increase serum BUN, creatinine, uric acid, creatinine kinase, potassium. May decrease Hgb,

Hct.

Availability (Rx)

 **Tablets, Film-Coated:** 150 mg, 300 mg.

Administration/handling

PO

- High-fat meals substantially decrease absorption.
- Consistent administration with regard to meals is recommended.
- Do not break, crush, dissolve, or divide film-coated tablets.

Indications/routes/dosage

Hypertension

PO: ADULTS, ELDERLY: Initially, 150 mg/day. May increase to 300 mg/day.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use caution.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Rare (2%–1%): Diarrhea, particularly in women, elderly (older than 65 yrs), gastroesophageal reflux, cough, rash.

Adverse effects/toxic reactions

Angioedema, periorbital edema, edema of hands, generalized edema have been reported.

Nursing considerations

Baseline assessment

Correct hypovolemia in pts on concurrent diuretic therapy. Obtain B/P and apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated.

Intervention/evaluation

Assess for edema. Monitor I&O; weigh daily. Monitor B/P, renal function tests, potassium, Hgb, Hct.

Patient/family teaching

- Pregnant pts should avoid second- and third-trimester exposure to aliskiren.
- Report swelling of face/lips/tongue, difficulty breathing.
- Avoid strenuous exercise during hot weather (risk of dehydration, hypotension).
- Do not chew, crush, dissolve, or divide film-coated tablets.

allopurinol

al-oh-pure-i-nol

Aloprim

Apo-Allopurinol 

Zyloprim

FIXED-COMBINATION(S)

Duzallo: allopurinol/leinurad (uric acid transporter-1 inhibitor): 200 mg/200 mg, 300 mg/200 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Xanthine oxidase inhibitor.

CLINICAL: anti-gout

Do not confuse allopurinol with Apresoline or haloperidol, or Zyloprim with Zorprin or Zovirax.

Uses

PO: Management of primary or secondary gout (e.g., acute attack, nephropathy). Treatment of secondary hyperuricemia that may occur during cancer treatment. Management of recurrent uric acid and calcium oxalate calculi. **Injection:** Management of elevated uric acid in cancer treatment for leukemia, lymphoma, or solid tumor malignancies.

Precautions

Contraindications: Severe hypersensitivity to allopurinol. **Cautions:** Renal/hepatic impairment; pts taking diuretics, mercaptopurine or azaTHIOprine, other drugs causing myelosuppression. Do not use in asymptomatic hyperuricemia.

Action

Decreases uric acid production by inhibiting xanthine oxidase, an enzyme responsible for converting xanthine to uric acid. **Therapeutic Effect:** Reduces uric acid concentrations in serum and urine.

Pharmacokinetics

Route	Onset	Peak	Duration
PO, IV	2–3 days	1–3 wks	1–2 wks

Well absorbed from GI tract. Widely distributed. Protein binding: less than 1%. Metabolized in liver. Excreted primarily in urine. Removed by hemodialysis. **Half-life:** 1–3 hrs; metabolite, 12–30 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: Loop or thiazide diuretics (e.g., furosemide, hydroCHLOROthiazide) may increase level/effect. May increase effect of oral

anticoagulants (e.g., warfarin). May increase concentration, toxicity of **azaTHIOprine, mercaptopurine. Amoxicillin, ampicillin** may increase incidence of rash. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, ALT, AST, creatinine.

Availability (Rx)

Injection, Powder for Reconstitution (Aloprim): 500 mg. **Tablets (Zyloprim):** 100 mg, 300 mg.

Administration/handling

IV

Reconstitution

- Reconstitute 500-mg vial with 25 mL Sterile Water for Injection (concentration of 20 mg/mL).
- Further dilute with 0.9% NaCl or D₅W (50–100 mL) to a concentration of 6 mg/mL or less.

Rate of Administration

- Infuse over 15–60 min. Daily doses can be given as a single infusion or in equally divided doses at 6-, 8-, or 12-hr intervals.

Storage

- Solution should appear clear and colorless.
- Store unreconstituted vials at room temperature.
- Do not refrigerate reconstituted and/or diluted solution. Must administer within 10 hrs of preparation.
- Do not use if precipitate forms or solution is discolored.

PO

- Give after meals with plenty of fluid.
- Fluid intake should yield slightly alkaline urine and output of approximately 2 L in adults.
- Dosages greater than 300 mg/day to be administered in divided doses.

IV incompatibilities

Amikacin (Amikin), carmustine (BiCNU), cefotaxime (Claforan), clindamycin (Cleocin), cytarabine (Ara-C), dacarbazine (DTIC), diphenhydrAMINE (Benadryl), DOXOrubicin (Adriamycin), doxycycline (Vibramycin), gentamicin, haloperidol (Haldol), hydrOXYzine (Vistaril), IDArubicin (Idamycin), imipenem-cilastatin (Primaxin), methylPREDNISolone (SOLU-Medrol), metoclopramide (Reglan), ondansetron (Zofran), streptozocin (Zanosar), tobramycin, vinorelbine (Navelbine).

■ IV Compatibilities

Bumetanide (Bumex), calcium gluconate, furosemide (Lasix), heparin, HYDRomorphone (Dilaudid), LORazepam (Ativan), morphine, potassium chloride.

Indications/routes/dosage

◀ALERT▶ Doses greater than 300 mg should be given in divided doses.

Gout

PO: ADULTS, CHILDREN OLDER THAN 10 YRS: Initially, 100 mg/day. Increase at weekly intervals needed to achieve desired serum uric acid level. **(Mild):** 200–300 mg/day. **(Moderate to Severe):** 400–600 mg/day in 2–3 divided doses. **Maximum:** 800 mg/day.

Secondary Hyperuricemia Associated with Chemotherapy

PO: ADULTS, CHILDREN OLDER THAN 10 YRS: 600–800 mg/day in 2–3 divided doses for 2–3 days starting 1–2 days before chemotherapy. **CHILDREN 6–10 YRS:** 300 mg/day in 2–3 divided doses. **CHILDREN YOUNGER THAN 6 YRS:** 150 mg/day in 3 divided doses.

◀ALERT▶ **IV:** Daily dose can be given as single infusion or at 6-, 8-, or 12-hr intervals.

IV: ADULTS, ELDERLY, CHILDREN 10 YRS OR OLDER: 200–400 mg/m²/day beginning 24–48 hrs before initiation of chemotherapy. **CHILDREN YOUNGER THAN 10 YRS:** 200 mg/m²/day beginning 24–48 hrs before initiation of chemotherapy. **Maximum:** 600 mg/day.

Recurrent Uric Acid Calcium Oxalate Calculi

PO: ADULTS: 200–300 mg/day in single or divided doses.

Dosage in Renal Impairment

Dosage is modified based on creatinine clearance. **PO:** Removed by hemodialysis. Administer dose following hemodialysis or administer 50% supplemental dose.

IV/PO

Creatinine Clearance	Dosage
10–20 mL/min	200 mg/day
3–9 mL/min	100 mg/day
Less than 3 mL/min	100 mg at extended intervals
HD	100 mg q48h (increase cautiously to 300 mg)

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional: PO: Drowsiness, unusual hair loss. **IV:** Rash, nausea, vomiting.

Rare: Diarrhea, headache.

Adverse effects/toxic reactions

Pruritic maculopapular rash, possibly accompanied by malaise, fever, chills, joint pain, nausea, vomiting should be considered a toxic reaction. Severe hypersensitivity reaction may follow appearance of rash. Bone marrow depression, hepatotoxicity, peripheral neuritis, acute renal failure occur rarely.

Nursing considerations

Baseline assessment

Obtain baseline BMP, LFT. Instruct pt to drink minimum of 2,500–3,000 mL of fluid daily while taking medication.

Intervention/evaluation

Discontinue medication immediately if rash or other evidence of allergic reaction occurs. Monitor I&O (output should be at least 2,000 mL/day). Assess serum chemistries, uric acid, hepatic function. Assess urine for cloudiness, unusual color, odor. **Gout:** Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

Patient/family teaching

- May take 1 wk or longer for full therapeutic effect.
- Maintain adequate hydration; drink 2,500–3,000 mL of fluid daily while taking medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol (may increase uric acid).

almotriptan

al-moe-**trip**-tan

Axert

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Serotonin receptor agonist (5-HT_{1B}).

CLINICAL: Antimigraine.

Do not confuse almotriptan with alvimopan, or Axert with Antivert.

Uses

Acute treatment of migraine headache with or without aura in adults. Acute treatment of migraine headache in adolescents 12–17 yrs with history of migraine with or without aura and having attacks usually lasting 4 or more hrs when left untreated.

Precautions

Contraindications: Hypersensitivity to almotriptan. Cerebrovascular disease (e.g., recent stroke, transient ischemic attacks), peripheral vascular disease (e.g.,

ischemic bowel disease), hemiplegic or basilar migraine, ischemic heart disease (including angina pectoris, history of MI, silent ischemia, and Prinzmetal's angina), uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another 5-HT_{1B} agonist. **Cautions:** Mild to moderate renal or hepatic impairment, pt profile suggesting cardiovascular risks, controlled hypertension; history of CVA, sulfonamide allergy.

Action

Binds selectively to serotonin receptors in cranial arteries producing a vasoconstrictive effect. Decreases inflammation associated with relief of migraine. **Therapeutic Effect:** Produces relief of migraine headache.

Pharmacokinetics

Well absorbed after PO administration. Protein binding: 35%. Metabolized by liver. Primarily excreted in urine. **Half-life:** 3–4 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Ergotamine-containing drugs may produce vasospastic reaction. MAOIs may increase concentration. Combined use of SSRIs or SNRIs (e.g., FLUoxetine, fluvoxamine, PARoxetine, sertraline) may produce weakness, hyperreflexia, incoordination. CYP3A4 inhibitors (e.g., erythromycin, itraconazole, ketoconazole, ritonavir) may increase plasma concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

 **Tablets:** 6.5 mg, 12.5 mg.

Administration/handling

PO

- Swallow whole; do not break, crush, dissolve, or divide tablets.
- Take with full glass of water.
- May give without regard to food.

Indications/routes/dosage

Migraine Headache

PO: ADULTS, ELDERLY, ADOLESCENTS 12–17 YRS: Initially, 6.25–12.5 mg as a single dose. If headache returns, dose may be repeated after 2 hrs.

Maximum: 2 doses/24 hrs (25 mg).

Concurrent Use of CYP3A4 Inhibitors

ADULTS, ELDERLY: Recommended initial dose is 6.25 mg, maximum daily dose is 12.5 mg. Avoid use in pts with renal or hepatic impairment AND use of CYP3A4 inhibitors.

Dosage in Renal Impairment

CrCl 30 mL/min or less: Initially, 6.25 mg in a single dose. **Maximum:** 12.5 mg/day.

Dosage in Hepatic Impairment

Initially, 6.25 mg in a single dose. **Maximum:** 12.5 mg/day.

Side effects

Rare (2%–1%): Nausea, dry mouth, headache, dizziness, somnolence, paresthesia, flushing.

Adverse effects/toxic reactions

Excessive dosage may produce tremor, redness of extremities, decreased respirations, cyanosis, seizures, chest pain. Serious arrhythmias occur rarely but particularly in pts with hypertension, diabetes, obesity, smokers, and those with

strong family history of coronary artery disease.

Nursing considerations

Baseline assessment

Question for history of peripheral vascular disease, cardiac conduction disorders, CVA. Question pt regarding onset, location, duration of migraine, and possible precipitating factors.

Intervention/evaluation

Evaluate for relief of migraine headache and associated photophobia, phonophobia (sound sensitivity), nausea, vomiting.

Patient/family teaching

- Take a single dose as soon as symptoms of an actual migraine attack appear.
- Medication is intended to relieve migraine, not to prevent or reduce number of attacks.
- Lie down in quiet, dark room for additional benefit after taking medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report immediately if palpitations, pain or tightness in chest or throat, or pain or weakness of extremities occurs.
- Swallow whole; do not chew, crush, dissolve, or divide tablets.

ALPRAZolam

al-**praz**-oh-lam

ALPRAZolam Intensol

ALPRAZolam XR

Apo-Alpraz 

Niravam

Xanax

Xanax XR

 **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Benzodiazepine (Schedule IV).

CLINICAL: Antianxiety.

DO NOT CONFUSE ALPRAZolam with LORazepam, or Xanax with Tenex, Tylox, Xopenex, Zantac, or ZyrTEC.

Uses

Management of generalized anxiety disorders (GAD). Short-term relief of symptoms of anxiety, panic disorder, with or without agoraphobia. Anxiety associated with depression. **OFF-LABEL:** Anxiety in children. Preoperative anxiety.

Precautions

Contraindications: Hypersensitivity to ALPRAZolam. Acute narrow angle-closure glaucoma, concurrent use with ketoconazole or itraconazole or other potent CYP3A4 inhibitors. **Cautions:** Renal/hepatic impairment, predisposition to urate nephropathy, obese pts. Concurrent use of CYP3A4 inhibitors/inducers and major CYP3A4 substrates; debilitated pts, respiratory disease, depression (esp. suicidal risk), elderly (increased risk of severe toxicity). History of substance abuse.

Action

Enhances the inhibitory effects of the neurotransmitter gamma-aminobutyric acid in the brain. **Therapeutic Effect:** Produces anxiolytic effect due to CNS depressant action.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 80%. Metabolized in liver. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 6–27 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. Chronic ingestion during pregnancy may produce withdrawal symptoms, CNS depression

in neonates. **Children:** Safety and efficacy not established. **Elderly:** Use small initial doses with gradual increase to avoid ataxia (muscular incoordination) or excessive sedation. May have increased risk of falls, delirium.

Interactions

DRUG: Potentiated effects when used with **other CNS depressants (including alcohol)**. **CYP3A4 inhibitors (e.g., antifungal agents [azole], OLANzapine, protease inhibitors, SSRIs)** may increase CNS effect. **CYP3A4 inducers (e.g., carbamazepine, rifampin)** may decrease effect. **HERBAL:** **Gotu kola, kava kava, St. John's wort, valerian** may increase CNS depressant effect. **St. John's wort, yohimbe** may decrease effectiveness. **FOOD:** **Grapefruit products** may increase level, effects. **LAB VALUES:** None significant.

Availability (Rx)

Solution, Oral (ALPRAZolam Intensol): 1 mg/mL. **Tablets (Orally Disintegrating [Niravam]):** 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Tablets (Immediate-Release [Xanax]):** 0.25 mg, 0.5 mg, 1 mg, 2 mg.

 **Tablets (Extended-Release [Xanax XR]):** 0.5 mg, 1 mg, 2 mg, 3 mg.

Administration/handling

PO, Immediate-Release

- May give without regard to meals.
- Tablets may be crushed.
- If oral intake is not possible, may be given sublingually.

PO, Extended-Release

- Administer once daily.
- Do not break, crush, dissolve, or divide extended-release tablets. Swallow whole.

PO, Orally Disintegrating

- Place tablet on tongue, allow to dissolve.

- Swallow with saliva.
- Administration with water not necessary.
- If using 1/2 tab, discard remaining 1/2 tab.

Indications/routes/dosage

Anxiety Disorders

PO: (Immediate-Release, Oral Concentrate, ODT) : ADULTS: Initially, 0.25–0.5 mg 3 times/day. May titrate q3–4days. **Maximum:** 4 mg/day in divided doses. **CHILDREN, YOUNGER THAN 18 YRS:** 0.125 mg 3 times/day. May increase by 0.125–0.25 mg/dose. **Maximum:** 0.06 mg/kg/day or 0.02 mg/kg/dose. Range: 0.375–3 mg/day. **ELDERLY, DEBILITATED PTS, PTS WITH HEPATIC DISEASE OR LOW SERUM ALBUMIN:** Initially, 0.25 mg 2–3 times/day. Gradually increase to optimum therapeutic response.

Anxiety with Depression

PO: ADULTS: (average dose required) 2.5–3 mg/day in divided doses.

Panic Disorder

PO (Immediate-Release, Oral Concentrate, ODT): ADULTS: Initially, 0.5 mg 3 times/day. May increase at 3- to 4-day intervals in increments of 1 mg or less a day. Range: 5–6 mg/day. **Maximum:** 10 mg/day. **ELDERLY:** Initially, 0.125–0.25 mg twice daily. May increase in 0.125-mg increments until desired effect attained.

PO: (Extended-Release):

◀ALERT▶ To switch from immediate-release to extended-release form, give total daily dose (immediate-release) as a single daily dose of extended-release form.

ADULTS: Initially, 0.5–1 mg once daily. May titrate at 3- to 4-day intervals. Range: 3–6 mg/day. **ELDERLY:** Initially, 0.5 mg once daily.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Severe Disease: Immediate-Release: 0.25 mg 2–3 mg times/day. **Extended-**

Release: 0.5 mg once daily.

Side effects

Frequent (41%–20%): Ataxia, light-headedness, drowsiness, slurred speech (particularly in elderly or debilitated pts). **Occasional (15%–5%):** Confusion, depression, blurred vision, constipation, diarrhea, dry mouth, headache, nausea. **Rare (4% or less):** Behavioral problems such as anger, impaired memory; paradoxical reactions (insomnia, nervousness, irritability).

Adverse effects/toxic reactions

Abrupt or too-rapid withdrawal may result in restlessness, irritability, insomnia, hand tremors, abdominal/muscle cramps, diaphoresis, vomiting, seizures. Overdose results in drowsiness, confusion, diminished reflexes, coma. Blood dyscrasias noted rarely. **Antidote:** Flumazenil (see [Appendix J](#) for dosage).

Nursing considerations

Baseline assessment

Assess degree of anxiety; assess for drowsiness, dizziness, light-headedness. Assess motor responses (agitation, trembling, tension), autonomic responses (cold/clammy hands, diaphoresis). Initiate fall precautions.

Intervention/evaluation

For pts on long-term therapy, perform hepatic/renal function tests, CBC periodically. Assess for paradoxical reaction, particularly during early therapy. Evaluate for therapeutic response: calm facial expression, decreased restlessness, insomnia. Monitor respiratory and cardiovascular status.

Patient/family teaching

- Drowsiness usually disappears during continued therapy.
- If dizziness occurs, change positions slowly from recumbent to sitting position before standing.
- Avoid tasks that require alertness, motor skills until response to drug is established.

- Smoking reduces drug effectiveness.
- Sour hard candy, gum, sips of water may relieve dry mouth.
- Do not abruptly withdraw medication after long-term therapy.
- Avoid alcohol.
- Do not take other medications without consulting physician.

alteplase

al-te-plase

Activase

Cathflo Activase

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tissue plasminogen activator (tPA).

CLINICAL: Thrombolytic.

Do not confuse alteplase or Activase with Altace, or Activase with Cathflo Activase.

HIGH
ALERT

Uses

Treatment of ST-elevation MI for lysis of thrombi in coronary arteries, acute ischemic stroke, acute massive pulmonary embolism. Treatment of occluded central venous catheters. **OFF-LABEL:** Acute peripheral occlusive disease, prosthetic valve thrombosis. Acute ischemic stroke presenting 3–4 1/2 hrs after onset of symptoms.

Precautions

Contraindications: Hypersensitivity to alteplase. Active internal bleeding, AV malformation or aneurysm, bleeding diathesis CVA, intracranial neoplasm, intracranial or intraspinal surgery or trauma, recent (within past 2 mos), severe uncontrolled hypertension, suspected aortic dissection. **Cautions:** Recent (within 10 days) major surgery or GI bleeding, OB delivery, organ biopsy, recent trauma or CPR, left heart thrombus, endocarditis, severe hepatic disease, pregnancy, elderly, cerebrovascular disease, diabetic retinopathy, thrombophlebitis, occluded AV cannula at infected site.

Action

Binds to fibrin in a thrombus and converts entrapped plasminogen to plasmin, initiating fibrinolysis. **Therapeutic Effect:** Degrades fibrin clots, fibrinogen, other plasma proteins.

Pharmacokinetics

Rapidly metabolized in liver. Primarily excreted in urine. **Half-life:** 35 min.

Lifespan considerations

Pregnancy/Lactation: Use only when benefit outweighs potential risk to fetus. Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of bleeding; monitor closely.

Interactions

DRUG: Heparin, low molecular weight heparins, medications altering platelet function (e.g., clopidogrel, NSAIDs, thrombolytics), oral anticoagulants (e.g., warfarin) increase risk of hemorrhage. **HERBAL:** Cat's claw, dong quai, evening primrose, feverfew, garlic, ginkgo, ginseng, green tea, horse chestnut, red clover may increase risk of bleeding due to antiplatelet activity. **FOOD:** None known. **LAB VALUES:** Decreases plasminogen, fibrinogen levels during infusion, decreases clotting time (confirms the presence of lysis). May decrease Hgb, Hct.

Availability (Rx)

Injection, Powder for Reconstitution: 2 mg (Cathflo Activase), 50 mg (Activase), 100 mg (Activase).

Administration/handling

IV

Reconstitution

- **Activase:** Reconstitute immediately before use with Sterile Water for Injection.
- Reconstitute 100-mg vial with 100 mL Sterile Water for Injection (50-mg vial with 50 mL sterile water) without preservative to provide a concentration of 1

mg/mL.

- **Activase Cathflo:** Add 2.2 mL Sterile Water for Injection to provide concentration of 1 mg/mL.

- Avoid excessive agitation; gently swirl or slowly invert vial to reconstitute.

Rate of Administration

- **Activase:** Give by IV infusion via infusion pump (see Indications/Routes/Dosage).

- If minor bleeding occurs at puncture sites, apply pressure for 30 sec; if unrelieved, apply pressure dressing.

- If uncontrolled hemorrhage occurs, discontinue infusion immediately (slowing rate of infusion may produce worsening hemorrhage).

- Avoid undue pressure when drug is injected into catheter (can rupture catheter or expel clot into circulation).

- Instill dose into occluded catheter.

- After 30 min, assess catheter function by attempting to aspirate blood.

- If still occluded, let dose dwell an additional 90 min.

- If function not restored, a second dose may be instilled.

Storage

- **Activase:** Store vials at room temperature.

- After reconstitution, solution appears colorless to pale yellow.

- Solution is stable for 8 hrs after reconstitution. Discard unused portions.

■ IV incompatibilities

DOBUTamine (Dobutrex), DOPamine (Intropin), heparin.

■ IV Compatibilities

Lidocaine, metoprolol (Lopressor), morphine, nitroglycerin, propranolol (Inderal).

Indications/routes/dosage

Acute MI

IV Infusion: ADULTS WEIGHING MORE THAN 67 KG: Total dose: 100 mg over 90 min, starting with 15-mg bolus over 1–2 min, then 50 mg over 30

min, then 35 mg over 60 min. **ADULTS WEIGHING 67 KG OR LESS: Total dose:** Start with 15-mg bolus over 1–2 min, then 0.75 mg/kg over 30 min (**maximum:** 50 mg), then 0.5 mg/kg over 60 min (**maximum:** 35 mg). **Maximum total dose:** 100 mg.

Acute Pulmonary Emboli

IV Infusion: ADULTS: 100 mg over 2 hrs. May give as a 10-mg bolus followed by 90 mg over 2 hrs. Institute or reinstitute heparin near end or immediately after infusion when activated partial thromboplastin time (aPTT) or thrombin time (TT) returns to twice normal or less.

Acute Ischemic Stroke

◀ALERT▶ Dose should be given within the first 3 hrs of the onset of symptoms. Recommended total dose: 0.9 mg/kg. **Maximum:** 90 mg.

IV Infusion: ADULTS WEIGHING 100 KG OR LESS: 0.09 mg/kg as IV bolus over 1 min, then 0.81 mg/kg as continuous infusion over 60 min. **WEIGHING GREATER THAN 100 KG:** 9 mg bolus over 1 min, then 81 mg as continuous infusion over 60 min.

Central Venous Catheter Clearance

IV: ADULTS, ELDERLY: Up to 2 mg; may repeat after 2 hrs. If catheter functional, withdraw 4–5 mL blood to remove drug and residual clot.

Usual Neonatal Dosage

Occluded IV Catheter: Use 1 mg/mL conc (**maximum:** 2 mg/2 mL) leave in lumen up to 2 hrs, then aspirate.

Systemic Thrombosis: 0.1–0.6 mg/kg/hr for 6 hrs.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Superficial bleeding at puncture sites, decreased B/P. **Occasional:** Allergic reaction (rash, wheezing, bruising).

Adverse effects/toxic reactions

Severe internal hemorrhage, intracranial hemorrhage may occur. Lysis of coronary thrombi may produce atrial or ventricular arrhythmias or stroke.

Nursing considerations

Baseline assessment

Assess for contraindications to therapy. Obtain baseline B/P, apical pulse. Record weight. Evaluate 12-lead EKG, cardiac enzymes, electrolytes. Assess Hct, platelet count, thrombin time (TT), prothrombin time (PT), activated partial thromboplastin time (aPTT), fibrinogen level before therapy is instituted. Type and screen blood.

Intervention/evaluation

Perform continuous cardiac monitoring for arrhythmias. Check B/P, pulse, respirations q15min until stable, then hourly. Check peripheral pulses, heart and lung sounds. Monitor for chest pain relief and notify physician of continuation or recurrence (note location, type, intensity). Assess for bleeding: overt blood, occult blood in any body substance. Monitor aPTT per protocol. Maintain B/P; avoid any trauma that might increase risk of bleeding (e.g., injections, shaving). Assess neurologic status frequently.

amikacin

am-i-kay-sin

Amikin 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Amino-glycoside.

CLINICAL: Antibiotic.

- **BLACK BOX ALERT** ■ May cause neurotoxicity, nephrotoxicity, and/or neuromuscular blockade and respiratory paralysis. Ototoxicity usually is irreversible; nephrotoxicity usually is reversible.

Do not confuse amikacin or Amikin with Amicar, or amikacin with anakinra.

Uses

Treatment of serious infections due to *Pseudomonas*, other gram-negative organisms (*Proteus*, *Serratia*, other gram-negative bacilli), including biliary tract, bone and joint, CNS, intra-abdominal, skin and soft tissue, urinary tract. Treatment of bacterial pneumonia, septicemia. **OFF-LABEL:** *Mycobacterium avium* complex (MAC).

Precautions

Contraindications: Hypersensitivity to amikacin, other aminoglycosides. **Cautions:** Preexisting renal impairment, auditory or vestibular impairment, hypocalcemia, elderly, pts with neuromuscular disorder, dehydration, concomitant use of neurotoxic or nephrotoxic medications.

Action

Inhibits protein synthesis in susceptible bacteria by binding to 30S ribosomal unit. **Therapeutic Effect:** Interferes with protein synthesis of susceptible microorganisms.

Pharmacokinetics

Rapid, complete absorption after IM administration. Protein binding: 0%–10%. Widely distributed (penetrates blood-brain barrier when meninges are inflamed). Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 2–4 hrs (increased in renal impairment, neonates; decreased in cystic fibrosis, burn pts, febrile pts).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta; small amounts distributed in breast milk. May produce fetal nephrotoxicity. **Children:** Neonates, premature infants may be more susceptible to toxicity due to immature renal function. **Elderly:** Higher risk of toxicity due to age-related renal impairment, increased risk of hearing loss.

Interactions

DRUG: Nephrotoxic (e.g., cyclosporine, gentamicin, IV contrast dye, NSAIDS) and ototoxic medications (e.g., aspirin, gentamicin, furosemide, quinine) may increase toxicity. May increase effects of cycloSPORINE, neuromuscular blocking agents. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, BUN, ALT, AST, bilirubin, LDH. May decrease serum calcium, magnesium, potassium, sodium. **Therapeutic levels:** Peak: life-threatening infections: 25–40 mcg/mL; serious infections: 20–25 mcg/mL; urinary tract infections: 15–20 mcg/mL. **Trough:** Less than 8 mcg/mL. **Toxic levels:** Peak: greater than 40 mcg/mL; **trough:** greater than 10 mcg/mL.

Availability (Rx)

Injection Solution: 250 mg/mL.

Administration/handling

IV

Reconstitution

- Dilute to concentration of 0.25–5 mg/mL in 0.9% NaCl or D₅W.

Rate of Administration

- Infuse over 30–60 min.

Storage

- Store vials at room temperature.
- Solution appears clear but may become pale yellow (does not affect potency).
- Intermittent IV infusion (piggyback) is stable for 24 hrs at room temperature, 2 days if refrigerated.
- Discard if precipitate forms or dark discoloration occurs.

IM

- To minimize discomfort, give deep IM slowly.
- Less painful if injected into gluteus maximus rather than in lateral aspect of thigh.

■ IV incompatibilities

Amphotericin, azithromycin (Zithromax), propofol (Diprivan).

■ IV Compatibilities

Amiodarone (Cordarone), aztreonam (Azactam), calcium gluconate, cefepime (Maxipime), cimetidine (Tagamet), ciprofloxacin (Cipro), clindamycin (Cleocin), dexmedetomidine (Precedex), diltiazem (Cardizem), diphenhydramine (Benadryl), enalapril (Vasotec), esmolol (Brevibloc), fluconazole (Diflucan), furosemide (Lasix), levofloxacin (Levaquin), lorazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, ondansetron (Zofran), potassium chloride, ranitidine (Zantac), vancomycin.

Indications/routes/dosage

Usual Parenteral Dosage

IV, IM: ADULTS, ELDERLY, CHILDREN, INFANTS: 5–7.5 mg/kg/dose q8h. **NEONATES:** 15 mg/kg/dose q12–48h (based on wgt).

Dosage in Renal Impairment

Dosage and frequency are modified based on degree of renal impairment and serum drug concentration. After a loading dose of 5–7.5 mg/kg, maintenance dose and frequency are based on serum creatinine levels and creatinine clearance.

Creatinine Clearance	Dosing Interval
50 mL/min or greater	q8h
30–49 mL/min	q12–18h
10–29 mL/min	q18–24h
Less than 10 mL/min	q48–72h
Hemodialysis	q48–72h (give after HD on dialysis days)
Continuous renal replacement therapy (CRRT)	Initially, 10 mg/kg, then 7.5 mg/kg q24–48h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Phlebitis, thrombophlebitis. **Occasional:** Rash, fever, urticaria, pruritus. **Rare:** Neuromuscular blockade (difficulty breathing, drowsiness, weakness).

Adverse effects/toxic reactions

Serious reactions include nephrotoxicity (increased thirst, decreased appetite, nausea, vomiting, increased BUN and serum creatinine levels, decreased creatinine clearance); neurotoxicity (muscle twitching, visual disturbances, seizures, paresthesia); ototoxicity (tinnitus, dizziness, loss of hearing).

Nursing considerations

Baseline assessment

Obtain BUN, serum creatinine. Dehydration must be treated prior to aminoglycoside therapy. Establish baseline hearing acuity before beginning therapy. Question for history of allergies, esp. to aminoglycosides and sulfite. Obtain specimen for culture, sensitivity before giving first dose (therapy may begin before results are known).

Intervention/evaluation

Monitor I&O (maintain hydration), urinalysis. Monitor results of serum peak/trough levels. Be alert to ototoxic, neurotoxic, nephrotoxic symptoms (see Adverse Effects/Toxic Reactions). Check IM injection site for pain, induration. Evaluate IV site for phlebitis. Assess for skin rash, diarrhea, superinfection (particularly genital/anal pruritus), changes of oral mucosa. When treating pts with neuromuscular disorders, assess respiratory response carefully. **Therapeutic levels:** Peak: life-threatening infections: 25–40 mcg/mL; serious infections: 20–25 mcg/mL; urinary tract infections: 15–20 mcg/mL. **Trough:** Less than 8 mcg/mL. **Toxic levels:** Peak: greater than 40 mcg/mL; **trough:** greater than 10 mcg/mL.

Patient/family teaching

- Continue antibiotic for full length of treatment.

- Space doses evenly.
- IM injection may cause discomfort.
- Report any hearing, visual, balance, urinary problems, even after therapy is completed.
- Do not take other medications without consulting physician.

amiodarone

a-mi-**oh**-da-rone

HIGH
ALERT

Apo-Amiodarone 

Nexterone

Pacerone

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Cardiac agent.

CLINICAL: Antiarrhythmic.

■ **BLACK BOX ALERT** ■ Pts should be hospitalized when amiodarone is initiated. Alternative therapies should be tried first before using amiodarone. Only indicated for pts with life-threatening arrhythmias due to risk of toxicity. Pulmonary toxicity may occur without symptoms. Hepatotoxicity is common, usually mild (rarely possible). Can exacerbate arrhythmias.

Do not confuse amiodarone with aMILoride, dronedarone, or Cordarone with Cardura.

Uses

Management of life-threatening recurrent ventricular fibrillation, hemodynamically unstable ventricular tachycardia (VT) unresponsive to other therapy. **OFF-LABEL:** Treatment of atrial fibrillation, paroxysmal supraventricular tachycardia (SVT); ventricular tachyarrhythmias.

Precautions

Contraindications: Hypersensitivity to amiodarone, iodine. Bradycardia-induced syncope (except in the presence of a pacemaker), second- and third-degree AV block (except in presence of a pacemaker); severe sinus node

dysfunction, causing marked sinus bradycardia; cardiogenic shock. **Cautions:** May prolong QT interval. Thyroid disease, electrolyte imbalance, hepatic disease, hypotension, left ventricular dysfunction, pulmonary disease. Pts taking warfarin, surgical pts.

Action

Prolongs duration of myocardial cell action potential and refractory period by acting directly on all cardiac tissue. Decreases AV and sinus node function.

Therapeutic Effect: Suppresses arrhythmias.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	3 days–3 wks	1 wk–5 mos	7–50 days after discontinuation

Slowly, variably absorbed from GI tract. Protein binding: 96%. Extensively metabolized in liver. Excreted via bile; not removed by hemodialysis. **Half-life:** 26–107 days; metabolite: 61 days.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. May adversely affect fetal development. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to effects on thyroid function. May experience increased incidence of ataxia, other neurotoxic effects.

Interactions

DRUG: **Sofosbuvir** may cause severe bradycardia. May increase **thioridazine** concentration and produce additive prolongation of QT interval. May increase cardiac effects with **other antiarrhythmics**. May increase effect of **beta blockers (e.g., carvedilol, labetalol, metoprolol)**, **oral anticoagulants (e.g., warfarin)**. May increase concentration, toxicity of **ARIPiprazole, colchicine, digoxin, phenytoin**. May increase risk of **simvastatin** toxicity, myopathy, rhabdomyolysis. **HERBAL:** **St. John's wort** may decrease effect. **Ephedra** may worsen arrhythmia. Herbals with hypotensive properties may increase levels/effects of amiodarone. **FOOD:** **Grapefruit products** may alter effect.

Avoid use during therapy. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, ANA titer. May cause changes in EKG, thyroid function test results. **Therapeutic serum level:** 0.5–2.5 mcg/mL; toxic serum level not established.

Availability (Rx)

Infusion (Pre-Mix): Nexterone: 150 mg/100 mL; 360 mg/200 mL. **Injection, Solution (Cordarone IV):** 50 mg/mL, 3 mL, 9 mL, 18 mL. **Tablets:** 100 mg (Pacerone), 200 mg (Cordarone, Pacerone), 400 mg (Pacerone).

Administration/handling

IV

Reconstitution

- Infusions longer than 2 hrs must be administered/diluted in glass or polyolefin bottles.
- Dilute loading dose (150 mg) in 100 mL D₅W (1.5 mg/mL).
- Dilute maintenance dose (900 mg) in 500 mL D₅W (1.8 mg/mL). Concentrations greater than 3 mg/mL cause peripheral vein phlebitis.

Rate of Administration

- Does not need protection from light during administration.
- Administer through central venous catheter (CVC) if possible, using in-line filter.
- Bolus over 10 min (15 mg/min) not to exceed 30 mg/min; then 1 mg/min over 6 hrs; then 0.5 mg/min over 18 hrs.
- Infusions longer than 1 hr, concentration not to exceed 2 mg/mL unless CVC used.

Storage

- Store at room temperature.
- Stable for 24 hrs when diluted in glass or polyolefin containers; stable for 2 hrs when diluted in PVC containers.

PO

- Give consistently with regard to meals to reduce GI distress.
- Tablets may be crushed.

- Do not give with grapefruit products.

■ IV incompatibilities

CeFAZolin (Ancef), heparin, sodium bicarbonate.

■ IV Compatibilities

Dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), insulin (regular), labetalol (Normodyne), lidocaine, LORazepam (Ativan), midazolam (Versed), morphine, nitroglycerin, norepinephrine (Levophed), phenylephrine (Neo-Synephrine), potassium chloride, vancomycin.

Indications/routes/dosage

Ventricular Arrhythmias

PO: ADULTS, ELDERLY: Initially, 800–1,600 mg/day in 1–2 divided doses for 1–3 wks. After arrhythmia is controlled or side effects occur, reduce to 600–800 mg/day for 4 wks. **Maintenance:** 400 mg/day.

IV Infusion: ADULTS, ELDERLY: Initially, 1,050 mg over 24 hrs; 150 mg over 10 min, then 360 mg over 6 hrs; then 540 mg over 18 hrs. May continue at 0.5 mg/min. After first 24 hrs, infuse 720 mg/24 hrs (0.5 mg/min) with a concentration of 1–6 mg/mL.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution.

Side effects

Expected: Corneal microdeposits noted in almost all pts treated for more than 6 mos (can lead to blurry vision). **Occasional (greater than 3%): PO:** Constipation, headache, decreased appetite, nausea, vomiting, paresthesia,

photosensitivity, muscular incoordination. **Parenteral:** Hypotension, nausea, fever, bradycardia. **Rare (less than 3%): PO:** Bitter or metallic taste, decreased libido, dizziness, facial flushing, blue-gray coloring of skin (face, arms, and neck), blurred vision, bradycardia, asymptomatic corneal deposits, rash, visual disturbances, halo vision.

Adverse effects/toxic reactions

Serious, potentially fatal pulmonary toxicity (alveolitis, pulmonary fibrosis, pneumonitis, acute respiratory distress syndrome) may begin with progressive dyspnea and cough with crackles, decreased breath sounds, pleurisy, HF, or hepatotoxicity. May worsen existing arrhythmias or produce new arrhythmias.

Nursing considerations

Baseline assessment

Obtain baseline serum ALT, AST, alkaline phosphatase, EKG; pulmonary function tests, CXR in pts with pulmonary disease. Assess B/P, apical pulse immediately before drug is administered (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician).

Intervention/evaluation

Monitor for symptoms of pulmonary toxicity (progressively worsening dyspnea, cough). Dosage should be discontinued or reduced if toxicity occurs. Assess pulse for quality, rhythm, bradycardia. Monitor EKG for cardiac changes (e.g., widening of QRS, prolongation of PR and QT intervals). Notify physician of any significant interval changes. Assess for nausea, fatigue, paresthesia, tremor. Monitor for signs of hypothyroidism (periorbital edema, lethargy, pudgy hands/feet, cool/pale skin, vertigo, night cramps) and hyperthyroidism (hot/dry skin, bulging eyes [exophthalmos], frequent urination, eyelid edema, weight loss, difficulty breathing). Monitor serum ALT, AST, alkaline phosphatase for evidence of hepatic toxicity. Assess skin, cornea for bluish discoloration in pts who have been on drug therapy longer than 2 mos. Monitor thyroid function test results. If elevated hepatic enzymes occur, dosage reduction or discontinuation is necessary. Monitor for therapeutic serum level (0.5–2.5 mcg/mL). Toxic serum level not established.

Patient/family teaching

- Protect against photosensitivity reaction on skin exposed to sunlight.
- Bluish skin discoloration gradually disappears when drug is discontinued.
- Report shortness of breath, cough.
- Outpatients should monitor pulse before taking medication.
- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control arrhythmias.
- Restrict salt, alcohol intake.
- Avoid grapefruit products.
- Recommend ophthalmic exams q6mos.
- Report any vision changes, signs/symptoms of cardiac arrhythmias.

amitriptyline

a-mi-**trip**-ti-leen

Apo-Amitriptyline 

Levate 

Novo-Tryptyn 

Elavil

Fixed-Combination(s)

Limbitrol: amitriptyline/chlordiazepoxide (an antianxiety): 12.5 mg/5 mg, 25 mg/10 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tricyclic.

CLINICAL: Antidepressant, antineuralgic, antitubercular.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse amitriptyline with aminophylline, imipramine, or nortriptyline, or Elavil with Eldepryl, enalapril, Equanil, or Mellaril.

Uses

Treatment of depression. **OFF-LABEL:** Neuropathic pain, related to diabetic neuropathy or postherpetic neuralgia; treatment of migraine. Treatment of depression in children, post-traumatic stress disorder (PTSD).

Precautions

Contraindications: Hypersensitivity to amitriptyline. Acute recovery period after MI, co-administered with or within 14 days of MAOIs. **Cautions:** Prostatic hypertrophy, history of urinary retention or obstruction, narrow-angle glaucoma, diabetes, seizures, hyperthyroidism, cardiac/hepatic/renal disease, schizophrenia, xerostomia, visual problems, constipation or bowel obstruction, elderly, increased intraocular pressure (IOP), hiatal hernia, suicidal ideation.

Action

Blocks reuptake of neurotransmitters (norepinephrine, serotonin) at presynaptic membranes, increasing availability at postsynaptic receptor sites. Strong anticholinergic activity. **Therapeutic Effect:** Antidepressant effect.

Pharmacokinetics

Rapidly and well absorbed from GI tract. Protein binding: 90%. Metabolized in liver. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 10–26 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; minimally distributed in breast milk. **Children:** More sensitive to increased dosage, toxicity, increased risk of suicidal ideation, worsening of depression. **Elderly:** Increased risk of toxicity. Increased sensitivity to anticholinergic effects. Caution in pts with cardiovascular disease.

Interactions

DRUG: CNS depressants (e.g., alcohol, anticonvulsants, barbiturates, phenothiazines, sedative-hypnotics) may increase sedation, respiratory depression, hypotensive effect. May increase concentrations of **dronedarone**,

thioridazine, toremifine, ziprasidone. QUetiapine may increase level/effect. May increase risk of hypertensive crisis, hyperpyresis, seizures with **MAOIs**. **HERBAL:** St. John's wort may decrease levels. **Gotu kola, kava kava, St. John's wort, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May alter EKG readings (flattened T wave), serum glucose (increase or decrease). **Therapeutic serum level:** Peak: 120–250 ng/mL; **toxic serum level:** greater than 500 ng/mL.

Availability (Rx)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg.

Administration/handling

PO

- Give with food or milk if GI distress occurs.

Indications/routes/dosage

Depression

PO: ADULTS: Initially, 25–50 mg/day as a single dose at bedtime, or in divided doses. May gradually increase up to 100–300 mg/day. Titrate to lowest effective dosage. **ELDERLY:** 10 mg 3 times/day and 20 mg at bedtime. **ADOLESCENTS:** 10 mg 3 times/day and 20 mg at bedtime.

Pain Management

PO: ADULTS, ELDERLY: 25–50 mg at bedtime. May increase to 150 mg/day. **CHILDREN:** Initially, 0.1 mg/kg. May increase over 2 wks to 0.5–2 mg/kg at bedtime.

Dosage in Renal/Hepatic Impairment

Use with caution.

Side effects

Frequent: Dizziness, drowsiness, dry mouth, orthostatic hypotension, headache, increased appetite, weight gain, nausea, unusual fatigue, unpleasant taste. **Occasional:** Blurred vision, confusion, constipation, hallucinations, delayed micturition, eye pain, arrhythmias, fine muscle tremors, parkinsonian syndrome, anxiety, diarrhea, diaphoresis, heartburn, insomnia. **Rare:** Hypersensitivity, alopecia, tinnitus, breast enlargement, photosensitivity.

Adverse effects/toxic reactions

Overdose may produce confusion, seizures, severe drowsiness, changes in cardiac conduction, fever, hallucinations, agitation, dyspnea, vomiting, unusual fatigue, weakness. Abrupt withdrawal after prolonged therapy may produce headache, malaise, nausea, vomiting, vivid dreams. Blood dyscrasias, cholestatic jaundice occur rarely.

Nursing considerations

Baseline assessment

Observe and record behavior. Assess psychological status, thought content, suicidal ideation, sleep patterns, appearance, interest in environment. For pts on long-term therapy, hepatic/renal function tests, blood counts should be performed periodically.

Intervention/evaluation

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood. Monitor B/P for hypotension, pulse, arrhythmias. **Therapeutic serum level:** Peak: 120–250 ng/mL; **toxic serum level:** greater than 500 ng/mL.

Patient/family teaching

- Go slowly from lying to standing.
- Tolerance to postural hypotension, sedative and anticholinergic effects usually develops during early therapy.
- Maximum therapeutic effect may be noted in 2–4 wks.
- Sensitivity to sun may occur.

- Report visual disturbances.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Sips of water may relieve dry mouth.

amLODIPine

am-loe-di-peen

TOP
100

Apo-AmLODIPine 🍁

Norvasc

Fixed-Combination(s)

Anturnide: amLODIPine/aliskiren (a renin inhibitor)/hydroCHLOROthiazide (a diuretic): 5 mg/150 mg/12.5 mg, 5 mg/300 mg/12.5 mg, 5 mg/300 mg/25 mg, 10 mg/300 mg/12.5 mg, 10 mg/300 mg/25 mg. **Azor:** amLODIPine/olmesartan (an angiotensin II receptor antagonist): 5 mg/20 mg, 10 mg/20 mg, 5 mg/40 mg, 10 mg/40 mg. **Caduet:** amLODIPine/atorvastatin (hydroxymethylglutaryl-CoA [HMG-CoA] reductase inhibitor): 2.5 mg/10 mg, 2.5 mg/20 mg, 2.5 mg/40 mg, 5 mg/10 mg, 10 mg/10 mg, 5 mg/20 mg, 10 mg/20 mg, 5 mg/40 mg, 10 mg/40 mg, 5 mg/80 mg, 10 mg/80 mg. **Exforge:** amLODIPine/valsartan (an angiotensin II receptor antagonist): 5 mg/160 mg, 10 mg/160 mg, 5 mg/320 mg, 10 mg/320 mg. **Exforge HCT:** amLODIPine/valsartan/hydroCHLOROthiazide (a diuretic): 5 mg/160 mg/12.5 mg, 5 mg/160 mg/25 mg, 10 mg/160 mg/12.5 mg, 10 mg/160 mg/25 mg, 10 mg/320 mg/25 mg. **Lotrel:** amLODIPine/benazepril (an angiotensin-converting enzyme [ACE] inhibitor): 2.5 mg/10 mg, 5 mg/10 mg, 5 mg/20 mg, 5 mg/40 mg, 10 mg/20 mg, 10 mg/40 mg. **Prestalia:** amLODIPine/perindopril (an ACE inhibitor): 2.5 mg/3.5 mg; 5 mg/7 mg; 10 mg/14 mg. **Tekamlo:** amLODIPine/aliskiren (a renin inhibitor): 5 mg/150 mg, 5 mg/300 mg, 10 mg/150 mg, 10 mg/300 mg. **Tribenzor:** amLODIPine/olmesartan/hydroCHLOROthiazide: 5 mg/20 mg/12.5 mg, 5 mg/40 mg/12.5 mg, 5 mg/40 mg/25 mg, 10 mg/40 mg/12.5 mg, 10 mg/40 mg/25 mg. **Twynsta:** amLODIPine/telmisartan (an angiotensin II receptor antagonist): 5 mg/40 mg, 5 mg/80 mg, 10 mg/40 mg, 10 mg/80 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Calcium channel blocker.

CLINICAL: Antihypertensive, antianginal.

Do not confuse amLODIPine with aMILoride, or Norvasc with Navane or Vascor.

Uses

Management of hypertension, coronary artery disease (chronic stable angina, vasospastic [Prinzmetal's or variant] angina).

Precautions

Contraindications: Hypersensitivity to amLODIPine. **Cautions:** Hepatic impairment, severe aortic stenosis, hypertrophic cardiomyopathy with outflow tract obstruction.

Action

Inhibits calcium movement across cardiac and vascular smooth muscle cell membranes. **Therapeutic Effect:** Dilates coronary arteries, peripheral arteries/arterioles. Decreases total peripheral vascular resistance and B/P by vasodilation.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	0.5–1 hr	N/A	24 hrs

Slowly absorbed from GI tract. Protein binding: 95%–98%. Metabolized in liver. Excreted primarily in urine. Not removed by hemodialysis. **Half-life:** 30–50 hrs (increased in elderly, pts with hepatic cirrhosis).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Half-life may be increased, more sensitive to hypotensive effects.

Interactions

DRUG: May increase level of **simvastatin**. **Azole antifungals, cycloSPORINE, protease inhibitors (e.g., darunavir, ritonavir)** may increase concentration. **CarBAMazepine, rifAMPin** may decrease level/effect. **HERBAL:** **St. John's wort** may decrease concentration. **Ephedra, yohimbe** may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:** **Grapefruit products** may increase concentration, hypotensive effects. **LAB VALUES:** May increase hepatic enzyme levels.

Availability (Rx)

Tablets: 2.5 mg, 5 mg, 10 mg.

Administration/handling

PO

- May give without regard to food.

Indications/routes/dosage

Hypertension

PO: ADULTS: Initially, 5 mg/day as a single dose. May titrate every 7–14 days. **Maximum:** 10 mg/day. **SMALL-FRAME, FRAGILE, ELDERLY:** 2.5 mg/day as a single dose. May titrate q7–14 days. **Maximum:** 10 mg/day. **CHILDREN 6–17 YRS:** 2.5–5 mg/day.

CAD

PO: ADULTS: 5–10 mg/day as a single dose. **ELDERLY, PTS WITH HEPATIC INSUFFICIENCY:** 5 mg/day as a single dose.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

ADULTS, ELDERLY: (Hypertension) Initially, 2.5 mg/day. (Angina) Initially, 5 mg/day. Titrate slowly in pts with severe impairment.

Side effects

Frequent (greater than 5%): Peripheral edema, headache, flushing.
Occasional (5%–1%): Dizziness, palpitations, nausea, unusual fatigue or weakness (asthenia). **Rare (less than 1%):** Chest pain, bradycardia, orthostatic hypotension.

Adverse effects/toxic reactions

Overdose may produce excessive peripheral vasodilation, marked hypotension with reflex tachycardia, syncope.

Nursing considerations

Baseline assessment

Assess baseline renal/hepatic function tests, B/P, apical pulse.

Intervention/evaluation

Assess B/P (if systolic B/P is less than 90 mm Hg, withhold medication, contact physician). Assess for peripheral edema behind medial malleolus (sacral area in bedridden pts). Assess skin for flushing. Question for headache, asthenia.

Patient/family teaching

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not ingest grapefruit products.

amoxicillin

a-mox-i-sil-in

Apo-Amoxi 🇨🇦

Moxatag

Novamoxin 🇨🇦

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Penicillin.

CLINICAL: Antibiotic.

Do not confuse amoxicillin with amoxapine or Atarax.

Uses

Treatment of susceptible infections due to streptococci, *E. coli*, *E. faecalis*, *P. mirabilis*, *H. influenzae*, *N. gonorrhoeae*, including ear, nose, and throat; lower respiratory tract; skin and skin structure; UTIs; acute uncomplicated gonorrhea; *H. pylori*. **OFF-LABEL:** Treatment of Lyme disease and typhoid fever.

Postexposure prophylaxis for anthrax exposure.

Precautions

Contraindications: Hypersensitivity to amoxicillin, other beta-lactams.

Cautions: History of allergies (esp. cephalosporins), infectious mononucleosis, renal impairment, asthma.

Action

Inhibits bacterial cell wall synthesis. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 20%. Partially metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1–1.3 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta, appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Immature renal function in neonate/young infant may delay renal excretion. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Allopurinol** may increase incidence of rash. **Probenecid** may increase concentration, toxicity risk. May decrease effect of **oral contraceptives**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, BUN, creatinine, LDH. May cause positive Coombs' test.

Availability (Rx)

Capsules: 250 mg, 500 mg. **Powder for Oral Suspension:** 125 mg/5 mL, 200

mg/5 mL, 250 mg/5 mL, 400 mg/5 mL. **Tablets:** 500 mg, 875 mg. **Tablets (Chewable):** 125 mg, 250 mg. **Tablets, Extended-Release (Moxatag):** 775 mg.

Administration/handling

PO

- Give without regard to meals.
- Instruct pt to chew/crush chewable tablets thoroughly before swallowing.
- Oral suspension dose may be mixed with formula, milk, fruit juice, water, cold drink.
- Give immediately after mixing.
- After reconstitution, oral suspension is stable for 14 days at either room temperature or refrigerated.

Indications/routes/dosage

Susceptible Infections

PO: ADULTS, ELDERLY: 250–500 mg q8h or 500–875 mg q12h or 775 mg (Moxatag) once daily. **CHILDREN OLDER THAN 3 MOS:** 25–50 mg/kg/day in divided doses q8h. Maximum single dose: 500 mg. **CHILDREN 3 MOS AND YOUNGER:** 25–50 mg/kg/day in divided doses q8h. **NEONATE:** 20–30 mg/kg/day in divided doses q12h.

H. Pylori Infection

PO: ADULTS, ELDERLY: 1 g twice daily in combination with at least 1 other antibiotic and an acid-suppressing agent (proton pump inhibitor or H₂ antagonist).

Otitis Media

PO: CHILDREN: 80–90 mg/kg/day in 2 divided doses. **NEONATES:** 30–40 mg/kg/day in divided doses q8h.

Dosage in Renal Impairment

◀ALERT▶ Immediate-release 875-mg tablet or 775-mg extended-release tablet should not be used in pts with creatinine clearance less than 30 mL/min. Dosage

interval is modified based on creatinine clearance. **Creatinine clearance 10–30 mL/min:** 250–500 mg q12h. **Creatinine clearance less than 10 mL/min:** 250–500 mg q24h.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: GI disturbances (mild diarrhea, nausea, vomiting), headache, oral/vaginal candidiasis. **Occasional:** Generalized rash, urticaria.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, occur rarely.

Nursing considerations

Baseline assessment

Question for history of allergies (esp. penicillins, cephalosporins), renal impairment.

Intervention/evaluation

Promptly report rash, diarrhea (fever, abdominal pain, mucus and blood in stool may indicate antibiotic-associated colitis). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, black "hairy" tongue, oral mucosal changes (ulceration, pain, erythema). Monitor renal/hepatic function tests.

Patient/family teaching

- Continue antibiotic for full length of treatment.
- Space doses evenly.
- Take with meals if GI upset occurs.
- Thoroughly crush or chew the chewable tablets before swallowing.

- Report rash, diarrhea, other new symptoms.

amoxicillin/clavulanate

a-mox-i-sil-in/klav-yoo-la-nate

Apo-Amoxi-Clav 🇨🇦

Augmentin

Augmentin ES 600

Augmentin XR

Clavulin 🇨🇦

Novo-Clavamoxin 🇨🇦

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Penicillin.

CLINICAL: Antibiotic.

Do not confuse Augmentin with amoxicillin or Azulfidine.

Uses

Treatment of susceptible infections due to *streptococci*, *E. coli*, *E. faecalis*, *P. mirabilis*, beta-lactamase producing *H. influenzae*, *Klebsiella* spp., *M. catarrhalis*, and *S. aureus* (not methicillin-resistant *Staphylococcus aureus* [MRSA]), including lower respiratory, skin and skin structure, UTIs, otitis media, sinusitis. **OFF-LABEL:** Chronic antimicrobial suppression of prosthetic joint infection.

Precautions

Contraindications: Hypersensitivity to amoxicillin, clavulanate, any penicillins; history of cholestatic jaundice or hepatic impairment with amoxicillin/clavulanate therapy. Augmentin XR (additional): Severe renal impairment (CrCl less than 30 mL/min), hemodialysis pt. **Cautions:** History of allergies, esp. cephalosporins; renal impairment, infectious mononucleosis.

Action

Amoxicillin inhibits bacterial cell wall synthesis. Clavulanate inhibits bacterial beta-lactamase. **Therapeutic Effect:** Amoxicillin is bactericidal in susceptible microorganisms. Clavulanate protects amoxicillin from enzymatic degradation.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 20%. Partially metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1–1.3 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta, appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Immature renal function in neonate/young infant may delay renal excretion. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Allopurinol** may increase incidence of rash. **Probenecid** may increase concentration, toxicity risk. May decrease effect of **oral contraceptives**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May cause positive Coombs' test.

Availability (Rx)

Powder for Oral Suspension (Amoclan, Augmentin): 125 mg–31.25 mg/5 mL, 200 mg–28.5 mg/5 mL, 250 mg–62.5 mg/5 mL, 400 mg–57 mg/5 mL, 600 mg–42.9 mg/5 mL. **Tablets (Augmentin):** 250 mg–125 mg, 500 mg–125 mg, 875 mg–125 mg. **Tablets (Chewable [Augmentin]):** 200 mg–28.5 mg, 400 mg–57 mg.

 **Tablets (Extended-Release [Augmentin XR]):** 1,000 mg–62.5 mg.

Administration/handling

PO

- Store tablets at room temperature.
- After reconstitution, oral suspension is stable for 10 days but should be refrigerated.
- May mix dose of suspension with milk, formula, or juice and give immediately.
- Give without regard to meals.
- Give with food to increase absorption, decrease stomach upset.
- Instruct pt to chew/crush chewable tablets thoroughly before swallowing.
- Do not break, crush, dissolve, or divide extended-release tablets.

Indications/routes/dosage

Note: Dosage based on amoxicillin component.

Usual Adult Dosage

PO: ADULTS, ELDERLY: 250 mg q8h or 500 mg q8–12h or 875 mg q12h or 2,000 mg q12h.

Usual Pediatric Dosage

PO: CHILDREN OLDER THAN 3 MOS, WEIGHING 40 KG OR MORE: (Mild-Moderate): 500 mg q12h or 250 mg q8h. (Severe): 875 mg q12h or 500 mg q8h. (Extended-Release): 2,000 mg q12h. **WEIGHING LESS THAN 40 KG: (Mild-Moderate):** 25 mg/kg/day in 2 divided doses or 20 mg/kg/day in 3 divided doses. (Severe): 45 mg/kg/day in 2 divided doses or 40 mg/kg/day in 3 divided doses. **Maximum Single Dose:** 500 mg. **LESS THAN 3 MOS:** Amoxicillin 30 mg/kg/day divided q12h using 125 mg/5mL suspension only.

Usual Neonate Dosage

PO: NEONATES, CHILDREN YOUNGER THAN 3 MOS: 30 mg/kg/day (125 mg/5 mL suspension) in divided doses q12h.

Dosage in Renal Impairment

◀ALERT▶ Do not use 875-mg tablet or extended-release tablets for creatinine clearance less than 30 mL/min.

Dosage and frequency are modified based on creatinine clearance. **Creatinine clearance 10–30 mL/min:** 250–500 mg q12h. **Creatinine clearance less than 10 mL/min:** 250–500 mg q24h. **HD:** 250–500 mg q24h, give dose during and

after dialysis. **PD:** 250 mg q12h.

Dosage in Hepatic Impairment

No dose adjustment (see Contraindications).

Side effects

Occasional (9%–4%): Diarrhea, loose stools, nausea, skin rashes, urticaria.

Rare (less than 3%): Vomiting, vaginitis, abdominal discomfort, flatulence, headache.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, occur rarely.

Nursing considerations

Baseline assessment

Question for history of allergies, esp. penicillins, cephalosporins, renal impairment.

Intervention/evaluation

Promptly report rash, diarrhea (fever, abdominal pain, mucus and blood in stool may indicate antibiotic-associated colitis). Be alert for signs of superinfection, including fever, vomiting, diarrhea, black "hairy" tongue, ulceration or changes of oral mucosa, anal/genital pruritus. Monitor renal/hepatic tests with prolonged therapy.

Patient/family teaching

- Continue antibiotic for full length of treatment.
- Space doses evenly.
- Take with meals if GI upset occurs.
- Thoroughly crush or chew the chewable tablets before swallowing.

- Notify physician if rash, diarrhea, other new symptoms occur.

amphotericin B

am-foe-**ter**-i-sin

HIGH
ALERT

Abelcet

AmBisome

Amphotec

Fungizone 🇨🇦

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Polyene antifungal.

CLINICAL: Antifungal, antiprotozoal.

■ **BLACK BOX ALERT** ■ (Nonliposomal) To be used primarily for pts with progressive, potentially fatal fungal infection. Not to be used for noninvasive forms of fungal disease (oral thrush, vaginal candidiasis).

Uses

Abelcet: Treatment of aspergillosis or any type of invasive fungal infections refractory or intolerant to Fungizone. **AmBisome:** Empiric treatment of fungal infection in febrile neutropenic pts. *Aspergillus*, *Candida* species, *Cryptococcus* infections refractory to Fungizone or pt with renal impairment or toxicity with Fungizone. Treatment of cryptococcal meningitis in HIV-infected pts. Treatment of visceral leishmaniasis. **Amphotec:** Treatment of invasive aspergillosis in pts with renal impairment or toxicity or prior treatment failure with Fungizone. **Fungizone:** Treatment of life-threatening fungal infections caused by susceptible fungi, including *Candida* spp., *Histoplasma*, *Cryptococcus*, *Aspergillus*, *Blastomyces*. **OFF-LABEL:** **Abelcet**, **Amphotec:** Serious *Candida* infections. **AmBisome:** Treatment of systemic histoplasmosis infection.

Precautions

Contraindications: Hypersensitivity to amphotericin B. **Cautions:** Concomitant use with other nephrotoxic drugs; renal impairment.

Action

Generally fungistatic but may become fungicidal with high dosages or very susceptible microorganisms. Binds to sterols in fungal cell membrane. **Therapeutic Effect:** Alters fungal cell membrane permeability, allowing loss of potassium, other cellular components, resulting in cell death.

Pharmacokinetics

Protein binding: 90%. Widely distributed. Metabolism not specified. Cleared by nonrenal pathways. Minimal removal by hemodialysis. Amphotec and Abelcet are not dialyzable. **Half-life:** Fungizone, 24 hrs (increased in neonates and children); Abelcet, 7.2 days; AmBisome, 100–153 hrs; Amphotec, 26–28 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; unknown if distributed in breast milk. **Children:** Safety and efficacy not established, but use the least amount for therapeutic regimen. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Antineoplastic agents may increase potential for bronchospasm, renal toxicity, hypotension. **Corticosteroids (e.g., hydrocortisone, prednisone, dexamethasone), corticotropin** may cause severe hypokalemia, cardiac dysfunction. **Nephrotoxic medications (e.g., cycloSPORINE, IV contrast dye, vancomycin)** may increase nephrotoxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, BUN, creatinine. May decrease serum calcium, magnesium, potassium.

Availability (Rx)

Injection, Powder for Reconstitution: 50 mg (AmBisome, Amphotec, Fungizone), 100 mg (Amphotec). **Injection, Suspension (Abelcet):** 5 mg/mL.

Administration/handling

IV

- Use strict aseptic technique; no bacteriostatic agent or preservative is present in diluent.

Reconstitution

ABELCET

- Shake 20-mL (100-mg) vial gently until contents are dissolved. Withdraw required dose using 5-micron filter needle (supplied by manufacturer).
- Dilute with D₅W to 1–2 mg/mL.

AMBISOME

- Reconstitute each 50-mg vial with 12 mL Sterile Water for Injection to provide concentration of 4 mg/mL.
- Shake vial vigorously for 30 sec. Withdraw required dose and inject syringe contents through a 5-micron filter into an infusion of D₅W to provide final concentration of 1–2 mg/mL (0.2–0.5 mg/mL for infants and small children).

AMPHOTEC

- Add 10 mL Sterile Water for Injection to each 50-mg vial to provide concentration of 5 mg/mL. Shake gently.
- Further dilute **only** with D₅W to a concentration of 0.1–2 mg/mL.

FUNGIZONE

- Add 10 mL Sterile Water for Injection to each 50-mg vial.
- Further dilute with 250–500 mL D₅W.
- Final concentration should not exceed 0.1 mg/mL (0.25 mg/mL for central infusion).

Rate of Administration

- Give by slow IV infusion. Infuse conventional amphotericin over 4–6 hrs; Abelcet over 2 hrs (shake contents if infusion longer than 2 hrs); Amphotec over minimum of 2 hrs (avoid rate faster than 1 mg/kg/hr); AmBisome over 1–2 hrs.

Storage

ABELCET

- Refrigerate unreconstituted solution. Reconstituted solution is stable for 48 hrs if refrigerated, 6 hrs at room temperature.

AMBISOME

- Refrigerate unreconstituted solution. Reconstituted vials are stable for 24 hrs when refrigerated. Concentration of 1–2 mg/mL is stable for 6 hrs.

AMPHOTEC

- Refrigerate unused vials.

- Reconstituted solution is stable for 24 hrs if refrigerated.

FUNGIZONE

- Refrigerate unused vials.
- Once reconstituted, vials stable for 24 hrs at room temperature, 7 days if refrigerated.
- Diluted solutions stable for 24 hrs at room temperature, 2 days if refrigerated.

■ IV incompatibilities

Note: Abelcet, AmBisome, Amphotec: Do not mix with any other drug, diluent, or solution. Fungizone: Allopurinol (Aloprim), aztreonam (Azactam), calcium gluconate, cefepime (Maxipime), cimetidine (Tagamet), ciprofloxacin (Cipro), dexmedetomidine (Precedex), diphenhydramine (Benadryl), DOPamine (Intropin), enalapril (Vasotec), filgrastim (Neupogen), fluconazole (Diflucan), foscarnet (Foscavir), magnesium sulfate, meropenem (Merrem IV), ondansetron (Zofran), piperacillin and tazobactam (Zosyn), potassium chloride, propofol (Diprivan).

IV compatibility

LORazepam (Ativan).

Indications/routes/dosage

Usual Abelcet Dose

IV Infusion (Abelcet):ADULTS, CHILDREN: 3–5 mg/kg/day at rate of 2.5 mg/kg/hr.

Usual AmBisome Dose

IV Infusion (Ambisome):ADULTS, CHILDREN: 3–6 mg/kg/day over 2 hrs.

Usual Amphotec Dose

IV Infusion (Amphotec):ADULTS, CHILDREN: 3–4 mg/kg/day at rate no faster than 1 mg/kg/hr. **Maximum:** 6 mg/kg/day.

Fungizone, Usual Dose

IV Infusion: ADULTS, ELDERLY: Dosage based on pt tolerance and severity of infection. Initially, 1-mg test dose is given over 20–30 min. If tolerated, usual dose is 0.3–1.5 mg/kg/day or 1–1.5 mg/kg q48h. **Maximum:** 1.5 mg/kg/day. **CHILDREN:** Test dose of 0.1 mg/kg/dose (**maximum:** 1 mg) is infused over 30–60 min. If test dose is tolerated, usual dose is 0.25–1 mg/kg/day or 1–1.5 mg/kg q48h. **NEONATES:** Initially, 0.5 mg/kg/dose once daily. May gradually increase by 0.25–0.5 mg/kg each day to maximum of 1.5 mg/kg/day. **Maintenance dose:** 0.25–1 mg/kg/day or 1–1.5 mg/kg/dose every other day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (greater than 10%): Abelcet: Chills, fever, increased serum creatinine, multiple organ failure. **AmBisome:** Hypokalemia, hypomagnesemia, hyperglycemia, hypocalcemia, edema, abdominal pain, back pain, chills, chest pain, hypotension, diarrhea, nausea, vomiting, headache, fever, rigors, insomnia, dyspnea, epistaxis, increased hepatic/renal function test results. **Amphotec:** Chills, fever, hypotension, tachycardia, increased serum creatinine, hypokalemia, bilirubinemia. **Amphocin:** Fever, chills, headache, anemia, hypokalemia, hypomagnesemia, anorexia, malaise, generalized pain, nephrotoxicity.

Adverse effects/toxic reactions

Cardiovascular toxicity (hypotension, ventricular fibrillation), anaphylaxis occur rarely. Altered vision/hearing, seizures, hepatic failure, coagulation defects, multiple organ failure, sepsis may occur. Each alternative formulation is less nephrotoxic than conventional amphotericin (Amphocin).

Nursing considerations

Baseline assessment

Obtain baseline BMP, LFT, serum magnesium, ionized calcium. Question for history of allergies, esp. to amphotericin B, sulfite. Avoid, if possible, other nephrotoxic medications. Obtain premedication orders (antipyretics,

antihistamines, antiemetics, corticosteroids) to reduce adverse reactions during IV therapy.

Intervention/evaluation

Monitor B/P, temperature, pulse, respirations; assess for adverse reactions (fever, tremors, chills, anorexia, nausea, vomiting, abdominal pain) q15min twice, then q30min for 4 hrs of initial infusion. If symptoms occur, slow infusion, administer medication for symptomatic relief. For severe reaction, stop infusion and notify physician. Evaluate IV site for phlebitis. Monitor I&O, renal function tests for nephrotoxicity. Monitor CBC, BMP (esp. potassium), LFT, serum magnesium.

Patient/family teaching

- Prolonged therapy (wks or mos) is usually necessary.
- Fever reaction may decrease with continued therapy.
- Muscle weakness may be noted during therapy (due to hypokalemia).

ampicillin

am-pi-sil-in

Apo-Ampi 🇨🇦

Novo-Ampicillin 🇨🇦

Nu-Ampi 🇨🇦

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Penicillin.

CLINICAL: Antibiotic.

Do not confuse ampicillin with aminophylline.

Uses

Treatment of susceptible infections due to streptococci, *S. pneumoniae*, staphylococci (non-penicillinase-producing), meningococci, *Listeria*, some *Klebsiella*, *E. coli*, *H. influenzae*, *Salmonella*, *Shigella*, including GI, GU, respiratory infections, meningitis, endocarditis prophylaxis. **OFF-LABEL:** Surgical prophylaxis for liver transplantation.

Precautions

Contraindications: Hypersensitivity to ampicillin or any penicillin. Infections caused by penicillinase-producing organisms. **Cautions:** History of allergies, esp. cephalosporins, renal impairment, asthmatic pts, infectious mononucleosis.

Action

Inhibits cell wall synthesis in susceptible microorganisms. **Therapeutic Effect:** Bactericidal in susceptible microorganisms.

Pharmacokinetics

Moderately absorbed from GI tract. Protein binding: 15%–25%. Widely distributed. Partially metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1–1.5 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Immature renal function in neonates/young infants may delay renal excretion. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Allopurinol** may increase incidence of rash. **Probenecid** may increase concentration, toxicity risk. May decrease effects of **oral contraceptives**. May increase level/effect of **methotrexate**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May cause positive Coombs' test.

Availability (Rx)

Capsules: 250 mg, 500 mg. **Injection, Powder for Reconstitution:** 125 mg, 250 mg, 500 mg, 1 g, 2 g. **Powder for Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL.

Administration/handling

IV

Reconstitution

- For IV injection, dilute each vial with 5 mL Sterile Water for Injection or 0.9% NaCl (10 mL for 1- and 2-g vials). **Maximum concentration:** 100 mg/mL for IV push.
- For intermittent IV infusion (piggyback), further dilute with 50–100 mL 0.9% NaCl. **Maximum concentration:** 30 mg/mL.

Rate of Administration

- For IV injection, give over 3–5 min (125–500 mg) or over 10–15 min (1–2 g). For intermittent IV infusion (piggyback), infuse over 15–30 min.
- Due to potential for hypersensitivity/anaphylaxis, start initial dose at few drops per min, increase slowly to ordered rate; stay with pt first 10–15 min, then check q10min.

Storage

- IV solution, diluted with 0.9% NaCl, is stable for 8 hrs at room temperature or 2 days if refrigerated.
- If diluted with D₅W, is stable for 2 hrs at room temperature or 3 hrs if refrigerated.
- Discard if precipitate forms.

IM

- Reconstitute each vial with Sterile Water for Injection or Bacteriostatic Water for Injection (consult individual vial for specific volume of diluent).
- Stable for 1 hr.
- Give deeply in large muscle mass.

PO

- Oral suspension, after reconstitution, is stable for 7 days at room temperature, 14 days if refrigerated.
- Shake oral suspension well before using.
- Give orally 1–2 hrs before meals for maximum absorption.

IV incompatibilities

Diltiazem (Cardizem), midazolam (Versed), ondansetron (Zofran).

■ IV Compatibilities

Calcium gluconate, cefepime (Maxipime), dexmedetomidine (Precedex), DOPamine (Intropin), famotidine (Pepcid), furosemide (Lasix), heparin, HYDROMorphone (Dilaudid), insulin (regular), levoFLOXacin (Levaquin), lipids, magnesium sulfate, morphine, multivitamins, potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage

PO: ADULTS, ELDERLY: 250–500 mg q6h. **CHILDREN:** 50–100 mg/kg/day in divided doses q6h. **Maximum:** 2–4 g/day.

IV, IM: ADULTS, ELDERLY: 1–2 g q4–6h or 50–250 mg/kg/day in divided doses. **Maximum:** 12 g/day. **CHILDREN:** 25–200 mg/kg/day in divided doses q6h. **Maximum:** 12 g/day. **NEONATES:** 50 mg/kg/dose q6–12h.

Dosage in Renal Impairment

Creatinine Clearance	Dosage
10–50 mL/min	Administer q6–12h
Less than 10 mL/min	Administer q12–24h
Hemodialysis	1–2 g q12–24h
Peritoneal dialysis	250 mg q12h
Continuous renal replacement therapy (CRRT)	2g, then 1–2 g q6–8h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Pain at IM injection site, GI disturbances (mild diarrhea, nausea, vomiting), oral or vaginal candidiasis. **Occasional:** Generalized rash, urticaria, phlebitis, thrombophlebitis (with IV administration), headache. **Rare:** Dizziness,

seizures (esp. with IV therapy).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, occur rarely.

Nursing considerations

Baseline assessment

Question for history of allergies, esp. penicillins, cephalosporins; renal impairment.

Intervention/evaluation

Promptly report rash (although common with ampicillin, may indicate hypersensitivity) or diarrhea (fever, abdominal pain, mucus and blood in stool may indicate antibiotic-associated colitis). Evaluate IV site for phlebitis. Check IM injection site for pain, induration. Monitor I&O, urinalysis, renal function tests. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Continue antibiotic for full length of treatment.
- Space doses evenly.
- More effective if taken 1 hr before or 2 hrs after food/beverages.
- Discomfort may occur with IM injection.
- Report rash, diarrhea, or other new symptoms.

ampicillin/sulbactam

amp-i-sil-in/sul-bak-tam

Unasyn

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Penicillin.

CLINICAL: Antibiotic.

Uses

Treatment of susceptible infections, including intra-abdominal, skin/skin structure, gynecologic infections, due to beta-lactamase-producing organisms, including *H. influenzae*, *E. coli*, *Klebsiella*, *Acinetobacter*, *Enterobacter*, *S. aureus*, and *Bacteroides* spp. **OFF-LABEL:** Endocarditis, community-acquired pneumonia, surgical prophylaxis, pelvic inflammatory disease.

Precautions

Contraindications: Hypersensitivity to ampicillin, any penicillins, or sulbactam. Hx of cholestatic jaundice, hepatic impairment associated with ampicillin/sulbactam. **Cautions:** History of allergies, esp. cephalosporins; renal impairment; infectious mononucleosis; asthmatic pts.

Action

Ampicillin inhibits bacterial cell wall synthesis. Sulbactam inhibits bacterial beta-lactamase. **Therapeutic Effect:** Ampicillin is bactericidal in susceptible microorganisms. Sulbactam protects ampicillin from enzymatic degradation.

Pharmacokinetics

Protein binding: 28%–38%. Widely distributed. Partially metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1–1.3 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; appears in cord blood, amniotic fluid. Distributed in breast milk in low concentrations. May lead to allergic sensitization, diarrhea, candidiasis, skin rash in infant. **Children:** Safety and efficacy not established in pts younger than 1 yr. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Allopurinol** may increase incidence of rash. **Probenecid** may increase concentration, toxicity risk. May decrease effect of **oral contraceptives**. May increase level/effect of **methotrexate**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, LDH, creatinine. May cause positive Coombs' test.

Availability (Rx)

Injection, Powder for Reconstitution: 1.5 g (ampicillin 1 g/sulbactam 0.5 g), 3 g (ampicillin 2 g/sulbactam 1 g).

Administration/handling

IV

Reconstitution

- For IV injection, dilute with Sterile Water for Injection to provide concentration of 375 mg/mL.
- For intermittent IV infusion (piggyback), further dilute with 50–100 mL 0.9% NaCl.

Rate of Administration

- For IV injection, give slowly over minimum of 10–15 min.
- For intermittent IV infusion (piggyback), infuse over 15–30 min.
- Due to potential for hypersensitivity/anaphylaxis, start initial dose at few drops per min, increase slowly to ordered rate; stay with pt first 10–15 min, then check q10min.

Storage

- IV solution, diluted with 0.9% NaCl, is stable for up to 72 hrs if refrigerated (4 hrs if diluted with D₅W).
- Discard if precipitate forms.

IM

- Reconstitute each 1.5-g vial with 3.2 mL Sterile Water for Injection or lidocaine to provide concentration of 250 mg ampicillin/125 mg sulbactam/mL.
- Give deeply into large muscle mass within 1 hr after preparation.

■ IV incompatibilities

Amiodarone (Cordarone), diltiazem (Cardizem), IDArubicin (Idamycin), ondansetron (Zofran).

■ IV Compatibilities

Famotidine (Pepcid), heparin, insulin (regular), morphine.

Indications/routes/dosage

Usual Dosage Range

IV, IM: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER: 1.5–3 g q6h. **Maximum:** 12 g/day. **IV: CHILDREN 12 YRS AND YOUNGER:** 100–200 mg ampicillin/kg/day in divided doses q6h. **Maximum:** 12 g/day (Unasyn). 8 g/day (ampicillin). **NEONATES:** 100 mg (ampicillin)/kg/day in divided doses q8–12h.

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and severity of infection.

Creatinine Clearance	Dosage
Greater than 30 mL/min	No dose adjustment
15–30 mL/min	1.5–3 g q12h
5–14 mL/min	1.5–3 g q24h
Hemodialysis	1.5–3 g q12–24h (after HD on dialysis days)
Peritoneal dialysis	1.5–3 g q12–24h
Continuous renal replacement therapy (CRRT)	3 g, then 1.5–3 g q6–12h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Diarrhea, rash (most common), urticaria, pain at IM injection site,

thrombophlebitis with IV administration, oral or vaginal candidiasis.
Occasional: Nausea, vomiting, headache, malaise, urinary retention.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps; severe, watery diarrhea; fever) may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, blood dyscrasias may occur. High dosage may produce seizures.

Nursing considerations

Baseline assessment

Question for history of allergies, esp. penicillins, cephalosporins; renal impairment.

Intervention/evaluation

Promptly report rash (although common with ampicillin, may indicate hypersensitivity) or diarrhea (fever, abdominal pain, mucus and blood in stool may indicate antibiotic-associated colitis). Evaluate IV site for phlebitis. Check IM injection site for pain, induration. Monitor I&O, urinalysis, renal function tests. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Take antibiotic for full length of treatment.
- Space doses evenly.
- Discomfort may occur with IM injection.
- Report rash, diarrhea, or other new symptoms.

anastrozole

an-as-troe-zole

Apo-Anastrozole 

Arimidex

 **CLASSIFICATION**

**HIGH
ALERT**

PHARMACOTHERAPEUTIC: Aromatase inhibitor.

CLINICAL: Antineoplastic hormone.

Do not confuse anastrozole with letrozole, or Arimidex with Imitrex.

Uses

Treatment of advanced breast cancer in postmenopausal women who have developed progressive disease while receiving tamoxifen therapy. First-line therapy in advanced or metastatic breast cancer in postmenopausal women. Adjuvant treatment in early hormone receptor–positive breast cancer in postmenopausal women. **OFF-LABEL:** Treatment of recurrent or metastatic endometrial or uterine cancers; treatment of ovarian cancer.

Precautions

Contraindications: Hypersensitivity to anastrozole. Pregnancy, women who may become pregnant. **Cautions:** Preexisting ischemic cardiac disease, osteopenia (higher risk of developing osteoporosis), hyperlipidemia. May increase fall risk with fractures during therapy in pts with history of osteoporosis.

Action

Decreases circulating estrogen level by inhibiting aromatase, the enzyme that catalyzes the final step in estrogen production. **Therapeutic Effect:** Inhibits growth of breast cancers that are stimulated by estrogens by lowering serum estradiol concentration.

Pharmacokinetics

Well absorbed into systemic circulation (absorption not affected by food). Protein binding: 40%. Metabolized in liver. Eliminated by biliary system and, to a lesser extent, kidneys. **Mean half-life:** 50 hrs in postmenopausal women. Steady-state plasma levels reached in approximately 7 days.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; may cause fetal harm. Unknown if

distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Estrogen therapies may reduce concentration/effects. **Tamoxifen** may reduce plasma concentration. **HERBAL:** Avoid **black cohosh, dong quai, licorice, red clover.** **FOOD:** None known. **LAB VALUES:** May elevate serum GGT level in pts with liver metastases. May increase serum ALT, AST, alkaline phosphatase, total cholesterol, LDL.

Availability (Rx)

Tablets: 1 mg.

Administration/handling

PO

- Give without regard to food.

Indications/routes/dosage

Breast Cancer (Advanced)

PO: ADULTS, ELDERLY: 1 mg once daily (continue until tumor progresses).

Breast Cancer (Early, Adjuvant)

PO: ADULTS, ELDERLY: 1 mg once daily.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (16%–8%): Asthenia, nausea, headache, hot flashes, back pain, vomiting, cough, diarrhea. **Occasional (6%–4%):** Constipation, abdominal pain, anorexia, bone pain, pharyngitis, dizziness, rash, dry mouth, peripheral

edema, pelvic pain, depression, chest pain, paresthesia. **Rare (2%–1%):** Weight gain, diaphoresis.

Adverse effects/toxic reactions

Thrombophlebitis, anemia, leukopenia occur rarely. Vaginal hemorrhage occurs rarely (2%).

Nursing considerations

Baseline Assessment

Obtain baseline bone mineral density, total cholesterol, LDL, mammogram, clinical breast exam.

Intervention/evaluation

Monitor for asthenia, dizziness; assist with ambulation if needed. Assess for headache, pain. Offer antiemetic for nausea, vomiting. Monitor for onset of diarrhea; offer antidiarrheal medication.

Patient/family teaching

- Notify physician if nausea, asthenia, hot flashes become unmanageable.

anidulafungin

a-nid-ue-la-fun-jin

Eraxis

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Echinocandin.

CLINICAL: Antifungal.

Uses

Treatment of candidemia, other forms of *Candida* infections (e.g., intra-abdominal abscess, peritonitis), esophageal candidiasis.

Precautions

Contraindications: Hypersensitivity to anidulafungin, other echinocandins.

Cautions: Hepatic impairment.

Action

Inhibits synthesis of the enzyme glucan (vital component of fungal cell formation), preventing fungal cell wall formation. **Therapeutic Effect:** Fungistatic.

Pharmacokinetics

Distributed in tissue. Moderately bound to albumin. Protein binding: 84%–99%. Slow chemical degradation; 30% excreted in feces over 9 days. Not removed by hemodialysis. **Half-life:** 40–50 hrs.

Lifespan considerations

Pregnancy/Lactation: May be embryotoxic. Crosses placental barrier. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, ALT, AST, bilirubin, calcium, creatinine, CPK, LDH, lipase. May decrease serum albumin, bicarbonate, magnesium, protein, potassium; Hgb, Hct, WBCs, neutrophils, platelet count. May prolong prothrombin time (PT).

Availability (Rx)

Injection, Powder for Reconstitution: 50-mg vial, 100-mg vial.

Administration/handling

 IV

Reconstitution

- Reconstitute each 50-mg vial with 15 mL Sterile Water for Injection (100 mg with 30 mL). Swirl, do not shake.
- Further dilute 50 mg with 50 mL D₅W or 0.9% NaCl (100 mg with 100 mL, 200 mg with 200 mL).

Rate of Administration

- Do not exceed infusion rate of 1.1 mg/min. Not for IV bolus injection.

Storage

- Refrigerate unreconstituted vials. Reconstituted vials are stable for 24 hrs at room temperature. Infusion solution is stable for 48 hrs at room temperature.

IV incompatibilities

Amphotericin B (Abelcet, AmBisome), ertapenem (INVanz), sodium bicarbonate.

IV Compatibilities

Dexamethasone (Decadron), famotidine (Pepcid), furosemide (Lasix), HYDROMorphone (Dilaudid), LORazepam (Ativan), methylPREDNISolone (SOLU), morphine. Refer to IV Compatibility Chart in front of book.

Indications/routes/dosage

◀ALERT▶ Duration of treatment based on pt's clinical response. In general, treatment is continued for at least 14 days after last positive culture.

Candidemia, Other Candida Infections

IV: ADULTS, ELDERLY: Give single 200-mg loading dose on day 1, followed by 100 mg/day thereafter for at least 14 days after last positive culture.

Esophageal Candidiasis

IV: ADULTS, ELDERLY: Give single 100-mg loading dose on day 1, followed by 50 mg/day thereafter for a minimum of 14 days and for at least 7 days following resolution of symptoms.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Rare (3%–1%): Diarrhea, nausea, headache, rigors, peripheral edema.

Adverse effects/toxic reactions

Hypokalemia occurs in 4% of pts. Hypersensitivity reaction characterized by facial flushing, hypotension, pruritus, urticaria, rash occurs rarely. Hepatitis, elevated LFT, hepatic failure was reported.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT. Obtain specimens for fungal culture prior to therapy. Treatment may be instituted before results are known.

Intervention/evaluation

Monitor for evidence of hepatic dysfunction, hypokalemia. Monitor daily pattern of bowel activity, stool consistency. Assess for rash, urticaria.

Patient/family teaching

- For esophageal candidiasis, maintain diligent oral hygiene.

antihemophilic factor (factor VIII, AHF)

an-tee-hee-moe-**fil**-ik **fak**-tor

Antihemophilic Factor/von Willebrand Factor Complex: Alphanate

Humate-P

Wilate. Human: Hemofil M

Koate-DVI

Monoclote-P. Recombinant: Advate

Eloctate

Kogenate FS

Recombinate

Xyntha

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Antihemophilic agent.

CLINICAL: Hemostatic.

Uses

Human: Prevention/treatment of hemorrhagic episodes, perioperative management of hemophilia A. **Alphanate, Humate-P, Wilate:** Prevention/treatment of hemorrhagic episodes in pts with hemophilia A. Prophylaxis with surgical/invasive procedures, treatment of bleeding in pts with von Willebrand disease (vWD) when desmopressin is known or suspected to be inadequate. **Recombinant:** Management of hemophilia A, prevention and control of bleeding episodes, perioperative management of hemophilia A, prophylaxis of joint bleeding and reduce risk of joint damage in children with hemophilia A.

Precautions

Contraindications: Hypersensitivity to any component of product. **Cautions:** Hepatic disease, pts with blood types A, B, AB (progressive anemia, intravascular hemolysis may occur).

Action

Assists in conversion of prothrombin to thrombin, essential for blood coagulation. Replaces missing clotting factor VIII. **Therapeutic Effect:** Produces hemostasis; corrects or prevents bleeding episodes.

Pharmacokinetics

Half-life: 8–27 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Human:Injection, Powder for Reconstitution (Hemofil M, Koate-DVI, Monoclate-P): Actual number of units listed on each vial. **Alphanate:** 250 units, 500 units, 1,000 units, 1,500 units. **Eloctate:** 250 units, 500 units, 750 units, 1,000 units, 1,500 units, 2,000 units, 3,000 units. **Humate-P:** 250 units, 500 units, 1,000 units. **Recombinant:Injection, Powder for Reconstitution:Advate:** 250 units, 500 units, 1,000 units, 1,500 units, 2,000 units, 3,000 units. **Kogenate, Recombinate:** 250 units, 500 units, 1,000 units. **Xyntha:** 250 units, 500 units, 1,000 units, 2,000 units.

Administration/handling

IV

Reconstitution

- Warm concentrate and diluent to room temperature.
- Using needle supplied by the manufacturer, add diluent to powder to dissolve, gently agitate or rotate. Do not shake vigorously. Complete dissolution may take 5–10 min.
- Use second filtered needle supplied by the manufacturer, and add to infusion bag.

Rate of Administration

- **Advate:** Over 5 min or less. **Maximum:** 10 mL/min.
- **Hexilate FS, Kogenate FS:** Over 1–15 min based on pt tolerance.
- **Xyntha:** Over several min.
- **Hemofil M, Koate-DVI:** Over 5–10 min. **Maximum:** 10 mL/min.
- **Monoclate-P:** Infuse at 2 mL/min.
- **Alphanate:** 10 mL/min.

- **Humate-P:** 4 mL/min.

Administration Precautions

- Check pulse rate prior to and following administration. If pulse rate increases, reduce or stop administration.
- After administration, apply prolonged pressure on venipuncture site.
- Monitor IV site for oozing q5–15min for 1–2 hrs following administration.

Storage

- May refrigerate or store at room temperature.
- See individual products for specific storage durations.

■ IV incompatibilities

Do not mix with other IV solutions or medications.

Indications/routes/dosage

Hemophilia A, Von Willebrand Disease

IV: ADULTS, ELDERLY, CHILDREN: Dosage is highly individualized and is based on pt's weight, severity of bleeding, coagulation studies.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Allergic reaction, including fever, chills, urticaria, wheezing, hypotension, nausea, feeling of chest tightness, stinging at injection site, dizziness, dry mouth, headache, altered taste.

Adverse effects/toxic reactions

Risk of transmitting viral hepatitis. Intravascular hemolysis may occur if large or frequent doses are used with blood group A, B, or AB.

Nursing considerations

Baseline assessment

Question history of hepatic disease, prior hypersensitivity reaction. When monitoring B/P, avoid overinflation of cuff to prevent trauma, bleeding. Remove adhesive tape from any pressure dressing carefully and slowly.

Intervention/evaluation

Following IV administration, apply prolonged pressure on venipuncture site. Monitor IV site for oozing q5–15 min for 1–2 hrs following administration. Assess for allergic reaction. Immediately report any evidence of hematuria or change in vital signs. Assess for decreases in B/P, increased pulse rate, complaint of abdominal or back pain, severe headache (may be evidence of hemorrhage). Question for increased discharge during menses. Assess skin for bruises, petechiae. Check for excessive bleeding from minor cuts, scratches. Assess gums for erythema, gingival bleeding. Assess urine for hematuria. Evaluate for therapeutic relief of pain, reduction of swelling, restricted joint movement.

Patient/family teaching

- Report any sign of bleeding, including red or dark urine, black/red stool, coffee-ground vomitus, blood-tinged mucus from cough.
- Wear identification indicating a hemolytic condition.
- Bring adequate supply of agent when traveling.

apixaban

a-pix-a-ban

Eliquis

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Factor Xa inhibitor.

CLINICAL: Anticoagulant.

■ **BLACK BOX ALERT** ■ Discontinuation in absence of alternative anticoagulation increases risk for thrombotic events. Spinal or epidural hematoma resulting in paralysis may occur with neuraxial anesthesia or spinal/epidural puncture.

Do not confuse apixaban with rivaroxaban, argatroban, or dabigatran.

Uses

Reduces risk for stroke, systemic embolism in pts with nonvalvular atrial fibrillation. Prophylaxis of DVT following hip or knee replacement surgery. Treatment of DVT and PE. Reduces risk of recurrent DVT/PE following initial therapy.

Precautions

Contraindications: Severe hypersensitivity to apixaban. Active pathologic bleeding. **Cautions:** Mild to moderate hepatic impairment, severe renal impairment (may increase bleeding risk). Avoid use in pts with severe hepatic impairment, prosthetic heart valve, significant rheumatic heart disease.

Action

Selectively blocks active site of factor Xa, a key factor in the intrinsic and extrinsic pathway of blood coagulation cascade. **Therapeutic Effect:** Inhibits clot-induced platelet aggregation, fibrin clot formation.

Pharmacokinetics

Readily absorbed after PO administration. Peak plasma concentration: 3–4 hrs. Protein binding: 87%. Metabolized in liver. Excreted primarily in urine, feces. **Half-life:** 12 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inducers (e.g., carbamazepine, rifampin) may decrease level/effect. Aspirin, NSAIDs, warfarin, heparin, antiplatelet agents, CYP3A4 inhibitors, (e.g., ketoconazole, clarithromycin) may increase concentration, bleeding risk. **HERBAL:** St. John's wort may decrease level/effect. Flaxseed, garlic, ginger, ginkgo biloba, ginseng, omega-3 may increase risk of bleeding. **FOOD:** Grapefruit products may increase

level/adverse effects. **LAB VALUES:** May decrease platelet count, Hgb, LFT.

Availability (Rx)

Tablets: 2.5 mg, 5 mg.

Administration/handling

◀ALERT▶ Discontinuation in absence of alternative anticoagulation increases risk for thrombotic events.

PO

- Give without regard to meals.
- If elective surgery or invasive procedures with moderate or high risk for bleeding, discontinue apixaban at least 24–48 hrs prior to procedure.

Indications/routes/dosage

Nonvalvular Atrial Fibrillation

PO: ADULTS, ELDERLY: 5 mg twice daily. In pts with at least 2 of the following characteristics: age 80 yrs or older, body weight 60 kg or less, serum creatinine 1.5 mg/dL or greater, concurrent use with CYP3A4, or P-gp inhibitors (e.g., ketoconazole, ritonavir), reduce dose to 2.5 mg twice daily.

DVT/PE Treatment

PO: ADULTS/ELDERLY: 10 mg twice daily for 7 days, then 5 mg twice daily.

DVT Prophylaxis (Hip/Knee Replacement)

Note: Begin 12–24 hrs postoperatively.

ADULTS, ELDERLY: 2.5 mg twice daily (35 days for hip; 12 days for knee).

DVT Prophylaxis, Reduce Risk Recurrent DVT/PE

PO: ADULTS, ELDERLY: 2.5 mg twice daily (after at least 6 mos of treatment).

Dosage in Renal Impairment

DVT/PE/Reduce Risk Recurrent DVT, Postoperative: No adjustment. **Nonvalvular A-fib, HD:SCr < 1.5:** No adjustment. **SCr 1.5 or greater, age older than 80 yrs, weight 60 kg or less:** 2.5 mg 2 times/day.

Dosage in Hepatic Impairment

Mild Impairment: No dose adjustment. **Moderate Impairment:** Use caution. **Severe Impairment:** Not recommended.

Side effects

Rare (3%–1%): Nausea, ecchymosis.

Adverse effects/toxic reactions

Increased risk for bleeding/hemorrhagic events. May cause serious, potentially fatal bleeding, accompanied by one or more of the following: a decrease in Hgb of 2 g/dL or more; a need for 2 or more units of packed RBCs; bleeding occurring at one of the following sites: intracranial, intraspinal, intraocular, pericardial, intra-articular, intramuscular with compartment syndrome, retroperitoneal. Serious reactions include jaundice, cholestasis, cytolytic hepatitis, Stevens-Johnson syndrome, hypersensitivity reaction, anaphylaxis.

Nursing considerations

Baseline assessment

Obtain baseline CBC. Question history of bleeding disorders, recent surgery, spinal punctures, intracranial hemorrhage, bleeding ulcers, open wounds, anemia, hepatic impairment. Obtain full medication history including herbal products.

Intervention/evaluation

Periodically monitor CBC, stool for occult blood. Be alert for complaints of abdominal/back pain, headache, confusion, weakness, vision change (may indicate hemorrhage). Question for increased menstrual bleeding/discharge. Assess for any sign of bleeding: bleeding at surgical site, hematuria, blood in stool, bleeding from gums, petechiae, ecchymosis.

Patient/family teaching

- Do not take/discontinue any medication except on advice from physician.
- Avoid alcohol, aspirin, NSAIDs, herbal supplements, grapefruit products.
- Consult physician before surgery, dental work.
- Use electric razor, soft toothbrush to prevent bleeding.
- Report blood-tinged mucus from coughing, heavy menstrual bleeding, headache, vision problems, weakness, abdominal pain, frequent bruising, bloody urine or stool, joint pain or swelling.

apremilast

a-pre-mi-last

Otezla

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Phosphodiesterase 4 (PDE4) inhibitor.

CLINICAL: Antipsoriatic arthritis agent.

Dot not confuse apremilast with roflumilast.

Uses

Treatment of adult pts with active psoriatic arthritis, moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy.

Precautions

Contraindications: Hypersensitivity to apremilast. **Cautions:** History of depression, severe renal impairment, suicidal ideation. Pts with latent infections (e.g., TB, viral hepatitis).

Action

Selectively inhibits PDE4, increasing cyclic AMP (cAMP) and inflammatory mediators. **Therapeutic Effect:** Reduces psoriatic arthritis exacerbations.

Pharmacokinetics

Readily absorbed after PO administration. Protein binding: 68%. Peak plasma

concentration: 2.5 hrs. Metabolized in liver. Excreted in urine (58%), feces (39%). **Half-life:** 6–9 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Not recommended for nursing mothers. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP450 inducers (e.g., carbamazepine, phenobarbital, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None significant. **LAB VALUES:** None known.

Availability (Rx)

 **Tablets:** 10 mg, 20 mg, 30 mg.

Administration/handling

PO

- Give without regard to meals. Administer whole; do not crush, cut, dissolve, or divide.

Indications/routes/dosage

Psoriatic Arthritis, Plaque Psoriasis

PO:ADULTS/ELDERLY: Initially, titrate dose from day 1–day 5. **Day 1:** 10 mg in am only. **Day 2:** 10 mg in am; 10 mg in pm. **Day 3:** 10 mg in am; 20 mg in pm. **Day 4:** 20 mg in am; 20 mg in pm. **Day 5:** 20 mg in am; 30 mg in pm. **Day 6/Maintenance:** 30 mg twice daily.

Dosage in Renal Impairment (CrCl less than 30 mL/min)

Days 1–3: 10 mg in am. **Days 4–5:** 20 mg in am, using only am schedule. **Day**

6/Maintenance: 30 mg once daily.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (9%–4%): Nausea, diarrhea, headache, upper respiratory tract infection. **Rare (3% or less):** Vomiting, nasopharyngitis, upper abdominal pain.

Adverse effects/toxic reactions

Increased risk of depression reported in less than 1% of pts. Weight decrease of 5%–10% of body weight occurred in 10% of pts.

Nursing considerations

Baseline assessment

Obtain baseline weight, vital signs. Question history of depression, severe renal impairment, suicidal ideations. Screen for prior allergic reactions to drug class. Receive full medication history including herbal products. Assess degree of joint pain, range of motion, mobility.

Intervention/evaluation

Be alert for worsening depression, suicidal ideation. Monitor for weight loss. Assess for dehydration if diarrhea occurs. Assess improvement of joint pain, range of motion, mobility.

Patient/family teaching

- Report changes in mood or behavior, thoughts of suicide, self-destructive behavior. Report weight loss of any kind.
- Increase fluid intake if dehydration suspected.
- Immediately notify physician if pregnancy suspected.
- Do not chew, crush, dissolve, or divide tablets.

a-prep-i-tant/fos-a-prep-i-tant

Emend

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Neurokinin receptor antagonist.

CLINICAL: Antinausea, antiemetic.

Do not confuse fosaprepitant with aprepitant, fosamprenavir, or fospropofol.

Uses

PO/IV: Prevention of nausea, vomiting associated with repeat courses of moderately to highly emetogenic cancer chemotherapy. **PO:** Prevention of postop nausea, vomiting.

Precautions

Contraindications: Hypersensitivity to aprepitant or fosaprepitant. Concurrent use with pimozone. **Cautions:** Severe hepatic impairment. Concurrent use of medications metabolized through CYP3A4 (e.g., docetaxel, etoposide, ifosfamide, imatinib, irinotecan, PACLitaxel, vinblastine, vinCRISTine, vinorelbine).

Action

Inhibits substance P receptor, augments antiemetic activity of 5-HT₃ receptor antagonists. **Therapeutic Effect:** Prevents acute and delayed phases of chemotherapy-induced emesis.

Pharmacokinetics

Moderately absorbed from GI tract. Crosses blood-brain barrier. Extensively metabolized in liver. Protein binding: greater than 95%. Eliminated primarily by liver metabolism (not excreted renally). **Half-life:** 9–13 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in

breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin) may increase concentration. Strong CYP3A4 inducers (e.g., carbamazepine, rifampin) may decrease concentration. May decrease effectiveness of hormonal contraceptives, warfarin. **HERBAL:** St. John's wort may decrease plasma concentration. **FOOD:** Grapefruit products may increase plasma concentration. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, BUN, creatinine, glucose. May produce proteinuria.

Availability (Rx)

Capsules (Emend): 40 mg, 80 mg, 125 mg. **Injection, Powder for Reconstitution (Fosaprepitant):** 150 mg.

Administration/handling

PO

- Give without regard to food.

IV

Reconstitution

- Reconstitute each vial with 5 mL 0.9% NaCl.
- Add to 145 mL 0.9% NaCl to provide a final concentration of 1 mg/mL.

Rate of Administration

- Infuse over 20–30 min 30 min prior to chemotherapy.

Storage

- Refrigerate unconstituted vials.
- After reconstitution, solution is stable at room temperature for 24 hrs.

IV incompatibilities

Do not infuse with any solutions containing calcium or magnesium.

Indications/routes/dosage

Prevention of Chemotherapy-Induced Nausea, Vomiting

Note: Administer in combination with a 5-HT₃ antagonist on day 1 and dexamethasone on days 1 through 4.

PO: ADULTS, ELDERLY, CHILDREN 12 YRS OR YOUNGER WEIGHING 30 KG OR MORE: 125 mg 1 hr before chemotherapy on day 1 and 80 mg once daily in the morning on days 2 and 3.

IV: ADULTS, ELDERLY (SINGLE-DOSE REGIMEN): 150 mg over 20–30 min 30 min prior to chemotherapy.

Prevention of Postop Nausea, Vomiting

PO: ADULTS, ELDERLY: 40 mg once within 3 hrs prior to induction of anesthesia.

Dosage in Renal/Hepatic Impairment

No dose adjustment. Caution in severe hepatic impairment.

Side effects

Frequent (17%–10%): Fatigue, nausea, hiccups, diarrhea, constipation, anorexia. **Occasional (8%–4%):** Headache, vomiting, dizziness, dehydration, heartburn. **Rare (3% or less):** Abdominal pain, epigastric discomfort, gastritis, tinnitus, insomnia.

Adverse effects/toxic reactions

Neutropenia, mucous membrane disorders occur rarely.

Nursing considerations

Baseline assessment

Assess for dehydration (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue).

Intervention/evaluation

Monitor hydration, nutritional status, I&O. Assess bowel sounds for peristalsis. Assist with ambulation if dizziness occurs. Provide supportive measures. Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching

- Relief from nausea/vomiting generally occurs shortly after drug administration.
- Report persistent vomiting, headache.
- May decrease effectiveness of oral contraceptives.

argatroban

ar-gat-roe-ban

HIGH
ALERT

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Thrombin inhibitor.

CLINICAL: Anticoagulant.

Do not confuse argatroban with Aggrastat.

Uses

Prophylaxis or treatment of thrombosis in heparin-induced thrombocytopenia (HIT) in pts with HIT or at risk of developing HIT undergoing. Pts with or at risk for HIT undergoing percutaneous coronary procedures. **OFF-LABEL:** Maintain extracorporeal circuit patency of continuous renal replacement therapy (CRRT) in pts with HIT.

Precautions

Contraindications: Hypersensitivity to argatroban, active major bleeding.

Cautions: Severe hypertension, immediately following lumbar puncture, spinal anesthesia, major surgery, pts with congenital or acquired bleeding disorders, gastrointestinal ulcerations, hepatic impairment, critically ill pts.

Action

Direct thrombin inhibitor that reversibly binds to thrombin-active sites. Inhibits thrombin-catalyzed or thrombin-induced reactions, including fibrin formation, activation of coagulant factors V, VIII, and XIII; inhibits protein C formation,

platelet aggregation. **Therapeutic Effect:** Produces anticoagulation.

Pharmacokinetics

Distributed primarily in extracellular fluid. Protein binding: 54%. Metabolized in liver. Primarily excreted in the feces, presumably through biliary secretion. **Half-life:** 39–51 min (prolonged in hepatic failure).

Lifespan considerations

Pregnancy/Lactation: Unknown if excreted in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Antiplatelet agents (e.g., aspirin, clopidogrel), other anticoagulants (e.g., warfarin), thrombolytics (e.g., tissue plasminogen activator [TPA]), NSAIDs may increase the risk of bleeding. **HERBAL:** Dong quai, evening primrose oil, ginkgo, policosanol, willow bark may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** Prolongs prothrombin time (PT), activated partial thromboplastin time (aPTT), international normalized ratio (INR). May decrease Hgb, Hct.

Availability (Rx)

Infusion (Pre-Mix): 125 mg/125 mL, 250 mg/250 mL. **Injection Solution:** 250 mg/2.5 mL vial.

Administration/handling

IV

Reconstitution

- Dilute each 250-mg vial with 250 mL 0.9% NaCl, D₅W to provide a final concentration of 1 mg/mL.

Rate of Administration

- Initial rate of administration is based on body weight at 2 mcg/kg/min (e.g., 50-kg pt infuse at 6 mL/hr). Dosage should not exceed 10 mcg/kg/min.

Storage

- Discard if solution appears cloudy or an insoluble precipitate is noted.
- Following reconstitution, stable for 96 hrs at room temperature or refrigerated.
- Avoid direct sunlight.

■ IV incompatibility

Amiodarone (Cardarone).

■ IV Compatibilities

DiphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), midazolam (Versed), morphine, vasopressin (Pitressin). Refer to IV Compatibility Chart in front of book.

Indications/routes/dosage

Heparin-Induced Thrombocytopenia (HIT)

IV Infusion: ADULTS, ELDERLY: Initially, 2 mcg/kg/min administered as a continuous infusion. After initial infusion, dose may be adjusted until steady-state aPTT is 1.5–3 times initial baseline value, not to exceed 100 sec. Dosage should not exceed 10 mcg/kg/min.

Percutaneous Coronary Intervention

IV Infusion: ADULTS, ELDERLY: Initially, administer bolus of 350 mcg/kg over 3–5 min, then infuse at 25 mcg/kg/min. Check ACT (activated clotting time) 5–10 min following bolus. If ACT is less than 300 sec, give additional bolus 150 mcg/kg, increase infusion to 30 mcg/kg/min. If ACT is greater than 450 sec, decrease infusion to 15 mcg/kg/min. Once ACT of 300–450 sec achieved, continue dose through duration of procedure.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Moderate to Severe Impairment: ADULTS, ELDERLY: Initially, 0.5

mcg/kg/min. **CHILDREN:** Initially, 0.2 mcg/kg/min. Adjust dose in increments of 0.05 mcg/kg/min or less.

Side effects

Frequent (8%–3%): Dyspnea, hypotension, fever, diarrhea, nausea, pain, vomiting, infection, cough.

Adverse effects/toxic reactions

Ventricular tachycardia, atrial fibrillation occur occasionally. Major bleeding, sepsis occur rarely.

Nursing considerations

Baseline assessment

Obtain CBC, PT, aPTT. Determine initial B/P. Minimize need for multiple injection sites, blood draws, catheters.

Intervention/evaluation

Assess for any sign of bleeding: bleeding at surgical site, hematuria, melena, bleeding from gums, petechiae, ecchymoses, bleeding from injection sites. Handle pt carefully and infrequently to prevent bleeding. Assess for decreased B/P, increased pulse rate, complaint of abdominal/back pain, severe headache (may indicate hemorrhage). Monitor ACT, PT, aPTT, platelet count, Hgb, Hct. Question for increase in discharge during menses. Assess for hematuria. Observe skin for any occurring ecchymoses, petechiae, hematoma. Use care in removing any dressing, tape.

Patient/family teaching

- Use electric razor, soft toothbrush to prevent cuts, gingival trauma.
- Report any sign of bleeding, including red/dark urine, black/red stool, coffee-ground vomitus, blood-tinged mucus from cough.

ARIPiprazole

ar-i-**pip**-ra-zole

TOP
100

Abilify

Abilify Maintena

Aristada

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: DOPamine agonist.

CLINICAL: Antipsychotic agent.

■ **BLACK BOX ALERT** ■ Increased risk of mortality in elderly pts with dementia-related psychosis, mainly due to pneumonia, HF. Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse Abilify with Ambien, or ARIPiprazole with esomeprazole, omeprazole, pantoprazole, or RABEprazole (proton pump inhibitors).

Uses

PO: Treatment of schizophrenia. Treatment of bipolar disorder. Adjunct treatment in major depressive disorder. Treatment of irritability associated with autistic disorder in children 6–17 yrs of age. Treatment of Tourette disorder. **IM: (Immediate-Release):** Agitation associated with schizophrenia/bipolar disorder. **(Extended-Release): Abilify Maintena:** Treatment of schizophrenia in adults. Maintenance monotherapy treatment of bipolar 1 disorder in adults. **Aristada:** Treatment of schizophrenia. **OFF-LABEL:** Schizoaffective disorder, depression with psychotic features, aggression, bipolar disorder (children), conduct disorder (children), psychosis/agitation related to Alzheimer's dementia.

Precautions

Contraindications: Hypersensitivity to ARIPiprazole. **Cautions:** Concurrent use of CNS depressants (including alcohol), disorders in which CNS depression is a feature, cardiovascular or cerebrovascular diseases (may induce hypotension), Parkinson's disease (potential for exacerbation), history of seizures or conditions that may lower seizure threshold (Alzheimer's disease), diabetes mellitus. Pts at risk for pneumonia. Elderly with dementia.

Action

Provides partial agonist activity at DOPamine (D2, D3) and serotonin (5-HT_{1A}) receptors and antagonist activity at serotonin (5-HT_{2A}) receptors. **Therapeutic Effect:** Improves symptoms associated with schizophrenia, bipolar disorder, autism, depression.

Pharmacokinetics

Well absorbed through GI tract. Protein binding: 99% (primarily albumin). Reaches steady levels in 2 wks. Metabolized in liver. Excreted in feces (55%), urine (25%). Not removed by hemodialysis. **Half-life:** 75 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta. May be distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** May increase risk of mortality in pts with dementia-related psychosis.

Interactions

DRUG: Alcohol may potentiate cognitive and motor effects. **CYP3A4 inducers** (e.g., carbamazepine, rifampin) may decrease concentration. **CYP3A4 inhibitors** (e.g., erythromycin, ketoconazole, ritonavir) may increase concentration. **CYP2D6 inhibitors** may increase concentration/effects. **HERBAL:** St. John's wort may decrease levels. **Gotu kola, kava kava, St. John's wort, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum glucose. May decrease neutrophils, leukocytes.

Availability (Rx)

Injection, Prefilled Syringe (Aristada): 441 mg, 662 mg, 882 mg, 1064 mg. **Injection, Solution (Abilify):** 9.75 mg/1.3 mL (7.5 mg/mL). **Solution, Oral:** 1 mg/mL. **Tablets:** 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Tablets, Orally Disintegrating:** 10 mg, 15 mg. **Injection, Powder for Reconstitution (Abilify Maintena):** 300 mg, 400 mg.

Administration/handling

IM (Abilify)

- For IM use only (inject slowly into deep muscle mass). Do not administer IV or subcutaneous.

IM (Abilify Maintena)

- Reconstitute 400-mg vial with 1.9 mL Sterile Water for Injection (300-mg vial with 1.5 mL) to provide a concentration of 100 mg/0.5 mL. Once reconstituted, administer in gluteal muscle. Do not administer via IV or subcutaneously.

PO

- Give without regard to food.

Orally Disintegrating Tablet

- Remove tablet, place entire tablet on tongue.
- Do not break, split tablet.
- May give without liquid.

Indications/routes/dosage

Note: May substitute oral solution/tablet mg per mg up to 25 mg. For 30-mg tablets, give 25 mg oral solution.

Strong CYP3A4 Inducers: ARIPiprazole dose should be doubled. **Strong**

CYP3A4 Inhibitors: ARIPiprazole dose should be reduced by 50%.

Schizophrenia

PO: ADULTS, ELDERLY: Initially, 10–15 mg once daily. May increase up to 30 mg/day. Titrate dose at minimum of 2-wk intervals. **CHILDREN 13–17 YRS:** Initially, 2 mg/day for 2 days, then 5 mg/day for 2 days. May further increase to target dose of 10 mg/day. May then increase in increments of 5 mg up to maximum of 30 mg/day. **IM:ADULTS, ELDERLY: (Abilify Maintena):** Initially, 400 mg monthly (separate doses by at least 26 days). **(Aristada):** 441 mg, 662 mg or 882 mg monthly or 882 mg q6wks, or 1064 mg q2mos. IM dose based on oral dose. (In conjunction with first IM dose, administer oral aripiprazole for 21 consecutive days).

Bipolar Disorder

PO: ADULTS, ELDERLY: Monotherapy: Initially, 15 mg once daily. May increase to 30 mg/day. **Adjunct to lithium or valproic acid:** Initially, 10–15 mg. May increase to 30 mg/day based on pt tolerance. **CHILDREN 10–17 YRS:** Initially, 2 mg/day for 2 days, then 5 mg/day for 2 days. May further increase to a target of 10 mg/day. Give subsequent dose increases of 5 mg/day. **Maximum:** 30 mg/day. **IM:ADULTS, ELDERLY: (Abilify Maintena):** Initially, 400 mg monthly (separate doses by at least 26 days).

Major Depressive Disorder (Adjunct to Antidepressants)

PO: ADULTS, ELDERLY:(Abilify): Initially, 2–5 mg/day. May increase up to maximum of 15 mg/day. Titrate dose in 5-mg increments of at least 1-wk intervals.

Agitation with Schizophrenia/Bipolar Disorder

IM: ADULTS, ELDERLY (Abilify):5.25–15 mg as a single dose. May repeat after 2 hrs. **Maximum:** 30 mg/day.

Irritability with Autistic Disorder

PO: CHILDREN 6–17 YRS: Initially, 2 mg/day for 7 days followed by increase to 5 mg/day. Subsequent increases made in 5-mg increments at intervals of at least 1 wk. **Maximum:** 15 mg/day.

Tourette Disorder

PO: CHILDREN 6–17 YRS WEIGHING 50 KG OR MORE: 2 mg/day for 2 days; then 5 mg/day for 5 days with target dose of 10 mg on day 8. **Maximum:** 20 mg/day. **LESS THAN 50 KG:** 2 mg/day for 2 days, then 5 mg/day. **Maximum:** 10 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (11%–5%): Weight gain, headache, insomnia, vomiting. **Occasional**

(4%–3%): Light-headedness, nausea, akathisia, drowsiness. **Rare (2% or less):** Blurred vision, constipation, asthenia (loss of strength, energy), anxiety, fever, rash, cough, rhinitis, orthostatic hypotension.

Adverse effects/toxic reactions

Extrapyramidal symptoms, neuroleptic malignant syndrome, tardive dyskinesia, hyperglycemia, ketoacidosis, hyperosmolar coma, CVA, TIA occur rarely. Prolonged QT interval occurs rarely. May cause leukopenia, neutropenia, agranulocytosis.

Nursing considerations

Baseline assessment

Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Correct dehydration, hypovolemia. Assess for suicidal tendencies. Question history (or family history) of diabetes. Obtain serum blood glucose level.

Intervention/evaluation

Periodically monitor weight. Monitor for extrapyramidal symptoms (abnormal movement), tardive dyskinesia (protrusion of tongue, puffing of cheeks, chewing/puckering of the mouth). Periodically monitor B/P, pulse (particularly in pts with preexisting cardiovascular disease). Monitor serum blood glucose levels during therapy. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

Patient/family teaching

- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report worsening depression, suicidal ideation, unusual changes in behavior, extrapyramidal effects.

ar-moe-**daf**-i-nil

Nuvigil

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Alpha₁ agonist.

CLINICAL: CNS stimulant.

Do not confuse armodafinil with modafinil.

Uses

Treatment of excessive daytime sleepiness associated with obstructive sleep apnea–hypopnea syndrome, narcolepsy, shift-work sleep disorder.

Precautions

Contraindications: History of sensitivity to armodafinil or modafinil.

Cautions: History of mitral valve prolapse, left ventricular hypertrophy, hepatic impairment, recent history of MI, unstable angina, cardiac ischemia, drug abuse, psychosis, depression, mania, renal impairment, elderly.

Action

Exact mechanism unknown. May bind to DOPamine reuptake carrier sites in the brain, increasing alpha activity, decreasing delta, theta, and beta activity.

Therapeutic Effect: Improves wakefulness.

Pharmacokinetics

Well absorbed. Widely distributed. Mainly eliminated by hepatic metabolism with less than 10% excreted by kidneys. Unknown if removed by hemodialysis.

Half-life: 15 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Use caution in pregnant women. **Children:** Safety and efficacy not established in pts younger than 17 yrs. **Elderly:** Age-related renal/hepatic impairment may require decreased dosage.

Interactions

DRUG: Carbamazepine, erythromycin, ketoconazole, PHENobarbital, rifAMPin may alter concentration/effect. May reduce effects of cycloSPORINE, oral contraceptives. May increase concentrations of diazePAM, omeprazole, phenytoin, propranolol, tricyclic antidepressants, warfarin. **HERBAL:** None significant. **FOOD:** Food slows peak concentration by 2–4 hrs; may affect time of onset, length of drug action. **LAB VALUES:** May increase alkaline phosphatase, GGT. May decrease serum uric acid.

Availability (Rx)

Tablets: 50 mg, 150 mg, 200 mg, 250 mg.

Administration/handling

PO

- May give without regard to food.

Indications/routes/dosage

Narcolepsy, Obstructive Sleep Apnea–Hypopnea Syndrome

PO: ADULTS, ELDERLY: 150 or 250 mg/day given as a single dose in the morning.

Shift-Work Sleep Disorder

PO: ADULTS, ELDERLY: 150 mg given daily approximately 1 hr prior to the start of work shift.

Dosage in Renal/Hepatic Impairment

No dose adjustment. **Severe Hepatic Impairment:** May decrease dose.

Side effects

Frequent (17%–7%): Headache, nausea. **Occasional (5%–4%):** Dizziness, insomnia, dry mouth, diarrhea, anxiety. **Rare (2%):** Depression, fatigue,

palpitations, dyspepsia, rash, upper abdominal pain.

Adverse effects/toxic reactions

Small risk of serious rash, including Stevens-Johnson syndrome.

Nursing considerations

Baseline assessment

Obtain baseline evidence of narcolepsy or other sleep disorders, including pattern, environmental situations, lengths of time of sleep episodes. Question for sudden loss of muscle tone (cataplexy) precipitated by strong emotional responses before sleep episode. Assess frequency/severity of sleep episodes prior to drug therapy.

Intervention/evaluation

Monitor sleep pattern, evidence of restlessness during sleep, length of insomnia episodes at night. Assess for dizziness, anxiety. Initiate fall precautions.

Patient/family teaching

- Avoid or limit alcohol.
- Use alternative contraceptives during therapy and 1 mo after discontinuing drug (reduces effectiveness of oral contraceptives).
- Report rash, depression, diarrhea, insomnia.
- Sips of water may relieve dry mouth.

Fixed-Combination(s)

Aggrenox: aspirin/dipyridamole (an antiplatelet agent): 25 mg/200 mg.

Fiorinal: aspirin/butalbital/cafeine (a barbiturate): 325 mg/50 mg/40 mg.

Lortab/ASA: aspirin/HYDROcodone (an analgesic): 325 mg/5 mg.

Percodan: aspirin/oxyCODONE (an analgesic): 325 mg/2.25 mg, 325 mg/4.5

mg. **Pravigard:** aspirin/pravastatin (a cholesterol-lowering agent): 81 mg/20

mg, 81 mg/40 mg, 81 mg/80 mg, 325 mg/20 mg, 325 mg/40 mg, 325 mg/80

mg. **Yosprala:** aspirin/omeprazole (a proton pump inhibitor [PPI]) 325 mg/40

mg, 81 mg/40 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Nonsteroidal salicylate.

CLINICAL: Anti-inflammatory, antipyretic, anticoagulant.

aspirin or Ascriptin with Afrin, Aricept, or Ecotrin with Epogen.

Uses

Treatment of mild to moderate pain, fever. Reduces inflammation related to rheumatoid arthritis (RA), juvenile arthritis, osteoarthritis, rheumatic fever. Used as platelet aggregation inhibitor in the prevention of transient ischemic attacks (TIAs), cerebral thromboembolism, MI or reinfarction. **Durlaza:** Reduce risk of MI in pts with CAD or stroke in pts who have had TIA or ischemic stroke. **OFF-LABEL:** Prevention of preeclampsia; alternative therapy for preventing thromboembolism associated with atrial fibrillation when warfarin cannot be used; pericarditis associated with MI; prosthetic valve thromboprophylaxis. Adjunctive treatment of Kawasaki's disease. Complications associated with autoimmune disorders, colorectal cancer.

Precautions

Contraindications: Hypersensitivity to salicylates, NSAIDs. Aspirin triad (asthma, rhinitis [with or without nasal polyps], aspirin intolerance). Asthma, rhinitis, nasal polyps; inherited or acquired bleeding disorders; use in children (younger than 16 yrs) for viral infections. Do not use for at least 7 days after

tonsillectomy or oral surgery. **Cautions:** Platelet/bleeding disorders, severe renal/hepatic impairment, dehydration, erosive gastritis, peptic ulcer disease, sensitivity to tartrazine dyes, elderly (chronic use of doses 325 mg or greater). Avoid use in pregnancy, especially third trimester.

Action

Inhibits cyclo-oxygenase enzyme via acetylation. Inhibits formation of prostaglandin derivative thromboxane A. **Therapeutic Effect:** Reduces inflammatory response, intensity of pain; decreases fever; inhibits platelet aggregation.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	1 hr	2–4 hrs	4–6 hrs

Rapidly and completely absorbed from GI tract; enteric-coated absorption delayed; rectal absorption delayed and incomplete. Protein binding: High. Widely distributed. Rapidly hydrolyzed to salicylate. **Half-life:** 15–20 min (aspirin); 2–3 hrs (salicylate at low dose); more than 20 hrs (salicylate at high dose).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta; distributed in breast milk. May prolong gestation and labor, decrease fetal birth weight, increase incidence of stillbirths, neonatal mortality, hemorrhage. Avoid use during last trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Caution in pts with acute febrile illness (Reye's syndrome). **Elderly:** May be more susceptible to toxicity; lower dosages recommended.

Interactions

DRUG: Alcohol, NSAIDs may increase risk of GI effects (e.g., ulceration). Antacids, urinary alkalinizers increase excretion. Anticoagulants, (e.g. enoxaparin, warfarin), heparin, thrombolytics, rivaroxaban, ticagrelor

increase risk of bleeding. **HERBAL:** Avoid **cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng, green tea, horse chestnut, red clover** (possess antiplatelet activity). **FOOD:** None known. **LAB VALUES:** May alter serum ALT, AST, alkaline phosphatase, uric acid; prolongs prothrombin time (PT) platelet function assay. May decrease serum cholesterol, potassium, T₃, T₄.

Availability (OTC)

Caplets: 325 mg, 500 mg. **Suppositories:** 300 mg, 600 mg. **Tablets:** 325 mg. **Tablets (Chewable):** 81 mg.

 **Capsule, Extended-Release: (Durlaza)** 162.5 mg. **Tablets (Enteric-Coated):** 81 mg, 325 mg, 500 mg, 650 mg.

Administration/handling

PO

- Do not break, crush, dissolve, or divide enteric-coated tablets or extended-release capsule.
- May give with water, milk, meals if GI distress occurs.

Rectal

- Refrigerate suppositories; do not freeze.
- If suppository is too soft, chill for 30 min in refrigerator or run cold water over foil wrapper.
- Moisten suppository with cold water before inserting well into rectum.

Indications/routes/dosage

Analgesia, Fever

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER AND 50 KG OR MORE: 325–650 mg q4–6h or 975 mg q6h prn or 500–1,000 mg q4–6h prn. **Maximum:** 4 g/day. **RECTAL:** 300–600 mg q4h prn. **INFANTS, CHILDREN LESS THAN 50 KG:** 10–15 mg/kg/dose q4–6h. **Maximum:** 4 g/day or 90 mg/kg/day.

Revascularization

PO: ADULTS, ELDERLY: 80–325 mg/day.

Kawasaki's Disease

PO: CHILDREN: 80–100 mg/kg/day in divided doses q6h up to 14 days (until fever resolves for at least 48 hrs). After fever resolves, 1–5 mg/kg once daily for at least 6–8 wks.

MI, Stroke (Risk Reduction)

PO: ADULTS, ELDERLY: *Durlaza*: 162.5 mg once daily.

Dosage in Renal/Hepatic Impairment

Avoid use in severe impairment.

Side effects

Occasional: GI distress (including abdominal distention, cramping, heartburn, mild nausea); allergic reaction (including bronchospasm, pruritus, urticaria).

Adverse effects/toxic reactions

High doses of aspirin may produce GI bleeding and/or gastric mucosal lesions. Dehydrated, febrile children may experience aspirin toxicity quickly. Reye's syndrome, characterized by persistent vomiting, signs of brain dysfunction, may occur in children taking aspirin with recent viral infection (chickenpox, common cold, or flu). Low-grade aspirin toxicity characterized by tinnitus, generalized pruritus (may be severe), headache, dizziness, flushing, tachycardia, hyperventilation, diaphoresis, thirst. Marked toxicity characterized by hyperthermia, restlessness, seizures, abnormal breathing patterns, respiratory failure, coma.

Nursing considerations

Baseline assessment

Do not give to children or teenagers who have or have recently had viral

infections (increases risk of Reye's syndrome). Do not use if vinegar-like odor is noted (indicates chemical breakdown). Assess history of GI bleed, peptic ulcer disease, OTC use of products that may contain aspirin. Assess type, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. **Therapeutic serum level for antiarthritic effect:** 20–30 mg/dL (toxicity occurs if level is greater than 30 mg/dL).

Intervention/evaluation

Monitor urinary pH (sudden acidification, pH from 6.5 to 5.5, may result in toxicity). Assess skin for evidence of ecchymosis. If given as antipyretic, assess temperature directly before and 1 hr after giving medication. Evaluate for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

Patient/family teaching

- Do not, chew, crush, dissolve, or divide enteric-coated tablets.
- Avoid alcohol, OTC pain/cold products that may contain aspirin.
- Report ringing of the ears or persistent abdominal GI pain, bleeding.
- Therapeutic anti-inflammatory effect noted in 1–3 wks.
- Behavioral changes, persistent vomiting may be early signs of Reye's syndrome; contact physician.

atazanavir

a-ta-zan-a-veer

Reyataz

Fixed-Combination(s)

Evotaz: atazanavir/cobicistat (antiretroviral booster): 300 mg/150 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antiretroviral.

CLINICAL: Protease inhibitor.

Do not confuse Reyataz with Retavase.

TOP
100

Uses

Treatment of HIV-1 infection in combination with at least two other antiretroviral agents in pts 3 mos and older, weighing 5 kg or more.

Precautions

Contraindications: Hypersensitivity to atazanavir. Concurrent use with alfuzosin, ergot derivatives, indinavir, irinotecan, lovastatin, lurasidone (when atazanavir given with ritonavir), midazolam (oral), nevirapine, pimozide, rifAMPin, sildenafil (for pulmonary arterial hypertension), St. John's wort, simvastatin, triazolam. **Cautions:** Preexisting conduction system defects (first-, second-, or third-degree AV block), diabetes, elderly, renal impairment (not recommended in end-stage renal disease or pts on hemodialysis), hemophilia A or B, hepatitis B or C virus infection. Do not use in pts younger than 3 mos (potential for kernicterus). Pts with increased transaminase levels prior to use or underlying hepatic disease.

Action

Binds to HIV-1 protease, inhibiting cleavage of viral precursors into functional proteins. **Therapeutic Effect:** Prevents formation of mature HIV viral cells.

Pharmacokinetics

Rapidly absorbed after PO administration. Protein binding: 86%. Extensively metabolized in liver. Excreted in feces (79%), urine (13%). **Half-life:** 5–8 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Lactic acidosis syndrome, hyperbilirubinemia, kernicterus have been reported. **Children:** Safety and efficacy not established in pts younger than 3 mos. **Elderly:** Age-related hepatic impairment may require dose reduction.

Interactions

DRUG: May increase concentration, toxicity of **amiodarone, atorvastatin, bepridil, clarithromycin, cycloSPORINE, diltiaZEM, felodipine, lidocaine, lovastatin, niCARDipine, NIFEdipine, rosuvastatin, sildenafil, simvastatin,**

sirolimus, tacrolimus, tadalafil, tricyclic antidepressants, vardenafil, verapamil, warfarin. H₂-receptor antagonists, proton pump inhibitors, rifAMPin may decrease concentration/effects. Ritonavir, voriconazole may increase concentration. **HERBAL: St. John's wort** may decrease concentration/effects. **FOOD: High-fat meals** may decrease absorption. **LAB VALUES:** May increase serum bilirubin, ALT, AST, amylase, lipase. May decrease Hgb, neutrophil count, platelets. May alter LDL, triglycerides.

Availability (Rx)

Capsules: 150 mg, 200 mg, 300 mg. **Packet, Oral:** 50 mg.

Administration/handling

PO

- Give with food.
- Swallow whole; do not break or open capsules.
- Administer at least 2 hrs before or 10 hrs after H

Indications/routes/dosage

Note: Dosage adjustment may be necessary with colchicine, bosentan, H₂ antagonists, proton pump inhibitors, PDE5 inhibitors.

HIV-1 Infection

PO: ADULTS, ELDERLY (ANTIRETROVIRAL-NAIVE): 300 mg and ritonavir 100 mg, or cobicistat 150 mg, once daily, or 400 mg (2 capsules) once daily with food in pts unable to tolerate ritonavir. **CHILDREN 6–17 YRS (NAIVE OR EXPERIENCED) WEIGHING 40 KG OR MORE: Capsules:** 300 mg once daily (with ritonavir 100 mg). **WEIGHING 20–39 KG:** 200 mg once daily (with ritonavir 100 mg). **WEIGHING 15–19 KG:** 150 mg once daily (with ritonavir 100 mg). **ADULTS, ELDERLY (ANTIRETROVIRAL-EXPERIENCED), PREGNANT PTS, CHILDREN WEIGHING 40 KG OR MORE: (Capsule):** 300 mg and ritonavir 100 mg or cobicistat 150 mg once daily. **WEIGHING 20–39 KG:** 200 mg and ritonavir 100 mg once daily. **WEIGHING 15–19 KG:** 150 mg and ritonavir 100 mg once daily.

Powder (Naive and Experienced)

CHILDREN WEIGHING 25 KG OR MORE: 300 mg (6 packets) plus ritonavir 100 mg once daily. **WEIGHING 15–24 KG:** 250 mg (5 packets) plus ritonavir 80 mg once daily. **WEIGHING 5–14 KG:** 200 mg (4 packets) plus ritonavir 80 mg once daily.

HIV-1 Infection (Concurrent Therapy with Efavirenz)

PO: ADULTS, ELDERLY: 400 mg atazanavir, 100 mg ritonavir (as a single dose given with food), and 600 mg efavirenz as a single daily dose on an empty stomach (preferably at bedtime).

HIV-1 Infection (Concurrent Therapy with Didanosine)

PO: ADULTS, ELDERLY: Give atazanavir with food 2 hrs before or 1 hr after didanosine.

HIV-1 Infection (Concurrent Therapy with Tenofovir)

PO: ADULTS, ELDERLY: 300 mg atazanavir, 100 mg ritonavir, and 300 mg tenofovir given as a single daily dose with food. **FOR TREATMENT-EXPERIENCED PREGNANT WOMEN DURING SECOND OR THIRD TRIMESTER:** 400 mg and ritonavir 100 mg once daily.

HIV-1 Infection in Pts with Mild to Moderate Hepatic Impairment

◀ALERT▶ Avoid use in pts with severe hepatic impairment.

PO: ADULTS, ELDERLY: 300 mg once daily with food.

Dosage in Renal Impairment

HD (Naive): 300 mg with ritonavir. **(Experienced):** Not recommended.

Side effects

Frequent (16%–14%): Nausea, headache. **Occasional (9%–4%):** Rash, vomiting, depression, diarrhea, abdominal pain, fever. **Rare (3% or less):** Dizziness, insomnia, cough, fatigue, back pain.

Adverse effects/toxic reactions

Severe hypersensitivity reaction (angioedema, chest pain), jaundice may occur.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT, viral load before beginning therapy and at periodic intervals during therapy. Offer emotional support.

Intervention/evaluation

Monitor lab results. Assess for nausea, vomiting; assess eating pattern. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Question for evidence of headache. Assess mood for evidence of depression.

Patient/family teaching

- Take with food.
- Small, frequent meals may offset nausea, vomiting.
- Swallow whole; do not break or open capsules.
- Pt must continue practices to prevent HIV transmission.
- Atazanavir is not a cure for HIV infection, nor does it reduce risk of transmission to others.
- Report dizziness, light-headedness, yellowing of skin or whites of eyes, flank pain or when urinating, blood in urine, skin rash.

atenolol

a-ten-oh-lol

Apo-Atenol 

Tenormin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Beta₁-adrenergic blocker.

CLINICAL: Antihypertensive, antianginal, antiarrhythmic.

■ **BLACK BOX ALERT** ■ Do not abruptly discontinue; taper gradually to avoid acute tachycardia, hypertension, ischemia.

HIGH
ALERT

Do not confuse atenolol with albuterol, timolol, or Tylenol, or Tenormin with Imuran, Norpramin, or thiamine.

Uses

Treatment of hypertension, alone or in combination with other agents; management of angina pectoris; management of pts with definite/suspected MI to reduce CV mortality. **OFF-LABEL:** Arrhythmia (esp. supraventricular and ventricular tachycardia), thyrotoxicosis.

Precautions

Contraindications: Hypersensitivity to atenolol. Cardiogenic shock, uncompensated HF, second- or third-degree heart block (except with functioning pacemaker), sinus bradycardia, sinus node dysfunction, pulmonary edema, pregnancy. **Cautions:** Elderly, renal impairment, peripheral vascular disease, diabetes, thyroid disease, bronchospastic disease, compensated HF, myasthenia gravis, psychiatric disease, history of anaphylaxis to allergens, concurrent use with digoxin, verapamil, or diltiazEM.

Action

Blocks beta₁-adrenergic receptors in cardiac tissue. **Therapeutic Effect:** Slows sinus node heart rate, decreasing cardiac output, B/P. Decreases myocardial oxygen demand.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	1 hr	2–4 hrs	24 hrs

Incompletely absorbed from GI tract. Protein binding: 6%–16%. Minimal liver metabolism. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 6–9 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta; distributed in breast milk. Avoid use during first trimester. May produce bradycardia, apnea, hypoglycemia, hypothermia during delivery; low birth-weight infants. **Children:** No age-related precautions noted. **Elderly:** Age-related peripheral vascular disease, renal impairment require caution.

Interactions

DRUG: Diuretics (e.g., furosemide, HCTZ), other antihypertensives (e.g., amlodipine, lisinopril, valsartan) may increase hypotensive effect. Sympathomimetics, xanthines may mutually inhibit effects. May mask symptoms of hypoglycemia, prolong hypoglycemic effect of **insulin, oral antidiabetic medications (e.g., glyburide)**. NSAIDs may decrease antihypertensive effect. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum ANA titer, serum BUN, creatinine, potassium, uric acid, lipoprotein, triglycerides.

Availability (Rx)

Tablets: 25 mg, 50 mg, 100 mg.

Administration/handling

PO

- Give without regard to food.
- Tablets may be crushed.

Indications/routes/dosage

Hypertension

PO: ADULTS: Initially, 25–50 mg once daily. After 1–2 wks, may increase dose up to 100 mg once daily. **ELDERLY:** Usual initial dose, 25 mg/day. **CHILDREN:** Initially, 0.5–1 mg/kg/dose given once daily. Range: 0.5–1.5 mg/kg/day. **Maximum:** 2 mg/kg/day up to 100 mg/day.

Angina Pectoris

PO: ADULTS: Initially, 50 mg once daily. May increase dose up to 200 mg once daily. **ELDERLY:** Usual initial dose, 25 mg/day.

Post-MI

PO: ADULTS: 100 mg once daily or 50 mg twice daily for 6–9 days post-MI.

Dosage in Renal Impairment

Dosage interval is modified based on creatinine clearance.

Creatinine Clearance	Maximum Dosage
15–35 mL/min	50 mg/day
Less than 15 mL/min	25 mg/day
Hemodialysis (HD)	Give dose post-HD or give 25–50 mg supplemental dose

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Atenolol is generally well tolerated, with mild and transient side effects. **Frequent:** Hypotension manifested as cold extremities, constipation or diarrhea, diaphoresis, dizziness, fatigue, headache, nausea. **Occasional:** Insomnia, flatulence, urinary frequency, impotence or decreased libido, depression. **Rare:** Rash, arthralgia, myalgia, confusion (esp. in the elderly), altered taste.

Adverse effects/toxic reactions

Overdose may produce profound bradycardia, hypotension. Abrupt withdrawal may result in diaphoresis, palpitations, headache, tremors. May precipitate HF, MI in pts with cardiac disease; thyroid storm in pts with thyrotoxicosis; peripheral ischemia in pts with existing peripheral vascular disease. Hypoglycemia may occur in previously controlled diabetes. Thrombocytopenia (unusual bruising, bleeding) occurs rarely. **Antidote:** Glucagon (see [Appendix J](#) for dosage).

Nursing considerations

Baseline assessment

Assess B/P, apical pulse immediately before drug is administered (if pulse is 60/min or less, or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). **Antianginal:** Record onset, quality (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress). Assess baseline renal/hepatic function tests.

Intervention/evaluation

Monitor B/P for hypotension, pulse for bradycardia, respiration for difficulty in breathing, EKG. Monitor daily pattern of bowel activity, stool consistency. Assess for evidence of HF: dyspnea (particularly on exertion or lying down), nocturnal cough, peripheral edema, distended neck veins. Monitor I&O (increased weight, decreased urinary output may indicate HF). Assess extremities for pulse quality, changes in temperature (may indicate worsening peripheral vascular disease). Assist with ambulation if dizziness occurs.

Patient/family teaching

- Do not abruptly discontinue medication.
- Compliance with therapy essential to control hypertension, angina.
- To reduce hypotensive effect, go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Advise diabetic pts to monitor blood glucose carefully (may mask signs of hypoglycemia).
- Report dizziness, depression, confusion, rash, unusual bruising/bleeding.
- Outpatients should monitor B/P, pulse before taking medication, following correct technique.
- Restrict salt, alcohol intake.
- Therapeutic antihypertensive effect noted in 1–2 wks.

atezolizumab

a-te-zoe-liz-ue-mab

Tecentriq

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Programmed death-ligand 1 (PD-L1) blocking antibody. Monoclonal antibody.

CLINICAL: Antineoplastic.

Do not confuse atezolizumab with daclizumab, certolizumab, eculizumab, omalizumab, or tocilizumab.

Uses

Treatment of pts with locally advanced or metastatic urothelial carcinoma who have disease progression during or following platinum-containing chemotherapy or have disease progression within 12 mos of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy. Treatment of metastatic NSCLC in pts with disease progression during or following platinum-containing chemotherapy.

Precautions

Contraindications: Hypersensitivity to atezolizumab. **Cautions:** Active infection; baseline anemia, lymphopenia; diabetes; pts at risk for dehydration, electrolyte imbalance; hepatic impairment, peripheral or generalized edema, neuropathy, optic disorders, interstitial lung disease; history of venous thromboembolism, intestinal obstruction, pancreatitis.

Action

Binds to PD-L1 and blocks interaction with both PD-L1 and B7.1 receptors. Releases the PD-1/PD-L1 pathway-mediated inhibition of the immune response (including antitumor immune response). **Therapeutic Effect:** Inhibits T-cell proliferation and cytokine production. Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Metabolism not specified. Steady state reached in 6–9 wks. Elimination not specified. **Half-life:** 27 days.

⌚ Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Unknown if

distributed in breast milk; however, human immunoglobulin G is present in breast milk. Breastfeeding not recommended during treatment and for at least 5 mos after discontinuation. Females of reproductive potential should use effective contraception during treatment and up to 5 mos after discontinuation. May impair fertility in females. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None known. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, creatinine, glucose. May decrease serum albumin, sodium; lymphocytes, Hgb, Hct, RBCs.

Availability (Rx)

Injection Solution: 1,200 mg/20 mL (60 mg/mL).

Administration/handling

IV

Reconstitution

- Visually inspect solution for particulate matter or discoloration. Solution should appear clear to slightly yellow. Discard if solution is cloudy or discolored or if visible particles are present.
- Do not shake vial.
- Withdraw 20 mL of solution from vial and dilute into a 250-mL polyvinyl chloride, polyethylene, or polyolefin infusion bag containing 0.9% NaCl. Dilute with 0.9% NaCl only.
- Mix by gentle inversion.
- Do not shake.
- Discard partially used or empty vials.

Rate of Administration

- Infuse over 60 min using sterile, nonpyrogenic, low protein-binding, 0.2- to 0.22-micron in-line filter.
- If first infusion is tolerated, all subsequent infusions may be delivered over 30 mins.
- Do not administer as IV bolus.

Storage

- Refrigerate diluted solution up to 24 hrs or store at room temperature for no more than 6 hrs (includes time of preparation and infusion).
- Do not freeze.
- Do not shake.

■ IV incompatibilities

Do not administer with other medications. Infuse via dedicated line.

Indications/routes/dosage

NSCLC, Urothelial Carcinoma

IV: ADULTS, ELDERLY: 1,200 mg q3wks until disease progression or unacceptable toxicity. No dose reductions are recommended.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE). **Withhold treatment for any of the following toxic reactions:** Grade 2 or 3 diarrhea or colitis; grade 2 pneumonitis; serum AST or ALT elevation 3–5 times upper limit of normal (ULN) or serum bilirubin elevation 1.5–3 times ULN; symptomatic hypophysitis, adrenal insufficiency, hypothyroidism, hyperthyroidism; grade 3 or 4 hyperglycemia; grade 3 rash; grade 2 ocular inflammatory toxicity, grade 2 or 3 pancreatitis, grade 3 or 4 infection, grade 2 infusion-related reactions. **Restarting treatment after interruption of therapy:** Resume treatment when adverse effects return to grade 0 or 1. **Permanently discontinue for any of the following toxic reactions:** Grade 3 or 4 diarrhea or colitis; grade 3 or 4 pneumonitis; serum AST or ALT elevation greater than 5 times ULN or serum bilirubin elevation 3 times ULN; grade 4 hypophysitis; grade 4 rash; grade 3 or 4 ocular inflammatory toxicity; grade 4 or any grade recurrent pancreatitis; grade 3 or 4 infusion-related reactions; any occurrence of encephalitis, Guillain-Barré, meningitis, meningoencephalitis, myasthenic syndrome/myasthenia gravis.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

Side effects

Frequent (52%–18%): Fatigue, decreased appetite, nausea, pyrexia, constipation, diarrhea, peripheral edema. **Occasional (17%–13%):** Abdominal pain, vomiting, dyspnea, back/neck pain, rash, arthralgia, cough, pruritus.

Adverse effects/toxic reactions

May cause severe immune-mediated events including adrenal insufficiency (0.4% of pts), interstitial lung disease or pneumonitis (3% of pts), colitis or diarrhea (20% of pts), hepatitis (2%–3% of pts), hypophysitis (0.2% of pts), hyperthyroidism (1% of pts), hypothyroidism (4% of pts), rash (up to 37% of pts), new-onset diabetes with ketoacidosis (0.2% of pts), pancreatitis (0.1% of pts); meningoencephalitis, myasthenic syndrome/myasthenia gravis, Guillain-Barré, ocular inflammatory toxicity (less than 1% of pts). Severe, sometimes fatal infections, including sepsis, herpes encephalitis, mycobacterial infection, occurred in 38% of pts. Urinary tract infections were the most common cause of grade 3 or higher infection, occurring in 7% of pts. Severe infusion-related reactions reported in less than 1% of pts. Other adverse events, including acute kidney injury, dehydration, dyspnea, encephalitis, hematuria, intestinal obstruction, meningitis, neuropathy, pneumonia, urinary obstruction, venous thromboembolism, were reported. Immunogenicity (auto-atezolizumab antibodies) occurred in 42% of pts.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT, thyroid panel, urine pregnancy, urinalysis; vital signs. Screen for history of pituitary/pulmonary/thyroid disease, autoimmune disorders, diabetes, hepatic impairment, venous thromboembolism. Conduct full dermatologic/neurologic/ophthalmologic exam. Verify use of effective contraception in females of reproductive potential. Screen for active

infection. Assess hydration status.

Intervention/evaluation

Monitor CBC, BMP, LFT, thyroid panel, vital signs. Diligently monitor for immune-mediated adverse events as listed in Adverse Effects/Toxic Reactions. Notify physician if any CTCAE toxicities occur, and initiate proper treatment. Obtain chest X-ray if interstitial lung disease, pneumonitis suspected. Due to high risk for dehydration/diarrhea, strictly monitor I&O. Encourage PO intake. If corticosteroid therapy is initiated for immune-mediated events, monitor capillary blood glucose and screen for corticosteroid side effects. Report any changes in neurologic status, including nuchal rigidity with fever, positive Kernig's sign, positive Brudzinski's sign, altered mental status, seizures. Diligently monitor for infection.

Patient/family teaching

- Blood levels will be routinely monitored.
- Avoid pregnancy; treatment may cause birth defects. Do not breastfeed. Females of childbearing potential should use effective contraception during treatment and for at least 5 mos after final dose.
- Treatment may cause serious or life-threatening inflammatory reactions. Report signs and symptoms of treatment-related inflammatory events in the following body systems: colon (severe abdominal pain or diarrhea); eye (blurry vision, double vision, unequal pupil size, sensitivity to light, eyelid drooping); lung (chest pain, cough, shortness of breath); liver (bruising easily, amber-colored urine, clay-colored/tarry stools, yellowing of skin or eyes); pituitary (persistent or unusual headache, dizziness, extreme weakness, fainting, vision changes); thyroid (trouble sleeping, high blood pressure, fast heart rate [overactive thyroid]), (fatigue, goiter, weight gain [underactive thyroid]), neurologic (confusion, headache, seizures, neck rigidity with fever, severe nerve pain or loss of motor function).
- Immediately report allergic reactions, bleeding of any kind, signs of infection.
- Treatment may cause severe diarrhea. Drink plenty of fluids.

atoMOXetine

at-oh-**mox**-e-teen

Apo-Atomoxetine

Strattera

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Norepinephrine reuptake inhibitor.

CLINICAL: Psychotherapeutic agent.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children and adolescents with attention-deficit hyperactivity disorder (ADHD).

atomoxetine with atorvastatin.

Uses

Treatment of ADHD.

Precautions

Contraindications: Hypersensitivity to atomoxetine. Narrow-angle glaucoma, use with or within 14 days of MAOIs. Pheochromocytoma or history of pheochromocytoma. Severe cardiovascular disease. **Cautions:** Hypertension, tachycardia, cardiovascular disease (e.g., structural abnormalities, cardiomyopathy), urinary retention, moderate or severe hepatic impairment, suicidal ideation, emergent psychotic or manic symptoms, comorbid bipolar disorder, renal impairment, poor metabolizers of CYP2D6 metabolized drugs (e.g., FLUoxetine, PARoxetine). Pts predisposed to hypotension.

Action

Inhibits reuptake of norepinephrine. **Therapeutic Effect:** Improves symptoms of ADHD.

Pharmacokinetics

Rapidly absorbed after PO administration. Protein binding: 98% (primarily to albumin). Excreted in urine (80%), feces (17%). Not removed by hemodialysis. **Half-life:** 4–5 hrs (increased in moderate to severe hepatic insufficiency).

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 yrs. May produce suicidal thoughts in children and adolescents. **Elderly:** Age-related hepatic/renal impairment, cardiovascular or cerebrovascular disease may increase risk of adverse effects.

Interactions

DRUG: MAOIs may increase concentration/effect. **FLUoxetine, PARoxetine** may increase concentration/effect. Avoid concurrent use of **medications that can increase heart rate or B/P.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase hepatic enzymes, serum bilirubin.

Availability (Rx)

Capsules: 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg.

Administration/handling

PO

- Give without regard to food.
- Swallow capsules whole, do not break or open (powder in capsule is ocular irritant). Give as single daily dose in the morning or 2 evenly divided doses in morning and late afternoon/early evening.

Indications/routes/dosage

Note: May discontinue without tapering dose.

Attention-Deficit Hyperactivity Disorder (ADHD)

PO: ADULTS, CHILDREN 6 YRS AND OLDER WEIGHING 70 KG OR MORE: Initially, 40 mg once daily. May increase after at least 3 days to 80 mg daily. **Maximum:** 100 mg. **CHILDREN 6 YRS AND OLDER WEIGHING LESS THAN 70 KG:** Initially, 0.5 mg/kg/day. May increase after at least 3 days to 1.2 mg/kg/day. **Maximum:** 1.4 mg/kg/day or 100 mg, whichever is less.

Dosage in Hepatic Impairment

Expect to administer 50% of normal atomoxetine dosage to pts with moderate hepatic impairment and 25% of normal dosage to pts with severe hepatic impairment.

Dosage in Renal Impairment

No dose adjustment.

Dosage with Strong CYP2D6 Inhibitors

ADULTS: Initially, 40 mg/day. May increase to 80 mg/day after minimum of 4 wks. **CHILDREN:** Initially, 0.5 mg/kg/day. May increase to 1.2 mg/kg/day only after minimum 4-wk interval.

Side effects

Frequent: Headache, dyspepsia, nausea, vomiting, fatigue, decreased appetite, dizziness, altered mood. **Occasional:** Tachycardia, hypertension, weight loss, delayed growth in children, irritability. **Rare:** Insomnia, sexual dysfunction in adults, fever.

Adverse effects/toxic reactions

Urinary retention, urinary hesitancy may occur. In overdose, gastric lavage, activated charcoal may prevent systemic absorption. Severe hepatic injury occurs rarely.

Nursing considerations

Baseline assessment

Assess pulse, B/P before therapy, following dose increases, and periodically during therapy. Assess attention span, interactions with others.

Intervention/evaluation

Monitor urinary output; complaints of urinary retention/hesitancy may be a related adverse reaction. Monitor B/P, pulse periodically and following dose

increases. Monitor for growth, attention span, hyperactivity, unusual changes in behavior, suicidal ideation. Assist with ambulation if dizziness occurs. Be alert to mood changes. Monitor fluid and electrolyte status in pts with significant vomiting.

Patient/family teaching

- Take last dose early in evening to avoid insomnia.
- Report palpitations, fever, vomiting, irritability.
- Monitor growth rate, weight.
- Report changes in behavior, suicidal ideation, chest pain, palpitations, dyspnea.

atorva**STAT**in

a-**tor**-va-sta-tin

TOP
100

Apo-Atorvastatin 🇨🇦

Lipitor

Novo-Atorvastatin 🇨🇦

Fixed-Combination(s)

Caduet: atorvastatin/amLODIPine (calcium channel blocker): 10 mg/2.5 mg, 10 mg/5 mg, 10 mg/10 mg, 20 mg/2.5 mg, 20 mg/5 mg, 20 mg/10 mg, 40 mg/2.5 mg, 40 mg/5 mg, 40 mg/10 mg, 80 mg/5 mg, 80 mg/10 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Hydroxymethylglutaryl CoA (HMG-CoA) reductase inhibitor.

CLINICAL: Antihyperlipidemic.

atorvastatin with atomoxetine, lovastatin, nystatin, pitavastatin, pravastatin, or simvastatin, or Lipitor with Levatol, lisinopril, or Zocor.

Uses

Primary prevention of cardiovascular disease in high-risk pts. Reduces risk of stroke and heart attack in pts with type 2 diabetes with or without evidence of heart disease. Reduces risk of stroke in pts with or without evidence of heart disease with multiple risk factors other than diabetes. Adjunct to diet therapy in management of hyperlipidemias (reduces elevations in total cholesterol, LDL-C,

apolipoprotein B, triglycerides in pts with primary hypercholesterolemia), homozygous familial hypercholesterolemia, heterozygous familial hypercholesterolemia in pts 10–17 yrs of age, females more than 1 yr postmenarche. **OFF-LABEL:** Secondary prevention in pts who have experienced a noncardioembolic stroke/TIA or following an acute coronary syndrome (ACS) event.

Precautions

Contraindications: Hypersensitivity to atorvastatin. Active hepatic disease, breastfeeding, pregnancy, unexplained elevated LFT results. **Cautions:** Anticoagulant therapy; history of hepatic disease; substantial alcohol consumption; pts with prior stroke/TIA; concomitant use of potent CYP3A4 inhibitors; elderly (predisposed to myopathy).

Action

Inhibits HMG-CoA reductase, the enzyme that catalyzes the early step in cholesterol synthesis. **Therapeutic Effect:** Decreases LDL and VLDL, plasma triglyceride levels; increases HDL concentration.

Pharmacokinetics

Poorly absorbed from GI tract. Protein binding: greater than 98%. Metabolized in liver. Primarily excreted in feces (biliary). **Half-life:** 14 hrs.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. Contraindicated during pregnancy. May produce fetal skeletal malformation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP3A4 inhibitors (e.g., clarithromycin, protease inhibitors, itraconazole) may increase concentration, risk of rhabdomyolysis. CycloSPORINE may increase concentration. **Gemfibrozil, fibrates, niacin, colchicine** may increase risk of myopathy, rhabdomyolysis. **Strong CYP3A4**

inducers (e.g., rifAMPin, efavirenz) may decrease concentration. **HERBAL:** St. John's wort may decrease level. **FOOD:** Grapefruit products may increase serum concentrations. **Red yeast rice** may increase serum levels (2.4 mg lovastatin per 600 mg rice). **LAB VALUES:** May increase serum transaminase, creatinine kinase concentrations.

Availability (Rx)

 **Tablets:** 10 mg, 20 mg, 40 mg, 80 mg.

Administration/handling

PO

- Give without regard to food or time of day.
- Do not break, crush, dissolve, or divide film-coated tablets.

Indications/routes/dosage

Do not use in pts with active hepatic disease.

Note: Individualize dosage based on baseline LDL/cholesterol, goal of therapy, pt response. **Maximum dose with strong CYP3A4 inhibitors:** 20 mg/day.

Dyslipidemias

PO: ADULTS, ELDERLY: Initially, 10–20 mg/day (40 mg in pts requiring greater than 45% reduction in LDL-C). Range: 10–80 mg/day.

Heterozygous Hypercholesterolemia

PO: CHILDREN 10–17 YRS: Initially, 10 mg/day. **Maximum:** 20 mg/day.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

See contraindications.

Side effects

Common: Atorvastatin is generally well tolerated. Side effects are usually mild and transient. **Frequent (16%):** Headache. **Occasional (5%–2%):** Myalgia, rash, pruritus, allergy. **Rare (less than 2%–1%):** Flatulence, dyspepsia, depression.

Adverse effects/toxic reactions

Potential for cataracts, photosensitivity, myalgia, rhabdomyolysis.

Nursing considerations

Baseline assessment

Obtain baseline cholesterol, triglycerides, LFT. Question for possibility of pregnancy before initiating therapy. Obtain dietary history.

Intervention/evaluation

Monitor for headache. Assess for rash, pruritus, malaise. Monitor cholesterol, triglyceride lab values for therapeutic response. Monitor LFTs, CPK.

Patient/family teaching

- Follow special diet (important part of treatment).
- Periodic lab tests are essential part of therapy.
- Do not take other medications without consulting physician.
- Do not chew, crush, dissolve, or divide tablets.
- Report dark urine, muscle fatigue, bone pain.
- Avoid excessive alcohol intake, large quantities of grapefruit products.

atropine

at-roe-peen

Lomotil: atropine/diphenoxylate [peristaltic inhibitor]: 0.025 mg/2.5 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Acetylcholine antagonist.

CLINICAL: Antiarrhythmic, antispasmodic, antidote, cycloplegic,

antisecretory, anticholinergic.

Uses

Injection: Preop to inhibit salivation/secretions; treatment of symptomatic sinus bradycardia; AV block; ventricular asystole; antidote for organophosphate pesticide poisoning. Adjuvant to decrease side effects during reversal of neuromuscular blockage.

Precautions

Contraindications: Hypersensitivity to atropine. Narrow-angle glaucoma, pyloric stenosis, prostatic hypertrophy. **Cautions:** Autonomic neuropathy, paralytic ileus, intestinal atony, severe ulcerative colitis, toxic megacolon, renal/hepatic impairment, myocardial ischemia, hyperthyroidism, hypertension, tachyarrhythmias, HF, coronary artery disease, esophageal reflux or hiatal hernia associated with reflux esophagitis; infants, children with spastic paralysis or brain damage; elderly; biliary tract disease, chronic pulmonary disease.

Action

Competes with acetylcholine for common binding sites on muscarinic receptors located on exocrine glands, cardiac and smooth muscle ganglia, intramural neurons. **Therapeutic Effect:** Decreases GI motility, secretory activity, GU muscle tone (ureter, bladder); abolishes various types of reflex vagal cardiac slowing or asystole.

Pharmacokinetics

Rapidly and well absorbed after IM administration. Widely distributed. Metabolized in liver. Excreted in urine (30%–50% as unchanged drug). **Half-life:** 2–3 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. **Children/Elderly:** Increased susceptibility to atropine effects.

Interactions

DRUG: Anticholinergics (e.g., glycopyrrolate, scopolamine) may increase effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Injection (AtroPen): 0.25 mg/0.3 mL, 0.5 mg/0.7 mL, 1 mg/0.7 mL, 2 mg/0.7 mL. **Injection, Solution:** 0.4 mg/mL, 1 mg/mL.

Administration/handling

IV

- Must be given rapidly (prevents paradoxical slowing of heart rate).

IM

- May be given subcutaneously or IM.

IV incompatibilities

None known.

IV Compatibilities

DiphenhydrAMINE (Benadryl), droperidol (Inapsine), fentaNYL (Sublimaze), glycopyrrolate (Robinul), heparin, HYDRomorphone (Dilaudid), midazolam (Versed), morphine, potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Preanesthetic

IV, IM, Subcutaneous: ADULTS, ELDERLY: 0.4–0.6 mg 30–60 min preop. **CHILDREN WEIGHING 5 KG OR MORE:** 0.01–0.02 mg/kg/dose to maximum of 0.4 mg/dose. Minimum dose: 0.1 mg. **CHILDREN WEIGHING LESS THAN 5 KG:** 0.02 mg/kg/dose 30–60 min preop.

Bradycardia

IV: ADULTS, ELDERLY: 0.5–1 mg q5min, not to exceed total of 3 mg or 0.04 mg/kg. **CHILDREN:** 0.02 mg/kg with a minimum of 0.1 mg to a maximum of 0.5 mg as a single dose. May repeat in 5 min. **Maximum total dose:** 1 mg.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Dry mouth, nose, throat (may be severe); decreased sweating; constipation; irritation at subcutaneous or IM injection site. **Occasional:** Dysphagia, blurred vision, bloated feeling, impotence, urinary hesitancy. **Ophthalmic:** Mydriasis, blurred vision, photophobia, decreased visual acuity, tearing, dry eyes or dry conjunctiva, eye irritation, crusting of eyelid. **Rare:** Allergic reaction, including rash, urticaria; mental confusion or excitement, particularly in children; fatigue.

Adverse effects/toxic reactions

Overdose may produce tachycardia, palpitations, hot/dry/flushed skin, absence of bowel sounds, increased respiratory rate, nausea, vomiting, confusion, drowsiness, slurred speech, dizziness, CNS stimulation. Overdose may also produce psychosis as evidenced by agitation, restlessness, rambling speech, visual hallucinations, paranoid behavior, delusions, followed by depression. Ophthalmic form may rarely produce increased IOP.

Nursing considerations

Baseline assessment

Determine if pt is sensitive to atropine, homatropine, scopolamine.

Intervention/evaluation

Monitor changes in B/P, pulse, temperature. Observe for tachycardia if pt has cardiac abnormalities. Assess skin turgor, mucous membranes to evaluate

hydration status (encourage adequate fluid intake unless NPO for surgery), bowel sounds for peristalsis. Be alert for fever (increased risk of hyperthermia). Monitor I&O, palpate bladder for urinary retention. Monitor daily pattern of bowel activity, stool consistency.

Patient/ family teaching

- For preop use, explain that warm flushing feeling may occur.

avelumab

a-vel-ue-mab

Bavencio

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Programmed death ligand-1 (PD-L1) blocking antibody. Monoclonal antibody.

CLINICAL: Antineoplastic.

Do not confuse avelumab with durvalumab, nivolumab or olaratumab.

Uses

Treatment of adults and pediatric pts 12 yrs and older with metastatic Merkel cell carcinoma. Treatment of pts with locally advanced or metastatic urothelial carcinoma who have disease progression during or following platinum-containing chemotherapy or have disease progression within 12 mos of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy.

Precautions

Contraindications: Hypersensitivity to avelumab. **Cautions:** Acute infection, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); corticosteroid intolerance, hematologic cytopenias, hepatic impairment, interstitial lung disease, renal insufficiency; history of autoimmune disorders (Crohn's disease, demyelinating polyneuropathy, Guillain-Barré syndrome, Hashimoto's thyroiditis, hyperthyroidism, myasthenia gravis, rheumatoid arthritis, Type I diabetes, vasculitis); CVA, diabetes, intestinal obstruction, pancreatitis.

Action

Binds to PD-L1 and blocks interaction with both PD-L1 and B7.1 receptors while still allowing interaction between PD-L2 and PD-L1. PD-L1 is an immune check point protein expressed on tumor cells, down regulating anti-tumor T-Cell function. **Therapeutic Effect:** Restores immune responses, including T-cell anti-tumor function.

Pharmacokinetics

Widely distributed. Degraded into small peptides and amino acids via proteolytic enzymes. Steady state reached in 4–6 wks. Excretion not specified. **Half-life:** 6.1 days.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breastmilk and is known to cross the placenta. Breastfeeding not recommended during treatment and for at least 1 mo after discontinuation. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May enhance adverse effects/toxicity of belimumab. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs. May increase serum alkaline phosphatase, ALT, AST, amylase, bilirubin, glucose, GGT, lipase.

Availability (Rx)

Injection: 200 mg/10 mL (20 mg/mL).

Administration/handling

 IV

Preparation

- Visually inspect for particulate matter or discoloration. Solution should appear clear and colorless to slightly yellow in color.
- Do not use if solution is cloudy, discolored, or if visible particles are observed.
- Withdraw proper volume from vial and inject into a 250-mL bag of 0.9% NaCl or 0.45% NaCl.
- Gently invert to mix; avoid foaming.
- Do not shake.
- Diluted solution should be clear, colorless, and free of particles.

Rate of Administration

- Infuse over 60 min via dedicated IV line using a sterile, non-pyrogenic, low protein-binding in-line filter.

Storage

- Refrigerate unused vials.
- May refrigerate diluted solution for no more than 24 hrs or store at room temperature for no more than 4 hrs. If refrigerated, allow diluted solution to warm to room temperature before infusing.
- Do not freeze or shake.
- Protect from light.

IV incompatibilities

Do not mix or infuse with other medications.

Indications/Routes/Dosage

NOTE: Premedicate with acetaminophen and an antihistamine prior to the first 4 infusions. Consider premedication for subsequent infusions based on prior infusion reactions.

Urothelial Carcinoma, Merkel Cell Carcinoma

IV: ADULTS, ELDERLY, CHILDREN: 10 mg/kg every 2 wks. Continue until disease progression or unacceptable toxicity.

Dose Modification

Infusion-related reactions

CTCAE grade 1 or 2: Interrupt or decrease rate of infusion. **CTCAE grade 3 or 4:** Permanently discontinue.

Endocrinopathies (e.g., adrenal insufficiency, hyperglycemia, hyperthyroidism, hypothyroidism) (treatment-induced)

CTCAE grade 3 or 4 endocrinopathies: Withhold treatment until resolved to grade 1 or 0, then resume therapy after corticosteroid taper. Consider hormone replacement therapy if hypothyroidism occurs.

Colitis (treatment-induced)

CTCAE grade 2 or 3 diarrhea or colitis: Withhold treatment until resolved to grade 1 or 0, then resume therapy after corticosteroid taper. **CTCAE grade 4 diarrhea or colitis; recurrent grade 3 diarrhea or colitis:** Permanently discontinue.

Hepatitis (treatment-induced)

Serum ALT/AST greater than 3 and up to 5 times upper limit normal (ULN) or serum bilirubin greater than 1.5 and up to 3 times ULN): Withhold treatment until resolved to grade 1 or 0, then resume therapy. **Serum ALT/AST greater than 5 times upper limit normal (ULN) or serum bilirubin greater than 3 times ULN):** Permanently discontinue.

Nephritis and Renal Dysfunction (treatment-induced)

Serum creatinine greater than 1.5 and up to 6 times ULN: Withhold treatment until resolved to grade 1 or 0, then resume therapy after corticosteroid taper. **Serum creatinine greater than 6 times ULN:** Permanently discontinue.

Other moderate or severe symptoms of treatment-induced reactions (e.g., arthritis, bullous dermatitis, encephalitis, erythema multiform, exfoliative dermatitis, demyelination, Guillain-Barré syndrome, hemolytic anemia, histiocytic necrotizing lymphadenitis, hypophysitis, hypopituitarism, iritis, myasthenia gravis, myocarditis, myositis, pancreatitis, pemphigoid, psoriasis, Stevens Johnson Syndrome/toxic epidermal necrolysis, rhabdomyolysis, uveitis, vasculitis): Withhold treatment until resolved to grade 1 or 0, then resume therapy after corticosteroid taper. **Life-threatening adverse effects, recurrent severe immune-mediated reactions; requirement of predniSONE 10 mg/day or greater (or equivalent) for more than 2 wks;**

persistent grade 2 or 3 immune-mediated reaction lasting 12 wks or longer: Permanently discontinue.

Pneumonitis (treatment induced)

CTCAE grade 2 pneumonitis: Withhold treatment until resolved to grade 1 or 0, then resume therapy after corticosteroid taper. **CTCAE grade 3 or 4 or recurrent grade 2 pneumonitis:** Permanently discontinue.

Dosage in Renal Impairment

Not specified; use caution.

Dosage in Hepatic Impairment

Not specified; use caution.

Side Effects

Note: Percentage of side effects may vary depending on indication of treatment.

Frequent (50%–18%): Fatigue, musculoskeletal pain, diarrhea, rash, infusion reactions (back pain, chills, pyrexia, hypotension), nausea, decreased appetite, peripheral edema, cough. **Occasional (17%–10%):** Constipation, arthralgia, abdominal pain, decreased weight, dizziness, vomiting, hypertension, dyspnea, pruritus, headache.

Adverse Effects/Toxic Reactions

Anemia, neutropenia, thrombocytopenia is an expected response to therapy. May cause severe, sometimes fatal cases of immune-mediated reactions such as pneumonitis (1% of pts), hepatitis (1% of pts), colitis (2% of pts), adrenal insufficiency (1% of pts), hypothyroidism, hyperthyroidism (6% of pts), type 1 diabetes mellitus including ketoacidosis (less than 1% of pts), nephritis (less than 1% of pts), other immune-mediated effects (less than 1%). Cellulitis, CVA, dyspnea, ileus, pericardial effusion, small bowel/intestinal obstruction, renal failure, respiratory failure, septic shock, transaminitis, urosepsis may occur. Immunogenicity (auto-avelumab antibodies) reported in 4% of pts.

Nursing Considerations

Baseline Assessment

Obtain ANC, CBC, BMP (esp. serum creatinine, creatinine clearance; BUN), TSH, vital signs; urine pregnancy. Question current breastfeeding status. Verify use of contraception in female pts of reproductive potential. Question history of prior hypersensitivity reaction, infusion-related reactions, allergy to corticosteroids/prednisone. Screen for history of autoimmune disorders, diabetes, pituitary/pulmonary/thyroid disease, renal insufficiency. Obtain nutrition consult. Offer emotional support.

Intervention/Evaluation

Monitor ANC, CBC, BMP, creatinine clearance, thyroid panel (if applicable); vital signs. Diligently monitor for infusion-related reactions, treatment-related toxicities, esp. during initial infusions. If immune-mediated reactions occur, consider referral to specialist; pt may require treatment with corticosteroids. Screen for allergic reactions, acute infections (cellulitis, sepsis, UTI), hepatitis, pulmonary events (dyspnea, pneumonitis, pneumonia). Monitor strict I&O, hydration status, stool frequency and consistency. Encourage proper calorie intake and nutrition. Assess skin for rash, lesions, dermal toxicities.

Patient/Family Teaching

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Avoid pregnancy; treatment may cause birth defects. Do not breastfeed. Females of childbearing potential should use effective contraception during treatment and for at least 1 mo after discontinuation.
- Serious adverse reactions may affect lungs, liver, intestines, kidneys, hormonal glands, nervous system, which may require anti-inflammatory medication.
- Immediately report any serious or life-threatening inflammatory symptoms in the following body systems: colon (severe abdominal pain/swelling, diarrhea); kidneys (decreased or dark-colored urine, flank pain); lung (chest pain, severe cough, shortness of breath); liver (bruising, dark-colored urine, clay-colored/tarry stools, nausea, yellowing of the skin or eyes); nervous system (paralysis, weakness); pituitary (persistent or unusual headaches, dizziness, extreme weakness, fainting, vision changes); skin (blisters, bubbling, inflammation, rash); thyroid (trouble sleeping, high blood pressure, fast heart

rate [overactive thyroid]; fatigue, goiter, weight gain [underactive thyroid]; vascular (low blood pressure, vein/artery pain or irritation).

- Do not take any over-the-counter anti-inflammatory medications unless approved by your doctor.

axitinib

ax-i-ti-nib

Inlyta

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse axitinib with afatinib, ibrutinib, or imatinib.

Uses

Treatment of advanced renal cell carcinoma after failure of one prior systemic chemotherapy.

Precautions

Contraindications: Hypersensitivity to axitinib. **Cautions:** Pts with increased risk or history of thrombotic events (CVA, MI), GI perforation or fistula formation, renal/hepatic impairment, hypertension, HF. Do not use in pts with untreated brain metastasis or recent active GI bleeding.

Action

Inhibits vascular endothelial growth factor receptors. **Therapeutic Effect:** Blocks tumor growth, inhibits angiogenesis.

Pharmacokinetics

Metabolized in liver. Protein binding: greater than 99%. Excreted primarily in feces with a lesser amount excreted in urine. **Half-life:** 2.5–6 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Unknown whether distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP3A4/5 inhibitors (e.g., erythromycin, ketoconazole, ritonavir) may significantly increase concentration; do not use concurrently. If used, reduce dose by 50%. Coadministration with strong CYP3A4/5 inducers (e.g., rifAMPin, phenytoin, carbAMazepine, PHENobarbital) may significantly decrease concentration; do not use concurrently. **HERBAL:** St. John's wort may decrease concentration. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May decrease Hgb, WBC count, platelets, lymphocytes; serum calcium, alkaline phosphatase, albumin, sodium, phosphate, bicarbonate. May increase serum ALT, AST, bilirubin, BUN, creatinine, serum potassium, lipase, amylase; urine protein. May alter serum glucose.

Availability (Rx)

Tablets, film-coated: 1 mg, 5 mg.

Administration/handling

PO

- Give without regard to food.
- Swallow tablets whole with full glass of water.

Indications/routes/dosage

Renal Cell Carcinoma

PO: ADULTS, ELDERLY: Initially, 5 mg twice daily, given approximately 12 hrs apart. If tolerated (no adverse events above grade 2, BP normal and no antihypertension use for at least 2 consecutive wks), may increase to 7 mg twice daily, then 10 mg twice daily. For adverse effects, may decrease to 3 mg twice daily, then 2 mg twice daily if adverse effects persist.

Dose Modification

Dosage with concomitant strong CYP3A4 inhibitors: Reduce dose by 50%. (Avoid concomitant use if possible.)

Dosage in Renal Impairment

No dose adjustment. Use caution in ESRD.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate Impairment:** Reduce initial dose by 50%. **Severe Impairment:** Not recommended.

Side effects

Frequent (55%–20%): Diarrhea, hypertension, fatigue, decreased appetite, nausea, dysphonia, palmar-plantar erythrodysesthesia (hand-foot) syndrome, weight loss, vomiting, asthenia, constipation. **Occasional (19%–11%):** Hypothyroidism, cough, stomatitis, arthralgia, dyspnea, abdominal pain, headache, peripheral pain, rash, proteinuria, dysgeusia. **Rare (10%–2%):** Dry skin, dyspepsia, dizziness, myalgia, pruritus, epistaxis, alopecia, hemorrhoids, tinnitus, erythema.

Adverse effects/toxic reactions

Arterial and venous thrombotic events (MI, CVA), GI perforation, fistula, hemorrhagic events (including cerebral hemorrhage, hematuria, hemoptysis, GI bleeding), hypertensive crisis, cardiac failure have been observed and can be fatal. Hypothyroidism requiring thyroid hormone replacement has been noted. Reversible posterior leukoencephalopathy syndrome (RPLS) has been observed.

Nursing considerations

Baseline assessment

Obtain baseline BMP, LFT, renal function test, urine protein, serum amylase, lipase, phosphate before initiation of, and periodically throughout, treatment. Offer emotional support. Assess medical history, esp. hepatic function

abnormalities. B/P should be well controlled prior to initiating treatment. Stop medication at least 24 hrs prior to scheduled surgery. Monitor thyroid function before and periodically throughout treatment.

Intervention/evaluation

Monitor CBC, BMP, LFT, renal function test, urine protein, serum amylase, lipase, phosphate, thyroid tests. Monitor daily pattern of bowel activity, stool consistency. Assess for evidence of bleeding or hemorrhage. Assess for hypertension. For persistent hypertension despite use of antihypertensive medications, dose should be reduced. Permanently discontinue if signs or symptoms of RPLS occur (extreme lethargy, increased B/P from pt baseline, pyuria). Contact physician if changes in voice, redness of skin, or rash is noted.

Patient/family teaching

- Avoid crowds, those with known infection.
- Avoid contact with anyone who recently received live virus vaccine; do not receive vaccinations.
- Swallow tablet whole; do not chew, crush, dissolve, or divide.
- Avoid grapefruit products.
- Report persistent diarrhea, extreme fatigue, abdominal pain, yellowing of skin or eyes, bruising easily; bleeding of any kind, esp. bloody stool or urine; confusion, seizure activity, vision loss, trouble speaking, chest pain; difficulty breathing, leg pain or swelling.

azaTHIOprine

a-za-thy-o-preen

Apo-AzaTHIOprine 🇨🇦

Azasan

Imuran

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Immunologic agent.

CLINICAL: Immunosuppressant.

■ **BLACK BOX ALERT** ■ Chronic immunosuppression increases risk of developing malignancy.

azaTHIOprine with Azulfidine, azaCITIDine, or azithromycin, or Imuran with Elmiron, Imdur, or Inderal.

Uses

Adjunct in prevention of rejection in kidney transplantation. Treatment of rheumatoid arthritis (RA) in pts unresponsive to conventional therapy. **OFF-LABEL:** Treatment of dermatomyositis, polymyositis. Maintenance, remission, or reduction of steroid use in Crohn's disease, lupus nephritis, chronic refractory immune thrombocytopenic purpura.

Precautions

Contraindications: Hypersensitivity to azaTHIOprine. Pregnant women with RA, pts previously treated for RA with alkylating agents (cyclophosphamide, chlorambucil, melphalan) may have a prohibitive risk of malignancy with azathioprine. **Cautions:** Immunosuppressed pts, pts with hepatic/renal impairment, active infection. Testing for genetic deficiency of thiopurine methyltransferase should be obtained. (Absence or reduced levels increase risk of myelosuppression.)

Pharmacokinetics

Well absorbed from GI tract. Peak levels: 1–2 hrs. Protein binding: 30%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 2 hrs.

Action

Antagonizes purine metabolism, inhibits DNA, protein, and RNA synthesis. **Therapeutic Effect:** Suppresses cell-mediated hypersensitivities; alters antibody production, immune response in transplant recipients. Reduces symptoms of arthritis severity.

Lifespan considerations

Pregnancy/Lactation: May depress spermatogenesis, reduce sperm viability, count. May cause fetal harm. Do not breastfeed. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Allopurinol, sulfamethoxazole/trimethoprim may increase activity, toxicity. **Bone marrow depressants** may increase myelosuppression. **Other immunosuppressants** may increase risk of infection or development of neoplasms. May increase effects of **live virus vaccines**. **HERBAL:** Avoid **cat's claw, echinacea** (immunostimulant properties). **FOOD:** None known. **LAB VALUES:** May decrease Hgb, serum albumin, uric acid, leukocytes, platelet count. May increase serum ALT, AST, alkaline phosphatase, amylase, bilirubin.

Availability (Rx)

Tablets: 50 mg (Imuran), 75 mg (Azasan), 100 mg (Azasan).

Administration/handling

PO

- Give with food or in divided doses to reduce potential for GI disturbances.
- Store oral form at room temperature.

Indications/routes/dosage

◀ALERT▶ Reduce dose to 1/3 or 1/4 usual dose when used with allopurinol or in low/absent thiopurine methyltransferase genetic deficiency.

Prevention of Renal Allograft Rejection

PO: ADULTS, ELDERLY, CHILDREN: 3–5 mg/kg/day on day of transplant (or 1–3 days prior to transplant), then 1–3 mg/kg/day as maintenance dose.

Rheumatoid Arthritis (RA)

PO: ADULTS, ELDERLY: Initially, 1 mg/kg/day (50–100 mg) as a single dose or in 2 divided doses for 6–8 wks. May increase by 0.5 mg/kg/day after 6–8 wks at 4-wk intervals. **Maximum:** 2.5 mg/kg/day. **Maintenance:** Lowest effective dosage. May decrease dose by 0.5 mg/kg or 25 mg/day q4wks (while other therapies, such as rest, physiotherapy, and salicylates, are maintained). May discontinue abruptly.

Dosage in Renal Impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance	Dosage
10–50 mL/min	75% of normal
Less than 10 mL/min	50% of normal
Hemodialysis	50% of normal (Adults: additional 0.25 mg/kg)
Continuous renal replacement therapy (CRRT)	75% of normal

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Nausea, vomiting, anorexia (particularly during early treatment and with large doses). **Occasional:** Rash. **Rare:** Severe nausea/vomiting with diarrhea, abdominal pain, hypersensitivity reaction.

Adverse effects/toxic reactions

Increases risk of neoplasia (new abnormal-growth tumors). Significant leukopenia and thrombocytopenia may occur, particularly in pts undergoing renal transplant rejection. Hepatotoxicity occurs rarely.

Nursing considerations

Baseline assessment

Arthritis: Assess onset, type, location, and duration of pain, fever, inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition.

Intervention/evaluation

CBC, LFT should be performed weekly during first mo of therapy, twice monthly during second and third mos of treatment, then monthly thereafter. If WBC falls rapidly, dosage should be reduced or discontinued. Assess particularly for delayed myelosuppression. Routinely watch for any change from

baseline. **Arthritis:** Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

Patient/family teaching

- Contact physician if unusual bleeding/bruising, sore throat, mouth sores, abdominal pain, fever occurs.
- Therapeutic response in rheumatoid arthritis may take up to 12 wks.
- Women of childbearing age must avoid pregnancy.

azilsartan

a-zil-sar-tan

Edarbi

Fixed-Combination(s)

Edarbyclor: azilsartan/chlorthalidone, a diuretic: 40 mg/12.5 mg, 40 mg/25 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Angiotensin II receptor blocker (ARB).

CLINICAL: Antihypertensive.

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Do not confuse azilsartan with losartan, irbesartan, or valsartan.

Uses

Treatment of hypertension alone or in combination with other antihypertensives.

Precautions

Contraindications: Hypersensitivity to azilsartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Renal/hepatic impairment, unstented renal artery stenosis, significant aortic/mitral stenosis, severe HF, volume

depletion/salt-depleted pts, history of angioedema.

Action

Inhibits vasoconstriction, aldosterone-secreting effects of angiotension II, blocking the binding of angiotension II to AT₁ receptors. **Therapeutic Effect:** Produces vasodilation, decreases peripheral resistance, decreases B/P.

Pharmacokinetics

Hydrolyzed to active metabolite in GI tract. Moderately absorbed (60%). Peak plasma concentration: 1.5–3 hrs. Metabolized in liver. Protein binding: greater than 99%. Excreted in feces (55%), urine (42%). **Half-life:** 11 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm when administered during third trimester. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Elevated creatinine levels may occur in pts older than 75 yrs.

Interactions

DRUG: ACE inhibitors (e.g., enalapril, lisinopril), potassium-sparing diuretics (e.g., spironolactone, triamterene), potassium supplements may increase risk of hyperkalemia. NSAIDs, COX-2 inhibitors (e.g., celecoxib) may decrease effect. Hypotensive agents may increase hypotensive effects. **HERBAL:** Yohimbe, ephedra, licorice, ginseng may increase B/P. Garlic may enhance antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine. May decrease Hgb, Hct.

Availability (Rx)

Tablets: 40 mg, 80 mg.

Administration/handling

PO

- May give without regard to food.

Indications/routes/dosage

Hypertension

PO: ADULTS, ELDERLY: 80 mg once daily. Reduce to 40 mg once daily if giving high-dose diuretic concurrently.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional (2%–0.4%): Diarrhea, orthostatic hypotension. **Rare (0.3%):** Nausea, fatigue, muscle spasm, cough.

Adverse effects/toxic reactions

Oliguria, acute renal failure may occur in pts with history of renal artery stenosis, severe HF, volume depletion.

Nursing considerations

Baseline assessment

Obtain baseline Hgb, Hct, BMP, LFT. Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Question for possibility of pregnancy. Assess medication history (esp. diuretics). Question history of hepatic/renal impairment, renal artery stenosis, severe HF.

Intervention/evaluation

Maintain hydration (offer fluids frequently). Monitor serum electrolytes, B/P, pulse, hepatic/renal function. Observe for symptoms of hypotension. If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated. Correct volume or salt depletion prior to treatment.

Patient/family teaching

- Take measures to avoid pregnancy. If pregnancy occurs, inform physician immediately.
- Low blood pressure is more likely to occur if pt takes diuretics or other medications to control hypertension, consumes low-salt diet, experiences vomiting or diarrhea, or becomes dehydrated.
- Change positions slowly, particularly from lying to standing position.
- Report light-headedness or dizziness; lie down immediately.
- Report swollen extremities or decreased urine output despite fluid intake.

azithromycin

a-zith-roe-mye-sin

Apo-Azithromycin 

AzaSite

Novo-Azithromycin 

Zithromax

Zithromax TRI-PAK

Zithromax Z-PAK

Zmax

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Macrolide.

CLINICAL: Antibiotic.

Do not confuse azithromycin with azaTHIOprine or erythromycin, or Zithromax with Fosamax or Zovirax.

Uses

IV/PO: Treatment of susceptible infections due to *Chlamydia pneumoniae*, *C. trachomatis*, *H. influenzae*, *Legionella*, *M. catarrhalis*, *Mycoplasma pneumoniae*, *N. gonorrhoeae*, *S. aureus.*, *S. pneumoniae*, *S. pyogenes*, including mild to moderate infections of upper respiratory tract (pharyngitis, tonsillitis), lower respiratory tract (acute bacterial exacerbations, COPD, pneumonia), uncomplicated skin and skin-structure infections, sexually transmitted diseases

(nongonococcal urethritis, cervicitis due to *C. trachomatis*), chancroid. Prevents disseminated *Mycobacterium avium* complex (MAC). Treatment of mycoplasma pneumonia, community-acquired pneumonia, pelvic inflammatory disease (PID). Prevention/treatment of MAC in pts with advanced HIV infection. **OFF-LABEL:** Prophylaxis of endocarditis. Prevention of pulmonary exacerbations in pts with cystic fibrosis. **Ophthalmic:** Treatment of bacterial conjunctivitis caused by susceptible infections due to *H. influenzae*, *S. aureus*, *S. mitis*, *S. pneumoniae*. Prevention of pulmonary exacerbations in pts with cystic fibrosis.

Precautions

Contraindications: Hypersensitivity to azithromycin or other macrolide antibiotics. History of cholestatic jaundice/hepatic impairment associated with prior azithromycin therapy. **Cautions:** Hepatic/renal impairment, myasthenia gravis, hepatocellular and/or cholestatic hepatitis (with or without jaundice), hepatic necrosis. May prolong QT interval.

Action

Binds to ribosomal receptor sites of susceptible organisms, inhibiting RNA-dependent protein synthesis. **Therapeutic Effect:** Bacteriostatic or bactericidal, depending on drug dosage.

Pharmacokinetics

Rapidly absorbed from GI tract. Protein binding: 7%–50%. Widely distributed. Metabolized in liver. Excreted primarily by biliary excretion. **Half-life:** 68 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 16 yrs for IV use and younger than 6 mos for oral use. **Elderly:** No age-related precautions in those with normal renal function.

Interactions

DRUG: Aluminum/magnesium-containing antacids may decrease

concentration (give 1 hr before or 2 hrs after antacid). May increase levels of **amiodarone, cycloSPORINE, dronedarone, QT-prolonging medications, thioridazine, toremifene, ziprasidone. QUETiapine** may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatine phosphokinase (CPK), ALT, AST, bilirubin, LDH, potassium.

Availability (Rx)

Injection, Powder for Reconstitution (Zithromax): 500 mg. **Ophthalmic Solution (AzaSite):** 1%. **Suspension, Oral (Zithromax):** 100 mg/5 mL, 200 mg/5 mL. **Suspension, Oral (Extended-Release [Zmax]):** 2-g single-dose packet. **Tablets:** 250 mg, 500 mg, 600 mg.

Administration/handling

IV

Reconstitution

- Reconstitute each 500-mg vial with 4.8 mL Sterile Water for Injection to provide concentration of 100 mg/mL.
- Shake well to ensure dissolution.
- Further dilute with 250 or 500 mL 0.9% NaCl or D₅W to provide final concentration of 2 mg/mL with 250 mL diluent or 1 mg/mL with 500 mL diluent.

Rate of Administration

- Infuse over 60 min (2 mg/mL). Infuse over 3 hrs (1 mg/mL).

Storage

- Store vials at room temperature.
- Following reconstitution, diluted solution is stable for 24 hrs at room temperature or 7 days if refrigerated.

PO (Immediate-Release Suspension)

- Give tablets without regard to food.
- May store suspension at room temperature. Stable for 10 days after reconstitution.

PO (Extended-Release Suspension)

- Do not administer oral suspension with food. Give at least 1 hr before or 2 hrs after meals.
- Give Zmax within 12 hrs of reconstitution.
- Give tablets with food to decrease GI effects.

PO

- Tablets: May give with food to decrease GI effects.

Ophthalmic

- Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid.
- Place prescribed number of drops into pocket.
- Instruct pt to close eye gently for 1 to 2 min (so that medication will not be squeezed out of sac) and to apply digital pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption.

■ IV incompatibilities

CefTRIAxone (Rocephin), ciprofloxacin (Cipro), famotidine (Pepcid), furosemide (Lasix), ketorolac (Toradol), levoFLOxacin (Levaquin), morphine, piperacillin/tazobactam (Zosyn), potassium chloride.

■ IV Compatibilities

Ceftaroline (Teflaro), doripenem (Doribax), ondansetron (Zofran), tigecycline (Tygacil), diphenhydrAMINE (Benadryl).

Indications/routes/dosage

Usual Dosage Range

PO: ADULTS, ELDERLY: 250–600 mg once daily or 1–2 g as single dose. (**Zmax**): 2 g as a single dose. **CHILDREN 6 MOS AND OLDER:** 5–12 mg/kg (**maximum:** 500 mg) once daily or 30 mg/kg (**maximum:** 1,500 mg) as single dose. (**Zmax**): 60 mg/kg as a single dose. **NEONATES:** 10–20 mg/kg once daily.

IV: ADULTS, ELDERLY: 250–500 mg once daily **CHILDREN, NEONATES:** 10 mg/kg once daily.

Mild to Moderate Respiratory Tract, Skin, Soft Tissue Infections

PO: ADULTS, ELDERLY: 500 mg day 1, then 250 mg days 2–5.

MAC Prevention

PO: ADULTS, ELDERLY: 1,200 mg once weekly. **CHILDREN:** 20 mg/kg once weekly. **Maximum:** 1,200 mg/dose.

MAC Treatment

PO: ADULTS, ELDERLY: 600 mg/day with ethambutol. **CHILDREN:** 10–12 mg/kg/day (**maximum:** 500 mg) with ethambutol.

Otitis Media

PO: CHILDREN 6 MOS AND OLDER: 30 mg/kg as single dose (**maximum:** 1,500 mg) or 10 mg/kg/day for 3 days (**maximum:** 500 mg) or 10 mg/kg on day 1 (**maximum:** 500 mg), then 5 mg/kg on days 2–5 (**maximum:** 250 mg).

Pharyngitis, Tonsillitis

PO: ADULTS, ELDERLY, CHILDREN: 12 mg/kg (**maximum:** 500 mg) on day 1, then 6 mg/kg (**maximum:** 250 mg) on days 2–5.

Pneumonia, Community-Acquired

PO (Zmax): ADULTS, ELDERLY: 2 g as single dose.

PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER: 500 mg on day 1, then 250 mg on days 2–5 or 500 mg/day IV for 2 days, then 500 mg/day PO to complete course of therapy. **CHILDREN 6 MOS–15 YRS:** 10 mg/kg on day 1 (**maximum:** 500 mg), then 5 mg/kg (**maximum:** 250 mg) on days 2–5.

Dosage in Renal/Hepatic Impairment

Use caution.

Bacterial Conjunctivitis

Ophthalmic: ADULTS, ELDERLY: 1 drop in affected eye twice daily for 2

days, then 1 drop once daily for 5 days.

Side effects

Occasional: **Systemic:** Nausea, vomiting, diarrhea, abdominal pain.
Ophthalmic: Eye irritation. **Rare:** **Systemic:** Headache, dizziness, allergic reaction.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections may result from altered bacterial balance in GI tract. Acute interstitial nephritis, hepatotoxicity occur rarely.

Nursing considerations

Baseline assessment

Question for history of hepatitis, allergies to azithromycin, erythromycins. Assess for infection (WBC count, appearance of wound, evidence of fever).

Intervention/evaluation

Check for GI discomfort, nausea, vomiting. Monitor daily pattern of bowel activity and stool consistency. Monitor LFT, CBC. Assess for hepatotoxicity: malaise, fever, abdominal pain, GI disturbances. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Continue therapy for full length of treatment.
- Avoid concurrent administration of aluminum- or magnesium-containing antacids.
- Bacterial conjunctivitis: Do not wear contact lenses.

aztreonam

az-**tree**-o-nam

Azactam

Cayston

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Mono-bactam.

CLINICAL: Antibiotic.

Uses

Injection: Treatment of infections caused by susceptible gram-negative microorganisms *P. aeruginosa*, *E. coli*, *S. marcescens*, *K. pneumoniae*, *P. mirabilis*, *H. influenzae*, *Enterobacter*, *Citrobacter* spp., including lower respiratory tract, skin/skin structure, intraabdominal, gynecologic, complicated/uncomplicated UTIs; septicemia; cystic fibrosis. **Cayston:** Improve respiratory symptoms in cystic fibrosis pts with *P. aeruginosa*. **OFF-LABEL:** Surgical prophylaxis.

Precautions

Contraindications: Hypersensitivity to aztreonam. **Cautions:** History of allergy, esp. cephalosporins, penicillins; renal impairment; bone marrow transplant pts with risk factors for toxic epidermal necrolysis (TEN).

Action

Binds to penicillin-binding proteins, which inhibits bacterial cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Completely absorbed after IM administration. Protein binding: 56%–60%. Partially metabolized by hydrolysis. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 1.4–2.2 hrs (increased in renal/hepatic impairment).

⌚ Lifespan considerations

Pregnancy/Lactation: Crosses placenta, distributed in amniotic fluid; low

concentration in breast milk. **Children:** Safety and efficacy not established in pts younger than 9 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, creatinine, LDH, ALT, AST levels. Produces a positive Coombs' test. May prolong partial thromboplastin time (PTT), prothrombin time (PT).

Availability (Rx)

Injection, Infusion Solution (Azactam): Premix 1 g/50 mL, 2 g/50 mL. **Injection, Powder for Reconstitution (Azactam):** 1 g, 2 g. **Oral Inhalation, Powder for Reconstitution (Cayston):** 75 mg.

Administration/handling

IV

Reconstitution

- For IV push, dilute each gram with 6–10 mL Sterile Water for Injection.
- For intermittent IV infusion, further dilute with 50–100 mL D₅W or 0.9% NaCl. Final concentration not to exceed 20 mg/mL.

Rate of Administration

- For IV push, give over 3–5 min.
- For IV infusion, administer over 20–60 min.

Storage

- Store vials at room temperature.
- Solution appears colorless to light yellow.
- Following reconstitution, solution is stable for 48 hrs at room temperature or 7 days if refrigerated.
- Discard if precipitate forms. Discard unused portions.

IM

- Reconstitute with at least 3 mL diluent per gram of aztreonam.
- Shake immediately, vigorously after adding diluent.

- Inject deeply into large muscle mass.
- Following reconstitution, solution is stable for 48 hrs at room temperature or 7 days if refrigerated.

Inhalation

- Administer only with an Altera nebulizer system.
- Nebulize over 2–3 min.
- Give bronchodilator 15 min–4 hrs (short-acting) or 30 min–12 hrs (long-acting) before administration.
- Reconstituted solution must be used immediately.

■ IV incompatibilities

Acyclovir (Zovirax), amphotericin (Fungizone), LORazepam (Ativan), metroNIDAZOLE (Flagyl), vancomycin (Vancocin).

■ IV Compatibilities

Bumetanide (Bumex), calcium gluconate, cimetidine (Tagamet), diltiazEM (Cardizem), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), famotidine (Pepcid), furosemide (Lasix), heparin, HYDROmorphine (Dilaudid), insulin (regular), magnesium sulfate, morphine, potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Severe Infections

IV: ADULTS, ELDERLY: 2 g q6–8h. **Maximum:** 8 g/day. **CHILDREN:** 30 mg/kg q6–8h. **Maximum:** 8 g/day (120 mg/kg/day).

Mild to Moderate Infections

IV: ADULTS, ELDERLY: 1–2 g q8–12h. **Maximum:** 8 g/day. **CHILDREN:** 30 mg/kg q8h. **Maximum:** 8 g/day.

Usual Neonatal Dosage

IV: 30 mg/kg/dose q6–12h.

Cystic Fibrosis

NOTE: Pretreatment with a bronchodilator is recommended.

IV: CHILDREN: 50 mg/kg/dose q6–8h up to 200 mg/kg/day. **Maximum:** 8 g/day. **Inhalation (Nebulizer): ADULTS, CHILDREN 7 YRS OR OLDER:** 75 mg 3 times/day (at least 4 hrs apart) for 28 days, then off for 28-day cycle.

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and severity of infection:

Creatinine Clearance	Dosage
10–30 mL/min	50% usual dose at usual intervals
Less than 10 mL/min	25% usual dose at usual intervals
Hemodialysis	500 mg–2 g, then 25% of initial dose at usual interval
Continuous renal replacement therapy (CRRT)	2 g, then 1 g q8–12h or 2g q12h

Dosage in Hepatic Impairment

Use with caution.

Side effects

Frequent (greater than 5%): Cayston: Cough, nasal congestion, wheezing, pharyngolaryngeal pain, pyrexia, chest discomfort, abdominal pain, vomiting.

Occasional (less than 3%): Discomfort and swelling at IM injection site, nausea, vomiting, diarrhea, rash. **Rare (less than 1%):** Phlebitis or thrombophlebitis at IV injection site, abdominal cramps, headache, hypotension.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections may result from altered bacterial balance in GI tract. Severe hypersensitivity reactions, including anaphylaxis, occur rarely.

Nursing considerations

Baseline assessment

Question for history of allergies, esp. to aztreonam, other antibiotics.

Intervention/evaluation

Evaluate for phlebitis, pain at IM injection site. Assess for GI discomfort, nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor renal/hepatic function.

Patient/family teaching

- Report nausea, vomiting, diarrhea, rash.

Canadian trade name

Non-Crushable Drug

High Alert drug

underlined underlined – top prescribed drug

B

baclofen

bak-loe-fen

Apo-Baclofen*

Gablofen

Lioresal

Novo-Baclofen*

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Skeletal muscle relaxant.

CLINICAL: Antispastic, analgesic in trigeminal neuralgia.

■ **BLACK BOX ALERT** ■ Abrupt withdrawal of intrathecal form has resulted in severe hyperpyrexia, obtundation, rebound or exaggerated spasticity, muscle rigidity, leading to organ failure, death.

Do not confuse baclofen with Bactroban or Beclovent, or Lioresal with lisinopril or Lotensin.

Uses

Oral: Management of reversible spasticity associated with multiple sclerosis, spinal cord lesions. **Intrathecal:** Management of severe spasticity of spinal cord or cerebral origin in pts 4 yrs of age and older. **OFF-LABEL:** Treatment of bladder spasms, cerebral palsy, intractable hiccups or pain, Huntington's chorea, trigeminal neuralgia.

Precautions

Contraindications: Hypersensitivity to baclofen. **Intrathecal:** IV, IM, SQ, or epidural administration in addition to intrathecal use. **Cautions:** Renal impairment, seizure disorder, elderly, autonomic dysreflexia, reduced GI motility, GI or urinary obstruction; respiratory, pulmonary, peptic ulcer disease.

Action

Inhibits transmission of reflexes at spinal cord level. **Therapeutic Effect:** Relieves muscle spasticity.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 30%. Partially metabolized in liver. Primarily excreted in urine. **Half-life:** 2.5–4 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if crosses placenta or distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. Limited published data in children. **Elderly:** Increased risk of CNS toxicity (hallucinations, sedation, confusion, mental depression); age-related renal impairment may require decreased dosage.

Interactions

DRUG: CNS depressants (e.g., alcohol, ALPRAZolam, LORazepam, morphine, oxyCODONE, traMADol) may potentiate effect. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS sedation. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, glucose.

Availability (Rx)

Intrathecal Injection Solution: 50 mcg/mL, 500 mcg/mL, 1,000 mcg/mL, 2,000 mcg/mL. **Tablets:** 10 mg, 20 mg.

Administration/handling

PO

- Give with food or milk.
- Tablets may be crushed.

Intrathecal

- For screening, a 50 mcg/mL concentration should be used for injection.
- For maintenance therapy, solution should be diluted for pts who require concentrations other than 500 mcg/mL or 2,000 mcg/mL.

Indications/routes/dosage

◀ALERT▶ Avoid abrupt withdrawal.

Spasticity

PO: ADULTS, CHILDREN 12 YRS AND OLDER: Initially, 5 mg 3 times daily. May increase by 15 mg/day (5 mg/dose) at 3-day intervals until optimal response achieved. Range: 40–80 mg/day. **Maximum:** 80 mg/day. **ELDERLY:** Initially, 5 mg 2–3 times daily. May gradually increase dosage.

Intrathecal Dose

ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: Initially, 50 mcg as screening dose (25 mcg in very small pediatric pts) for 1 dose; observe pt for 4–8 hrs for positive response (decrease in muscle tone and/or frequency and/or severity of spasm). If response is inadequate, give 75 mcg 24h after 1st dose. If response is still inadequate, give 100 mcg 24h after 2nd dose. Initial pump dose: give double screening dose (unless efficacy of bolus maintained greater than 8 hrs, then screening dose). After 24h, dose may be increased/decreased only once q24h until satisfactory response.

Dosage in Renal Impairment

Use caution.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (greater than 10%): Transient drowsiness, asthenia, dizziness, nausea, vomiting. **Occasional (10%–2%):** Headache, paresthesia, constipation, anorexia, hypotension, confusion, nasal congestion. **Rare (less than 1%):** Paradoxical CNS excitement or restlessness, slurred speech, tremor, dry mouth, diarrhea, nocturia, impotence.

Adverse effects/toxic reactions

Abrupt discontinuation may produce hallucinations, seizures. Overdose results in blurred vision, seizures, myosis, mydriasis, severe muscle weakness, strabismus, respiratory depression, vomiting.

Nursing considerations

Baseline assessment

Record onset, type, location, duration of muscular spasm, pain. Check for immobility, stiffness, swelling.

Intervention/evaluation

For pts on long-term therapy, BMP, LFT, CBC should be performed periodically. Assess for paradoxical reaction. Observe for drowsiness, dizziness, ataxia. Assist with ambulation at all times. Evaluate for therapeutic response: decreased intensity of skeletal muscle spasm, pain.

Patient/family teaching

- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly withdraw medication after long-term therapy (may result in muscle rigidity, rebound spasticity, high fever, altered mental status).
- Avoid alcohol, CNS depressants.

basiliximab

ba-si-**lik**-si-mab

Simulect

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Immunosuppressive.

■ **BLACK BOX ALERT** ■ Must be prescribed by a physician experienced in immunosuppression therapy and organ transplant management.

Do not confuse basiliximab with daclizumab or brentuximab.

Uses

Adjunct with cycloSPORINE, corticosteroids in prevention of acute organ rejection in pts receiving renal transplant. **OFF-LABEL:** Treatment of refractory graft-vs-host disease, prevention of liver or cardiac transplant rejection.

Precautions

Contraindications: Hypersensitivity to basiliximab. **Cautions:** Re-exposure to subsequent courses of basiliximab.

Action

Binds to and blocks receptor of interleukin-2, a protein that stimulates proliferation of T-lymphocytes, which play a major role in organ transplant rejection. **Therapeutic Effect:** Impairs response of immune system to antigens, prevents acute renal transplant rejection.

Pharmacokinetics

Half-life: 4–10 days (adults); 5–17 days (children).

🕒 Lifespan considerations

Pregnancy/Lactation: Unknown if crosses placenta or distributed in breast milk. Breastfeeding not recommended. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: Tacrolimus (topical), trastuzumab may increase concentration. **HERBAL:** Echinacea may decrease therapeutic effect. **Bilberry, garlic, ginger, ginseng** may increase hypoglycemic effect. **FOOD:** None known. **LAB VALUES:** May alter serum calcium, glucose, potassium; Hgb, Hct. May increase serum cholesterol, BUN, creatinine, uric acid. May decrease serum magnesium, phosphate; platelet count.

Availability (Rx)

Injection, Powder for Reconstitution: 10 mg, 20 mg.

Administration/handling

IV

Reconstitution

- Reconstitute 10-mg vial with 2.5 mL or 20-mg vial with 5 mL Sterile Water for Injection.
- Shake gently to dissolve.
- May further dilute with 25–50 mL 0.9% NaCl or D₅W to a final concentration of 0.4 mg/mL.
- Gently invert to avoid foaming.
- Do not shake.

Rate of Administration

- Give as IV bolus over 10 min. or as IV infusion over 20–30 min.

Storage

- Refrigerate unused vials.
- After reconstitution, use within 4 hrs (24 hrs if refrigerated).
- Discard if precipitate forms.

IV incompatibilities

Specific information not available. Do not add other medications simultaneously through same IV line.

Indications/routes/dosage

Prophylaxis of Organ Rejection

IV: ADULTS, ELDERLY, CHILDREN WEIGHING 35 KG OR MORE: 20 mg within 2 hrs before transplant surgery and 20 mg 4 days after transplant.
CHILDREN WEIGHING LESS THAN 35 KG: 10 mg within 2 hrs before transplant surgery and 10 mg 4 days after transplant.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (greater than 10%): GI disturbances (constipation, diarrhea, dyspepsia), CNS effects (dizziness, headache, insomnia, tremor), respiratory tract infection, dysuria, acne, leg or back pain, peripheral edema, hypertension.
Occasional (10%–3%): Angina, neuropathy, abdominal distention, tachycardia, rash, hypotension, urinary disturbances (urinary frequency, genital edema, hematuria), arthralgia, hirsutism, myalgia.

Adverse effects/toxic reactions

Severe, acute hypersensitivity reactions including anaphylaxis characterized by bronchospasm, capillary leak syndrome, cytokine release syndrome, dyspnea, HF, hypotension, pulmonary edema, pruritus, respiratory failure, tachycardia, rash, urticaria, wheezing have been reported. May increase risk of cytomegalovirus infection.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, serum ionized calcium, phosphate, uric acid; vital signs, particularly B/P, pulse rate. Question current breastfeeding status.

Intervention/evaluation

Diligently monitor CBC, electrolytes, renal function. Assess B/P for hypertension/hypotension, pulse for evidence of tachycardia. Question for GI

disturbances, CNS effects, urinary changes. Monitor for presence of wound infection, signs of infection (fever, sore throat, unusual bleeding/bruising), hypersensitivity reaction.

Patient/family teaching

- Report difficulty in breathing or swallowing, palpitations, bruising/bleeding, rash, itching, swelling of lower extremities, weakness.
- Female pts should take measures to avoid pregnancy; avoid breastfeeding.

beclomethasone

be-kloe-**meth**-a-son

Apo-Beclomethasone 

Beconase AQ

QNASL

QVAR

Rivanase AQ 

CLASSIFICATION

PHARMACOTHERAPEUTIC: Adreno-corticosteroid.

CLINICAL: Anti-inflammatory, immunosuppressant.

Do not confuse beclomethasone with betamethasone or dexamethasone, or Beconase with baclofen.

Uses

Inhalation: Maintenance and prophylactic treatment of asthma in pts 5 yrs and older. **Intranasal: Beconase AQ:** Relief of seasonal/perennial rhinitis; prevention of nasal polyp recurrence after surgical removal; treatment of nonallergic rhinitis. **QNASL:** Treatment of seasonal and perennial allergic rhinitis in pts 4 yrs and older. **OFF-LABEL:** Prevention of seasonal rhinitis (nasal form).

Precautions

Contraindications: Hypersensitivity to beclomethasone. **Oral inhalation:**

Acute exacerbation of asthma, status asthmaticus. **Cautions:** Cardiovascular disease, cataracts, diabetes, elderly, glaucoma, hepatic/renal impairment, myasthenia gravis, risk for osteoporosis, peptic ulcer disease, seizure disorder, thyroid disease, ulcerative colitis; following acute MI. Avoid use in pts with untreated viral, fungal, or bacterial systemic infections.

Action

Controls or prevents inflammation by altering rate of protein synthesis; depresses migration of polymorphonuclear leukocytes, fibroblasts; reverses capillary permeability. **Therapeutic Effect:** **Inhalation:** Inhibits bronchoconstriction, produces smooth muscle relaxation, decreases mucus secretion. **Intranasal:** Decreases response to seasonal, perennial rhinitis.

Pharmacokinetics

Rapidly absorbed from pulmonary, nasal, GI tissue. Metabolized in liver. Protein binding: 87%. Excreted in feces (60%), urine (12%). **Half-life:** 2–4.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if crosses placenta or distributed in breast milk. **Children:** Prolonged treatment/high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** **Echinacea** may decrease effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Inhalation, Oral (Qvar): 40 mcg/inhalation, 80 mcg/inhalation. **Nasal Inhalation (Beconase AQ):** 42 mcg/inhalation. **QNASL:** 40 mcg/actuation, 80 mcg/actuation.

Administration/handling

Inhalation

- Shake container well.
- Instruct pt to exhale completely, place mouthpiece between lips, inhale, hold breath as long as possible before exhaling.
- Allow at least 1 min between inhalations.
- Rinse mouth after each use (decreases dry mouth, hoarseness, thrush).

Intranasal

- Instruct pt to clear nasal passages as much as possible before use.
- Tilt pt's head slightly forward.
- Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
- Spray into one nostril while pt holds the other nostril closed, concurrently inhaling through nose to permit medication as high into nasal passages as possible.

Indications/routes/dosage

Asthma

Oral Inhalation (QVAR): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 40–160 mcg twice daily. **Maximum:** 320 mcg twice daily. **CHILDREN 5–11 YRS:** 40 mcg twice daily. **Maximum:** 80 mcg twice daily.

Rhinitis, Prevention of Recurrence of Nasal Polyps

Nasal Inhalation (Beconase AQ): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 1–2 sprays in each nostril twice daily. **CHILDREN 6–11 YRS:** 1 spray each nostril twice daily. May increase to 2 sprays 2 times/day. Once adequate control achieved, decrease to 1 spray in each nostril twice daily.

Allergic Rhinitis

Nasal Inhalation (QNASL): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 80 mcg/spray: 2 sprays in each nostril daily. **Maximum:** 320 mcg (4 sprays/day). **CHILDREN, 4–11 YRS OF AGE:** 40 mcg/spray: 1 spray each nostril once daily. **Maximum:** 80 mcg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Inhalation (14%–4%): Throat irritation, dry mouth, hoarseness, cough. **Intranasal:** Nasal burning, mucosal dryness. **Occasional: Inhalation (3%–2%):** Localized fungal infection (thrush). **Intranasal:** Nasal-crusting epistaxis, sore throat, ulceration of nasal mucosa. **Rare: Inhalation:** Transient bronchospasm, esophageal candidiasis. **Intranasal:** Nasal and pharyngeal candidiasis, eye pain.

Adverse effects/toxic reactions

Acute hypersensitivity reaction (urticaria, angioedema, severe bronchospasm) occurs rarely. Change from systemic to local steroid therapy may unmask previously suppressed bronchial asthma condition.

Nursing considerations

Baseline assessment

Establish baseline history for asthma, rhinitis. Question for hypersensitivity to corticosteroids.

Intervention/evaluation

Monitor respiratory status. Auscultate lung sounds. Observe for signs of oral candidiasis. In pts receiving bronchodilators by inhalation concomitantly with inhaled steroid therapy, advise use of bronchodilator several minutes before corticosteroid aerosol (enhances penetration of steroid into bronchial tree).

Patient/family teaching

- Do not change dose schedule or stop taking drug; must taper off gradually under medical supervision.
- **Inhalation:** Maintain diligent oral hygiene.
- Rinse mouth with water immediately after inhalation (prevents mouth/throat

dryness, fungal infection of mouth).

- Report sore throat or mouth.
- **Intranasal:** Report symptoms that do not improve; or if sneezing, nasal irritation occurs.
- Clear nasal passages prior to use.
- Improvement may take days to several weeks.

belatacept

bel-**at**-a-sept

Nulojix

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Selective T-cell costimulation blocker.

CLINICAL: Immunosuppressive agent.

■ **BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of immunosuppression therapy. Increased risk of malignancies, infection. Increased risk of post-transplant lymphoproliferative disorder (PTLD), mainly in central nervous system. Not recommended for hepatic transplants due to increased risk of graft loss, death.

Uses

Prevention of acute organ rejection in pts receiving kidney transplants (in combination with basiliximab induction, mycophenolate mofetil, corticosteroids). For use in Epstein-Barr virus (EBV) seropositive kidney transplant recipients.

Precautions

Contraindications: Hypersensitivity to belatacept. Transplant pts who are Epstein-Barr virus (EBV) seronegative or unknown sero-status. **Cautions:** History of opportunistic infections: bacterial, mycobacterial, invasive fungal, viral, protozoal (e.g., histoplasmosis, aspergillosis, candidiasis, coccidioidomycosis, listeriosis, HIV, tuberculosis, pneumocystosis). Recent open

wounds, ulcerations. Not recommended in liver transplants. Avoid use of live vaccines.

Action

Inhibits T-lymphocyte proliferation and production of a critical pathway in cellular immune response involved in allograft rejection. **Therapeutic Effect:** Prevents renal transplant rejection.

Pharmacokinetics

Half-life: 8–10 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if crosses placenta or distributed in breast milk. Must either discontinue breastfeeding or discontinue drug. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May increase concentration/effects of **belimumab, mycophenolate. Pimecrolimus, tacrolimus (topical)** may increase concentration/effect. **Live vaccines** not recommended. **HERBAL:** **Echinacea, cat's claw** may reduce effect. **FOOD:** None known. **LAB VALUES:** May increase serum potassium, cholesterol, uric acid, glucose; urine protein. May decrease serum calcium, magnesium, phosphate, potassium; Hgb, Hct, WBC.

Availability (Rx)

Lyophilized Powder for Injection: 250 mg per vial.

Administration/handling

 Use only silicone-free disposable syringe provided. Using different syringe may produce translucent particles. Administer via dedicated line only.

IV

Reconstitution

- Reconstitute vial with 10.5 mL of suitable diluent (0.9% NaCl, D₅W, or Sterile Water for Injection) using provided syringe, 18- to 20-gauge needle.
- Direct stream to glass wall (avoids foaming).
- Swirl gently (do not shake).
- Discard if opaque particles, discoloration, or foreign particles are present.
- Infusion bag must match diluent (0.9% NaCl with 0.9% NaCl, D₅W with D₅W; may use Sterile Water for Injection with NaCl or D₅W).
- To mix infusion bag, withdraw and discard volume equal to the volume of reconstituted solution.
- Using same silicone-free disposable syringe, gently inject reconstituted solution into 100- to 250-mL bag (based on concentration).
- Final concentration of infusion bag should range from 2 mg/mL to 10 mg/mL.
- IV infusion stable for 24 hrs at room temperature.

Rate of Administration

- Infuse over 30 min using infusion set with a 0.2- to 1.2-micron low-protein-binding filter.

Storage

- Refrigerate vials.
- Solution should be clear to slightly opalescent and colorless to slightly yellow.
- May refrigerate solution up to 24 hrs.
- Discard if reconstituted solution remains at room temperature longer than 24 hrs.

Indications/routes/dosage

Note: Dosage based on actual body weight at time of transplantation. Do not modify dose unless a change in body weight is greater than 10%.

Prophylaxis of Acute Kidney Transplant Rejection (in Combination with an Immunosuppressant)

IV: ADULTS, ELDERLY: Initial phase: 10 mg/kg on day 1 (day of transplantation, prior to implantation), day 5, end of wk 2, 4, 8, and 12 after transplantation. **Maintenance:** 5 mg/kg end of wk 16, then q4wks thereafter (plus or minus 3 days).

Dosage Modification

Infusion is based on actual body weight at the time of transplantation; modify dose for weight changes greater than 10% during treatment. Prescribed dose must be evenly divisible by 12.5 to match closest increment (0, 12.5, 25, 37.5, 50, 62.5, 75, 87.5, 100) in mg. For example, the actual dose for a 64-kg pt is 637.5 mg or 650 mg, not 640 mg.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (45%–20%): Anemia, diarrhea, UTI, peripheral edema, constipation, hypertension, pyrexia, nausea, cough, vomiting, headache. **Occasional (19%–5%):** Abdominal pain, hypotension, arthralgia, hematuria, upper respiratory infection, insomnia, nasopharyngitis, back pain, dyspnea, influenza, dysuria, bronchitis, stomatitis, anxiety, dizziness, abdominal pain, muscle tremor, acne, alopecia, hyperhidrosis.

Adverse effects/toxic reactions

Serious conditions, including malignancies (esp. skin cancer), progressive multifocal leukoencephalopathy (caused by JC virus), cytomegalovirus, polyoma virus nephropathy, viral reactivation (herpes zoster, hepatitis), may occur. Other opportunistic infections (bacterial, fungal, viral, protozoal) may cause tuberculosis, cryptococcal meningitis, Chagas' disease, West Nile encephalitis, Guillain-Barré syndrome, cerebral aspergillosis. Additional complications, including chronic allograft nephropathy, renal tubular necrosis, renal artery necrosis, atrial fibrillation, hematoma at incision site, wound dehiscence, lymphocele, arteriovenous fistula thrombosis, hydronephrosis, urinary incontinence, anti-belatacept antibody formation, were reported.

Nursing considerations

Baseline assessment

Obtain baseline CBC, serum chemistries, renal function, glomerular filtration rate (GFR), serum magnesium, ionized calcium, phosphate, lipid panel,

urinalysis. Evaluate pt for active tuberculosis or latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin test should be considered a positive result when assessing whether treatment for latent tuberculosis is necessary. Assess baseline mental status to compare any worsening cognitive symptoms. Obtain Epstein-Barr virus (EBV) serology prior to treatment (contraindicated in pts who are EBV seronegative). Note any skin discoloration, ulcers, excoriation, lesions. Question history of hypertension/hypotension, arrhythmia, diabetes, HIV. Receive full medication history. Question possibility of pregnancy.

Intervention/evaluation

Monitor B/P, vital signs, I&O, weight. Diligently monitor CBC, renal function, serum electrolytes (hypokalemia may result in changes in muscle strength, muscle cramps, altered mental status, cardiac arrhythmias). Routinely monitor serum glucose levels for new-onset diabetes after transplantation, corticosteroid use. Monitor for fever, tenderness over transplantation site, skin lesions, changing characteristics of moles, neurologic deterioration related to PTLD or PML.

Patient/family teaching

- Therapy may increase risk of malignancies and life-threatening infections.
- Treatment is given with immunosuppressive therapy with basiliximab induction, corticosteroids.
- Report history of HIV, opportunistic infections, hepatitis, coughing of blood, or close relatives with active tuberculosis.
- Avoid sunlight, sunlamps.
- Seek immediate attention if toxic reactions occur.
- Do not receive live vaccines.
- Report pregnancy or plans of becoming pregnant.
- Adhere to strict dosing schedule.
- Report chest pain, palpitations, edema, fever, night sweats, weight loss, swollen glands, flu-like symptoms, stomach pain, vomiting, diarrhea, weakness, or urinary changes (color, frequency, odor, concentration, burning, blood).

belimumab

be-**lim**-oo-mab

Benlysta

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Immunosuppressant, anti-lupus agent.

Do not confuse belimumab with bevacizumab.

Uses

Treatment for active, autoantibody-positive, systemic lupus erythematosus, in addition to standard therapy.

Precautions

Contraindications: Hypersensitivity (anaphylaxis) to belimumab. **Cautions:** Severe, active, chronic infections; depression, pts at risk for suicide, other mood changes. Avoid live vaccines within 30 days before or concurrently with belimumab.

Action

Blocks binding of human B-lymphocyte stimulator protein to receptors on B-lymphocyte. **Therapeutic Effect:** Reduces activity of B-cell-mediated immunity and autoimmune response.

Pharmacokinetics

Half-life: 19 days.

🕒 Lifespan considerations

Pregnancy/Lactation: Unknown if crosses placenta or distributed in breast milk. Contraception recommended during therapy and for at least 4 wks after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Abatacept, belatacept, etanercept, pimecrolimus, tacrolimus

(topical) may increase concentration/effect. **Cyclophosphamide** not recommended concomitantly. **HERBAL: Echinacea** may decrease effect. **FOOD:** None known. **LAB VALUES:** May decrease WBC.

Availability (Rx)

Lyophilized Powder for Injection: 120 mg, 400 mg. **Single-Dose Prefilled Syringe:** 200 mg/mL.

Administration/handling

Reconstitution

- Allow vial to warm to room temperature (10–15 min).
- Reconstitute 120-mg vial with 1.5 mL Sterile Water for Injection or 400-mg vial with 4.8 mL Sterile Water for Injection (both vials will equal final concentration of 80 mg/mL).
- Direct stream toward glass wall to avoid foaming.
- Gently swirl for 60 sec every 5 min until fully dissolved (usually 10–30 min).
- If mechanical reconstitution device is used, do not swirl greater than 30 min or exceed 500 rpm.
- Small air bubbles expected, acceptable.
- Dilute in 250 mL 0.9% NaCl only.
- From infusion bag, withdraw and discard volume equal to the volume of reconstituted solution.
- Invert bag and gently inject solution to mix.
- Infuse within 8 hrs of reconstitution.

Rate of Administration

- Infuse over 1 hr.

Storage

- Refrigerate vials/infusion bag until time of use.
- Solution should be opalescent and colorless to pale yellow with no particles present.
- Discard solution if particulate matter or discoloration observed.
- Protect from sunlight.

IV incompatibilities

Do not infuse with dextrose-based solution. Use dedicated line only.

Indications/routes/dosage

Active Systemic Lupus Erythematosus

IV: ADULTS, ELDERLY: Initially, 10 mg/kg q2 wks for 3 doses, then q4 wks thereafter.

SUBCUTANEOUS: ADULTS, ELDERLY: 200 mg once weekly.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (15%–12%): Nausea, diarrhea. **Occasional (10%–5%):** Pyrexia, nasopharyngitis, bronchitis, insomnia, extremity pain, depression, migraine, pharyngitis. **Rare (less than 4%):** Cystitis, viral gastroenteritis.

Adverse effects/toxic reactions

May increase risk of mortality. Anti-belimumab antibody formation reported in less than 1%. Hypersensitivity reaction, including anaphylactic reaction, may include urticaria, pruritus, erythema, dyspnea, angioedema, hypotension (13% of pts). Infusion reactions such as nausea, headaches, flushing occur more frequently. Serious infections related to immunosuppression, including respiratory tract infection, pneumonia, nasopharyngitis, sinusitis, influenza, UTI, cellulitis, bronchitis, viral reactivation, may occur. Mental health issues, including psychiatric events (16%) and depression (6%), have been noted. Life-threatening psychiatric events and depression (including suicide) reported in less than 1%. Pts who experienced life-threatening episodes had prior psychiatric history.

Nursing considerations

Baseline assessment

Obtain baseline CBC with differential, BMP, IgG level, vital signs. Assess history of recent immunizations, malignancies, open sores, ulcerations, weight

loss, HIV infection, chronic infection. Assess psychiatric history, including insomnia, anxiety, depression, impulsiveness, suicidal ideations, mood changes. Question possibility of pregnancy, current breastfeeding.

Intervention/evaluation

Monitor vital signs, CBC. If hypersensitivity reaction occurs, immediately notify physician. Premedication with antihistamines, antipyretics, and/or corticosteroids may prevent subsequent reactions. Discontinue treatment if anaphylactic reaction occurs; initiate appropriate medical treatment. Routinely inspect skin, paying close attention to areas that are discolored, irregular, or have ill-defined borders (may indicate malignancies). Obtain anti-belimumab antibody titer if immunogenicity suspected. Consider interrupting therapy if acute infection occurs.

Patient/family teaching

- Report any signs of allergic reaction (see Adverse Effects/Toxic Reactions).
- If anaphylactic reaction occurs, pt may require rapid-sequence intubation.
- Allergic reactions include itching, hives, dizziness, or difficulty breathing.
- Notify physician if pregnant or plan on becoming pregnant.
- Contraception recommended during treatment and at least 4 mos after discontinuation.
- Report suicidal ideation, mood changes, or worsening depression.
- Do not receive live vaccines 30 days before or during treatment.
- Report any fever, cough, night sweats, flu-like symptoms, skin changes, or painful/burning urination.

belinostat

beh-**lih**-noh-**stat**

Beleodaq

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Histone deacetylase inhibitor.

CLINICAL: Antineoplastic.

Uses

Treatment of relapsed or refractory peripheral T-cell lymphoma (PTCL).

Precautions

Contraindications: Hypersensitivity to belinostat. **Cautions:** Pts with high tumor burden, hx of hepatic impairment, thrombocytopenia. Avoid use in pts with active infection.

Action

Inhibits enzymatic activity of histone deacetylases by catalyzing removal of acetyl groups from lysine residues of histones and nonhistone proteins.

Therapeutic Effect: Inhibits tumor cell growth and metastasis; causes tumor cellular death (apoptosis).

Pharmacokinetics

Limited tissue distribution. Metabolized in liver. Protein binding: 93%–95%. Excreted primarily in urine. **Half-life:** 1.1 hrs.

Lifespan considerations

Pregnancy/Lactation: Has teratogenic effects; may cause fetal harm/demise. Not recommended in nursing mothers. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong UGT1A1 inhibitors (e.g., atazanavir, lopinavir, ritonavir) may increase concentration/effect. **HERBAL:** None known. **FOOD:** None significant. **LAB VALUES:** May decrease ANC, Hgb/Hct, lymphocytes, platelets, WBC; serum potassium. May increase blood lactic dehydrogenase, serum creatinine.

Availability (Rx)

Lyophilized Powder for Injection: 500 mg vial.

Administration/handling

IV

Reconstitution

- Maintain standard chemotherapy preparation and handling precautions.
- Reconstitute each vial with 9 mL of Sterile Water for Injection, using suitable syringe for final concentration of 50 mg/mL.
- Gently swirl contents until completely dissolved.
- Visually inspect for particulate matter.
- Do not use if cloudiness or particulate matter observed.
- Withdraw required dosage and mix into infusion bag containing 250 mL of 0.9% NaCl.

Rate of Administration

- Infuse over 30 min using 0.22-micron in-line filter.
- May extend infusion time to 45 min if infusion site pain or other infusion-related symptoms occur.

Storage

- Reconstituted vial may be stored at room temperature (max 77°F/ 25°C) for up to 12 hrs.
- Infusion bag may be stored at room temperature (max 77°F/25°C) for up to 36 hrs.

Indications/routes/dosage

Peripheral T-Cell Lymphoma

IV Infusion:ADULTS/ELDERLY: 1,000 mg/m² once daily on days 1–5 of a 21-day cycle. Cycles may be repeated every 21 days until disease progression or unacceptable toxicity.

Dose Modification

ANC should be greater than or equal to 1,000/mm³ and platelet count greater than or equal to 50,000/mm³ prior to start of each cycle or prior to resuming treatment following toxicity. Discontinue treatment if ANC nadir less than 500/mm³ or recurrent platelet count nadir less than 25,000/mm³ after two dose reductions. Other toxicities must be Grade 2 or less prior to resuming treatment.

Hematologic Toxicities

Platelet count greater than 25,000/mm³ or ANC greater than 500 cells/mm³: No change. **Platelet count less than 25,000/mm³ or ANC less than 500 cells/mm³:** Decrease dose by 25% (750 mg/m²).

Nonhematologic Toxicities

Any Grade 3 or 4: Decrease dose by 25% (750 mg/m²). **Recurrence of Grade 3 or 4 Adverse Reaction After Two Dosage Reductions:** Discontinue treatment. **Nausea, Vomiting, Diarrhea:** Only modify dose if duration is greater than 7 days with supportive management. **Pts with Reduced UGT1A1 Activity:** Reduce starting dose to 750 mg/m² in pts known to be homozygous for UGT1A1*28 allele.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (47%–29%): Nausea, fatigue, pyrexia, vomiting, anemia. **Occasional (23%–10%):** Constipation, diarrhea, dyspepsia, rash, peripheral edema, cough, pruritus, chills, decreased appetite, headache, infusion site pain, abdominal pain, hypotension, phlebitis, dizziness.

Adverse effects/toxic reactions

Anemia, lymphopenia, neutropenia, thrombocytopenia are expected responses to therapy. Serious and sometimes fatal infections including pneumonia, sepsis have occurred. May cause hepatotoxicity, LFT abnormalities, tumor lysis syndrome. GI toxicities including severe diarrhea, nausea, vomiting may require use of antiemetic and antidiarrheal medication or result in dosage reduction. Nineteen percent of pts required treatment discontinuation related to toxic anemia, febrile neutropenia, multiorgan failure, ventricular fibrillation (rare).

Nursing considerations

Baseline assessment

Obtain baseline ANC, CBC, BMP, LFT, vital signs; urine pregnancy in women of reproductive potential. Question history of anemia, arrhythmias, hepatic impairment, peripheral edema, or if pt homozygous for UGT1A1 allele (may require reduced starting dose). Question possibility of pregnancy, current breastfeeding status. Receive full medication history including herbal products.

Intervention/evaluation

Diligently monitor blood counts (esp. ANC, Hgb/Hct, WBC, platelet count) weekly; hepatic/renal function prior to start of first dose of each cycle, vital signs. Monitor for symptoms of hypokalemia. Screen for tumor lysis syndrome (electrolyte imbalance, uric acid nephropathy, acute renal failure). Obtain EKG if arrhythmia, palpitations occur. Notify physician if any CTCAE toxicities occur (see [Appendix M](#)). Offer antiemetics if nausea, vomiting occurs.

Patient/family teaching

- Blood levels will be routinely monitored.
- Avoid pregnancy; treatment may cause birth defects or miscarriage. Do not breastfeed.
- Report any abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes, dark urine, decreased urine output.
- Severe diarrhea may lead to dehydration.
- Body aches, burning with urination, chills, cough, difficulty breathing, fever may indicate an acute infection.

benazepril

ben-ay-ze-pril

Lotensin

Fixed-Combination(s)

Lotensin HCT: benazepril/hydrochlorothiazide (a diuretic): 5 mg/6.25 mg, 10 mg/12.5 mg, 20 mg/12.5 mg, 20 mg/25 mg. **Lotrel:** benazepril/amLODIPine (a calcium blocker): 2.5 mg/10 mg, 5 mg/10 mg, 5 mg/20 mg, 5 mg/40 mg, 10 mg/20 mg, 10 mg/40 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC:

PHARMACOTHERAPEUTIC:

Angiotensin-converting enzyme (ACE) inhibitor.

CLINICAL: Antihypertensive.

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Do not confuse benazepril with enalapril, lisinopril, or Benadryl, or Lotensin with Lioresal.

Uses

Treatment of hypertension. Used alone or in combination with other antihypertensives.

Precautions

Contraindications: Hypersensitivity to benazepril. History of angioedema with or without previous treatment with ACE inhibitors. Use with aliskiren in pts with diabetes. **Cautions:** Renal impairment; hypertrophic cardiomyopathy without flow tract obstruction; severe aortic stenosis; before, during, or immediately following major surgery; unstented renal artery stenosis; diabetes mellitus, pregnancy, breastfeeding. Concomitant use of potassium-sparing diuretics, potassium supplements.

Action

Decreases rate of conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Reduces peripheral arterial resistance. **Therapeutic Effect:** Lowers B/P.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	1 hr	2–4 hrs	24 hrs

Partially absorbed from GI tract. Protein binding: 97%. Metabolized in liver. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 35 min; metabolite, 10–11 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Unknown if distributed in breast milk. May cause fetal, neonatal mortality or morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

Interactions

DRUG: Diuretics (e.g., furosemide, HCTZ), antihypertensives (e.g., amlodipine, atenolol, valsartan) may increase effect. NSAIDs (e.g., ibuprofen, naproxen), sympathomimetics may decrease effect. **Potassium-sparing diuretics** (e.g., spironolactone), **potassium supplements** may cause hyperkalemia. May increase **cycloSPORINE**, **lithium** concentration/effect. **HERBAL:** Ephedra, ginseng, licorice may worsen hypertension. **Black cohosh, periwinkle** may have increased antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum potassium, ALT, AST, alkaline phosphatase, bilirubin, BUN, creatinine, glucose. May decrease serum sodium; Hgb, Hct. May cause positive ANA titer.

Availability (Rx)

Tablets: 5 mg, 10 mg, 20 mg, 40 mg.

Administration/handling

- Give without regard to food.

Indications/routes/dosage

Hypertension (Monotherapy)

PO: ADULTS: Initially, 10 mg/day. **Maintenance:** 10–40 mg/day as single dose or in 2 divided doses. **Maximum:** 80 mg/day. **ELDERLY:** Initially, 5–10 mg/day. Range: 10–40 mg/day. **CHILDREN 6 YRS AND OLDER:** Initially, 0.2 mg/kg/day (up to 10 mg/day). Range: 0.1–0.6 mg/kg/day. **Maximum:** 40 mg/day.

Hypertension (Combination Therapy)

PO: ADULTS: Discontinue diuretic 2–3 days prior to initiating benazepril, then dose as noted above. If unable to discontinue diuretic, begin benazepril at 5 mg/day.

Dosage in Renal Impairment

CrCl less than 30 mL/min: ADULTS: Initially, 5 mg/day titrated up to maximum of 40 mg/day. **CHILDREN:** Not recommended.

HD, PD: 25%–50% of usual dose; supplement dose not necessary.

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent (6%–3%): Cough, headache, dizziness. **Occasional (2%):** Fatigue, drowsiness, nausea. **Rare (less than 1%):** Rash, fever, myalgia, diarrhea, loss of taste.

Adverse effects/toxic reactions

Excessive hypotension ("first-dose syncope") may occur in pts with HF, severe salt or volume depletion. Angioedema, hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with renal impairment, collagen vascular disease (scleroderma, systemic lupus erythematosus). Nephrotic syndrome may occur in pts with history of renal disease.

Nursing considerations

Baseline assessment

Obtain CBC before therapy begins and q2wks for 3 mos, then periodically thereafter. Obtain B/P immediately before each dose, in addition to regular monitoring (be alert to fluctuations).

Intervention/evaluation

Assist with ambulation if dizziness occurs. Monitor B/P, renal function, urinary protein, serum potassium. Monitor CBC with differential if pt has collagen

vascular disease or renal impairment. If excessive reduction in B/P occurs, place pt in supine position with legs elevated. Monitor pt with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response.

Patient/family teaching

- To reduce hypotensive effect, go from lying to standing slowly.
- Full therapeutic effect may take 2–4 wks.
- Skipping doses or noncompliance with drug therapy may produce severe rebound hypertension.
- Report dizziness, persistent cough.

bendamustine

ben-da-**mus**-teen

Bendeka

Treanda

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alkylating agent.

CLINICAL: Antineoplastic.

Do not confuse bendamustine with carmustine or lomustine.

Uses

Treatment of chronic lymphocytic leukemia (CLL). Treatment of indolent B-cell non-Hodgkin's lymphoma (NHL) that has progressed during or within 6 mos of treatment with ritUXimab or a ritUXimab-containing regimen. **OFF-LABEL:** Treatment of mantle cell lymphoma, relapsed multiple myeloma. First-line treatment for follicular lymphoma. Treatment of Waldenström's macroglobulinemia.

Precautions

Contraindications: Hypersensitivity to bendamustine. (Bendeka only): polyethylene glycol 400, or propylene glycol mono-thioglycerol. **Cautions:** Myelosuppression (may increase risk of infection), renal/hepatic impairment, dehydration, HF.

Action

Alkylates and cross-links macromolecules, resulting in DNA, RNA, and protein synthesis inhibition. **Therapeutic Effect:** Inhibits tumor cell growth, causes cell death.

Pharmacokinetics

Metabolized via hydrolysis to metabolites. Protein binding: 64%–95%. Excreted primarily in feces. **Half-life:** 40 min.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Unknown if distributed in breast milk. Impaired spermatogenesis, azoospermia have been reported in male pts. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Ciprofloxacin, fluvoxamine may increase concentration, decrease plasma concentrations of active metabolites. **CYP1A2 inducers (e.g., omeprazole), nicotine** may decrease concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum AST, bilirubin, creatinine, glucose, uric acid. May decrease WBCs, neutrophils, Hgb, platelets; serum potassium, sodium, calcium.

Availability (Rx)

Injection, Powder for Reconstitution: (Treanda): 25 mg, 100 mg.
Injection, (Bendeka): 100 mg/4 mL.

Administration/handling

IV

Reconstitution

- Reconstitute each 100-mg vial with 20 mL Sterile Water for Injection (25-mg vial with 5 mL) for final concentration of 5 mg/mL.

- Powder should completely dissolve in 5 min.
- Discard if particulate matter is observed.
- Withdraw volume needed for required dose (based on 5 mg/mL concentration) and immediately transfer to 500-mL infusion bag of 0.9% NaCl for final concentration of 0.2–0.6 mg/mL.
- Reconstituted solution must be transferred to infusion bag within 30 min of reconstitution.
- After transferring, thoroughly mix contents of infusion bag.

Rate of Administration

- Infuse over 30 min for CLL or 60 min for NHL.

Storage

- Reconstituted solution should appear clear and colorless to pale yellow.
- Final solution is stable for 24 hrs if refrigerated or 3 hrs at room temperature.
- Administration must be completed within these stability time frames.

Indications/routes/dosage

◀ALERT▶ Antiemetics are recommended to prevent nausea and vomiting.

Chronic Lymphocytic Leukemia

IV Infusion: ADULTS/ELDERLY: 100 mg/m² given over 30 min daily on days 1 and 2 of a 28-day cycle, up to 6 cycles.

Non-Hodgkin's Lymphoma

IV Infusion: ADULTS/ELDERLY: 120 mg/m² on days 1 and 2 of a 21-day cycle, up to 8 cycles.

Dose Modification

Hematologic Toxicity: Grade 4 or greater: Withhold until ANC 1,000/mm³ or greater, platelet 75,000/mm³ or greater. **CLL: Toxicity Grade 3 or greater:** Reduce dose to 50 mg/m² on days 1 and 2 of each treatment cycle. **Recurrence:** Reduce dose to 25 mg/m² on days 1 and 2 of each cycle. **NHL: Hematologic toxicity Grade 4 or nonhematologic toxicity Grade 3 or greater:** Reduce dose to 90 mg/m² on days 1 and 2 of each cycle. **Recurrence:** Reduce dose to 60 mg/m² on days 1 and 2 of each treatment cycle.

Dosage in Renal Impairment

Not recommended in pts with CrCl less than 40 mL/min.

Dosage in Hepatic Impairment

Mild: Use caution. **Moderate to Severe:** Not recommended.

Side effects

Frequent (24%–16%): Fever, nausea, vomiting. **Occasional (9%–8%):** Diarrhea, fatigue, asthenia (loss of strength, energy), rash, decreased weight, nasopharyngitis. **Rare (6%–3%):** Chills, pruritus, cough, herpes simplex infections.

Adverse effects/toxic reactions

Myelosuppression characterized as neutropenia (75% of pts), thrombocytopenia (77% of pts), anemia (89% of pts), leukopenia (61% of pts) is an expected response to therapy. Infection, including pneumonia, sepsis may occur. Tumor lysis syndrome may lead to acute renal failure. Worsening of hypertension occurs rarely.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT before treatment begins and routinely thereafter. Question for possibility of pregnancy. Offer emotional support.

Intervention/evaluation

Offer antiemetics to control nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Assess skin for evidence of rash. Monitor for signs of infection (fever, chills, cough, flu-like symptoms). Monitor for hypertension. Hematologic nadirs occur in 3rd week of therapy and may require dose delays if recovery to recommended values has not occurred by day 28.

Patient/family teaching

- Avoid crowds, those with known infection.
- Avoid contact with anyone who recently received live virus vaccine.
- Do not have immunizations without physician's approval (drug lowers body resistance).
- Promptly report fever, chills, flu-like symptoms, sore throat, unusual bruising/bleeding from any site.
- Male pts should be warned of potential risk to their reproductive capacities.

benztropine

benz-**tr**ow-peen

Cogentin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Anticholinergic.

CLINICAL: Antiparkinson agent.

Do not confuse benztropine with bromocriptine or benzonatate.

Uses

Adjunctive therapy for all forms of Parkinson's disease, control of extrapyramidal reactions (except tardive dyskinesia) due to neuroleptic medications.

Precautions

Contraindications: Hypersensitivity to benztropine. Children younger than 3 yrs (due to atropine-like adverse effects). **Cautions:** Children 3 yrs and older. Glaucoma, heart disease, hypertension, hypotension; pts with tachycardia, arrhythmias, prostatic hypertrophy, hepatic/renal impairment, obstructive diseases of GI/GU tract, urinary retention, elderly, myasthenia gravis, use during hot weather or during exercise.

Action

Possesses anticholinergic effects. **Therapeutic Effect:** Reduces incidence/severity of akinesia, rigidity, tremor.

Pharmacokinetics

Well absorbed following PO and IM administration. Metabolized in liver. PO onset of action: 1–2 hrs; IM onset of action: minutes. Pharmacologic effects may not be apparent until 2–3 days after initiation of therapy and may persist for up to 24 hrs after discontinuation of drug. **Half-life:** Extended (no specific determination).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 3 yrs. **Elderly:** Increased risk for adverse reactions.

Interactions

DRUG: CNS depressants (e.g., alcohol, ALPRAZolam, LORazepam, morphine, oxyCODONE, traMADol) may increase sedative effects. May increase effects of anticholinergics. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Injection, Solution: 1 mg/mL. **Tablets:** 0.5 mg, 1 mg, 2 mg.

Administration/handling

IM

- Inject slow, deep IM.

PO

- Give without regard to food.
- Give with food if GI upset occurs.

Indications/routes/dosage

Parkinsonism

PO: ADULTS, ELDERLY: Initially, 0.5–1 mg at bedtime or in 2–4 divided doses. Titrate by 0.5 mg at 5- to 6-day intervals. Usual dose: 1–2 mg daily. Range: 0.5–6 mg daily. **Maximum:** 6 mg/day.

Drug-Induced Extrapyrarnidal Symptoms

PO, IM, IV: ADULTS, ELDERLY: Initially, 1–2 mg 2–3 times/day. Titrate at 0.5 mg q5–6days. **Usual dose:** 1–4 mg once or twice daily. **Maximum:** 6 mg/day. **CHILDREN OLDER THAN 3 YRS:** 0.02–0.05 mg/kg/dose once or twice daily.

Acute Dystonic Reactions

IV, IM: ADULTS: Initially, 1–2 mg as a single dose followed by 1–2 mg orally 1–2 times/day for up to 7–28 days to prevent recurrence.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Drowsiness, dry mouth, blurred vision, constipation, urinary retention, GI upset, photosensitivity. **Occasional:** Headache, memory loss, muscle cramps, anxiety, peripheral paresthesia, orthostatic hypotension, abdominal cramps. **Rare:** Rash, confusion, eye pain.

Adverse effects/toxic reactions

Overdose may produce severe anticholinergic effects (drowsiness, tachycardia, paralytic ileus, malignant hyperthermia, urinary retention, dyspnea, skin flushing, dryness of mouth/nose/throat). Severe paradoxical reactions (hallucinations, tremor, seizures, toxic psychosis) may occur.

Nursing considerations

Baseline assessment

Assess mental status for confusion, disorientation, agitation, psychotic-like symptoms (medication frequently produces such side effects in pts older than 60

yrs). Note severity of baseline rigidity, tremors.

Intervention/evaluation

Be alert to neurologic effects: headache, drowsiness, mental confusion, agitation. Assess for clinical reversal of symptoms (improvement of tremor of head and hands at rest, mask-like facial expression, shuffling gait, muscular rigidity). Monitor daily pattern of bowel activity, stool consistency, esp. constipation. Monitor I/O. Assess for urinary retention.

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Dry mouth, drowsiness, dizziness may be an expected side effect.
- Drowsiness tends to diminish or disappear with continued therapy.
- Avoid alcohol.
- Report sudden muscle weakness or stiffness.
- Report trouble urinating, bladder pain, or distention.

betamethasone

bay-ta-**meth**-a-sone

Betaderm 

Betaject 

Betnesol 

Celestone Soluspan

Diprolene

Luxiq

Sernivo

Fixed-Combination(s)

Lotrisone: betamethasone/clotrimazole (an antifungal): 0.05%/1%. **Taclonex:** betamethasone/calcipotriene (an antipsoriatic): 0.064%/0.005%.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Adrenocorticosteroid.

CLINICAL: Anti-inflammatory, immunosuppressant.

Do not confuse betamethasone with dexamethasone or Luxiq with Lasix.

Uses

Systemic: Anti-inflammatory, immunosuppressant in the treatment of diseases, including those of allergic, dermatologic, endocrine, GI, hematologic, respiratory, or rheumatoid origin. **Topical:** Relief of inflammatory and pruritic dermatoses. **Foam:** Relief of inflammation, itching associated with dermatosis of the scalp. **Sernivo:** Treatment of mild to moderate plaque psoriasis. **OFF-LABEL:** Accelerate fetal lung maturation in pts with preterm labor.

Precautions

Contraindications: Hypersensitivity to betamethasone. IM administration in idiopathic thrombocytopenia purpura. **Cautions:** Hypothyroidism, hepatic/renal impairment, cardiovascular disease, diabetes, glaucoma, cataracts, myasthenia gravis, pts at risk for osteoporosis/seizures/GI disease, following acute MI, elderly, systemic fungal infections.

Action

Controls rate of protein synthesis, depresses migration of polymorphonuclear leukocytes/fibroblasts, reverses capillary permeability, prevents or controls inflammation. **Therapeutic Effect:** Decreases tissue response to inflammatory process.

Pharmacokinetics

Rapidly absorbed following PO administration. Protein binding: 64%. After topical application, limited absorption systemically. Metabolized in liver. Excreted in urine. **Half-life:** 6.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta, distributed in breast milk. **Children:** Prolonged treatment, high-dose therapy may decrease short-term growth rate,

cortisol secretion. **Elderly:** Increased risk for developing hypertension, osteoporosis.

Interactions

DRUG: **Amphotericin** may increase risk of hypokalemia. May decrease effects of **insulin, oral hypoglycemics (e.g., glimepiride, metFORMIN, SITagliptin), potassium supplements.** May increase **digoxin** toxicity (due to hypokalemia). **Hepatic enzyme inducers (e.g., carBAMazepine, PHENobarbital, rifAMPin)** may decrease effect. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** **Cat's claw, echinacea** possess immunostimulant effects. **FOOD:** None known. **LAB VALUES:** May decrease serum calcium, potassium, thyroxine. May increase serum cholesterol, lipids, glucose, sodium, amylase.

Availability (Rx)

Cream (Diprolene AF): 0.05%. **Foam (Luxiq):** 0.12%. **Gel:** 0.05%. **Injection, Suspension (Celestone Soluspan):** 3 mg/mL. **Lotion (Diprolene):** 0.05%. **Ointment:** 0.05%, 0.1%. **Topical Spray:** 0.05%.

Administration/handling

IM

- Inject slowly, deep IM into large muscle mass.

Topical

- Gently cleanse area before application.
- Apply sparingly and rub into area thoroughly.
- Do not apply to face, groin, axillae, or inguinal areas. Not for use on broken skin, areas of infection, or in diaper area.
- Do not dispense foam directly into hands; use fingers to apply small amounts.

Indications/routes/dosage

Anti-Inflammation, Immunosuppression, Corticosteroid

Replacement Therapy

IM: ADULTS, ELDERLY: 0.25–9 mg/day in 2 divided doses. **CHILDREN:** 0.02–0.3 mg/kg/day in 3–4 divided doses.

Relief of Inflamed and Pruritic Dermatoses

Topical: (Cream/Ointment):ADULTS, ELDERLY: 1–2 times daily. **Foam:** Apply twice daily (morning and night).

Plaque Psoriasis

Topical:ADULTS, ELDERLY:(Sernivo):Apply to affected areas 2 times/day for up to 4 wks.

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent: Systemic: Increased appetite, abdominal distention, nervousness, insomnia, false sense of well-being. **Topical:** Burning, stinging, pruritus. **Occasional: Systemic:** Dizziness, facial flushing, diaphoresis, decreased or blurred vision, mood swings. **Topical:** Allergic contact dermatitis, purpura or blood-containing blisters, thinning of skin with easy bruising, telangiectases, raised dark red spots on skin, angiomas.

Adverse effects/toxic reactions

Overdose may cause systemic hypercorticism, adrenal suppression.

Nursing considerations

Baseline assessment

Question for hypersensitivity to any corticosteroid, sulfite. Obtain baseline values for height, weight, B/P, serum glucose, electrolytes. Obtain baseline results of initial tests (tuberculosis [TB] skin test, X-rays, EKG).

Intervention/evaluation

Monitor B/P, blood glucose, electrolytes. Apply topical preparation sparingly. Do not use on broken skin or in areas of infection. Do not apply to wet skin, face, inguinal areas.

Patient/family teaching

- Take with food, milk.
- Take single daily dose in the morning.
- Do not stop abruptly.
- Apply topical preparations in a thin layer.
- Do not receive smallpox vaccination during or immediately after therapy.

bethanechol

be-**than**-e-kole

Duvoid 

Urecholine

CLASSIFICATION

PHARMACOTHERAPEUTIC: Parasympathomimetic choline ester.

CLINICAL: Cholinergic.

Do not confuse bethanechol with betaxolol.

Uses

Treatment of acute postoperative and postpartum nonobstructive urinary retention, retention due to neurogenic bladder. **OFF-LABEL:** Treatment of gastroesophageal reflux.

Precautions

Contraindications: Hypersensitivity to bethanechol. Mechanical obstruction of GI/GU tract, GI or bladder wall instability, hyperthyroidism, cardiac disease, bronchial asthma, peptic ulcer, epilepsy, pronounced bradycardia or hypotension, parkinsonism. **Cautions:** None known.

Action

Stimulates parasympathetic nervous system, increasing bladder muscle tone and causing contractions, which initiates urination. Also stimulates gastric motility, increasing gastric tone, and may restore peristalsis. **Therapeutic Effect:** May initiate urination, bladder emptying. Stimulates gastric, intestinal motility.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	30–90 min	60 min	6 hrs

Poorly absorbed following PO administration. Does not cross blood-brain barrier. **Half-life:** Unknown.

Lifespan considerations

Pregnancy/Lactation: Unknown if crosses placenta or distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: Beta blockers (e.g., labetalol, metoprolol), anticholinesterase inhibitors (e.g., donepezil, rivastigmine) may increase effect/toxicity. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase, ALT, AST.

Availability (Rx)

Tablets: 5 mg, 10 mg, 25 mg, 50 mg.

Administration/handling

PO

- Administer 1 hr before or 2 hrs after meals.

Indications/routes/dosage

Nonobstructive Urinary Retention, Neurogenic Bladder

PO: ADULTS, ELDERLY: Usual dose: 10–50 mg 3–4 times/day. Minimum effective dose determined by giving 5–10 mg initially, repeating same amount at 1-hr intervals until desired response is achieved. **CHILDREN:** 0.3–0.6 mg/kg/day in 3–4 divided doses.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Belching, changes in vision, blurred vision, diarrhea, urinary urgency or frequency. **Rare:** Dyspnea, chest tightness, bronchospasm.

Adverse effects/toxic reactions

Overdose produces CNS stimulation (insomnia, anxiety, orthostatic hypotension), cholinergic stimulation (headache, increased salivation/diaphoresis, nausea, vomiting, flushed skin, abdominal pain, seizures).

Nursing considerations

Baseline assessment

Ensure pt has emptied bladder prior to procedure.

Intervention/evaluation

Monitor urine output. Palpate bladder for evidence of urinary retention.

Patient/family teaching

- Report nausea, vomiting, diarrhea, diaphoresis, increased salivary secretions, irregular heartbeat, muscle weakness, severe abdominal pain, difficulty breathing.

betrixaban

be-trix-a-ban

Bevyxxa

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Factor Xa inhibitor.

CLINICAL: Anticoagulant.

■ **BLACK BOX ALERT** ■ Epidural/spinal hematomas may occur in pts receiving neuraxial anesthesia or undergoing spinal puncture, resulting in long-term or permanent paralysis. Factors increasing risk of epidural/spinal hematoma include indwelling epidural catheters or concomitant use of medical products affecting hemostasis. Consider the risks before spinal procedures.

Do not confuse betrixaban with apixaban, edoxaban, or rivaroxaban.

Uses

Prophylaxis of venous thromboembolism (VTE) in adult pts hospitalized for an acute medical illness who are at risk for thromboembolic complications due to moderate or severe restricted mobility and other risk factors for VTE.

Precautions

Contraindications: Hypersensitivity to betrixaban. Major active bleeding.
Cautions: Severe renal impairment, concomitant use of P-gp inhibitors, pts at risk for bleeding (e.g., active GI ulcerative disease, congenital/acquired disorders, hemophilia, menses, severe hypertension, open wounds; recent history of intracranial hemorrhage, lumbar puncture, spinal anesthesia, surgery, trauma). Not recommended in pts with hepatic impairment. Safety and efficacy not established in pts with prosthetic heart valves.

Action

Directly and selectively inhibits factor Xa (FXa). FXa is part of the prothrombinase complex that catalyzes the conversion of prothrombin to thrombin. Thrombin activates platelets and catalyzes conversion of fibrinogen to fibrin. **Therapeutic Effect:** Inhibits fibrin clot formation.

Pharmacokinetics

Widely distributed. Protein binding: 60%. Peak plasma concentration: 3–4 hrs. Steady state reached in 6 days. Excreted in feces (85%), urine (11%). **Half-life:** 19–27 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. May increase risk of bleeding during pregnancy/delivery. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Anticoagulants (e.g., apixaban, dabigatran, edoxaban, heparin, rivaroxaban, warfarin), vorapaxar may increase risk of bleeding. **P-gp inhibitors** (e.g., amiodarone, azithromycin, ketoconazole, verapamil) may increase concentration/effect; may increase risk of bleeding. **HERBAL:** Herbals with anticoagulant activity (e.g., anise, bilberry) may increase of bleeding. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium.

Availability (Rx)

Capsules: 40 mg, 80 mg.

Administration/handling

PO

- Give with food.
- If a dose is missed, administer as soon as possible on same day (do not double dose if a day is missed).

Indications/Routes/Dosage

Venous Thromboembolism

PO: ADULTS, ELDERLY: Initially, 160 mg as a single dose. **Maintenance:** 80 mg once daily for 35–42 days.

Dose Modification

Concomitant use of P-gp inhibitors: Initially, 80 mg as a single dose.
Maintenance: 40 mg once daily for 35–42 days.

Dosage in Renal Impairment

Severe impairment (CrCl 15–29 mL/min): Initially, 80 mg as a single dose.
Maintenance: 40 mg once daily for 35–42 days.

Dosage in Hepatic Impairment

Not recommended in hepatic impairment.

Side Effects

Rare (3%–2%): Constipation, hypertension, headache, nausea, diarrhea.

Adverse Effects/Toxic Reactions

Hemorrhagic events, some of them fatal, were reported; events included intracranial hemorrhage; hemorrhagic CVA; epistaxis; and intra-articular, intraspinal, intraocular, GI, GU, pericardial, and retroperitoneal bleeding. Discontinuation in the absence of other adequate anticoagulants may increase the risk of ischemic events, stroke. May increase risk of epidural or spinal hematomas, which may lead to permanent or long-time paralysis. Protamine sulfate, vitamin K, tranexamic acid are not expected to reverse anticoagulant effect.

Nursing Considerations

Baseline Assessment

Question history of bleeding disorders, recent surgery, spinal procedures, intracranial hemorrhage, bleeding ulcers, open wounds, trauma. Receive full medication history and screen for interactions (esp. P-gp inhibitors, herbals with anticoagulant properties). Question history of hepatic/renal impairment.

Intervention/Evaluation

Be alert for decrease in B/P, increase in pulse rate; complaints of abdominal/back pain, dysarthria, headache, confusion, weakness, vision change (may indicate hemorrhage). If internal hemorrhage suspected, recommend emergent radiologic imaging. Question for increased menstrual bleeding/discharge. Assess skin for ecchymosis, petechiae. Check for excessive bleeding from minor cuts, scratches. Monitor urine and stool for occult blood. Avoid IM injections.

Patient/Family Teaching

- Do not discontinue current blood thinning regimen or take any newly prescribed medications unless approved by the physician who originally started treatment.
- Suddenly stopping therapy may increase the risk of blood clots or stroke. Promptly refill prescription so that the next scheduled dose is not missed.
- Report bleeding of any kind (bloody urine, stool; nosebleeds; increased menstrual bleeding). If bleeding occurs, it may take longer to stop bleeding.
- Immediately report signs of stroke (confusion, headache, numbness, one-sided weakness, trouble speaking, loss of vision).
- Minor blunt force trauma to the head, chest, or abdomen can be life-threatening.
- Monitor changes in urine output.
- Do not take aspirin, herbal supplements, OTC nonsteroidal anti-inflammatories (may increase risk of bleeding).
- Consult physician before any surgery or dental work.
- Use electric razor, soft toothbrush to prevent bleeding.

bevacizumab

be-va-siz-ue-mab

Avastin, Mvasi

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ May result in development of GI perforation, presented as intra-abdominal abscess, fistula, wound dehiscence, wound healing complications. Severe, sometimes fatal, hemorrhagic events including central nervous system/GI/vaginal bleeding, epistaxis, hemoptysis, pulmonary hemorrhage has occurred.

Do not confuse Avastin with Astelin, or bevacizumab with cetuximab or riTUXimab.

Uses

First- or second-line combination chemotherapy with 5-fluorouracil (5-FU) for treatment of pts with colorectal cancer. Second-line treatment of colorectal cancer after progression of first-line treatment with bevacizumab. Treatment with CARBOplatin and PACLitaxel for nonsquamous, non-small-cell lung cancer (NSCLC). Treatment of renal cell carcinoma (metastatic) with interferon alfa, brain cancer (glioblastoma) that has progressed following prior therapy. Treatment of platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with PACLitaxel, DOXOrubicin [liposomal] or topotecan). Treatment of platinum-sensitive ovarian cancer. Treatment of persistent, recurrent, or metastatic cervical cancer (in combination with PACLitaxel and either CISplatin or topotecan). **OFF-LABEL:** Adjunctive therapy in malignant mesothelioma, ovarian cancer, prostate cancer, age-related macular degeneration. Treatment of metastatic breast cancer.

Precautions

Contraindications: Hypersensitivity to bevacizumab. **Cautions:** Cardiovascular disease, acquired coagulopathy, preexisting hypertension, pts at risk of thrombocytopenia. Pts with CNS metastasis. Do not administer within 28 days of major surgery or active bleeding.

Action

Binds to and inhibits vascular endothelial growth factor, a protein that plays a major role in formation of new blood vessels to tumors. **Therapeutic Effect:** Inhibits metastatic disease progression.

Pharmacokinetics

Clearance varies by body weight, gender, tumor burden. **Half-life:** 20 days (range: 11–50 days).

Lifespan considerations

Pregnancy/Lactation: May possess teratogenic effects. Potential for fertility impairment. May decrease maternal and fetal body weight, increase risk of skeletal fetal abnormalities. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Higher incidence of severe adverse reactions in pts older than 65 yrs.

Interactions

DRUG: SUNItinib may increase concentration/effect. May increase levels of **cloZAPine, SORafenib, SUNItinib**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, platelet count, WBC; serum potassium, sodium. May increase urine protein.

Availability (Rx)

Injection, Solution: 25-mg/mL vial (4 mL, 16 mL).

Administration/handling

IV

 Do not give by IV push or bolus.

Reconstitution

- Dilute prescribed dose in 100 mL 0.9% NaCl.
- Avoid dextrose-containing solutions.
- Discard any unused portion.

Rate of Administration

- Usually given following other chemotherapy. Infuse initial dose over 90 min.
- If first infusion is well tolerated, second infusion may be administered over 60 min.
- If 60-min infusion is well tolerated, all subsequent infusions may be administered over 30 min.

Storage

- Diluted solution may be stored for up to 8 hrs if refrigerated.

IV incompatibilities

Do not mix with dextrose solutions.

Indications/routes/dosage

Colorectal Cancer (with Fluorouracil-Based Chemotherapy)

IV:ADULTS, ELDERLY: 5 mg/kg q2wks (in combination with bolus-IFL) or 10 mg/kg q2wks in combination with FOLFOX4).

Colorectal Cancer Progression (Following Initial Bevacizumab/Fluorouracil-Based Chemotherapy)

IV:ADULTS, ELDERLY: 5 mg/kg q2wks or 7.5 mg/kg q3wks (in combination with fluoropyrimidine-irinotecan- or fluoropyrimidine-oxaliplatin-based regimen).

Non-Small-Cell Lung Cancer (NSCLC)

IV:ADULTS, ELDERLY: 15 mg/kg q3wks (in combination with CARBOplatin and PACLitaxel) for 6 cycles.

Metastatic Renal Cell Carcinoma

IV:ADULTS, ELDERLY: 10 mg/kg once q2wks (with interferon alfa).

Brain Cancer

IV:ADULTS, ELDERLY: 10 mg/kg q2wks (as monotherapy).

Ovarian Cancer (Platinum-Resistant)

IV: ADULTS, ELDERLY: 10 mg/kg q2wks with PACLitaxel, DOXOrubicin [liposomal], or wkly topotecan or 15 mg/kg q3wks (with topotecan q3wks).

Ovarian Cancer (Platinum-Sensitive)

IV: ADULTS, ELDERLY: 15 mg/kg q3wks with CARBOplatin/PACLitaxel for 6–8 cycles then 15 mg/kg q3wks as a single agent or 15 mg/kg with CARBOplatin/gemcitabine for 6–10 cycles, then 15 mg/kg q3wks as a single agent. Continue until disease progression or unacceptable toxicity.

Cervical Cancer

IV:ADULTS, ELDERLY: 15 mg/kg q3wks (in combination with PACLitaxel and either CISplatin or topotecan). Continue until disease progression or unacceptable toxicity.

Dose Adjustment for Toxicity

Temporary suspension: Mild to moderate proteinuria, severe hypertension not controlled with medical management. **Permanent discontinuation:** Wound dehiscence requiring intervention, GI perforation, hypertensive crises, serious bleeding, nephrotic syndrome.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (73%–25%): Asthenia, vomiting, anorexia, hypertension, epistaxis, stomatitis, constipation, headache, dyspnea. **Occasional (21%–15%):** Altered taste, dry skin, exfoliative dermatitis, dizziness, flatulence, excessive lacrimation, skin discoloration, weight loss, myalgia. **Rare (8%–6%):** Nail disorder, skin ulcer, alopecia, confusion, abnormal gait, dry mouth.

Adverse effects/toxic reactions

UTI, manifested as urinary frequency/urgency, proteinuria, occurs frequently. Most serious adverse effects include HF, deep vein thrombosis, GI perforation, wound dehiscence, hypertensive crisis, nephrotic syndrome, severe hemorrhage. Anemia, neutropenia, thrombocytopenia occur occasionally. Hypersensitivity reactions occur rarely. May increase risk of tracheoesophageal fistula development.

Nursing considerations

Baseline assessment

Obtain baseline CBC, serum potassium, sodium levels and at regular intervals

during therapy. Assess for proteinuria with urinalysis. For pts with 2+ or greater urine dipstick reading, a 24-hr urine collection is advised.

Intervention/evaluation

Monitor B/P regularly for hypertension. Assess for asthenia. Assist with ambulation if asthenia occurs. Monitor for fever, chills, abdominal pain, epistaxis. Offer antiemetic if nausea, vomiting occurs. Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching

- Report abdominal pain, vomiting, constipation, headache.
- Do not receive immunizations without physician's approval (lowers body's resistance).
- Avoid contact with anyone who recently received a live virus vaccine.
- Avoid crowds, those with infection.
- Female pts should take measures to avoid pregnancy during treatment.

bicalutamide

bye-ka-**loo**-ta-mide

HIGH
ALERT

Apo-Bicalutamide 

Casodex

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antiandrogen hormone.

CLINICAL: Anti-neoplastic.

Uses

Treatment of advanced metastatic prostatic carcinoma (in combination with luteinizing hormone-releasing hormone [LHRH] agonist analogues, e.g., leuprolide). Treatment with both drugs must be started at same time. **OFF-LABEL:** Monotherapy for locally advanced prostate cancer.

Precautions

Contraindications: Hypersensitivity to bicalutamide. Women, esp. those who are or may become pregnant. **Cautions:** Moderate to severe hepatic impairment,

diabetes.

Action

Competitively inhibits androgen action by binding to androgen receptors in target tissue. **Therapeutic Effect:** Prevents testosterone stimulation of cell growth in prostate cancer.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 96%. Metabolized in liver. Excreted in urine and feces. Not removed by hemodialysis. **Half-life:** 5.8–7 days.

Lifespan considerations

Pregnancy/Lactation: May inhibit spermatogenesis in males. Not used in women. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May increase effects of **ARIPiprazole, budesonide, colchicine, fentaNYL, salmeterol, SAXagliptin.** **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, creatinine, bilirubin, BUN, glucose. May decrease WBC, Hgb.

Availability (Rx)

Tablets: 50 mg.

Administration/handling

PO

- Give without regard to food.
- Give at same time each day.

Indications/routes/dosage

Prostatic Carcinoma

PO: ADULTS, ELDERLY: 50 mg once daily in morning or evening, given concurrently with an LHRH analogue or after surgical castration.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (49%–10%): Hot flashes, breast pain, muscle pain, constipation, asthenia, diarrhea, nausea. **Occasional (9%–8%):** Nocturia, abdominal pain, peripheral edema. **Rare (7%–3%):** Vomiting, weight loss, dizziness, insomnia, rash, impotence, gynecomastia.

Adverse effects/toxic reactions

Sepsis, HF, hypertension, iron deficiency anemia, interstitial pneumonitis, pulmonary fibrosis may occur. Severe hepatotoxicity occurs rarely within the first 3–4 mos after treatment initiation.

Nursing considerations

Baseline assessment

Obtain baseline CBC, LFT, PSA, serum testosterone, luteinizing hormone (LH) levels.

Intervention/evaluation

Monitor lab studies for changes from baseline. Perform periodic LFT. If ALT, AST increase over 2 times the upper limit of normal (ULN) or jaundice is noted, discontinue treatment. Monitor for diarrhea, nausea, vomiting.

Patient/family teaching

- Do not stop taking either medication (both drugs must be continued).

- Take medications at same time each day.
- Explain possible expectancy of frequent side effects.
- Report persistent nausea, vomiting, diarrhea, or yellowing of skin or eyes.

bisacodyl

bis-**ak**-oh-dil

Apo-Bisacodyl 

Dulcolax

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: GI stimulant.

CLINICAL: Laxative.

Uses

Treatment of constipation, colonic evacuation before examinations or procedures.

Precautions

Contraindications: Hypersensitivity to bisacodyl. Abdominal pain, appendicitis, intestinal obstruction, nausea, undiagnosed rectal bleeding, vomiting, pregnancy, lactation. **Cautions:** Long-term use may lead to laxative dependence, loss of normal bowel function.

Action

Direct effect on colonic smooth musculature by stimulating intramural nerve plexi. **Therapeutic Effect:** Promotes fluid and electrolyte accumulation in colon, increasing peristalsis, producing laxative effect.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	6–12 hrs	N/A	N/A
Rectal	15–60 min	N/A	N/A

Minimal absorption following PO and rectal administration. Absorbed drug is excreted in urine; remainder is eliminated in feces.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Use with caution in pts younger than 6 yrs (usually unable to describe symptoms or more severe side effects). **Elderly:** Repeated use may cause weakness, orthostatic hypotension due to fluid, electrolyte imbalance.

Interactions

DRUG: Antacids may decrease effect, cause premature dissolution of enteric coating and possible gastric irritation. **HERBAL:** None significant. **FOOD: Milk** may cause rapid dissolution of bisacodyl. **LAB VALUES:** May increase serum glucose. May decrease serum potassium (due to fluid loss).

Availability (OTC)

 **Suppositories (Dulcolax):** 10 mg.

Tablets (Enteric-Coated [Dulcolax]): 5 mg.

Administration/handling

PO

- Give on empty stomach (faster action).
- Offer 6–8 glasses of water a day (aids stool softening).
- Administer tablets whole; do not break, crush, dissolve, or divide.
- Avoid giving within 1 hr of antacids, milk, other oral medication.

Rectal, Suppository

- If suppository is too soft, chill for 30 min in refrigerator or run cold water over foil wrapper.
- Moisten suppository with cold water before inserting well into rectum.

Storage

Store rectal enema, suppositories at room temperature.

Indications/routes/dosage

Treatment of Constipation

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 5–15 mg as needed. **Maximum:** 30 mg. **CHILDREN 3–12 YRS:** 5–10 mg or 0.3 mg/kg at bedtime or after breakfast.

Rectal, Suppository: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 10 mg to induce bowel movement. **CHILDREN 2–12 YRS:** 5–10 mg as a single dose. **CHILDREN YOUNGER THAN 2 YRS:** 5 mg.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Some degree of abdominal discomfort, nausea, mild cramps, faintness. **Occasional:** Rectal administration: burning of rectal mucosa, mild proctitis.

Adverse effects/toxic reactions

Long-term use may result in laxative dependence, chronic constipation, loss of normal bowel function. Overdose may result in electrolyte or metabolic disturbances (hypokalemia, hypocalcemia, metabolic acidosis, alkalosis), persistent diarrhea, vomiting, muscle weakness, malabsorption, weight loss.

Nursing considerations

Baseline assessment

Observe for evidence of constipation. Assess pattern of bowel activity, stool consistency.

Intervention/evaluation

Encourage adequate fluid intake. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency; record time of evacuation.

Assess for abdominal disturbances. Monitor serum electrolytes in those exposed to prolonged, frequent, or excessive use of medication.

Patient/family teaching

- Institute measures to promote defecation: increase fluid intake, exercise, high-fiber diet.
- Do not take antacids, milk, or other medication within 1 hr of taking medication (decreased effectiveness).
- Report unrelieved constipation, rectal bleeding, muscle pain or cramps, dizziness, weakness.
- Do not chew, crush, dissolve, or divide tablets.

bisoprolol

bi-soe-proe-lol

HIGH
ALERT

Apo-Bisoprolol 

Novo-Bisoprolol 

Zebeta

Fixed-Combination(s)

Ziac: bisoprolol/hydroCHLOROthiazide (a diuretic): 2.5 mg/6.25 mg, 5 mg/6.25 mg, 10 mg/6.25 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Beta-adrenergic blocker.

CLINICAL: Antihypertensive.

Do not confuse Zebeta with DiaBeta or Zetia.

Uses

Management of hypertension, alone or in combination with other medications.

OFF-LABEL: Chronic stable angina pectoris, premature ventricular contractions, supraventricular arrhythmias, HF.

Precautions

Contraindications: Hypersensitivity to bisoprolol. Cardiogenic shock, marked

sinus bradycardia, overt HF, second- or third-degree heart block (except in pts with pacemaker). **Cautions:** Concurrent use of digoxin, verapamil, diltiazem, HF, history of severe anaphylaxis to allergens, renal/hepatic impairment, hyperthyroidism, diabetes, bronchospastic disease, myasthenia gravis, psychiatric disease, peripheral vascular disease, Raynaud's disease.

Action

Blocks β_1 -adrenergic receptors in cardiac tissue. **Therapeutic Effect:** Slows sinus heart rate, decreases B/P.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 26%–33%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 9–12 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta; distributed in breast milk. Avoid use during first trimester. May produce bradycardia, apnea, hypoglycemia, hypothermia during delivery, low-birth-weight infants. **Children:** Safety and efficacy not established. **Elderly:** Age-related peripheral vascular disease may increase risk of decreased peripheral circulation.

Interactions

DRUG: Diuretics (e.g., furosemide), other antihypertensives (e.g., amlodipine, lisinopril, valsartan) may increase hypotensive effect. May mask symptoms of hypoglycemia, prolong hypoglycemic effect of insulin, oral hypoglycemics (e.g., glimepiride, metFORMIN, SITagliptin). NSAIDs (e.g., diclofenac, ibuprofen, naproxen) may decrease antihypertensive effect. Verapamil, diltiazem, digoxin may increase risk of bradycardia or heart block. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. Garlic may have increased antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase ANA titer, serum BUN, creatinine, potassium, uric acid, lipoproteins, triglycerides.

Availability (Rx)

Tablets: 5 mg, 10 mg.

Administration/handling

PO

- Give without regard to food.

Indications/routes/dosage

Hypertension

PO: ADULTS, ELDERLY: Initially, 2.5–5 mg once daily. May increase to 10 mg, then to 20 mg once daily. Usual dose: 5–10 mg once daily.

Dosage in Renal Impairment

ADULTS, ELDERLY:CrCl less than 40 mL/min: Initially, give 2.5 mg.

Dosage in Hepatic Impairment

Cirrhosis, Hepatitis: Initially, 2.5 mg.

Side effects

Frequent (11%–8%): Fatigue, headache. **Occasional (4%–2%):** Dizziness, arthralgia, peripheral edema, URI, rhinitis, pharyngitis, diarrhea, nausea, insomnia. **Rare (less than 2%):** Chest pain, asthenia, dyspnea, vomiting, bradycardia, dry mouth, diaphoresis, decreased libido, impotence.

Adverse effects/toxic reactions

Overdose may produce profound bradycardia, hypotension. Abrupt withdrawal may result in diaphoresis, palpitations, headache, tremors. May precipitate HF, MI in pts with cardiac disease, thyroid storm in pts with thyrotoxicosis, peripheral ischemia in those with existing peripheral vascular disease. Hypoglycemia may occur in previously controlled diabetes. Thrombocytopenia, unusual bruising/bleeding occur rarely.

Nursing considerations

Baseline assessment

Assess baseline renal/hepatic function tests. Assess B/P, apical pulse immediately before drug is administered (if pulse is 60/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician).

Intervention/evaluation

Monitor B/P, pulse for quality, irregular rate, bradycardia. Assist with ambulation if dizziness occurs. Assess for peripheral edema. Monitor daily pattern of bowel activity, stool consistency. Assess neurologic status.

Patient/family teaching

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension.
- If dizziness occurs, sit or lie down immediately.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Take pulse properly before each dose and report excessively slow pulse rate (less than 60 beats/min). Report numbness of extremities, dizziness.
- Do not use nasal decongestants, OTC cold preparations (stimulants) without physician's approval.
- Restrict salt, alcohol intake.

bivalirudin

bye-**val**-i-rue-din

HIGH
ALERT

Angiomax

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Thrombin inhibitor.

CLINICAL: Anticoagulant.

Uses

Anticoagulant in pts undergoing percutaneous transluminal coronary angioplasty (PTCA) in conjunction with aspirin and provisional glycoprotein IIb/IIIa

inhibitor. Pts with heparin-induced thrombocytopenia (HIT) and thrombosis syndrome (HITTS) while undergoing percutaneous coronary intervention (PCI) (in conjunction with aspirin). **OFF-LABEL:** HIT; ST-segment elevation MI (STEMI) undergoing PCI.

Precautions

Contraindications: Hypersensitivity to bivalirudin. Active major bleeding. **Cautions:** Renal impairment, conditions associated with increased risk of bleeding (e.g., bacterial endocarditis, recent major bleeding, CVA, stroke, intracerebral surgery, hemorrhagic diathesis, severe hypertension, severe renal/hepatic impairment, recent major surgery).

Action

Specifically and reversibly inhibits thrombin by binding to its receptor sites. **Therapeutic Effect:** Decreases acute myocardial ischemic complications in pts with unstable angina pectoris.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	Immediate	N/A	1 hr

Primarily eliminated by kidneys. Twenty-five percent removed by hemodialysis. **Half-life:** 25 min (increased in moderate to severe renal impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Anticoagulants (e.g., heparin, warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs (e.g., diclofenac, ibuprofen, naproxen), thrombolytic therapy (e.g., TPA) may increase risk of bleeding. **HERBAL:** Dong quai, fish oil (omega-3), feverfew, ginger, ginkgo, ginseng, garlic, licorice, saw

palmetto, vitamin E may increase risk of bleeding. **FOOD:** None known. **LAB VALUES:** Prolongs activated partial thromboplastin time (aPTT), prothrombin time (PT).

Availability (Rx)

Injection, Powder for Reconstitution: 250 mg.

Administration/handling

IV

Reconstitution

- To each 250-mg vial add 5 mL Sterile Water for Injection.
- Gently swirl until fully dissolved.
- Dilute each vial in 50 mL D₅W or 0.9% NaCl bag to yield final concentration of 5 mg/mL (1 vial in 50 mL, 2 vials in 100 mL, 5 vials in 250 mL).
- If low-rate infusion is used after initial infusion, reconstitute the 250-mg vial with added 5 mL Sterile Water for Injection.
- Gently swirl until fully dissolved.
- Dilute each vial in 500 mL D₅W or 0.9% NaCl bag to yield final concentration of 0.5 mg/mL.
- Produces a clear, colorless solution (do not use if cloudy or contains a precipitate).

Rate of Administration

- Adjust IV infusion based on aPTT or pt's body weight.

Storage

- Store unreconstituted vials at room temperature.
- Reconstituted solution may be refrigerated for up to 24 hrs.
- Final dilution with a concentration of 0.5–5 mg/mL is stable at room temperature for up to 24 hrs.

IV incompatibilities

Alteplase (Activase), amiodarone (Cordarone), amphotericin B (AmBisome, Abelcet), diazepam (Valium), DOBUTamine (Dobutrex), reteplase (Retavase), streptokinase (Streptase), vancomycin (Vancocin).

■ IV Compatibilities

Refer to IV compatibility chart in front of book.

Indications/routes/dosage

Anticoagulant in Pts with Unstable Angina, HIT, or HITTS Undergoing PTCA

IV: ADULTS, ELDERLY: 0.75 mg/kg as IV bolus, followed by IV infusion at rate of 1.75 mg/kg/hr for duration of procedure and up to 4 hrs postprocedure. IV infusion may be continued beyond initial 4 hrs at rate of 0.2 mg/kg/hr for up to 20 hrs.

Dosage in Renal Impairment

◀ALERT▶ Initial bolus dose remains unchanged.

Creatinine Clearance	Dosage
30 mL/min or greater	1.75 mg/kg/hr
10–29 mL/min	1 mg/kg/hr
Dialysis	0.25 mg/kg/hr

Dosage in Hepatic Impairment

No dosage adjustment.

Side effects

Frequent (42%): Back pain. **Occasional (15%–12%):** Nausea, headache, hypotension, generalized pain. **Rare (8%–4%):** Injection site pain, insomnia, hypertension, anxiety, vomiting, pelvic or abdominal pain, bradycardia, nervousness, dyspepsia, fever, urinary retention.

Adverse effects/toxic reactions

Hemorrhagic events occur rarely, characterized by significant fall in B/P or Hgb/Hct.

Nursing considerations

Baseline assessment

Assess CBC, PT/INR, aPTT, renal function. Determine initial B/P.

Intervention/evaluation

Monitor aPTT, CBC, urine and stool specimen for occult blood, renal function studies. Monitor for evidence of bleeding. Assess for decrease in B/P, increase in pulse rate. Question for increase in vaginal bleeding during menses.

blinatumomab

blin-a-toom-oh-mab

Blincyto

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Bispecific CD-19-directed CD3 T-cell engager.

CLINICAL: Antineoplastic.

- **BLACK BOX ALERT** ■ Cytokine release syndrome (CRS) or neurologic toxicities, which may be life threatening or fatal, have occurred. Interrupt or discontinue treatment as recommended.

Do not confuse blinatumomab with ibritumomab or tositumomab.

Uses

Treatment of Philadelphia chromosome-negative relapsed or refractory B-cell precursor acute lymphoblastic leukemia (ALL) in adults and children.

Precautions

Contraindications: Hypersensitivity to blinatumomab. **Cautions:** Baseline anemia, leukopenia, neutropenia, thrombocytopenia; active infection or pts at increased risk of infection (diabetes, indwelling catheters), hepatic/renal impairment, electrolyte imbalance, high tumor burden, history of cognitive or

seizure disorders, syncope, elderly.

Action

Activates endogenous T cells by connecting CD3 in the T-cell receptor complex with CD19 on benign and malignant B cells. Mediates proliferation of T cells, release of inflammatory cytokines, production of cytolytic proteins, and upregulation of cell adhesions, resulting in lysis of tumor cells. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis in ALL.

Pharmacokinetics

Widely distributed. Metabolism not specified; degrades into small peptides and amino acids via catabolic pathway. Protein binding: Not specified. Steady state reached within 24 hrs. Excretion not specified; negligible amounts excreted in urine. **Half-life:** 2.1 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Avoid pregnancy. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of neurologic toxicities, including cognitive disorder, encephalopathy, confusion, seizure; serious infections, hepatic impairment.

Interactions

DRUG: May alter concentration of **medications with a narrow therapeutic index (e.g., cycloSPORINE, warfarin)**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease immunoglobulins, Hgb, Hct, neutrophils, leukocytes, platelets; serum albumin, magnesium, phosphate, potassium. May increase serum ALT, AST, bilirubin, GGT, glucose; body weight.

Availability (Rx)

Injection, Lyophilized Powder for Reconstitution: 35 mcg/vial.

Administration/handling

IV

- Hospitalization is recommended for the first 9 days of the first cycle and the first 2 days of the second cycle. For all subsequent cycle starts and reinitiation (e.g., if treatment is interrupted for 4 or more hrs), supervision by a health care professional or hospitalization is recommended.
- Do not flush infusion line after administration, esp. when changing infusion bags. Flushing of infusion line can result in excess dosage and complications.
- At end of infusion, any used solution in IV bag and IV lines should be disposed of in accordance with local requirements.

Premedication

- Premedicate with dexamethasone 20 mg IV 1 hr prior to the first dose of each cycle, prior to step dose (such as cycle 1 on day 8), or when restarting an infusion after an interruption of 4 or more hrs.

Reconstitution

- Reconstitution guidelines are highly specific. Infusion bags must be prepared by personnel trained in aseptic preparations and admixing of oncologic drugs following strict environmental specifications at a USP <797> compliant facility using ISO Class 5 laminar flow hood or better.
- See manufacturer guidelines for details.

Rate of Administration

- Administer as continuous IV infusion at a constant flow rate using an infusion pump. The pump should be programmable, lockable, nonelastomeric, and have an alarm.
- Infusion bags should be infused over 24–48 hrs. Infuse the total 240-mL solution according to the instructions on the pharmacy label of the bag at one of the following constant rates: 10 mL/hr over 24 hrs, or 5 mL/hr over 48 hrs.
- Infuse via dedicated line.
- Use sterile, nonpyrogenic, low protein-binding, 0.2-micron in-line filter.

Storage

- Refrigerate unused vials and IV solution stabilizer until time of use.
- Protect from light.
- Do not freeze.
- Reconstituted vials may be stored at room temperature up to 4 hrs or refrigerated up to 24 hrs.
- Prepared IV bag solutions may be stored at room temperature up to 48 hrs or

refrigerated up to 8 days.

- If prepared IV bag solution is not administered with the infusion time frame and temperature indicated, it must be discarded; do not refrigerate again.

Indications/routes/dosage

Note: See Administration/Handling.

Acute Lymphoblastic Leukemia (ALL)

IV:ADULTS, ELDERLY, CHILDREN: A treatment course consists of up to 2 cycles for induction followed by 3 additional cycles for consolidation and up to 4 additional cycles of continued therapy. Cycles 1–5 consist of 4 wks of continuous IV infusion followed by a 2-wk treatment-free interval. Cycles 6–9 consist of 4 wks of continuous IV infusion followed by an 8-wk treatment-free interval. **PTS WEIGHING 45 KG OR MORE:** (Induction cycle 1): Administer 9 mcg/day on days 1–7, then at 28 mcg/day on days 8–28 as continuous infusion. (Induction cycle 2, consolidation cycles 3–5, continued therapy cycles 6–9): Administer 28 mcg/day on days 1–28. **PTS WEIGHING LESS THAN 45 KG:** (Cycle 1): 5 mcg/m²/day (not to exceed 9 mcg/day) on days 1–7 and 15 mcg/m²/day (**Maximum:** 28 mcg/day) on days 8–28 as continuous infusion. (Induction cycle 2, consolidation cycles 3–5): Administer 15 mcg/m²/day (**Maximum:** 28 mcg/day) on days 1–28.

Dose Modification

(Based on Common Terminology Criteria for Adverse Events)

Note: If interruption after an adverse event is no longer than 7 days, continue the same cycle to a total of 28 days of infusion inclusive of the days before and after the interruption in that cycle. If interruption due to an adverse event is longer than 7 days, start new cycle.

Cytokine Release Syndrome

CTCAE Grade 3: Withhold until resolved, then restart at 9 mcg/day. Increase dose to 28 mcg/day after 7 days if toxicity does not occur. **CTCAE Grade 4:** Permanently discontinue.

Neurological Toxicity

CTCAE Grade 3: Withhold until no more than Grade 1 for at least 3 days, then restart at 9 mcg/day. Increase dose to 28 mcg/day after 7 days if toxicity does not recur. If toxicity occurred at 9 mcg/day, or if toxicity takes more than 7 days to

resolve, permanently discontinue. **CTCAE Grade 4:** Permanently discontinue.

Seizure

Permanently discontinue if more than one seizure occurs.

Other Clinically Relevant Adverse Reactions

CTCAE Grade 3: Withhold until no more than Grade 1, then restart at 9 mcg/day. Increase dose to 28 mcg/day after 7 days if toxicity does not recur. If toxicity takes more than 14 days to resolve, permanently discontinue. **CTCAE Grade 4:** Consider permanent discontinuation.

Elevated Hepatic Enzymes

Interrupt treatment if ALT/AST rise to greater than 5 times upper limit of normal (ULN) or bilirubin rises to more than 3 times ULN. Consider dose recommendation as listed in other clinically relevant adverse reactions or as ordered by prescriber.

Dosage in Renal Impairment

CrCl equal to or greater than 30 mL/min: No dose adjustment. **CrCl less than 30 mL/min or hemodialysis:** Not specified; use caution.

Dosage in Hepatic Impairment

Not specified; use caution. Hepatic toxicity during treatment: see dose modification.

Side effects

Frequent (62%–36%): Pyrexia, headache. **Occasional (25%–5%):** Peripheral edema, nausea, tremor, constipation, diarrhea, cough, fatigue, dyspnea, insomnia, chills, abdominal pain, dizziness, back pain, extremity pain, vomiting, bone pain, chest pain, decreased appetite, arthralgia, hypotension, hypertension, tachycardia, confusion, paresthesia. **Rare (4%–2%):** Aphasia, memory impairment.

Adverse effects/toxic reactions

Myelosuppression (principally, anemia, leukopenia, neutropenia, thrombocytopenia) is an expected outcome of treatment. Cytokine release syndrome (CRS) may be life threatening or fatal. Symptoms of CRS may include asthenia, hypotension, nausea, pyrexia; elevated ALT/AST, bilirubin;

disseminated intravascular coagulation (DIC), capillary leak syndrome, hemophagocytic lymphohistiocytosis/macrophage activation syndrome (HLH/MAS). Infusion reactions have occurred and may be clinically indistinguishable from CRS. Neurologic toxicities such as altered level of consciousness, balance disorders, confusion, disorientation encephalopathy, seizures, speech disorders, syncope occurred in approx. 50% of pts and may affect ability to drive or operate machinery. Median time to onset of neurologic toxicity was 7 days. CTCAE Grade 3 toxicities or higher occurred in 15% of pts. Serious infections such as opportunistic infections, bacterial/viral/fungal infections, sepsis, pneumonia, catheter-site infections occurred in 25% of pts. Other life-threatening or fatal events may include tumor lysis syndrome, neutropenia/febrile neutropenia, leukoencephalopathy. Medication preparation and administration errors have occurred, resulting in underdose or overdose. Immunogenicity (anti-blinatumomab antibodies) occurred in less than 1% of pts.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFTs, serum magnesium, phosphate, ionized calcium, vital signs. Consider electrolyte correction before starting treatment. Screen for home medications requiring narrow therapeutic index. Screen for active infection, history of seizures, hepatic/renal impairment, cognitive disorders. Verify pregnancy status in women of childbearing potential. Assess plans of breastfeeding. Conduct full neurologic assessment.

Intervention/evaluation

Monitor CBC, LFTs, serum electrolytes (correct as indicated), vital signs. Monitor closely for cytokine release syndrome, neurologic toxicities, serious infection, tumor lysis syndrome, hepatic impairment. Keep area around IV site clean to reduce risk of infection. Do not adjust setting of infusion pump. Pump changes may result in dosing errors. Do not flush IV line after infusion completion. Initiate fall precautions. Monitor I&O.

Patient/family teaching

- Treatment may cause life-threatening side effects that must be immediately treated by medical personnel.

- Report symptoms of cytokine release syndrome, such as chills, facial swelling, fever, low blood pressure, nausea, vomiting, weakness; any infusion-related reactions, such as difficulty breathing or skin rash.
- Report any neurologic problems, such as confusion, difficulty speaking or slurred speech, loss of consciousness, loss of balance, or seizures.
- Treatment may lower your white blood cell count and increase your risk of infection. Report any signs of infection, such as fever, cough, fatigue, or burning with urination. Keep area around IV catheter clean at all times to reduce risk of infection.
- Do not change or alter settings on infusion pump, even if the pump alarm sounds. Any changes made to the infusion pump by anyone other than trained medical personnel can result in a dose that is too high or too low and may be life threatening.
- Report symptoms of liver problems, such as bruising, confusion, dark or amber-colored urine, right upper abdominal pain, or yellowing of the skin or eyes.
- Avoid tasks that require alertness, motor skills until response to drug is established. Do not drive or operate machinery.
- Blood levels will be monitored routinely.
- Hospitalization is required when starting therapy.

bortezomib

bor-**tez**-oh-mib

**HIGH
ALERT**

Velcade

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Protease inhibitor.

CLINICAL: Antineoplastic.

Uses

Treatment of relapsed or refractory mantle cell lymphoma. Treatment of multiple myeloma. **OFF-LABEL:** Treatment of Waldenström's macroglobulinemia; peripheral or cutaneous T-cell lymphoma; systemic light-chain amyloidosis.

Precautions

Contraindications: Hypersensitivity to bortezomib, boron or mannitol;

intrathecal administration. **Cautions:** Concomitant use of CYP3A4 inhibitors, history of syncope, concomitant use of antihypertensives; dehydration, diabetes, hepatic impairment, preexisting cardiac disease, neuropathy.

Action

Inhibits proteasomes (enzyme complexes regulating protein homeostasis within the cell). **Therapeutic Effect:** Produces cell-cycle arrest, apoptosis.

Pharmacokinetics

Widely distributed. Protein binding: 83%. Primarily metabolized by enzymatic action. Significant biliary excretion, with lesser amount excreted in urine. **Half-life:** 9–15 hrs.

Lifespan considerations

Pregnancy/Lactation: May induce degenerative effects in ovary, degenerative changes in testes. May affect male/female fertility. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Increased incidence of Grade 3 or 4 thrombocytopenia.

Interactions

DRUG: CYP3A4 inhibitors (e.g., itraconazole, ketoconazole) may increase concentration/toxicity. CYP3A4 inducers (e.g., rifAMPin) may decrease concentration/effect (avoid use). **HERBAL:** Green tea, green tea extracts may diminish effect. **St. John's wort** may decrease level/effect. **FOOD:** Grapefruit products may increase concentration. **LAB VALUES:** May significantly decrease WBC, Hgb, Hct, platelet count, neutrophils.

Availability (Rx)

Injection, Powder for Reconstitution: 3.5 mg.

Administration/handling

 IV

Reconstitution

- Reconstitute vial with 3.5 mL 0.9% NaCl to provide a concentration of 1 mg/mL.

Rate of Administration

- Give as bolus IV injection over 3–5 sec.

Storage

- Store unopened vials at room temperature.
- Once reconstituted, solution may be stored at room temperature for up to 3 days or for 5 days if refrigerated.

Subcutaneous

Reconstitution

- Reconstitute vial with 1.4 mL 0.9% NaCl to provide a concentration of 2.5 mg/mL.

Indications/routes/dosage

Mantle Cell Lymphoma (Initial Treatment)

IV:ADULTS, ELDERLY: 1.3 mg/m² days 1, 4, 8, 11 of a 21-day cycle for 6 cycles (in combination with ritUXimab, cyclophosphamide, DOXOrubicin, and predniSONE).

Mantle Cell Lymphoma (Relapsed)

IV:Subcutaneous: ADULTS, ELDERLY: Treatment cycle consists of 1.3 mg/m² twice wkly on days 1, 4, 8, and 11 for 2 wks of a 21-day treatment for 8 cycles. Therapy extending beyond 8 cycles may be given by standard schedule or given once weekly for 4 wks followed by a 13-day rest period.

Multiple Myeloma (Initial Treatment)

IV:Subcutaneous:ADULTS, ELDERLY: (with melphalan and predniSONE) 1.3 mg/m² on days 1, 4, 8, 11, 22, 25, 29, 32 of a 42-day cycle for 4 cycles, then 1.3 mg/m² on days 1, 8, 22, 29 of a 42-day cycle for 5 cycles.

Multiple Myeloma (Relapsed)

IV, Subcutaneous:ADULTS, ELDERLY: 1.3 mg/m² twice wkly for 2 wks on

days 1, 4, 8, 11 of a 21-day treatment cycle for 8 cycles. Therapy extending beyond 8 cycles may be given by standard schedule or given once weekly × 4 wks followed by a 13-day rest period.

Dosage Adjustment Guidelines

Withhold therapy at onset of CTCAE Grade 3 nonhematologic or Grade 4 hematologic toxicities, excluding neuropathy. When symptoms resolve, resume therapy at a 25% reduced dosage.

Dosage Adjustment Guidelines with Neuropathic Pain, Peripheral Sensory Neuropathy

For CTCAE Grade 1 toxicity with pain or Grade 2 (interfering with function but not activities of daily living [ADL]), 1 mg/m². For Grade 2 toxicity with pain or Grade 3 (interfering with ADL), withhold drug until toxicity is resolved, then reinitiate with 0.7 mg/m². For Grade 4 toxicity (permanent sensory loss that interferes with function), discontinue bortezomib.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: No initial adjustment. **Moderate (bilirubin greater than 1.5–3 times upper limit of normal [ULN]) to severe (bilirubin greater than 3 times ULN) impairment:** Decrease initial dose to 0.7 mg/m² (based on tolerance may increase to 1 mg/m² or decrease to 0.5 mg/m²).

Side effects

Expected (65%–36%): Fatigue, malaise, asthenia, nausea, diarrhea, anorexia, constipation, fever, vomiting. **Frequent (28%–21%):** Headache, insomnia, arthralgia, limb pain, edema, paresthesia, dizziness, rash. **Occasional (18%–11%):** Dehydration, cough, anxiety, bone pain, muscle cramps, myalgia, back pain, abdominal pain, taste alteration, dyspepsia, pruritus, hypotension (including orthostatic hypotension), rigors, blurred vision.

Adverse effects/toxic reactions

Thrombocytopenia occurs in 40% of pts. GI, intracerebral hemorrhage are associated with drug-induced thrombocytopenia. Anemia occurs in 32% of pts. New onset or worsening of existing neuropathy occurs in 37% of pts. Symptoms may improve in some pts upon drug discontinuation. Pneumonia occurs occasionally.

Nursing considerations

Baseline assessment

Obtain baseline CBC. Ensure adequate hydration prior to initiation of therapy. Antiemetics, antidiarrheals may be effective in preventing, treating nausea, vomiting, diarrhea.

Intervention/evaluation

Routinely assess B/P; monitor pt for orthostatic hypotension. Maintain strict I&O. Monitor CBC, esp. platelet count, throughout treatment. Monitor renal, hepatic, pulmonary function throughout therapy. Encourage adequate fluid intake to prevent dehydration. Monitor temperature and be alert to high potential for fever. Monitor for peripheral neuropathy (burning sensation, neuropathic pain, paresthesia, hyperesthesia). Avoid IM injections, rectal temperatures, other traumas that may induce bleeding.

Patient/family teaching

- Report new/worsening vomiting, bruising/bleeding, breathing difficulties.
- Discuss importance of pregnancy testing, avoidance of pregnancy, measures to prevent pregnancy.
- Increase fluid intake.
- Avoid tasks that require mental alertness, motor skills until response to drug is established.

bosutinib

boe-**sue**-ti-nib

Bosulif

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor.

CLINICAL: Antineoplastic.

Uses

Treatment of chronic, accelerated, or blast phase Philadelphia chromosome–positive chronic myelogenous leukemia (CML) with resistance or intolerance to prior therapy.

Precautions

Contraindications: Hypersensitivity to bosutinib. **Cautions:** Baseline anemia, thrombocytopenia, neutropenia; hepatic impairment, recent diarrhea, pulmonary edema, HF, fluid retention. Pts with history of pancreatitis, moderate to severe renal impairment. Avoid concurrent use of CYP3A4 inducers/inhibitors.

Action

Inhibits Bcr-Abl tyrosine kinase, a translocation-created enzyme, created by the Philadelphia chromosome abnormality noted in chronic myelogenous leukemia (CML). Inhibits Src-family kinase, including Src, Lyn, and Hck. **Therapeutic Effect:** Inhibits tumor cell growth and proliferation in chronic, accelerated, or blast phase CML.

Pharmacokinetics

Well absorbed following oral administration. Protein binding: 94%. Metabolized in liver. Excreted in feces (91%), urine (3%). **Half-life:** 22.5 hrs.

⌚ Lifespan considerations

Pregnancy/Lactation: Potential for embryo/fetal toxicity. Avoid pregnancy. Must use effective contraception during treatment and for at least 30 days after treatment. Unknown if distributed in breast milk. Avoid breastfeeding. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP3A inhibitors and/or P-glycoprotein (P-gp) inhibitors (e.g., clarithromycin, ketoconazole, ritonavir, miSOPROStol, nafcillin, salmeterol), moderate CYP3A4 inhibitors (e.g., ciprofloxacin, diltiazEM, erythromycin, verapamil) may increase concentration/effect. **Strong CYP3A4 inducers** (e.g., rifAMPin, phenytoin, PHENobarbital) and **moderate CYP3A4 inducers** (e.g., bosentan, nafcillin, modafinil) may decrease concentration/effect. **Proton pump inhibitors** (e.g., omeprazole, pantoprazole) may reduce absorption, concentration. **HERBAL:** **St. John's wort** may decrease effectiveness. **FOOD:** **Grapefruit products** may decrease bosutinib concentration. **LAB VALUES:** May decrease Hgb, platelets, WBCs, serum phosphorous. May increase serum ALT, AST, bilirubin, lipase.

Availability (Rx)

 **Tablets:** 100 mg, 500 mg.

Administration/handling

PO

- Give with food. Do not break, crush, dissolve, or divide tablets.

Indications/routes/dosage

Chronic Myelogenous Leukemia (CML)

PO: ADULTS, ELDERLY: 500 mg once daily with food. If complete hematologic response not achieved by wk 8 or complete cytogenetic response not achieved by wk 12, in absence of grade 3 or higher adverse reactions, may increase to 600 mg once daily.

CML with Baseline Renal Impairment

CrCl less than 30 mL/min: 300 mg once daily. **CrCl 30–50 mL/min:** 400 mg once daily.

CML with Baseline Hepatic Impairment

PO:ADULTS: 200 mg once daily with food.

Dosage Modification

Hepatotoxicity: Withhold treatment until serum ALT, AST less than or equal to 2.5 times ULN. Then, resume at 400 mg once daily with food. Discontinue if recovery lasts longer than 4 wks or hepatotoxicity, including elevated serum bilirubin levels greater than 2 times ULN. **Severe diarrhea:** Withhold until recovery to low-grade diarrhea. Then, resume at 400 mg once daily with food. **Myelosuppression:** Withhold until absolute neutrophil count greater than 1000 cells/mm³ and platelet count greater than 50,000 cells/mm³. Then, resume at same dose if recovery occurs within 2 wks. May reduce dose to 400 mg for recovery lasting greater than 2 wks.

Side effects

Frequent (82%–35%): Diarrhea, nausea, vomiting, abdominal pain, rash. **Occasional (26%–10%):** Pyrexia, fatigue, headache, cough, peripheral edema, arthralgia, anorexia, upper respiratory infection, asthenia, back pain, nasopharyngitis, dizziness, pruritus.

Adverse effects/toxic reactions

Severe fluid retention may result in pleural effusion, pericardial effusion, pulmonary edema, ascites. Neutropenia, thrombocytopenia, anemia is an expected response of drug therapy. Severe diarrhea may result in fluid loss, electrolyte imbalance, hypotension. Hepatotoxicity occurred in 7%–9% of pts.

Nursing considerations

Baseline assessment

Offer emotional support. Assess baseline weight, BMP, LFT. Confirm negative pregnancy test before initiating treatment. Obtain full medication history, including vitamins, herbal products. Screen for peripheral edema, signs/symptoms of HF, anemia.

Intervention/evaluation

Weigh daily and monitor for unexpected rapid weight gain, edema. Monitor for changes in serum electrolytes, LFT during treatment. Offer antiemetics for nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Monitor CBC for neutropenia, thrombocytopenia, anemia. Assess for bruising, hematuria, jaundice, right upper abdominal pain, weight loss, or acute infection (fever, diaphoresis, lethargy, productive cough).

Patient/family teaching

- Blood levels will be drawn routinely.
- Take with meals.
- Drink plenty of fluids (diarrhea may result in dehydration).
- Swallow whole; do not break, chew, crush, dissolve, or divide tablets.
- Strictly avoid pregnancy.
- Use contraception during treatment and for at least 30 days after treatment.
- Report urine changes, bloody or clay-colored stools, upper abdominal pain, nausea, vomiting, bruising, persistent diarrhea, fever, cough, difficulty breathing, chest pain.
- Immediately report any newly prescribed medications.
- Avoid alcohol, grapefruit products.
- Discuss using antacids for indigestion, heartburn, upset stomach (omeprazole, lansoprazole, pantoprazole may reduce absorption, concentration of bosutinib).
- Separate antacid dosing by more than 2 hrs before and after medication.

brentuximab vedotin

bren-**tux**-i-mab ve-**doe**-tin

Adcetris

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody, antimetabolic.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ JC virus infection resulting in progressive multifocal leukoencephalopathy and death can occur.

Uses

Treatment of relapsed or refractory Hodgkin's lymphoma after failure of autologous hematopoietic stem cell transplant (HSCT) or after failure of at least two prior multiagent chemotherapy regimens in pts who are not transplant candidates. Treatment of systemic anaplastic large-cell lymphoma (ALCL) after failure of at least one prior multiagent chemotherapy regimen.

Precautions

Contraindications: Hypersensitivity to brentuximab. Avoid use with bleomycin (increased risk for pulmonary toxicity). **Cautions:** Renal/hepatic impairment, peripheral neuropathy, infusion reactions, neutropenia, tumor lysis syndrome, Stevens-Johnson syndrome, pregnancy.

Action

Binds to CD30-expressing cells, allowing the antibody to direct the drug to a target on lymphoma cells, disrupting the microtubule network within the cell. **Therapeutic Effect:** Induces cell cycle arrest, cell death.

Pharmacokinetics

Minimally metabolized. Protein binding: 68%–82%. Excreted primarily in feces (72%). **Half-life:** 4–6 days.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm (embryo-fetal toxicities). Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

Interactions

DRUG: Strong CYP3A4 inhibitors (e.g., atazanavir, clarithromycin, ketoconazole) increase concentration/effect. CYP3A4 inducers (e.g., rifAMPin) may reduce concentration/effect. **FOOD:** None known. **HERBAL:** Echinacea may decrease effect. **LAB VALUES:** May decrease Hgb, Hct, WBC, RBC, platelets. May increase serum bicarbonate, lactate dehydrogenase, glucose, albumin, magnesium, sodium.

Availability (Rx)

Injection, Powder for Reconstitution: 50-mg single-use vial.

Administration/handling

IV

Reconstitution

- Reconstitute each 50-mg vial with 10.5 mL Sterile Water for Injection, directing the stream toward wall of vial and not at powder.
- Gently swirl (do not shake).
- This will yield a concentration of 5 mg/mL.
- The dose for pts weighing over 100 kg should be calculated for 100 kg.
- Reconstituted solution must be transferred to infusion bag with a minimum 100 mL diluent, yielding a final concentration of 0.4–1.8 mg/mL brentuximab.
- Gently invert bag to mix solution.

Rate of Administration

- Infuse over 30 min.

Storage

- Discard if solution contains particulate or is discolored; solution should appear clear to slightly opalescent, colorless.
- May store solution at 36°–46°F.
- Use within 24 hrs after reconstitution.

IV Compatibilities

0.9% NaCl, D₅W, lactated Ringer's.

Indications/routes/dosage

◀ALERT▶ Do not give by IV bolus or IV push.

Hodgkin's Lymphoma (Relapsed or Refractory)

IV Infusion: ADULTS, ELDERLY: 1.8 mg/kg (**Maximum:** 180 mg) infused over 30 min every 3 wks. Continue treatment until disease progression or unacceptable toxicity.

Hodgkin's Lymphoma (After HSCT)

IV Infusion: ADULTS/ELDERLY: 1.8 mg/kg (**Maximum:** 180 mg) infused over 30 min every 3 wks. Continue treatment until a maximum of 16 cycles, disease progression, or unacceptable toxicity occurs. Begin within 4–6 wks post HSCT or upon recovery from HSCT.

Systemic Anaplastic Large-Cell Lymphoma

IV Infusion: ADULTS/ELDERLY: 1.8 mg/kg (**Maximum:** 180 mg) infused over 30 min every 3 wks. Continue treatment until disease progression or unacceptable toxicity occurs.

Dosage in Renal Impairment

CrCl less than 30 mL/min: Avoid use.

Dosage in Hepatic Impairment

Mild impairment: Initial dose 1.2 mg/kg (**Maximum:** 120 mg) q3wks.

Moderate to Severe impairment: Avoid use.

Side effects

◀ALERT▶ Effects present as mild, manageable.

Frequent (52%–22%): Peripheral neuropathy, fatigue, respiratory tract infection, nausea, diarrhea, fever, rash, abdominal pain, cough, vomiting.

Occasional (19%–11%): Headache, dizziness, constipation, chills, bone/muscle pain, insomnia, peripheral edema, alopecia. **Rare (10%–5%):** Anxiety, muscle spasm, decreased appetite, dry skin.

Adverse effects/toxic reactions

Myelosuppression characterized as neutropenia (54% of pts), peripheral neuropathy (52% of pts), thrombocytopenia (28% of pts), anemia (19% of pts) have occurred. Infusion reactions (including anaphylaxis), Stevens-Johnson syndrome have been reported. Tumor lysis syndrome may lead to acute renal failure. Progressive multifocal leukoencephalopathy (changes in mood, confusion, loss of memory, decreased strength or weakness on one side of body, changes in speech, walking, and vision) has been reported.

Nursing considerations

Baseline assessment

Obtain baseline CBC before treatment begins and as needed to monitor response and toxicity but particularly prior to each dosing cycle. Question for evidence of peripheral neuropathy (hypoesthesia, hyperesthesia, paresthesia, burning sensation, neuropathic pain or weakness). Pts experiencing new or worsening neuropathy may require a delay, dose change, or discontinuation of treatment.

Intervention/evaluation

Offer antiemetics to control nausea, vomiting. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, bruising, unusual bleeding), symptoms of anemia (excessive fatigue, weakness). Assess response to medication. Monitor and report nausea, vomiting, diarrhea. Monitor daily pattern of bowel activity, stool consistency. Assess skin for evidence of rash.

Patient/family teaching

- Avoid crowds, persons with known infections.
- Report signs of infection at once (fever, flu-like symptoms).
- Avoid contact with those who recently received live virus vaccine.
- Do not receive immunizations without physician's approval (drug lowers body resistance).
- Promptly report fever, easy bruising or unusual bleeding from any site.
- Male pts should be warned of potential risk to their reproductive capacities.

brexpiprazole

brex-**pip**-ra-zole

Rexulti

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: DOPamine agonist.

CLINICAL: Antipsychotic agent.

■ **BLACK BOX ALERT** ■ Elderly pts with dementia-related psychosis are at increased risk of death, mainly due to HF, pneumonia. Increased risk of suicidal thoughts and behaviors in patients aged 24 yrs and younger with

major depression, other psychiatric disorders.

Do not confuse brexpiprazole with ARIPiprazole, esomeprazole, omeprazole, or pantoprazole, or RABEprazole.

Uses

Adjunctive therapy to antidepressants for the treatment of major depressive disorder. Treatment of schizophrenia.

Precautions

Contraindications: Hypersensitivity to brexpiprazole. **Cautions:** Concurrent use of CNS depressants (including alcohol) antihypertensives, disorders in which CNS depression is a feature, cardiovascular or cerebrovascular disease (may induce hypotension), Parkinson's disease, Parkinson's disease dementia, Lewy body dementia, history of seizures or conditions that may lower seizure threshold (Alzheimer's disease). Pts at risk for aspiration pneumonia, elderly, HF, diabetes. Pts at high risk for suicide. Preexisting low WBC/ANC, history of drug-induced leukopenia/neutropenia, dehydration.

Action

Exact mechanism of action unknown. Provides partial agonist activity at DOPamine and serotonin (5-HT_{1A}) receptors and antagonist activity at serotonin (5-HT_{2A}) receptors. **Therapeutic Effect:** Diminishes schizophrenic, depressive behavior.

Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: greater than 99%. Peak plasma concentration: 4 hrs. Steady state reached in 10–12 days. Excreted in urine (25%), feces (46%). **Half-life:** 86–91 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. May cause extrapyramidal and/or withdrawal symptoms in neonates if given in third

trimester. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk for adverse effects due to age-related hepatic, renal, cardiac disease. May increase risk of death in elderly pts with dementia-related psychosis.

Interactions

DRUG: **Alcohol** may potentiate cognitive and motor effects. **Strong CYP3A4 inducers** (e.g., **carbamazepine, rifampin**) may decrease concentration/effect. **Strong CYP3A4 inhibitors** (e.g., **itraconazole, ketoconazole**), **strong CYP2D6 inhibitors** (e.g., **fluoxetine, paroxetine**) may increase concentration/effect. **HERBAL:** **St John's wort** may decrease concentration. **Gotu kola, kava kava, St John's wort, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease leukocytes, neutrophils. May increase serum blood glucose, lipid levels.

Availability (Rx)

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg.

Administration/handling

PO

- Give without regard to food.

Indications/routes/dosage

Major Depressive Disorder (MDD)

PO:ADULTS, ELDERLY: Initially, 0.5–1 mg once daily. May increase at weekly intervals, to 1 mg once daily, then up to target dose of 2 mg once daily.

Maximum: 3 mg once daily.

Schizophrenia

PO:ADULTS, ELDERLY: Initially, 1 mg once daily on days 1–4. May increase to 2 mg once daily on days 5–7, then to 4 mg once daily on day 8 based on clinical response and tolerability. **Maximum:** 4 mg once daily.

Dose Modification

Renal Impairment (CrCl less than 60 mL/min)

Maximum: 2 mg once daily for MDD, or 3 mg once daily for schizophrenia.

Hepatic Impairment

Maximum recommended dose: 2 mg once daily for MDD, or 3 mg once daily for schizophrenia.

CYP2D6 Poor Metabolizers or Pts Taking Strong CYP2D6 Inhibitors or Strong CYP3A4 Inhibitors

Administer half of the usual dose.

CYP2D6 Poor Metabolizers Taking Strong/Moderate CYP3A4 Inhibitors or Pts Taking Strong/Moderate CYP2D6 Inhibitors with Strong/Moderate CYP3A4 Inhibitors

Administer a quarter of the usual dose.

Pts Taking Strong CYP3A4 Inducers

Double the usual dose over 1–2 wks.

Side effects

Occasional (9%–4%): Headache, nasopharyngitis, dyspepsia, akathisia, somnolence, tremor. **Rare (3%–1%):** Constipation, fatigue, increased appetite, weight gain, anxiety, restlessness, dizziness, diarrhea, blurry vision, dry mouth, salivary hypersecretion, abdominal pain, flatulence, myalgia, abnormal dreams, insomnia, hyperhidrosis.

Adverse effects/toxic reactions

May increase risk of death in elderly pts with dementia-related psychosis. Most deaths appeared to be cardiovascular (e.g., HF, sudden death) or infectious (e.g., pneumonia) in nature. Increased incidence of suicidal thoughts and behaviors in pts 24 yrs and younger was reported. May increase risk of neuroleptic malignant syndrome (NMS). Symptoms of NMS may include hyperpyrexia, muscle rigidity, altered mental status, autonomic instability (irregular pulse or blood pressure, tachycardia, diaphoresis, and cardiac dysrhythmia), elevated creatinine, phosphokinase, myoglobinuria (rhabdomyolysis), acute renal failure. Metabolic changes such as hyperglycemia, ketoacidosis, hyperosmolar coma, diabetes, dyslipidemia, dystonia, and weight gain may occur. Other adverse effects may include leukopenia, neutropenia, agranulocytosis, orthostatic hypotension,

syncope, cerebrovascular events (e.g., CVA, transient ischemic attack), seizures, hyperthermia, dysphagia, cognitive or motor impairment, tardive dyskinesia.

Nursing considerations

Baseline assessment

Obtain baseline BMP, capillary blood glucose, vital signs; CBC in pts with preexisting low WBC or history of leukopenia or neutropenia. Receive full medication history and screen for drug interactions. Assess behavior, appearance, emotional state, response to environment, speech pattern, thought content. Correct dehydration, hypovolemia. Assess for suicidal tendencies, history of dementia-related psychosis, HF, CVA, NMS, diabetes.

Intervention/evaluation

Monitor weight, BMP, capillary blood glucose, vital signs. Diligently monitor for extrapyramidal symptoms, tardive dyskinesia, hypotension, syncope, cerebrovascular or cardiovascular dysfunction, NMS. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

Patient/family teaching

- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report worsening depression, suicidal ideation, usual changes in behavior.
- Treatment may cause life-threatening conditions such as involuntary, uncontrollable movements; elevated body temperature, altered mental status, high or low blood pressure, seizures.
- Pts with HF or active pneumonia are at increased risk of sudden death.
- Immediately report fever, cough, increased sputum production, palpitations, fainting, or signs of HF.

brigatinib

bri-ga-ti-nib

Alunbrig

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse brigatinib with axitinib, cabozantinib, ceritinib, crizotinib, erlotinib, imatinib.

Uses

Treatment of pts with anaplastic lymphoma kinase (ALK)-positive metastatic non-small-cell lung cancer (NSCLC) who have progressed or are intolerant to crizotinib.

Precautions

Contraindications: Hypersensitivity to brigatinib. **Cautions:** Baseline anemia, leukopenia. History of symptomatic bradycardia, bradyarrhythmias, diabetes, hepatic/renal impairment, hypertension, ocular disease, pancreatitis, pulmonary disease. Concomitant use of strong CYP3A inhibitors, beta blockers, calcium channel blockers (see Interactions).

Action

A broad-spectrum kinase inhibitor (activity against ALK, ROSI, IGF-1R and FLT-3). Inhibits ALK downstream signaling proteins. Has activity against cells expressing EML4-ALK. **Therapeutic Effect:** Expresses anti-tumor activity against EML-ALK; mutant forms shown in NSCLC in pts progressed with crizotinib.

Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: 66%. Peak plasma concentration: 1–4 hrs. Excreted in feces (65%), urine (25%). **Half-life:** 25 hrs.

🕒 Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective nonhormonal contraception during treatment and for at least 4 mos after discontinuation. Unknown if distributed in

breast milk. Breastfeeding not recommended during treatment and for at least 1 wk after discontinuation. **Males:** Males with female partners of reproductive potential should use barrier methods during sexual activity during treatment for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole, ritonavir) may increase concentration/effect. Strong CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. May decrease effectiveness of hormonal contraceptives. Concomitant use of beta blockers (e.g., atenolol, carvedilol, metoprolol), calcium channel blockers (e.g., diltiazem, verapamil), digoxin may increase risk of symptomatic bradycardia. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, amylase, bilirubin, CPK, glucose, lipase. May decrease Hct, Hgb, lymphocytes, RBCs; serum phosphate. May prolong aPTT.

Availability (Rx)

Tablets: 30 mg, 90 mg.

Administration/handling

PO

- Give with or without food.
- Administer tablets whole; do not break, crush, cut, or divide.
- If a dose is missed or vomiting occurs after administration, do not give extra dose. Administer next dose at regularly scheduled time.

Indications/Routes/Dosage

Non–Small-Cell Lung Cancer

PO: ADULTS, ELDERLY: 90 mg once daily for 7 days. If 90-mg dose is

tolerated, then increase to 180 mg once daily. Continue until disease progression or unacceptable toxicity. If treatment is interrupted for 14 days (or more) for reasons other than toxic reactions, restart at 90 mg once daily for 7 days before increasing to the dose that was previously tolerated.

Dose Reduction Schedule

First dose reduction: 90 mg once daily: Reduce to 60 mg once daily. **180 mg once daily:** Reduce to 120 mg once daily.

Second dose reduction: 90 mg once daily: Permanently discontinue. **180 mg once daily:** Reduce to 90 mg once daily.

Third dose reduction: 90 mg once daily: N/A. **180 mg once daily:** Reduce to 60 mg once daily. **Note:** Once dose has been reduced, do not subsequently increase dose. If pt is unable to tolerate 60-mg dose, permanently discontinue.

Dose Modification

Symptomatic Bradycardia

Withhold treatment until recovery to asymptomatic bradycardia or to a heart rate of 60 bpm or greater, then resume at reduced dose level (if pt not taking concomitant medications known to cause bradycardia). **Symptomatic bradycardia in pts taking concomitant medications known to cause bradycardia:** Withhold treatment until recovery to asymptomatic bradycardia or heart rate of 60 bpm or greater. If concomitant medication can be adjusted or discontinued, then resume at same dose. If concomitant medication cannot be adjusted or discontinued, then resume at reduced dose level.

Life-threatening bradycardia in pts who are not taking concomitant medications known to cause bradycardia: Permanently discontinue. **Life-threatening bradycardia in pts who are taking concomitant medications known to cause bradycardia:** Withhold treatment until recovery to asymptomatic bradycardia or heart rate of 60 bpm or greater. If concomitant medication can be adjusted or discontinued, then resume at reduced dose level with frequent monitoring. Permanently discontinue if symptomatic bradycardia recurs despite dose reduction.

CPK Elevation

CTCAE grade 3 CPK elevation (greater than 5 times upper limit of normal

[ULN]: Withhold treatment until recovery to baseline or less than or equal to 2.5 times ULN, then resume at same dose. **CTCAE grade 4 CPK elevation (greater than 10 times ULN) or recurrence of CTCAE grade 3 CPK elevation:** Withhold treatment until recovery to baseline or less than or equal to 2.5 times ULN, then resume at reduced dose level.

Hyperglycemia

CTCAE grade 3 serum glucose elevation (greater than 250 mg/dL or 13.9 mmol/L): If adequate medical management of hyperglycemia cannot be achieved, withhold treatment until adequately controlled. Consider dose reduction or permanent discontinuation.

Hypertension

CTCAE grade 3 hypertension (systolic BP greater than or equal to 160 mm Hg or diastolic BP greater than or equal to 100 mm Hg); concomitant use of more than one antihypertensive drug; required medical intervention; requirement of aggressive hypertensive therapy: Withhold treatment until recovery to grade 1 or 0, then resume at reduced dose level. **CTCAE grade 4 hypertension (first occurrence) or recurrence of grade 3 hypertension:** Withhold treatment until recovery to grade 1 or 0, then either resume at reduced dose level or permanently discontinue. **Recurrence of grade 4 hypertension:** Permanently discontinue.

Lipase/Amylase Elevation

CTCAE grade 3 serum amylase or lipase elevation (greater than 2 times upper limit of normal [ULN]): Withhold treatment until recovery to grade 1 or 0 (or baseline), then resume at same dose. **CTCAE grade 4 serum amylase or lipase elevation (greater than 5 times ULN) or recurrence of grade 3 serum lipase or amylase elevation:** Withhold treatment until recovery to grade 1 or 0, then resume at reduced dose level.

Pulmonary

CTCAE grade 1 pulmonary symptoms during the first 7 days of therapy: Withhold treatment until recovery to baseline, then resume at same dose level. Do not increase dose if interstitial lung disease (ILD)/pneumonitis suspected. **CTCAE grade 1 pulmonary symptoms after the first 7 days of therapy:**

Withhold treatment until recovery to baseline, then resume at same dose level. **CTCAE grade 2 pulmonary symptoms during the first 7 days of therapy:** Withhold treatment until recovery to baseline, then resume at reduced dose level. Do not increase dose if ILD/pneumonitis suspected. **CTCAE grade 2 pulmonary symptoms after the first 7 days of therapy:** Withhold treatment until recovery to baseline, then resume at same dose level. If ILD/pneumonitis is suspected, resume at reduced dose level. With any recurrence of ILD/pneumonitis or any grade 3 or 4 pulmonary symptoms, permanently discontinue.

Visual Disturbance

CTCAE grade 2 or 3 visual disturbance: Withhold treatment until recovery to baseline, then resume at reduced dose level. **Grade 4 visual disturbance:** Permanently discontinue.

Other Toxicities

Any other CTCAE grade 3 toxicity: Withhold treatment until recovery to baseline, then resume at same dose level. **Recurrence of any other grade 3 toxicity:** Withhold treatment until recovery to baseline, then either resume at reduced dose level or permanently discontinue. **First occurrence of any other CTCAE grade 4 toxicity:** Withhold treatment until recovery to baseline, then either resume at reduced dose level or permanently discontinue. **Recurrence of any other grade 4 toxicity:** Permanently discontinue.

Concomitant use of strong CYP3A inhibitors: Reduce daily dose by 50% if strong CYP3A inhibitor cannot be discontinued. If strong CYP3A inhibitor is discontinued, then resume the dose that was previously tolerated before starting CYP3A inhibitor.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Not specified; use caution.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

Side Effects

Frequent (33%–19%): Nausea, fatigue, headache, dyspnea, vomiting, decreased appetite, diarrhea, constipation. **Occasional (18%–9%):** Cough, abdominal pain, rash (acneiform dermatitis, exfoliative rash, pruritic rash, pustular rash), pyrexia, arthralgia, peripheral neuropathy, muscle spasm, extremity pain, hypertension, back pain, myalgia.

Adverse Effects/Toxic Reactions

Anemia, leukopenia are expected responses to therapy. Serious events, such as ILD/pneumonitis (3%–9% of pts), hypertension (6%–21% of pts), symptomatic bradycardia (6%–7% of pts), visual disturbance (blurred vision, diplopia, reduced visual acuity, macular edema, vitreous floaters, visual field defect, vitreous detachment, cataract [7%–10% of pts]), CPK elevation (27%–48% of pts), pancreatic enzyme elevation (27%–39%), hyperglycemia (43% of pts), may occur.

Nursing Considerations

Baseline Assessment

Obtain baseline CBC, CPK, BMP, LFT; urine pregnancy, vital signs. Obtain baseline EKG in pts with history of arrhythmia, HF. Question plans for breastfeeding. Question history of hepatic/renal impairment, diabetes, cardiac/pulmonary disease, hypertension, pancreatitis. Receive full medication history and screen for interactions. Assess visual acuity. Verify ALK-positive NSCLC test prior to initiation. Obtain nutritional consult. Offer emotional support.

Intervention/Evaluation

Monitor CBC, CPK, BMP, LFT; vital signs (esp. heart rate) periodically. Obtain serum amylase, lipase in pts with severe abdominal pain, nausea, periumbilical ecchymosis (Cullen's sign), flank ecchymosis (Grey Turner's sign). Monitor for hepatotoxicity, hyperglycemia, vision changes, myalgia, musculoskeletal pain, interstitial lung disease/pneumonitis. If treatment-related toxicities occur, consider referral to specialist; pt may require treatment with corticosteroids.

Screen for acute infections. Monitor I&O, hydration status, stool frequency and consistency. Encourage proper calorie intake and nutrition. Assess skin for rash, lesions.

Patient/Family Teaching

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection, such as body aches, burning with urination, chills, cough, fatigue, fever. Avoid those with active infection.
- Therapy may decrease your heart rate, which may be life-threatening; report dizziness, chest pain, palpitations, or fainting.
- Worsening cough, fever, or shortness of breath may indicate severe lung inflammation.
- Avoid pregnancy. Do not breastfeed. Females of childbearing potential should use effective contraception during treatment and up to 4 mos after final dose. Males with female partners of reproductive potential should use condoms during sexual activity during treatment and for up to 3 mos after final dose.
- Blurry vision, confusion, frequent urination, increased thirst, fruity breath may indicate high blood sugar levels.
- Report abdominal pain, bruising around belly button or flank bruising, black/tarry stools, dark-colored urine, decreased urine output, severe muscle aches, yellowing of the skin or eyes.
- Do not take newly prescribed medication unless approved by the doctor who originally started treatment.
- Do not ingest grapefruit products.

brivaracetam

briv-a-ra-se-tam

Briviact

Brivlera 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Synaptic vesicle protein 2A ligand.

CLINICAL: Anticonvulsant.

Do not confuse brivaracetam with levETIRAcetam.

Uses

Monotherapy or adjunctive therapy in the treatment of partial-onset seizures in pts 16 years and older with epilepsy.

Precautions

Contraindications: Hypersensitivity to brivaracetam. **Cautions:** Baseline neutropenia, hepatic impairment; pts at high risk for suicide; history of depression, mood disorder, psychiatric disorder; history of drug abuse.

Action

Exact mechanism unknown. Binds to synaptic proteins that modulate neurotransmitter release in the brain. **Therapeutic Effect:** Prevents seizure activity.

Pharmacokinetics

Rapidly, completely absorbed following PO administration. Metabolized primarily by enzymatic hydrolysis, mediated by hepatic and extrahepatic amidase. Protein binding: less than or equal to 20%. Peak plasma concentration: 1 hr. Primarily excreted in urine (95%). **Half-life:** 9 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established in pts younger than 16 yrs. **Elderly:** Not specified; use caution.

Interactions

DRUG: RifAMPin may decrease concentration/effect. May increase concentration/effect of **phenytoin, carbamazepine**. **HERBAL:** Ginseng, goldenseal, gotu kola, hawthorn, melatonin, valerian may increase CNS depression. **Ginkgo** may decrease anticonvulsant effect. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils, WBCs. May increase serum phenytoin (free and total) levels.

Availability (Rx)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg. **Oral Solution:** 10 mg/mL.
Injection Solution: 50 mg/5 mL.

Administration/handling

IV

Reconstitution

- Visually inspect for particulate matter or discoloration. Do not use if particulate matter or discoloration observed.
- May be given without further dilution or may be mixed with 0.9% NaCl, 5% dextrose injection.

Rate of Administration

- Give over 2–15 min.

Storage

- Injection solution should appear clear and colorless.
- Diluted solution should not be stored more than 4 hrs at room temperature. Do not freeze.

PO

- Give without regard to food.
- Administer tablets whole; do not crush, cut, dissolve, or divide.
- Oral solution should appear slightly viscous, clear, colorless to yellowish in color, and have a raspberry flavor.
- Store oral solution at room temperature.
- Discard unused oral solution remaining after 5 mos of first opening bottle.
- Do not freeze oral solution. Oral solution should be delivered using calibrated measuring device (does not require dilution). May give oral solution via nasogastric tube or gastrostomy tube.

Indications/routes/dosage

Partial-Onset Seizures (Monotherapy or Adjunctive Therapy)

PO/IV: ADOLESCENTS, ADULTS: Initially, 50 mg twice daily. May either decrease to 25 mg twice daily or increase to 100 mg twice daily. **Maintenance:**

25–100 mg twice daily. **Maximum:** 200 mg/day. When initiating treatment, gradual dose escalation is not required. Injection solution should be administered at same dose and same frequency as tablets and oral solution. Gradually taper dose to discontinue treatment. **ELDERLY:** Consider initiating at lower end of the dosage range.

Dose Modification

Concomitant use with rifAMPin: May need to increase brivaracetam dosage by 100% (double dose).

Dosage in Renal Impairment

No dosage adjustment. Not recommended in pts with ESRD undergoing dialysis (not studied).

Dosage in Hepatic Impairment

Mild, moderate, severe impairment: Initially, 25 mg twice daily. **Maintenance:** 25–75 mg twice daily. **Maximum:** 75 mg twice daily.

Side effects

Occasional (16%–9%): Somnolence, sedation, dizziness, fatigue. **Rare (5%–2%):** Nausea, vomiting, ataxia, balance disorder, abnormal coordination, nystagmus, irritability, constipation.

Adverse effects/toxic reactions

Sudden discontinuance may increase risk of seizure frequency and status epilepticus. May increase risk of suicidal thoughts or behavior. Psychiatric events including nonpsychotic behavior (anger, agitation, aggression, anxiety, apathy, depression, hyperactivity, irritability, mood swings, nervousness, restlessness, tearfulness) and psychotic symptoms (psychotic behavior with acute psychosis, delirium, hallucinations, paranoia) occurred in 13% of pts. Hypersensitivity reactions including bronchospasm, angioedema were reported. Clinically significant decreased WBC count (less than 3,000 cells/mm³) and decreased neutrophil count (less than 1000 cells/mm³) occurred in 1.8% and 0.3% of pts, respectively.

Nursing considerations

Baseline assessment

Obtain CBC in pts with baseline neutropenia. Review history of seizure disorder (intensity, frequency, duration, LOC). Initiate seizure precautions, fall precautions. Question history of hypersensitivity reaction, hepatic impairment, psychiatric disorder; history of suicidal thoughts or behavior. Obtain urine pregnancy in female pts of reproductive potential.

Intervention/evaluation

Periodically monitor CBC in pts with neutropenia. Monitor phenytoin levels in pts taking concomitant phenytoin (treatment may increase phenytoin levels). Observe for recurrence of seizure activity. Assess for clinical improvement (decrease in intensity/frequency of seizures). Diligently monitor for depression, changes in behavior, psychosis, suicidal ideation. Assist with ambulation if dizziness occurs.

Patient/family teaching

- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly discontinue medication (may precipitate seizures).
- Strict maintenance of drug therapy is essential for seizure control.
- Report anxiety, anger, depression, mood swings, hostile behavior, thoughts of suicide, unusual changes in behavior.
- Difficulty breathing, swelling of tongue or throat may indicate emergent allergic reaction.
- Avoid alcohol.

brodalumab

broe-dal-ue-mab

Siliq

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Anti-interleukin 17-receptor antibody.
Monoclonal antibody.

CLINICAL: Anti-psoriasis agent.

■ **BLACK BOX ALERT** ■ Suicidal ideation and behavior, including completed suicides, were reported with brodalumab. Screen for history of depression, suicidal ideation. Recommend mental health consultation in pts with suicidal ideation and behavior. Pts must seek immediate medical attention if new-onset suicidal ideation, anxiety, depression, mood change occurs.

Do not confuse brodalumab with avelumab, dupilumab, durvalumab, nivolumab, or sarilumab.

Uses

Treatment of moderate to severe plaque psoriasis in adults who are candidates for systemic therapy or phototherapy and have failed to respond or have lost response to other systemic therapies.

Precautions

Contraindications: Hypersensitivity to brodalumab. Crohn's disease. **Cautions:** Baseline neutropenia; history of anxiety, depression, suicidal ideation and behavior, mood disorder; concomitant immunosuppressant therapy, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds), prior exposure to tuberculosis. Concomitant use of live vaccines not recommended. Not recommended in pts with active TB.

Action

Selectively binds to the IL-17A receptor, inhibiting the release of pro-inflammatory cytokines (involved in the pathogenesis of immune-mediated diseases, including plaque psoriasis). **Therapeutic Effect:** Blocks cytokine-induced responses.

Pharmacokinetics

Widely distributed. Metabolism: not specified. Degraded into small peptides and amino acids via catabolic pathway. Peak plasma concentration: 3 days. Steady

state reached in 4 wks. Excretion not specified. **Half-life:** Not specified.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. However, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Avoid use of live vaccines. May decrease therapeutic effect of **BCG**. May increase adverse effects/toxicity of **belimumab, natalizumab, pimecrolimus, tacrolimus**. **HERBAL:** **Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May decrease neutrophils.

Availability (Rx)

Injection Solution: 210 mg/1.5 mL in prefilled single-dose syringe.

Administration/handling

Subcutaneous

Preparation

- Remove prefilled syringe from refrigerator and allow solution to warm to room temperature (approx. 30 min) with needle cap intact.
- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed.

Administration

- Insert needle subcutaneously into upper arms, outer thigh, or abdomen, and inject solution.
- Do not inject into areas of active skin disease or injury, such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Do not administer IV or intramuscularly.
- Rotate injection sites.

Storage

- Refrigerate prefilled syringes in original carton until time of use.

- May store at room temperature for up to 14 days. Once warmed to room temperature, do not place back into refrigerator.
- Do not freeze or expose to heating sources.
- Do not shake.
- Protect from light.

Indications/Routes/Dosage

Plaque Psoriasis

SQ: ADULTS, ELDERLY: Initially, 210 mg once at wks 0, 1, 2.
MAINTENANCE: 210 mg once q2wks thereafter.

Permanent Discontinuation: Consider discontinuation in pts who have not achieved an adequate response after 12–16 wks.

Dosage in Renal Impairment

Not specified; use caution.

Dosage in Hepatic Impairment

Not specified; use caution.

Side Effects

Occasional (5%-4%): Arthralgia, headache. **Rare (3%-1%):** Fatigue, diarrhea, oropharyngeal pain, nausea, myalgia, injection site reactions (bruising, erythema, hemorrhage, pain, pruritus), conjunctivitis.

Adverse Effects/Toxic Reactions

Suicidal ideation and behavior, including completed suicides, were reported. May increase risk of tuberculosis. Infections such as bronchitis, influenza, nasopharyngitis, pharyngitis, upper respiratory tract infection, tinea infections, UTI may occur. May cause exacerbation of Crohn's disease and ulcerative colitis. Immunogenicity (auto-brodalumab antibodies) occurred in 3% of pts.

Nursing Considerations

Baseline Assessment

Obtain CBC in pts with known history of neutropenia. Screen for active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin test should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Verify pt has not received live vaccines prior to initiation. Question history of Crohn's disease, ulcerative colitis, hypersensitivity reaction; anxiety, depression, mood disorder, suicidal ideation and behavior. Conduct dermatological exam; record characteristics of psoriatic lesions. Assess pt's willingness to self-inject medication.

Intervention/Evaluation

Diligently monitor for suicidal ideation and behavior, new onset or worsening of anxiety, depression, mood disorder. Consult mental health professional if mood disorder suspected. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection prior to initiation. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Monitor for hypersensitivity reaction, symptoms of inflammatory bowel disease. Assess skin for improvement of lesions.

Patient/Family Teaching

- Seek immediate medical attention if thoughts of suicide, new onset or worsening of anxiety, depression, or changes in mood occurs.
 - A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
 - Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection, such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
 - Do not receive live vaccines.
 - Expect frequent tuberculosis screening.
 - Report travel plans to possible endemic areas.
 - Treatment may cause worsening of Crohn's disease or cause inflammatory bowel disease. Report abdominal pain, diarrhea, weight loss.
-

budesonide

TOP
100

bue-**des**-oh-nide

Entocort EC

Pulmicort Flexhaler

Pulmicort

Rhinocort Allergy

Rhinocort Aqua

Uceris

Fixed-Combination(s)

Symbicort: budesonide/formoterol (bronchodilator): 80 mcg/4.5 mcg, 160 mcg/4.5 mcg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Glucocorticosteroid.

CLINICAL: Anti-inflammatory, antiallergy.

Do not confuse budesonide with Budeprion.

Uses

Nasal: (Rx): Management of seasonal or perennial allergic rhinitis in adults and children 6 yrs and older. **(OTC):** Relief of hay fever, other upper respiratory allergies. **Nebulization, Oral Inhalation:** Maintenance or prophylaxis therapy for asthma. **PO:(Entocort EC):** Treatment of mild to moderate active Crohn's disease. Maintenance of clinical remission of mild to moderate Crohn's disease. **(Uceris):** Induction of remission in active, mild to moderate ulcerative colitis. **OFF-LABEL:** Treatment of vasomotor rhinitis.

Precautions

Contraindications: Hypersensitivity to budesonide, primary treatment of status asthmaticus, acute episodes of asthma. Not for relief of acute bronchospasms. **Cautions:** Thyroid disease, hepatic impairment, renal impairment, cardiovascular disease, diabetes, glaucoma, cataracts, myasthenia gravis, pts at

risk for osteoporosis, seizures, GI disease, post acute MI, elderly.

Action

Inhibits accumulation of inflammatory cells; controls rate of protein synthesis; decreases migration of polymorphonuclear leukocytes (reverses capillary permeability and lysosomal stabilization at cellular level). **Therapeutic Effect:** Relieves symptoms of allergic rhinitis, asthma, Crohn's disease.

Pharmacokinetics

Form	Onset	Peak	Duration
Pulmicort Respules	2–8 days	4–6 wks	—
Rhinocort Aqua	10 hrs	2 wks	—

Minimally absorbed from nasal tissue; moderately absorbed from inhalation. Protein binding: 88%. Primarily metabolized in liver. **Half-life:** 2–3 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (e.g., itraconazole, ketoconazole) may increase concentration. **HERBAL:** Echinacea may decrease effects. **FOOD:** Grapefruit products may increase systemic exposure. **LAB VALUES:** May decrease serum potassium.

Availability (Rx)

Oral Inhalation Powder (Pulmicort Flexhaler): 90 mcg per inhalation; 180 mcg per inhalation. **Inhalation Suspension for Nebulization (Pulmicort):** 0.25 mg/2 mL; 0.5 mg/2 mL; 1 mg/2 mL. **Nasal Spray (Rhinocort Allergy, Rhinocort Aqua):** 32 mcg/spray.

 **Capsules, Enteric-Coated (Entocort EC):** 3 mg. **Tablets,**

Extended-Release: (Uceris): 9 mg.

Administration/handling

Inhalation

- Hold inhaler in upright position to load dose. Do not shake prior to use. Prime prior to first use only.
- Place mouthpiece between lips and inhale forcefully and deeply. Do not exhale through inhaler; do not use a spacer.
- Rinsing mouth after each use decreases incidence of candidiasis.

Intranasal

- Instruct pt to clear nasal passages before use.
- Tilt pt's head slightly forward.
- Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
- Spray into one nostril while pt holds other nostril closed and concurrently inspires through nostril to allow medication as high into nasal passages as possible.

Nebulization

- Shake well before use.
- Administer with mouthpiece or face mask.
- Rinse mouth following treatment.

PO

- May take with or without food. Swallow whole. Do not break, crush, dissolve, or divide capsule or tablet.

Indications/routes/dosage

Rhinitis

Intranasal: (Rx): ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: 1 spray (32 mcg) in each nostril once daily. **Maximum:** 4 sprays in each nostril once daily for adults and children 12 yrs and older; 2 sprays in each nostril once

daily for children 6–11 yrs.

Intranasal: (OTC): ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: 2 sprays in each nostril once daily. May decrease to 1 spray in each nostril once daily.

Bronchial Asthma

Nebulization: CHILDREN 12 MOS–8 YRS: (*Previous therapy with bronchodilators alone*): 0.5 mg/day as single dose or 2 divided doses. **Maximum:** 0.5 mg/day. (*Previous therapy with inhaled corticosteroids*): 0.5 mg/day as single dose or 2 divided doses. **Maximum:** 1 mg/day. (*Previous therapy of oral corticosteroids*): 1 mg/day as single dose in 2 divided doses. **Maximum:** 1 mg/day.

Oral Inhalation: (Pulmicort Flexhaler): ADULTS, ELDERLY: Initially, 360 mcg 2 times/day. **Maximum:** 720 mcg 2 times/day. **CHILDREN, 6 YRS AND OLDER:** 180 mcg 2 times/day. **Maximum:** 360 mcg 2 times/day.

Crohn's Disease

PO: ADULTS, ELDERLY: (Capsule) 9 mg once daily for up to 8 wks. Recurring episodes may be treated with a repeat 8-wk course of treatment. **Maintenance of remission:** 6 mg once daily for up to 3 mos.

Ulcerative Colitis

PO: ADULTS, ELDERLY: (Tablet) 9 mg once daily in morning for up to 8 wks.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (greater than 3%): Nasal: Mild nasopharyngeal irritation, burning, stinging, dryness; headache, cough. **Inhalation:** Flu-like symptoms, headache, pharyngitis. **Occasional (3%–1%): Nasal:** Dry mouth, dyspepsia, rebound congestion, rhinorrhea, loss of taste. **Inhalation:** Back pain, vomiting, altered taste, voice changes, abdominal pain, nausea, dyspepsia.

Adverse effects/toxic reactions

Acute hypersensitivity reaction (urticaria, angioedema, severe bronchospasm) occurs rarely.

Nursing considerations

Baseline assessment

Question for hypersensitivity to any corticosteroids, components. Auscultate lung sounds.

Intervention/evaluation

Monitor for relief of symptoms. Auscultate lung sounds. Observe proper use of medication delivery device to ensure correct technique.

Patient/family teaching

- Improvement noted in 24 hrs, but full effect may take 3–7 days.
- Report if no improvement in symptoms or if sneezing, nasal irritation occurs.

bumetanide

bue-met-a-nide

Bumex

Burinex 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Loop diuretic.

CLINICAL: Diuretic.

■ **BLACK BOX ALERT** ■ Excess dosage can lead to profound diuresis with fluid and electrolyte loss.

Do not confuse bumetanide with Buminate.

Uses

Management of edema associated with HF, renal disease, or hepatic disease.

Precautions

Contraindications: Hypersensitivity to bumetanide. Anuria, hepatic coma, severe electrolyte depletion (until condition improves or is corrected). **Cautions:** Severe hypersensitivity to sulfonamides; hypotension.

Action

Enhances excretion of sodium, chloride, and, to lesser degree, potassium by direct action at ascending limb of loop of Henle and in proximal tubule. **Therapeutic Effect:** Produces diuresis.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	30–60 min	60–120 min	4–6 hrs
IV	Rapid	15–30 min	2–3 hrs

Completely absorbed from GI tract (absorption decreased in HF, nephrotic syndrome). Protein binding: 94%–96%. Partially metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1–1.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotension/electrolyte effects. Increased risk for circulatory collapse or thrombolytic episode. Age-related renal impairment may require reduced or extended dosage interval.

Interactions

DRUG: Agents inducing hypokalemia (e.g., metOLazone, hydroCHLOROthiazide) may increase risk of hypokalemia. May increase risk of lithium toxicity. NSAIDs (e.g., diclofenac, naproxen) may increase effect. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may have increased antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, BUN, uric acid; urinary phosphate. May decrease serum calcium, chloride, magnesium, potassium, sodium.

Availability (Rx)

Injection Solution: 0.25 mg/mL. **Tablets:** 0.5 mg, 1 mg, 2 mg.

Administration/handling

IV

Rate of Administration

- May give undiluted but is compatible with D₅W, 0.9% NaCl, or lactated Ringer's solution.
- Administer IV push over 1–2 min.
- May give through Y tube or 3-way stopcock.
- May give as continuous infusion.

Storage

- Store at room temperature.
- Stable for 24 hrs if diluted.

PO

- Give with food to avoid GI upset, preferably with breakfast (may prevent nocturia).

IV incompatibility

Midazolam (Versed).

IV Compatibilities

Aztreonam (Azactam), cefepime (Maxipime), dexmedetomidine (Precedex), diltiazem (Cardizem), DOBUTamine (Dobutrex), furosemide (Lasix), LORazepam (Ativan), milrinone (Primacor), morphine, piperacillin and tazobactam (Zosyn), propofol (Diprivan).

Indications/routes/dosage

Edema, HF

PO: ADULTS, ELDERLY: 0.5–2 mg 1–2 times/day. May repeat in 4–5 hrs for

up to 2 doses. **Maximum:** 10 mg/day.

IV, IM; ADULTS, ELDERLY: 0.5–1 mg/dose; may repeat in 2–3 hrs for up to 2 doses (**Maximum:** 10 mg/day) or 0.5–2 mg/hr by continuous IV infusion. Repeat loading dose before increasing infusion rate.

Usual Pediatric Dosage

IV, IM, PO; CHILDREN: 0.015–0.1 mg/kg/dose q6–24h. **Maximum:** 10 mg/day. **NEONATES:** 0.01–0.05 mg/kg/dose q12–48h.

Dosage in Renal/Hepatic Impairment

Use caution; contraindicated in anuria, hepatic coma.

Side effects

Expected: Increased urinary frequency and urine volume. **Frequent (5%):** Muscle cramps, dizziness, hypotension, headache, nausea. **Occasional (3%–1%):** Impaired hearing, pruritus, EKG changes, weakness, hives, abdominal pain, dyspepsia, musculoskeletal pain, rash, nausea, vomiting. **Rare (less than 1%):** Chest pain, ear pain, fatigue, dry mouth, premature ejaculation, impotence, nipple tenderness.

Adverse effects/toxic reactions

Vigorous diuresis may lead to profound water and electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration, coma, circulatory collapse. Ototoxicity manifested as deafness, vertigo, tinnitus may occur, esp. in pts with severe renal impairment or those taking other ototoxic drugs. Blood dyscrasias, acute hypotensive episodes have been reported.

Nursing considerations

Baseline assessment

Obtain baseline vital signs, esp. B/P for hypotension, before administration. Assess baseline electrolytes, particularly for hypokalemia, hyponatremia. Assess for edema. Observe skin turgor, mucous membranes for hydration status. Initiate I&O, obtain baseline weight.

Intervention/evaluation

Continue to monitor B/P, vital signs, electrolytes, I&O, weight. Note extent of diuresis. Watch for changes from initial assessment (hypokalemia may result in muscle weakness, tremor, muscle cramps, altered mental status, cardiac arrhythmias; hyponatremia may result in confusion, thirst, cold/clammy skin).

Patient/family teaching

- Expect increased urinary frequency/volume.
- Report auditory abnormalities (e.g., sense of fullness in ears, tinnitus).
- Eat foods high in potassium such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
- Rise slowly from sitting/lying position.

buprenorphine

Fixed-Combination(s)

Brunavail: buprenorphine/naloxone (narcotic antagonist): 2.1 mg/0.3 mg; 4.2 mg/0.7 mg; 6.3 mg/1 mg.

Suboxone: buprenorphine/naloxone: 2 mg/0.5 mg, 4 mg/1 mg, 8 mg/2 mg, 12 mg/3 mg. **Zubsolv:** buprenorphine/naloxone: 1.4 mg/0.36 mg; 5.7 mg/1.4 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Opioid agonist, antagonist injection (Schedule V).

CLINICAL: Opioid dependence adjunct, analgesic.

■ **BLACK BOX ALERT** ■ **Transdermal:** Prolonged use during pregnancy may result in neonatal abstinence syndrome. Potential for abuse, misuse, and diversion. Do not exceed dose of one 20 mcg/hr patch due to risk of QT

interval prolongation. May cause potentially life-threatening respiratory depression. **Implant:** Potential for implant migration, protrusion, expulsion, and nerve damage associated with insertion and removal.

Do not confuse Buprenex with Bumex, or buprenorphine with buPROPion.

Uses

Sublingual Tablet: Treatment of opioid dependence. **Implant:** Maintenance treatment of opioid dependence in pts who achieved/sustained prolonged clinical stability on low to moderate doses of a transmucosal buprenorphine product for 3 months or longer with no need for supplemental dosing or adjustments. **Injection:** Relief of moderate to severe pain. **Transdermal, Buccal film:** Moderate to severe chronic pain requiring continuous around-the-clock opioid analgesic for extended period. **OFF-LABEL:** Injection: Heroin/opioid withdrawal in hospitalized pts.

Precautions

Contraindications: Hypersensitivity to buprenorphine. **Transdermal patch, Buccal film:** (Additional) Significant respiratory depression, severe asthma in an unmonitored setting or in absence of resuscitative equipment, known or suspected GI obstruction, including paralytic ileus. **Cautions:** Hepatic/renal impairment, elderly, debilitated, pediatric pts, head injury/increased intracranial pressure, pts at risk for respiratory depression, hyperthyroidism, myxedema, adrenal cortical insufficiency (e.g., Addison's disease), urethral stricture, CNS depression, morbid obesity, toxic psychosis, prostatic hypertrophy, delirium tremens, kyphoscoliosis, biliary tract dysfunction, acute pancreatitis, acute abdominal conditions, acute alcoholism, pts with prolonged QT syndrome, concurrent use of antiarrhythmics, hypovolemia, cardiovascular disease, ileus, bowel obstruction, hx of seizure disorder.

Action

Binds to opioid receptors within CNS. **Therapeutic Effect:** Suppresses opioid withdrawal symptoms, cravings. Alters pain perception, emotional response to

pain.

Pharmacokinetics

Route	Onset	Peak	Duration
Sublingual	15 min	1 hr	6 hrs
IV	Less than 15 min	Less than 1 hr	6 hrs
IM	15 min	1 hr	6 hrs

Excreted primarily in feces with lesser amount eliminated in urine. Protein binding: High. **Half-life: Parenteral:** 2–3 hrs; **Sublingual:** 37 hrs (increased in hepatic impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. Breast-feeding not recommended. Neonatal withdrawal noted in infant if mother was treated with buprenorphine during pregnancy, with onset of withdrawal symptoms generally noted on day 1, manifested as hypertonia, tremor, agitation, myoclonus. Apnea, bradycardia, seizures occur rarely. **Children:** Safety and efficacy of injection form not established in those 2–12 yrs. Safety and efficacy of tablet, fixed-combination form not established in pts 16 yrs or younger. **Elderly:** Age-related hepatic impairment may require dosage adjustment.

Interactions

DRUG: CNS depressants, MAOIs may increase CNS or respiratory depression, hypotension. **CYP3A4 inhibitors (e.g., azole antifungals, macrolide antibiotics, protease inhibitors)** may increase plasma concentration. **CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may cause increased clearance of buprenorphine. May decrease effects of **other opioid analgesics**. **HERBAL:** St. John's wort, kava kava, gotu kola, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

Availability (Rx)

Buccal Film: 75 mcg, 150 mcg, 300 mcg, 450 mcg, 600 mcg, 750 mcg, 900

mcg. **Implant (Probuphine):** Set of 4 implants, each containing 74.2 mg of buprenorphine (equivalent to 80 mg of buprenorphine hydrochloride). **Injection Solution (Buprenex):** 0.3 mg/1 mL. **Tablets, Sublingual:** 2 mg, 8 mg. **Transdermal Weekly Patch (Butrans):** 5 mcg/hr, 7.5 mcg/hr, 10 mcg/hr, 15 mcg/hr, 20 mcg/hr.

Administration/handling

IV

Reconstitution

- May be diluted with lactated Ringer's solution, D₅W, 0.9% NaCl.

Rate of Administration

- If given as IV push, administer over at least 2 min.

IM

- Give deep IM into large muscle mass.

Buccal Film

Moisten inside cheek. Apply with dry finger. Press and hold in place for 5 sec. Keep film in place until dissolved (approx 30 min). Do not chew, swallow, touch, or move film. Do not cut/tear. Avoid areas with open sores/lesions.

Sublingual

- Instruct pt to dissolve tablet(s) under tongue; avoid swallowing (reduces drug bioavailability).
- For doses greater than 2 tablets, either place all tablets at once or 2 tablets at a time under the tongue.

Storage

- Store parenteral form at room temperature.
- Protect from prolonged exposure to light.
- Store tablets at room temperature.

Transdermal

- Apply to clean, dry, intact, nonirritated, hairless skin of upper outer arm, upper chest, upper back, or side of chest. Hair at application site should be clipped; do

not shave.

- Clean site with clear water and allow to dry. Do not use soaps, alcohol, oils (may increase absorption). Press patch in place and hold for 15 seconds.
- Wait minimum of 21 days before reapplying to same site.
- Avoid exposing patch to external heat sources. Incidental exposure to water is acceptable. Patch may be taped in place with first-aid tape.
- If patch falls off during 7-day dosing interval, apply new patch to a different skin site.

■ IV incompatibilities

DiazePAM (Valium), furosemide (Lasix), LORazepam (Ativan).

■ IV Compatibilities

Allopurinol (Aloprim, Zyloprim), aztreonam (Azactam), cefepime (Maxipime), diphenhydrAMINE (Benadryl), granisetron (Kytril), haloperidol (Haldol), heparin, linezolid (Zyvox), midazolam (Versed), piperacillin/tazobactam (Zosyn), promethazine (Phenergan), propofol (Diprivan).

Indications/routes/dosage

Opioid Dependence

Sublingual: ADULTS, CHILDREN 13 YRS AND OLDER: 8 mg on day 1, then 16 mg on day 2 and subsequent induction days. Range: 12–16 mg/day (usually over 3–4 days). **Maintenance:** Target dose 12–16 mg/day. Pts should be switched to buprenorphine/naloxone combination for maintenance and unsupervised therapy. **Implant:** Four implants inserted subdermally in upper arm for 6 mos of treatment.

Moderate to Severe Pain

IM/IV: ADULTS, CHILDREN 13 YRS AND OLDER: 0.3 mg (1 mL) q6–8h prn; may repeat once 30–60 min after initial dose. Range: 0.15–0.6 mg q4–8h prn. **ELDERLY:** 0.15 mg q6h prn. **CHILDREN 2–12 YRS:** 2–6 mcg/kg q4–6h prn.

Transdermal: ADULTS, ELDERLY:(OPIOID NAIVE): Initial dose always 5

mcg/hr once q7days. **THOSE ALREADY RECEIVING OPIOIDS:** Refer to conversion chart in package insert. Do not increase dose until pt exposed to previous dose for 72 hrs.

Buccal: ADULTS, ELDERLY: (OPIOID NAIVE): Initially, 75 mcg once or q12h for 4 days, then 150 mcg q12h. **(OPIOID EXPERIENCED):** Taper current opioid to no more than 30 mg oral morphine equivalent. Based on opioid dose prior to tapering: 75 mcg once daily or q12h for less than 30 mg; 150 mcg q12h for 30–89 mg; 300 mcg q12h for 90–160 mg.

Dosage in Renal Impairment

Use caution.

Dosage in Hepatic Impairment

Injection: Use caution.

Transdermal: No adjustment.

Side effects

Frequent (67%–10%): Sedation, dizziness, nausea. **Butrans (more than 5%):** Nausea, headache, pruritus at application site, dizziness, rash, vomiting, constipation, dry mouth. **Implant: (more than 5%):** Headache, nausea, vomiting, constipation. **Occasional (5%–1%):** Headache, hypotension, vomiting, miosis, diaphoresis. **Rare (less than 1%):** Dry mouth, pallor, visual abnormalities, injection site reaction.

Adverse effects/toxic reactions

Overdosage results in cold, clammy skin, weakness, confusion, severe respiratory depression, cyanosis, pinpoint pupils, seizures, extreme drowsiness progressing to stupor, coma.

Nursing considerations

Baseline assessment

Obtain baseline B/P, pulse rate. Assess mental status, alertness. Assess type, location, intensity of pain. Obtain history of pt's last opioid use. Assess for early

signs of withdrawal symptoms before initiating therapy.

Intervention/evaluation

Monitor for change in respirations, B/P, rate/quality of pulse, mental status. Assess lab results. Initiate deep breathing, coughing exercises, particularly in pts with pulmonary impairment. Assess for clinical improvement; record onset of relief of pain. Monitor strictly for compliance, signs of abuse or misuse.

Patient/family teaching

- Change positions slowly to avoid dizziness, orthostatic hypotension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol, sedatives, antidepressants, tranquilizers.

buPROPion

bue-**proe**-pee-on

Aplenzin

Forfivo XL

Wellbutrin SR

Wellbutrin XL

Zyban

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Aminoketone.

CLINICAL: Antidepressant, smoking cessation aid.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders. Agitation, hostility, depressed mood also reported. Use in smoking cessation may cause serious neuropsychiatric events.

Do not confuse Aplenzin with Relpenza, buPROPion with busPIRone, Wellbutrin SR with Wellbutrin XL, or Zyban with Diovan or Zagam.

Uses

Treatment of depression, seasonal affective disorder (SAD). Zyban assists in smoking cessation. **OFF-LABEL:** Treatment of ADHD in adults, children. Depression associated with bipolar disorder.

Precautions

Contraindications: Hypersensitivity to buPROPion. Current or prior diagnosis of anorexia nervosa or bulimia, seizure disorder, use within 14 days of MAOIs; concomitant use of other buPROPion products; pts undergoing abrupt discontinuation of alcohol or sedatives. Initiation of buPROPion in pts receiving linezolid or IV methylene blue. **Aplenzin, Forfivo XL, Wellbutrin XL (additional):** Conditions increasing seizure risk, severe head injury, stroke, CNS tumor/infection. **Forfivo XL (additional):** Pts receiving other dosage forms of bupropion. **Cautions:** History of seizure, cranial or head trauma, cardiovascular disease, history of hypertension or coronary artery disease, elderly, pts at high risk for suicide, renal/hepatic impairment. Concurrent use of antipsychotics, antidepressants, theophylline, steroids, stimulants, hypoglycemic agents, excessive use of alcohol, sedatives/hypnotics, opioids.

Action

Blocks reuptake of neurotransmitters, (DOPamine, norepinephrine) at CNS presynaptic membranes. **Therapeutic Effect:** Relieves depression. Eliminates nicotine withdrawal symptoms.

Pharmacokinetics

Rapidly absorbed from GI tract. Protein binding: 84%. Crosses the blood-brain barrier. Metabolized in liver. Primarily excreted in urine. **Half-life:** 14 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** More sensitive to increased dosage, toxicity; increased risk of suicidal ideation, worsening of depression. Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** More sensitive to

anticholinergic, sedative, cardiovascular effects. Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Ritonavir, efavirenz may reduce concentration. **Carbamazepine, Phenytoin, Phenoxyethylamine** may decrease effectiveness. **MAOIs** may increase risk of toxicity. **Levodopa, amantadine** may increase risk of side effects. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May decrease WBC.

Availability (Rx)

Tablets: 75 mg, 100 mg.

 **Tablets, Extended-Release (24 hr):** 174 mg, 348 mg, 522 mg (**Aplenzin**); 450 mg (**Forfivo XL**); 150 mg, 300 mg (**Wellbutrin XL**). **Tablets, Sustained-Release (12 hr):** 100 mg, 150 mg, 200 mg (**Wellbutrin SR**), 150 mg (**Zyban**).

Administration/handling

PO

- Give without regard to food (give with food if GI irritation occurs).
- Give at least 4-hr interval for immediate onset and 8-hr interval for sustained-release tablet to avoid seizures.
- Give Aplenzin once daily in the morning.
- Avoid bedtime dosage (decreases risk of insomnia).
- Do not break, crush, dissolve, or divide sustained-, extended-release preparations.

Indications/routes/dosage

Depression

PO (Immediate-Release): ADULTS: Initially, 100 mg twice daily. May increase to 100 mg 3 times/day no sooner than 3 days after beginning therapy. **Maximum:** 150 mg 3 times/day. **ELDERLY:** Initially, 37.5 mg 2 times/day.

May increase by 37.5 q3–4days. **Maximum:** 300 mg/day in divided doses.

PO (Sustained-Release):ADULTS: Initially, 150 mg/day as a single dose in the morning. May increase to 150 mg twice daily as early as day 4 after beginning therapy. **Maximum:** 400 mg/day in 2 divided doses. **ELDERLY:** Initially, 100 mg/day. May increase by 100 mg q3–4days. **Maximum:** 300 mg/day in divided doses.

PO (Extended-Release):ADULTS: 150 mg once daily. May increase to 300 mg once daily as early as day 4. **Maximum:** 450 mg/day. **(Forfivo XL):** Use only after initial dose titration with other buPROPion products. **(Aplenzin):** Initially, 174 mg once daily in morning; may increase as soon as 4 days to 348 mg/day. **Maximum:** 522 mg/day.

Smoking Cessation

PO: ADULTS, ELDERLY: (Zyban): Initially, 150 mg/day for 3 days, then 150 mg twice daily for 7–12 wks.

SAD

PO: ADULTS, ELDERLY: (Wellbutrin XL): 150 mg/day for 1 wk, then 300 mg/day. Begin in autumn (Sept–Nov). End of treatment begins in spring (Mar–Apr) by decreasing dose to 150 mg/day for 2 wks before discontinuation. **(Aplenzin):** 174 mg once daily. May increase after 1 wk to 348 mg once daily.

Dosage in Renal Impairment

Use caution.

Dosage in Hepatic Impairment

Mild to moderate impairment: Use caution, reduce dosage. **Severe impairment:** Use extreme caution. **Maximum dose:** Aplenzin: 174 mg every other day. Wellbutrin: 75 mg/day. Wellbutrin SR: 100 mg/day or 150 mg every other day. Wellbutrin XL: 150 mg every other day. Zyban: 150 mg every other day.

Side effects

Frequent (32%–18%): Constipation, weight gain or loss, nausea, vomiting, anorexia, dry mouth, headache, diaphoresis, tremor, sedation, insomnia,

dizziness, agitation. **Occasional (10%–5%):** Diarrhea, akinesia, blurred vision, tachycardia, confusion, hostility, fatigue.

Adverse effects/toxic reactions

Risk of seizures increases in pts taking more than 150 mg/dose; in pts with history of bulimia, seizure disorders, discontinuing drugs that may lower seizure threshold.

Nursing considerations

Baseline assessment

Assess psychological status, thought content, suicidal tendencies, appearance. For pts on long-term therapy, hepatic/renal function tests should be performed periodically.

Intervention/evaluation

Supervise suicidal-risk pt closely during early therapy and dose changes (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood changes.

Patient/family teaching

- Full therapeutic effect may be noted in 4 wks.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report signs/symptoms of seizure, worsening depression, suicidal ideation, unusual behavioral changes.
- Avoid alcohol.
- Do not chew, crush, dissolve, or divide sustained-, extended-release tablets.

busPIRone

bue-spye-rone

Apo-BusPIRone 

 **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Nonbarbiturate.

CLINICAL: Antianxiety.
busPIRone with buPROPion.

Uses

Short-term management (up to 4 wks) of generalized anxiety disorder (GAD).
OFF-LABEL: Augmenting medication for antidepressants.

Precautions

Contraindications: Hypersensitivity to busPIRone. **Cautions:** Concurrent use of MAOIs, severe hepatic/renal impairment (not recommended).

Action

Exact mechanism of action unknown. Binds to serotonin, DOPamine at presynaptic neurotransmitter receptors in CNS. **Therapeutic Effect:** Produces anxiolytic effect.

Pharmacokinetics

Rapidly and completely absorbed from GI tract. Protein binding: 95%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis.
Half-life: 2–3 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CNS depressants (e.g., alcohol, ALPRAZolam, LORazepam, morphine, oxyCODONE, traMADol) potentiate effect, may increase sedation. **CYP3A4 inhibitors** (e.g., erythromycin, ketoconazole) may increase concentration/effect. **CYP3A4 inducers** (e.g., rifAMPin) may decrease concentration/effect. May increase effects of MAOIs. **HERBAL:** Gotu kola,

kava kava, St. John's wort, valerian may increase CNS depression. **FOOD: Grapefruit products** may increase concentration, risk of toxicity. **LAB VALUES:** May produce false-positive urine metanephrine/catecholamine assay test.

Availability (Rx)

Tablets: 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg.

Administration/handling

PO

- Give without regard to food. Must be consistent.

Indications/routes/dosage

Short-Term Management (up to 4 wks) of Anxiety Disorders

PO: ADULTS, ELDERLY: Initially, 7.5 mg twice daily. May increase every 2–3 days in increments of 2.5 mg twice daily. **Maintenance:** 10–15 mg twice daily. **Maximum:** 30 mg twice daily.

Dosage in Renal/Hepatic Impairment

Not recommended in severe impairment.

Side effects

Frequent (12%–6%): Dizziness, drowsiness, nausea, headache. **Occasional (5%–2%):** Nervousness, fatigue, insomnia, dry mouth, light-headedness, mood swings, blurred vision, poor concentration, diarrhea, paresthesia. **Rare:** Muscle pain/stiffness, nightmares, chest pain, involuntary movements.

Adverse effects/toxic reactions

No evidence of drug tolerance, psychological or physical dependence, withdrawal syndrome. Overdose may produce severe nausea, vomiting, dizziness, drowsiness, abdominal distention, excessive pupil constriction.

Nursing considerations

Baseline assessment

Assess degree/manifestations of anxiety. Offer emotional support. Assess motor responses (agitation, trembling, tension), autonomic responses (cold, clammy hands; diaphoresis).

Intervention/evaluation

For pts on long-term therapy, CBC, LFT, renal function tests should be performed periodically. Assist with ambulation if drowsiness, dizziness occur. Evaluate for therapeutic response: calm facial expression, decreased restlessness, lessened insomnia, mental status.

Patient/family teaching

- Improvement may be noted in 7–10 days, but optimum therapeutic effect generally takes 3–4 wks.
- Drowsiness usually disappears during continued therapy.
- If dizziness occurs, slowly go from lying to standing.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol, grapefruit products.
- Be consistent in taking with regard to food.

 Canadian trade name

 Non-Crushable Drug

 High Alert drug

underlined underlined – top prescribed drug

C

cabazitaxel

ka-baz-i-tax-el

Jevtana

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Microtubule inhibitor.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ All pts should be premedicated with a corticosteroid, an antihistamine, and an H₂ serum antagonist prior to infusion. Severe hypersensitivity reactions have occurred. Immediately discontinue infusion and give appropriate treatment if hypersensitivity reaction occurs. Neutropenic deaths reported. CBC, particularly ANC, should be obtained prior to and during treatment. Do not administer with neutrophil count 1,500 cells/mm³ or less.

Do not confuse cabazitaxel with PACLitaxel or Paxil, or Jevtana with Januvia, Levitra, or Sentra.

Uses

Used in combination with predniSONE for treatment of hormone-refractory metastatic prostate cancer previously treated with a DOCEtaxel-containing regimen.

Precautions

Contraindications: Hypersensitivity to cabazitaxel. Severe hepatic impairment (total serum bilirubin greater than 3 times upper limit of normal [ULN]).

Neutrophil count of 1,500/mm³ or less, history of hypersensitivity to polysorbate 80. **Caution:** Mild to moderate hepatic impairment (bilirubin equal to or less than 3 times ULN), elderly, pregnancy, renal impairment (CrCl less than 30 mL/min). Pts at risk for developing GI complications (e.g., GI ulceration, concomitant use of NSAIDs).

Action

Binds to tubulin to promote assembly into microtubules and inhibits disassembly, which inhibits microtubules depolymerization/cell division. **Therapeutic Effect:** Blocks cells in mitotic phase of cell cycle, inhibiting tumor proliferation.

Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: 89%–92%. Excreted in feces (76%), urine (3.7%). **Half-life:** 95 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Crosses placental barrier. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Pts 65 yrs and older have 5% greater risk of developing neutropenia, fatigue, dizziness, fever, urinary tract infection, dehydration.

Interactions

DRUG: Strong CYP3A4 inhibitors (e.g., atazanavir, clarithromycin, ketoconazole, ritonavir) may increase concentration/effect; avoid use. Strong CYP3A4 inducers (e.g., carbamazepine, phenobarbital, phenytoin, rifampin) may decrease cabazitaxel concentration effects. Live virus vaccine may potentiate virus replication, increase vaccine's side effects, decrease response to vaccine. **HERBAL:** St. John's wort, valerian may increase CNS depression. St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effects. **LAB VALUES:** May increase serum bilirubin. May decrease Hgb, Hct, neutrophils, platelets.

Availability (Rx)

Injection: 60 mg/1.5 mL

Administration/handling

◀ALERT▶ Wear gloves during preparation, handling. Two-step dilution process must be performed under aseptic conditions to prepare second (final) infusion solution. Medication undergoes two dilutions. After second dilution, administration should be initiated within 30 min.

Reconstitution

Step 1, First Dilution:

- Each vial of cabazitaxel contains 60 mg/1.5 mL; must first be mixed with entire contents of supplied diluent.
- Once reconstituted, solution contains 10 mg/mL of cabazitaxel.
- When transferring diluent, direct needle onto inside vial wall and inject slowly to limit foaming.
- Remove syringe and needle, then gently mix initial diluted solution by repeated inversions for at least 45 sec to ensure full mixing of drug and diluent.
- Do not shake.
- Allow any foam to dissipate.

Step 2, Final Dilution:

- Withdraw recommended dose and further dilute with 250 mL 0.9% NaCl or D₅W.
- If dose greater than 65 mg is required, use larger volume of 0.9% NaCl or D₅W so that concentration of 0.26 mg/mL is not exceeded.
- Concentration of final diluted solution should be between 0.10 and 0.26 mg/mL.

Rate of Administration

- Infuse over 1 hr using in-line 0.22-micron filter.

Storage

- Store vials at room temperature.
- First dilution solution stable for 30 min.
- Final diluted solution stable for 8 hrs at room temperature or 24 hrs if refrigerated.

Indications/routes/dosage

◀ALERT▶ Antihistamine (dexchlorpheniramine 5 mg, diphenhydrAMINE 25 mg, or equivalent antihistamine), corticosteroid (dexamethasone 8 mg or equivalent), and H₂ antagonist (raNITidine 50 mg or equivalent H₂ antagonist) should be given at least 30 min prior to each dose to reduce risk/severity of hypersensitivity.

Hormone-Refractory Metastatic Prostate Cancer

◀ALERT▶ Monitoring of CBC is essential on wkly basis during cycle 1 and before each treatment cycle thereafter so that the dose can be adjusted.

IV Infusion: ADULTS, ELDERLY: 20–25 mg/m² given as 1-hr infusion every 3 wks in combination with 10 mg predniSONE daily throughout treatment.

Dose Modification

Grade 3 neutropenia, febrile neutropenia, grade 3 or persistent diarrhea, neuropathy: Reduce dosage to 20 mg/m² after treatment interruption.

Dosage with Strong CYP3A Inhibitors

Consider dose reduction by 25%.

Dosage in Renal Impairment

CrCl less than 15 mL/min: Use caution.

Dosage in Hepatic Impairment

Mild Impairment: 20 mg/m². **Moderate Impairment:** 15 mg/m². **Severe Impairment:** Contraindicated.

Side effects

Frequent (47%–16%): Diarrhea, fatigue, nausea, vomiting, constipation, esthesia, abdominal pain, anorexia, back pain. **Occasional (13%–5%):** Peripheral neuropathy, fever, dyspnea, cough, arthralgia, dysgeusia, dyspepsia, alopecia, peripheral edema, weight decrease, urinary tract infection, dizziness, headache, muscle spasm, dysuria, hematuria, mucosal inflammation, dehydration.

Adverse effects/toxic reactions

Hypersensitivity reaction may include generalized rash, erythema, hypotension, bronchospasm. 94% of pts develop grade 1–4 neutropenia and associated complications including anemia, thrombocytopenia, sepsis. GI abnormalities, hypertension, arrhythmias, renal failure may occur.

Nursing considerations

Baseline assessment

Obtain ANC, CBC, BMP, LFT, serum testosterone. Assess ANC, CBC prior to each infusion. Question history of hypersensitivity reaction; renal/hepatic impairment; intolerance to corticosteroids. Receive full medication history and screen for interactions.

Intervention/evaluation

Monitor CBC, ANC on wkly basis during cycle 1 and before each treatment cycle thereafter; do not administer if ANC less than 1,500 cells/mm³. Monitor serum ALT, AST, renal function. Monitor for hypersensitivity reaction (rash, erythema, dyspnea). Encourage adequate fluid intake. Monitor daily pattern of bowel activity, stool consistency. Offer antiemetics if nausea, vomiting occur. Closely monitor for signs/symptoms of neutropenia.

Patient/family teaching

- Report fever, chills, persistent sore throat, unusual bruising/bleeding, pale skin, fatigue.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Maintain strict oral hygiene.
- Do not have immunizations without physician approval (drug lowers body's resistance).
- Avoid those who have received a live virus vaccine.
- Avoid crowds, those with cough, sneezing.
- Avoid grapefruit products.
- Diarrhea may cause dehydration; drink plenty of fluids.

caffeine citrate

kaf-een **sit**-rate

Cafcit

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Citrate salt of caffeine.

CLINICAL: Bronchial smooth muscle relaxant.

Uses

Short-term treatment of apnea in premature infants from 28 wks to younger than 33 wks gestational age.

Precautions

Contraindications: Hypersensitivity to caffeine. **Cautions:** Hepatic/renal impairment, seizure disorder. Avoid in pts with symptomatic cardiac arrhythmias, agitation, anxiety, tremors.

Action

Stimulates medullary respiratory center. Appears to increase sensitivity of respiratory center to stimulatory effects of CO₂. **Therapeutic Effect:** Increases alveolar ventilation, reducing severity, frequency of apneic episodes.

Pharmacokinetics

Rapidly distributed in the brain. Peak plasma concentration: 30–120 min (PO). **Half-life:** 3–4 days (neonates); 5 hrs (9 mos and older).

Interactions

DRUG: CNS stimulants may cause excessive CNS stimulation (e.g., nervousness, insomnia, seizures, arrhythmias). **CYP1A2 inhibitors (e.g., cimetidine, ciprofloxacin)** may increase concentration, risk of side effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May alter serum glucose.

Availability (Rx)

Injection Solution: 20 mg/mL. **Oral Solution:** 20 mg/mL.

Administration/handling

PO

- May give without regard to feedings.
- May administer injectable solution orally.

IV

- Infuse loading dose over at least 30 min; maintenance dose over at least 10 min.
- May give without further dilution.

IV Compatibilities

Alprostadil, calcium gluconate, cefotaxime, dexamethasone, DOBUTamine, DOPamine, gentamicin, heparin, vancomycin.

IV incompatibilities

Acyclovir (Zovirax, Sitavig), furosemide (Lasix).

Indications/routes/dosage

Apnea

PO, IV: Loading dose: 20 mg/kg as caffeine citrate (5–10 mg/kg as caffeine base). If theophylline given within previous 72 hrs, a modified dose (50%–75%) may be given. **Maintenance:** 5–10 mg/kg/day as caffeine citrate (2.5 mg/kg/day as caffeine base) starting 24 hrs after loading dose. Dosage adjusted based on pt response and serum caffeine concentrations.

Side effects

Occasional (9%–2%): Feeding intolerance, rash, gastritis, abnormal healing,

dyspnea, dry skin.

Adverse effects/toxic reactions

Sepsis, necrotizing enterocolitis reported in 4% of pts. Hemorrhage including GI bleeding, intracranial hemorrhage; retinopathy of prematurity, renal failure, pulmonary edema, disseminated intravascular coagulation, acidosis, accidental injury, skin breakdown reported in 2% of pts.

Nursing considerations

Baseline assessment

Baseline serum caffeine levels should be measured in infants previously treated with theophylline (preterm infants metabolize theophylline to caffeine).

Intervention/evaluation

Diligently monitor respirations. Assess skin for rash. Monitor heart rate, number/severity of apnea spells, serum caffeine levels. Monitor for toxic reactions.

calcitonin

kal-si-toe-nin

Calcimar 

Miacalcin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Synthetic hormone.

CLINICAL: Calcium regulator, bone resorption inhibitor.

Do not confuse calcitonin with calcitriol, or Miacalcin with Micatin.

Uses

Parenteral: Treatment of Paget's disease of bone, hypercalcemia, postmenopausal osteoporosis in women greater than 5 yrs postmenopause.

Intranasal: Postmenopausal osteoporosis in women more than 5 yrs

postmenopause.

Precautions

Contraindications: Hypersensitivity to calcitonin, salmon protein. **Cautions:** None known.

Action

Antagonizes effects of parathyroid hormone. Increases jejunal secretion of water, sodium, potassium, chloride. Inhibits osteoclast bone resorption, increases excretion of calcium, phosphate, sodium, magnesium, potassium. **Therapeutic Effect:** Regulates serum calcium concentrations.

Pharmacokinetics

Nasal form rapidly absorbed. Injection form rapidly metabolized primarily in kidneys. Primarily excreted in urine. **Half-life: Nasal:** 43 min; **Injection:** 70–90 min.

Lifespan considerations

Pregnancy/Lactation: Does not cross placenta; unknown if distributed in breast milk. Safe usage during lactation not established (inhibits lactation in animals). **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May decrease **lithium** concentration/effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Injection Solution (Miacalcin): 200 units/mL. **Nasal Spray (Miacalcin Nasal):** 200 units/activation.

Administration/handling

IM, Subcutaneous

- IM route preferred if injection volume greater than 2 mL. Subcutaneous injection for outpatient self-administration unless volume greater than 2 mL.
- Skin test should be performed before therapy in pts suspected of sensitivity to calcitonin.
- Bedtime administration may reduce nausea, flushing.

Intranasal

- Refrigerate unopened nasal spray. Store at room temperature after initial use.
- Instruct pt to clear nasal passages.
- Tilt head slightly forward.
- Insert spray tip into nostril, pointing toward nasal passages, away from nasal septum.
- Spray into one nostril while pt holds other nostril closed and concurrently inspires through nose to deliver medication as high into nasal passage as possible. Spray into one nostril daily.
- Discard after 30 doses.

Indications/routes/dosage

Skin Testing before Treatment in Pts with Suspected Sensitivity to Calcitonin-Salmon

Note: A detailed skin testing protocol is available from the manufacturer.

Paget's Disease

IM, Subcutaneous: ADULTS, ELDERLY: 100 units/day.

Postmenopausal Osteoporosis

IM, Subcutaneous: ADULTS, ELDERLY: 100 units daily with adequate calcium and vitamin D intake.

Intranasal: ADULTS, ELDERLY: 200 units/day as a single spray in one nostril, alternating nostrils daily.

Hypercalcemia

IM, Subcutaneous: ADULTS, ELDERLY: Initially, 4 units/kg q12h; may increase to 8 units/kg q12h if no response in 2 days; may further increase to 8 units/kg q6h if no response in another 2 days.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: IM, Subcutaneous (10%): Nausea (may occur soon after injection; usually diminishes with continued therapy), inflammation at injection site. **Nasal (12%–10%):** Rhinitis, nasal irritation, redness, mucosal lesions. **Occasional: IM, Subcutaneous (5%–2%):** Flushing of face, hands. **Nasal (5%–3%):** Back pain, arthralgia, epistaxis, headache. **Rare: IM, Subcutaneous:** Epigastric discomfort, dry mouth, diarrhea, flatulence. **Nasal:** Itching of earlobes, pedal edema, rash, diaphoresis.

Adverse effects/toxic reactions

Pts with a protein allergy may develop a hypersensitivity reaction (rash, dyspnea, hypotension, tachycardia).

Nursing considerations

Baseline assessment

Obtain baseline serum electrolyte levels.

Intervention/evaluation

Ensure rotation of injection sites; check for inflammation. Assess vertebral bone mass (document stabilization/improvement). Assess for allergic response: rash, urticaria, swelling, dyspnea, tachycardia, hypotension. Monitor serum electrolytes, calcium, alkaline phosphatase.

Patient/family teaching

- Instruct pt/family on aseptic technique, proper injection method of subcutaneous medication, including rotation of sites, proper administration of

nasal medication.

- Nausea is transient and usually decreases over time.
- Immediately report rash, itching, shortness of breath, significant nasal irritation.
- Improvement in biochemical abnormalities and bone pain usually occurs in the first few months of treatment.
- Improvement of neurologic lesions may take more than a year.

calcium acetate

Eliphos

PhosLo

calcium carbonate

Apo-Cal

OsCal 

Titralac

Tums

calcium chloride

Cal-Citrate

Citracal

Osteocit 

calcium glubionate

calcium gluconate

kal-si-um

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Electrolyte replenisher.

CLINICAL: Antacid, antihypocalcemic, antihyperkalemic, antihypermagnesemic, antihyperphosphatemic.

Do not confuse Citracal with Citrucel, OsCal with Asacol, or PhosLo with ProSom.

Uses

Parenteral (calcium chloride): Treatment of hypocalcemia and conditions secondary to hypocalcemia (e.g., seizures, arrhythmias), emergency treatment of severe hypermagnesemia; **(calcium gluconate):** Treatment of hypocalcemia and conditions secondary to hypocalcemia (e.g., seizures, arrhythmias), cardiac disturbances secondary to hyperkalemia; adjunctive treatment of rickets, osteomalacia, and magnesium sulfate overdose; used to decrease capillary permeability in allergic conditions, nonthrombocytopenic purpura, and exudative dermatoses. **Calcium carbonate:** Antacid, dietary supplement. **Calcium acetate:** Controls hyperphosphatemia in end-stage renal disease. **OFF-LABEL (Calcium chloride):** Calcium channel blocker overdose, severe hyperkalemia, malignant arrhythmias associated with hypermagnesemia.

Precautions

Contraindications: Hypersensitivity to calcium formulation. **All preparations:** Calcium-based renal calculi, hypercalcemia, ventricular fibrillation. **Calcium chloride:** Digoxin toxicity. **Calcium gluconate: Neonates:** Concurrent IV use with cefTRIAXone. **Cautions:** Chronic renal impairment, hypokalemia, concurrent use with digoxin.

Action

Essential for function, integrity of nervous, muscular, skeletal systems. Plays an important role in normal cardiac/renal function, respiration, blood coagulation, cell membrane and capillary permeability. Assists in regulating release/storage of hormones/neurotransmitters. Neutralizes/reduces gastric acid (increases pH). **Calcium acetate:** Binds with dietary phosphate, forming insoluble calcium phosphate. **Therapeutic Effect:** Replaces calcium in deficiency states; controls hyperphosphatemia in end-stage renal disease; relieves heartburn, indigestion.

Pharmacokinetics

Moderately absorbed from small intestine (absorption depends on presence of vitamin D metabolites, pH). Primarily eliminated in feces.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. Unknown whether calcium chloride or calcium gluconate is distributed in breast milk. **Children:** Risk of extreme irritation, possible tissue necrosis or sloughing with IV calcium preparations. Restrict IV use due to small vasculature. **Elderly:** Oral absorption may be decreased.

Interactions

DRUG: Hypercalcemia may increase **digoxin** toxicity. Oral form may decrease absorption of **biphosphonates (e.g., risedronate)**, **calcium channel blockers (e.g., amlodipine, diltiazem, verapamil)**, **tetracycline derivatives**, **thyroid products**. **HERBAL:** None significant. **FOOD:** Food may increase calcium absorption. **LAB VALUES:** May increase serum pH, calcium, gastrin. May decrease serum phosphate, potassium.

Availability (Rx)

CALCIUM ACETATE (667 mg = 169 mg calcium)

Gelcap (PhosLo): 667 mg. **Tablets (Eliphos):** 667 mg.

CALCIUM CARBONATE (1 g = 400 mg calcium)

Tablets: 500 mg, 600 mg, 1,250 mg, 1,500 mg. **Tablets (Chewable):** 500 mg, 750 mg, 1,000 mg.

CALCIUM CHLORIDE

Injection Solution: 10% (100 mg/mL) equivalent to 27.2 mg elemental calcium per mL.

CALCIUM GLUCONATE (1 g = 93 mg calcium)

Injection Solution: 10%.

Administration/handling

 IV

Dilution

Calcium Chloride

- May give undiluted or may dilute with 0.9% NaCl or Sterile Water for Injection.

Calcium Gluconate

- May give undiluted or may dilute with 100 mL 0.9% NaCl or D5W.

Rate of Administration

Calcium Chloride

- **Note:** Rapid administration may produce bradycardia, metallic/chalky taste, hypotension, sensation of heart, peripheral vasodilation.
- **IV push:** Infuse slowly at maximum rate of 50–100 mg/min (in cardiac arrest, may administer over 10–20 sec).
- **IV infusion:** Dilute to maximum final concentration of 20 mg/mL and infuse over 1 hr or no faster than 45–90 mg/kg/hr. Give via a central line. Do **NOT** use scalp, small hand or foot veins. Stop infusion if pt complains of pain or discomfort.

Calcium Gluconate

- **Note:** Rapid administration may produce vasodilation, hypotension, arrhythmias, syncope, cardiac arrest.
- **IV push:** Infuse slowly over 3–5 min or at maximum rate of 50–100 mg/min (in cardiac arrest, may administer over 10–20 sec).
- **IV infusion:** Dilute 1–2 g in 100 mL 0.9% NaCl or D₅W and infuse over 1 hr.

Storage

- Store at room temperature.
- Once diluted, stable for 24 hrs at room temperature.

PO

Calcium Acetate

- Administer with plenty of fluids during meals to optimize effectiveness.

Calcium Carbonate

- Administer with or immediately following meals with plenty of water (give with meals if used for phosphate binding). Instruct pt to thoroughly chew chewable tablets before swallowing.

■ IV incompatibilities

Calcium chloride: Amphotericin B complex (Abelcet, AmBisome, Amphotec),

pantoprazole (Protonix), phosphate-containing solutions, propofol (Diprivan), sodium bicarbonate. **Calcium gluconate:** Amphotericin B complex (Abelcet, AmBisome, Amphotec), fluconazole (Diflucan).

■ IV Compatibilities

Calcium chloride: Amikacin (Amikin), DOBUTamine (Dobutrex), lidocaine, milrinone (Primacor), morphine, norepinephrine (Levophed). **Calcium gluconate:** Ampicillin, aztreonam (Azactam), ceFAZolin (Ancef), cefepime (Maxipime), ciprofloxacin (Cipro), DOBUTamine (Dobutrex), enalapril (Vasotec), famotidine (Pepcid), furosemide (Lasix), heparin, lidocaine, lipids, magnesium sulfate, meropenem (Merrem IV), midazolam (Versed), milrinone (Primacor), norepinephrine (Levophed), piperacillin and tazobactam (Zosyn), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Hyperphosphatemia

PO (Calcium Acetate):ADULTS, ELDERLY: Initially, 2 tablets 3 times/day with meals. May increase gradually (q2–3wks) to decrease serum phosphate level to less than 6 mg/dL as long as hypercalcemia does not develop. Usual dose: 2001–2668 mg with each meal.

Hypocalcemia

IV (Calcium chloride): ADULTS, ELDERLY: (Acute, symptomatic): 200–1,000 mg at intervals of q1–3 days. (Severe, symptomatic): 1 g over 10 min; may repeat q60min until symptoms resolve. **CHILDREN, NEONATES:** 2.7–5 mg/kg q4–6h as needed (**Maximum:** 1,000 mg).

IV (Calcium Gluconate):ADULTS, ELDERLY: (Mild): 1–2 g over 2 hrs; (Moderate to severe, asymptomatic): 4 g over 4 hrs; (Severe, symptomatic): 1–2 g over 10 min; may repeat q60min until symptoms resolve. **CHILDREN:** 200–500 mg/kg/day as a continuous infusion or in 4 divided doses. (**Maximum:** 1,000 mg). **NEONATES:** 200 mg/kg q6–12h or 400 mg/kg/day as a continuous infusion.

Antacid

PO (*Calcium Carbonate*):ADULTS, ELDERLY: 1–4 tabs as needed. **Maximum:** 8,000 mg/day. **CHILDREN 6–11 YRS:** 750–800 mg. **Maximum:** 3,000 mg/day. **CHILDREN 2–5 YRS:** 375–400 mg. **Maximum:** 1,500 mg/day.

Cardiac Arrest

IV (*Calcium Chloride*):ADULTS, ELDERLY: 500–1,000 mg over 2–5 min. May repeat as necessary. **CHILDREN, NEONATES:** 20 mg/kg. May repeat in 10 min if necessary. If effective, consider IV infusion of 20–50 mg/kg/hr.

Supplement

PO (*Calcium carbonate*): ADULTS, ELDERLY: 500 mg–4 g/day in 1–3 divided doses. **CHILDREN OLDER THAN 4 YRS:** 750 mg 3 times/day. **CHILDREN 2–4 YRS:** 750 mg 2 times/day. (***Calcium Citrate***): **ADULTS, ELDERLY:** 0.5–2 g 2–4 times/day. **CHILDREN:** 45–65 mg/kg/day in 4 divided doses.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: PO: Chalky taste. **Parenteral:** Pain, rash, redness, burning at injection site; flushing, nausea, vomiting, diaphoresis, hypotension. **Occasional: PO:** Mild constipation, fecal impaction, peripheral edema, metabolic alkalosis (muscle pain, restlessness, slow respirations, altered taste). **Calcium carbonate:** Milk-alkali syndrome (headache, decreased appetite, nausea, vomiting, unusual fatigue). **Rare:** Urinary urgency, painful urination.

Adverse effects/toxic reactions

Hypercalcemia: Early signs: Constipation, headache, dry mouth, increased thirst, irritability, decreased appetite, metallic taste, fatigue, weakness, depression. **Later signs:** Confusion, drowsiness, hypertension, photosensitivity, arrhythmias, nausea, vomiting, painful urination.

Nursing considerations

Baseline assessment

Assess B/P, EKG and cardiac rhythm, renal function, serum magnesium, phosphate, calcium, ionized calcium.

Intervention/evaluation

Monitor serum BMP, calcium, ionized calcium, magnesium, phosphate; B/P, cardiac rhythm, renal function. Monitor for signs of hypercalcemia.

Patient/family teaching

- Do not take within 1–2 hrs of other oral medications, fiber-containing foods.
- Avoid excessive use of alcohol, tobacco, caffeine.

canagliflozin

kan-a-gli-floe-zin

Invokana

Fixed-Combination(s)

Invokamet: canagliflozin/metFORMIN (an antidiabetic): 50 mg/500 mg, 50 mg/1,000 mg, 150 mg/500 mg, 150 mg/1,000 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Sodium-glucose co-transporter 2 (SGLT2) inhibitor.

CLINICAL: Antidiabetic.

■ **BLACK BOX ALERT** ■ May increase risk of lower limb amputations, including the toe, midfoot, and leg. Some pts had multiple amputations, including both legs. Monitor for new pain, tenderness, ulcers of lower legs.

Uses

Adjunctive treatment to diet and exercise to improve glycemic control in pts with type 2 diabetes mellitus.

Precautions

Contraindications: History of hypersensitivity to canagliflozin, other SGLT2 inhibitors, severe renal impairment, end-stage renal disease, dialysis. **Cautions:** Not recommended in type 1 diabetes, diabetic ketoacidosis. Concurrent use of diuretics, ACE inhibitors, angiotensin receptor blockers (ARB), other hypoglycemic or nephrotoxic medications; mild to moderate renal impairment, hypovolemia (dehydration/anemia), elderly, episodic hypotension, hyperkalemia, genital mycotic infection.

Action

Increases excretion of urinary glucose by inhibiting reabsorption of filtered glucose in kidney. Inhibits SGLT2 in proximal renal tubule. **Therapeutic Effect:** Lowers serum glucose levels.

Pharmacokinetics

Readily absorbed following PO administration. Metabolized in liver. Peak plasma concentration: 1–2 hrs. Protein binding: 99%. Excreted in feces (42%), urine (33%). **Half-life:** 11–13 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May have increased risk for adverse reactions (e.g., hypotension, syncope, dehydration).

Interactions

DRUG: Phenytoin, rifAMPin may decrease concentration/effect. **Potassium-sparing diuretics (e.g., spironolactone, triamterene)** may increase serum potassium level. **Antihypertensives (e.g., amLODIPine, lisinopril), beta blockers (e.g., carvedilol, metoprolol), diuretics (e.g., furosemide, HCTZ)** may increase risk of hypotension. **Insulin, oral hypoglycemics** may increase risk of hypoglycemia. May increase concentration/effects of **digoxin**. **HERBAL:** Herbs with hypoglycemic properties (e.g., fenugreek, garlic, ginger,

ginseng, gotu) may increase risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** May increase serum low-density lipoprotein-cholesterol (LDL-C), Hgb, creatinine, magnesium, phosphate, potassium. May decrease glomerular filtration rate.

Availability (Rx)

Tablets: 100 mg, 300 mg.

Administration/handling

PO

- Give before first meal of the day.

Indications/routes/dosage

Type 2 Diabetes Mellitus

PO: ADULTS/ELDERLY: 100 mg daily before first meal. May increase to 300 mg daily if glomerular filtration rate (GFR) greater than 60 mL/min.

Dosage in Renal Impairment

GFR 45–60 mL/min: 100 mg daily (maximum). **GFR less than 45 mL/min:** Permanently discontinue.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (5%): Increased urination. **Rare (3%–2%):** Thirst, nausea, constipation.

Adverse effects/toxic reactions

Symptomatic hypotension (postural dizziness, orthostatic hypotension, syncope) may occur. Genital mycotic (yeast) infections reported in 10% of pts.

Hypoglycemic events reported in 1.5% of pts (5% in elderly). Concomitant use of hypoglycemic medications may increase hypoglycemic risk. Hypersensitivity reactions, including angioedema, urticaria, rash, pruritus, erythema, occurred in 3%–4% of pts. May cause hyperkalemia. May increase risk of ketoacidosis.

Nursing considerations

Baseline assessment

Assess hydration status. Obtain BMP, capillary blood glucose, hemoglobin A1c, LDL-C, digoxin level (if applicable). Assess pt's understanding of diabetes management, routine blood glucose monitoring. Receive full medication history, including minerals, herbal products. Question history of co-morbidities, esp. renal or hepatic impairment.

Intervention/evaluation

Monitor serum potassium, cholesterol; capillary blood glucose, hepatic/renal function tests. Assess for hypoglycemia, hypersensitivity reaction. Monitor for signs of hyperkalemia. Screen for glucose-altering conditions: fever, increased activity or stress, surgical procedures. Obtain dietary consult for nutritional education. Encourage PO intake. Diligently monitor for new leg ulcers, sores, pain; wound may lead to amputation.

Patient/family teaching

- Diabetes mellitus requires lifelong control.
- Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Test blood sugar regularly.
- When taking combination drug therapy or when glucose demands are altered (fever, infection, trauma, stress), have low blood sugar treatment available (glucagon, oral dextrose).
- Report suspected pregnancy or plans of breastfeeding.
- Monitor daily calorie intake.
- Go from lying to standing slowly to prevent dizziness.
- Genital itching may indicate yeast infection.
- Therapy may increase risk for dehydration/low blood pressure.
- Report any palpitations or muscle weakness.
- Treatment may cause loss of limbs; immediately report new leg ulcers, pain,

tenderness.

candesartan

kan-de-sar-tan

Apo-Candesartan 

Atacand

Fixed-Combination(s)

Atacand HCT: candesartan/hydroCHLOROthiazide (a diuretic): 16 mg/12.5 mg, 32 mg/12.5 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Angiotensin II receptor antagonist.

CLINICAL: Antihypertensive.

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Uses

Treatment of hypertension alone or in combination with other antihypertensives, HF: NYHA class II–IV.

Precautions

Contraindications: Hypersensitivity to candesartan. Concomitant use with aliskiren in pts with diabetes mellitus. **Cautions:** Significant aortic/mitral stenosis, renal/hepatic impairment, unstented (unilateral/bilateral) renal artery stenosis, HF (may induce hypotension when treatment initiated).

Action

Blocks vasoconstriction, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT₁ receptors. **Therapeutic Effect:** Produces vasodilation; decreases peripheral resistance, B/P.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	2–3 hrs	6–8 hrs	Greater than 24 hrs

Rapidly, completely absorbed. Protein binding: greater than 99%. Undergoes minor hepatic metabolism to inactive metabolite. Excreted unchanged in urine and in feces through biliary system. Not removed by hemodialysis. **Half-life:** 9 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. May cause fetal/neonatal morbidity/mortality. **Children:** Safety and efficacy not established in pts younger than 1 yr. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May increase risk of **lithium** toxicity. **NSAIDs (e.g., ibuprofen, ketorolac, naproxen)** may decrease effects. **HERBAL: Ephedra, ginseng, yohimbe** may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, ALT, AST. May decrease Hgb, Hct.

Availability (Rx)

Tablets: 4 mg, 8 mg, 16 mg, 32 mg.

Administration/handling

PO

- Give without regard to food.

Indications/routes/dosage

Hypertension

Note: Antihypertensive effect usually seen in 2 wks. Maximum effect within 4–6

wks.

PO: ADULTS, ELDERLY: Initially, 16 mg once daily. Titrate to response. Range: 8–32 mg/day in 1–2 divided doses. **CHILDREN 6–16 YRS, GREATER THAN 50 KG:** Initially, 8–16 mg/day in 1–2 divided doses. Range: 4–32 mg. **Maximum:** 32 g/day. **50 KG OR LESS:** Initially, 4–8 mg in 1–2 divided doses. Range: 2–16 mg/day. **Maximum:** 32 mg/day. **CHILDREN 1–5 YRS:** Initially, 0.2 mg/kg/day in 1–2 divided doses. Range: 0.05–0.4 mg/kg/day. **Maximum:** 0.4 mg/kg/day.

HF

PO: ADULTS, ELDERLY: Initially, 4 mg once daily. May double dose at approximately 2-wk intervals up to a target dose of 32 mg/day.

Dosage in Renal/Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use caution.

Side effects

Occasional (6%–3%): Upper respiratory tract infection, dizziness, back/leg pain. **Rare (2%–1%):** Pharyngitis, rhinitis, headache, fatigue, diarrhea, nausea, dry cough, peripheral edema.

Adverse effects/toxic reactions

Overdosage may manifest as hypotension, tachycardia. Bradycardia occurs less often. May increase risk of renal failure, hyperkalemia.

Nursing considerations

Baseline assessment

Obtain B/P, apical pulse immediately before each dose in addition to regular monitoring (be alert to fluctuations). Question for possibility of pregnancy. Assess medication history (esp. diuretic). Question for history of hepatic/renal impairment, renal artery stenosis. Obtain serum BUN, creatinine, LFT; Hgb, Hct.

Intervention/evaluation

Maintain hydration (offer fluids frequently). Assess for evidence of upper respiratory infection. Assist with ambulation if dizziness occurs. Monitor electrolytes, renal function, urinalysis. Assess B/P for hypertension/hypotension. If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated.

Patient/family teaching

- Hypertension requires lifelong control.
- Inform female pts regarding potential for fetal injury, mortality with second- and third-trimester exposure to candesartan.
- Report suspected pregnancy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report any sign of infection (sore throat, fever).
- Do not stop taking medication.
- Caution against exercising during hot weather (risk of dehydration, hypotension).

cangrelor

kan-grel-or

Kengreal

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: P2Y₁₂ platelet inhibitor.

CLINICAL: Antiplatelet.

Do not confuse cangrelor with ticagrelor.

Uses

Adjunct to percutaneous coronary intervention (PCI) for reducing risk of periprocedural myocardial infarction, repeat coronary revascularization, and stent thrombosis in pts who have not been treated with a P2Y₁₂ platelet inhibitor and are not being given a glycoprotein IIb/IIIa inhibitor.

Precautions

Contraindications: Major active bleeding. Hypersensitivity to cangrelor.

Cautions: Renal impairment; history of intracranial hemorrhage, GI bleeding.

Action

Blocks adenosine diphosphate (ADP)-induced platelet activation and aggregation. Binds selectively and reversibly to P2Y₁₂ receptor to prevent further signaling and platelet activation. **Therapeutic Effect:** Reduces platelet aggregation.

Pharmacokinetics

Widely distributed. Metabolized rapidly in circulatory system via dephosphorylation. Protein binding: 97%–98%. Peak plasma concentration: 2 min. Platelet function returns to baseline within 1 hr after discontinuing infusion. Eliminated in urine (58%), feces (35%). **Half-Life:** 3–6 min.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Clopidogrel, prasugrel have no antiplatelet effect if administered during cangrelor infusion. **HERBAL:** None significant. **FOOD:** None known.

LAB VALUES: May increase serum creatinine (in pts with severe renal impairment).

Availability (Rx)

Injection, Lyophilized Power for Reconstitution: 50 mg/10 mL vial.

Administration/handling

 IV

Reconstitution

- Obtain weight in kg.
- For each 50 mg/mL vial, reconstitute with 5 mL of Sterile Water for Injection.
- Swirl gently until fully dissolved. Do not shake or agitate. Allow foam to settle.
- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to pale yellow in color.
- Further dilute with 250 mL 0.9% NaCl or 5% Dextrose Injection.
- Gently invert bag to mix.
- Final concentration of diluted solution: 200 mcg/mL.

Rate of Administration

- Administer bolus rapidly (less than 1 min) from diluted bag via manual IV push or infusion pump. Ensure that bolus dose is completely administered before starting PCI.
- Start infusion immediately via dedicated line after administration of bolus.

Storage

- Diluted solution is stable up to 12 hrs in 5% dextrose or up to 24 hrs in 0.9% NaCl at room temperature.

Indications/routes/dosage

Coronary Revascularization/Cardiac Stent Thrombosis

IV Infusion: ADULTS, ELDERLY: 30 mcg/kg bolus, then 4 mcg/kg/min infusion. Maintenance infusion should be continued for at least 2 hrs or for the duration of PCI (whichever is longer).

Transition to Oral P2Y₁₂ Therapy

To maintain platelet inhibition after discontinuation, one oral P2Y₁₂ platelet inhibitor should be administered as follows:

- Ticagrelor 180 mg PO at any time during infusion or immediately after discontinuation.
- Prasugrel 60 mg PO immediately after discontinuation (do not administer prasugrel prior to discontinuing infusion).
- Clopidogrel 600 mg PO immediately after discontinuation (do not administer clopidogrel prior to discontinuing infusion).

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

None known (see Adverse Effects/Toxic Reactions).

Adverse effects/toxic reactions

Bleeding complications, including intracranial hemorrhage, other life-threatening/severe/moderate bleeding events, occurred in less than 1% of pts. Mild bleeding reported in 15% of pts. Coronary artery dissection, coronary artery perforation, and dyspnea were the most common events leading to discontinuation. Serious hypersensitivity reactions, including angioedema, anaphylaxis, anaphylactic shock, bronchospasm, stridor, occurred in less than 1% of pts. Worsening renal function was reported in 3% of pts with severe renal impairment. Dyspnea occurred in less than 2% of pts.

Nursing considerations

Baseline assessment

Obtain renal function test in pts with renal impairment. Cross-check dose with co-worker. Question history of renal impairment; colon polyps, gastric/duodenal ulcers, GI bleeding; CVA, head trauma, recent intracranial hemorrhage; hypersensitivity to drug class.

Intervention/evaluation

Report hematuria, epistaxis, coffee ground emesis, black/tarry stools. Assess for headache, altered mental status, stroke-like symptoms, hypertension (may indicate intracranial hemorrhage). Assess peripheral pulses; skin for ecchymosis, petechiae; gums for erythema, gingival bleeding.

Patient/family teaching

- It may take longer to stop bleeding during therapy.
- Use soft toothbrush, electric razor to decrease risk of bleeding.
- Report any sign of red or dark urine, black or tarry stools, coffee-ground vomitus, blood-tinged mucus, nosebleeds.

- Do not vigorously blow nose.
- Report any confusion, headache, lethargy, one-sided weakness, trouble speaking.

capecitabine

kap-e-sye-ta-bine

TOP
100 HIGH
ALERT

Xeloda

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antimetabolite.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ May increase anticoagulant effect of warfarin.

Do not confuse capecitabine with decitabine or emtricitabine, or Xeloda with Xenical.

Uses

Treatment of metastatic breast cancer, metastatic colorectal cancer. Adjuvant (postsurgical) treatment of Dukes C colon cancer. **OFF-LABEL:** Gastric cancer, pancreatic cancer, esophageal cancer, ovarian cancer, neuroendocrine tumors, hepatobiliary cancer.

Precautions

Contraindications: Severe renal impairment (CrCl less than 30 mL/min), dihydropyrimidine dehydrogenase (DPD) deficiency, hypersensitivity to capecitabine, 5-fluorouracil (5-FU). **Cautions:** Existing bone marrow depression, hepatic impairment, mild to moderate renal impairment, previous cytotoxic therapy/radiation therapy, elderly (60 yrs of age or older).

Action

Enzymatically converted to 5-fluorouracil (5-FU). Inhibits enzymes necessary for synthesis of essential cellular components. **Therapeutic Effect:** Interferes with DNA synthesis, RNA processing, protein synthesis.

Pharmacokinetics

Readily absorbed from GI tract. Protein binding: less than 60%. Metabolized in liver. Primarily excreted in urine. **Half-life:** 45 min.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May be more sensitive to GI side effects.

Interactions

DRUG: May increase concentration, toxicity of **warfarin, phenytoin.** Myelosuppression may be enhanced when given concurrently with **bone marrow depressants.** **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** **Echinacea** may decrease level/effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST. May decrease Hgb, Hct, WBC. May increase PT/INR.

Availability (Rx)

Tablets: 150 mg, 500 mg.

Administration/handling

- Give within 30 min after meals with water.
- Administer whole; do not cut, crush.

Indications/routes/dosage

Metastatic Breast Cancer (as monotherapy or in combination with docetaxel), Metastatic Colorectal Cancer, Adjuvant (Postsurgery) Treatment of Dukes C Colon Cancer

PO: ADULTS, ELDERLY: Initially, 2,500 mg/m²/day in 2 equally divided doses approximately q12h apart for 2 wks. Follow with a 1-wk rest period; given in 3-wk cycles.

Dosage in Renal Impairment

CrCl 51–80 mL/min: No adjustment. **CrCl 30–50 mL/min:** 75% of normal dose. **CrCl less than 30 mL/min:** Contraindicated.

Dosage in Hepatic Impairment

No dose adjustment at start of therapy; interrupt therapy for grade 3 or 4 hyperbilirubinemia until bilirubin is 3 times ULN or less.

Side effects

Frequent (55%–25%): Diarrhea, nausea, vomiting, stomatitis, fatigue, anorexia, dermatitis. **Occasional (24%–10%):** Constipation, dyspepsia, headache, dizziness, insomnia, edema, myalgia, pyrexia, dehydration, dyspnea, back pain. **Rare (less than 10%):** Mood changes, depression, sore throat, epistaxis, cough, visual abnormalities.

Adverse effects/toxic reactions

Serious reactions include myelosuppression (neutropenia, thrombocytopenia, anemia), cardiovascular toxicity (angina, cardiomyopathy, DVT), respiratory toxicity (dyspnea, epistaxis, pneumonia), lymphedema. Palmar-plantar erythrodysesthesia syndrome (PPES), presenting as redness, swelling, numbness, skin sloughing of hands and feet, may occur.

Nursing considerations

Baseline assessment

Assess sensitivity to capecitabine or 5-fluorouracil. Obtain baseline Hgb, Hct, serum chemistries, renal function.

Intervention/evaluation

Monitor for severe diarrhea, nausea, vomiting; if dehydration occurs, fluid and electrolyte replacement therapy should be initiated. Assess hands/feet for PPES. Monitor CBC for evidence of bone marrow depression. Monitor renal/hepatic function. Monitor for blood dyscrasias (fever, sore throat, signs of local

infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness).

Patient/family teaching

- Report nausea, vomiting, diarrhea, hand-and-foot syndrome, stomatitis.
- Do not have immunizations without physician's approval (drug lowers body's resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever higher than 100.5°F, sore throat, signs of local infection, unusual bruising/bleeding from any site.

captopril

kap-toe-pril

Apo-Capto 

Fixed-Combination(s)

Capozide: captopril/hydroCHLOROthiazide (a diuretic): 25 mg/15 mg, 25 mg/25 mg, 50 mg/15 mg, 50 mg/25 mg.

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Angiotensin-converting enzyme (ACE) inhibitor.

CLINICAL: Antihypertensive, vasodilator.

■ **BLACK BOX ALERT** ■ May cause injury/death to developing fetus. Discontinue as soon as possible once pregnancy is detected.

Do not confuse captopril with calcitriol, Capitrol, carvedilol, enalapril, fosinopril, lisinopril, Monopril, or quinapril.

Uses

Treatment of hypertension, HF, diabetic nephropathy, post-MI for prevention of ventricular failure.

Precautions

Contraindications: Hypersensitivity to captopril. History of angioedema from previous treatment with ACE inhibitors, concomitant use with aliskiren in pts with diabetes mellitus. **Cautions:** Renal impairment; hypertrophic cardiomyopathy with outflow obstruction, before, during, or immediately after major surgery. Unstented unilateral/bilateral renal artery stenosis. Concomitant use of potassium-sparing diuretics, potassium supplements.

Action

Suppresses renin-angiotensin-aldosterone system (prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular and renal sites). Decreases plasma angiotensin II, increases plasma renin activity, decreases aldosterone secretion. **Therapeutic Effect:** Reduces peripheral arterial resistance, pulmonary capillary wedge pressure; improves cardiac output, exercise tolerance.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	0.25 hr	0.5–1.5 hrs	Dose-related

Rapidly, well absorbed from GI tract (absorption decreased in presence of food). Protein binding: 25%–30%. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** Less than 3 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. May cause fetal/neonatal mortality/morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

Interactions

DRUG: Antihypertensives (e.g., amLODIPine, metoprolol, valsartan), diuretics (e.g., furosemide, HCTZ) may increase hypotensive effects. May increase lithium concentration, toxicity. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect. **Potassium-sparing diuretics**

(e.g., spironolactone, triamterene), potassium supplements may cause hyperkalemia. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:** Licorice may cause sodium and water retention, hypokalemia. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive ANA titer.

Availability (Rx)

Tablets: 12.5 mg, 25 mg, 50 mg, 100 mg.

Administration/handling

PO

- Administer 1 hr before or 2 hrs after meals for maximum absorption (food may decrease drug absorption).
- Tablets may be crushed.

Indications/routes/dosage

Hypertension

PO: ADULTS, ELDERLY: Initially, 12.5–25 mg 2–3 times/day. May increase by 12.5–25 mg/dose at 1–2-wk intervals up to 50 mg 3 times/day. Add diuretic before further increase in dose. **Maximum:** 450 mg/day in 3 divided doses. **CHILDREN, ADOLESCENTS:** 0.3–0.5 mg 3 times/day. **Maximum:** 6 mg/kg/day in 2–4 divided doses. **INFANTS:** 0.15–0.3 mg/kg/dose. May titrate up to maximum of 6 mg/kg/day in 1–4 divided doses. Usual range: 2.5–6 mg/kg/day in 2–4 divided doses. **NEONATES:** 0.01–0.1 mg/kg/dose q8–24h. **Maximum:** 0.5 mg/kg/dose q6–24h.

HF

PO: ADULTS, ELDERLY: Initially, 6.25–25 mg 3 times/day. **Target dose:** 50 mg 3 times/day.

Post-MI

PO: ADULTS, ELDERLY: Initially, 6.25 mg. If tolerated, then 12.5 mg 3 times/day. Increase to 25 mg 3 times/day over several days, up to target dose of 50 mg 3 times/day over several wks.

Diabetic Nephropathy

PO: ADULTS, ELDERLY: 25 mg 3 times/day.

Dosage in Renal Impairment

CrCl 10–50 mL/min: 75% of normal dosage. **CrCl less than 10 mL/min:** 50% of normal dosage.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (7%–4%): Rash. **Occasional (4%–2%):** Pruritus, dysgeusia. **Rare (less than 2%):** Headache, cough, insomnia, dizziness, fatigue, paresthesia, malaise, nausea, diarrhea or constipation, dry mouth, tachycardia.

Adverse effects/toxic reactions

Hypotension ("first-dose syncope") may occur in pts with HF and in those who are severely sodium/volume depleted. Angioedema, hyperkalemia occur rarely. Agranulocytosis, neutropenia noted in those with collagen vascular disease (scleroderma, systemic lupus erythematosus), renal impairment. Nephrotic syndrome noted in those with history of renal disease.

Nursing considerations

Baseline assessment

Obtain B/P immediately before each dose in addition to regular monitoring (be alert to fluctuations). If hypotension occurs, place pt in supine position with legs elevated. In pts with prior renal disease or receiving dosages greater than 150 mg/day, test urine for protein by dipstick method with first urine of day before therapy begins and periodically thereafter. In pts with renal impairment,

autoimmune disease, or taking drugs that affect leukocytes or immune response, obtain CBC before beginning therapy, q2wks for 3 mos, then periodically thereafter.

Intervention/evaluation

Assess skin for rash, pruritus. Assist with ambulation if dizziness occurs. Monitor urinalysis for proteinuria. Monitor serum potassium levels in pts on concurrent diuretic therapy. Monitor B/P, serum BUN, creatinine, CBC. Discontinue medication, contact physician if angioedema occurs.

Patient/family teaching

- Full therapeutic effect of B/P reduction may take several wks.
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- Limit alcohol intake.
- Immediately report if swelling of face, lips, or tongue; difficulty breathing, vomiting, diarrhea, excessive perspiration, dehydration, persistent cough, sore throat, fever occur.
- Inform physician if pregnant or planning to become pregnant.
- Rise slowly from sitting/lying position.

carBAMazepine

kar-ba-**maz**-e-peen

Apo-CarBAMazepine 

Carbatrol

Carnexiv

Epitol

Equetro

TEGretol

TEGretol XR

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Iminostilbene derivative.

CLINICAL: Anticonvulsant, antineuralgic, antimanic, antipsychotic.

■ **BLACK BOX ALERT** ■ Potentially fatal aplastic anemia, agranulocytosis reported. Potentially fatal, severe dermatologic reactions (e.g., Stevens-Johnson syndrome, toxic epidermal necrolysis) may occur. Risk increased in pts with the variant HLA-β* 1502 allele, almost exclusively in pts of Asian ancestry.

Do not confuse carBAMazepine with OXcarbazepine, eslicarbazepine, or TEGretol with Mebaral, Toprol XL, Toradol, or TRENtal.

Uses

Carbatrol, Epitol, TEGretol, TEGretol XR: Treatment of partial seizures with complex symptomatology, generalized tonic-clonic seizures, mixed seizure patterns, pain relief of trigeminal, glossopharyngeal neuralgia. **Carnexiv:** Replacement when oral therapy not feasible in adults with seizures. **Equetro:** Acute manic and mixed episodes associated with bipolar disorder. **OFF-LABEL:** Neuropathic pain in critically ill pts.

Precautions

Contraindications: Concomitant use or within 14 days of use of MAOIs, myelosuppression. Concomitant use of delavirdine or other NNRT inhibitors, hypersensitivity to carBAMazepine, tricyclic antidepressants. **Cautions:** High risk of suicide, increased IOP, hepatic or renal impairment, history of cardiac impairment, EKG abnormalities, elderly.

Action

Decreases sodium ion influx into neuronal membranes, reducing post-tetanic potentiation at synapses. **Therapeutic Effect:** Produces anticonvulsant effect.

Pharmacokinetics

Slowly, completely absorbed from GI tract. Protein binding: 75%–90%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 25–65 hrs (decreased with chronic use).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. Accumulates in fetal tissue. **Children:** Behavioral changes more likely to occur. **Elderly:** More susceptible to confusion, agitation, AV block, bradycardia, syndrome of inappropriate antidiuretic hormone (SIADH).

Interactions

DRUG: CYP3A4 inhibitors (e.g., cimetidine, clarithromycin, azole antifungals, protease inhibitors) may increase concentration. CYP3A4 inducers (e.g., rifAMPin, phenytoin) may decrease concentration/effects. May decrease concentration/effects of **hormonal contraceptives, warfarin, traZODone.** **HERBAL:** Evening primrose may decrease seizure threshold. Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** Grapefruit products may increase absorption, concentration. **LAB VALUES:** May increase serum BUN, glucose, alkaline phosphatase, bilirubin, ALT, AST, cholesterol, HDL, triglycerides. May decrease serum calcium, thyroid hormone (T₃, T₄ index) levels. **Therapeutic serum level:** 4–12 mcg/mL; **toxic serum level:** greater than 12 mcg/mL.

Availability (Rx)

Injection, Solution (Carnexiv): 200 mg/20 mL single-use vial. **Suspension (TEGretol):** 100 mg/5 mL. **Tablets (Epitol, TEGretol):** 200 mg. **Tablets (Chewable [TEGretol]):** 100 mg.

 **Capsules (Extended-Release [Carbatrol, Equetro]):** 100 mg, 200 mg, 300 mg. **Tablets (Extended-Release[TEGretol XR]):** 100 mg, 200 mg, 400 mg.

Administration/handling

PO

- Store oral suspension, tablets at room temperature.
- Give with meals to reduce GI distress.
- May give extended-release capsules without regard to food.
- Extended-release tablets should be given with meals.

- Shake oral suspension well. Do not administer simultaneously with other liquid medicine.
- Do not crush or open extended-release capsules or tablets.
- Extended-release capsules may be opened and sprinkled over food (e.g., applesauce).

IV

Must be diluted with 100 mL 0.9% NaCl or D₅W. Solution stable for 4 hrs at room temperature, 24 hrs refrigerated.

Indications/routes/dosage

◀ALERT▶ Suspension must be given on a 3–4 times/day schedule; tablets on a 2–4 times/day schedule; extended-release capsules 2 times/day. **Carnexiv:** 70% of total oral dose given as four 30-min infusions separated by 6 hrs.

Seizure Control

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: Initially, 200 mg twice daily (tablet or extended-release or in 4 divided doses as suspension). May increase dosage by 200 mg/day at wkly intervals. Usual dose: 800–1,200 mg/day in 2–4 divided doses. **Maximum: ADULTS, ELDERLY:** 1,600 mg/day; **CHILDREN OLDER THAN 15 YRS:** 1,200 mg/day; **CHILDREN 13–15 YRS:** 1,000 mg/day. **CHILDREN 6–12 YRS:** Initially, 100 mg twice daily (tablets) or 4 times/day (oral suspension). May increase by 100 mg/day at wkly intervals. **Usual dose:** 400–800 mg/day. **Maximum:** 1,000 mg/day. **CHILDREN YOUNGER THAN 6 YRS:** Initially, 10–20 mg/kg/day 2–3 times/day (tablets) or 4 times/day (suspension). May increase at wkly intervals until optimal response and therapeutic levels are achieved. **Maximum:** 35 mg/kg/day.

Trigeminal, Glossopharyngeal Neuralgia, Diabetic Neuropathy

PO: ADULTS, ELDERLY: Initially, 100 mg twice a day (tablets or extended-release) or 4 times/day (oral suspension). May increase by 100 mg twice daily up to 400–800 mg/day. **Maximum:** 1,200 mg/day.

Bipolar Disorder

PO: ADULTS, ELDERLY (Equetro): Initially, 400 mg/day in 2 divided doses. May adjust dose in 200-mg increments. **Maximum:** 1,600 mg/day in divided doses.

Dosage in Renal Impairment

CrCl less than 10 mL/min: 75% of normal dose. **HD:** 75% of normal dose. **CRRT:** 75% of normal dose.

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent (greater than 10%): Vertigo, somnolence, ataxia, fatigue, leukopenia, rash, urticaria, nausea, vomiting. **Occasional (10%–1%):** Headache, diplopia, blurred vision, thrombocytopenia, dry mouth, edema, fluid retention, increased weight. **Rare (less than 1%):** Tremors, visual disturbances, lymphadenopathy, jaundice, involuntary muscle movements, nystagmus, dermatitis.

Adverse effects/toxic reactions

Toxic reactions appear as blood dyscrasias (aplastic anemia, agranulocytosis, thrombocytopenia, leukopenia, leukocytosis, eosinophilia), cardiovascular disturbances (HF, hypotension/hypertension, thrombophlebitis, arrhythmias), dermatologic effects (rash, urticaria, pruritus, photosensitivity). Abrupt withdrawal may precipitate status epilepticus.

Nursing considerations

Baseline assessment

CBC, serum iron determination, urinalysis, BUN should be performed before therapy begins and periodically during therapy. **Seizures:** Review history of seizure disorder (intensity, frequency, duration, level of consciousness [LOC]). Initiate seizure precautions. **Neuralgia:** Assess facial pain, stimuli that may cause facial pain. **Bipolar:** Assess mental status, cognitive abilities.

Intervention/evaluation

Seizures: Observe frequently for recurrence of seizure activity. Monitor therapeutic levels. Assess for clinical improvement (decrease in intensity, frequency of seizures). Assess for clinical evidence of early toxicity (fever, sore throat, mouth ulcerations, unusual bruising/bleeding, joint pain). **Neuralgia:** Avoid triggering tic douloureux (draft, talking, washing face, jarring bed, hot/warm/cold food or liquids). **Bipolar:** Monitor for suicidal ideation, behavioral changes. Observe for excessive sedation. **Therapeutic serum level:** 4–12 mcg/mL; **toxic serum level:** greater than 12 mcg/mL.

Patient/family teaching

- Do not abruptly discontinue medication after long-term use (may precipitate seizures).
- Strict maintenance of therapy is essential for seizure control.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report visual disturbances.
- Blood tests should be repeated frequently during first 3 mos of therapy and at monthly intervals thereafter for 2–3 yrs.
- Do not take oral suspension simultaneously with other liquid medicine.
- Do not ingest grapefruit products.
- Report serious skin reactions.

carbidopa/levodopa

kar-bi-doe-pa/lee-voe-doe-pa

Apo-Levocarb 

Duopa

Rytary

Sinemet

Sinemet CR

Fixed-Combination(s)

Stalevo: carbidopa/levodopa/entacapone (antiparkinson agent): 12.5 mg/50

mg/200 mg, 18.75 mg/75 mg/200 mg, 25 mg/100 mg/200 mg, 31.25 mg/125 mg/200 mg, 37.5 mg/150 mg/200 mg, 50 mg/200 mg/200 mg.

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: DOPamine precursor.

CLINICAL: Antiparkinson agent.

Do not confuse Sinemet with Serevent.

Uses

Treatment of Parkinson's disease, postencephalitic parkinsonism, symptomatic parkinsonism following CNS injury by carbon monoxide poisoning, manganese intoxication. **Duopa:** Treatment of motor fluctuations in advanced Parkinson's disease. **OFF-LABEL:** Restless legs syndrome.

Precautions

Contraindications: Hypersensitivity to carbidopa/levodopa. Concurrent use with MAOIs or use within 14 days. (Tablets only): Narrow-angle glaucoma. **Cautions:** History of MI, arrhythmias, bronchial asthma, emphysema, severe cardiac, pulmonary, renal/hepatic impairment; active peptic ulcer, treated open-angle glaucoma, seizure disorder, pts at risk for hypotension, elderly.

Action

Converted to DOPamine in basal ganglia, increasing DOPamine concentration in brain, inhibiting hyperactive cholinergic activity. Carbidopa prevents peripheral breakdown of levodopa, making more levodopa available for transport into brain. **Therapeutic Effect:** Reduces tremor.

Pharmacokinetics

Rapidly and completely absorbed from GI tract. Widely distributed. Excreted primarily in urine. Levodopa is converted to DOPamine. Excreted primarily in urine. **Half-life:** 1–2 hrs (carbidopa); 1–3 hrs (levodopa).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. May inhibit lactation. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** More sensitive to effects of levodopa. Anxiety, confusion, nervousness more common when receiving anticholinergics.

Interactions

DRUG: Isoniazid, antipsychotics, phenytoin, pyridoxine may decrease effects. MAOIs (e.g., selegiline, phenelzine) may increase concentration, effects of orthostatic hypotension. Antihypertensives (e.g., amlodipine, lisinopril, valsartan) may increase risk of orthostatic hypotension. **HERBAL:** Kava kava may decrease effect. **FOOD:** High-protein diets may cause decreased or erratic response to levodopa. **LAB VALUES:** May increase serum BUN, LDH, alkaline phosphatase, bilirubin, ALT, AST. May decrease Hgb, Hct, WBC.

Availability (Rx)

Enteral Suspension (Duopa): 100-mL cassette containing 4.63 mg carbidopa and 20 mg levodopa per mL. **Tablets (Immediate-Release [Sinemet]):** 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa. **Tablets (Orally Disintegrating Immediate-Release):** 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa.

 **Capsules (Extended-Release [Rytary]):** carbidopa/levodopa: 23.75 mg/95 mg, 36.25 mg/145 mg, 48.75 mg/195 mg, 61.25 mg/245 mg. **Tablets (Extended-Release [Sinemet CR]):** 25 mg carbidopa/100 mg levodopa, 50 mg carbidopa/200 mg levodopa.

Administration/handling

Note: Space doses evenly over waking hours.

Enteral Suspension

Refrigerate. Remove 20 min prior to administration.

PO

- Scored tablets may be crushed.
- Give with meals to decrease GI upset.
- Do not crush or chew extended-release tablets.

PO (Parcopa)

- Place orally disintegrating tablet on top of tongue. Tablet will dissolve in seconds; pt to swallow with saliva. Not necessary to administer with liquid.

Indications/routes/dosage

Parkinsonism

PO: ADULTS, ELDERLY (IMMEDIATE-RELEASE ORALLY DISINTEGRATING TABLET): Initially, 25/100 mg 3 times/day. May increase daily or every other day by 1 tablet up to 200/2,000 mg daily. **(EXTENDED-RELEASE):** (Sinemet CR) 50/200 mg 2 times/day at least 6 hrs apart. Intervals between doses of Sinemet CR should be 4–8 hrs while awake, with smaller doses at end of day if doses are not equal. May adjust q3days. **Maximum:** 8 tablets/day. **(RYTARY):** Initially, 23.75/95 mg 3 times/day for 3 days, then to 36.25/145 mg 3 times/day. Frequency may be increased to maximum of 5 times/day if needed and tolerated. **Maximum daily dose:** 612.5/2450 mg/day. **(ENTERAL SUSPENSION): Maximum:** 2000 mg (1 container) over 16 hrs through NJ or PEG tube via infusion pump. Also take oral immediate-release in evening after disconnecting pump. Refer to manufacturer's guidelines for morning dose, continuous dose escalation, titration instructions.

Dosage in Renal/Hepatic Impairment

Use caution.

Side effects

Frequent (80%–50%): Involuntary movements of face, tongue, arms, upper body; nausea/vomiting; anorexia. **Occasional:** Depression, anxiety, confusion, nervousness, urinary retention, palpitations, dizziness, light-headedness, decreased appetite, blurred vision, constipation, dry mouth, flushed skin, headache, insomnia, diarrhea, unusual fatigue, darkening of urine and sweat.

Rare: Hypertension, ulcer, hemolytic anemia (marked by fatigue).

Adverse effects/toxic reactions

High incidence of involuntary choreiform, dystonic, dyskinetic movements in those on long-term therapy. Numerous mild to severe CNS and psychiatric disturbances may occur (reduced attention span, anxiety, nightmares, daytime drowsiness, euphoria, fatigue, paranoia, psychotic episodes, depression, hallucinations).

Nursing considerations

Baseline assessment

Assess symptoms of Parkinson's disease (e.g., rigidity, pill rolling, gait). Receive full medication history and screen for interactions.

Intervention/evaluation

Be alert to neurologic effects (headache, lethargy, mental confusion, agitation). Monitor for evidence of dyskinesia (difficulty with movement). Assess for clinical reversal of symptoms (improvement of tremor of head and hands at rest, mask-like facial expression, shuffling gait, muscular rigidity). Monitor B/P (standing, sitting, supine).

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Sugarless gum, sips of water may relieve dry mouth.
- Take with food to minimize GI upset.
- Effects may be delayed from several wks to mos.
- May cause darkening of urine or sweat (not harmful).
- Report any uncontrolled movement of face, eyelids, mouth, tongue, arms, hands, legs; mental changes; palpitations; severe or persistent nausea/vomiting; difficulty urinating.
- Report exacerbations of asthma, underlying depression, psychosis.

kar-boe-plat-in

CARBOplatin Injection 

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Alkylating agent.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents (high potential for severe reactions, including anaphylaxis [may occur within minutes of administration] and sudden death). Profound myelosuppression (anemia, thrombocytopenia) has occurred. Vomiting may occur.

Do not confuse CARBOplatin with CISplatin or oxaliplatin, or with Platinol.

Uses

Treatment of advanced ovarian carcinoma. Palliative treatment of recurrent ovarian cancer. **OFF-LABEL:** Brain tumors, Hodgkin's and non-Hodgkin's lymphomas, malignant melanoma, retinoblastoma; treatment of breast, bladder, cervical, endometrial, esophageal, small-cell lung, non-small-cell lung, head and neck, testicular carcinomas; germ cell tumors, osteogenic sarcoma.

Precautions

Contraindications: Hypersensitivity to CARBOplatin. History of severe allergic reaction to CISplatin, platinum compounds, mannitol; severe bleeding, severe myelosuppression. **Cautions:** Moderate bone marrow depression, renal impairment, elderly.

Action

Inhibits DNA synthesis by cross-linking with DNA strands, preventing cell division. **Therapeutic Effect:** Interferes with DNA function.

Pharmacokinetics

Protein binding: Low. Hydrolyzed in solution to active form. Primarily excreted in urine. **Half-life:** 2.6–5.9 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Peripheral neurotoxicity increased, myelotoxicity may be more severe. Age-related renal impairment may require decreased dosage, careful monitoring of blood counts.

Interactions

DRUG: **Bone marrow depressants** may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **Nephrotoxic, ototoxic medications (e.g., gentamicin, ketorolac, furosemide)** may increase risk of toxicity. **HERBAL:** Avoid **black cohosh, dong quai** in estrogen-dependent tumors. **Echinacea** may decrease level/effects. **FOOD:** None known. **LAB VALUES:** May decrease serum calcium, magnesium, potassium, sodium. May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, AST.

Availability (Rx)

Injection Solution: 10 mg/mL.

Administration/handling

 **ALERT** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

IV

Reconstitution

- Dilute with D₅W or 0.9% NaCl to a final concentration as low as 0.5 mg/mL.

Rate of Administration

- Infuse over 15–60 min.
- Rarely, anaphylactic reaction occurs minutes after administration. Use of

epinephrine, corticosteroids alleviates symptoms.

Storage

- Store vials at room temperature.
- After dilution, solution is stable for 8 hrs.

IV incompatibility

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

IV Compatibilities

Etoposide (VePesid), granisetron (Kytril), ondansetron (Zofran), PACLitaxel (Taxol), palonosetron (Aloxi).

Indications/routes/dosage

Note: Doses commonly calculated by target AUC.

Ovarian Carcinoma

IV: ADULTS: 360 mg/m² on day 1, every 4 wks (as single agent), or 300 mg/m² q4 wks (in combination with cyclophosphamide) or target AUC 4–6 (single agent; in previously treated pts). Do not repeat dose until neutrophil and platelet counts are within acceptable levels.

Dose Modification

Platelets less than 50,000 cells/mm³ or ANC less than 500 cells/mm³: Give 75% of dose.

Dosage in Renal Impairment

Initial dosage is based on creatinine clearance; subsequent dosages are based on pt's tolerance, degree of myelosuppression.

Creatinine Clearance	Dosage Day 1
60 mL/min or greater	360 mg/m ²
41–59 mL/min	250 mg/m ²
16–40 mL/min	200 mg/m ²

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (80%–65%): Nausea, vomiting. **Occasional (17%–4%):** Generalized pain, diarrhea/constipation, peripheral neuropathy. **Rare (3%–2%):** Alopecia, asthenia, hypersensitivity reaction (erythema, pruritus, rash, urticaria).

Adverse effects/toxic reactions

Myelosuppression may be severe, resulting in anemia, infection (sepsis, pneumonia), major bleeding. Prolonged treatment may result in peripheral neurotoxicity.

Nursing considerations

Baseline assessment

Obtain EKG, CBC, serum chemistries, renal function test. Offer emotional support. Do not repeat treatment until WBC recovers from previous therapy. Transfusions may be needed in pts receiving prolonged therapy (myelosuppression increased in those with previous therapy, renal impairment).

Intervention/evaluation

Monitor pulmonary function studies, hepatic/renal function tests, CBC, serum electrolytes. Monitor for fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, symptoms of anemia (excessive fatigue, weakness).

Patient/family teaching

- Nausea, vomiting generally abate within 24 hrs.
- Do not have immunizations without physician's approval (drug lowers body's resistance).
- Avoid contact with those who have recently received live virus vaccine.

carfilzomib

kar-**fil**-zoh-mib

Kyprolis

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Proteasome inhibitor.

CLINICAL: Antineoplastic.

Do not confuse carfilzomib with crizotinib, ixazomib, PAZOpanib.

Uses

Treatment of pts with multiple myeloma who have received at least 2 prior therapies including bortezomib and an immunomodulatory agent and have demonstrated disease progression on or within 60 days of completion of last therapy. In combination with dexamethasone or lenalidomide and dexamethasone for treatment of relapsed multiple myeloma who have received 1 to 3 prior therapies.

Precautions

Contraindications: Hypersensitivity to carfilzomib. **Cautions:** Preexisting HF, decreased left ventricular ejection fraction, myocardial abnormalities, complications of pulmonary hypertension (e.g., dyspnea), hepatic impairment, thrombocytopenia.

Action

Blocks action of proteasomes, intracellular proteins to induce cell death in rapidly dividing cells. **Therapeutic Effect:** Produces cell cycle arrest and apoptosis.

Pharmacokinetics

Protein binding: 97%. Rapidly, extensively metabolized. Excreted primarily extrahepatically. Minimal removal by hemodialysis. **Half-life:** Equal to or less than 1 hr on day 1 of cycle 1. Proteasome inhibition was maintained for 48 hrs or longer following first dose of carfilzomib for each week of dosing.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy. May cause fetal harm. Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, glucose, creatinine, ALT, AST, bilirubin, calcium. May decrease RBC, Hgb, Hct, absolute neutrophil count (ANC), platelet count; serum magnesium, phosphate, potassium, sodium.

Availability (Rx)

Injection Powder for Reconstitution (Single-Use Vial): 30 mg, 60 mg.

Administration/handling

IV

Reconstitution

- Reconstitute 60-mg vial with 29 mL Sterile Water for Injection, (30-mg vial with 15 mL), directing solution to inside wall of vial (minimizes foaming).
- Swirl and invert vial slowly for 1 min or until completely dissolved.
- Do not shake.
- If foaming occurs, rest vial for 2–5 min until subsided.
- Withdraw calculated dose from vial and dilute into 50–100 mL D₅W (depending on dose and infusion duration).
- Final concentration of reconstituted solution: 2 mg/mL.

Rate of administration

- Infuse over 10–30 min (depending on the dose regimen) via dedicated IV line. Flush line before and after with NaCl or D₅W.
- Do not administer as a bolus.

Storage

- Refrigerate undiluted vials.
- Reconstituted solution may be refrigerated up to 24 hrs.
- At room temperature, use diluted solution within 4 hrs.

■ IV incompatibilities

Do not mix with other IV medications or additives. Flush IV administration line with NaCl or D₅W immediately before and after carfilzomib administration.

Indications/routes/dosage

◀ALERT▶ Dose is calculated using pt's actual body surface area at baseline. Pts with a body surface area greater than 2.2 m² should receive dose based on a body surface area of 2.2 m². No dose adjustment needed for weight changes of less than or equal to 20%.

◀ALERT▶ Prior to each dose in cycle 1, give 250 mL to 500 mL NaCl bolus. Give an additional 250 mL to 500 mL IV fluid following administration. Continue IV hydration in subsequent cycles (reduces risk of renal toxicity, tumor lysis syndrome).

Premedicate with dexamethasone 4 mg PO or IV prior to all doses during cycle 1 and prior to all doses during first cycle of dose escalation to 27 mg/m² (reduces incidence, severity of infusion reactions). Reinstate dexamethasone premedication (4 mg PO or IV) if symptoms develop or reappear during subsequent cycles.

Multiple Myeloma, Relapsed/Refractory (Single-Agent 20/27 mg/m² regimen)

IV infusion: ADULTS, ELDERLY: Cycle 1: 20 mg/m² over 10 min on days 1 and 2. If tolerated, increase to 27 mg/m² over 10 min on days 8, 9, 15, and 16 of a 28-day cycle. Cycles 2–12: 27 mg/m² over 10 min on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle. Cycles 13 and beyond: 27 mg/m² over 10 min on days 1, 2, 15, and 16 of a 28-day cycle. Continue until disease progression or unacceptable toxicity.

Multiple Myeloma, Relapsed/Refractory (Single-Agent 20/56 mg/m² regimen)

IV infusion: ADULTS, ELDERLY: Cycle 1: 20 mg/m² over 30 min on days 1 and 2. If tolerated, increase to 56 mg/m² over 30 min on days 8, 9, 15, and 16 of a 28-day cycle. Cycles 2–12: 56 mg/m² over 30 min on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle. Cycles 13 and beyond: 56 mg/m² over 30 min on days 1, 2, 15, and 16 of a 28-day cycle. Continue until disease progression or unacceptable

toxicity.

Multiple Myeloma, Relapsed/Refractory (In Combination with Lenalidomide and Dexamethasone)

IV infusion: ADULTS, ELDERLY: Cycle 1: 20 mg/m² over 10 min on days 1 and 2. If tolerated, increase to 27 mg/m² over 10 min on days 8, 9, 15, and 16 of a 28-day cycle. Cycles 2–12: 27 mg/m² over 10 min on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle. Cycles 13–18: 27 mg/m² over 10 min on days 1, 2, 15, and 16 of a 28-day cycle. Beginning with cycle 19, lenalidomide and dexamethasone may be continued (until disease progression or unacceptable toxicity) without carfilzomib.

Multiple Myeloma, Relapsed/Refractory (In Combination with Dexamethasone)

IV infusion: ADULTS, ELDERLY: Cycle 1: 20 mg/m² over 30 min on days 1 and 2. If tolerated, increase to 56 mg/m² over 30 min on days 8, 9, 15, and 16 of a 28-day cycle. Cycle 2 and beyond: 56 mg/m² over 30 min on days 1, 2, 8, 9, 15, and 16 of a 28-day cycle. Continue until disease progression or unacceptable toxicity.

Dose Modification

Hematologic

Grade 3 or 4 neutropenia: Withhold dose. Continue at same dose if fully recovered prior to next scheduled dose. If recovered to grade 2, reduce dose by one dose level. If dose tolerated, may escalate to previous dose. **Grade 4 thrombocytopenia:** Withhold dose. Continue at same dose if fully recovered prior to next scheduled dose. If recovered to grade 3, reduce dose by one dose level. If dose tolerated, may escalate to previous dose.

Cardiac

Grade 3 or 4, new onset or worsening of HF, decreased LVE, myocardial ischemia: Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

Hepatic

Grade 3 or 4 elevation of bilirubin, transaminases: Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

Peripheral Neuropathy

Grade 3 or 4: Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

Pulmonary Toxicity

Pulmonary hypertension: Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose. **Grade 3 or 4 pulmonary complications:** Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

Renal

Serum creatinine 2 times or greater from baseline: Withhold dose until renal function improves to grade 1 or baseline. Withhold dose until resolved or at baseline. After resolution, restart at reduced dose level. If dose tolerated, may escalate to previous dose.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (56%–20%): Fatigue, anemia, nausea, exertional dyspnea, diarrhea, fever, headache, cough, peripheral edema, vomiting, constipation, back pain.

Occasional (18%–14%): Insomnia, chills, arthralgia, muscle spasms, hypertension, asthenia, extremity pain, dizziness, hypoesthesia (decreased sensitivity to touch), anorexia.

Adverse effects/toxic reactions

Pneumonia (10% of pts), acute renal failure (4% of pts), pyrexia (3% of pts), and HF (3% of pts) were reported. Adverse reactions leading to discontinuation occurred in 15% of pts. Upper respiratory tract infection reported in 28% of pts. HF, pulmonary edema, decrease in ejection fraction were reported in 7% of pts. Infusion reaction characterized by chills, fever, wheezing, facial flushing, dyspnea, vomiting, chest tightness can occur immediately following or up to 24 hrs after administration. Tumor lysis syndrome occurs rarely.

Nursing considerations

Baseline assessment

Obtain accurate height and weight. Obtain full history of home medications including vitamins, herbal products. Ensure hydration status and maintain throughout treatment. Obtain CBC, serum chemistries. Assess vital signs, O₂ saturation. Platelet nadirs occur around day 8 of each 28-day cycle and recover to baseline by start of the next 28-day cycle.

Intervention/evaluation

Monitor for fluid overload. Monitor platelet count frequently; adjust dose according to grade of thrombocytopenia. Obtain serum ALT, AST, bilirubin for evidence of hepatotoxicity. Monitor vital signs, O₂ saturation routinely. Monitor cardiac function and manage as needed. Assess for palpitations, tachycardia. Assess for anemia-related dizziness, exertional dyspnea, fatigue, weakness, syncope. Report decreases in Hgb, Hct, platelets, neutrophils. Monitor for acute infection (fever, diaphoresis, lethargy, oral mucosal changes, productive cough), bloody stools, bruising, hematuria, DVT, pulmonary embolism. Encourage nutritional intake and assess anorexia, weight loss. Reinforce birth control compliance. Monitor daily pattern of bowel activity, stool consistency. Offer antiemetics if nausea, vomiting occur. Monitor for symptoms of neutropenia.

Patient/family teaching

- Blood tests will be drawn routinely.
- Immediately report any newly prescribed medications.
- May alter taste of food or decrease appetite.
- Report bloody stool/urine, increased bruising, difficulty breathing, weakness, dizziness, palpitations, weight loss.
- Maintain strict oral hygiene.
- Do not have immunizations without physician approval (drug lowers body's resistance).
- Avoid those who have recently taken live virus vaccine.
- Avoid crowds, those with symptoms of viral illness.

kar-**ip**-ra-zeen

Vraylar

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Serotonin receptor antagonist.

CLINICAL: Antipsychotic.

■ **BLACK BOX ALERT** ■ Elderly pts treated with antipsychotic drugs are at an increased risk of death. Treatment not approved in pts with dementia-related psychosis.

Do not confuse cariprazine with Compazine or mirtazapine.

Uses

Treatment of schizophrenia. Acute treatment of manic or mixed episodes associated with bipolar I disorder.

Precautions

Contraindications: Hypersensitivity to cariprazine. **Cautions:** Baseline leukopenia, neutropenia; hx of drug-induced leukopenia, neutropenia; debilitated, diabetes mellitus, dyslipidemia, elderly, hepatic impairment, Parkinson's disease, pts at risk for hypotension (dehydration, hypovolemia, concomitant use of antihypertensives), pts at risk for aspiration, dysphagia; history of cardiovascular disease (e.g., ischemic heart disease, HF, cardiac arrhythmias); pts at risk for CVA, TIA; hx of seizures. Concomitant use of medications that lower seizure threshold. Avoid concomitant use of CYP3A inducers.

Action

Exact mechanism unknown. Partial agonist of central DOPamine D₂ and serotonin 5-HT_{1A} receptors and antagonist of serotonin 5-HT_{2A} receptors. **Therapeutic Effect:** Diminishes symptoms of psychotic behavior.

Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: 91%–97%. Peak plasma concentration: 3–6 hrs. Mean plasma concentrations decrease approx. 50% after 1 wk from last dose. Excreted primarily in urine (21%). **Half-Life:** 2–4 days.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. May increase risk of extrapyramidal symptoms and/or withdrawal syndrome in neonates. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** May increase risk of adverse effects due to age-related cardiac/hepatic/renal impairment.

Interactions

DRUG: Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, rifampin), moderate CYP3A inducers (e.g., nafcillin) may decrease concentration/effect; avoid use. Alcohol, antidepressants (e.g., sertraline, nortriptyline), benzodiazepines (e.g., diazepam, lorazepam), opioids (e.g., morphine), phenothiazines (e.g., thioridazine), sedative/hypnotics (e.g., zolpidem) may increase CNS depression. Antihypertensives (e.g., amlodipine, enalapril, valsartan) may increase hypotensive effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products may increase concentration/effect. **LAB VALUES:** May increase serum ALT, AST; CPK. May decrease serum sodium.

Availability (Rx)

 **Capsules:** 1.5 mg, 3 mg, 4.5 mg, 6 mg.

Administration/handling

PO

Give without regard to food. Administer whole; do not break, crush, cut, or open

capsule.

Indications/routes/dosage

Schizophrenia

PO: ADULTS, ELDERLY: Initially, 1.5 mg once daily. May increase to 3 mg on day 2 if tolerated. May further increase in increments of 1.5–3 mg based on clinical response and tolerability. **Range:** 1.5–6 mg once daily.

Bipolar I Disorder

PO: ADULTS, ELDERLY: 1.5 mg once on day 1, then increase to 3 mg once daily on day 2. May further increase in increments of 1.5–3 mg based on clinical response and tolerability. **Range:** 3–6 mg once daily.

Concomitant Use of Strong CYP3A Inhibitors

Pts starting strong CYP3A inhibitor while on stable dose of cariprazine: Reduce maintenance cariprazine dose by 50%. Pts taking cariprazine 4.5 mg/day should reduce dosage to 1.5 mg/day or 3 mg/day. Pts taking 1.5 mg/day, adjust dosing to every other day. If the strong CYP3A inhibitor is discontinued, cariprazine may need to be increased. **Pts starting cariprazine while on CYP3A inhibitor:** 1.5 mg once on day 1; no dose on day 2; 1.5 mg once on day 3. After day 3, increase dose to 3 mg once daily as tolerated. If strong CYP3A inhibitor is discontinued, cariprazine may need to be increased.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Treatment not recommended.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Treatment not recommended.

Side effects

Frequent (26%–11%): Bradykinesia, cogwheel rigidity, drooling, dyskinesia,

masked faces, muscle rigidity, dystonia, tremor, salivary hypersecretion, torticollis, trismus, insomnia, akathisia, headache. **Occasional (5%–3%):** Nausea, constipation, restlessness, vomiting, dizziness, agitation, anxiety, dyspepsia, abdominal pain, diarrhea, fatigue, asthenia, back pain, toothache, hypertension, decreased appetite. **Rare (2%–1%):** Dry mouth, weight gain, extremity pain, somnolence, sedation, cough, tachycardia, arthralgia.

Adverse effects/toxic reactions

May increase risk of hypotension, orthostatic hypotension, syncope; diabetes mellitus, DKA, hyperglycemia, hyperglycemic hyperosmolar nonketotic coma; leukopenia, neutropenia, febrile neutropenia; aspiration, dysphagia, gastritis, gastric reflux; extrapyramidal symptoms including akathisia, dystonia, parkinsonism, tardive dyskinesia; suicidal ideation. May cause neuroleptic malignant syndrome (NMS), manifested by altered mental status, cardiac arrhythmias, diaphoresis, labile blood pressure, malignant hyperthermia, muscle rigidity, rhabdomyolysis, renal failure. May increase risk of death in pts with dementia-related psychosis. Cognitive and motor impairment reported in 7% of pts. May increase seizure-like activity related to decrease in seizure threshold. Infectious processes including nasopharyngitis, urinary tract infection reported in 1% of pts. Hypersensitivity reactions including angioedema, rash, pruritus have occurred.

Nursing considerations

Baseline assessment

Obtain baseline fasting lipid profile, fasting plasma glucose level, vital signs; Hgb A1c in pts with diabetes; ANC, CBC in pts with baseline leukopenia, neutropenia. Receive full medication history, including herbal products, and screen for interactions. Assess appearance, behavior, speech pattern, levels of interest. Verify pregnancy status. Question history of diabetes, cardiovascular disease, CVA, dysphagia, hepatic impairment, hypersensitivity reaction, TIA, seizures.

Intervention/evaluation

Monitor ANC, CBC, fasting lipid profile, fasting plasma glucose levels

periodically. Assess mental status for anxiety, depression, suicidal ideation (esp. at initiation and with change in dosage), social function. Due to long half-life, any change in dosage will not be fully reflected for several wks; monitor closely for adverse effects during the following wks. Monitor for hypersensitivity reaction, dysphagia, tardive dyskinesia, extrapyramidal symptoms, metabolic changes including hyperglycemia. Screen for infection. Monitor for neuroleptic malignant syndrome.

Patient/family teaching

- Immediately report thoughts of suicide or plans to commit suicide.
- Avoid tasks that require alertness until response to drug is established.
- Therapy may increase blood sugar levels. Monitor for blurry vision, confusion, frequent urination, fruity-smelling breath, thirst, weakness.
- Treatment may cause fetal harm. Avoid pregnancy. Do not breastfeed.
- Treatment may lower ability to fight infection.
- Swallow capsules whole; do not chew, crush, cut, or open capsules.
- Do not ingest grapefruit products or herbal products. Report drooling, muscle rigidity, lockjaw, tremors, or inability to control muscle movements.
- Treatment may increase risk of seizures.
- Report confusion, palpitations, profuse sweating, fluctuating blood pressure, unusually high core body temperature, muscle rigidity, dark-colored urine or decreased urine output; may indicate life-threatening neurologic event called neuroleptic malignant syndrome (NMS).

carmustine

kar-**mus**-teen

**HIGH
ALERT**

BiCNU

Gliadel Wafer

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Alkylating agent, nitrosourea.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Profound myelosuppression (leukopenia, thrombocytopenia) is major toxicity. High risk of pulmonary toxicity. Must be administered by personnel trained in administration/handling of chemotherapeutic agents (high potential for severe reactions, including

anaphylaxis, sudden death).

Do not confuse carmustine with bendamustine or lomustine.

Uses

BiCNU: Treatment of brain tumors, Hodgkin's lymphomas, non-Hodgkin's lymphomas, multiple myeloma. **Gliadel Wafer:** Adjunct to surgery and radiation in treatment of newly diagnosed high-grade malignant glioma. Adjunct to surgery to prolong survival in recurrent glioblastoma multiforme. **OFF-LABEL:** Treatment of mycosis fungoides (topical).

Precautions

Contraindications: Hypersensitivity to carmustine. **Cautions:** Thrombocytopenia, leukopenia, anemia, renal/hepatic impairment.

Action

Inhibits DNA, RNA synthesis by cross-linking with DNA, RNA strands, preventing cell division. Cell cycle–phase nonspecific. **Therapeutic Effect:** Interferes with DNA, RNA function.

Pharmacokinetics

Crosses blood-brain barrier. Metabolized in liver. Excreted in urine. **Half-life:** 15–30 min.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy, particularly first trimester; may cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Bone marrow depressants, cimetidine may enhance myelosuppressive

effect. **Hepatotoxic, nephrotoxic medications** (e.g., furosemide, gentamicin, ketorolac) may increase risk of hepatotoxicity, nephrotoxicity. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL: Echinacea** may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, ALT, AST.

Availability (Rx)

Injection, Powder for Reconstitution (BiCNU): 100 mg. **Implant Device (Gliadel Wafer):** 7.7 mg.

Administration/handling

 May be carcinogenic, mutagenic, teratogenic. Wear protective gloves during preparation of drug; may cause transient burning, brown staining of skin.

IV

Reconstitution

- Reconstitute 100-mg vial with 3 mL sterile dehydrated (absolute) alcohol, followed by 27 mL Sterile Water for Injection to provide concentration of 3.3 mg/mL.
- Further dilute with 50–250 mL D₅W to final concentration of 0.2–1 mg/mL.

Rate of Administration

- Infuse over 1–2 hrs (shorter duration may produce intense burning pain at injection site, intense flushing of skin, conjunctiva).
- Flush IV line with 5–10 mL 0.9% NaCl or D₅W before and after administration to prevent irritation at injection site.

Storage

- Refrigerate unused vials.
- Reconstituted vials are stable for 8 hrs at room temperature or 24 hrs if refrigerated.
- Solutions further diluted with D₅W are stable for 8 hrs at room temperature.
- Solutions appear clear, colorless to yellow.
- Discard if precipitate forms, color change occurs, or oily film develops on bottom of vial.
- **Gliadel Wafers:** Store at or below –20°C (–4°F). Unopened pouches may be

kept at room temperature for maximum of 6 hrs.

■ IV incompatibilities

Allopurinol (Aloprim), sodium bicarbonate.

■ IV Compatibilities

Granisetron (Kytril), ondansetron (Zofran).

Indications/routes/dosage

◀ALERT▶ Refer to individual oncology protocols.

Usual Dosage (Refer to Individual Protocols)

IV (BiCNU): ADULTS, ELDERLY: 150–200 mg/m² as a single dose q6wks or 75–100 mg/m² on 2 successive days q6wks.

◀ALERT▶ Next dosage is based on clinical and hematologic response to previous dose (platelets greater than 100,000/mm³ and leukocytes greater than 4,000/mm³).

Implantation (Gliadel Wafer): ADULTS, ELDERLY, CHILDREN: Up to 8 wafers (62.6 mg) may be placed in resection cavity.

Dosage Modification

Leukocytes 2,000–2,999 cells/mm³ or platelets 25,000–74,999 cells/mm³: Give 70% of dose. **Leukocytes less than 2,000 cells/mm³ or platelets less than 25,000 cells/mm³:** Give 50% of dose.

Dosage in Renal Impairment

Creatinine Clearance (mL/min)	Dosage
46–60	80% of dose
31–45	75% of dose
Less than 31	Not recommended

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent: Nausea, vomiting (may last up to 6 hrs). **Occasional:** Diarrhea, esophagitis, anorexia, dysphagia, hyperpigmentation. **Rare:** Thrombophlebitis, burning sensation, pain at injection site.

Adverse effects/toxic reactions

Hematologic toxicity due to myelosuppression occurs frequently. Thrombocytopenia occurs approximately 4 wks after treatment begins and lasts 1–2 wks. Leukopenia is evident 5–6 wks after treatment begins and lasts 1–2 wks. Anemia occurs less frequently. Mild, reversible hepatotoxicity occurs frequently. Prolonged, high-dose therapy may produce impaired renal function, pulmonary toxicity (pulmonary infiltrate/fibrosis).

Nursing considerations

Baseline assessment

Obtain CBC, renal/hepatic function studies before initiation and periodically thereafter. Offer emotional support.

Intervention/evaluation

Monitor renal/hepatic function tests. Obtain CBC wkly during and for at least 6 wks after therapy ends. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Monitor for pulmonary toxicity; observe for dyspnea, adventitious breath sounds.

Patient/family teaching

- Maintain adequate hydration (may protect against renal impairment).
- Do not have immunizations without physician's approval (drug lowers body's resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Report nausea, vomiting, fever, sore throat, chills, unusual bleeding/bruising.

kar-ve-dil-ole

Apo-Carvedilol 

Coreg

Coreg CR

Novo-Carvedilol 

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Beta-adrenergic blocker.

CLINICAL: Antihypertensive.

Do not confuse carvedilol with atenolol or carteolol, or Coreg with Corgard, Cortef, or Cozaar.

Uses

Treatment of mild to severe HF, left ventricular dysfunction following MI, hypertension. **OFF-LABEL:** Treatment of angina pectoris, idiopathic cardiomyopathy.

Precautions

Contraindications: Hypersensitivity to carvedilol. Bronchial asthma or related bronchospastic conditions, cardiogenic shock, decompensated HF requiring intravenous inotropic therapy, severe hepatic impairment, second- or third-degree AV block, severe bradycardia, or sick sinus syndrome (except in pts with pacemaker). **Cautions:** Diabetes, myasthenia gravis, mild to moderate hepatic impairment. Withdraw gradually to avoid acute tachycardia, hypertension, and/or ischemia. Pts suspected of having Prinzmetal's angina, pheochromocytoma, hx of severe anaphylaxis to allergens.

Action

Possesses nonselective beta-blocking and alpha-adrenergic blocking activity. Causes vasodilation. **Therapeutic Effect: Hypertension:** Reduces cardiac output, exercise-induced tachycardia, reflex orthostatic tachycardia; reduces peripheral vascular resistance. **HF:** Decreases pulmonary capillary wedge pressure, heart rate, systemic vascular resistance; increases stroke volume index.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	30 min	1–2 hrs	24 hrs

Rapidly, extensively absorbed from GI tract. Protein binding: 98%. Metabolized in liver. Excreted primarily via bile into feces. Minimally removed by hemodialysis. **Half-life:** 7–10 hrs. Food delays rate of absorption.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. May produce bradycardia, apnea, hypoglycemia, hypothermia during delivery; may contribute to low birth-weight infants. **Children:** Safety and efficacy not established. **Elderly:** Incidence of dizziness may be increased.

Interactions

DRUG: Calcium channel blockers (e.g., diltiazEM, verapamil), digoxin, CYP2C9 inhibitors (e.g., amiodarone, fluconazole) increase risk of cardiac conduction disturbances. Diuretics (e.g., furosemide, HCTZ), other antihypertensives (e.g., amlodipine, lisinopril, valsartan) may potentiate hypotensive effects. Cimetidine may increase concentration. May increase concentration of cycloSPORINE, digoxin. CYP2D6 inhibitors (e.g., FLUoxetine, PARoxetine) may increase concentration/side effects; may enhance slowing of HR or cardiac conduction. May increase effects of insulin, oral hypoglycemics (e.g., glyburide, metformin). RifAMPin decreases concentration. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. Garlic may increase antihypertensive effect. **FOOD:** None known. **LAB VALUE:** May increase serum creatinine, bilirubin, ALT, AST, PT.

Availability (Rx)

Tablets (Immediate-Release): 3.125 mg, 6.25 mg, 12.5 mg, 25 mg.

 **Capsules (Extended-Release [Coreg CR]):** 10 mg, 20 mg, 40 mg, 80 mg.

Administration/handling

PO

- Give with food (slows rate of absorption, reduces risk of orthostatic effects).
- Do not crush or cut extended-release capsules.
- Capsules may be opened and sprinkled on applesauce for immediate use.

Indications/routes/dosage

Hypertension

PO (Immediate-Release): ADULTS, ELDERLY: Initially, 6.25 mg twice daily. May double at intervals of 1–2 wks to 12.5 mg twice daily, then to 25 mg twice daily. **Maximum:** 25 mg twice daily. **(Extended-Release):** Initially, 20 mg once daily. May increase to 40 mg once daily after 1–2 wks. **Maximum:** 80 mg once daily.

HF

PO (Immediate-Release): ADULTS, ELDERLY: Initially, 3.125 mg twice daily. May double at 2-wk intervals to highest tolerated dosage. **Maximum:** **Greater than 85 kg:** 50 mg twice daily; **Less than 85 kg:** 25 mg twice daily. **(Extended-Release):** Initially, 10 mg once daily for 2 wks. May increase to 20 mg, 40 mg, and 80 mg over successive intervals of at least 2 wks. **Maximum:** 80 mg/day.

Left Ventricular Dysfunction Following MI

PO (Immediate-Release): ADULTS, ELDERLY: Initially, 3.125–6.25 mg twice daily. May increase at intervals of 3–10 days up to 25 mg twice daily. **Maximum:** 50 mg twice daily. **(Extended-Release):** Initially, 10–20 mg once daily. May increase incrementally in intervals of 3–10 days. Target dose: 80 mg once daily.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Contraindicated in severe impairment.

Side effects

Frequent (6%–4%): Fatigue, dizziness. **Occasional (2%):** Diarrhea, bradycardia, rhinitis, back pain. **Rare (less than 2%):** Orthostatic hypotension, drowsiness, UTI, viral infection.

Adverse effects/toxic reactions

Overdose may produce profound bradycardia, hypotension, bronchospasm, cardiac insufficiency, cardiogenic shock, cardiac arrest. Abrupt withdrawal may result in diaphoresis, palpitations, headache, tremors. May precipitate HF, MI in pts with cardiac disease; thyroid storm in pts with thyrotoxicosis; peripheral ischemia in pts with existing peripheral vascular disease. Hypoglycemia may occur in pts with previously controlled diabetes. May mask symptoms of hypoglycemia.

Nursing considerations

Baseline assessment

Assess B/P, apical pulse immediately before drug is administered (if pulse is 60 beats/min or less or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). Receive full medication history and screen for interactions.

Intervention/evaluation

Monitor B/P for hypotension, respirations for dyspnea. Take standing systolic B/P 1 hr after dosing as guide for tolerance. Assess pulse for quality, regularity, rate; monitor for bradycardia. Monitor EKG for cardiac arrhythmias. Assist with ambulation if dizziness occurs. Assess for evidence of HF: dyspnea (particularly on exertion or lying down), night cough, peripheral edema, distended neck veins. Monitor I&O (increase in weight, decrease in urine output may indicate HF). Monitor renal/hepatic function tests.

Patient/family teaching

- Full therapeutic effect of B/P may take 1–2 wks.
- Contact lens wearers may experience decreased lacrimation.
- Take with food.

- Abruptly stopping treatment or missing multiple doses may cause beta-blocker withdrawal symptoms (fast heart rate, high blood pressure, palpitations, sweating, tremors).
- Compliance with therapy regimen is essential to control hypertension.
- Report excessive fatigue, prolonged dizziness.
- Do not use nasal decongestants, OTC cold preparations (stimulants) without physician's approval.
- Monitor B/P, pulse before taking medication.
- Restrict salt, alcohol intake.

casprofungin

kas-poe-**fun**-jin

Candidas

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Echinocandin antifungal.

CLINICAL: Antifungal.

Uses

Treatment of invasive aspergillosis, candidemia, *Candida* infection (intra-abdominal abscess, peritonitis, esophageal, pleural space) in pts aged 3 months and older. Empiric therapy for presumed fungal infections in febrile neutropenia.

Precautions

Contraindications: Hypersensitivity to casprofungin. **Cautions:** Concurrent use of cycloSPORINE, hepatic impairment.

Action

Inhibits synthesis of glucan, a vital component of fungal cell wall formation, damaging fungal cell membrane. **Therapeutic Effect:** Fungistatic.

Pharmacokinetics

Distributed in tissue. Protein binding: 97%. Metabolized in liver. Excreted in

urine (50%), feces (30%). Not removed by hemodialysis. **Half-life:** 40–50 hrs.

Lifespan considerations

Pregnancy/Lactation: May be embryotoxic. Crosses placental barrier. Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related moderate renal impairment may require dosage adjustment.

Interactions

DRUG: **CycloSPORINE** may increase concentration. **RifAMPin** may decrease concentration. May decrease concentration/effect of **tacrolimus**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, creatinine, ALT, AST, urine protein. May decrease serum albumin, bicarbonate, potassium, magnesium; Hgb, Hct.

Availability (Rx)

Injection, Powder for Reconstitution: 50-mg, 70-mg vials.

Administration/handling

IV

Reconstitution

- Reconstitute 50-mg or 70-mg vial with 0.9% NaCl, Sterile Water for Injection, or Bacteriostatic Water for Injection. Further dilute in 0.9% NaCl or D₅W to maximum concentration of 0.5 mg/mL.

Rate of Administration

- Infuse over 60 min.

Storage

- Refrigerate vials but warm to room temperature before preparing with diluent.
- Reconstituted solution, diluted solution, may be stored at room temperature for 1 hr before infusion.
- Final infusion solution can be stored at room temperature for 24 hrs or 48 hrs if refrigerated.
- Discard if solution contains particulate or is discolored.

■ IV Compatibilities

Aztreonam (Azactam), DAPTOmycin (Cubicin), fluconazole (Diflucan), linezolid (Zyvox), meropenem (Merrem IV), piperacillin/tazobactam (Zosyn), vancomycin.

■ IV incompatibilities

Cefepime (Maxipime), ceftaroline (Teflaro), cefTAZidime (Fortaz), cefTRIAxone (Rocephin), furosemide (Lasix).

Indications/routes/dosage

Aspergillosis

Note: Continue for minimum of 6–12 wks.

IV:ADULTS, ELDERLY: Give single 70-mg loading dose on day 1, followed by 50 mg/day thereafter. **CHILDREN 3 MOS–17 YRS:** 70 mg/m² on day 1, then 50 mg/m² daily. **Maximum:** 70-mg loading dose, 50-mg daily dose.

Candidemia

Note: Continue for at least 14 days after last positive culture.

IV:ADULTS, ELDERLY: Initially, 70 mg followed by 50 mg daily. **CHILDREN 3 MOS–17 YRS:** 70 mg/m² on day 1, then 50 mg/m² daily. **Maximum:** 70-mg loading dose, 50-mg daily dose.

Esophageal Candidiasis

Note: Continue for 7–14 days after symptom resolution.

IV: ADULTS, ELDERLY: 50 mg/day. **CHILDREN 3 MOS–17 YRS:** 50 mg/m² daily. **Maximum:** 50 mg.

Empiric Therapy

Note: Continue for minimum 14 days if fungal infection confirmed (continue for 7 days after resolution of neutropenia/clinical symptoms).

IV: ADULTS, ELDERLY: Initially 70 mg, then 50 mg/day. May increase to 70 mg/day. **CHILDREN 3 MOS–17 YRS:** 70 mg/m² on day 1, then 50 mg/m² daily. **Maximum:** 70 mg.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild: No adjustment. **Moderate:Child-Pugh score 7–9:** Decrease dose to 35 mg/day.

Severe: No clinical experience.

Side effects

Frequent (26%): Fever. **Occasional (11%–4%):** Headache, nausea, phlebitis. **Rare (3% or less):** Paresthesia, vomiting, diarrhea, abdominal pain, myalgia, chills, tremor, insomnia.

Adverse effects/toxic reactions

Hypersensitivity reaction (rash, facial edema, pruritus, sensation of warmth), including anaphylaxis, may occur. May cause hepatic dysfunction, hepatitis (drug-induced), or hepatic failure.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT, serum magnesium. Determine baseline temperature. Question history of prior hypersensitivity reaction.

Intervention/evaluation

Assess for signs/symptoms of hepatic dysfunction. Monitor LFT in pts with preexisting hepatic impairment. Monitor CBC, serum potassium. Monitor for fever, hypersensitivity reaction.

Patient/family teaching

- Report rash, facial swelling, itching, difficulty breathing, abdominal pain, yellowing of skin or eyes, dark-colored urine, nausea.

cefaclor

sef-a-klor

Apo-Cefaclor 

Ceclor 

Novo-Cefaclor 

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Second-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse cefaclor with cephalexin.

Uses

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *S. aureus*, *H. influenzae*, *E. coli*, *M. catarrhalis*, *Klebsiella* spp., *P. mirabilis*, including acute otitis media, bronchitis, pharyngitis/tonsillitis, respiratory tract, skin/skin structure, UTIs.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cefaclor, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy. Extended release not approved in children younger than 16 yrs.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 25%. Widely distributed. Partially metabolized in liver. Primarily excreted in urine. Moderately removed by hemodialysis. **Half-life:** 0.6–0.9 hr (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted in pts older than 1 mo. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Probenecid may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

 **Capsules:** 250 mg, 500 mg. **Powder for Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL, 375 mg/5 mL.

Tablets (Extended-Release): 500 mg.

Administration/handling

PO

- After reconstitution, oral solution is stable for 14 days if refrigerated.
- Shake oral suspension well before using.
- Give without regard to food; if GI upset occurs, give with food, milk.

Indications/routes/dosage

Usual Dosage

PO: ADULTS, ELDERLY: 250–500 mg q8h or 500 mg q12h (extended-release). **CHILDREN:** 20–40 mg/kg/day divided q8–12h. **Maximum:** 1 g/day.

Otitis Media

PO: CHILDREN: 40 mg/kg/day divided q12h. **Maximum:** 1 g/day.

Pharyngitis

CHILDREN: 20 mg/kg/day divided q12h. **Maximum:** 1 g/day.

Dosage in Renal Impairment

Use caution.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (pruritus, rash, urticaria).

Adverse effects/toxic reactions

Antibiotic-associated colitis, (abdominal cramps, severe watery diarrhea, fever) other superinfections may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain baseline CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal

changes (ulceration, pain, erythema).

Patient/family teaching

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- May cause GI upset (may take with food, milk).
- Chewable tablets must be chewed; do not swallow whole.
- Refrigerate oral suspension.
- Report persistent diarrhea.

cefadroxil

sef-a-**drox**-il

Apo-Cefadroxil 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: First-generation cephalosporin.

CLINICAL: Antibiotic.

Uses

Treatment of susceptible infections due to group A streptococci, staphylococci, *S. pneumoniae*, *H. influenzae*, *Klebsiella* spp., *E. coli*, *P. mirabilis*, including impetigo, pharyngitis/tonsillitis, skin/skin structure, UTIs. **OFF-LABEL:** Chronic suppression of prosthetic joint infection.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cefadroxil, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy. History of GI disease (colitis).

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 15%–20%. Widely distributed. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1.2–1.5 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Probenecid may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

 **Capsules:** 500 mg. **Powder for Oral Suspension:** 250 mg/5 mL, 500 mg/5 mL. **Tablets:** 1 g.

Administration/handling

PO

- After reconstitution, oral solution is stable for 14 days if refrigerated.
- Shake oral suspension well before using.
- Give without regard to meals; if GI upset occurs, give with food, milk.

Indications/routes/dosage

Usual Dosage

PO: ADULTS, ELDERLY: 1–2 g/day as single dose or in 2 divided doses. **CHILDREN:** 30 mg/kg/day in 2 divided doses. **Maximum:** 2 g/day.

Dosage in Renal Impairment

After initial 1-g dose, dosage and frequency are modified based on creatinine clearance and severity of infection.

Creatinine Clearance	Dosage
26–50 mL/min	q12h
10–25 mL/min	q24h
Less than 10 mL/min	q36h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, unusual bruising/bleeding, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- May cause GI upset (may take with food, milk).
- Refrigerate oral suspension.
- Report persistent diarrhea.

ceFAZolin

sef-a-zoe-lin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: First-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse ceFAZolin with cefOXitin, cefprozil, cefTRIAxone, or cephalixin.

Uses

Treatment of susceptible infections due to *S. aureus*, *S. epidermidis*, group A beta-hemolytic streptococci, *S. pneumoniae*, *E. coli*, *P. mirabilis*, *Klebsiella* spp., *H. influenzae*, including biliary tract, bone and joint, genital, respiratory tract, skin/skin structure infections; UTIs, endocarditis, perioperative prophylaxis, septicemia. **OFF-LABEL:** Prophylaxis against infective endocarditis.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to ceFAZolin, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy, history of seizures.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed. Protein binding: 85%. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. **Half-life:** 1.4–1.8 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta; distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require reduced dosage.

Interactions

DRUG: Probenecid may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

Injection, Powder for Reconstitution: 500 mg, 1 g. **Ready-to-Hang Infusion:** 1 g/50 mL, 2 g/100 mL.

Administration/handling

IV

Reconstitution

- Reconstitute each 1 g with at least 10 mL Sterile Water for Injection or 0.9% NaCl.
- May further dilute in 50–100 mL D₅W or 0.9% NaCl (decreases incidence of thrombophlebitis).

Rate of Administration

- For IV push, administer over 3–5 min (**maximum concentration:** 100 mg/mL).
- For intermittent IV infusion (piggyback), infuse over 30–60 min (**maximum concentration:** 20 mg/mL).

Storage

- Solution appears light yellow to yellow in color.
- Reconstituted solution stable for 24 hrs at room temperature or for 10 days if refrigerated.
- IV infusion (piggyback) stable for 48 hrs at room temperature or for 14 days if refrigerated.

IM

- To minimize discomfort, inject deep IM slowly.
- Less painful if injected into gluteus maximus rather than lateral aspect of thigh.

■ IV incompatibilities

Amikacin (Amikin), amiodarone (Cordarone), HYDROmorphone (Dilaudid).

■ IV Compatibilities

Calcium gluconate, dexamethasone (Decadron), diltiazem (Cardizem), famotidine (Pepcid), heparin, insulin (regular), lidocaine, lorazepam (Ativan), magnesium sulfate, meperidine (Demerol), metoclopramide (Reglan), midazolam (Versed), morphine, multivitamins, ondansetron (Zofran), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage Range

IV, IM: ADULTS: 1–1.5 g q6–12h (usually q8h). **Maximum:** 12 g/day.
CHILDREN OLDER THAN 1 MO: 25–100 mg/kg/day divided q6–8h.
Maximum: 6 g/day. **NEONATES:** 25 mg/kg/dose q8–12h.

Dosage in Renal Impairment

Dosing frequency is modified based on creatinine clearance.

Creatinine Clearance	Dosage
11–34 mL/min	50% usual dose q12h
10 mL/min or less	50% usual dose q18–24h
HD	500 mg–1 g q24h
PD	500 mg q12h
CRRT	
CVVH	Loading dose 2 g, then 1–2 g q12h
CVVHD/CVVHDF	Loading dose 2 g, then 1 g q8h or 2 g q12h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Evaluate IM site for induration and tenderness. Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Discomfort may occur with IM injection.

cefdinir

sef-di-neer

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Third-generation cephalosporin.

CLINICAL: Antibiotic.

Uses

Treatment of susceptible infections due to *S. pyogenes*, *S. pneumoniae*, *H. influenzae*, *H. parainfluenzae*, *M. catarrhalis*, including community-acquired pneumonia, acute exacerbation of chronic bronchitis, acute maxillary sinusitis, pharyngitis, tonsillitis, uncomplicated skin/skin structure infections, otitis media.

Precautions

Contraindications: Hypersensitivity to cefdinir. History of anaphylactic reaction to cephalosporins. **Cautions:** Hypersensitivity to penicillins; renal impairment.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Moderately absorbed from GI tract. Protein binding: 60%–70%. Widely distributed. Not appreciably metabolized. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 1–2 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Not detected in breast milk. **Children:** Newborns, infants may have lower renal clearance. **Elderly:** Age-related renal impairment may require decreased dosage or increased dosing interval.

Interactions

DRUG: Antacids, iron preparations may interfere with absorption. **Probenecid** increases concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May produce false-positive reaction for urine ketones. May increase serum alkaline phosphatase, bilirubin, LDH, ALT, AST.

Availability (Rx)

 **Capsules:** 300 mg. **Powder for Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL.

Administration/handling

PO

- Give without regard to food. Give at least 2 hrs before or after antacids or iron supplements.
- Twice-daily doses should be given 12 hrs apart.
- Shake oral suspension well before administering.
- Store mixed suspension at room temperature for 10 days.

Indications/routes/dosage

Usual Dosage Range

PO: ADULTS, ELDERLY: 300 mg q12h or 600 mg once daily. **CHILDREN 6**

MOS–12 YRS: 7 mg/kg q12h or 14 mg/kg once daily. **Maximum:** 600 mg/day.

Dosage in Renal Impairment

CrCl less than 30 mL/min: 300 mg/day or 7 mg/kg as single daily dose. **Maximum:** 300 mg. **Hemodialysis pts:** 300 mg or 7 mg/kg/dose every other day. **Maximum:** 300 mg.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for hypersensitivity to cefdinir or other cephalosporins, penicillins.

Intervention/evaluation

Observe for rash. Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Be alert for superinfection: fever, vomiting, diarrhea,

anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor hematology reports.

Patient/family teaching

- Take antacids 2 hrs before or following medication.
- Continue medication for full length of treatment; do not skip doses.
- Doses should be evenly spaced.
- Report persistent severe diarrhea, rash, muscle aches, fever, enlarged lymph nodes, joint pain.

cefepime

sef-e-peem

Maxipime

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Fourth-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse cefepime with cefixime or ceftAZidime.

Uses

Susceptible infections due to aerobic gram-negative organisms including *P. aeruginosa*, gram-positive organisms including *S. aureus*. Treatment of empiric febrile neutropenia, intra-abdominal infections, skin/skin structure infections, UTIs, pneumonia. **OFF-LABEL:** Brain abscess, malignant otitis externa, septic lateral/cavernous sinus thrombus.

Precautions

Contraindications: History of anaphylactic reaction to penicillins, hypersensitivity to cefepime, cephalosporins. **Cautions:** Renal impairment, history of seizure disorder, GI disease (colitis), elderly.

Action

Binds to bacterial cell wall membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Well absorbed after IM administration. Protein binding: 20%. Widely distributed. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 2–2.3 hrs (increased in renal impairment, elderly pts).

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** No age-related precautions noted in pts older than 2 mos. **Elderly:** Age-related renal impairment may require reduced dosage or increased dosing interval.

Interactions

DRUG: Probenecid may increase concentration. May increase **aminoglycoside** concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

Injection, Powder for Reconstitution: 1 g, 2 g. **Injection, Premix:** 1 g (50 mL), 2 g (50 mL).

Administration/handling

IV

Reconstitution

- Add 10 mL of diluent for 1-g and 2-g vials.
- Further dilute with 50–100 mL 0.9% NaCl or D₅W.

Rate of Administration

- For intermittent IV infusion (piggyback), infuse over 30 min. For direct IV, administer over 5 min.

Storage

- Solution is stable for 24 hrs at room temperature, 7 days if refrigerated.

IM

- Add 2.4 mL Sterile Water for Injection, 0.9% NaCl, or D₅W to 1-g and 2-g vials.
- Inject into a large muscle mass (e.g., upper gluteus maximus).

■ IV incompatibilities

Acyclovir (Zovirax), amphotericin (Fungizone), cimetidine (Tagamet), ciprofloxacin (Cipro), CISplatin (Platinol), dacarbazine (DTIC), DAUNOrubicin (Cerubidine), diazePAM (Valium), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), DOXOrubicin (Adriamycin), droperidol (Inapsine), famotidine (Pepcid), ganciclovir (Cytovene), haloperidol (Haldol), magnesium, magnesium sulfate, mannitol, metoclopramide (Reglan), morphine, ofloxacin (Floxin), ondansetron (Zofran), vancomycin (Vancocin).

■ IV Compatibilities

Bumetanide (Bumex), calcium gluconate, furosemide (Lasix), HYDROmorphone (Dilaudid), LORazepam (Ativan), propofol (Diprivan).

Indications/routes/dosage

Usual Dosage Range

IV:ADULTS, ELDERLY: 1–2 g q8–12h. **CHILDREN:** 50 mg/kg q8–12h not to exceed adult dosing. **NEONATES:** 30 mg/kg q12h up to 50 mg/kg q8–12h.

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and severity of infection.

Creatinine Clearance	Dosage
30–60 mL/min	500 mg q24h–2 g q12h
11–29 mL/min	500 mg–2 g q24h
10 mL/min or less	250 mg–1 g q24h
Hemodialysis	Initially, 1 g, then 0.5–1 g q24h or 1–2 g q48–72h
Peritoneal dialysis	Normal dose q48h
Continuous renal replacement therapy	Initially, 2 g, then 1 g q8h or 2 g q12h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Evaluate IM site for induration and tenderness. Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, CBC, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Discomfort may occur with IM injection.
- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- Report persistent diarrhea.

cefixime

sef-ix-eem

Suprax

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Third-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse cefixime with cefepime, or Suprax with Sporanox or Surbex.

Uses

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *M. catarrhalis*, *H. influenzae*, *E. coli*, *P. mirabilis*, including otitis media, acute bronchitis, acute exacerbations of chronic bronchitis, pharyngitis, tonsillitis, uncomplicated UTI.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cefixime, cephalosporins. **Cautions:** History of penicillin allergy, renal impairment.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Moderately absorbed from GI tract. Protein binding: 65%–70%. Widely

distributed. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 3–4 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Not recommended during labor and delivery. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Probenecid** may increase concentration. May increase **aminoglycoside (e.g., gentamicin, tobramycin)** concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause a positive direct/indirect Coombs' test.

Availability (Rx)

Oral Suspension: 100 mg/5 mL, 200 mg/5 mL, 500 mg/5 mL. **Capsules:** 400 mg. **Tablets: (Chewable):** 100 mg, 200 mg.

Administration/handling

PO

- Give without regard to food.
- After reconstitution, oral suspension is stable for 14 days at room temperature or refrigerated.
- Shake oral suspension well before administering. Chewable tablets must be chewed or crushed before swallowing.

Indications/routes/dosage

Usual Dosage

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER WEIGHING MORE THAN 45 KG: 400 mg/day as a single dose or in 2 divided doses. **CHILDREN 6 MOS–12 YRS WEIGHING 45 KG OR LESS:** 8 mg/kg/day as a single dose or in 2 divided doses. **Maximum:** 400 mg.

Dosage in Renal Impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance	Dosage
21–60 mL/min	260 mg/day
20 mL/min or less	200 mg/day
Hemodialysis	260 mg/day

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (arthralgia, fever; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for hypersensitivity to cefixime or other cephalosporins, penicillins.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor renal function tests for evidence of nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Continue medication for full length of treatment; do not skip doses.
- Doses should be evenly spaced.
- May cause GI upset (may take with food or milk).
- Report persistent diarrhea.

cefotaxime

sef-oh-**tax**-eem

Claforan

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Third-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse cefotaxime with cefOXitin, ceftizoxime, or cefuroxime, or Claforan with Claritin.

Uses

Treatment of susceptible infections (active vs. most gram-negative [not *Pseudomonas*] and gram-positive cocci [not *Enterococcus*]), including bone, joint, GU, gynecologic, intra-abdominal, lower respiratory tract, skin/skin structure infections; septicemia, meningitis, perioperative prophylaxis. **OFF-**

LABEL: Surgical prophylaxis.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cefotaxime, cephalosporins. **Cautions:** History of penicillin allergy, colitis, renal impairment with CrCl less than 30 mL/min.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed to CSF. Protein binding: 30%–50%. Partially metabolized in liver. Primarily excreted in urine. Moderately removed by hemodialysis. **Half-life:** 1 hr (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Probenecid may increase concentration. May increase **aminoglycoside** (e.g., **gentamicin, tobramycin**) concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause positive direct/indirect Coombs' test. May increase serum BUN, creatinine, ALT, AST, alkaline phosphatase.

Availability (Rx)

Injection, Powder for Reconstitution: 500 mg, 1 g, 2 g. **Intravenous Solution (Premix):** 1 g/50 mL, 2 g/50 mL.

Administration/handling

IV

Reconstitution

- Reconstitute with 10 mL Sterile Water for Injection or 0.9% NaCl to provide a maximum concentration of 100 mg/mL.
- May further dilute with 50–100 mL 0.9% NaCl or D₅W.

Rate of Administration

- For IV push, administer over 3–5 min.
- For intermittent IV infusion (piggyback), infuse over 15–30 min.

Storage

- Solution appears light yellow to amber.
- IV infusion (piggyback) is stable for 24 hrs at room temperature, 5 days if refrigerated.
- Discard if precipitate forms.

IM

- Reconstitute with Sterile Water for Injection or Bacteriostatic Water for Injection to provide a concentration of 230–330 mg/mL.
- To minimize discomfort, inject deep IM slowly. Less painful if injected into gluteus maximus than lateral aspect of thigh. For 2-g IM dose, give at 2 separate sites.

IV incompatibilities

Allopurinol (Aloprim), filgrastim (Neupogen), fluconazole (Diflucan), vancomycin (Vancocin).

IV Compatibilities

Diltiazem (Cardizem), famotidine (Pepcid), HYDROMorphone (Dilaudid), LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage Range

IV, IM: ADULTS, ELDERLY, CHILDREN WEIGHING 50 KG OR MORE: 1–2 g q4–12h. **Maximum:** 12 g/day. **CHILDREN 1 MO–12 YRS WEIGHING LESS THAN 50 KG:** 50–180 mg/kg/day in divided doses q4–6h. **Maximum:** 12 g/day. **NEONATES:** 50 mg/kg/dose q8–12h.

Dosage in Renal Impairment

Creatinine Clearance	Dosage Interval
10–50 mL/min	6–12 hrs
Less than 10 mL/min	24 hrs
Hemodialysis	1–2g q24h
Peritoneal dialysis	1g q24h
CVVH	1–2 g q8–12h
CVVHD	1–2g q8h
CVVHDF	1–2g q6–8h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Check IM injection sites for induration, tenderness. Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Discomfort may occur with IM injection.
- Doses should be evenly spaced.
- Continue antibiotic therapy for full length of treatment.

cefpodoxime

sef-poe-**dox**-eem

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Third-generation cephalosporin.

CLINICAL: Antibiotic.

Uses

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *S. aureus*, *H. influenzae*, *M. catarrhalis*, *E. coli*, *Proteus*, *Klebsiella* spp., including acute maxillary sinusitis, chronic bronchitis, community-acquired pneumonia, gonorrhea, otitis media, pharyngitis, tonsillitis, skin/skin structure infections, UTIs.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to

cefepodoxime, cephalosporins. **Cautions:** Renal impairment, history of penicillin allergy.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Well absorbed from GI tract (food increases absorption). Protein binding: 18%–23%. Widely distributed. Primarily excreted unchanged in urine. Partially removed by hemodialysis. **Half-life:** 2.3 hrs (increased in renal impairment, elderly pts).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk.

Children: Safety and efficacy not established in pts younger than 6 mos.

Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: High doses of **antacids containing aluminum, H₂ antagonists (e.g., famotidine, ranitidine)** may decrease absorption. **Probenecid** may increase concentration.

HERBAL: None significant. **FOOD: Food** enhances absorption.

LAB VALUES: May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

Oral Suspension: 50 mg/5 mL, 100 mg/5 mL. **Tablets:** 100 mg, 200 mg.

Administration/handling

PO

- Administer tablet with food (enhances absorption).
- Administer suspension without regard to food.

- After reconstitution, oral suspension is stable for 14 days if refrigerated.

Indications/routes/dosage

Usual Dosage Range

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 100–400 mg q12h. **CHILDREN 2 MOS–12 YRS:** 10 mg/kg/day in 2 divided doses. **Maximum:** 200 mg/dose.

Dosage in Renal Impairment

For pts with CrCl less than 30 mL/min, usual dose is given q24h. For pts on hemodialysis, usual dose is given 3 times/wk after dialysis.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (pruritus, rash, urticaria).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Doses should be evenly spaced.
- Shake oral suspension well before using.
- Take tablets with food (enhances absorption).
- Continue antibiotic therapy for full length of treatment.
- Refrigerate oral suspension.
- Report persistent diarrhea.

cefprozil

sef-proe-zil

Apo-Cefprozil 

Cefzil 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Second-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse cefprozil with ceFAZolin, or Cefzil with Cefol, Ceftin, or Kefzol.

Uses

Treatment of susceptible infections due to *S. pneumoniae*, *S. pyogenes*, *S. aureus*, *H. influenzae*, *M. catarrhalis*, including pharyngitis, tonsillitis, otitis media, secondary bacterial infection of acute bronchitis, acute bacterial exacerbation of chronic bronchitis, uncomplicated skin/skin structure infections,

acute sinusitis.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cefprozil, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 36%–45%. Widely distributed. Primarily excreted in urine. Moderately removed by hemodialysis. **Half-life:** 1.3 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk.

Children: Safety and efficacy not established in pts younger than 6 mos.

Elderly: Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Probenecid** may increase concentration. May increase **aminoglycoside (e.g., gentamicin, tobramycin)** concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause positive direct/indirect Coombs' test. May increase serum BUN, creatinine, alkaline phosphatase, ALT, AST.

Availability (Rx)

Oral Suspension: 125 mg/5 mL, 250 mg/5 mL. **Tablets:** 250 mg, 500 mg.

Administration/handling

PO

- Give without regard to food; if GI upset occurs, give with food, milk.
- After reconstitution, oral suspension is stable for 14 days if refrigerated.
- Shake oral suspension well before using.

Indications/routes/dosage

Usual Dosage Range

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 250–500 mg q12h or 500 mg q24h. **CHILDREN OLDER THAN 6 MOS–12 YRS:** 7.5–15 mg/kg/day in 2 divided doses. **Maximum:** 500 mg/dose. Do not exceed adult dose.

Dosage in Renal Impairment

CrCl less than 30 mL/min: 50% of usual dose at usual interval. **Hemodialysis:** Administer dose after completion of dialysis.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (pruritus, rash, urticaria).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Assess oral cavity for evidence of stomatitis. Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (but increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Doses should be evenly spaced.
- Continue antibiotic therapy for full length of treatment.
- May cause GI upset (may take with food or milk).
- Report persistent diarrhea.

ceftaroline

sef-**tar**-o-leen

Teflaro

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Fifth-generation cephalosporin.

CLINICAL: Antibiotic.

Uses

Treatment of susceptible infections due to gram-positive and gram-negative organisms, including *S. pneumoniae*, *S. aureus* (methicillin-susceptible only), *H. influenzae*, *Klebsiella pneumoniae*, *E. coli*, including acute bacterial skin and skin structure infections, community-acquired bacterial pneumonia.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to ceftaroline, cephalosporins. **Cautions:** History of allergy to penicillin, severe renal impairment with CrCl less than 50 mL/min, elderly.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Protein binding: 20%. Widely distributed in plasma. Not metabolized. Primarily excreted in urine. Hemodialyzable. **Half-life:** 1.6 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Age-related renal impairment may require dose adjustment.

Interactions

DRUG: Probenecid may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May cause positive direct/indirect Coombs' test. May increase serum BUN, creatinine. May decrease serum potassium.

Availability (Rx)

Injection, Powder for Reconstitution: 400-mg, 600-mg single-use vial.

Administration/handling

 Give by intermittent IV infusion (piggyback). Do not give IV push.

Reconstitution

- Reconstitute either 400-mg or 600-mg vial with 20 mL Sterile Water for

Injection.

- Mix gently to dissolve powder.
- Further dilute with 50–250 mL D₅W, 0.9% NaCl.

Rate of Administration

- Infuse over 5–60 min.

Storage

- Discard if particulate is present.
- Following reconstitution, solution should appear clear, light to dark yellow.
- Solution is stable for 6 hrs at room temperature or 24 hrs if refrigerated.

■ IV incompatibilities

Fluconazole (Diflucan), vancomycin (Vancocin).

■ IV Compatibilities

Famotidine (Pepcid), HYDROmorphine (Dilaudid), LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage

IV: ADULTS, ELDERLY: 600 mg q12h. **CHILDREN 2–18 YRS (WEIGHING MORE THAN 33 KG):** 400 mg q8h or 600 mg q12h. **(WEIGHING 33 KG OR LESS):** 12 mg/kg q8h. **CHILDREN 2 MOS TO LESS THAN 2 YRS:** 8 mg/kg q8h.

Dosage in Renal Impairment

Creatinine Clearance	Dosage
30–50 mL/min	400 mg q12h
15–29 mL/min	300 mg q12h
End-stage renal disease, hemodialysis	200 mg every 12 hrs (give after dialysis)

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (5%–4%): Diarrhea, nausea. **Rare (3%–2%):** Allergic reaction (rash, pruritus, urticaria), phlebitis.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other super infections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for hypersensitivity to other cephalosporins, penicillins. For pts on hemodialysis, administer medication after dialysis.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Monitor I&O, renal function tests for evidence of nephrotoxicity. Be alert for superinfection: fever, vomiting, severe genital/anal pruritus, moderate to severe diarrhea, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Continue medication for full length of treatment.
- Doses should be evenly spaced.

cefTAZidime

sef-**taz**-i-deem

Fortaz

Tazicef

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Third-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse cefTAZidime with ceFAZolin, cefepime, or cefTRIAXone.

Uses

Treatment of susceptible infections due to gram-negative organisms (including *Pseudomonas* and *Enterobacteriaceae*), including bone, joint, CNS (including meningitis), gynecologic, intra-abdominal, lower respiratory tract, skin/skin structure infections; UTI, septicemia. Treatment of CNS infections due to *H. influenzae*, *N. meningitidis*, including meningitis. **OFF-LABEL:** Bacterial endophthalmitis.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cefTAZidime, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy, seizure disorder.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed, including to CSF. Protein binding: 5%–17%. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 2 hrs (increased in renal impairment).

⌚ Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Probenecid may increase concentration. May increase aminoglycoside (e.g., gentamicin, tobramycin) concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

Injection, Powder for Reconstitution (Fortaz, Tazicef): 500 mg, 1 g, 2 g.
Injection, Premix: 1 g/50 mL, 2 g/50 mL.

Administration/handling

 Give by IM injection, direct IV injection (IV push), or intermittent IV infusion (piggyback).

IV

Reconstitution

- Add 10 mL Sterile Water for Injection to each 1 g to provide concentration of 90 mg/mL.
- May further dilute with 50–100 mL 0.9% NaCl, D₅W, or other compatible diluent.

Rate of Administration

- For IV push, administer over 3–5 min (**maximum concentration:** 180 mg/mL).
- For intermittent IV infusion (piggyback), infuse over 15–30 min.

Storage

- Solution appears light yellow to amber, tends to darken (color change does not indicate loss of potency).
- IV infusion (piggyback) stable for 12 hrs at room temperature or 3 days if refrigerated.
- Discard if precipitate forms.

IM

- For reconstitution, add 1.5 mL Sterile Water for Injection or lidocaine 1% to

500-mg vial or 3 mL to 1-g vial to provide a concentration of 280 mg/mL.

- To minimize discomfort, inject deep IM slowly. Less painful if injected into gluteus maximus than lateral aspect of thigh.

■ IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), fluconazole (Diflucan), IDArubicin, midazolam (Versed), vancomycin (Vancocin).

■ IV Compatibilities

Diltiazem (Cardizem), famotidine (Pepcid), heparin, HYDROMORPHONE (Dilaudid), lipids, morphine, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage Range

IV, IM: ADULTS, ELDERLY: 500 mg–2 g q8–12h.

IV: CHILDREN 1 MO–12 YRS: 90–150 mg/kg/day in divided doses q8h.

Maximum: 6 g/day. **NEONATES 0–4 WKS:** 50 mg/kg/dose q8–12h.

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and severity of infection.

Creatinine Clearance	Dosage
31–50 mL/min	1g q12h
16–30 mL/min	1g q24h
6–15 mL/min	500 mg q24h
Less than 6 mL/min	500 mg q48h
Hemodialysis	0.5–1 g q24h or 1–2 g q48–72h (give post hemodialysis on dialysis days)
Peritoneal dialysis	Initially, 1 g, then 0.5 g q24h
Continuous renal replacement therapy	Initially, 2 g, then 1 g q8h or 2 g q12h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (pruritus, rash, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Evaluate IV site for phlebitis (heat, pain, red streaking over vein). Assess IM injection sites for induration, tenderness. Check oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Discomfort may occur with IM injection.
- Doses should be evenly spaced.

- Continue antibiotic therapy for full length of treatment.

cefTAZidime/avibactam

sef-taz-i-deem/a-vi-bak-tam

Avycaz

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Cephalosporin/beta-lactamase inhibitor.

CLINICAL: Antibacterial.

Do not confuse cefTAZidime with ceFAZolin or cefepime, or avibactam with sulbactam or tazobactam.

Uses

Used in combination with metroNIDAZOLE for treatment of complicated intra-abdominal infections caused by the following susceptible microorganisms: *E. cloacae*, *E. coli*, *K. pneumoniae*, *K. oxytoca*, *P. mirabilis*, *P. stuartii*, and *P. aeruginosa* in pts 18 yrs or older. Treatment of complicated urinary tract infections, including pyelonephritis, caused by the following susceptible microorganisms: *C. freundii*, *C. koseri*, *E. aerogenes*, *E. cloacae*, *E. coli*, *K. pneumoniae*, *Proteus spp.*, and *P. aeruginosa* in pts 18 yrs or older.

Precautions

Contraindications: Hypersensitivity to avibactam-containing products, cefTAZidime, cephalosporins. **Cautions:** History of renal impairment, seizure disorder, encephalopathy, recent *C. difficile* (C-diff) infection or antibiotic-associated colitis. Hypersensitivity to penicillins, other beta-lactams.

Action

Inhibits cell wall synthesis by binding to bacterial cell membrane. Bacterial action of cefTAZidime is mediated through binding to essential penicillin-binding proteins. Avibactam inactivates some beta-lactamases and protects cefTAZidime from degradation by certain beta-lactamases. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed. Excreted unchanged as parent drug; not significantly metabolized in liver. Protein binding: less than 10%. Removed extensively by hemodialysis (55% of dose). Eliminated in urine (80%–90% unchanged). **Half-life:** 2.7 hrs (dependent on dose and severity of renal impairment).

Lifespan considerations

Pregnancy/Lactation: CefTAZidime is excreted in breast milk in low concentrations. Unknown if avibactam is excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects (due to renal impairment).

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, GGT, LDH. May decrease platelets, eosinophils, leukocytes, lymphocytes, serum potassium. May result in positive Coombs' test or false-positive elevated urine glucose.

Availability (Rx)

 **ALERT** CefTAZidime/avibactam is a combination product.

Injection, Powder for Reconstitution: 2 gm cefTAZidime/0.5 gm avibactam.

Administration/handling

IV

Reconstitution

- Reconstitute vial with 10 mL of one of the following solutions: 0.9% NaCl, Sterile Water for Injection, or 5% Dextrose Injection.
- Shake gently until powder is completely dissolved.
- Visually inspect for particulate matter or discoloration. Solution should appear clear to slightly yellow in color.
- Final concentration of vial will equal approx. 0.167 g/mL of cefTAZidime and 0.042 g/mL of avibactam.
- Further dilute with 50 mL to 250 mL 0.9% NaCl or 5% Dextrose Injection.

Rate of Administration

- Infuse over 2 hrs.

Storage

- Diluted solution may be stored at room temperature up to 12 hrs or refrigerated up to 24 hrs.
- Infuse within 12 hrs once removed from refrigerator.
- Do not freeze.

Indications/routes/dosage

Complicated Intra-Abdominal Infections

IV: ADULTS, ELDERLY: 2.5 g (cefTAZidime 2 g/avibactam 0.5 g) q8h for 5–14 days (in combination with metroNIDAZOLE).

Complicated Urinary Tract Infections Including Pyelonephritis

IV: ADULTS, ELDERLY: 2.5 g (2 g ceftazidime/0.5 g avibactam) q8h for 7–14 days.

Dosage in Renal Impairment

Note: Infuse after hemodialysis on hemodialysis days.
Dosage is modified based on creatinine clearance.

Creatinine Clearance	Dosage
Greater than 50 mL/min	2.5 g (2 g/0.5 g) q8h
31–50 mL/min	1.25 g (1 g/0.25 g) q8h
16–30 mL/min	0.94 g (0.75 g/0.19 g) q12h
6–15 mL/min	0.94 g (0.75 g/0.19 g) q24h
Less than or equal to 5 mL/min	0.94 g (0.75 g/0.19 g) q48h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (14%–5%): Vomiting, nausea, abdominal pain, anxiety, rash. **Rare (4%–2%):** Constipation, dizziness.

Adverse effects/toxic reactions

May cause worsening of renal function or acute renal failure in pts with renal impairment. Clinical cure rates were lower in pts with CrCl 30–50 mL/min compared with those with CrCl greater than 50 mL/min, and in pts receiving metroNIDAZOLE combination therapy. Blood and lymphatic disorders such as agranulocytosis, hemolytic anemia, leukopenia, lymphocytosis, neutropenia, thrombocytopenia were reported. Hypersensitivity reactions, including anaphylaxis or severe skin reactions, have been reported in pts treated with beta-lactam antibacterial drugs. *C. difficile* (C-diff)–associated diarrhea, with severity ranging from mild diarrhea to fatal colitis, was reported. C-diff infection may occur more than 2 mos after treatment completion. Central nervous system reactions including asterixis, coma, encephalopathy, neuromuscular excitability, myoclonus, nonconvulsive status epilepticus, seizures have been reported in pts receiving cefTAZidime, esp. in pts with renal impairment. May increase risk of development of drug-resistant bacteria when used in the absence of a proven or strongly suspected bacterial infection. Skin and subcutaneous tissue disorders such as angioedema, erythema multiforme, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis were reported in pts receiving cefTAZidime. Other reported adverse effects, including infusion site inflammation/hematoma/thrombosis, jaundice, candidiasis, dysgeusia, paresthesia, tubulointerstitial nephritis, vaginal inflammation, occur rarely.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BUN, serum creatinine, potassium; CrCl, GFR, LFT; bacterial culture and sensitivity; vital signs. Question history of recent *C. difficile* infection, renal impairment, seizure disorder; hypersensitivity reaction to beta-lactams, carbapenem, cephalosporins, PCN. Assess skin for wounds; assess hydration status. Question pt's usual stool characteristics (color, frequency, consistency).

Intervention/evaluation

Monitor CBC, BMP, renal function periodically. For pts with changing renal function, monitor renal function test daily and adjust dose accordingly.

Diligently monitor I&Os. Observe daily pattern of bowel activity, stool consistency (increased severity may indicate antibiotic-associated colitis). If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until test result confirmed; manage proper fluids levels/PO intake, electrolyte levels, protein intake. Antibacterial drugs that are not directed against *C. difficile* infection may need to be discontinued. Report any sign of hypersensitivity reaction.

Patient/family teaching

- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increased risk of recurrent infection.
- Report any episodes of diarrhea, esp. in the mos following treatment completion. Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea and may be contagious to others.
- Report abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes; dark urine, decreased urine output; skin problems such as development of sores, rash, skin bubbling/necrosis.
- Drink plenty of fluids.
- Report any nervous system changes such as anxiety, confusion, hallucinations, muscle jerking, or seizure-like activity.
- Severe allergic reactions such as hives, palpitations, shortness of breath, rash, tongue-swelling may occur.

ceftolozane/tazobactam

cef-**tol**-oh-zane/tay-zoe-**bak**-tam

Zerbaxa

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Cephalosporin/beta-lactamase inhibitor.

CLINICAL: Antibacterial.

Do not confuse ceftolozane with ceftAZidime, or tazobactam with avibactam or sulbactam.

Uses

Used in combination with metroNIDAZOLE for treatment of complicated intra-abdominal infections caused by the following susceptible gram-negative and gram-positive microorganisms: *B. fragilis*, *E. cloacae*, *E. coli*, *K. oxytoca*, *K. pneumoniae*, *P. mirabilis*, *P. aeruginosa*, *S. anginosus*, *S. constellatus*, and *S. salivarius* in pts 18 yrs or older. Treatment of complicated urinary tract infections, including pyelonephritis, caused by the following susceptible gram-negative microorganisms: *E. coli*, *K. pneumoniae*, *P. mirabilis*, and *P. aeruginosa* in pts 18 yrs or older.

Precautions

Contraindications: Hypersensitivity to ceftolozane/tazobactam, piperacillin/tazobactam, or other beta-lactams. **Cautions:** History of atrial fibrillation, electrolyte imbalance—associated arrhythmias, recent *C. difficile* (C-diff) infection or antibiotic-associated colitis, renal/hepatic impairment, seizure disorder; prior hypersensitivity to penicillins, other cephalosporins.

Action

Inhibits cell wall synthesis by binding to bacterial cell membrane. Bacterial action of ceftolozane is mediated through binding to essential penicillin-binding proteins. Tazobactam inactivates certain beta-lactamases and binds to certain chromosomal and plasmid-mediated bacterial beta-lactamases. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed. Excreted unchanged as parent drug; not significantly metabolized in liver. Protein binding: 16%–30%. Eliminated in urine (95% unchanged). Removed extensively by hemodialysis. **Half-life:** 2.7 hrs (dependent on dose and severity of renal impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects (due to renal impairment).

Interactions

DRUG: None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, GGT. May decrease Hgb, Hct, platelets; serum potassium, magnesium, phosphate. May result in positive Coombs' test.

Availability (Rx)

⚠️ ALERT ▶ Ceftolozane/tazobactam is a combination product.

Injection, Powder for Reconstitution: 1 g ceftolozane/0.5 g tazobactam.

Administration/handling

 **IV**

Reconstitution

- Reconstitute vial with 10 mL of Sterile Water for Injection or 0.9% NaCl.
- Shake gently until powder is completely dissolved.
- Final volume of vial will equal approx. 11.4 mL.
- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color.
- Withdraw required volume from reconstituted vial and inject into diluent bag containing 100 mL 0.9% NaCl or 5% dextrose injection as follows:

Ceftolozane/Tazobactam	Volume to Withdraw from Reconstituted Vial
1.5 g (1 g/0.5 g)	11.4 mL
750 mg (500 mg/250 mg)	5.7 mL
375 mg (250 mg/125 mg)	2.9 mL
150 mg (100 mg/50 mg)	1.2 mL

Rate of Administration

- Infuse over 60 min.

Storage

- Refrigerate intact vials.
- Reconstituted vial may be held for 1 hr prior to transfer to diluent bag.
- May refrigerate diluted solution up to 7 days or store at room temperature up to 24 hrs.
- Do not freeze.

Indications/routes/dosage

Complicated Intra-Abdominal Infections

IV: ADULTS, ELDERLY: 1.5 g (ceftolozane 1 g/tazobactam 0.5 g) q8h for 4–14 days (in combination with metroNIDAZOLE).

Complicated Urinary Tract Infections Including Pyelonephritis

IV: ADULTS, ELDERLY: 1.5 g (ceftolozane 1 g/tazobactam 0.5 g) q8h for 7 days.

Dosage in Renal Impairment

CrCl 30–50 mL/min: 750 mg (500 mg/250 mg) q8h. **CrCl 15–29 mL/min:** 375 mg (250 mg/125 mg) q8h.

End-Stage Renal Disease or on Hemodialysis: 750 mg (500 mg/250 mg) loading dose, then 150 mg (100 mg/50 mg) maintenance dose q8h for the remainder of the treatment period.

Note: Administer after hemodialysis on hemodialysis days.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (6%–3%): Nausea, diarrhea, pyrexia, insomnia, headache, vomiting.

Rare (2%–1%): Constipation, anxiety, hypotension, rash, abdominal pain, dizziness, tachycardia, dyspnea, urticaria, gastritis, abdominal distention, dyspepsia, flatulence.

Adverse effects/toxic reactions

Clinical cure rates were lower in pts with CrCl 30–50 mL/min compared with those with CrCl greater than 50mL/min, and in pts receiving metroNIDAZOLE combination therapy. Hypersensitivity reactions including anaphylaxis or severe skin reactions have been reported with use of beta-lactam antibacterial drugs. *Clostridium difficile* (C-diff)–associated diarrhea, with severity ranging from

mild diarrhea to fatal colitis, was reported. C-diff infection may occur more than 2 mos after treatment completion. May increase risk of development of drug-resistant bacteria when used in the absence of a proven or strongly suspected bacterial infection. Atrial fibrillation reported in 1.2% of pts. Other reported adverse events such as angina pectoris, infections (candidiasis, oropharyngeal infection, fungal urinary tract infection), paralytic ileus, venous thrombosis occur rarely.

Nursing considerations

Baseline assessment

Obtain baseline CBC, serum BUN, creatinine; CrCl, GFR, LFT; bacterial culture and sensitivity; vital signs. Question history of atrial fibrillation, recent *C. difficile* infection, hepatic/renal impairment, hypersensitivity reaction to beta-lactams, cephalosporins, penicillins, carbapenem. Assess skin for wounds; assess hydration status. Question pt's usual stool characteristics (color, frequency, consistency).

Intervention/evaluation

Monitor CBC, BMP, renal function test periodically; serum magnesium, ionized calcium in pts at risk for arrhythmias. For pts with changing renal function, monitor renal function test daily and adjust dose accordingly. Diligently monitor I&Os. Observe daily pattern of bowel activity, stool consistency (increased severity may indicate antibiotic-associated colitis). If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until test result confirmed; manage proper fluids levels/PO intake, electrolyte levels, protein intake. Antibacterial drugs that are not directed against C-diff infection may need to be discontinued. Report any signs of hypersensitivity reaction.

Patient/family teaching

- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increased risk of recurrent infection.
- Report any episodes of diarrhea, esp. the following mos after treatment completion. Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea and may be contagious to others.

- Report abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes; dark urine, decreased urine output.
- Drink plenty of fluids.
- Severe allergic reactions such as hives, palpitations, rash, shortness of breath, tongue swelling may occur.

cefTRIAxone

sef-trye-ax-own

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Third-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse cefTRIAxone with ceFAZolin, cefOXitin, or ceftazidime.

Uses

Treatment of susceptible infections due to gram-negative aerobic organisms, some gram-positive organisms, including respiratory tract, GU tract, skin and skin structure, bone and joint, intra-abdominal, pelvic inflammatory disease (PID), biliary tract/urinary tract infections; bacterial septicemia, meningitis, perioperative prophylaxis, acute bacterial otitis media. **OFF-LABEL:** Complicated gonococcal infections, STDs, Lyme disease, salmonellosis, shigellosis, atypical community-acquired pneumonia.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cefTRIAxone, cephalosporins. Hyperbilirubinemic neonates, esp. premature infants, should not be treated with cefTRIAxone (can displace bilirubin from its binding to serum albumin, causing bilirubin encephalopathy). Do not administer with calcium-containing IV solutions, including continuous calcium-containing infusion such as parenteral nutrition (in neonates) due to the risk of precipitation of cefTRIAxone-calcium salt. **Cautions:** Hepatic impairment, history of GI disease (esp. ulcerative colitis, antibiotic-associated colitis). History of penicillin allergy.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed, including to CSF. Protein binding: 83%–96%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life: IV:** 4.3–4.6 hrs; **IM:** 5.8–8.7 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. **Children:** May displace bilirubin from serum albumin. Contraindicated in hyperbilirubinemic neonates. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Probenecid** may increase excretion. May increase **aminoglycoside (e.g., gentamicin, tobramycin)** concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

Injection, Powder for Reconstitution (Rocephin): 250 mg, 500 mg, 1 g, 2 g.
Intravenous Solution (Rocephin): 1 g/50 mL, 2 g/50 mL.

Administration/handling

IV

Reconstitution

- Add 2.4 mL Sterile Water for Injection to each 250 mg to provide concentration of 100 mg/mL.
- May further dilute with 50–100 mL 0.9% NaCl, D₅W.

Rate of Administration

- For IV push, administer over 1–4 min (**maximum concentration:** 40 mg/mL).

- For intermittent IV infusion (piggyback), infuse over 30 min.

Storage

- Solution appears light yellow to amber.
- IV infusion (piggyback) is stable for 2 days at room temperature, 10 days if refrigerated.
- Discard if precipitate forms.

IM

- Add 0.9 mL Sterile Water for Injection, 0.9% NaCl, D₅W, or lidocaine to each 250 mg to provide concentration of 250 mg/mL.
- To minimize discomfort, inject deep IM slowly. Less painful if injected into gluteus maximus than lateral aspect of thigh.

■ IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), famotidine (Pepcid), fluconazole (Diflucan), labetalol (Normodyne), vancomycin (Vancocin).

■ IV Compatibilities

Diltiazem (Cardizem), heparin, lidocaine, metroNIDAZOLE (Flagyl), morphine, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage Range

IM/IV: ADULTS, ELDERLY: 1–2 g q12–24h. **CHILDREN:** 50–100 mg/kg/day in 1–2 divided doses. **Maximum:** 4 g/day (meningitis), 2 g/day (other). **NEONATES:** 25–50 mg/kg/dose given once daily.

Dosage in Renal/Hepatic Impairment

Dosage modification is usually unnecessary, but hepatic/renal function test results should be monitored in pts with renal and hepatic impairment or severe renal impairment.

Side effects

Frequent: Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity, CBC. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Discomfort may occur with IM injection.
 - Doses should be evenly spaced.
 - Continue antibiotic therapy for full length of treatment.
-

cefuroxime

sef-ue-rox-eem

Apo-Cefuroxime 

Ceftin

Zinacef

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Second-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse Ceftin with Cefzil or Cipro, cefuroxime with cefotaxime, cefprozil, or deferoxamine, or Zinacef with Zithromax.

Uses

Treatment of susceptible infections due to group B streptococci, pneumococci, staphylococci, *H. influenzae*, *E. coli*, *Enterobacter*, *Klebsiella*, including acute/chronic bronchitis, gonorrhea, impetigo, early Lyme disease, otitis media, pharyngitis/tonsillitis, sinusitis, skin/skin structure, UTI, perioperative prophylaxis.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cefuroxime, cephalosporins. **Cautions:** Severe renal impairment, history of penicillin allergy. Pts with hx of colitis, GI malabsorption, seizures.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Rapidly absorbed from GI tract. Protein binding: 33%–50%. Widely distributed, including to CSF. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. **Half-life:** 1.3 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Probenecid** may increase concentration. **Antacids, H₂-receptor antagonists (e.g, cimetidine, famotidine)** may decrease absorption. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, alkaline phosphatase, bilirubin, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

Injection, Powder for Reconstitution: 750 mg, 1.5 g. **Injection, Solution:** 1.5 g/50 mL. **Oral Suspension (Ceftin):** 125 mg/5 mL, 250 mg/5 mL. **Tablets (Ceftin):** 250 mg, 500 mg.

Administration/handling

IV

Reconstitution

- Reconstitute 750 mg in 8 mL (1.5 g in 14 mL) Sterile Water for Injection to provide a concentration of 100 mg/mL.
- For intermittent IV infusion (piggyback), further dilute with 50–100 mL 0.9% NaCl or D₅W.

Rate of Administration

- For IV push, administer over 3–5 min.
- For intermittent IV infusion (piggyback), infuse over 15–30 min.

Storage

- Solution appears light yellow to amber (may darken, but color change does not indicate loss of potency).
- IV infusion (piggyback) is stable for 24 hrs at room temperature, 7 days if refrigerated.
- Discard if precipitate forms.

IM

- To minimize discomfort, inject deep IM slowly in large muscle mass.

PO

- Give tablets without regard to food (give 400-mg dose with food).
- If GI upset occurs, give with food, milk.
- Avoid crushing tablets due to bitter taste.
- Suspension must be given with food.
- Suspension stable at room temperature or refrigerated for 10 days.

■ IV incompatibilities

Fluconazole (Diflucan), midazolam (Versed), vancomycin (Vancocin).

■ IV Compatibilities

Diltiazem (Cardizem), HYDROMORPHONE (Dilaudid), morphine, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage

IV, IM: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 750 mg–1.5 g q8h up to 1.5 g q6h for severe infections. **CHILDREN: 3 MOS TO YOUNGER THAN 12 YRS:** 75–150 mg/kg/day divided q8h up to 100–200 mg/kg/day divided in 3–4 doses. **Maximum:** 6 g/day. **NEONATES:** 50 mg/kg/dose q8–12h.

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 250–500 mg twice a day. **CHILDREN 3 MOS TO YOUNGER THAN 12 YRS:** 20–30 mg/kg/day in 2 divided doses. **Maximum:** 1 g/day.

Dosage in Renal Impairment

Adult dosage frequency is modified based on creatinine clearance and severity of infection.

Creatinine Clearance	Dosage
----------------------	--------

IV	
Greater than 20 mL/min	q8h
10–20 mL/min	q12h
Less than 10 mL/min	q24h
Peritoneal dialysis	Dose q24h
Continuous renal replacement therapy	1 g q12h
PO	
Greater than 30 mL/min	No adjustment
10–29 mL/min	q24h
Less than 10 mL/min	q48h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Discomfort with IM administration, oral candidiasis (thrush), mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly

cephalosporins, penicillins.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Discomfort may occur with IM injection.
- Doses should be evenly spaced.
- Continue antibiotic therapy for full length of treatment.
- May cause GI upset (may take with food, milk).

celecoxib

sel-e-kox-ib

TOP
100

Apo-Celecoxib 

CeleBREX

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: NSAID, COX-2 selective.

CLINICAL: Anti-inflammatory.

■ **BLACK BOX ALERT** ■ Increased risk of serious cardiovascular thrombotic events, including MI, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation of stomach, intestines.

Do not confuse CeleBREX with CeleXA, Cerebyx, or Clarinex.

Uses

Relief of signs/symptoms of osteoarthritis, rheumatoid arthritis (RA) in adults. Treatment of acute pain, primary dysmenorrhea. Relief of signs/symptoms associated with ankylosing spondylitis. Treatment of juvenile rheumatoid arthritis (JRA).

Precautions

◀ALERT▶ May increase cardiovascular risk when high doses are given to prevent colon cancer.

Contraindications: Hypersensitivity to celecoxib, sulfonamides. Active GI bleeding. Pts experiencing asthma, urticaria, or allergic reactions to aspirin, other NSAIDs. Treatment of perioperative pain in coronary artery bypass graft (CABG) surgery. **Cautions:** History of GI disease (bleeding/ulcers); concurrent use with aspirin, anticoagulants, smoking; alcohol, elderly, debilitated pts, hypertension, asthma, renal/hepatic impairment. Pts with edema, cerebrovascular disease, ischemic heart disease, HF, known or suspected deficiency of cytochrome P450 isoenzyme 2C9. Pediatric pts with systemic-onset juvenile idiopathic arthritis.

Action

Inhibits cyclooxygenase-2, the enzyme responsible for prostaglandin synthesis. **Therapeutic Effect:** Reduces inflammation, relieves pain.

Pharmacokinetics

Rapidly absorbed from GI tract. Widely distributed. Protein binding: 97%. Metabolized in liver. Primarily eliminated in feces. **Half-life:** 11.2 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May decrease antihypertensive effect of **ACE inhibitors (e.g., enalapril, lisinopril, ramipril)**, **angiotensin II antagonists (e.g., losartan, valsartan)**. **Fluconazole** may significantly increase concentration. May increase **lithium** concentration. **Warfarin** may increase risk of bleeding. **Aspirin** may

increase risk of celecoxib-induced GI ulceration, other GI complications. **HERBAL:** Avoid herbs with anticoagulant or antiplatelet activity (**e.g., evening primrose, garlic, ginger, ginseng**). **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, creatinine, BUN. May decrease serum phosphate.

Availability (Rx)

 **Capsules:** 50 mg, 100 mg, 200 mg, 400 mg.

Administration/handling

PO

- May give without regard to meals.
- Capsules may be swallowed whole or opened and mixed with applesauce.

Indications/routes/dosage

Note: Consider reduced initial dose of 50% in poor CYP2C9 metabolizers.

Osteoarthritis

PO: ADULTS, ELDERLY: 200 mg/day as a single dose or 100 mg twice daily.

Rheumatoid Arthritis (RA)

PO: ADULTS, ELDERLY: 100–200 mg twice daily.

Juvenile Rheumatoid Arthritis (JRA)

PO: CHILDREN 2 YRS AND OLDER, WEIGHING MORE THAN 25 KG: 100 mg twice daily. **WEIGHING 10–25 KG:** 50 mg twice daily.

Acute Pain, Primary Dysmenorrhea

PO: ADULTS, ELDERLY: Initially, 400 mg with additional 200 mg on day 1, if needed. **Maintenance:** 200 mg twice daily as needed.

Ankylosing Spondylitis

PO: ADULTS, ELDERLY: 200 mg/day as a single dose or in 2 divided doses. May increase to 400 mg/day if no effect is seen after 6 wks.

Dosage in Renal Impairment

Not recommended in severe renal impairment.

Dosage in Hepatic Impairment

Decrease dose by 50% in pts with moderate hepatic impairment. Not recommended in severe hepatic impairment.

Side effects

Frequent (16%–5%): Diarrhea, dyspepsia, headache, upper respiratory tract infection. **Occasional (less than 5%):** Abdominal pain, flatulence, nausea, back pain, peripheral edema, dizziness, insomnia, rash.

Adverse effects/toxic reactions

Increased risk of cardiovascular events (MI, CVA), serious, potentially life-threatening GI bleeding.

Nursing considerations

Baseline assessment

Assess onset, type, location, duration of pain/inflammation. Inspect appearance of affected joints for immobility, deformity, skin condition. Assess for allergy to sulfa, aspirin, or NSAIDs (contraindicated).

Intervention/evaluation

Assess for therapeutic response: pain relief; decreased stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Observe for bleeding, bruising, weight gain.

Patient/family teaching

- If GI upset occurs, take with food.

- Avoid aspirin, alcohol (increases risk of GI bleeding).
- Immediately report chest pain, jaw pain, sweating, confusion, difficulty speaking, one-sided weakness (may indicate heart attack or stroke).

cephalexin

sef-a-**lex**-in

Apo-Cephalexin 

Keflex

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: First-generation cephalosporin.

CLINICAL: Antibiotic.

Do not confuse cephalexin with cefaclor, ceFAZolin, or ciprofloxacin.

Uses

Treatment of susceptible infections due to staphylococci, group A *streptococcus*, *K. pneumoniae*, *E. coli*, *P. mirabilis*, *H. influenzae*, *M. catarrhalis*, including respiratory tract, genitourinary tract, skin, soft tissue, bone infections; otitis media; rheumatic fever prophylaxis; follow-up to parenteral therapy. **OFF-LABEL:** Suppression of prosthetic joint infection.

Precautions

Contraindications: History of hypersensitivity/anaphylactic reaction to cephalexin, cephalosporins. **Cautions:** Renal impairment, history of GI disease (esp. ulcerative colitis, antibiotic-associated colitis), history of penicillin allergy.

Action

Binds to bacterial cell membranes, inhibits cell wall synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Rapidly absorbed from GI tract (delayed in young children). Protein binding: 10%–15%. Widely distributed. Primarily excreted unchanged in urine.

Moderately removed by hemodialysis. **Half-life:** 0.9–1.2 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Probenecid may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, alkaline phosphatase, bilirubin, LDH, ALT, AST. May cause positive direct/indirect Coombs' test.

Availability (Rx)

 **Capsules:** 250 mg, 500 mg, 750 mg. **Powder for Oral Suspension:** 125 mg/5 mL, 250 mg/5 mL. **Tablets:** 250 mg, 500 mg.

Administration/handling

PO

- After reconstitution, oral suspension is stable for 14 days if refrigerated.
- Shake oral suspension well before using.
- Give without regard to food. If GI upset occurs, give with food, milk.

Indications/routes/dosage

Usual Dosage Range

PO: ADULTS, ELDERLY: 250–1,000 mg q6h or 500 mg q12h. **Maximum:** 4 g/day. **CHILDREN 1 YR AND OLDER:** 25–100 mg/kg/day in 3–4 divided doses. **Maximum:** 4 g/day.

Dosage in Renal Impairment

After usual initial dose, dosing frequency is modified based on creatinine clearance and severity of infection.

Creatinine Clearance	Dosage
60 mL/min or greater	No adjustment
30–59 mL/min	Maximum: 1,000 mg/day
15–29 mL/min	250 mg q8-12h
5–14 mL/min	250 mg q24h
1–4 mL/min	250 mg q48-60h
Hemodialysis	250–500 mg q12–24h (administer after dialysis session)

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis. **Occasional:** Nausea, serum sickness–like reaction (fever, joint pain; usually occurs after second course of therapy and resolves after drug is discontinued). **Rare:** Allergic reaction (rash, pruritus, urticaria).

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Nephrotoxicity may occur, esp. in pts with preexisting renal disease. Pts with history of penicillin allergy are at increased risk for developing a severe hypersensitivity reaction (severe pruritus, angioedema, bronchospasm, anaphylaxis).

Nursing considerations

Baseline assessment

Obtain CBC, renal function tests. Question for history of allergies, particularly cephalosporins, penicillins.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable (increasing severity may indicate onset of antibiotic-associated colitis). Monitor I&O, renal function tests for nephrotoxicity. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). With prolonged therapy, monitor renal/hepatic function tests.

Patient/family teaching

- Doses should be evenly spaced.
- Continue therapy for full length of treatment.
- May cause GI upset (may take with food, milk).
- Refrigerate oral suspension.
- Report persistent diarrhea.

ceritinib

se-ri-ti-nib

Zykadia

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse ceritinib with crizotinib, gefitinib, imatinib, or lapatinib.

Uses

Treatment of pts with anaplastic lymphoma kinase (ALK)-positive metastatic non-small-cell lung cancer (NSCLC).

Precautions

Contraindications: Hypersensitivity to ceritinib. **Cautions:** Bradyarrhythmias/ventricular arrhythmias, diabetes, dehydration, electrolyte imbalance (e.g., hypomagnesemia, hypokalemia), hepatic impairment, HF, ocular disease, pulmonary disease. Medications that prolong QT interval. Not

recommended in pts with congenital long QT syndrome. Avoid use of medications that cause bradycardia.

Action

Inhibits tyrosine kinase activity and tumor cell proliferation. Inhibits autophosphorylation of ALK and ALK-dependent signaling proteins. **Therapeutic Effect:** Inhibits lung cancer growth and metastasis.

Pharmacokinetics

Well absorbed after PO administration. Metabolized in liver. Peak plasma concentration: 4–6 hrs. Protein binding: 97%. Eliminated in feces (92%), urine (1.3%). **Half-life:** 41 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Do not initiate therapy until pregnancy status confirmed. Contraception recommended during treatment and for at least 2 wks after discontinuation. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP3A inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect; avoid use. Strong CYP3A inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect; avoid use. **HERBAL:** St. John's wort may decrease effectiveness. **FOOD:** All food may increase absorption/effect. Grapefruit products may increase concentration/effect; avoid use. **LAB VALUES:** May decrease Hgb, phosphate. May increase serum ALT, AST, bilirubin, creatinine, glucose, lipase.

Availability (Rx)

 Capsules: 150 mg.

Administration/handling

PO

- Give on empty stomach only. Do not administer within 2 hrs of meal.
- Administer whole; do not break, cut, or open.
- If a dose is missed, take dose unless next dose due within 12 hrs. If vomiting occurs, do not administer an additional dose.

Indications/routes/dosage

Non–Small-Cell Lung Cancer

PO: ADULTS/ELDERLY: 750 mg once daily until disease progression or unacceptable toxicity.

Dosage in Renal Impairment

Mild to moderate impairment (CrCl 30-90 mL/min): No dose adjustment.
Severe impairment: Not specified; use caution.

Dosage in Hepatic Impairment

Mild to Moderate impairment: No dose adjustment. **Severe impairment:** Decrease dose by 1/3 (round to nearest 150 mg).

Dosage Modification

Cardiac

QTc interval greater than 500 msec on at least 2 separate EKGs: Withhold until QTc interval is less than 481 msec, or recovery to baseline (if baseline QTc interval is greater than or equal to 481 msec), then resume with a 150-mg dose reduction.

QTc prolongation in combination with torsades de pointes or polymorphic ventricular tachycardia or serious arrhythmia: Permanently discontinue.

Severe or intolerable diarrhea, nausea, vomiting despite optimal antiemetic or antidiarrheal therapy: Withhold until improved, then resume with a 150-mg dose reduction.

Symptomatic, non–life-threatening bradycardia: Withhold until recovery to asymptomatic bradycardia or heart rate of 60 beats/min or greater. Evaluate

concomitant medications known to cause bradycardia and adjust dose as tolerated (reduction not specified).

Clinically significant, life-threatening bradycardia requiring intervention or life-threatening bradycardia in pts taking concomitant medications known to cause bradycardia or hypotension: Withhold until recovery to asymptomatic bradycardia or heart rate of 60 beats/min or greater. If concomitant medication can be adjusted or discontinued, then resume with a 150-mg dose reduction.

Life-threatening bradycardia in pts who are not taking concomitant medications known to cause bradycardia or hypotension: Permanently discontinue.

Concomitant use of strong CYP3A inhibitors: If concomitant use unavoidable, reduce ceritinib dose by one third, rounded to the nearest 150-mg dose strength. After discontinuation of a strong CYP3A inhibitor, resume ceritinib dose that was taken prior to initiating strong CYP3A inhibitor.

Endocrine

Persistent hyperglycemia greater than 250 mL/dL despite optimal antihyperglycemic therapy: Withhold until hyperglycemia is adequately controlled, then resume with a 150-mg dose reduction. If adequate control cannot be achieved with optimal medical management, then permanently discontinue.

Hepatic (During Treatment)

ALT, AST greater than 5 times upper limit of normal (ULN) with total bilirubin elevation less than or equal to 2 times ULN: Withhold until recovery to baseline or less than or equal to 2 times ULN, then resume with a 150-mg dose reduction.

ALT, AST greater than 3 times ULN with total bilirubin elevation greater than or equal to 2 times ULN in the absence of cholestasis or hemolysis: Permanently discontinue.

Pulmonary

Any grade treatment related to interstitial lung disease/pneumonitis: Permanently discontinue.

Intolerability/Toxicity

If unable to tolerate 300-mg dose: Permanently discontinue.

Side effects

Frequent (86%–52%): Diarrhea, nausea, vomiting, abdominal pain, fatigue, asthenia.

Occasional (34%–9%): Decreased appetite, constipation, paresthesia, muscular weakness, gait disturbance, peripheral motor/sensory neuropathy, hypotonia, polyneuropathy, dyspepsia, gastric reflux disease, dysphagia, rash, maculopapular rash, acneiform dermatitis, vision impairment, blurred vision, photopsia, presbyopia, reduced visual acuity.

Adverse effects/toxic reactions

Approximately 60% of pts required at least one dose reduction. Median time to first dose reduction was approximately 7 wks. Decreased Hgb levels reported in 84% of pts. Severe or persistent GI toxicity including nausea, vomiting, diarrhea occurred in 96% of pts; severe cases reported in 14% of pts. Drug-induced hepatotoxicity with elevation of serum ALT 5 times ULN occurred in 27% of pts. Bradycardia, severe interstitial lung disease (ILD), QT interval prolongation, ILD reported in 3% of pts. Grade 3–4 hyperglycemia reported in 13% of pts; diabetics have a sixfold increase in risk; pts receiving corticosteroids have twofold increase in risk. Fatal adverse reactions including pneumonia, respiratory failure, ILD/pneumonitis, pneumothorax, gastric hemorrhage, general physical health deterioration, tuberculosis, cardiac tamponade, sepsis occurred in 5% of pts.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT; serum ionized calcium, magnesium, phosphate; capillary blood glucose, O₂ saturation, urine pregnancy, vital signs. Obtain baseline EKG in pts with history of arrhythmias, HF, electrolyte imbalance, or concurrent use of medications known to prolong QTc interval. Question possibility of pregnancy or plans of breastfeeding. Assess hydration status. Screen for history/co-morbidities. Receive full medication history including herbal products; esp. CYP3A inhibitors or inducers, medications that prolong QT interval. Assess visual acuity. Verify ALK-positive NSCLC test prior to initiation.

Intervention/evaluation

Monitor CBC routinely; LFT monthly (or more frequently in pts with elevated hepatic enzymes). Obtain BMP, serum ionized calcium, magnesium if arrhythmia or dehydration occurs. Monitor vital signs (esp. heart rate). Obtain EKG for bradycardia, chest pain, dyspnea; chest X-ray if ILD, pneumonitis, pneumothorax suspected. Worsening cough, fever, or shortness of breath may indicate pneumonitis. Monitor for hepatic dysfunction, hyperglycemia, sepsis, vision changes. Assess hydration status. Encourage PO intake. Offer antidiarrheal medication for loose stool, antiemetic for nausea, vomiting.

Patient/family teaching

- Blood levels, EKGs will be monitored routinely.
- Most pts experience diarrhea, nausea, vomiting, which may lead to dehydration; drink plenty of fluids.
- Report history of heart problems, including extremity swelling, HF, congenital long QT syndrome, palpitations, syncope. Therapy may decrease your heart rate; report dizziness, chest pain, palpitations, or fainting.
- Worsening cough, fever, or shortness of breath may indicate severe lung inflammation.
- Avoid pregnancy; contraception recommended during treatment and up to 2 wks after final dose. Do not breastfeed.
- Blurry vision, confusion, frequent urination, increased thirst, fruity breath may indicate high blood sugar levels.
- Report any yellowing of skin or eyes, upper abdominal pain, bruising, black/tarry stools, dark urine.
- Immediately report any newly prescribed medications.
- Take on empty stomach only; do not eat 2 hrs before or 2 hrs after any dose.
- Avoid alcohol. Do not consume grapefruit products.

certolizumab pegol

ser-toe-**liz**-ue-mab

Cimzia

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tumor necrosis factor (TNF) blocker.

CLINICAL: Anti-inflammatory agent.

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal cases of tuberculosis, invasive fungal infections, or other opportunistic infections, including viral and bacterial infection, have been reported. Lymphoma reported in children/adolescents receiving other TNF-blocking medications.

Uses

Treatment of moderate to severe active rheumatoid arthritis, moderate to severe active Crohn's disease, active ankylosing spondylitis, active psoriatic arthritis.

Precautions

Contraindications: Hypersensitivity to certolizumab. **Cautions:** Chronic, latent, or localized infection; preexisting or recent-onset CNS demyelinating disorders, moderate to severe HF, underlying hematologic disorders, elderly. Pts who have resided in regions where TB is endemic, pts who are hepatitis B virus carriers. Use of live vaccines.

Action

Binds specifically to TNF-alpha cell, a protein in the immune system that causes inflammation. **Therapeutic Effect:** Reduces signs and symptoms of Crohn's disease and joint destruction associated with rheumatoid arthritis.

Pharmacokinetics

Higher clearance with increasing body weight. Peak plasma concentrations: 54–171 hrs. **Half-life:** 14 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use cautiously due to higher rate of infection.

Interactions

DRUG: Anakinra, other TNF antagonists (e.g., adalimumab, etanercept, inFLIXimab) may increase risk of infection. **Live virus vaccines** may decrease immune response. **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin; aPTT.

Availability (Rx)

Injection, Powder for Reconstitution: 200 mg. **Injection, Solution:** 200 mg/mL in a single-use prefilled syringe.

Administration/handling

Subcutaneous

Reconstitution

- Bring to room temperature before reconstitution.
- Reconstitute with 1 mL Sterile Water for Injection.
- Gently swirl without shaking, using syringe with 20-gauge needle.
- Leave undisturbed to fully reconstitute (may take as long as 30 min).
- Using a new 20-gauge needle, withdraw reconstituted solution into syringe for final concentration of 1 mL (200 mg). Use separate syringes for multiple vials.
- Switch each 20-gauge needle to a 23-gauge needle and inject full contents of each syringe subcutaneously into separate sites on the abdomen or thigh.

Storage

- Store vial in refrigerator.
- Once powder reconstituted, solution should appear clear to opalescent, colorless to pale yellow.
- Discard if solution is discolored or contains precipitate.
- Reconstituted solution is stable for up to 2 hrs at room temperature or 24 hrs if refrigerated.

Indications/routes/dosage

Note: Each 400-mg dose is given as two injections of 200 mg each.

Crohn's Disease

Subcutaneous: Initially, 400 mg (given as two subcutaneous injections of 200

mg) and at weeks 2 and 4. **Maintenance:** In pts who obtain a therapeutic response, 400 mg q4wks.

Rheumatoid Arthritis, Ankylosing Spondylitis, Psoriatic Arthritis

Subcutaneous: ADULTS, ELDERLY: Initially, 400 mg and at weeks 2 and 4.

Maintenance: 200 mg q2wks or 400 mg q4wks.

Dosage Modification

Discontinue for hypersensitivity reaction, lupus-like syndrome, serious infection, sepsis, hepatitis B virus reactivation.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional (6%): Arthralgia. **Rare (less than 1%):** Abdominal pain, diarrhea.

Adverse effects/toxic reactions

Upper respiratory tract infection occurs in 20% of pts. UTI occurs in 7% of pts. Serious infections such as pneumonia, pyelonephritis occur in 3% of pts. Hypersensitivity reaction (rash, urticaria, hypotension, dyspnea) occurs rarely. May increase risk of malignancies (e.g., lymphoma).

Nursing considerations

Baseline assessment

Obtain baseline CBC, urinalysis, C-reactive protein. Do not initiate treatment in pts with active infections, including chronic or localized infection. TB test should be obtained before initiation.

Intervention/evaluation

Monitor pts for infection during and after treatment. If pt develops an infection, treatment should be discontinued. Monitor lab results, especially WBC count,

urinalysis, C-reactive protein for evidence of infection.

Patient/family teaching

- Report cough, fever, flu-like symptoms.
- Do not receive live virus vaccine during treatment or within 3 mos after last dose.

cetirizine

se-teer-i-zeen

Apo-Cetirizine 

Reactine 

ZyrTEC

Fixed-Combination(s)

ZyrTEC D 12 Hour Tablets: cetirizine/pseudoephedrine: 5 mg/120 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Second-generation piperazine.

CLINICAL: Antihistamine.

Do not confuse cetirizine with levocetirizine, or ZyrTEC with Xanax, Zantac, Zocor, or ZyPREXA.

Uses

Relief of symptoms (sneezing, rhinorrhea, postnasal discharge, nasal pruritus, ocular pruritus, tearing) of upper respiratory allergies; relieves itching due to urticaria.

Precautions

Contraindications: Hypersensitivity to cetirizine, hydrOXYzine. **Cautions:** Elderly, hepatic/renal impairment.

Action

Competes with histamine for H₁-receptor sites on effector cells in GI tract, blood vessels, respiratory tract. **Therapeutic Effect:** Prevents allergic response, produces mild bronchodilation, blocks histamine-induced bronchitis.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	Less than 1 hr	4–8 hrs	Less than 24 hrs

Well absorbed from GI tract. Protein binding: 93%. Undergoes low first-pass metabolism; not extensively metabolized. Primarily excreted in urine. **Half-life:** 6.5–10 hrs.

Lifespan considerations

Pregnancy/Lactation: Not recommended during first trimester of pregnancy. Distributed in breast milk. Breastfeeding not recommended. **Children:** Less likely to cause anticholinergic effects. **Elderly:** More sensitive to anticholinergic effects (e.g., dry mouth, urinary retention). Dizziness, sedation, confusion may occur.

Interactions

DRUG: Alcohol, other CNS depressants may increase CNS depression. **Anticholinergics** (e.g., glycopyrrolate, hyoscyamine, oxybutynin) may increase anticholinergic effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May suppress wheal and flare reactions to antigen skin testing unless drug is discontinued 4 days before testing.

Availability (Rx)

 **Capsule:** 10 mg. **Oral solution:** 5 mg/5 mL. **Syrup:** 5 mg/5 mL. **Tablets:** 5 mg, 10 mg. **Tablets (Chewable):** 5 mg, 10 mg. **Tablet (Dispersible):** 10 mg.

Administration/handling

PO

- Give without regard to food.

Indications/routes/dosage

◀ALERT▶ May cause drowsiness at dosage greater than 10 mg/day.

Upper Respiratory Allergies, Urticaria

PO: ADULTS, CHILDREN OLDER THAN 5 YRS: Initially, 5–10 mg/day as single dose. **ELDERLY:** 5 mg once/day. **Maximum:** 5 mg/day. **CHILDREN 2–5 YRS:** 2.5 mg/day. May increase up to 5 mg/day as a single dose or in 2 divided doses. **CHILDREN 12–23 MOS:** Initially, 2.5 mg/day. May increase up to 5 mg/day in 2 divided doses. **CHILDREN 6–11 MOS:** 2.5 mg once daily.

Dosage in Renal Impairment

Adult: GFR 50 mL/min or less: 5 mg once daily. **Children:** GFR 10–29 mL/min: reduce dose by 50 %. GFR <10 mL/min: Not recommended. **Dosage in Hepatic Impairment**No dose adjustment.

Side effects

Occasional (10%–2%): Pharyngitis, dry mucous membranes, nausea, vomiting, abdominal pain, headache, dizziness, fatigue, thickening of mucus, drowsiness, photosensitivity, urinary retention.

Adverse effects/toxic reactions

Children may experience paradoxical reaction (restlessness, insomnia, euphoria, nervousness, tremor). Dizziness, sedation, confusion more likely to occur in elderly.

Nursing considerations

Baseline assessment

Assess lung sounds. Assess severity of rhinitis, urticaria, other symptoms.

Intervention/evaluation

For upper respiratory allergies, increase fluids to maintain thin secretions and offset thirst. Monitor symptoms for therapeutic response.

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.

cetuximab

se-**tux**-i-mab

**HIGH
ALERT**

Erbitux

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Antineoplastic, epidermal growth factor receptor (EGFR) inhibitor.

- **BLACK BOX ALERT** ■ Severe infusion reactions (bronchospasm, stridor, urticaria, hypotension, cardiac arrest) have occurred, especially with first infusion in pts with head and neck cancer. Cardiopulmonary arrest reported in pts receiving radiation in combination with cetuximab.

Do not confuse cetuximab with bevacizumab.

Uses

As a single agent or in combination with irinotecan for treatment of KRAS wild type, EGFR-expressing, metastatic colorectal carcinoma in pts who are refractory or intolerant to irinotecan-based chemotherapy. Treatment of advanced squamous cell cancer of head/neck (with radiation). Treatment of recurrent or metastasized squamous cell carcinoma of head/neck progressing after platinum-based therapy. First-line treatment of squamous cell carcinoma of head and neck in combination with platinum-based therapy with 5-FU. **OFF-LABEL:** EGFR-expressing advanced non-small-cell lung cancer (NSCLC). Treatment of unresectable squamous cell skin cancer.

Precautions

Contraindications: Hypersensitivity to cetuximab. **Cautions:** Preexisting IgE antibodies to cetuximab, coronary artery disease, HF, arrhythmias, pulmonary disease.

Action

Binds to the epidermal growth factor receptor (EGFR), a glycoprotein on normal and tumor cells. **Therapeutic Effect:** Inhibits tumor cell growth, inducing apoptosis (cell death).

Pharmacokinetics

Reaches steady-state levels by the third wkly infusion. Clearance decreases as dose increases. **Half-life:** 114 hrs (range: 75–188 hrs).

Lifespan considerations

Pregnancy/Lactation: Crosses placental barrier; may cause fetal harm; abortifacient. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease WBCs; serum calcium, magnesium, potassium.

Availability (Rx)

Injection Solution: 2 mg/mL (50 mL, 100 mL).

Administration/handling

IV

ALERT Do not give by IV push or bolus.

Reconstitution

- Does not require reconstitution.
- Solution should appear clear, colorless; may contain a small amount of visible, white particulates.

- Do not shake or dilute.
- Infuse with a low protein-binding 0.22-micron in-line filter.

Rate of Administration

- First dose should be given as a 120-min infusion.
- Maintenance infusion should be infused over 60 min.
- Maximum infusion rate should not exceed 5 mL/min.

Storage

- Refrigerate vials.
- Infusion containers are stable for up to 12 hrs if refrigerated, up to 8 hrs at room temperature.
- Discard unused portions.

IV compatibility

Irinotecan (Camptosar).

Indications/routes/dosage

Head/Neck Cancer, Metastatic Colorectal Carcinoma

IV: ADULTS, ELDERLY: Initially, 400 mg/m² as a loading dose.
Maintenance: 250 mg/m² infused over 60 min wkly.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (90%–25%): Acneiform rash, malaise, fever, nausea, diarrhea, constipation, headache, abdominal pain, anorexia, vomiting. **Occasional (16%–10%):** Nail disorder, back pain, stomatitis, peripheral edema, pruritus, cough, insomnia. **Rare (9%–5%):** Weight loss, depression, dyspepsia, conjunctivitis, alopecia.

Adverse effects/toxic reactions

Anemia occurs in 10% of pts. Severe infusion reaction (rapid onset of airway

obstruction, hypotension, severe urticaria) occurs rarely. Dermatologic toxicity, pulmonary embolus, leukopenia, renal failure occur rarely.

Nursing considerations

Baseline assessment

Monitor Hgb, Hct, serum potassium, magnesium. Assess for evidence of anemia. Question possibility of pregnancy. Question history of hypersensitivity reaction.

Intervention/evaluation

Monitor for evidence of infusion reaction (rapid onset of bronchospasm, stridor, hoarseness, urticaria, hypotension) during infusion and for at least 1 hr postinfusion. Pts may experience first severe infusion reaction during later infusions. Assess skin for evidence of dermatologic toxicity (development of inflammatory sequelae, dry skin, exfoliative dermatitis, rash). Monitor CBC, serum electrolytes, acute onset or worsening pulmonary symptoms.

Patient/family teaching

- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with anyone who recently received a live virus vaccine.
- Avoid crowds, those with infection.
- Wear sunscreen, limit sun exposure (sunlight can exacerbate skin reactions).
- Avoid pregnancy.
- Report cardiac or lung symptoms, severe rash.

chlorambucil

klor-**am**-bue-sil

HIGH
ALERT

Leukeran

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alkylating agent, nitrogen mustard.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ May cause myelosuppression. Affects fertility; potential for carcinogenic, mutagenic, teratogenic effects. May cause azoospermia.

Do not confuse Leukeran with Alkeran, Leukine, or Myleran.

Uses

Treatment of chronic lymphocytic leukemia (CLL), Hodgkin's and non-Hodgkin's lymphomas (NHL). **OFF-LABEL:** Nephrotic syndrome in children, Waldenström's macroglobulinemia.

Precautions

Contraindications: Hypersensitivity to chlorambucil. Previous allergic reaction to other alkylating agents, prior resistance to chlorambucil, pregnancy. **Extreme Cautions:** Treatment within 4 wks after full-course radiation therapy or myelosuppressive drug regimen. **Cautions:** History of bone marrow suppression, head trauma, hepatic impairment, nephrotic syndrome, seizure disorder; administration of live vaccines to immunocompromised pts.

Action

Inhibits DNA, RNA synthesis by cross-linking with DNA, RNA strands. **Therapeutic Effect:** Interferes with DNA replication and RNA transcription.

Pharmacokinetics

Rapidly, completely absorbed from GI tract. Protein binding: 99%. Metabolized in liver to active metabolite. Not removed by hemodialysis. **Half-life:** 1.5 hrs; metabolite, 2.5 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended. **Children:** No age-related precautions noted. When taken for nephrotic syndrome, may increase risk of seizures. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Bone marrow depressants may increase myelosuppression. **Other immunosuppressants (e.g., steroids)** may increase risk of infection or development of neoplasms. **Live virus vaccines** may potentiate virus replication, decrease antibody response to vaccine. **HERBAL: Echinacea** may decrease effects. **FOOD: Acidic foods, spicy foods** may delay absorption. **LAB VALUES:** May increase serum alkaline phosphatase, AST, uric acid.

Availability (Rx)

Tablets: 2 mg.

Administration/handling

PO

- Give 30–60 min before food.

Indications/routes/dosage

Chronic Lymphocytic Leukemia (CLL)

PO: ADULTS, ELDERLY: 0.1 mg/kg/day for 3–6 wks or 0.4 mg/kg pulsed doses administered intermittently, biweekly or monthly (increased by 0.1 mg/kg/dose until response/toxicity observed).

Hodgkin's Lymphoma (HL)

PO: ADULTS, ELDERLY: 0.2 mg/kg/day for 3–6 wks.

Non-Hodgkin's Lymphoma (NHL)

PO: ADULTS, ELDERLY: 0.1 mg/kg/day for 3–6 wks.

Dosage in Renal Impairment

CrCl 10–50 mL/min: 75% of dose. CrCl less than 10 mL/min: 50% of dose.

Dosage in Hepatic Impairment

Use caution.

Side effects

Expected: GI effects (nausea, vomiting, anorexia, diarrhea, abdominal distress), generally mild, last less than 24 hrs, occur only if single dose exceeds 20 mg.

Occasional: Rash, dermatitis, pruritus, oral ulcerations. **Rare:** Alopecia, urticaria, erythema, hyperuricemia.

Adverse effects/toxic reactions

Hematologic toxicity due to severe myelosuppression occurs frequently, manifested as neutropenia, anemia, thrombocytopenia. After discontinuation of therapy, thrombocytopenia, neutropenia usually last for 1–2 wks, but may persist for 3–4 wks. Neutrophil count may continue to decrease for up to 10 days after last dose. Toxicity appears to be less severe with intermittent drug administration. Overdosage may produce seizures in children. Excessive serum uric acid level, hepatotoxicity occur rarely.

Nursing considerations

Baseline assessment

Obtain CBC before therapy and wkly during therapy, WBC count 3–4 days following each wkly, CBC during first 3–6 wks of therapy (4–6 wks if pt on intermittent dosing schedule).

Intervention/evaluation

Monitor CBC, serum uric acid, LFT. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Assess skin for rash, pruritus, urticaria.

Patient/family teaching

- Increase fluid intake (may protect against hyperuricemia).
- Avoid acidic or spicy foods; may delay absorption of medication.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.

- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, nausea, vomiting, rash.

cilostazol

sil-**o**-sta-zol

Pletal

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Phosphodiesterase enzyme inhibitor.

CLINICAL: Antiplatelet.

■ **BLACK BOX ALERT** ■ Contraindicated in pts with HF of any severity, active bleeding.

Do not confuse Pletal with Plendil.

Uses

Reduces symptoms of intermittent claudication (increases walking distance).

Precautions

Contraindications: Hypersensitivity to cilostazol. HF of any severity.

Cautions: Hemostatic disorders or active bleeding (bleeding peptic ulcer, intracranial bleeding). Severe underlying heart disease, thrombocytopenia, pts receiving other platelet aggregation inhibitors, moderate to severe hepatic impairment, severe renal impairment.

Action

Inhibits phosphodiesterase, increasing cAMP, leading to inhibition of platelet aggregation. **Therapeutic Effect:** Improves walking distance in pts with intermittent claudication.

Pharmacokinetics

Moderately absorbed from GI tract. Protein binding: 95%–98%. Metabolized in liver. Excreted in urine (74%), feces (20%). Not removed by hemodialysis. **Half-**

life: 11–13 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: **Aspirin** may potentiate inhibition of platelet aggregation. **CYP3A4 inhibitors** (e.g., **clarithromycin**, **diltiazem**, **fluconazole**), **CYP2C19 inhibitors** (e.g., **omeprazole**) may increase concentration/effect. **HERBAL:** **St. John's wort** may decrease effect. Avoid herbs with antiplatelet activity (e.g., **garlic**, **ginger**, **ginkgo**). **FOOD:** **Grapefruit products** may increase concentration, toxicity. **LAB VALUES:** May increase serum BUN, glucose, uric acid. May decrease platelet count, WBC.

Availability (Rx)

Tablets: 50 mg, 100 mg.

Administration/handling

PO

- Give at least 30 min before or 2 hrs after meals.
- Do not give with grapefruit products.

Indications/routes/dosage

Intermittent Claudication

PO: ADULTS, ELDERLY: 100 mg twice daily (in combination with aspirin or clopidogrel) at least 30 min before or 2 hrs after meals. Decrease to 50 mg twice daily during concurrent therapy with CYP3A4 or CYP2C19 inhibitors (e.g., clarithromycin, diltiazem, erythromycin, fluconazole, FLUoxetine, omeprazole, sertraline).

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (34%–10%): Headache, diarrhea, palpitations, dizziness, pharyngitis.

Occasional (7%–3%): Nausea, rhinitis, back pain, peripheral edema, dyspepsia, abdominal pain, tachycardia, cough, flatulence, myalgia. **Rare (2%–1%):** Leg cramps, paresthesia, rash, vomiting.

Adverse effects/toxic reactions

Overdose noted as severe headache, diarrhea, hypotension, cardiac arrhythmias. May increase risk of endocardial hemorrhage, fibrosis of left ventricle, intimal thickening of coronary artery.

Nursing considerations

Baseline assessment

Assess CBC (esp. platelet count), BMP, LFT before treatment and periodically during treatment. Assess walking distance prior to initiation.

Intervention/evaluation

Monitor for improvement of symptoms (e.g., improved walking distance). Monitor lab tests periodically. Monitor for bleeding events, cardiovascular toxicity, or lesions.

Patient/family teaching

- Take on an empty stomach (at least 30 min before or 2 hrs after meals).
- Do not take with grapefruit products.
- Report severe bleeding of any kind.

cinacalcet

sin-a-**kal**-set

Sensipar

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Calcium receptor agonist.

CLINICAL: Calcimimetic.

Uses

Treatment of severe hypercalcemia in pts with primary parathyroid carcinoma. Treatment of secondary hyperparathyroidism in pts with chronic renal disease on dialysis. Treatment of severe hypercalcemia in pts with primary hyperparathyroidism unable to undergo parathyroidectomy.

Precautions

Contraindications: Hypersensitivity to cinacalcet. Serum calcium lower than the lower limit of normal range. **Cautions:** Cardiovascular disease, moderate to severe hepatic impairment, seizure disorder.

Action

Increases sensitivity of calcium-sensing receptor on parathyroid gland to activation by extracellular calcium, thus lowering parathyroid hormone (PTH) levels. **Therapeutic Effect:** Decreases serum calcium, PTH levels.

Pharmacokinetics

Extensively distributed after PO administration. Protein binding: 93%–97%. Metabolized in liver. Excreted in urine (80%), feces (15%). **Half-life:** 30–40 hrs.

⌚ Lifespan considerations

Pregnancy/Lactation: May cross placental barrier; unknown if distributed in breast milk. Safe usage during lactation not established (potential adverse reaction in infants). **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP3A4 inhibitors (e.g., erythromycin, ketoconazole)

increase concentration/effects. Concurrent administration of drugs metabolized by **CYP2D6 enzyme (e.g., flecainide, tricyclic antidepressants, metoprolol, carvedilol)** may require dosage adjustment. **HERBAL:** None significant. **FOOD: High-fat meals** increase plasma concentration. **LAB VALUES:** May decrease serum calcium, phosphorus.

Availability (Rx)

Tablets: 30 mg, 60 mg, 90 mg.

Administration/handling

PO

- Store at room temperature.
- Do not break, crush, dissolve, or divide film-coated tablets.
- Administer with food or shortly after a meal.

Indications/routes/dosage

Hypercalcemia in Parathyroid Carcinoma; Primary Hyperparathyroidism

PO: ADULTS, ELDERLY: Initially, 30 mg twice daily. Titrate dosage sequentially (60 mg twice daily, 90 mg twice daily, and 90 mg 3–4 times/day) every 2–4 wks as needed to normalize serum calcium level. **Maximum:** 360 mg/day (as 90 mg 4 times/day).

Secondary Hyperparathyroidism in Pts on Dialysis

PO: ADULTS, ELDERLY: Initially, 30 mg once daily. Titrate dosage sequentially (60, 90, 120, and 180 mg once daily) every 2–4 wks to maintain iPTH level between 150 and 300 pg/mL. **Maximum:** 180 mg/day.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Moderate to severe impairment: Use caution.

Side effects

Frequent (31%–21%): Nausea, vomiting, diarrhea. **Occasional (15%–10%):** Myalgia, dizziness. **Rare (7%–5%):** Asthenia, hypertension, anorexia, noncardiac chest pain.

Adverse effects/toxic reactions

Overdose may lead to hypocalcemia, seizures, worsening of HF.

Nursing considerations

Baseline assessment

Establish baseline serum electrolyte levels (esp. serum calcium, phosphate, ionized calcium).

Intervention/evaluation

Monitor serum calcium, phosphate, ionized calcium for hyperparathyroidism. Monitor daily pattern of bowel activity, stool consistency. Obtain order for antidiarrhea, antiemetic medication to prevent serum electrolyte imbalance. Assess for evidence of dizziness; institute fall risk precautions.

Patient/family teaching

- Take with food or shortly after a meal.
- Do not chew, crush, dissolve, divide film-coated tablets.
- Notify physician if vomiting, diarrhea, cramping, muscle pain, numbness occurs.

ciprofloxacin

sip-roe-**flox**-a-sin

Apo-Ciproflox 

Cetraxal

Ciloxan

Cipro 

Cipro XR

Fixed-Combination(s)

Cipro HC Otic: ciprofloxacin/hydrocortisone (a steroid): 0.2%/1%. **CiproDex Otic:** ciprofloxacin/dexamethasone (a corticosteroid): 0.3%/0.1%.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Fluoroquinolone.

CLINICAL: Antibiotic.

■ **BLACK BOX ALERT** ■ May increase risk of tendonitis, tendon rupture. May exacerbate myasthenia gravis.

Do not confuse Ciloxan with Cytoxan, or Cipro with Ceftin, or ciprofloxacin with cephalexin.

Uses

Treatment of susceptible infections due to *E. coli*, *K. pneumoniae*, *E. cloacae*, *P. mirabilis*, *P. vulgaris*, *P. aeruginosa*, *H. influenzae*, *M. catarrhalis*, *S. pneumoniae*, *S. aureus* (methicillin susceptible), *S. epidermidis*, *S. pyogenes*, *C. jejuni*, *Shigella* spp., *S. typhi* including intra-abdominal, bone, joint, lower respiratory tract, skin/skin structure infections; UTIs, infectious diarrhea, prostatitis, sinusitis, typhoid fever, febrile neutropenia. **Ophthalmic:** Treatment of superficial ocular infections. **Otic:** Treatment of acute otitis externa due to susceptible strains of *P. aeruginosa* or *S. aureus*. **OFF-LABEL:** Treatment of chancroid. Acute pulmonary exacerbations in cystic fibrosis, disseminated gonococcal infections, prophylaxis to *Neisseria meningitidis* following close contact with infected person. Infectious diarrhea (children); periodontitis.

Precautions

Contraindications: Hypersensitivity to ciprofloxacin, other quinolones. Concurrent use of tiZANidine. **Cautions:** Renal impairment, CNS disorders, seizures, rheumatoid arthritis, history of QT prolongation, uncorrected

hypokalemia, hypomagnesemia, myasthenia gravis. Suspension not used through feeding or gastric tubes. Use in children (due to adverse events to joints/surrounding tissue).

Action

Inhibits enzyme, DNA gyrase, in susceptible bacteria, interfering with bacterial cell replication. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 20%–40%. Widely distributed including to CSF. Metabolized in liver. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 3–5 hrs (increased in renal impairment, elderly).

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. If possible, do not use during pregnancy/lactation (risk of arthropathy to fetus/infant). **Children:** Arthropathy may occur if given to children younger than 18 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Antacids, calcium, magnesium, zinc, iron preparations, sucralfate may decrease absorption. May increase effects of caffeine, oral anticoagulants (e.g., warfarin). May decrease concentration of fosphenytoin, phenytoin. May increase concentration, toxicity of theophylline. **HERBAL:** Dong quai, St. John's wort may increase photosensitization. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, creatine kinase (CK), LDH, ALT, AST.

Availability (Rx)

Infusion, Solution: 200 mg/100 mL, 400 mg/200 mL. **Injection, Solution (Cipro):** 10 mg/mL. **Ophthalmic Ointment (Ciloxan):** 0.3%. **Ophthalmic Solution (Ciloxan):** 0.3%. **Otic Solution (Cetraxal):** 0.2% (single-dose

container: 0.25 mL). **Suspension, Oral:** 250 mg/5 mL, 500 mg/5 mL. **Tablets (Cipro):** 100 mg, 250 mg, 500 mg, 750 mg.

 **Tablets (Extended-Release):** 500 mg, 1,000 mg.

Administration/handling

IV

Reconstitution

- Available prediluted in infusion container ready for use. Final concentration not to exceed 2 mg/mL.

Rate of Administration

- Infuse over 60 min (reduces risk of venous irritation).

Storage

- Store at room temperature.
- Solution appears clear, colorless to slightly yellow.

PO

- May be given with food to minimize GI upset.
- Give at least 2 hrs before or 6 hrs after antacids, calcium, iron, zinc-containing products.
- Do not administer suspension through feeding or gastric tubes.
- **NG tube:** Crush immediate-release tablet and mix with water. Flush tube before/after administration.

Ophthalmic

- Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid.
- Place ointment or drops into pocket.
- Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac).
- Instruct pt using ointment to roll eyeball to increase contact area of drug to eye.
- Instruct pt using solution to apply digital pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption.
- Do not use ophthalmic solution for injection.

■ IV incompatibilities

Ampicillin and sulbactam (Unasyn), cefepime (Maxipime), dexamethasone (Decadron), furosemide (Lasix), heparin, hydrocortisone (Solu-Cortef), methylPREDNISolone (Solu-Medrol), phenytoin (Dilantin), sodium bicarbonate.

■ IV Compatibilities

Calcium gluconate, diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), lidocaine, LORazepam (Ativan), magnesium, midazolam (Versed), potassium chloride.

Indications/routes/dosage

Note: Not recommended as first choice in pregnancy/lactation or in children younger than 18 yrs due to adverse events related to joints/surrounding tissue.

Usual Dosage Range

PO: ADULTS, ELDERLY: 250–750 mg q12h. **CHILDREN: (Mild to moderate infections):** 10 mg/kg twice daily. **Maximum:** 500 mg/dose. **(Severe infections):** 15-20 mg/kg twice daily. **Maximum:** 750 mg/dose.

IV: ADULTS, ELDERLY: 200–400 mg q12h. **CHILDREN:** 10 mg/kg q8–12h. **Maximum:** 400 mg/dose.

Usual Ophthalmic Dosage

ADULTS, ELDERLY, CHILDREN: (Solution): 1–2 drops q2h while awake for 2 days, then 1–2 drops q4h while awake for 5 days. **(Ointment):** Apply 3 times/day for 2 days, then 2 times/day for 5 days.

Usual Otic Dosage

ADULTS, ELDERLY, CHILDREN: Otic solution 0.2%. Instill 0.25 mL (0.5 mg) 2 times/day for 7 days.

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and the severity of the infection.

Creatinine Clearance	Dosage
Immediate-Release	
30–50 mL/min	PO: 250–500 mg q12h
5–29 mL/min	250–500 mg q18h
ESRD, HD, PD	250–500 mg q24h
Extended-Release	
< 30 mL/min	500 mg q24h
ESRD, HD, PD	500 mg q24h
IV 5–29 mL/min	200–400 mg q18–24h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (5%–2%): Nausea, diarrhea, dyspepsia, vomiting, constipation, flatulence, confusion, crystalluria. **Ophthalmic:** Burning, crusting in corner of eye. **Occasional (less than 2%):** Abdominal pain/discomfort, headache, rash. **Ophthalmic:** Altered taste, sensation of foreign body in eye, eyelid redness, itching. **Rare (less than 1%):** Dizziness, confusion, tremors, hallucinations, hypersensitivity reaction, insomnia, dry mouth, paresthesia.

Adverse effects/toxic reactions

Superinfection (esp. enterococcal, fungal), nephropathy, cardiopulmonary arrest, cerebral thrombosis may occur. Hypersensitivity reaction (rash, pruritus, blisters, edema, burning skin), photosensitivity have occurred. Sensitization to ophthalmic form may contraindicate later systemic use of ciprofloxacin. May exacerbate muscle weakness in pts with myasthenia gravis. Dermatologic conditions such as toxic epidermal necrolysis, Stevens-Johnson syndrome have been reported. Cases of severe hepatotoxicity have occurred. May increase risk of tendonitis, tendon rupture.

Nursing considerations

Baseline assessment

Question for history of hypersensitivity to ciprofloxacin, quinolones; myasthenia gravis, renal/hepatic impairment.

Intervention/evaluation

Obtain urinalysis for microscopic analysis for crystalluria prior to and during treatment. Evaluate food tolerance. Monitor daily pattern of bowel activity, stool consistency. Encourage hydration (reduces risk of crystalluria). Monitor for dizziness, headache, visual changes, tremors. Assess for chest, joint pain.

Ophthalmic: Observe therapeutic response.

Patient/family teaching

- Do not skip doses; take full course of therapy.
- Maintain adequate hydration to prevent crystalluria.
- Do not take antacids within 2 hrs of ciprofloxacin (reduces/destroys effectiveness).
- Shake suspension well before using; do not chew microcapsules in suspension.
- Sugarless gum, hard candy may relieve bad taste.
- Avoid caffeine.
- Report tendon pain or swelling.
- Avoid exposure to sunlight/artificial light (may cause photosensitivity reaction).
- Report persistent diarrhea.

CISplatin

sis-**pla**-tin

HIGH
ALERT

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alkylating agent.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Cumulative renal toxicity may be severe. Dose-related toxicities include myelosuppression, nausea, vomiting. Ototoxicity, especially pronounced in children, noted by tinnitus, loss of high-frequency hearing, deafness. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Anaphylactic reaction can occur within minutes of administration. Avoid confusion between CISplatin and CARBOplatin.

Do not confuse CISplatin with CARBOplatin or oxaliplatin.

Uses

Treatment of metastatic testicular cancers, metastatic ovarian cancers, advanced bladder cancer. **OFF-LABEL:** Breast, cervical, endometrial, esophageal, gastric, head and neck, lung (small-cell, non-small-cell) carcinomas; Hodgkin's and non-Hodgkin's lymphomas; malignant melanoma, neuroblastoma, osteosarcoma, soft tissue sarcoma, Wilms' tumor.

Precautions

Contraindications: Hypersensitivity to CISplatin. Hearing impairment, myelosuppression, preexisting renal impairment. **Cautions:** Elderly, renal impairment.

Action

Inhibits DNA and, to a lesser extent, RNA protein synthesis by cross-linking with DNA strands. Cell cycle-phase nonspecific. **Therapeutic Effect:** Prevents cellular division.

Pharmacokinetics

Widely distributed. Protein binding: greater than 90%. Undergoes rapid nonenzymatic conversion to inactive metabolite. Excreted in urine. Removed by hemodialysis. **Half-life:** 58–73 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended. **Children:** Ototoxic effects may be more severe. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: May decrease effects of **anticonvulsant medications**. **Bone marrow**

depressants (e.g., PACLitaxel) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **Nephrotoxic, ototoxic agents (e.g., gentamicin, furosemide, NSAIDs)** may increase risk of toxicity. **HERBAL:** Avoid **black cohosh, dong quai** with estrogen-dependent tumors. **Echinacea** may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, uric acid, AST. May decrease CrCl, serum calcium, magnesium, phosphate, potassium, sodium. May cause positive Coombs' test.

Availability (Rx)

Injection Solution: 1 mg/mL (50 mL, 100 mL, 200 mL).

Administration/handling

 **ALERT** Wear protective gloves during handling. May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

IV

Dilution

- Dilute desired dose in 250–1,000 mL 0.9% NaCl, D₅/0.45% NaCl, or D₅/0.9% NaCl to concentration of 0.05–2 mg/mL. Solution should have final NaCl concentration of 0.2% or greater.

Rate of Administration

- Infuse over 6–8 hrs (per protocol).
- Avoid rapid infusion (increases risk of nephrotoxicity, ototoxicity).
- Monitor for anaphylactic reaction during first few minutes of infusion.

Storage

- Protect from sunlight.
- Do not refrigerate (may precipitate). Discard if precipitate forms. IV infusion: Stable for 72 hrs at 39°F–77°F.

IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), piperacillin and tazobactam (Zosyn), sodium bicarbonate.

■ IV Compatibilities

Etoposide (VePesid), granisetron (Kytril), heparin, HYDROmorphone (Dilaudid), lipids, LORazepam (Ativan), magnesium sulfate, mannitol, morphine, ondansetron (Zofran), palonosetron (Aloxi).

Indications/routes/dosage

Note: Pretreatment hydration with 1–2 liters of fluid recommended. Adequate hydration, urine output greater than 100 mL/hr should be maintained for 24 hrs after administration. Verify any cisplatin dose exceeding 100 mg/m²/course.

Bladder Cancer

IV: ADULTS, ELDERLY: (Single agent): 50–70 mg/m² q3–4wks.

Ovarian Cancer

IV: ADULTS, ELDERLY: 75–100 mg/m² q3–4wks (combination therapy) or 100 mg/m² q4wks (single agent).

Testicular Cancer

IV: ADULTS, ELDERLY: 20 mg/m² daily for 5 days repeated q3wks (in combination with bleomycin and etoposide).

Dosage in Renal Impairment

Dosage is modified based on CrCl, BUN.

◀ALERT▶ Repeated courses of CISplatin should not be given until serum creatinine is less than 1.5 mg/100 mL and/or BUN is less than 25 mg/100 mL.

Creatinine Clearance	Dosage
10–50 mL/min	75% of normal dose
Less than 10 mL/min	50% of normal dose
Hemodialysis	50% of dose post dialysis
Peritoneal dialysis	50% of dose
Continuous renal replacement therapy	75% of dose

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Nausea, vomiting (occurs in more than 90% of pts, generally beginning 1–4 hrs after administration and lasting up to 24 hrs); myelosuppression (affecting 25%–30% of pts, with recovery generally occurring in 18–23 days). **Occasional:** Peripheral neuropathy (with prolonged therapy [4–7 mos]). Pain/redness at injection site, loss of taste, appetite. **Rare:** Hemolytic anemia, blurred vision, stomatitis.

Adverse effects/toxic reactions

Anaphylactic reaction (angioedema, wheezing, tachycardia, hypotension) may occur in first few minutes of administration in pt previously exposed to CISplatin. Nephrotoxicity occurs in 28%–36% of pts treated with a single dose, usually during second wk of therapy. Ototoxicity (tinnitus, hearing loss) occurs in 31% of pts treated with a single dose (more severe in children). Symptoms may become more frequent, severe with repeated doses.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT. Pts should be well hydrated before and 24 hrs after medication to ensure adequate urinary output (100 mL/hr), decrease risk of nephrotoxicity.

Intervention/evaluation

Measure all emesis, urine output (general guideline requiring immediate notification of physician: 750 mL/8 hrs, urinary output less than 100 mL/hr). Monitor I&O q1–2h beginning with pretreatment hydration, continue for 48 hrs after dose. Assess vital signs q1–2h during infusion. Monitor urinalysis, serum electrolytes, LFT, renal function tests, CBC, platelet count for changes from baseline.

Patient/family teaching

- Report signs of ototoxicity (tinnitus, hearing loss).
- Do not have immunizations without physician's approval (lowers body's resistance).
- Avoid contact with those who have recently taken oral polio vaccine.
- Report if nausea/vomiting continues at home.
- Report signs of peripheral neuropathy.

citalopram

sy-e-tal-o-pram

Apo-Citalopram 

CeleXA

CLASSIFICATION

PHARMACOTHERAPEUTIC: Serotonin reuptake inhibitor.

CLINICAL: Antidepressant.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive

disorder, other psychiatric disorders.

Do not confuse CeleXA with CeleBREX, Cerebyx, Ranexa, or ZyPREXA.

Uses

Treatment of depression. **OFF-LABEL:** Treatment of alcohol abuse, diabetic neuropathy, obsessive-compulsive disorder, smoking cessation, GAD, panic disorder.

Precautions

Contraindications: Hypersensitivity to citalopram, use of MAOIs intended to treat psychiatric disorders (concurrently or within 14 days of discontinuing either citalopram or MAOI), initiation in pts receiving linezolid or methylene blue. Concurrent use with pimozide. **Cautions:** Elderly, hepatic/renal impairment, seizure disorder. Not recommended in pts with congenital long QT syndrome, bradycardia, recent MI, uncompensated HF, hypokalemia, or hypomagnesemia; pts at high risk of suicide.

Action

Blocks uptake of the neurotransmitter serotonin at CNS presynaptic neuronal membranes, increasing its availability at postsynaptic receptor sites. **Therapeutic Effect:** Relieves symptoms of depression.

Pharmacokinetics

Well absorbed after PO administration. Protein binding: 80%. Extensively metabolized in liver. Excreted in urine. **Half-life:** 35 hrs.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. **Children:** May cause increased anticholinergic effects, hyperexcitability. **Elderly:** More sensitive to anticholinergic effects (e.g., dry mouth), more likely to experience dizziness, sedation, confusion, hypotension, hyperexcitability.

Interactions

DRUG: CYP2C19 inhibitors (e.g., fluconazole), other medications prolonging QT interval (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol) may increase risk of QT prolongation. **Linezolid, MAOIs (e.g., phenelzine, selegiline), triptans** may cause serotonin syndrome (excitement, diaphoresis, rigidity, hyperthermia, autonomic hyperactivity, coma). **HERBAL:** **Gotu kola, kava kava, SAMe, St. John's wort, valerian** may increase CNS depression. **St. John's wort** may increase risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

Availability (Rx)

Oral Solution: 10 mg/5 mL. **Tablets:** 10 mg, 20 mg, 40 mg.

Administration/handling

PO

- Give without regard to food.

Indications/routes/dosage

Note: Doses greater than 40 mg not recommended.

Depression

PO: ADULTS (less than 60 yrs of age): Initially, 20 mg once daily in the morning or evening. May increase in 20-mg increments at intervals of no less than 1 wk. **Maximum:** 40 mg/day. **ELDERLY (60 yrs of age or older):** 20 mg once daily. **Maximum:** 20 mg/day.

Dose Modification

Hepatic impairment; poor metabolizers of CYP2C19; concomitant use of CYP2C19 inhibitors: 20 mg once daily. **Maximum:** 20 mg/day.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use

caution.

Side effects

Frequent (21%–11%): Nausea, dry mouth, drowsiness, insomnia, diaphoresis.

Occasional (8%–4%): Tremor, diarrhea, abnormal ejaculation, dyspepsia, fatigue, anxiety, vomiting, anorexia. **Rare (3%–2%):** Sinusitis, sexual dysfunction, menstrual disorder, abdominal pain, agitation, decreased libido.

Adverse effects/toxic reactions

Overdose manifested as dizziness, drowsiness, tachycardia, confusion, seizures, torsades de pointes, ventricular tachycardia, sudden death. Serotonin syndrome or neuroleptic malignant syndrome (NMS)–like reactions have been reported.

Nursing considerations

Baseline assessment

Hepatic/renal function tests, blood counts should be performed periodically for pts on long-term therapy. Observe, record behavior. Assess psychological status, thought content, sleep pattern, appearance, interest in environment. Screen for bipolar disorder.

Intervention/evaluation

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood.

Patient/family teaching

- Do not stop taking medication or increase dosage.
- Avoid alcohol.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report worsening depression, suicidal ideation, unusual changes in behavior.

kla-**rith**-roe-**mye**-sin

Apo-Clarithromycin 

Biaxin

Biaxin XL

PMS-Clarithromycin 

CLASSIFICATION

PHARMACOTHERAPEUTIC: Macrolide.

CLINICAL: Antibiotic.

Do not confuse clarithromycin with Claritin, clindamycin, or erythromycin.

Uses

Treatment of susceptible infections due to *C. pneumoniae*, *H. influenzae*, *H. parainfluenzae*, *H. pylori*, *M. catarrhalis*, *M. avium*, *M. pneumoniae*, *S. aureus*, *S. pneumoniae*, *S. pyogenes*, including bacterial exacerbation of bronchitis, otitis media, acute maxillary sinusitis, *Mycobacterium avium* complex (MAC), pharyngitis, tonsillitis, *H. pylori* duodenal ulcer, community-acquired pneumonia, skin and soft tissue infections. Prevention of MAC disease. **OFF-LABEL:** Prophylaxis of infective endocarditis, pertussis, Lyme disease.

Precautions

Contraindications: Hypersensitivity to clarithromycin, other macrolide antibiotics. History of QT prolongation or ventricular arrhythmias, including torsades de pointes. History of cholestatic jaundice or hepatic impairment with prior use of clarithromycin. Concomitant use with colchicine (in pts with renal/hepatic impairment), lovastatin, simvastatin, pimozide, ergotamine, dihydroergotamine. **Cautions:** Hepatic/renal impairment, elderly with severe renal impairment, myasthenia gravis, coronary artery disease. Pts at risk of prolonged cardiac repolarization. Avoid use with uncorrected electrolytes (e.g., hypokalemia, hypomagnesemia), clinically significant bradycardia, class IA or III antiarrhythmics (see Classification).

Action

Binds to ribosomal receptor sites of susceptible organisms, inhibiting protein synthesis of bacterial cell wall. **Therapeutic Effect:** Bacteriostatic; may be bactericidal with high dosages or very susceptible microorganisms.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 65%–75%. Widely distributed (except CNS). Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–7 hrs; metabolite, 5–9 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 6 mos. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: May increase concentrations, toxicity of **carbamazepine, colchicine, digoxin, ergotamine, theophylline, sildenafil, tadalafil, vardenafil. Atorvastatin, efavirenz, rifabutin, rifampin** may decrease plasma concentration. May increase effect of **warfarin**. May decrease concentration of **zidovudine. Atazanavir, ritonavir** may increase concentration of clarithromycin. **HERBAL:** **St. John's wort** may decrease plasma concentration. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, ALT, AST, alkaline phosphatase, LDH, creatinine, PT. May decrease WBC.

Availability (Rx)

Oral Suspension (Biaxin): 125 mg/5 mL, 250 mg/5 mL. **Tablets (Biaxin):** 250 mg, 500 mg.

 **Tablets (Extended-Release [Biaxin XL]):** 500 mg.

Administration/handling

PO

- Give immediate-release tablets, oral suspension without regard to food.
- Give q12h (rather than twice daily).
- Shake suspension well before each use.
- Extended-release tablets should be given with food.
- Do not break, crush, dissolve, or divide extended-release tablets.

Indications/routes/dosage

Usual Dosage Range

PO: ADULTS, ELDERLY: 250–500 mg q12h or 1,000 mg once daily (extended-release tablets). **CHILDREN 6 MOS AND OLDER: (Immediate-Release):** 7.5 mg/kg q12h. **Maximum:** 500 mg/dose.

Dosage in Renal Impairment

CrCl less than 30 mL/min: Reduce dose by 50% and administer once or twice daily. **HD:** Administer dose after dialysis complete.

Combination with atazanavir or ritonavir	
CrCl 30–60 mL/min	Decrease dose by 50%
CrCl less than 30 mL/min	Decrease dose by 75%

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (6%–3%): Diarrhea, nausea, altered taste, abdominal pain. **Rare (2%–1%):** Headache, dyspepsia.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Hepatotoxicity, thrombocytopenia occur rarely.

Nursing considerations

Baseline assessment

Question pt for allergies to clarithromycin, erythromycins.

Intervention/evaluation

Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- Biaxin may be taken without regard to food. Take Biaxin XL with food.
- Report severe diarrhea.

clevidipine

clev-eye-di-peen

Cleviprex

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Dihydropyridine calcium channel blocker.

CLINICAL: Antihypertensive.

Do not confuse clevidipine with amlodipine, cladribine, clofarabine, clozapine, or Cleviprex with Claravis.

Uses

Management of hypertension when oral therapy is not feasible or not desirable.

Precautions

Contraindications: Hypersensitivity to clevidipine. Allergy to soy or egg products; abnormal lipid metabolism (e.g., acute pancreatitis, lipoid nephrosis, pathologic hyperlipidemia if accompanied by hyperlipidemia), severe aortic

stenosis. **Cautions:** HF; pt with disorders of lipid metabolism.

Action

Causes potent arterial vasodilation by inhibiting the influx of calcium during depolarization in arterial smooth muscle. **Therapeutic Effect:** Decreases mean arterial pressure (MAP) by reducing systemic vascular resistance.

Pharmacokinetics

Widely and rapidly distributed. Full recovery of therapeutic B/P occurs 5–15 min. after discontinuation. Onset of effects: 2–4 min. Metabolized via hydrolysis by esterases in blood and extravascular tissue. Protein binding: 99.5%. Excreted in urine (74%), feces (22%). **Half-life:** 15 min.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. May depress uterine contractions during labor and delivery. **Children:** Safety and efficacy not established in pts younger than 18. **Elderly:** Start at low end of dosing range. May experience greater hypotensive effect.

Interactions

DRUG: Diuretics (e.g., furosemide, HCTZ, spironolactone), other antihypertensives (e.g., hydralazine, lisinopril, metoprolol, valsartan) may increase hypotensive effect. NSAIDs (e.g., ibuprofen, naproxen, ketorolac) may decrease antihypertensive effect. **HERBAL:** Herbs with hypotensive properties (e.g., garlic, ginger, hawthorn) may enhance effect. **Yohimbe** may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, potassium, triglycerides, uric acid.

Availability (Rx)

Injection, Emulsion: 50 mL (0.5 mg/mL), 100 mL (0.5 mg/mL), 250-mL vial (0.5 mg/mL).

Administration/handling

IV

Preparation

- Do not dilute.
- To ensure uniformity of emulsion, gently invert vial several times before use.
- Visually inspect for particulate matter or discoloration. Emulsion should appear milky white. Discard if discoloration or particulate matter is observed.

Rate of Administration

- Titrate to desired effect using infusion pump via peripheral or central line.

Storage

- Refrigerate unused vial in original carton.
- May store at controlled room temperature (77°F) for up to 2 mos.
- Do not freeze.
- Do not return to refrigerator once warmed to room temperature. Once the stopper is punctured, use within 12 hrs.
- Discard unused portions.

IV incompatibilities

May be administered with, but not diluted in, solutions including Sterile Water for Injection, 0.9% NaCl, dextrose-containing solutions, lactated Ringer's, 10% amino acid. Do not administer with other medications.

Indications/Routes/Dosage

Note: Individualize dosage depending on desired B/P and pt response. See manufacturer guidelines for dose conversion.

Hypertension

IV: ADULTS, ELDERLY: Initiate infusion at 1–2 mg/hr. **Titration:** Initially, dosage may be doubled at short (90-sec) intervals. As B/P approaches goal, an increase in dosage should be less than double, and time intervals between dose adjustments should be lengthened to q5–10 min. **Maintenance:** Desired therapeutic effect generally occurs at a rate of 4–6 mg/hr (pts with severe hypertension may require limited doses up to 32 mg/hr). **Maximum:** 16 mg/hr (no more than 21 mg/hr or 1000 mL is recommended per 24 hrs due to lipid load).

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Not specified; use caution.

Side Effects

Occasional (6%-3%): Headache, insomnia, nausea, vomiting. **Rare (less than 1%):** Syncope, dyspnea.

Adverse Effects/Toxic Reactions

May cause atrial fibrillation, hypotension, reflex tachycardia. Rebound hypertension may occur in pts who are not transitioned to oral antihypertensives after discontinuation. Dihydropyridine calcium channel blockers are known to have negative inotropic effects, which may exacerbate HF. Rebound hypertension may cause emergent hypertensive crisis, which may cause CVA, myocardial infarction, renal failure, HF, seizures.

Nursing Considerations

Baseline Assessment

Screen for history of defective lipid metabolism, pancreatitis, hypertriglyceridemia, severe aortic stenosis; allergy to soy products, eggs products. Assess B/P, apical pulse immediately before initiation.

Intervention/Evaluation

Monitor B/P, pulse rate. Generally, an increase of 1–2 mg/hour will produce an additional 2–4 mm Hg decrease in systolic B/P. If an oral antihypertensive is required to wean off infusion, consider the delay of onset of oral medication's effect. Pts who receive prolonged IV infusions and are not changed to other antihypertensives should be monitored for rebound hypertension for at least 8 hrs after discontinuation. Obtain serum triglyceride level in pts receiving prolonged infusions. Monitor for atrial fibrillation, hypotension, reflex

tachycardia; exacerbation of HF in pts with history of HF. Beta blockers should be discontinued only after a gradual reduction in dose.

Patient/Family Teaching

- In some pts, an oral blood pressure medication may need to be started; compliance is essential to control high blood pressure.
- Life-threatening high blood pressure crisis may occur up to 8 hrs after stopping infusion; report severe anxiety, chest pain, difficulty breathing, headache, stroke-like symptoms (confusion, difficulty speaking, paralysis, one-sided weakness, vision loss).

clindamycin

klin-da-**mye**-sin

Apo-Clindamycin 

Cleocin

Cleocin T

Cleocin Vaginal

Clindagel

Clindamax

Clindesse

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Lincosamide.

CLINICAL: Antibiotic.

■ **BLACK BOX ALERT** ■ May cause severe, potentially fatal colitis characterized by severe, persistent diarrhea, severe abdominal cramps, passage of blood and mucus.

Do not confuse Cleocin with Clinoril or Cubicin, or clindamycin with clarithromycin, Claritin, or vancomycin.

Uses

Systemic: Treatment of aerobic gram-positive staphylococci and streptococci (not enterococci), *Fusobacterium*, *Bacteroides* spp., and *Actinomyces* for treatment of respiratory tract infections, skin/soft tissue infections, sepsis, intra-abdominal infections, infections of female pelvis and genital tract, bacterial endocarditis prophylaxis for dental and upper respiratory procedures in penicillin-allergic pts, perioperative prophylaxis. **Topical:** Treatment of acne vulgaris. **Intravaginal:** Treatment of bacterial vaginosis. **OFF-LABEL:** Treatment of actinomycosis, babesiosis, erysipelas, malaria, otitis media, *Pneumocystis jiroveci* pneumonia (PCP), sinusitis, toxoplasmosis. **PO:** Bacterial vaginosis.

Precautions

Contraindications: Hypersensitivity to clindamycin. **Cautions:** Severe hepatic dysfunction; history of GI disease (especially colitis).

Action

Inhibits protein synthesis of bacterial cell wall by binding to bacterial ribosomal receptor sites. Topically, decreases fatty acid concentration on skin. **Therapeutic Effect:** Bacteriostatic or bacteriocidal.

Pharmacokinetics

Rapidly absorbed from GI tract. Protein binding: 92%–94%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1.6–5.3 hrs (increased in renal/hepatic impairment, premature infants).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. **Topical/vaginal:** Unknown if distributed in breast milk. **Children:** Caution in pts younger than 1 mo. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Adsorbent antidiarrheals may delay absorption. Erythromycin may increase effect. May increase effects of neuromuscular blockers (e.g.,

rocuronium, vecuronium). **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST.

Availability (Rx)

 **Capsules:** 75 mg, 150 mg, 300 mg. **Cream, Vaginal:** 2%. **Gel, Topical:** 1%. **Infusion, Premix:** 300 mg/50 mL, 600 mg/50 mL, 900 mg/50 mL. **Injection Solution:** 150 mg/mL. **Lotion:** 1%. **Oral Solution:** 75 mg/5 mL. **Suppositories, Vaginal:** 100 mg. **Swabs, Topical:** 1%.

Administration/handling

IV

Reconstitution

- Dilute 300–600 mg with 50 mL D₅W or 0.9% NaCl (900–1,200 mg with 100 mL).

Rate of Administration

- Infuse over at least 10–60 min at rate not exceeding 30 mg/min. Severe hypotension, cardiac arrest can occur with rapid administration.
- No more than 1.2 g should be given in a single infusion.

Storage

- Reconstituted IV infusion (piggyback) is stable for 16 days at room temperature, 32 days if refrigerated.

IM

- Do not exceed 600 mg/dose.
- Administer deep IM.

PO

- Store capsules at room temperature.
- After reconstitution, oral solution is stable for 2 wks at room temperature.
- Do not refrigerate oral solution (avoids thickening).
- Give with at least 8 oz water (minimizes esophageal ulceration).

- Give without regard to food.

Topical

- Wash skin; allow to dry completely before application.
- Shake topical lotion well before each use.
- Apply liquid, solution, or gel in thin film to affected area.
- Avoid contact with eyes or abraded areas.

Vaginal, Cream or Suppository

- Use one applicatorful or suppository at bedtime.
- Fill applicator that comes with cream or suppository to indicated level.
- Instruct pt to lie on back with knees drawn upward and spread apart.
- Insert applicator into vagina and push plunger to release medication.
- Withdraw, wash applicator with soap and warm water.
- Wash hands promptly to avoid spreading infection.

■ IV incompatibilities

Allopurinol (Aloprim), fluconazole (Diflucan).

■ IV Compatibilities

Amiodarone (Cordarone), diltiazEM (Cardizem), heparin, HYDROmorphine (Dilaudid), magnesium sulfate, midazolam (Versed), morphine, multivitamins, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage

IV, IM: ADULTS, ELDERLY: 600–2,700 mg/day in 2–4 divided doses. **Maximum:** 4,800 mg/day. **CHILDREN 1 MO–16 YRS:** 20–40 mg/kg/day in 3–4 divided doses. **Maximum:** 2,700 mg/day. **CHILDREN YOUNGER THAN 1 MO:** 5 mg/kg/dose q6–12h.

PO: ADULTS, ELDERLY: 150–450 mg q6h. **Maximum:** 1,800 mg/day. **CHILDREN 1 MO–16 YRS: (Capsule):** 8–40 mg/kg/day in divided doses q6–8h. **Maximum:** 1,800 mg/day. **(Oral Solution):** 8–25 mg/kg/day in 3–4 divided

doses. Minimum dose: 37.5 mg 3 times/day. **CHILDREN YOUNGER THAN 1 MO:** 5 mg/kg/dose q6–12h.

Bacterial Vaginosis

Intravaginal (Cream): ADULTS: One applicatorful at bedtime for 3–7 days or 1 suppository at bedtime for 3 days. **(Clindesse): ADULTS:** One applicatorful once daily.

Acne Vulgaris

Topical: ADULTS: Apply thin layer to affected area twice daily.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Systemic: Abdominal pain, nausea, vomiting, diarrhea. **Topical:** Dry, scaly skin. **Vaginal:** Vaginitis, pruritus. **Occasional: Systemic:** Phlebitis; pain, induration at IM injection site; allergic reaction, urticaria, pruritus. **Topical:** Contact dermatitis, abdominal pain, mild diarrhea, burning, stinging. **Vaginal:** Headache, dizziness, nausea, vomiting, abdominal pain. **Rare: Vaginal:** Hypersensitivity reaction.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may occur during and several wks after clindamycin therapy (including topical form). Blood dyscrasias (leukopenia, thrombocytopenia), nephrotoxicity (proteinuria, azotemia, oliguria) occur rarely. Thrombophlebitis with IV administration.

Nursing considerations

Baseline assessment

Obtain baseline WBC. Question pt for history of allergies. Avoid, if possible, concurrent use of neuromuscular blocking agents.

Intervention/evaluation

Monitor daily pattern of bowel activity, stool consistency. Report diarrhea promptly due to potential for serious colitis (even with topical or vaginal administration). Assess skin for rash (dryness, irritation) with topical application. With all routes of administration, be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- Take oral doses with at least 8 oz water.
- Use caution when applying topical clindamycin concurrently with peeling or abrasive acne agents, soaps, alcohol-containing cosmetics to avoid cumulative effect.
- Do not apply topical preparations near eyes, abraded areas.
- Report severe persistent diarrhea, cramps, bloody stool.
- **Vaginal:** In event of accidental contact with eyes, rinse with large amounts of cool tap water.
- Do not engage in sexual intercourse during treatment.
- Wear sanitary pad to protect clothes against stains. Tampons should not be used.

cloBAZam

kloe-**ba**-zam

Apo-CloBAZam 

Novo-CloBAZam 

Onfi

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Benzodiazepine (Schedule IV).

CLINICAL: Anticonvulsant.

Do not confuse cloBAZam with clonazepam or clozapine.

Uses

Adjunctive treatment of seizures associated with Lennox-Gastaut syndrome in pts 2 yrs of age and older. **OFF-LABEL:** Catamenial epilepsy; epilepsy (monotherapy).

Precautions

Contraindications: Hypersensitivity to cloBAZam. **Cautions:** Elderly, debilitated, mild to moderate hepatic impairment, preexisting muscle weakness or ataxia, concomitant CNS depressants, impaired gag reflex, respiratory disease, sleep apnea, concomitant poor CYP2C19 metabolizers, pts at risk for falls, myasthenia gravis, narrow-angle glaucoma.

Action

Potentiates neurotransmission of gamma-aminobutyric acid (GABA) by binding to GABA receptor. Depresses nerve impulse transmission in motor cortex. **Therapeutic Effect:** Decreases seizure activity.

Pharmacokinetics

Rapidly absorbed after PO administration. Metabolized in liver. Peak plasma concentration: 0.5–4 hrs. Protein binding: 80–90%. Primarily excreted in urine. Unknown if removed by dialysis. **Half-life:** 36–42 hrs.

Lifespan considerations

Pregnancy/Lactation: Excreted in breast milk. Hormonal contraceptives may have decreased effectiveness. Nonhormonal contraception recommended. **Children:** Safety and efficacy not established in pts younger than 2 yrs. **Elderly:** May have decreased clearance levels (initial dose 5 mg/day).

Interactions

DRUG: CYP2C19 inhibitors (e.g., fluconazole, fluvoxamine, omeprazole, ticlopidine) may increase concentration/effects. Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depression. May decrease effects of hormonal contraceptives. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase

CNS depression. **St. John's wort** may decrease effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Suspension, Oral: 2.5 mg/mL. **Tablets:** 5 mg, 10 mg, 20 mg.

Administration/handling

- May give without regard to food.
- Tablets may be crushed and mixed with applesauce.
- Shake suspension well. Use oral syringe supplied with suspension.

Indications/routes/dosage

Seizure Control (Lennox-Gastaut Syndrome)

PO: ADULTS, CHILDREN WEIGHING 30 KG OR LESS: Initially, 5 mg once daily for at least 7 days, then increase to 5 mg twice for at least 7 days, then increase to 10 mg twice daily. **Maximum:** 20 mg/day. **ADULTS, CHILDREN WEIGHING MORE THAN 30 KG:** Initially, 5 mg twice daily for at least 7 days, then increase to 10 mg twice daily for at least 7 days, then increase to 20 mg twice daily. **Maximum:** 40 mg/day.

ELDERLY WEIGHING MORE THAN 30 KG, HEPATIC IMPAIRMENT, CYP2C19 POOR METABOLIZERS: Initially, 5 mg once daily for at least 7 days, then increase to 5 mg twice daily for at least 7 days, then increase to 10 mg twice daily. After 1 wk, may increase to 20 mg twice daily.

ELDERLY WEIGHING 30 KG OR LESS, HEPATIC IMPAIRMENT, CYP2C19 POOR METABOLIZERS: Initially, 5 mg once daily for at least 2 wks, then 5 mg twice daily for at least 1 wk, then 10 mg twice daily.

Dosage in Renal Impairment

No dose adjustment.

Side effects

Frequent (26%–10%): Sleepiness, URI, lethargy. **Occasional (9%–5%):** Drooling, nausea, vomiting, constipation, irritability, ataxia, insomnia, cough,

fatigue. **Rare (4%–2%):** Psychomotor hyperactivity, UTI, decreased/increased appetite, dysarthria, pyrexia, dysphagia, bronchitis.

Adverse effects/toxic reactions

May increase risk of suicidal behavior/ideation (less than 1%). Physical dependence can increase with higher doses or concomitant alcohol/drug abuse. Abrupt benzodiazepine withdrawal may present as profuse sweating, cramping, nausea, vomiting, muscle pain, convulsions, psychosis, hallucinations, aggression, tremor, anxiety, insomnia. Overdose may result in confusion, lethargy, diminished reflexes, respiratory depression, coma. **Antidote:** Flumazenil (see [Appendix J](#) for dosage). Decreased mobility may potentiate higher risk of pneumonia.

Nursing considerations

Baseline assessment

Offer emotional support. Review history of seizure disorder (frequency, duration, intensity, level of consciousness [LOC]). Question history of alcohol use. Obtain baseline vital signs. Assess history of depression/suicidal ideation.

Intervention/evaluation

Monitor for excess sedation, respiratory depression, suicidal ideation. Implement seizure precautions, observe frequently for seizure activity. Assist with ambulation if drowsiness, dizziness occurs. Evaluate for therapeutic response. Encourage turning, coughing, deep breathing for pts with decreased mobility or who are bedridden.

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly discontinue medication.
- If tapering, monitor for drug withdrawal symptoms.
- Avoid alcohol.
- Report depression, aggression, thoughts of suicide/self-harm, excessive drowsiness.

clofarabine

kloe-far-a-bine

Clolar

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antimetabolite.

CLINICAL: Antineoplastic.

Do not confuse clofarabine with cladribine or clevudipine.

Uses

Treatment of pediatric pts (1–21 yrs) with relapsed or refractory acute lymphoblastic leukemia (ALL). **OFF-LABEL:** Acute myeloid leukemia (AML) in adults 60 yrs or older. Treatment of relapsed/refractory ALL.

Precautions

Contraindications: Hypersensitivity to clofarabine. **Cautions:** Dehydration, hypotension, concomitant nephrotoxic or hepatotoxic medications, renal/hepatic impairment.

Action

Metabolized intracellularly to ribonucleotide reductase. Alters mitochondrial membrane necessary in DNA synthesis. **Therapeutic Effect:** Decreases cell replication, inhibits cell repair. Produces cell death.

Pharmacokinetics

Protein binding: 47%. Metabolized intracellularly. Primarily excreted in urine (40%–60% unchanged). **Half-life:** 5.2 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Breastfeeding not recommended.

Children: Safety and efficacy not established in pts younger than 1 yr. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Hepatotoxic, nephrotoxic medications (e.g., gentamicin, furosemide, NSAIDs) may increase risk of hepatic/renal toxicity. **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum creatinine, uric acid, ALT, AST, bilirubin.

Availability (Rx)

Injection, Solution: 1 mg/mL (20-mL vial).

Administration/handling

IV

Reconstitution

- Filter clofarabine through sterile, 0.2-micrometer syringe filter prior to dilution with D₅W or 0.9% NaCl to final concentration of 0.15–0.4 mg/mL.

Rate of Administration

- Administer over 1–2 hrs.
- Continuously infuse IV fluids to decrease risk of tumor lysis syndrome, other adverse events.

Storage

- Store undiluted or diluted solution at room temperature.
- Use diluted solution within 24 hrs.

IV incompatibilities

Do not administer any other medication through same IV line.

Indications/routes/dosage

Acute Lymphoblastic Leukemia (ALL)

IV: CHILDREN 1–21 YRS: 52 mg/m² over 2 hrs once daily for 5 consecutive days; repeat q2–6wks following recovery or return to baseline organ function. (Subsequent cycles should begin no sooner than 14 days from day 1 of previous cycle and when ANC is 750 cells/mm³ or greater.)

Dosage in Renal Impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance	Dosage
30–60 mL/min	Decrease dose by 50%
Less than 30 mL/min	Use with caution

Dosage in Hepatic Impairment

Baseline impairment: No dose adjustment. **Hepatotoxicity during treatment; grade 3 or higher increase in bilirubin:** Discontinue. May restart at 25% dose reduction following recovery to baseline.

Side effects

Frequent (83%–20%): Vomiting, nausea, diarrhea, pruritus, headache, fever, dermatitis, rigors, abdominal pain, fatigue, tachycardia, epistaxis, anorexia, petechiae, limb pain, hypotension, anxiety, constipation, edema. **Occasional (19%–11%):** Cough, mucosal inflammation, erythema, flushing, hematuria, dizziness, gingival bleeding, injection site pain, respiratory distress, pharyngitis, back pain, palmar-plantar erythrodysesthesia syndrome, myalgia, oral candidiasis, hypertension, depression, irritability, arthralgia, anorexia. **Rare (10%):** Tremor, weight gain, drowsiness.

Adverse effects/toxic reactions

Neutropenia occurred in 57% of pts; pericardial effusion in 35%; left ventricular systolic dysfunction in 27%; hepatomegaly, jaundice in 15%; pleural effusion, pneumonia, bacteremia in 10%; capillary leak syndrome in less than 10%.

Nursing considerations

Baseline assessment

Question possibility of pregnancy. Obtain CBC, BMP, LFT, CrCl prior to therapy.

Intervention/evaluation

Monitor CBC, renal function test, LFT, serum uric acid. Monitor respiratory status, cardiac function. Monitor daily pattern of bowel activity, stool consistency. Assess for GI disturbances. Assess skin for pruritus, dermatitis, petechiae, erythema on palms of hands and soles of feet. Assess for fever, sore throat; obtain blood cultures to detect evidence of infection. Ensure adequate hydration.

Patient/family teaching

- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with anyone who recently received a live virus vaccine.
- Avoid crowds, those with infection.
- Avoid pregnancy; pts of childbearing potential should use effective contraception.
- Maintain strict oral hygiene and frequent handwashing.
- Report fever, respiratory distress, prolonged nausea, vomiting, diarrhea, easy bruising.

clomiPRAMINE

kloe-**mip**-rah-meen

Anafranil

Apo-ClomiPRAMINE 

Novo-ClomiPRAMINE 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tricyclic.

CLINICAL: Antidepressant.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse Anafranil with enalapril, or clomiPRAMINE with chlorproMAZINE, clevidipine, clomiPHENE, or desipramine.

Uses

Treatment of obsessive-compulsive disorder. **OFF-LABEL:** Depression, panic attacks.

Precautions

Contraindications: Hypersensitivity to clomipRAMINE, other tricyclic agents. Acute recovery period after MI, use of MAOIs intended for psychiatric disorders (concurrently or within 14 days of discontinuing either clomipramine or MAOI). Initiation in pts receiving linezolid or methylene blue. **Cautions:** Pts at high risk for suicide, prostatic hypertrophy, history of urinary retention/obstruction, narrow-angle glaucoma, seizures, cardiovascular/hepatic/renal disease, hyperthyroidism, alcoholism, xerostomia, visual problems, elderly, constipation, history of bowel obstruction. Tumors of the adrenal medulla (e.g., pheochromocytoma).

Action

Blocks reuptake of neurotransmitters (norepinephrine, serotonin) at CNS presynaptic membranes, increasing availability at postsynaptic receptor sites. **Therapeutic Effect:** Reduces obsessive-compulsive behavior.

Pharmacokinetics

Rapidly absorbed. Metabolized in liver. Eliminated in urine (51%–60%), feces (24%–32%). **Half-life:** 20–30 hrs.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. **Children:** Increased risk of suicidal ideation, behavior noted in children, adolescents. Safety and effectiveness in pts younger than 10 yrs not established. **Elderly:** Not recommended in elderly due to anticholinergic effects, potential for sedation, orthostatic hypotension.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., lorazepam, morphine,

zolpidem) may increase CNS, respiratory depression, hypotensive effect. **Cimetidine, haloperidol** may increase concentration, risk of toxicity. May decrease effects of **clonidine**. **PHENobarbital** may decrease concentration, antidepressant effect. **MAOIs (e.g., phenelzine, selegiline)** may increase risk of neuroleptic malignant syndrome, seizures, hyperpyrexia, hypertensive crisis. **Phenothiazines (e.g., chlorpromazine, thioridazine)** may increase anticholinergic, sedative effects. **Sympathomimetics (e.g., dopamine, norepinephrine)** may increase the risk of cardiac effects. **HERBAL: Gota kola, kava kava, SAMe, St. John's wort, valerian** may increase CNS depression. **FOOD: Grapefruit products** may increase concentration, toxicity. **LAB VALUES:** May alter serum glucose, ECG readings.

Availability (Rx)

 **Capsules:** 25 mg, 50 mg, 75 mg.

Administration/handling

PO

- May give with food to decrease risk of GI disturbance.
- Recommend bedtime administration.

Indications/routes/dosage

NOTE: Following dose titration, may give once-daily dose at bedtime.

Obsessive-Compulsive Disorder (OCD)

PO: ADULTS, ELDERLY: Initially, 25 mg/day. May gradually increase to 100 mg/day in divided doses in the first 2 wks. **Maximum:** 250 mg/day. **CHILDREN 10 YRS AND OLDER:** Initially, 25 mg/day. May gradually increase up to maximum of 3 mg/kg/day or 100 mg in divided doses (whichever is lowest). **Maintenance:** May further increase to 3 mg/kg or 200 mg/day (whichever is less).

Dosage in Renal/Hepatic Impairment

Use caution.

Side effects

Frequent (30%–15%): Ejaculatory failure, dry mouth, somnolence, tremors, dizziness, headache, constipation, fatigue, nausea. **Occasional (14%–5%):** Impotence, diaphoresis, dyspepsia, sexual dysfunction, dysmenorrhea, nervousness, weight gain, pharyngitis. **Rare (less than 5%):** Diarrhea, myalgia, rhinitis, increased appetite, paresthesia, memory impairment, anxiety, rash, pruritus, anorexia, abdominal pain, vomiting, flatulence, flushing, UTI, back pain.

Adverse effects/toxic reactions

Overdose may produce seizures, cardiovascular effects (severe orthostatic hypotension, dizziness, tachycardia, palpitations, arrhythmias), altered temperature regulation (hyperpyrexia, hypothermia). Abrupt discontinuation after prolonged therapy may produce headache, malaise, nausea, vomiting, vivid dreams. Anemia, agranulocytosis have been noted.

Nursing considerations

Baseline assessment

Assess psychological status, thought content, level of interest, mood, behavior, suicidal ideation.

Intervention/evaluation

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood.

Patient/family teaching

- May cause dry mouth, constipation, blurred vision. Avoid tasks that require alertness, motor skills until response to drug is established.
- Tolerance to postural hypotension, sedative, anticholinergic effects usually develop during early therapy.
- Maximum therapeutic effect may be noted in 2–4 wks.
- Do not abruptly discontinue medication.

- Daily dose may be given at bedtime to minimize daytime sedation.
- Avoid alcohol.
- Report worsening depression, suicidal ideation, change in behavior.

clonazepam

kloe-**naz**-e-pam

Apo-Clonazepam 

Klonopin

Rivotril 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Benzodiazepine (Schedule IV).

CLINICAL: Anticonvulsant, antianxiety.

■ **BLACK BOX ALERT** ■ Concomitant use with opioids may result in profound sedation, respiratory depression, coma, and death.

Do not confuse clonazepam or Klonopin with clobazam, clonidine, clozapine, or lorazepam.

Uses

Adjunct in treatment of Lennox-Gastaut syndrome (petit mal variant epilepsy); akinetic, myoclonic seizures; absence seizures (petit mal) unresponsive to succinimides. Treatment of panic disorder. **OFF-LABEL:** Burning mouth syndrome, REM sleep behavior disorder, essential tremor.

Precautions

Contraindications: Hypersensitivity to clonazepam. Active narrow-angle glaucoma, severe hepatic disease, pregnancy. **Cautions:** Renal/hepatic impairment, impaired gag reflex, chronic respiratory disease, elderly, debilitated pts, depression, pts at risk of suicide or drug dependence, concomitant use of other CNS depressants.

Action

Depresses all levels of CNS; depresses nerve impulse transmission in motor cortex. Suppresses abnormal discharge in petit mal seizures. **Therapeutic Effect:** Produces anxiolytic, anticonvulsant effects.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	20–60 min	—	12 hrs or less

Well absorbed from GI tract. Protein binding: 85%. Metabolized in liver. Excreted in urine. Not removed by hemodialysis. **Half-life:** 18–50 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. May be distributed in breast milk. Chronic ingestion during pregnancy may produce withdrawal symptoms, CNS depression in neonates. **Children:** Long-term use may adversely affect physical/mental development. **Elderly:** Not recommended in elderly due to anticholinergic effects, potential for sedation, orthostatic hypotension.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depressant effect. **CYP3A4 inhibitors** (e.g., azole antifungals) may increase concentration, toxicity. **HERBAL:** Gotu kola, kava kava, SAME, St. John's wort, valerian may increase CNS depression. St. John's wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Tablets (Klonopin): 0.5 mg, 1 mg, 2 mg. **Tablets (Orally Disintegrating):** 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg.

Administration/handling

PO

- Give without regard to food.

- Swallow whole with water.

Orally Disintegrating Tablet

- Open pouch, peel back foil; do not push tablet through foil.
- Remove tablet with dry hands, place in mouth.
- Swallow with or without water.
- Use immediately after removing from package.

Indications/routes/dosage

Seizures

PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER: Initial dose not to exceed 1.5 mg/day in 3 divided doses; may be increased in 0.5- to 1-mg increments every 3 days until seizures are controlled or adverse effects occur. **Maintenance:** 2–8 mg/day in 1–2 divided doses. **Maximum:** 20 mg/day. **INFANTS, CHILDREN YOUNGER THAN 10 YRS OR WEIGHING LESS THAN 30 KG:** 0.01–0.03 mg/kg/day (maximum initial dose: 0.05 mg/kg/day) in 2–3 divided doses; may be increased by no more than 0.25–0.5 mg every 3 days until seizures are controlled or adverse effects occur. **Maintenance:** 0.1–0.2 mg/kg/day in 3 divided doses. **Maximum:** 0.2 mg/kg/day.

Panic Disorder

PO: ADULTS, ELDERLY: Initially, 0.25 mg twice daily. Increase in increments of 0.125–0.25 mg twice daily every 3 days. **Target dose:** 1 mg/day. **Maximum:** 4 mg/day. **Note:** Discontinue gradually by 0.125 mg twice daily q3days until completely withdrawn.

Dosage in Renal Impairment

Use caution.

Dosage in Hepatic Impairment

Mild to moderate impairment: Use with caution. **Severe impairment:** Contraindicated.

Side effects

Frequent (37%–11%): Mild, transient drowsiness; ataxia, behavioral disturbances (aggression, irritability, agitation), esp. in children. **Occasional (10%–5%):** Dizziness, ataxia, URI, fatigue. **Rare (4% or less):** Impaired memory, dysarthria, nervousness, sinusitis, rhinitis, constipation, allergic reaction.

Adverse effects/toxic reactions

Abrupt withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremors, abdominal/muscle cramps, diaphoresis, vomiting, status epilepticus. Overdose results in drowsiness, confusion, diminished reflexes, coma. **Antidote:** Flumazenil (see [Appendix J](#) for dosage).

Nursing considerations

Baseline assessment

Review history of seizure disorder (frequency, duration, intensity, level of consciousness [LOC]). For panic attack, assess motor responses (agitation, trembling, tension), autonomic responses (cold/clammy hands, diaphoresis).

Intervention/evaluation

Observe for excess sedation, respiratory depression, suicidal ideation. Assess children, elderly for paradoxical reaction, particularly during early therapy. Initiate seizure precautions, observe frequently for recurrence of seizure activity. Assist with ambulation if drowsiness, ataxia occur. For pts on long-term therapy, CBC, BMP, LFT should be performed periodically. Evaluate for therapeutic response: decreased intensity and frequency of seizures or, if used in panic attack, calm facial expression, decreased restlessness.

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not abruptly discontinue medication after long-term therapy.
- Strict maintenance of drug therapy is essential for seizure control.

- Avoid alcohol.
- Report depression, thoughts of suicide/self-harm, excessive drowsiness, GI symptoms, worsening or loss of seizure control.

cloNIDine

klon-i-deen

Apo-CloNIDine 

Catapres

Catapres-TTS

Dixarit 

Duraclon

Kapvay

Novo-CloNIDine 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alpha₂-adrenergic agonist.

CLINICAL: Antihypertensive.

■ **BLACK BOX ALERT** ■ **Epidural:** Not to be used for perioperative, obstetric, or postpartum pain. Must dilute concentrated epidural injectable (500 mcg/mL) prior to use.

Do not confuse Catapres with Cataflam, or cloNIDine with clomiPHENE, clonazepam, Klonopin, or quiNIDine.

Uses

Immediate-Release, Transdermal Patch: Treatment of hypertension alone or in combination with other antihypertensive agents. **Kapvay:** Treatment of attention-deficit hyperactivity disorder (ADHD). **Epidural:** Combined with opiates for relief of severe cancer pain. **OFF-LABEL:** Opioid or nicotine withdrawal, prevention of migraine headaches, treatment of diarrhea in diabetes mellitus, treatment of dysmenorrhea, menopausal flushing, alcohol dependence, glaucoma, cloZAPine-induced sialorrhea, Tourette's syndrome, insomnia in children.

Precautions

Contraindications: Hypersensitivity to cloNIDine. **Epidural:** Contraindicated in pts with bleeding diathesis or infection at the injection site; pts receiving anticoagulation therapy. **Cautions:** Depression, elderly. Severe coronary insufficiency, recent MI, cerebrovascular disease, chronic renal impairment, preexisting bradycardia, sinus node dysfunction, conduction disturbances; concurrent use with digoxin, diltiazEM, metoprolol, verapamil.

Action

Stimulates α_2 -adrenergic receptors, reducing sympathetic CNS response. **Epidural:** Prevents pain signal transmission to brain and produces analgesia at pre- and post- α -adrenergic receptors in spinal cord. **ADHD:** Mechanism of action unknown. **Therapeutic Effect:** Reduces peripheral resistance; decreases B/P, heart rate. Produces analgesia.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	0.5–1 hr	2–4 hrs	6–10 hrs

Well absorbed from GI tract. Transdermal best absorbed from chest and upper arm; least absorbed from thigh. Protein binding: 20%–40%. Metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 6–20 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. **Children:** More sensitive to effects; use caution. **Elderly:** Not recommended in elderly due to high risk of CNS adverse effects, orthostatic hypotension. Avoid as first-line antihypertensive.

Interactions

DRUG: Discontinuation of concurrent **beta-blocker** (e.g., carvedilol, metoprolol) therapy may increase risk of cloNIDine-withdrawal hypertensive crisis. **Tricyclic antidepressants** (e.g., amitriptyline, doxepin, nortriptyline)

may decrease effect (may require increased dose of cloNIDine). **Digoxin, diltiazEM, metoprolol, verapamil** may increase risk of serious bradycardia. **HERBAL: Gotu kola, kava kava, SAME, St. John's wort, valerian** may increase CNS depression. **Ephedra, ginseng, yohimbe** may decrease antihypertensive effect. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Injection Solution (Duraclon): 100 mcg/mL, 500 mcg/mL. **Tablets (Catapres):** 0.1 mg, 0.2 mg, 0.3 mg. **(Kapvay):** 0.1 mg, 0.2 mg. **Transdermal Patch (Catapres-TTS):** 2.5 mg (release at 0.1 mg/24 hrs), 5 mg (release at 0.2 mg/24 hrs), 7.5 mg (release at 0.3 mg/24 hrs).

 **Extended-Release Tablets:(Kapvay):** 0.1 mg.

Administration/handling

PO

- Give without regard to food.
- Tablets may be crushed.
- Give last oral dose just before bedtime.
- Swallow extended-release tablets whole; do not break, crush, dissolve, or divide.

Transdermal

- Apply transdermal system to dry, hairless area of intact skin on upper arm or chest.
- Rotate sites (prevents skin irritation).
- Do not trim patch to adjust dose.

Epidural

- Must be administered only by medical personnel trained in epidural management.

IV incompatibilities

None known.

■ IV Compatibilities

Bupivacaine (Marcaine, Sensorcaine), fentaNYL (Sublimaze), heparin, ketamine (Ketalar), lidocaine, LORazepam (Ativan).

Indications/routes/dosage

Hypertension

PO: ADULTS: (Immediate Release): Initially, 0.1 mg twice a day. Increase by 0.1–0.2 mg q2–4days. **Maintenance:** 0.2–1.2 mg/day in 2–4 divided doses up to maximum of 2.4 mg/day. **ELDERLY:** Initially, 0.1 mg at bedtime. May increase gradually. **CHILDREN 12 YRS AND OLDER:** Initially, 0.2 mg/day in 2 divided doses. May increase gradually at 5- to 7-day intervals in 0.1 mg/day increments. **Maximum:** 2.4 mg/day.

Transdermal: ADULTS, ELDERLY: Initially, system delivering 0.1 mg/24 hrs applied once q7days. May increase by 0.1 mg at 1- to 2-wk intervals. Usual dosage range: 0.1–0.3 mg once wkly.

Acute Hypertension

PO: ADULTS: Initially, 0.1–0.2 mg followed by 0.1 mg every hr if necessary, up to maximum total dose of 0.7 mg.

Attention-Deficit Hyperactivity Disorder (ADHD)

PO: CHILDREN 45 KG OR LESS: (Immediate Release): Initially 0.05 mg/day at bedtime. May increase in increments of 0.05 mg/day q3–7days up to 0.2 mg/day (27–40.5 kg), 0.3 mg/day (40.5–45 kg). **GREATER THAN 45 KG: (Immediate Release):** 0.1 mg at bedtime. May increase 0.1 mg/day q3–7 days. **Maximum:** 0.4 mg/day. **Extended-Release Tablet (Kapvay): CHILDREN 6 YRS AND OLDER:** Initially, 0.1 mg daily at bedtime. May increase in increments of 0.1 mg/day at wkly intervals (**Maximum:** 0.4 mg/day). Doses should be taken twice daily with higher split dose given at bedtime.

Severe Pain

Epidural: ADULTS, ELDERLY: 30–40 mcg/hr. **CHILDREN:** Range: 0.5–2 mcg/kg/hr, not to exceed adult dose.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (40%–10%): Dry mouth, drowsiness, dizziness, sedation, constipation. **Occasional (5%–1%):** **Tablets, Injection:** Depression, pedal edema, loss of appetite, decreased sexual function, itching eyes, dizziness, nausea, vomiting, nervousness. **Transdermal:** Pruritus, redness or darkening of skin. **Rare (less than 1%):** Nightmares, vivid dreams, feeling of coldness in distal extremities (esp. the digits).

Adverse effects/toxic reactions

Overdose produces profound hypotension, irritability, bradycardia, respiratory depression, hypothermia, miosis (pupillary constriction), arrhythmias, apnea. Abrupt withdrawal may result in rebound hypertension associated with nervousness, agitation, anxiety, insomnia, paresthesia, tremor, flushing, diaphoresis. May produce sedation in pts with acute CVA.

Nursing considerations

Baseline assessment

Obtain B/P immediately before each dose is administered, in addition to regular monitoring (be alert to B/P fluctuations).

Intervention/evaluation

Monitor B/P, pulse, mental status. Monitor daily pattern of bowel activity, stool consistency. If cloNIDine is to be withdrawn, discontinue concurrent beta-blocker therapy several days before discontinuing cloNIDine (prevents cloNIDine withdrawal hypertensive crisis). Slowly reduce cloNIDine dosage over 2–4 days.

Patient/family teaching

- Sugarless gum, sips of water may relieve dry mouth.

- Avoid tasks that require alertness, motor skills until response to drug is established.
- To reduce hypotensive effect, rise slowly from lying to standing.
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- Avoid alcohol.
- If patch loosens during 7-day application period, secure with adhesive cover.

clopidogrel

kloe-**pid**-oh-grel

Apo-Clopidogrel 

Plavix

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Thienopyridine derivative.

CLINICAL: Antiplatelet.

■ **BLACK BOX ALERT** ■ Diminished effectiveness in CYP2C19 metabolizers increases risk for cardiovascular events. Pts with CYP2C19*2 and/or CYP2C19*3 alleles may have reduced platelet inhibition.

Do not confuse Plavix with Elavil or Paxil.

Uses

To decrease rate of MI and stroke in pts with non-ST-segment elevation acute coronary syndrome (ACS), acute ST-elevation MI (STEMI); pts with history of recent MI or stroke, established peripheral arterial disease (PAD). **OFF-LABEL:** Graft patency (saphenous vein), stable coronary artery disease (in combination with aspirin). Initial treatment of ACS in pts allergic to aspirin.

Precautions

Contraindications: Hypersensitivity to clopidogrel. Active bleeding (e.g., peptic ulcer, intracranial hemorrhage). **Cautions:** Severe hepatic/renal impairment, pts at risk of increased bleeding (e.g., trauma), concurrent use of anticoagulants. Avoid concurrent use of CYP2C19 inhibitors (e.g., omeprazole).

Action

Inhibits binding of enzyme adenosine phosphate (ADP) to its platelet receptor and subsequent ADP-mediated activation of a glycoprotein complex.

Therapeutic Effect: Inhibits platelet aggregation.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	2 hrs	5–7 days (with repeated doses of 75 mg/day)	5 days after last dose

Rapidly absorbed. Protein binding: 98%. Metabolized in liver. Eliminated equally in the urine and feces. **Half-life:** 8 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), warfarin may increase risk of bleeding. **Proton pump inhibitors (e.g., omeprazole, pantoprazole)** may decrease efficacy, increase risk of cardiovascular events. **HERBAL:** Cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng, green tea, red clover may have additive antiplatelet effects. **FOOD:** Grapefruit products may decrease effects. **LAB VALUES:** May increase serum bilirubin, ALT, AST, cholesterol, uric acid. May decrease neutrophil count, platelet count.

Availability (Rx)

Tablets: 75 mg, 300 mg.

Administration/handling

PO

- Give without regard to food.
- Avoid grapefruit products.

Indications/routes/dosage

Recent MI, Stroke, PAD

PO: ADULTS, ELDERLY: 75 mg once daily.

Acute Coronary Syndrome (ACS), Unstable Angina/NSTEMI

PO: ADULTS, ELDERLY: Initially, loading dose of 300–600 mg, then 75 mg once daily (in combination with aspirin for up to 12 months, then aspirin indefinitely).

ACS (STEMI)

Note: Continue for at least 14 days up to 12 months.

PO: ADULTS, ELDERLY 75 YRS OR YOUNGER: Initially 300-mg loading dose, then 75 mg once daily. **ELDERLY OLDER THAN 75 YRS:** 75 mg once daily.

ACS (PCI)

PO: ADULTS, ELDERLY: Initially, 600 mg, then 75 mg once daily (in combination with aspirin) for at least 12 months.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent (15%): Skin disorders. **Occasional (8%–6%):** Upper respiratory tract infection, chest pain, flu-like symptoms, headache, dizziness, arthralgia. **Rare (5%–3%):** Fatigue, edema, hypertension, abdominal pain, dyspepsia, diarrhea, nausea, epistaxis, dyspnea, rhinitis.

Adverse effects/toxic reactions

Agranulocytosis, aplastic anemia/pancytopenia, thrombotic thrombocytopenic purpura (TTP) occur rarely. Hepatitis, hypersensitivity reaction, anaphylactoid reaction have been reported.

Nursing considerations

Baseline assessment

Obtain baseline chemistries, platelet count, PFA. Perform platelet counts before drug therapy, q2days during first wk of treatment, and wkly thereafter until therapeutic maintenance dose is reached. Abrupt discontinuation of drug therapy produces elevated platelet count within 5 days.

Intervention/evaluation

Monitor platelet count for evidence of thrombocytopenia. Assess Hgb, Hct, for evidence of bleeding; serum ALT, AST, bilirubin, BUN, creatinine; signs/symptoms of hepatic insufficiency during therapy.

Patient/family teaching

- It may take longer to stop bleeding during drug therapy.
- Report any unusual bleeding.
- Inform physicians, dentists if clopidogrel is being taken, esp. before surgery is scheduled or before taking any new drug.

cloZAPine

kloe-za-peen

Apo-CloZAPine 

Clozaril

FazaClo

Versacloz

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Second-generation (atypical) antipsychotic.

CLINICAL: Antipsychotic.

■ **BLACK BOX ALERT** ■ Significant risk of life-threatening agranulocytosis, increased risk of potentially fatal cardiovascular events, particularly myocarditis, in elderly pts with dementia-related psychosis. May cause severe orthostatic hypotension, bradycardia, syncope, cardiac arrest, dose-dependent seizures.

Do not confuse cloZAPine with clonazePAM, cloNIDine, or KlonoPIN, or Clozaril with Clinoril or Colazal.

Uses

Management of severely ill schizophrenic pts who have failed to respond to other antipsychotic therapy. Treatment of recurrent suicidal behavior in schizophrenia or schizoaffective disorder. **OFF-LABEL:** Schizoaffective disorder, bipolar disorder, childhood psychosis, obsessive-compulsive disorder, agitation related to Alzheimer's dementia.

Precautions

Contraindications: Hypersensitivity to cloZAPine. History of cloZAPine-induced agranulocytosis or severe granulocytopenia. **Cautions:** History of seizures, cardiovascular disease, myocarditis, respiratory/hepatic/renal impairment, alcohol withdrawal, high risk of suicide, paralytic ileus, myasthenia gravis, pts at risk for aspiration pneumonia, urinary retention, narrow-angle glaucoma, prostatic hypertrophy, xerostomia, visual disturbances, constipation, history of bowel obstruction, diabetes mellitus. History of long QT prolongation/ventricular arrhythmias; concomitant use of medications that prolong QT interval; hypokalemia, hypomagnesemia.

Action

Interferes with binding of DOPamine and serotonin receptor sites. **Therapeutic Effect:** Diminishes schizophrenic behavior.

Pharmacokinetics

Readily absorbed from GI tract. Protein binding: 97%. Metabolized in liver.

Excreted in urine. **Half-life:** 12 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Avoid use during pregnancy. Distributed in breast milk. Breastfeeding not recommended. **Children:** Not recommended for use. **Elderly:** Avoid use in pts with dementia.

Interactions

DRUG: Antihypertensive medications (e.g., amLODIPine, lisinopril, valsartan) may increase risk of hypotension. Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depressant effects. Bone marrow depressants may increase myelosuppression. Cimetidine, citalopram, ciprofloxacin, erythromycin may increase concentration, risk of adverse effects. SSRIs (e.g., PARoxetine) may increase concentration. Lithium may increase risk of confusion, dyskinesia, seizures. Medications prolonging QT interval (e.g., amiodarone, azithromycin, ciprofloxacin, haloperidol) may increase risk of QT prolongation. CYP3A4 inducers (e.g., phenytoin, carbamazepine, rifampin) may decrease concentration/effects. **HERBAL:** St. John's wort may decrease concentration/therapeutic effects. Kava kava, gotu kola, valerian, St. John's wort may increase risk of CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, cholesterol (rare), triglycerides (rare).

Availability (Rx)

Suspension, Oral (Versacloz): 50 mg/mL (100 mL). **Tablets (Clozaril):** 25 mg, 50 mg, 100 mg, 200 mg. **Tablets (Orally Disintegrating [FazaClo]):** 12.5 mg, 25 mg, 100 mg, 150 mg, 200 mg.

Administration/handling

PO

- Give without regard to food.
- **Suspension:** Use oral syringes (provided). Shake well, administer dose immediately after preparing. Suspension stable for 100 days after initial bottle opening.

Orally Disintegrating Tablets

- Remove from foil blister; do not push tablet through foil.
- Remove tablet with dry hands, place in mouth.
- Allow to dissolve in mouth; swallow with saliva.
- If dose requires splitting tablet, discard unused portion.

Indications/routes/dosage

Schizophrenic Disorders

◀ALERT▶ For initiation of therapy, must have WBC equal to or greater than 3,500 cells/mm³ and ANC equal to or greater than 1,500 cells/mm³. 1,000 cells/mm³ or greater in pts with documented benign ethnic neutropenia (BEN).

PO: ADULTS: Initially, 12.5 mg once or twice daily. May increase by 25–50 mg/day over 2 wks until target dose of 300–450 mg/day is achieved. May further increase by 50–100 mg/day no more than once or twice wkly. Range: 200–600 mg/day. **Maximum:** 900 mg/day. **ELDERLY:** Initially, 12.5 mg/day for 3 days, then 25 mg/day for 3 days. May further increase in increments of 12.5–25 mg daily q3days. **Mean dose:** 300 mg/day. **Maximum:** 700 mg/day.

Suicidal Behavior in Schizophrenia or Schizoaffective Disorder

PO: ADULTS: Initially, 12.5 mg 1–2 times/day. May increase in increments of 25–50 mg/day to a target dose of 300–450 mg/day after 2 wks. **Mean dose:** 300 mg/day. **Maximum:** 900 mg/day.

Dose Modification

Leukopenia/granulocytopenia: Mild: (WBC 3,000–3,500 cells/mm³ and/or ANC 1,500–2,000 cells/mm³): Continue treatment, monitor WBC and ANC twice wkly until WBC greater than 3,500 cells/mm³ and ANC greater than 2,000 cells/mm³. **Moderate: (WBC 2,000–3,000 cells/mm³ and/or ANC greater than 1,000 cells/mm³–1,500 cells/mm³):** Interrupt therapy, monitor WBC and ANC daily until WBC greater than 3,000 cells/mm³ and ANC greater than 1,500 cells/mm³, then twice wkly until WBC greater than 3,500 cells/mm³ and ANC greater than 2,000 cells/mm³. **Severe: (WBC less than 2,000 cells/mm³ and/or ANC less than 1,500 cells/mm³):** Discontinue treatment. **Discontinue:** QT_c interval greater than 500 msec, cardiomyopathy/myocarditis, hepatotoxicity, or

neuroleptic malignant syndrome.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (39%–14%): Drowsiness, salivation, tachycardia, dizziness, constipation. **Occasional (9%–4%):** Hypotension, headache, tremor, syncope, diaphoresis, dry mouth, nausea, visual disturbances, nightmares, restlessness, akinesia, agitation, hypertension, abdominal discomfort, heartburn, weight gain. **Rare:** Rigidity, confusion, fatigue, insomnia, diarrhea, rash.

Adverse effects/toxic reactions

Seizures occur occasionally (3% of pts). Overdose produces CNS depression (sedation, delirium, coma), respiratory depression, hypersalivation. Blood dyscrasias, particularly agranulocytosis, mild leukopenia, may occur.

Nursing considerations

Baseline assessment

Obtain baseline weight, glucose, Hgb A1c, WBC, absolute neutrophil count (ANC) before initiating treatment. Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content.

Intervention/evaluation

Monitor B/P for hypertension/hypotension. Assess pulse for tachycardia (common side effect). Monitor CBC for blood dyscrasias. Monitor ANC, WBC count every wk for first 6 mos, then biweekly for 6 mos. If CBC and ANC are normal after 12 mos, then monthly monitoring of CBC and ANC is recommended. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess for therapeutic response (interest in surroundings, improvement in self-care, increased ability to concentrate, relaxed facial expression).

Patient/family teaching

- Do not abruptly discontinue long-term drug therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Drowsiness generally subsides during continued therapy.
- Avoid alcohol, caffeine.
- Report fever, sore throat, flu-like symptoms.

cobicistat

koe-bi-sye-stat

Tybost

Fixed-Combination(s)

Evotaz: cobicistat (antiretroviral booster)/atazanavir (antiretroviral): 150 mg/300 mg. **Genvoya:** cobicistat (antiretroviral booster)/emtricitabine/elvitegravir/tenofovir (TAF) (antiretroviral agents): 150 mg/200 mg/150 mg/25 mg. **Prezcobix:** cobicistat (antiretroviral booster)/darunavir (antiretroviral): 150 mg/800 mg. **Stribild:** cobicistat (antiretroviral booster)/emtricitabine/elvitegravir/tenofovir (TDF) (antiretroviral agents): 150 mg/200 mg/150 mg/300 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: CYP3A inhibitor.

CLINICAL: Antiretroviral booster.

Uses

Indicated to increase systemic exposure of atazanavir or darunavir (once-daily dosing regimen), in combination with other antiretroviral agents for treatment of HIV-1 infection.

Precautions

Contraindications: Concomitant use with atazanavir or darunavir with alfuzosin, carbamazepine, colchicine (in pts with renal or hepatic impairment), dihydroergotamine, dronedarone, ergotamine, indinavir, irinotecan, lovastatin,

methylergonovine, midazolam (oral), phenobarbital, phenytoin, pimozide, ranolazine, rifAMPin, sildenafil (use in PAH), simvastatin, St. John's wort. Concomitant use with atazanavir with indinavir, irinotecan, or nevirapine. **Cautions:** Renal impairment, hypercholesterolemia. Avoid use with nephrotoxic medications. Do not initiate in pts with CrCl less than 70 mL/min. Use with HIV-1 protease inhibitors other than atazanavir or darunavir (once daily) or more than 1 antiretroviral requiring kinetic enhancement is NOT recommended. Coadministration of cobicistat and ritonavir. Cobicistat is not interchangeable with ritonavir.

Action

Inhibits cytochrome P450 3A (CYP3A).

Therapeutic Effect: Boosts exposure of atazanavir or darunavir. Does not exhibit antiviral activity.

Pharmacokinetics

Readily absorbed after PO administration. Metabolized in liver. Protein binding: 97%–98%. Peak plasma concentration: 3.5 hrs. Eliminated in feces (86%), urine (8%). **Half-life:** 3–4 hrs.

Lifespan considerations

Pregnancy/Lactation: Breastfeeding not recommended due to risk of postnatal HIV transmission. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Safety and efficacy not established in pts older than 65 yrs. May have increased risk of side effects/adverse reactions, renal failure.

Interactions

DRUG: Note: See contraindications. **Nephrotoxic medications (e.g., gentamicin, NSAIDs)** may increase risk of acute renal failure. **Efavirenz, etravirine, nevirapine** may decrease cobicistat effectiveness. May increase concentration/effect of **antiarrhythmics (e.g., amiodarone, digoxin), antifungals (e.g., ketoconazole), atorvastatin, benzodiazepines, beta blockers (e.g., carvedilol, metoprolol), calcium channel blockers (e.g., amLODIPine, diltiazEM), clarithromycin, colchicine, cycloSPORINE, fluticasone,**

maraviroc, neuroleptics (e.g., risperidone, thioridazine), opioids (e.g., morphine), PDE-5 inhibitors (e.g., sildenafil), SSRIs, tricyclic antidepressants. Antacids, anticonvulsants (e.g., carbamazepine, phenytoin), famotidine, omeprazole may decrease absorption/effect. **HERBAL:** St. John's wort contraindicated; may decrease effectiveness. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, ALT, AST, bilirubin, BUN, cholesterol (LDL/HDL), creatine kinase (CK), creatinine, GGT, triglycerides, urine glucose; urine protein, urine RBC. May decrease CrCl.

Availability (Rx)

Film-Coated Tablets: 150 mg.

Administration/handling

PO

- Give with food.
- Must be administered simultaneously with atazanavir or darunavir.
- If pt receiving antacid with cobicistat/atazanavir regimen, do not give aluminum- or magnesium-containing antacids within 2 hrs, H₂-receptor antagonists (e.g., famotidine) within 10 hrs, or proton pump inhibitors (e.g., omeprazole) within 12 hrs of antiretroviral dose.

Indications/routes/dosage

HIV Infection

Note: Must be given with atazanavir or darunavir and other antiretroviral medications.

PO: ADULTS/ELDERLY: 150 mg once daily (see Uses).

Dosage in Renal Impairment

No dose adjustment. Not recommended in pts with CrCl less than 70 mL/min when used with tenofovir (TDF).

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment; use caution. **Severe impairment:** Not recommended.

Side effects

Occasional (5%): Jaundice, dermatitis, pruritus, pustular folliculitis, rash, urticaria. **Rare (3%–2%):** Ocular icterus, nausea, diarrhea, headache, depression, abnormal dreams, insomnia.

Adverse effects/toxic reactions

May cause acute renal failure or Fanconi syndrome when administered with tenofovir. Nephrolithiasis reported in 2% of pts. Pts co-infected with hepatitis B or C virus have increased risk for viral reactivation, worsening of hepatic function, or may experience hepatic decompensation and/or failure if therapy is discontinued.

Nursing considerations

Baseline assessment

Obtain CBC, BMP, CrCl, GFR, lipid panel, LFT, serum phosphate (baseline renal impairment), urine glucose, urine protein, vital signs; CD4+ count, viral load. Screen for hepatitis B or C virus co-infection, hypercholesterolemia. Receive full medication history, including herbal products, and screen for contraindications. Question possibility of pregnancy.

Intervention/evaluation

Diligently monitor hepatic/renal function tests. An increase in serum creatinine greater than 0.4 mg/dL from baseline may indicate renal impairment. Monitor CD4+ count, viral load for treatment effectiveness. Assess skin for urticaria, pruritus, rash. Cough, dyspnea, fever, excess of band cells on CBC may indicate acute infection (WBC test may be unreliable in pts with uncontrolled HIV infection).

Patient/family teaching

- Offer emotional support.

- Take cobicistat with atazanavir or darunavir at the same time each day with food (optimizes absorption).
- Antacids may decrease drug effectiveness.
- Drug resistance can form if therapy is interrupted; do not run out of supply.
- Cobicistat does not cure HIV infection nor reduce risk of transmission.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report body aches, chills, cough, fever, night sweats, shortness of breath.
- Treatment may cause kidney failure if used with tenofovir regimen. Report abdominal pain, darkened urine, decreased urine output.
- Clay-colored stools, significant weight loss, or yellowing of skin or eyes may indicate liver problem.
- Do not take any new medications, including over-the-counter drugs or herbal products, unless approved by your doctor.

cobimetinib

koe-bi-me-ti-nib

Cotellic

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse cobimetinib with cabozantinib, imatinib, or trametinib.

Uses

Treatment of pts with unresectable or metastatic melanoma with a BRAF V600E or V600K mutation, in combination with vemurafenib.

Precautions

Contraindications: Hypersensitivity to cobimetinib. **Cautions:** Baseline anemia, lymphopenia, thrombocytopenia; cardiomyopathy, hepatic/renal impairment, HF, hypertension, ocular disorders; pts at risk for bleeding (history of gastrointestinal, genitourinary, intracranial, reproductive system bleeding), electrolyte imbalance. Not recommended in pts taking moderate or strong CYP3A inhibitors.

Action

Inhibits mitogen-activated protein kinase/extracellular signal regulated kinase 1 (MEK1) and MEK2. Cobimetinib also prevents vemurafenib-mediated growth enhancement of a wild-type BRAF tumor cell line. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: 95%. Peak plasma concentration: 2.4 hrs. Steady state reached in 9 days. Eliminated in feces (76%), urine (18%). **Half-life:** 44 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm/malformations. Female pts of reproductive potential should use effective contraception during treatment and up to 2 wks after discontinuation. Unknown if distributed in breast milk. Breastfeeding not recommended. May reduce fertility in females and males. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

Interactions

DRUG: Strong CYP3A inhibitors (e.g., clarithromycin, ketoconazole, ritonavir), moderate CYP3A inhibitors (e.g., atazanavir, ciprofloxacin) may increase concentration/effect. Strong CYP3A inducers (e.g., carbamazepine, rifampicin), moderate CYP3A inducers (e.g., bosentan, nafcillin) may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** Many increase serum alkaline phosphatase, ALT, AST, creatine phosphokinase, creatinine, GGT. May decrease Hct, Hgb, lymphocytes, platelets, RBCs; serum albumin, calcium, sodium. May increase or decrease serum potassium.

Availability (Rx)

Tablets: 20 mg.

Administration/handling

PO

- Give without regard to food.
- If dose is missed or vomiting occurs during administration, give next dose at regularly scheduled time.

Indications/routes/dosage

Metastatic Melanoma

PO:ADULTS, ELDERLY: 60 mg (three 20-mg tablets) once daily for first 21 days of 28-day cycle. Continue until disease progression or unacceptable toxicity.

Concomitant Use of CYP3A Inhibitors

Reduce dose to 20 mg once daily if short-term (14 days or less) use of moderate CYP3A inhibitors is unavoidable. May resume 60-mg once-daily dose once the short-term CYP3A inhibitor is discontinued. Use an alternative strong or moderate CYP3A inhibitor in pts already taking reduced dose of 20 mg or 40 mg daily.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE) grading 1–4. See prescribing information for vemurafenib for recommended dose modification.

Dose Reduction Schedule

First dose reduction: 40 mg once daily. **Second dose reduction:** 20 mg once daily. Permanently discontinue if unable to tolerate 20 mg once daily.

Cardiomyopathy

Asymptomatic decrease in left ventricular ejection fraction (LVEF) greater than 10% from baseline and less than institutional lower limit of normal (LLN): Withhold treatment for 2 wks, then reassess LVEF. Resume at next lower dose level if LVEF is at or above LLN and the decrease from baseline is

10% or less. Permanently discontinue if LVEF is less than LLN or the decrease from baseline LVEF is more than 10%. **Symptomatic decrease of LVEF from baseline:** Withhold treatment for up to 4 wks, then reassess LVEF. Resume at next lower dose level if symptoms resolve, LVEF is at or above LLN, and the decrease from baseline LVEF is 10% or less. Permanently discontinue if symptoms persist, LVEF is less than LLN, or the decrease from baseline LVEF is more than 10%.

Dermatologic Reactions

Grade 2 (intolerable); grade 3 or 4: Withhold or reduce dose.

Hepatotoxicity or Hepatic Laboratory Abnormalities

First occurrence, grade 4: Withhold treatment for up to 4 wks. If improved to grade 0 or 1, resume at next lower dose level. If not improved to grade 0 or 1 within 4 wks, permanently discontinue. **Recurrent grade 4:** Permanently discontinue.

Hemorrhage

Grade 3: Withhold treatment for up to 4 wks. If not improved to grade 0 or 1, resume at next lower dose level. If not improved within 4 wks, permanently discontinue. **Grade 4:** Permanently discontinue.

New Primary Malignancies (Cutaneous or Noncutaneous)

No dose adjustment.

Nonspecific Adverse Effects

Any intolerable grade 2; any grade 3: Withhold for up to 4 wks. If improved to grade 0 or 1, resume at next lower dose level. If not improved within 4 wks, permanently discontinue. **First occurrence of any grade 4:** Permanently discontinue.

Ocular Toxicities

Serious retinopathy: Withhold treatment for up to 4 wks. If signs and symptoms improve, resume at next lower dose level. If not improved or symptoms recur at the lower dose within 4 wks, permanently discontinue.

Retinal vein occlusion: Permanently discontinue.

Photosensitivity

Grade 2 (intolerable); grade 3 or 4: Withhold treatment for up to 4 wks. If improved to grade 0 or 1, resume at next lower dose level. If not improved within 4 wks, permanently discontinue.

Rhabdomyolysis, CPK Level Elevations

Grade 4 CPK elevation or any CPK elevation with myalgia: Withhold treatment for up to 4 wks. If improved to grade 3 or lower, resume at next lower dose level. If not improved within 4 wks, permanently discontinue.

Severe Hypersensitivity Reaction

Permanently discontinue.

Renal Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Not specified; use caution.

Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Not specified; use caution.

Side effects

Frequent (60%–24%): Diarrhea, photosensitivity, sunburn, solar dermatitis, nausea, pyrexia, vomiting. **Occasional (16%–10%):** Acneiform dermatitis, stomatitis, aphthous stomatitis, mouth ulceration, mucosal inflammation, alopecia, hypertension, vision impairment, blurred vision, reduced visual acuity, hyperkeratosis, erythema, chills.

Adverse effects/toxic reactions

Anemia, lymphopenia, thrombocytopenia is an expected response to therapy. New primary malignancies, including squamous cell carcinoma, keratoacanthoma, secondary-primary melanomas, were reported. Serious,

sometimes fatal hemorrhagic events, including GI bleeding (4% of pts), intracranial bleeding (1% of pts), hematuria (2% of pts), reproductive system hemorrhage (2% of pts), have occurred. Other hemorrhagic events may include cerebral/conjunctival/intracranial/gingival/hemorrhoidal/ovarian/pulmonary/recta bleeding; ecchymosis, epistaxis. Grade 3 or 4 cardiomyopathy reported in 26% of pts. Grade 3 or 4 skin reactions including severe rash occurred in 16% of pts. Ocular toxicities, including retinopathy, chorioretinopathy, retinal detachment, reported in 26% of pts. Grade 3 or 4 CPK level elevations occurred in 14% of pts and may lead to rhabdomyolysis. Hepatotoxicity reported in 7%–11% of pts. Severe photosensitivity reported in 47% of pts.

Nursing considerations

Baseline assessment

Confirm presence of BRAF V600E or V600K mutation in tumor specimen prior to initiation. Obtain baseline CBC, BMP, LFT, CPK; serum albumin, magnesium, phosphate, ionized calcium; urine pregnancy; vital signs. Obtain ophthalmologic exam with visual acuity; EKG, echocardiogram for LVEF. Assess skin for moles, lesions, papillomas. Verify use of effective contraception in female pts of reproductive potential. Receive full medication history, including herbal products. Question history as listed in Precautions. Assess hydration status.

Intervention/evaluation

Monitor CBC, BMP, LFT, CPK; serum albumin, magnesium, phosphate, ionized calcium; vital signs. Assess skin for new lesions, dermal toxicities at least q2mos during treatment and for least 6 mos after discontinuation. Assess LVEF by echocardiogram 1 mo after initiation, then q3mos thereafter until discontinuation. If treatment interrupted due to change in LVEF, monitor LVEF at 2 wks, 4 wks, 10 wks, and 16 wks, and then as indicated. Conduct ophthalmologic examinations regularly, esp. with any new or worsening visual disturbances. Assess for eye pain, visual changes. Immediately report GI bleeding, hematuria, unusual reproductive system hemorrhage; symptoms of intracranial bleeding (aphasia, blindness, confusion, facial droop, hemiplegia, seizures). Monitor for hepatotoxicity; monitor for signs of rhabdomyolysis, such as dark-colored urine, flank pain, decreased urine output, muscle aches. Due to

high risk of diarrhea, strictly monitor I&O.

Patient/family teaching

- Blood levels monitoring, cardiac function tests, eye exams, skin exams will be conducted frequently.
- Treatment may lead to severe anemia, HF, kidney failure, new cancers, severe light sensitivity, liver dysfunction, skin toxicities (such as severe rash, peeling), vision changes.
- Report bloody stools, bloody urine, unusual reproductive system bleeding, nose bleeds, coughing up blood; abdominal or flank pain, dark-colored urine, decreased urinary output; strokelike symptoms; new skin moles or lesions, rash; eye pain, vision changes; heart problems such as shortness of breath, dizziness, fainting, palpitations.
- Report any newly prescribed medications.
- Avoid sunlight, tanning beds. Wear protective clothing, high-SPF sunscreen, and lip balm when outdoors.
- Treatment may cause fetal harm. Women of childbearing potential should use effective contraception during treatment and up to 2 wks after last dose. Immediately report suspected pregnancy. Do not breastfeed. Treatment may reduce fertility.

codeine

koe-deen

Codeine Contin[®]

HIGH
ALERT

Fixed-Combination(s)

Capital with Codeine, Tylenol with Codeine: acetaminophen/codeine: 120 mg/12 mg per 5 mL. **Tylenol with Codeine:** acetaminophen/codeine: 300 mg/15 mg, 300 mg/30 mg, 300 mg/60 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Opioid agonist.

CLINICAL: **Schedule II** (single entity). **Schedule III** (Fixed combination).

CLINICAL: Analgesic.

■ **BLACK BOX ALERT** ■ Respiratory depression, death have occurred in children following tonsillectomy and/or adenoidectomy.

Do not confuse codeine with Cardene or Lodine.

Uses

Relief of mild to moderate pain. **OFF-LABEL:** Short-term relief of cough.

Precautions

Contraindications: Hypersensitivity to codeine. Respiratory depression in absence of resuscitative equipment, acute or severe bronchial asthma or hypercarbia, paralytic ileus. Postoperative pain management in children following tonsillectomy/adenoidectomy. **Cautions:** Adrenal insufficiency, biliary tract impairment, CNS depression/coma, morbid obesity, prostatic hyperplasia, urinary stricture, thyroid dysfunction, severe renal/hepatic impairment, COPD, respiratory disease, cardiovascular disease, hypovolemia, GI obstruction, head injury, elevated intracranial pressure, history of drug abuse, patients with 2 or more copies of variant CYP2D6*2 allele (may have extensive conversion to morphine), elderly, debilitated pts, seizure disorder, acute alcoholism.

Action

Binds to opioid receptors in CNS. Inhibits ascending pain pathways. **Therapeutic Effect:** Alters perception, emotional response to pain; suppresses cough reflex.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	30–60 min	1–1.5 hrs	4–6 hrs
IM	10–30 min	0.5–1 hr	4–6 hrs

Well absorbed following PO administration. Protein binding: 7%–25%. Metabolized in liver. Excreted in urine. **Half-life:** 2.5–3.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Birth defects associated with maternal use of codeine

during first trimester. Excreted in breast milk. Breastfeeding not recommended. Non-opioid analgesics recommended for postpartum pain. **Children:** Efficacy not established in pts younger than 2 yrs. **Elderly:** May cause confusion, oversedation; use lower dosing range.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS, respiratory depression, hypotension. **Anticholinergics** may increase risk of urinary retention, severe constipation. **MAOIs (e.g., phenelzine, selegiline)** may produce a severe, sometimes fatal reaction (reduce dosage to 1/4 usual dose). **HERBAL:** St. John's wort may decrease concentration. Gotu kola, kava kava, SAMe, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

Availability (Rx)

Tablets: 15 mg, 30 mg, 60 mg.

Administration/handling

PO

- May give without regard to food.
- Take with food or milk to decrease adverse GI effects.

Indications/routes/dosage

◀ALERT▶ Reduce initial dosage in pts with hypothyroidism, Addison's disease, renal insufficiency, pts using other CNS depressants concurrently. Respiratory depression and death have occurred in children receiving codeine following tonsillectomy and/or adenoidectomy and found to have evidence of being ultrarapid metabolizers of codeine due to a CYP2D6 polymorphism.

Analgesia

PO: ADULTS, ELDERLY: 15–60 mg q4h as needed. **Maximum total daily dose:** 360 mg. **CHILDREN:** 0.5–1 mg/kg q4–6h. **Maximum:** 60 mg/dose.

Dosage in Renal Impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance	Dosage
10–50 mL/min	75% of usual dose
Less than 10 mL/min	50% of usual dose
CRRT	75% of usual dose

Dosage in Hepatic Impairment

Use caution.

Side effects

◀ALERT▶ Ambulatory pts, pts not in severe pain may experience dizziness, nausea, vomiting, hypotension more frequently than those in supine position or with severe pain. **Frequent:** Constipation, drowsiness, nausea, vomiting. **Occasional:** Paradoxical excitement, confusion, palpitations, facial flushing, decreased urination, blurred vision, dizziness, dry mouth, headache, hypotension (including orthostatic hypotension), decreased appetite, injection site redness, burning, or pain. **Rare:** Hallucinations, depression, abdominal pain, insomnia.

Adverse effects/toxic reactions

Chronic use may result in paralytic ileus. Overdose may produce cold/clammy skin, confusion, seizures, decreased B/P, restlessness, pinpoint pupils, bradycardia, respiratory depression, decreased LOC, severe weakness. Tolerance to drug's analgesic effect, physical dependence may occur with chronic use.

Nursing considerations

Baseline assessment

Analgesic: Assess onset, type, location, duration of pain. Effect of medication is reduced if full pain response recurs before next dose. **Antitussive:** Assess type, severity, frequency of cough, sputum production.

Intervention/evaluation

Monitor daily pattern of bowel activity, stool consistency. Increase fluid intake, environmental humidity to improve viscosity of lung secretions. Initiate deep breathing, coughing exercises. Assess for clinical improvement; record onset of relief of pain, cough.

Patient/family teaching

- Change positions slowly to avoid orthostatic hypotension.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Tolerance, dependence may occur with prolonged use of high dosages.
- Avoid alcohol.

colchicine

kol-chi-seen

Colcrys

Mitigare

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alkaloid.

CLINICAL: Antigout.

Do not confuse colchicine with Cortrosyn.

HIGH
ALERT

Uses

Prevention, treatment of acute gouty arthritis. Used to reduce frequency of recurrence of familial Mediterranean fever (FMF). **OFF-LABEL:** Treatment of biliary cirrhosis, recurrent pericarditis.

Precautions

Contraindications: Hypersensitivity to colchicine. Concomitant use of a P-glycoprotein (e.g., cycloSPORINE) or strong CYP3A4 inhibitor (e.g., clarithromycin) in presence of renal or hepatic impairment. **Mitigare:** Pts with both renal/hepatic impairment. **Cautions:** Hepatic impairment, elderly, debilitated pts, renal impairment. Concomitant use of cycloSPORINE, diltiazEM, verapamil, fibrates, statins may increase risk of myopathy.

Action

Decreases leukocyte motility, phagocytosis, lactic acid production. **Therapeutic Effect:** Reduces inflammatory process.

Pharmacokinetics

Rapidly absorbed from GI tract. Oral bioavailability: 45%. Highest concentration is in liver, spleen, kidney. Protein binding: 30%–50%. Re-enters intestinal tract by biliary secretion and is reabsorbed from intestines. Partially metabolized in liver via CYP3A4. Eliminated primarily in feces. **Half-life:** 27–31 hrs.

Lifespan considerations

Pregnancy/Lactation: Drug crosses placenta and is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more susceptible to cumulative toxicity. Age-related renal impairment may increase risk of myopathy.

Interactions

DRUG: May increase concentration of **statins** and increase risk of rhabdomyolysis. **Atazanavir, clarithromycin, cycloSPORINE, diltiaZEM, erythromycin, fluconazole, fosamprenavir, indinavir, ketoconazole, ranolazine, ritonavir, saquinavir, verapamil** may increase colchicine concentration, toxicity. **HERBAL:** None significant. **FOOD: Grapefruit products** may increase concentration/toxicity. **LAB VALUES:** May increase serum alkaline phosphatase, AST. May decrease platelet count.

Availability (Rx)

Tablets (Colcrys): 0.6 mg. **Capsule (Mitigare):** 0.6 mg.

Administration/handling

PO

- Give without regard to food.

- For FMF, give in 1 or 2 divided doses.
- Give with adequate water and maintain fluid intake.

Indications/routes/dosage

Acute Gouty Arthritis (Colcrys)

PO: ADULTS, ELDERLY: Initially, 1.2 mg at first sign of gout flare, then 0.6 mg 1 hr later. **Maximum:** 1.8 mg within 1 hr. **Coadministration with strong CYP3A4 inhibitors:** Initially, 0.6 mg, then 0.3 mg dose 1 hr later. Do not repeat for at least 3 days. **Coadministration with moderate CYP3A4 inhibitors:** 1.2 mg once. Do not repeat for at least 3 days. **Coadministration with P-glycoprotein inhibitors:** 0.6 mg once. Do not repeat for at least 3 days.

Gout Prophylaxis (Colcrys, Mitigare)

Note: Duration of prophylaxis is 6 mos or 3 mos (pts without tophi) to 6 mos (pts with 1 or more tophi)

PO: ADULTS, ELDERLY: 0.6 mg 1–2 times/day. **Maximum:** 1.2 mg/day. **Coadministration with strong CYP3A4 inhibitors:** If dose is 0.6 mg 2 times/day, adjust dose to 0.3 mg once daily; if dose is 0.6 mg once daily, adjust dose to 0.3 mg every other day. **Coadministration with moderate CYP3A4 inhibitors:** If dose is 0.6 mg 2 times/day, adjust dose to 0.3 mg twice daily or 0.6 mg once daily; if dose is 0.6 mg once daily, adjust dose to 0.3 mg once daily. **Coadministration with P-glycoprotein inhibitors:** If dose is 0.6 mg 2 times/day, adjust dose to 0.3 mg once daily; if dose is 0.6 mg once daily, adjust dose to 0.3 mg every other day.

FMF (Colcrys)

PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 1.2–2.4 mg/day in 1–2 divided doses. Titrate dose in 0.3-mg increments. **Coadministration with strong CYP3A4 inhibitors: Maximum:** 0.6 mg once daily (or 0.3 mg twice daily). **Coadministration with moderate CYP3A4 inhibitors:** 1.2 mg/day (0.6 mg twice daily). **Coadministration with P-glycoprotein inhibitors:** 0.6 mg once daily (or 0.3 mg twice daily). **CHILDREN 6–12 YRS:** 0.9–1.8 mg/day in 1–2 divided doses. **CHILDREN 4–5 YRS:** 0.3–1.8 mg/day in 1–2 divided doses. **Note:** Increase or decrease dose by 0.3 mg/day, not to exceed maximum dose.

Pericarditis

PO: ADULTS, ELDERLY: 0.6 mg 2 times/day.

Dosage in Renal Impairment

Creatinine Clearance	Dosage
Less than 30 mL/min	
FMF	0.3 mg initially
Gout prophylaxis	0.3 mg/day
Gout flare	No reduction
HD	
FMF	0.3 mg as single dose
Gout prophylaxis	0.3 mg 2–4 times/wk

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent: Nausea, vomiting, abdominal discomfort. **Occasional:** Anorexia.

Rare: Hypersensitivity reaction, including angioedema.

Adverse effects/toxic reactions

Bone marrow depression (aplastic anemia, agranulocytosis, thrombocytopenia) may occur with long-term therapy. Overdose initially causes burning feeling in skin/throat; severe diarrhea, abdominal pain. Second stage manifests as fever, seizures, delirium, renal impairment (hematuria, oliguria). Third stage causes hair loss, leukocytosis, stomatitis.

Nursing considerations

Baseline assessment

Obtain baseline laboratory studies. **Gout:** Assess involved joints for pain, mobility, edema. **Mediterranean fever:** Assess abdominal pain, fever, chills, erythema, swollen skin lesions.

Intervention/evaluation

Discontinue medication immediately if GI symptoms occur. Encourage high fluid intake (3,000 mL/day). Monitor I&O (output should be at least 2,000 mL/day), CBC, hepatic/renal function tests. Monitor serum uric acid. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

Patient/family teaching

- Drink 8–10 (8-oz) glasses of fluid daily while taking medication.
- Report skin rash, sore throat, fever, unusual bruising/bleeding, weakness, fatigue, numbness.
- Stop medication as soon as gout pain is relieved or at first sign of nausea, vomiting, diarrhea.
- Avoid grapefruit products.

conjugated estrogens

kon-joo-gate-ed ess-troe-jenz

Premarin

Fixed-Combination(s)

Duavee: conjugated estrogen/bazedoxifene (estrogen agonist/antagonist): 0.45 mg/20 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Estrogen.

CLINICAL: Hormone.

■ **BLACK BOX ALERT** ■ Risk of dementia may be increased in postmenopausal women. Do not use to prevent cardiovascular disease. May increase risk of endometrial carcinoma or invasive breast cancer in postmenopausal women.

Do not confuse Premarin with Primaxin, Provera, or Remeron.

Uses

Management of moderate to severe vasomotor symptoms associated with menopause. Treatment of hypoestrogenism due to hypogonadism, castration, or primary ovarian failure. Prevention of osteoporosis in postmenopausal women. Palliative treatment of inoperable, progressive cancer of the prostate and breast in men, and of the breast in postmenopausal women. Abnormal uterine bleeding (injection only). Treatment of moderate to severe vulvar and vaginal atrophy due to menopause. **OFF-LABEL:** Prevention of estrogen deficiency–induced premenopausal osteoporosis. **Cream:** Prevention of nosebleeds.

Precautions

Contraindications: Hypersensitivity to estrogens. Breast cancer (except in pts being treated for metastatic disease), hepatic disease, history of or current thrombophlebitis, undiagnosed abnormal vaginal bleeding, pregnancy, DVT or PE (current or history of), angioedema or anaphylactic reaction to estrogens, estrogen-dependent tumors. Known protein C, protein S, antithrombin deficiency or other thrombophilic disorder. **Cautions:** Asthma, epilepsy, migraine headaches, diabetes, cardiac/renal dysfunction, history of severe hypocalcemia, lupus erythematosus, porphyria, endometriosis, gallbladder disease, familial defects of lipoprotein metabolism. Hypoparathyroidism, history of cholestatic jaundice.

Action

Responsible for development and maintenance of female reproductive system and secondary sexual characteristics; modulates release of gonadotropin-releasing hormone, reduces follicle-stimulating hormone (FSH), luteinizing hormone (LH). **Therapeutic Effect:** Reduces elevated levels of gonadotropins, LH, and FSH.

Pharmacokinetics

Well absorbed from GI tract. Widely distributed. Protein binding: 50%–80%. Metabolized in liver. Primarily excreted in urine. **Half-life (total estrone):** 27 hrs.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** **Black cohosh, dong quai** may increase estrogenic activity. **Ginseng, red clover, saw palmetto** may increase hormonal effects. **St. John's wort** may decrease concentration. **FOOD:** **Grapefruit products** may increase concentration/toxicity. **LAB VALUES:** May increase serum glucose, HDL, calcium, triglycerides. May decrease serum cholesterol, LDH. May affect serum metapyrone testing, thyroid function tests.

Availability (Rx)

Cream, Vaginal (Premarin): 0.625 mg/g. **Injection, Powder for Reconstitution:** 25 mg. **Tablet:** 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg.

Administration/handling

IV

Reconstitution

- Reconstitute with Sterile Water for Injection.
- Slowly add diluent, shaking gently.
- Avoid vigorous shaking.

Rate of Administration

- Give slowly to prevent flushing reaction.

Storage

- Refrigerate vials for IV use.
- Use immediately following reconstitution.

PO

- Administer at same time each day.
- Give with milk, food if nausea occurs.

IV incompatibilities

No information available on Y-site administration.

Indications/routes/dosage

Note: Cyclic administration is either 3 wks on, 1 wk off or 25 days on, 5 days off.

Vasomotor Symptoms Associated with Menopause

PO: ADULTS, ELDERLY: 0.3 mg/day cyclically or daily. May titrate up to 1.25 mg/day.

Vulvar and Vaginal Atrophy

PO: ADULTS, ELDERLY: 0.3 mg/day cyclically or daily.

Intravaginal: ADULTS, ELDERLY: 0.5–2 g/day cyclically.

Female Hypogonadism

PO: ADULTS: 0.3–0.625 mg/day given cyclically. Dose may be titrated in 6- to 12-mo intervals. Progestin treatment should be added to maintain bone mineral density once skeletal maturity is achieved.

Female Castration, Primary Ovarian Failure

PO: ADULTS: Initially, 1.25 mg/day cyclically. Adjust dosage, upward or downward, according to severity of symptoms and pt response. For maintenance, adjust dosage to lowest level that will provide effective control.

Postmenopausal Osteoporosis Prevention

PO: ADULTS, ELDERLY: 0.3 daily or cyclically.

Breast Cancer

PO: ADULTS, ELDERLY: 10 mg 3 times/day for at least 3 mos.

Prostate Cancer

PO: ADULTS, ELDERLY: 1.25–2.5 mg 3 times/day.

Abnormal Uterine Bleeding

IV, IM: ADULTS: 25 mg; may repeat once in 6–12 hrs.

Dyspareunia

Intravaginal: ADULTS, ELDERLY: 0.5 g cyclically (21 days on, 7 days off) or 0.5 g twice weekly.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Contraindicated.

Side effects

Frequent: Vaginal bleeding (spotting, breakthrough bleeding), breast pain/tenderness, gynecomastia. **Occasional:** Headache, hypertension, intolerance to contact lenses. **High doses:** Anorexia, nausea. **Rare:** Loss of scalp hair, depression.

Adverse effects/toxic reactions

Prolonged administration may increase risk of breast, cervical, endometrial, hepatic, vaginal carcinoma; cerebrovascular disease, coronary heart disease, gallbladder disease, hypercalcemia.

Nursing considerations

Baseline assessment

Question for hypersensitivity to estrogen, hepatic impairment, thromboembolic disorders associated with pregnancy, estrogen therapy. Assess frequency/severity of vasomotor symptoms. Review results of baseline mammogram in pts with breast cancer.

Intervention/evaluation

Assess B/P periodically. Assess for edema; weigh daily. Monitor for loss of

vision, diplopia, migraine, thromboembolic disorder, sudden onset of proptosis.

Patient/family teaching

- Avoid smoking due to increased risk of heart attack, blood clots.
- Avoid grapefruit products.
- Diet, exercise important part of therapy when used to retard osteoporosis.
- Promptly report signs/symptoms of thromboembolic, thrombotic disorders: sudden severe headache, shortness of breath, vision/speech disturbance, weakness/numbness of an extremity, loss of coordination; pain in chest, groin, leg.
- Report abnormal vaginal bleeding, depression.
- Teach female pts to perform breast self-exam.
- Report weight gain of more than 5 lbs a wk.
- Stop taking medication, contact physician if pregnancy is suspected.

crizotinib

kriz-**o**-ti-nib

Xalkori

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor.

CLINICAL: Antineoplastic.

Uses

Treatment of locally advanced or metastatic non–small-cell lung cancer (NSCLC) that is anaplastic lymphoma kinase (ALK) positive. Metastatic NSCLC in pts whose tumors are ROS1 positive.

Precautions

Contraindications: Hypersensitivity to crizotinib. **Cautions:** Baseline hepatic impairment, congenital long QT interval syndrome. Pregnancy (avoid use). Concomitant use of CYP3A4 inducers/inhibitors, medications known to cause bradycardia, renal impairment.

Action

Inhibits receptor tyrosine kinases including anaplastic lymphoma kinase (ALK), hepatocyte growth factor receptors (HGFR, c-Met), receptor d'origine nantais (RON). **Therapeutic Effect:** Inhibits tumor cell proliferation and survival.

Pharmacokinetics

Well absorbed after PO administration. Peak plasma concentration: 4–6 hrs. Protein binding: 91%. Metabolized in liver. Excreted in feces (63%) and urine (22%). **Half-life:** 42 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy. May cause fetal harm. Contraception should be considered during therapy and for at least 12 wks after discontinuation. Do not initiate therapy until pregnancy status confirmed. Unknown if crosses placenta or distributed in breast milk. Nursing mothers must discontinue either nursing or drug therapy. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP3A inhibitors, including atazanavir, clarithromycin, itraconazole, ketoconazole, ritonavir, saquinavir, voriconazole, may increase concentration. Strong CYP3A inducers, including carbamazepine, phenytoin, rifabutin, rifampin, may decrease concentration. May alter plasma levels of alfentanil, cyclosporine, dihydroergotamine, ergotamine, fentanyl, pimozone, sirolimus. Proton pump inhibitors, H₂ blockers, antacids may decrease solubility. May increase plasma levels of colchicine, dexamethasone, doxorubicin, etoposide, non-nucleoside reverse transcriptase inhibitors, protease inhibitors, quinidine, tacrolimus, vinblastine. **HERBAL:** St. John's wort may decrease effectiveness. **FOOD:** Grapefruit products may increase concentration/toxicity (potential for torsades, myelotoxicity). **LAB VALUES:** May increase serum ALT, AST, alkaline phosphatase, bilirubin. May decrease neutrophils, platelets, lymphocytes.

Availability (Rx)

 **Capsules:** 200 mg, 250 mg.

Administration/handling

- May give without regard to meals.
- Avoid grapefruit products.
- Do not break, crush, dissolve, or divide capsules.

Indications/routes/dosage

Non–Small-Cell Lung Cancer (ALK Positive), Metastatic NSCLC, ROS-1 Positive

PO: ADULTS: 250 mg twice daily. Continue until disease progression or unacceptable toxicity. **Dosage Modification:** Interrupt and/or reduce to 200 mg twice daily based on graded protocol, including hematologic toxicity (grade 4), elevated LFT with bilirubin elevation (grade 1), QT prolongation (grade 3). May reduce to 250 mg once daily if indicated. Discontinue treatment for QT prolongation (grade 4), elevated LFT with bilirubin elevation (grades 2, 3, 4), pneumonitis of any grade.

Dosage in Renal Impairment

CrCl less than 30 mL/min: 250 mg once daily.

Dosage in Hepatic Impairment

No dose adjustment (see dose for hepatotoxicity during treatment).

Dose Modification

Hematologic

Grade 3 toxicity (WBC 1,000–2,000 cells/mm³, ANC 500–1,000 cells/mm³, platelets 25,000–50,000 cells/mm³), grade 3 anemia: Withhold treatment until recovery to grade 2 or less, then resume at same dosage. **Grade 4 toxicity (WBC less than 1,000 cells/mm³, ANC less than 500 cells/mm³, platelets less than 25,000 cells/mm³), grade 4 anemia:** Withhold treatment until recovery to grade 2 or less, then resume at 200 mg twice daily. **Grade 4 toxicity on 200 mg**

twice daily: Withhold treatment until recovery to grade 2 or less, then resume at 250 mg once daily. **Recurrent grade 4 toxicity on 250 mg once daily:** Permanently discontinue.

Cardiac

Grade 3 QTc prolongation on at least 2 separate EKGs: Withhold treatment until recovery to baseline or grade 1 or less. Resume at 200 mg twice daily.

Recurrent grade 3 QTc prolongation on 200 mg twice daily: Withhold treatment until recovery to baseline or grade 1 or less. Resume at 250 mg once daily. **Recurrent Grade 3 QTc prolongation on 250 mg once daily:** Permanently discontinue.

Bradycardia

Grades 2 or 3: Withhold until recovery to asymptomatic bradycardia or heart rate 60 or more beats/min, evaluate concomitant medications, then resume at 200 mg twice daily. **Grade 4 due to crizotinib:** Permanently discontinue. **Grade 4 associated with concurrent medications known to cause bradycardia/hypotension:** Withhold until recovery to asymptomatic bradycardia or heart rate 60 or more beats/min, and if concurrent medications can be stopped, resume at 250 mg once daily.

Pulmonary

Pulmonary toxicity: Permanently discontinue.

Side effects

Frequent (62%–27%): Diplopia, photopsia, photophobia, blurry vision, visual field defect, vitreous floaters, reduced visual acuity, nausea, diarrhea, vomiting, peripheral/localized edema, constipation. **Occasional (20%–4%):** Fatigue, decreased appetite, dizziness, neuropathy, paresthesia, dysgeusia, dyspepsia, dysphagia, esophageal obstruction/pain/spasm/ulcer, odynophagia, reflux esophagitis, rash, abdominal pain/tenderness, stomatitis, glossodynia, glossitis, cheilitis, mucosal inflammation, oropharyngeal pain/discomfort, bradycardia, headache, cough. **Rare (3%–1%):** Musculoskeletal chest pain, insomnia, dyspnea, arthralgia, nasopharyngitis, rhinitis, pharyngitis, URI, back pain, complex renal cysts, chest pain/tightness.

Adverse effects/toxic reactions

Severe, sometimes fatal treatment-related pneumonitis, pneumonia, dyspnea,

pulmonary embolism in less than 2% of pts was noted. Grade 3–4 elevation of hepatic enzymes, increased QT prolongation may require discontinuation. May cause thrombocytopenia, neutropenia, lymphopenia. Severe/worsening vitreous floaters, photopsia may indicate retinal hole, retinal detachment.

Nursing considerations

Baseline assessment

Assess vital signs, O₂ saturation. Obtain baseline CBC with differential, serum chemistries, LFT, PT/INR, EKG. Question possibility of pregnancy or plans for breastfeeding. Obtain full medication history including vitamins, herbal products. Detection of ALK-positive NSCLC test needed prior to treatment. Assess history of tuberculosis, HIV, HF, bradyarrhythmias, electrolyte imbalance, medications that prolong QT interval. Assess visual acuity, history of vitreous floaters. Offer emotional support.

Intervention/evaluation

Assess vital signs, O₂ saturation routinely. Monitor CBC with differential monthly, LFT, monthly; increase testing for grades 2, 3, 4 adverse effects. Obtain EKG for bradycardia, electrolyte imbalance, chest pain, difficulty breathing. Monitor for bruising, hematuria, jaundice, right upper abdominal pain, weight loss, or acute infection (fever, diaphoresis, lethargy, oral mucosal changes, productive cough). Report decrease in RBC, Hgb, Hct, platelets, neutrophils, lymphocytes. Worsening cough, fever, or shortness of breath may indicate pneumonitis. Consider ophthalmological evaluation for vision changes. Reinforce birth control compliance.

Patient/family teaching

- Blood levels will be drawn routinely.
- Report urine changes, bloody or clay-colored stools, upper abdominal pain, nausea, vomiting, bruising, fever, cough, difficulty breathing.
- Report history of liver abnormalities or heart problems, including long QT syndrome, syncope, palpitations, extremity swelling.
- Immediately report any newly prescribed medications, suspected pregnancy, or vision changes, including light flashes, blurred vision, photophobia, or new or

increased floaters.

- Contraception recommended during treatment and for at least 3 mos after treatment.
- Avoid alcohol, grapefruit products.

cyanocobalamin (vitamin B₁₂)

sy-e-an-oh-koe-**bal**-a-min

Nascobal

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Coenzyme.

CLINICAL: Vitamin, antianemic.

Uses

Treatment of pernicious anemia, vitamin B₁₂ deficiency due to malabsorption diseases, increased B₁₂ requirement due to pregnancy, thyrotoxicosis, hemorrhage, malignancy, hepatic/renal disease.

Precautions

Contraindications: Hypersensitivity to cyanocobalamin. Hereditary optic nerve atrophy. **Cautions:** Folic acid deficiency, anemia, premature neonates.

Action

Coenzyme for metabolic functions (fat, carbohydrate metabolism, protein synthesis). **Therapeutic Effect:** Necessary for cell growth and replication, hematopoiesis, myelin synthesis.

Pharmacokinetics

In presence of calcium, absorbed systemically in lower half of ileum. Initially, bound to intrinsic factor; this complex passes down intestine, binding to receptor sites on ileal mucosa. Protein binding: High. Metabolized in liver. Primarily eliminated unchanged in urine. **Half-life:** 6 days.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk.

Children/Elderly: No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known.

LAB VALUES: None significant.

Availability (Rx)

Injection Solution: 1,000 mcg/mL. **Nasal Spray (Nascobal):** 500 mcg/spray.

Tablets: 50 mcg, 100 mcg, 250 mcg, 500 mcg, 1,000 mcg. **Tablets (Extended-Release):** 1,000 mcg. **Tablets (Sublingual):** 2,500 mcg.

Administration/handling

IM, Subcutaneous

- Avoid IV route.

PO

- May give without regard to food.

Intranasal

- Clear both nostrils.
- Pull clear cover off top of pump.
- Press down firmly and quickly on pump's finger grips until a droplet of gel appears at top. Then press down on finger grips two more times.
- Place the tip halfway into nostril, pointing tip toward back of nose.
- Press down firmly and quickly on finger grips to release medication into one nostril while pressing other nostril closed.
- Massage medicated nostril for a few seconds.
- Administer nasal preparation at least 1 hr before or 1 hr after hot foods or liquids are consumed (hot foods can cause nasal secretion, resulting in loss of medication).

Indications/routes/dosage

Pernicious Anemia

IM, Subcutaneous: ADULTS, ELDERLY: 100 mcg/day for 7 days, then every other day for 7 doses, then every 3–4 days for 2–3 wks. **Maintenance:** 100 mcg/mo (PO 1,000–2,000 mcg/day). **CHILDREN:** 30–50 mcg/day for 2 or more wks (to a total dose of 1,000–5,000 mcg). **Maintenance:** 100 mcg/mo. **NEONATES:** 0.2 mcg/kg for 2 days, then 1,000 mcg/day for 2–7 days. **Maintenance:** 100 mcg/mo.

Vitamin Deficiency

IM, Subcutaneous: ADULTS, ELDERLY: 100 mcg daily for 6–7 days; if improvement, 100 mcg q other day for 7 doses, then q3–4 days for 2–3 wks. **Maintenance:** 100 mcg monthly.

PO: ADULTS, ELDERLY: 1,000–2,000 mcg daily for 1–2 wks. **Maintenance:** 1,000 mcg daily.

Intranasal: ADULTS, ELDERLY: (NASCOBAL): 500 mcg in one nostril once wkly.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Diarrhea, pruritus.

Adverse effects/toxic reactions

Impurities in preparation may cause rare allergic reaction. Peripheral vascular thrombosis, pulmonary edema, hypokalemia, HF occur rarely.

Nursing considerations

Baseline assessment

Assess for signs, symptoms of vitamin B₁₂ deficiency (anorexia, ataxia, fatigue,

hyporeflexia, insomnia, irritability, loss of positional sense, pallor, palpitations on exertion).

Intervention/evaluation

Assess for HF, pulmonary edema, hypokalemia in cardiac pts receiving subcutaneous/IM therapy. Monitor serum potassium, serum B₁₂, rise in reticulocyte count (peaks in 5–8 days). Assess for reversal of deficiency symptoms (hyporeflexia, loss of positional sense, ataxia, fatigue, irritability, insomnia, anorexia, pallor, palpitations on exertion). Therapeutic response usually dramatic within 48 hrs.

Patient/family teaching

- Lifetime treatment may be necessary with pernicious anemia.
- Report symptoms of infection.
- Foods rich in vitamin B₁₂ include clams, oysters, herring, red snapper, muscle meats, fermented cheese, dairy products, egg yolks.
- Use nasal preparation at least 1 hr before or 1 hr after consuming hot foods, liquids.

cyclobenzaprine

syə-kloe-**ben**-za-preen

Amrix

Apo-Cyclobenzaprine 

Fexmid

Novo-Cycloprine 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Centrally acting muscle relaxant.

CLINICAL: Skeletal muscle relaxant.

Do not confuse cyclobenzaprine with cycloSERINE or cyproheptadine, or Flexeril with Floxin.

Uses

Treatment of muscle spasm associated with acute, painful musculoskeletal

conditions. **OFF-LABEL:** Treatment of muscle spasms associated with temporomandibular joint pain (TMJ).

Precautions

Contraindications: Hypersensitivity to cyclobenzaprine. Acute recovery phase of MI, arrhythmias, HF, heart block, conduction disturbances, hyperthyroidism, use within 14 days of MAOIs. **Cautions:** Hepatic impairment, history of urinary hesitancy or retention, angle-closure glaucoma, increased intraocular pressure (IOP), elderly.

Action

Centrally acting skeletal muscle relaxant that reduces tonic somatic muscle activity at level of brainstem. Influences both alpha and gamma motor neurons. **Therapeutic Effect:** Relieves local skeletal muscle spasm.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	1 hr	3–4 hrs	12–24 hrs

Well but slowly absorbed from GI tract. Protein binding: 93%. Metabolized in GI tract and liver. Primarily excreted in urine. **Half-life:** 8–37 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased sensitivity to anticholinergic effects (e.g., confusion, urinary retention). Increased risk of falls, fractures. Not recommended.

Interactions

DRUG: Alcohol, other CNS depressant medications (e.g., lorazepam, morphine, zolpidem) may increase CNS depression. MAOIs (e.g., phenelzine, selegiline) may increase risk of hypertensive crisis, seizures. TraMADol may increase risk of seizures. **HERBAL:** Gotu kola, kava kava, SAME, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB**

VALUES: None significant.

Availability (Rx)

Tablets: 5 mg, 7.5 mg, 10 mg.

 **Capsules (Extended-Release [Amrix]):** 15 mg, 30 mg.

Administration/handling

PO

- Give without regard to food.
- Do not break, crush, dissolve, or divide extended-release capsule.
- Give extended-release capsule at same time each day.

Indications/routes/dosage

 Do not use longer than 2–3 wks.

Acute, Painful Musculoskeletal Conditions

PO: ADULTS, ELDERLY, CHILDREN 15 YRS AND OLDER: Initially, 5 mg 3 times/day. May increase to 7.5–10 mg 3 times/day.

PO (Extended-Release): ADULTS: 15–30 mg once daily. Not recommended in elderly.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Note: Extended-release capsule not recommended in hepatic impairment. **Mild impairment:** 5 mg 3 times/day. **Moderate to severe impairment:** Not recommended.

Side effects

Frequent (39%–11%): Drowsiness, dry mouth, dizziness. **Rare (3%–1%):** Fatigue, asthenia, blurred vision, headache, anxiety, confusion, nausea,

constipation, dyspepsia, unpleasant taste.

Adverse effects/toxic reactions

Overdose may result in visual hallucinations, hyperactive reflexes, muscle rigidity, vomiting, hyperpyrexia.

Nursing considerations

Baseline assessment

Record onset, type, location, duration of muscular spasm. Check for immobility, stiffness, swelling.

Intervention/evaluation

Assist with ambulation. Assess for therapeutic response: relief of pain; decreased stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Drowsiness usually diminishes with continued therapy.
- Avoid alcohol, other depressants while taking medication.
- Avoid sudden changes in posture.
- Sugarless gum, sips of water may relieve dry mouth.

cyclophosphamide

syeh-kloh-foss-fa-mide

HIGH
ALERT

Procytox 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alkylating agent.

CLINICAL: Antineoplastic.

cyclophosphamide with cycloSPORINE or ifosfamide.

Uses

Treatment of acute lymphocytic, acute nonlymphocytic, chronic myelocytic, chronic lymphocytic leukemias; ovarian, breast carcinomas; neuroblastoma; retinoblastoma; Hodgkin's, non-Hodgkin's lymphomas; multiple myeloma; mycosis fungoides; nephrotic syndrome in children. **OFF-LABEL:** Treatment of adrenocortical, bladder, cervical, endometrial, prostatic, testicular carcinomas; Ewing's sarcoma; multiple sclerosis; non-small-cell, small-cell lung cancer; organ transplant rejection; osteosarcoma; ovarian germ cell, primary brain, trophoblastic tumors; rheumatoid arthritis; soft-tissue sarcomas; systemic dermatomyositis; systemic lupus erythematosus; Wilms' tumor.

Precautions

Contraindications: Hypersensitivity to cyclophosphamide. Urinary outflow obstruction. **Cautions:** Severe leukopenia, thrombocytopenia, tumor infiltration of bone marrow, previous therapy with other antineoplastic agents, radiation, renal/hepatic/cardiac impairment, active UTI.

Action

Inhibits DNA, RNA protein synthesis by cross-linking with DNA, RNA strands. Cell cycle-phase nonspecific. **Therapeutic Effect:** Prevents cell growth. Potent immunosuppressant.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 10%–60%. Crosses blood-brain barrier. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 3–12 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy. Use of effective contraception during therapy and up to 1 yr after completion of therapy is recommended. May cause fetal malformations (limb abnormalities, cardiac anomalies, hernias). Distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: CYP2D6 inducers (e.g., carbamazepine, phenobarbital) may decrease concentration; CYP2D6 inhibitors (e.g., paroxetine, amiodarone) may increase concentration. Anthracycline agents (e.g., doxorubicin, epirubicin) may increase risk of cardiomyopathy. CYP3A4 inhibitors (e.g., ketoconazole) may increase concentration, risk of adverse effects. Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Pts with an estrogen-dependent tumor should avoid black cohosh, dong quai. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid.

Availability (Rx)

 **Capsules:** 25 mg, 50 mg. **Injection, Powder for Reconstitution:** 500 mg, 1 g, 2 g.

Administration/handling

 **ALERT** May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

IV

Reconstitution

- Reconstitute each 100 mg with 5 mL Sterile Water for Injection, 0.9% NaCl, or D₅W to provide concentration of 20 mg/mL.
- Shake to dissolve.
- Allow to stand until clear.

Rate of Administration

- Infusion rates vary based on protocol. May give by direct IV injection, IV piggyback, or continuous IV infusion.

Storage

- Reconstituted solution in 0.9% NaCl is stable for 24 hrs at room temperature or up to 6 days if refrigerated.

PO

- Give on an empty stomach. If GI upset occurs, give with food.

- Do not cut or crush.
- To minimize risk of bladder irritation, do not give at bedtime.

■ IV incompatibility

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

■ IV Compatibilities

Granisetron (Kytril), heparin, HYDROmorphine (Dilaudid), LORazepam (Ativan), morphine, ondansetron (Zofran), propofol (Diprivan).

Indications/routes/dosage

Note: Hematologic toxicity may require dose reduction.

Usual Dosage (Refer to Individual Protocols)

IV: ADULTS, ELDERLY, CHILDREN: (Single agent): 40–50 mg/kg in divided doses over 2–5 days or 10–15 mg/kg q7–10 days or 3–5 mg/kg twice wkly.

PO: ADULTS, ELDERLY, CHILDREN: 1–5 mg/kg/day.

Nephrotic Syndrome

PO: ADULTS, CHILDREN: 2 mg/kg/day for 60–90 days. **Maximum cumulative dose:** 168 mg/kg.

Dosage in Renal/Hepatic Impairment

No dose adjustment. Use caution.

Side effects

Expected: Marked leukopenia 8–15 days after initiation. **Frequent:** Nausea, vomiting (beginning about 6 hrs after administration and lasting about 4 hrs); alopecia (33%). **Occasional:** Diarrhea, darkening of skin/fingernails, stomatitis, headache, diaphoresis. **Rare:** Pain/redness at injection site.

Adverse effects/toxic reactions

Myelosuppression resulting in blood dyscrasias (leukopenia, anemia, thrombocytopenia, hypoprothrombinemia) has been noted. Expect leukopenia to resolve in 17–28 days. Anemia generally occurs after large doses or prolonged therapy. Thrombocytopenia may occur 10–15 days after drug initiation. Hemorrhagic cystitis occurs commonly in long-term therapy (esp. in children). Pulmonary fibrosis, cardiotoxicity noted with high doses. Amenorrhea, azoospermia, hyperkalemia may occur.

Nursing considerations

Baseline assessment

Obtain CBC wkly during therapy or until maintenance dose is established, then at 2- to 3-wk intervals. Question history of urinary outlet flow obstruction, hepatic/renal impairment, active infections. Obtain urine/serum pregnancy test.

Intervention/evaluation

Monitor CBC, serum BUN, creatinine, electrolytes; urine output. Monitor WBC counts closely during initial therapy. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Recovery from marked leukopenia due to myelosuppression can be expected in 17–28 days.

Patient/family teaching

- Encourage copious fluid intake, frequent voiding (assists in preventing cystitis) at least 24 hrs before, during, after therapy.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever, sore throat, signs of local infection, difficulty or pain with urination, unusual bruising/bleeding from any site.
- Hair loss is reversible, but new hair growth may have different color, texture.
- Avoid pregnancy for up to 1 yr after completion of treatment.

sye-kloe-**spor**-in

Apo-Cyclo**SPORINE** 

Gengraf

Neoral

Restasis

Sand**IMMUNE**

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Calcineurin inhibitor.

CLINICAL: Immunosuppressant.

■ **BLACK BOX ALERT** ■ Only physicians experienced in management of immunosuppressive therapy and organ transplant pts should prescribe. Renal impairment may occur with high dosage. Increased risk of neoplasia, susceptibility to infections. May cause hypertension, nephrotoxicity. Psoriasis pts: Increased risk of developing skin malignancies. The modified/non-modified formulations are not bioequivalent and cannot be used interchangeably without close monitoring.

Do not confuse cycloSPORINE with cycloSERINE or cyclophosphamide, Gengraf with ProGraf, Neoral with Neurontin or Nizoral, or SandIMMUNE with SandoSTATIN.

Uses

Modified, Non-Modified: Prevents organ rejection of kidney, liver, heart in combination with steroid therapy and/or aza**THIO**prine. **Non-Modified:** Treatment of chronic allograft rejection in those previously treated with other immunosuppressives. **Modified:** Treatment of severe, active rheumatoid arthritis, severe recalcitrant plaque psoriasis in nonimmunocompromised adults. **Ophthalmic:** Chronic dry eyes. **OFF-LABEL:** Allogeneic stem cell transplants for prevention/treatment of graft-vs-host disease; focal segmental glomerulosclerosis, lupus nephritis, severe ulcerative colitis.

Precautions

Contraindications: History of hypersensitivity to cycloSPORINE, polyoxyethylated castor oil; uncontrolled hypertension, renal impairment, or malignancies in treatment of psoriasis or rheumatoid arthritis. **Cautions:** Hepatic/renal impairment. History of seizures. Avoid live vaccines.

Action

Inhibits cellular, humoral immune responses by inhibiting interleukin-2, a proliferative factor needed for T-cell activity. **Therapeutic Effect:** Prevents organ rejection, relieves symptoms of psoriasis, arthritis.

Pharmacokinetics

Variably absorbed from GI tract. Protein binding: 90%. Metabolized in liver. Eliminated primarily by biliary or fecal excretion. Not removed by hemodialysis. **Half-life:** Adults, 10–27 hrs; children, 7–19 hrs.

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted in transplant pts. **Elderly:** Increased risk of hypertension, increased serum creatinine.

Interactions

DRUG: Allopurinol, bromocriptine, cimetidine, clarithromycin, danazol, diltiazEM, oral contraceptives, erythromycin, fluconazole, ketoconazole may increase concentration, risk of hepatic/renal toxicity. RifAMPin, carBAMazepine, phenytoin may decrease cycloSPORINE concentration. ACE inhibitors (e.g., enalapril, lisinopril), potassium-sparing diuretics (e.g., spironolactone, triamterene), potassium supplements may cause hyperkalemia. Immunosuppressants may increase risk of infection, lymphoproliferative disorders. Lovastatin, simvastatin, atorvastatin, pravastatin may increase risk of rhabdomyolysis. Live virus vaccines may potentiate virus replication, increase vaccine side effects, decrease pt's response to vaccine. May increase concentration/toxicity of digoxin, colchicine. **HERBAL:** Avoid cat's claw, echinacea (possess immunostimulant properties).

St. John's wort may decrease plasma concentration. **FOOD: Grapefruit products** may increase absorption/immunosuppression, risk of toxicity. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, amylase, bilirubin, creatinine, potassium, uric acid, ALT, AST. May decrease serum magnesium. **Therapeutic peak serum level:** 50–400 ng/mL; **toxic serum level:** greater than 400 ng/mL.

Availability (Rx)

 **Capsules (Gengraf, Neoral [Modified], SandIMMUNE [Nonmodified]):** 25 mg, 50 mg, 100 mg. **Injection, Solution (SandIMMUNE):** 50 mg/mL. **Ophthalmic Emulsion (Restasis):** 0.05%. **Oral Solution (Gengraf, Neoral [Modified], SandIMMUNE [Nonmodified]):** 100 mg/mL.

Administration/handling

 **ALERT** Oral solution available in bottle form with calibrated liquid measuring device. Oral form should replace IV administration as soon as possible.

IV

Reconstitution

- Dilute each mL (50 mg) concentrate with 20–100 mL 0.9% NaCl or D₅W (**maximum concentration:** 2.5 mg/mL).

Rate of Administration

- Infuse over 2–6 hrs.
- Monitor pt continuously for hypersensitivity reaction (facial flushing, dyspnea).

Storage

- Store parenteral form at room temperature.
- Protect IV solution from light.
- After diluted, stable for 6 hrs in PVC; 24 hrs in Excel or glass.

PO

- Administer consistently with relation to time of day and meals.
- Oral solution may be mixed in glass container with milk, chocolate milk, orange juice, or apple juice (preferably at room temperature). Stir well.

- Drink immediately.
- Add more diluent to glass container. Mix with remaining solution to ensure total amount is given.
- Dry outside of calibrated liquid measuring device before replacing cover.
- Do not rinse with water.
- Avoid refrigeration of oral solution (solution may separate).
- Discard oral solution after 2 mos once bottle is opened.

Ophthalmic

- Invert vial several times to obtain uniform suspension.
- Instruct pt to remove contact lenses before administration (may reinsert 15 min after administration).
- May use with artificial tears.

■ IV incompatibilities

Acyclovir (Zovirax), amphotericin B complex (Abelcet, AmBisome, Amphotec), magnesium.

IV compatibility

Propofol (Diprivan).

Indications/routes/dosage

Note: The modified/non-modified formulations are not bioequivalent and cannot be used interchangeably without close monitoring.

Transplantation, Prevention of Organ Rejection

Note: Initial dose given 4–12 hrs prior to transplant or postoperatively.

PO: ADULTS, ELDERLY, CHILDREN: NOT MODIFIED: Initially, 10–12 mg/kg daily for 1–2 wks, then taper by 5% each wk to maintenance dose of 5–10 mg/kg daily. **MODIFIED:** (dose dependent upon type of transplant). **Renal:** 6–12 mg/kg/day in 2 divided doses. **Hepatic:** 4–12 mg/kg/day in 2 divided doses. **Heart:** 4–10 mg/kg/day in 2 divided doses.

IV: ADULTS, ELDERLY, CHILDREN: NOT MODIFIED: Initially, 5–6 mg/kg/dose daily. Switch to oral as soon as possible.

Rheumatoid Arthritis

PO: ADULTS, ELDERLY:MODIFIED: Initially, 2.5 mg/kg a day in 2 divided doses. May increase by 0.5–0.75 mg/kg/day after 8 wks with additional increases made at 12 wks. **Maximum:** 4 mg/kg/day.

Psoriasis

PO: ADULTS, ELDERLY:MODIFIED: Initially, 2.5 mg/kg/day in 2 divided doses. May increase by 0.5 mg/kg/day after 4 wks; additional increases may be made q2wks. **Maximum:** 4 mg/kg/day.

Dry Eye

Ophthalmic: ADULTS, ELDERLY: Instill 1 drop in each affected eye q12h.

Dosage in Renal Impairment

Modify dose if serum creatinine levels 25% or above pretreatment levels.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use caution.

Side effects

Frequent (26%–12%): Mild to moderate hypertension, hirsutism, tremor. **Occasional (4%–2%):** Acne, leg cramps, gingival hyperplasia (red, bleeding, tender gums), paresthesia, diarrhea, nausea, vomiting, headache. **Rare (less than 1%):** Hypersensitivity reaction, abdominal discomfort, gynecomastia, sinusitis.

Adverse effects/toxic reactions

Mild nephrotoxicity occurs in 25% of renal transplants, 38% of cardiac transplants, 37% of liver transplants, generally 2–3 mos after transplantation (more severe toxicity may occur soon after transplantation). Hepatotoxicity occurs in 4% of renal, 7% of cardiac, and 4% of liver transplants, generally within first mo after transplantation. Both toxicities usually respond to dosage reduction. Severe hyperkalemia, hyperuricemia occur occasionally.

Nursing considerations

Baseline assessment

Obtain baseline serum chemistries, esp. renal function, LFT. If nephrotoxicity occurs, mild toxicity is generally noted 2–3 mos after transplantation; more severe toxicity noted early after transplantation; hepatotoxicity may be noted during first mo after transplantation.

Intervention/evaluation

Diligently monitor serum BUN, creatinine, bilirubin, ALT, AST, LDH levels for evidence of hepatotoxicity/nephrotoxicity (mild toxicity noted by slow rise in serum levels; more overt toxicity noted by rapid rise in levels; hematuria also noted in nephrotoxicity). Monitor serum potassium for evidence of hyperkalemia. Encourage diligent oral hygiene (gingival hyperplasia). Monitor B/P for evidence of hypertension. **Note:** Reference ranges dependent on organ transplanted, organ function, cycloSPORINE toxicity. Trough levels should be obtained immediately prior to next dose. **Therapeutic serum level:** 50–400 ng/mL; **toxic serum level:** greater than 400 ng/mL.

Patient/family teaching

- Blood levels will be drawn routinely.
- Report severe headache, persistent nausea/vomiting, unusual swelling of extremities, chest pain.
- Avoid grapefruit products (increases concentration/effects), St. John's wort (decreases concentration).
- Do not take any newly prescribed or OTC medications unless approved by the prescriber who originally started treatment.

cytarabine

sye-tar-a-bine

Ara-C

Cytosar-U 

Depo-Cyt

CLASSIFICATION

PHARMACOTHERAPEUTIC: Antimetabolite.

HIGH
ALERT

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents. **Conventional:** Potent myelosuppressant. High risk of multiple toxicities (GI, CNS, pulmonary, cardiac). **Liposomal:** Chemical arachnoiditis, manifested by profound nausea, vomiting, fever, may be fatal if untreated.

Do not confuse cytarabine with Cytosan or vidarabine, or Cytosar with Cytosan or Neosar.

Uses

Conventional: Remission induction in acute myeloid leukemia (AML), treatment of acute lymphocytic leukemia (ALL) and chronic myelocytic leukemia (CML), prophylaxis and treatment of meningeal leukemia. **Liposomal:** Treatment of lymphomatous meningitis. **OFF-LABEL: Ara-C:** Carcinomatous meningitis, Hodgkin's and non-Hodgkin's lymphomas, myelodysplastic syndrome.

Precautions

Contraindications: Hypersensitivity to cytarabine. (Liposomal): Active meningeal infection. **Cautions:** Renal/hepatic impairment, prior drug-induced bone marrow suppression.

Action

Inhibits DNA polymerase. Cell cycle-specific for S phase of cell division. **Therapeutic Effect:** Appears to inhibit DNA synthesis. Potent immunosuppressive activity.

Pharmacokinetics

Widely distributed; moderate amount crosses blood-brain barrier. Protein binding: 15%. Primarily excreted in urine. **Half-life:** 1–3 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy. May cause fetal malformations. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: May decrease concentration of **digoxin, flucytosine**. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's response to vaccine. **HERBAL: Echinacea** may decrease therapeutic effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, uric acid, AST.

Availability (Rx)

Injection, Powder for Reconstitution (Conventional): 100 mg, 500 mg, 1 g.
Injection, Solution (Conventional): 20 mg/mL, 100 mg/mL. **Injection, Suspension (Liposomal):** 10 mg/mL.

Administration/handling

 May give by subcutaneous, IV push, IV infusion, intrathecal routes at concentration not to exceed 100 mg/mL. May be carcinogenic, mutagenic, teratogenic (embryonic deformity). Handle with extreme care during preparation/administration. Liposomal for intrathecal use only.

IV, Intrathecal

IV

Reconstitution

- Conventional: Reconstitute with Bacteriostatic Water for Injection.
- Dose may be further diluted with 250–1,000 mL D₅W or 0.9% NaCl for IV infusion.
- For intrathecal use, reconstitute vial with preservative-free 0.9% NaCl or pt's spinal fluid. Dose usually administered in 5–15 mL of solution, after equivalent volume of CSF removed.

- Liposomal: No reconstitution required.

Rate of Administration

- Conventional: For IV infusion, give over 1–3 hrs or as continuous infusion.

Storage

- Conventional: Store at room temperature.
- Reconstituted solution is stable for 48 hrs at room temperature.
- Use diluted solution within 24 hrs.
- Discard if slight haze develops.
- Liposomal: Refrigerate; use within 4 hrs following withdrawal from vial.

■ IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ganciclovir (Cytovene), heparin, insulin (regular).

■ IV Compatibilities

Dexamethasone (Decadron), diphenhydrAMINE (Benadryl), filgrastim (Neupogen), granisetron (Kytril), HYDROmorphine (Dilaudid), LORazepam (Ativan), morphine, ondansetron (Zofran), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Usual Dosage for Induction (Conventional) (Refer to Individual Protocols)

IV: ADULTS, ELDERLY, CHILDREN:(Induction): 100 mg/m²/day continuous infusion for 7 days or 200 mg/m²/day continuous infusion (as 100 mg/m² over 12 hrs q12h) for 7 days.

Intrathecal: ADULTS, ELDERLY, CHILDREN: Usual dose: 30 mg/m² q4days. Range: 5–75 mg/m² daily for 4 days or once q4days until CNS findings normalize, followed by one additional treatment.

Usual Maintenance Dosage (Conventional)

IV: ADULTS, ELDERLY, CHILDREN: 70–200 mg/m²/day for 2–5 days q mo.

Usual Dosage for Depo-Cyt (Liposomal)

Intrathecal: ADULTS, ELDERLY: (Induction): 50 mg q14 days for 2 doses (wks 1, 3). **(Consolidation):** 50 mg q14 days for 3 doses (wks 5, 7, 9) followed by additional dose at wk 13. **(Maintenance):** 50 mg q28days for 4 doses (wks 17, 21, 25, 29).

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: IV, (33%–16%): Asthenia, fever, pain, altered taste/smell, nausea, vomiting (risk greater with IV push than with continuous IV infusion). **Intrathecal (28%–11%):** Headache, asthenia, altered taste/smell, confusion, drowsiness, nausea, vomiting. **Occasional: IV, (11%–7%):** Abnormal gait, drowsiness, constipation, back pain, urinary incontinence, peripheral edema, headache, confusion. **Intrathecal (7%–3%):** Peripheral edema, back pain, constipation, abnormal gait, urinary incontinence.

Adverse effects/toxic reactions

Myelosuppression resulting in blood dyscrasias (leukopenia, anemia, thrombocytopenia, megaloblastosis, reticulocytopenia), occurring minimally after single IV dose. Leukopenia, anemia, thrombocytopenia should be expected with daily or continuous IV therapy. Cytarabine syndrome (fever, myalgia, rash, conjunctivitis, malaise, chest pain), hyperuricemia may occur. High-dose therapy may produce severe CNS, GI, pulmonary toxicity.

Nursing considerations

Baseline assessment

Obtain baseline CBC, renal function, LFT. Leukocyte count decreases within 24 hrs after initial dose, continues to decrease for 7–9 days followed by brief rise at 12 days, decreases again at 15–24 days, then rises rapidly for next 10 days. Platelet count decreases 5 days after drug initiation to its lowest count at 12–15 days, then rises rapidly for next 10 days.

Intervention/evaluation

Monitor BMP, LFT; serum uric acid. Monitor CBC for evidence of myelosuppression. Monitor for blood dyscrasias (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Monitor for signs of neuropathy (gait disturbances, handwriting difficulties, paresthesia).

Patient/family teaching

- Increase fluid intake (may protect against hyperuricemia).
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site.

 Canadian trade name

 Non-Crushable Drug

 High Alert drug

underlined underlined – top prescribed drug

D

dabigatran

dab-i-gah-tran

TOP
100

Pradaxa

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Thrombin inhibitor.

CLINICAL: Anticoagulant.

- **BLACK BOX ALERT** ■ Risk of thrombotic events (e.g., stroke) increased if discontinued for a reason other than pathological bleeding. Spinal or epidural hematoma may occur with neuraxial anesthesia.

Uses

Indicated to reduce risk of stroke, systemic embolism in pts with nonvalvular atrial fibrillation. Treatment and reduction of risk of deep vein thrombosis (DVT) and pulmonary embolism (PE). Prophylaxis of DVT and PE in pts who have undergone hip replacement surgery.

Precautions

Contraindications: Severe hypersensitivity to dabigatran. Active major bleeding, pts with mechanical prosthetic heart valves. **Cautions:** Renal impairment (CrCl 15–30 mL/min), moderate hepatic impairment, invasive procedures, spinal anesthesia, major surgery, pts with congenital or acquired bleeding disorders, elderly, concurrent use of medications that increase risk of bleeding, valvular heart disease.

Action

Direct thrombin inhibitor that inhibits coagulation by preventing thrombin effects (e.g., inhibition of thrombin-induced platelet aggregation). **Therapeutic Effect:** Produces anticoagulation, preventing development of thrombus.

Pharmacokinetics

Metabolized in liver. Protein binding: 35%. Eliminated primarily in urine. **Half-life:** 12–17 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Severe renal impairment may require dosage adjustment.

Interactions

DRUG: RifAMPin may decrease concentration. **Antacids, proton pump inhibitors (e.g., omeprazole, pantoprazole)** may decrease level, effect. **Antiplatelet agents (e.g., aspirin, clopidogrel), NSAIDs (e.g., ibuprofen, ketorolac, naproxen), thrombolytics (e.g., tPA)** may increase risk of bleeding. **HERBAL:** Feverfew, ginkgo biloba, green tea, red clover may increase risk of bleeding. **St. John's wort** may decrease concentration/effect. **FOOD: High-fat meal** delays absorption approx. 2 hrs. **LAB VALUES:** May increase aPTT, PT, INR.

Availability (Rx)

 **Capsules:** 75 mg, 110 mg, 150 mg.

Administration/handling

PO

- May be given without regard to food. Administer with water.
- Do not break, cut, open capsules.

Indications/routes/dosage

◀ALERT▶ Medication should be discontinued prior to invasive or surgical procedures.

Treatment/Prevention of DVT/PE

PO: ADULTS, ELDERLY: 150 mg twice daily (after 5–10 days of treatment with parenteral anticoagulants).

Nonvalvular Atrial Fibrillation

PO:ADULTS, ELDERLY: 150 mg twice daily (to reduce risk of stroke/systemic embolism).

Prophylaxis following Hip Surgery

PO: ADULTS, ELDERLY: 110 mg on day one (1–4 hr postoperative and established hemostasis), then 220 mg daily for up to 35 days.

Dosage in Renal Impairment (Nonvalvular Atrial Fibrillation)

CrCl 15–30 mL/min: 75 mg twice daily. **CrCl less than 15, or HD:** Not recommended (HD removes ~60% over 2–3 hrs).

Dosage in Hepatic Impairment

No dosage adjustment.

Side effects

Frequent (less than 16%): Dyspepsia (heartburn, nausea, indigestion), diarrhea, upper abdominal pain.

Adverse effects/toxic reactions

Severe, sometimes fatal, hemorrhagic events, including intracranial hemorrhage, hemorrhagic stroke, GI bleeding, may occur. Hypersensitivity reactions, including anaphylaxis, reported in less than 1% of pts.

Nursing considerations

Baseline assessment

Obtain CBC (esp. platelet count), renal function test, PT, aPTT. Question history of mechanical heart valve, recent surgery; hepatic, renal impairment; recent spinal, epidural procedures. Receive full medication history and screen for interactions.

Intervention/evaluation

Assess for any sign of bleeding (hematuria, melena, bleeding from gums, petechiae, bruising), decrease in B/P, increase in pulse rate, complaint of abdominal pain, diarrhea. Obtain aPTT, PT, platelet count. Question for increase in discharge during menses. Monitor for hematoma. Use care in removing any dressing, tape. Monitor for symptoms of intracranial hemorrhage (e.g., altered mental status, aphagia, lethargy, one-sided weakness, seizures, vision changes).

Patient/family teaching

- Do not chew, crush, open, or divide capsules.
- Use electric razor, soft toothbrush to prevent bleeding.
- Report any sign of red or dark urine, black or red stool, coffee-ground vomitus, red-speckled mucus from cough.
- Keep in original container.
- Once bottle is opened, must be used within 60 days.
- Open blister pack at time of use.
- Treatment may increase risk of bleeding into the brain; report difficulty speaking, headache, numbness, paralysis, vision changes, seizures.

dabrafenib

da-**braf**-e-nib

Tafinlar

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse dabrafenib with dasatinib.

Uses

Treatment of unresectable or metastatic melanoma with BRAF V600E mutation as detected by FDA-approved test.

◀ALERT▶ Not indicated for treatment of wild-type BRAF melanomas.

Precautions

Contraindications: Hypersensitivity to dabrafenib. **Cautions:** Diabetes, hepatic/renal impairment, dehydration, glucose-6-phosphate dehydrogenase (G6PD) deficiency, pts at increased risk for arrhythmias.

Action

Inhibits BRAF kinase gene mutation, a main cause of tumor cell growth, in the absence of growth factors that are normally required for proliferation.

Therapeutic Effect: Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Readily absorbed after PO administration. Protein binding: 99.7%. Peak plasma concentration: 2 hrs. Metabolized in liver. Excreted in feces (71%), urine (23%).

Half-life: 8 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy. May cause fetal harm. Must use effective nonhormonal contraception during treatment and for at least 2 wks after treatment (intrauterine device, barrier methods). Unknown if distributed in breast milk. Must either discontinue breastfeeding or discontinue therapy. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of adverse effects, skin lesions.

Interactions

DRUG: Antacids, H₂-receptors blockers (e.g., famotidine, ranitidine), proton pump inhibitors (e.g., omeprazole, pantoprazole) may decrease concentration/effect. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. CYP3A4 inhibitors (e.g., clarithromycin, gemfibrozil, ketoconazole) may increase concentration. May

decrease effectiveness of **hormonal contraceptives, warfarin**. **HERBAL: St. John's wort** may decrease concentration/effect. **FOOD: High-fat meals** may decrease absorption/effect. **LAB VALUES:** May increase serum glucose, alkaline phosphatase. May decrease serum phosphate, sodium.

Availability (Rx)

 **Capsules:** 50 mg, 75 mg.

Administration/handling

PO

- Give at least 1 hr before or at least 2 hrs after meal.
- Do not break, crush, open, or divide capsule.
- Missed dose may be given up to 6 hrs prior to next dose.

Indications/routes/dosage

Metastatic Melanoma

PO: ADULTS/ELDERLY: 150 mg twice daily (about 12 hrs apart) until disease progression or unacceptable toxicity.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE) grading 1–4.

Reduction Levels	Dose
1st dose reduction	100 mg twice daily
2nd dose reduction	75 mg twice daily
3rd dose reduction	50 mg twice daily

Fever Greater Than 101.3°F or Any Grade 2 or Grade 3 Adverse Event

Withhold until fever or adverse event resolves to grade 1 or less, then reduce dose by one level. May further decrease each dose level based on tolerability.

Recurrent Grade 4 Adverse Event or 50-mg Dose Intolerability or Hemodynamic Instability

Permanently discontinue.

Dosage in Renal Impairment

No dosage adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dosage adjustment. **Severe impairment:** Use with caution.

Side effects

Frequent (37%–17%): Hyperkeratosis, headache, pyrexia, arthralgia, alopecia, rash. **Occasional (12%–10%):** Back pain, cough, myalgia, constipation, nasopharyngitis, fatigue.

Adverse effects/toxic reactions

Cutaneous squamous cell carcinoma (cuSCC) and keratocanthomas reported in 11% of pts (esp. elderly, prior skin cancer, chronic sun exposure). Skin reactions including palmar-plantar erythrodysesthesia syndrome (PPES), papilloma have occurred. May increase cell proliferation of wild-type BRAF melanoma or new malignant melanomas. Eye conditions including uveitis, iritis reported. Hyperglycemia reported in 6% of pts. Serious febrile drug reactions including hypotension, rigors, dehydration reported in 4% of pts. Pts with G6PD deficiency have increased risk of hemolytic anemia. Pancreatitis, interstitial nephritis, bullous rash reported in less than 10% of pts.

Nursing considerations

Baseline assessment

Obtain BMP, LFT, serum magnesium, phosphate, blood glucose level. Confirm presence of BRAF V600E mutation, negative urine pregnancy before initiating treatment. Assess skin for moles, lesions, papillomas. Baseline ophthalmologic

exam, visual acuity. Question current breastfeeding status. Receive full medication history including herbal products. Offer emotional support.

Intervention/evaluation

Monitor serum electrolytes, blood glucose routinely. Obtain CBC if hemolytic anemia suspected. Monitor for signs of hyperglycemia. Assess for skin lesions every 2 mos during treatment and at least 6 mos after discontinuation. Immediately report any vision changes, eye pain/swelling, febrile events, renal impairment. Monitor urinary output.

Patient/family teaching

- Treatment may cause hair loss.
- Do not breastfeed.
- Avoid pregnancy; nonhormonal contraception should be used during treatment and up to 4 wks after last dose.
- Take capsule at least 1 hr before or at least 2 hrs after meal. Swallow whole; do not chew, crush, open, or divide.
- Report any increased urination, thirst, confusion, vision changes, eye pain, fever, skin changes including moles or lesions, rash, hematuria, weight gain from water retention.
- Minimize exposure to sunlight.
- Males may experience a decreased sperm count.
- Report any newly prescribed medications.

daclatasvir

dak-**lat**-as-vir

Daklinza

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: NS5A inhibitor.

CLINICAL: Antiviral.

Do not confuse daclatasvir with ombitasvir, or Daklinza with Zolinza.

Uses

Treatment of chronic hepatitis C virus (HCV) genotypes 1 or 3 infection, in

combination with other antiviral therapy.

Precautions

Contraindications: Hypersensitivity to daclatasvir. Concomitant use of strong CYP3A inducers (e.g., phenytoin, carbamazepine, rifampin, St. John's wort).

Cautions: Concomitant use of strong or moderate CYP3A inhibitors, moderate CYP3A inducers. Concomitant use of amiodarone is not recommended. History of bradycardia, bradyarrhythmias, cardiovascular disease, severe hepatic disease.

Action

Inhibits NS5A, a nonstructural protein encoded by HCV. Binds to N-terminus of NS5A and inhibits both viral RNA replication and virion assembly. **Therapeutic**

Effect: Inhibits viral replication of hepatitis C virus.

Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: 99%. Peak plasma concentration: 2 hrs. Eliminated in feces (88%), urine (7%). **Half-life:** 12–15 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Amiodarone, beta blockers (e.g., carvedilol, metoprolol) may increase risk of symptomatic bradycardia. **Strong CYP3A inhibitors (e.g., clarithromycin, itraconazole, saquinavir), moderate CYP3A inhibitors (e.g., ciprofloxacin, diltiazem, fosamprenavir)** may increase concentration/effect. **Moderate CYP3A inducers (e.g., dexamethasone, efavirenz, nafcillin)** may decrease concentration/effect. May increase concentration/effect, anticoagulant effect of **dabigatran**. May increase concentration/effect of **digoxin**. May increase risk of myopathy, concentration/effects of **HMG-CoA reductase**

inhibitors (e.g., atorvastatin, simvastatin). HERBAL: St. John's wort may decrease concentration/effect; use contraindicated. **FOOD: High-fat, high-caloric meal** may decrease absorption by 28%. **LAB VALUES:** May increase serum lipase.

Availability (Rx)

Tablets: 30 mg, 60 mg, 90 mg.

Administration/handling

PO

- Give without regard to meals.

Indications/routes/dosage

Note: Cirrhotic pts with genotype 1a should undergo testing for presence of virus with NS5A-resistance-associated polymorphisms.

Genotype 1

PO: ADULTS, ELDERLY: (Without cirrhosis or with compensated Child-Pugh A cirrhosis): 60 mg once daily with sofosbuvir for 12 wks. (With decompensated Child-Pugh B or C cirrhosis or post-liver transplant): 60 mg once daily with sofosbuvir and ribavirin for 12 wks.

Genotype 3

PO: ADULTS, ELDERLY: (Without cirrhosis): 60 mg once daily with sofosbuvir for 12 wks. (With compensated Child-Pugh A or decompensated Child-Pugh B or C cirrhosis or post-liver transplant): 60 mg once daily with sofosbuvir and ribavirin for 12 wks.

Dose Modification

Concomitant use of strong CYP3A inhibitors

30 mg once daily, in combination with sofosbuvir, with or without riboflavin for 12 wks.

Concomitant use of moderate CYP3A inducers

90 mg once daily, in combination with sofosbuvir, with or without riboflavin for 12 wks.

Discontinuation

If sofosbuvir is permanently discontinued, then daclatasvir should also be discontinued.

Concomitant use of digoxin

Consider decreasing digoxin dose by 30%–50%, or use lowest dose possible to maintain adequate response.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

No dose adjustment. Safety and efficacy not established in pts with decompensated hepatic cirrhosis or in liver transplant pts.

Side effects

Occasional (14%–8%): Headache, fatigue, nausea. **Rare (5%):** Diarrhea.

Adverse effects/toxic reactions

Symptomatic bradycardia and some cases requiring pacemaker intervention have been reported when amiodarone is coadministered with sofosbuvir, in combination with another HCV direct-acting antiviral, including daclatasvir. Bradycardia generally occurred within hrs to days, but may extend up to 2 wks after initiation. Pts taking beta blockers (e.g., metoprolol), those with underlying cardiac disease, or pts with advanced hepatic disease are at increased risk of bradycardia when treated with amiodarone. Transient, asymptomatic elevations of serum lipase levels greater than 3 times upper limit of normal reported in 2% of pts.

Nursing considerations

Baseline assessment

Obtain HCV-RNA level, LFT. Receive full medication history, including herbal

products, and screen for contraindications/interactions, esp. concomitant use of amiodarone or digoxin. Confirm HCV genotype. Question history of bradycardia, arrhythmias. Assess hydration status.

Intervention/evaluation

Monitor HCV-RNA level, LFT. Pts requiring treatment with amiodarone should be monitored with a cardiac monitor in an inpatient setting for the first 48 hrs of initiation. Further outpatient monitoring or self-monitoring of the heart rate should occur on a daily basis for at least the first 2 wks of treatment. Due to amiodarone's long half-life, pts discontinuing amiodarone just prior to starting sofosbuvir, in combination with daclatasvir, should have similar cardiac monitoring as listed earlier. Immediately report symptoms of bradycardia.

Patient/family teaching

- There is an increased risk of drug interactions with other medications.
- Do not take any new medications unless approved by physician.
- Treatment with amiodarone, an antiarrhythmic drug, may increase the risk of a slow heartbeat and is not recommended during drug therapy. If taking amiodarone, seek immediate medical attention if chest pain, confusion, dizziness, fainting, lethargy, or shortness of breath occurs after starting therapy.
- Do not take herbal products, esp. St. John's wort.
- Daclatasvir must be used in combination with sofosbuvir (an antiviral drug) and should not be used alone.

daclizumab

dac-**klye**-zue-mab

Zinbryta

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Interleukin-2 receptor blocking antibody.

CLINICAL: Multiple sclerosis agent.

■ **BLACK BOX ALERT** ■ May cause severe, sometimes life-threatening, hepatic injury, including hepatic failure and autoimmune hepatitis. Hepatic injury, including autoimmune hepatitis, may occur at any time during treatment and up to 4 mos after discontinuation. Contraindicated in pts with preexisting hepatic disease or impairment. Immune-mediated disorders,

including toxic skin reactions, lymphadenopathy, noninfectious colitis, were reported.

Do not confuse daclizumab with certolizumab, eculizumab, efalizumab, natalizumab, tocilizumab, vedolizumab.

Uses

Treatment of adult pts with relapsing forms of multiple sclerosis (MS). Therapy should generally be reserved for pts who have had an inadequate response to 2 or more medications indicated for the treatment of MS.

Precautions

Contraindications: Hypersensitivity to daclizumab; preexisting hepatic disease or impairment, including serum ALT or AST at least 2 times upper limit of normal (ULN), history of autoimmune hepatitis or other autoimmune disorders involving the liver. **Cautions:** History of chronic opportunistic infections (esp. fungal infections, viral infections, tuberculosis); history of autoimmune disorders (demyelinating polyneuropathy, Crohn's disease, Guillain-Barré syndrome, Hashimoto's thyroiditis, hyperthyroidism, myasthenia gravis, psoriasis, rheumatoid arthritis, systemic lupus erythematosus, type 1 diabetes, vasculitis); concomitant use of other immunosuppressants; conditions predisposing to infection (e.g., diabetes, kidney failure, open wounds), elderly, HIV infection, hematologic cytopenias; history of depression, suicidal ideation. Concomitant use of live vaccines not recommended during treatment and up to 4 mos after treatment. Avoid use during severe active infection.

Action

Exact mechanism of action unknown. May involve modulation of interleukin-2 mediated activation of lymphocytes, reducing the number of lymphocytes available to CNS. **Therapeutic Effect:** May reduce lymphocyte migration into CNS, which reduces central inflammation.

Pharmacokinetics

Widely distributed. Bioavailability: 90%. Degraded into small peptides and amino acids via catabolic pathway. Peak plasma concentration: 5–7 days. Elimination not specified. **Half-life:** 21 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Monoclonal antibodies are known to cross the placenta. **Children:** Safety and efficacy not established in pts younger than 17 yrs. **Elderly:** Not specified; use caution.

Interactions

DRUG: None known. **Note:** Use caution with other **hepatotoxic medications** (e.g., **acetaminophen, ketoconazole, methotrexate, simvastatin**). **HERBAL:** **Echinacea** may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin. May decrease ANC, Hgb, Hct, lymphocytes, RBC.

Availability (Rx)

Injection Solution: 150 mg/mL in prefilled syringe.

Administration/handling

Subcutaneous

- 30 min prior to injection, remove syringe from the refrigerator to allow to warm to room temperature.
- Do not use external heat sources (e.g., hot water, heating plate).
- Visually inspect for particulate matter or discoloration.
- Solution should appear colorless to slightly yellow, clear to slightly opalescent in color. Discard if solution is cloudy or discolored or if visible particles are observed.

Administration

- Insert needle subcutaneously into upper arms, outer thigh, or abdomen and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.

Storage

- Refrigerate until time of use.
- If unable to refrigerate, may store protected from light at room temperature (no more than 30°C [86°F]) up to 30 days.
- Do not place syringe back in refrigerator after allowing it to warm to room temperature.
- Do not freeze.

Indications/routes/dosage

Multiple Sclerosis, Relapsing

SQ: ADULTS: 150 mg once monthly. If a dose is missed, inject missed dose as soon as possible if no more than 2 wks have passed. If more than 2 wks have passed, skip missed dose and administer the next dose on schedule.

Dose Modification

Hepatic Impairment

Serum ALT or AST greater than 5 times ULN; total serum bilirubin greater than 2 times ULN; serum ALT or AST 3 to less than 5 times ULN with total serum bilirubin 1.5 to less than 2 times ULN: Withhold treatment and investigate for other etiologies of abnormal LFT values. If none are identified, discontinue treatment. If other etiologies are identified, use clinical judgment and consider if it is appropriate to resume treatment when both serum ALT or AST are less than 2 times ULN and total serum bilirubin is less than or equal to ULN.

Suspected autoimmune hepatitis: Permanently discontinue.

Immune-Mediated Disorders

Dermatologic toxicity, serious diffuse or inflammatory rashes; lymphadenopathy, lymphadenitis; noninfectious colitis; other single-organ or multiorgan inflammatory events: Consider interrupting treatment or permanent discontinuation.

Other Toxicities

Allergic reaction, anaphylaxis: Permanently discontinue. **Severe depression, suicidal ideation:** Consider permanent discontinuation. **Infection:** Withhold treatment until infection fully resolved.

Dosage in Renal Impairment

Not specified; use caution.

Side effects

Occasional (11%–5%): Rash, oropharyngeal pain, eczema. **Rare (3%–2%):** Acne, pyrexia, diarrhea, dry skin, erythema.

Adverse effects/toxic reactions

Serious, sometimes life-threatening, hepatic injury, including autoimmune hepatitis, may occur (less than 1% of pts). Serum ALT or AST elevation reported in 6% of pts. Infections occurred in up to 60% of pts. Respiratory tract infections, including nasopharyngitis, upper respiratory tract infection, influenza, bronchitis, pharyngitis, tonsillitis, rhinitis, laryngitis, pneumonia, reported in 29%–4% of pts. Dermatitis, folliculitis, skin exfoliation, toxic skin eruption may occur. Lymphadenopathy, lymphadenitis reported in 5%–2% of pts. Other immune-mediated disorders may include immune hemolytic anemia, glomerulonephritis, noninfectious colitis, pancreatitis, rheumatoid arthritis, sarcoidosis, sialadenitis thyroiditis. Depression occurred in 7% of pts. Severe hypersensitivity reactions, including anaphylaxis, angioedema, may occur any time during treatment. Immunogenicity (auto-daclizumab antibodies) reported in 8%–19% of pts.

Nursing considerations

Baseline assessment

Obtain baseline LFT, vital signs. Screen for hepatitis B and C virus infection, active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing for latent tuberculosis infection. Antifungal

therapy should be considered for pts who reside in or travel to regions where mycoses are endemic. Question history of autoimmune diseases (as listed in Precautions), depression or suicidal ideation, demyelinating disorders, HIV infection, prior hypersensitivity reactions. Conduct neurologic and dermatologic exam. Assess motor function and speech characteristics. Assess pt's willingness to self-administer medication.

Intervention/evaluation

Monitor LFT monthly during treatment and for at least 6 mos after discontinuation. If autoimmune hepatitis is suspected or severe immune-mediated disorder occurs, consider referral to specialist; may require treatment with corticosteroids and other immunosuppressant agents. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection at baseline. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Diligently monitor for depression or suicidal ideation, hepatotoxicity, hypersensitivity reaction (esp. anaphylaxis, angioedema), lymphadenopathy, noninfectious colitis, other immune-mediated disorders, reactivation of latent infection, toxic skin reactions. Assess neurologic status for symptom improvement. Assess skin for rash, lesions.

Patient/family teaching

- A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Treatment may depress immune system and reduce ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Report travel plans to possible endemic areas.
- Do not receive live vaccines during treatment and up to 4 mos following last dose.
- Expect frequent tuberculosis screening.
- Treatment may cause signs of a common cold or flu-like symptoms.
- Allergic reactions such as difficulty breathing, hives, rash, swelling of the face or tongue, wheezing can happen at any time. If allergic reaction occurs, seek immediate medical attention.

- Treatment may cause worsening of chronic autoimmune disorders; inflammatory disorders such as toxic skin reactions, inflammation of the lymph nodes or colon, or life-threatening inflammation of the liver.
- Report abdominal pain, diarrhea, easy bruising, clay-colored stools, dark-amber urine, fatigue, loss of appetite, yellowing of skin or eyes; swelling or pain of lymph nodes.
- Immediately report thoughts of suicide or worsening of depression.

dalbavancin

dal-ba-van-sin

Dalvance

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Glycopeptide.

CLINICAL: Antibiotic.

Do not confuse dalbavancin with oritavancin or telavancin.

Uses

Treatment of adult pts with acute bacterial skin and skin structure infections (ABSSSI) caused by susceptible strains of gram-positive microorganisms, including *S. aureus* (methicillin-susceptible and methicillin-resistant strains), *S. pyogenes*, *S. agalactiae*, and *S. anginosus* group (including *S. anginosus*, *S. intermedius*, *S. constellatus*).

Precautions

Contraindications: Known hypersensitivity reaction to dalbavancin. **Cautions:** Hepatic/renal impairment, chronic hepatitis, hx alcohol abuse, hx hypersensitivity reaction to glycopeptides (e.g., vancomycin), recent *C. difficile* infection or antibiotic-associated colitis.

Action

Inhibits cell wall synthesis by binding to bacterial cell membrane. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed. Metabolism not defined. Protein binding: 93%. Primarily eliminated in urine. **Half-life:** 14.4 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk; use caution. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None known. **HERBAL:** None known. **FOOD:** None significant. **LAB VALUES:** May increase serum ALT, AST, bilirubin.

Availability (Rx)

Injection, Powder for Reconstitution: 500 mg.

Administration/handling

IV

 Must be reconstituted with Sterile Water for Injection and subsequently diluted with 5% Dextrose Injection only.

Reconstitution

- Reconstitute each 500-mg vial with 25 mL of Sterile Water for Injection for final concentration of 20 mg/mL.
- To avoid foaming, alternate between gentle swirling and inversion of vial until completely dissolved. Do not shake.
- Visually inspect for particulate matter. Solution should appear clear, colorless to yellow. Do not use if particulate matter observed.
- Aseptically transfer required dose into 5% dextrose to a final concentration of 1–5 mg/mL.

Rate of Administration

- Infuse over 30 min.

Storage

- Store unused vials at room temperature.

- Reconstituted vials/diluted bag may be refrigerated or stored at room temperature for up to 48 hrs.
- Do not freeze.

■ IV incompatibilities

Do not infuse with other medications or electrolytes. Saline-based solutions may cause precipitate formation. If using single IV access, flush IV with 5% dextrose before and after each use.

Indications/routes/dosage

Acute Bacterial Skin and Skin Structure Infection

IV: ADULTS/ELDERLY: (*Two-Dose Regimen*): 1,000 mg once, followed by 500 mg once 7 days later. (*Single-Dose Regimen*): 1,500 mg.

Dosage in Renal Impairment

CrCl less than 30 mL/min in pts who are not receiving regularly scheduled hemodialysis: (*Two-Dose Regimen*): 750 mg once, followed by 375 mg once 7 days later. (*Single-Dose Regimen*): 1,125 mg. **Pts receiving regularly scheduled hemodialysis:** No dose adjustment necessary.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Not defined; use caution.

Side effects

Occasional (6%–4%): Nausea, vomiting, diarrhea, headache. **Rare (3%–2%):** Rash, pruritus.

Adverse effects/toxic reactions

Serious hypersensitivity reactions including anaphylaxis or severe skin reactions have been reported with glycopeptide antibacterial agents. Too-rapid infusion may cause "red-man syndrome" reaction, characterized by flushing of upper

body, urticaria, pruritus, rash. *C. difficile*–associated diarrhea with severity ranging from mild diarrhea to fatal colitis has occurred. Drug-induced hepatotoxicity with hepatic enzymes greater than 3 times upper limit of normal has been reported. Treatment in the absence of proven or strongly suspected bacterial infection may increase risk of drug-resistant bacteria.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT, wound culture and sensitivity, vital signs. Question history of recent *C. difficile* infection, hepatic/renal impairment, hypersensitivity reaction. Assess skin wound characteristics, hydration status. Question pt's usual stool characteristics (color, frequency, consistency).

Intervention/evaluation

Assess skin infection/wound for improvement. Monitor daily pattern of bowel activity, stool consistency; increasing severity may indicate antibiotic-associated colitis. If frequent diarrhea occurs, obtain *C. difficile* toxin screen and initiate isolation precautions until result confirmed. Encourage PO intake. Monitor I&O. Monitor for "red-man syndrome" during infusion; stopping or slowing infusion may decrease reaction.

Patient/family teaching

- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increased risk of recurrent infection.
- Report any episodes of diarrhea, esp. following weeks after treatment completion. Frequent diarrhea, fever, abdominal pain, blood-streaked stool may indicate infectious diarrhea, which may be contagious to others.
- Report abdominal pain, black/tarry stools, bruising, yellowing of skin or eyes, dark urine, decreased urine output.
- Do not breastfeed.
- Drink plenty of fluids.

dalfampridine

dal-**fam**-pri-deen

Ampyra

Fampyra 

CLASSIFICATION

PHARMACOTHERAPEUTIC: Potassium channel blocker.

CLINICAL: Multiple sclerosis agent.

Do not confuse Ampyra with anakinra, or dalfampridine with desipramine.

Uses

Indicated to improve ambulation in pts with MS.

Precautions

Contraindications: Hypersensitivity to dalfampridine. History of seizures, moderate to severe renal impairment (CrCl equal to or less than 50 mL/min).

Cautions: Mild renal impairment (CrCl equal to 51–80 mL/min).

Action

Increases conduction of action potentials in demyelinated axons, inhibiting potassium channels. **Therapeutic Effect:** Improves ambulation in pts with multiple sclerosis (MS).

Pharmacokinetics

Rapidly absorbed from GI tract. Minimally metabolized in liver. Primarily excreted in urine. **Half-life:** 5.2–6.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known.
LAB VALUES: May increase creatinine clearance.

Availability (Rx)

 **Tablet, Film-Coated, Extended-Release:** 10 mg.

Administration/handling

PO

- May give without regard to food.
- Do not break, crush, dissolve, or divide tablets.

Indications/routes/dosage

Multiple Sclerosis

PO: ADULTS 18 YRS AND OLDER, ELDERLY: 10 mg twice daily.

Dosage in Renal Impairment

CrCl 50 mL/min or less: Contraindicated.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (9%–5%): Insomnia, dizziness, headache, nausea, asthenia, back pain.

Rare (4%–2%): Paresthesia, nasopharyngitis, constipation, dyspepsia, pharyngolaryngeal pain.

Adverse effects/toxic reactions

Urinary tract infection occurs in 12% of pts.

Nursing considerations

Baseline assessment

Obtain CBC, BUN, creatinine clearance, serum chemistries prior to treatment and routinely thereafter. Conduct baseline neurologic exam. Assess motor function, speech characteristics, gait, ability to ambulate.

Intervention/evaluation

Monitor CBC, serum chemistries, renal function tests, particularly creatinine clearance. Monitor for urinary, respiratory infection. Assess for therapeutic response (improvement in walking as demonstrated by increase in walking speed).

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report difficulty in sleeping, dizziness, headache, nausea, back pain, loss of strength or energy.
- Do not chew, crush, dissolve, or divide tablets.
- Inform physician if ambulation does not improve or worsens.

dalteparin

dal-te-par-in

Fragmin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Low molecular weight heparin.

CLINICAL: Anticoagulant.

■ **BLACK BOX ALERT** ■ Epidural or spinal anesthesia greatly increases potential for spinal or epidural hematoma, subsequent long-term or permanent paralysis.

Do not confuse dalteparin with heparin.

HIGH
ALERT

Uses

Prevention of ischemic complications in pts with unstable angina or non-Q-wave MI. Prevention of deep vein thrombosis (DVT) in pts undergoing hip replacement surgery or in pts undergoing abdominal surgery who are at risk for thromboembolic complications (e.g., pts older than 40 yrs, obese, pts with malignancy, history of DVT or PE, surgery requiring general anesthesia and lasting more than 30 min). Extended treatment of symptomatic venous thromboembolism (VTE) to reduce recurrence of VTE in cancer pts. Prevention of DVT or pulmonary embolism in acutely ill pts with severely restricted mobility.

Precautions

Contraindications: Active major bleeding; concurrent heparin therapy; hypersensitivity to dalteparin, heparin, pork products; unstable angina; history of heparin-induced thrombocytopenia (HIT), or HIT with thrombosis; non-Q-wave MI; prolonged venous thromboembolism undergoing epidural/neuraxial anesthesia. **Cautions:** Conditions with increased risk for hemorrhage, bacterial endocarditis, renal/hepatic impairment, uncontrolled hypertension, history of recent GI ulceration/hemorrhage, peptic ulcer disease, pericarditis, preexisting thrombocytopenia, recent childbirth, concurrent use of aspirin.

Action

Antithrombin in presence of low molecular weight heparin inhibits factor Xa, thrombin. Only slightly influences platelet aggregation, PT, aPTT. **Therapeutic Effect:** Produces anticoagulation.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcutaneous	N/A	4 hrs	N/A

Protein binding: less than 10%. **Half-life:** 3–5 hrs.

Lifespan considerations

Pregnancy/Lactation: Use with caution, particularly during last trimester,

immediate postpartum period (increased risk of maternal hemorrhage). Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Anticoagulants (e.g., warfarin), NSAIDs (e.g., ibuprofen, ketorolac, naproxen), platelet inhibitors (e.g., clopidogrel), thrombolytic agents (e.g., tPA) may increase risk of bleeding. **HERBAL:** Cat's claw, dong quai, evening primrose, garlic, ginseng, other herbs with anticoagulant/antiplatelet activity may increase antiplatelet activity. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST. May decrease serum triglycerides.

Availability (Rx)

Injection, Solution: 2,500 units/0.2 mL, 5,000 units/0.2 mL, 7,500 units/0.3 mL, 10,000 units/mL, 12,500 units/0.5 mL, 15,000 units/0.6 mL, 18,000 units/0.72 mL.

Administration/handling

Subcutaneous

- Visually inspect for particulate matter or discoloration.
- Subcutaneously insert needle into abdomen, outer thigh, or upper arm region and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, rashes, inflammation, or infection. Rotate injection sites.

Indications/routes/dosage

Abdominal Surgery

SQ: ADULTS, ELDERLY: (Low DVT Risk): 2,500 units 1–2 hrs before surgery, then daily for 5–10 days. **(High DVT Risk):** 5,000 units evening before surgery or 2,500 units 1–2 hrs before surgery, 2,500 units 12 hrs later, then 5,000 units daily for 5–10 days.

Total Hip Surgery

SQ: ADULTS, ELDERLY: 2,500 units 1–2 hrs before surgery, then 2,500 units 4–8 hrs after surgery, then 5,000 units/day (starting at least 6 hrs after postsurgical dose) for 10–14 days.

Unstable Angina, Non-Q-Wave MI

SQ: ADULTS, ELDERLY: 120 units/kg q12h for up to 5–8 days (**maximum:** 10,000 units/dose) given with aspirin. Discontinue dalteparin once clinically stable.

Venous Thromboembolism (Cancer Pts)

SQ: ADULTS, ELDERLY: Initially (1 mo), 200 units/kg (**maximum:** 18,000 units) daily for 30 days. **Maintenance (2–6 mos):** 150 units/kg once daily (**maximum:** 18,000 units). If platelet count 50,000–100,000 cells/mm³, reduce dose by 2,500 units until platelet count recovers to 100,000 cells/mm³ or more. If platelet count less than 50,000 cells/mm³, discontinue until platelet count recovers to more than 50,000 cells/mm³.

Prevention of DVT, Acutely Ill Pt, Immobile Pt

SQ:ADULTS, ELDERLY: 5,000 units once daily.

Dosage in Renal Impairment

For CrCl less than 30 mL/min, monitor anti-Xa levels to determine appropriate dose.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (7%–3%): Hematoma at injection site. **Rare (less than 1%):** Hypersensitivity reaction (chills, fever, pruritus, urticaria, asthma, rhinitis, lacrimation, headache); mild, local skin irritation.

Adverse effects/toxic reactions

Overdose may lead to bleeding complications ranging from local ecchymoses to major hemorrhage. Thrombocytopenia occurs rarely.

Nursing considerations

Baseline assessment

Obtain baseline coagulation studies, CBC, esp. platelet count. Determine baseline B/P. Screen for risk factors as listed in Precautions.

Intervention/evaluation

Periodically monitor CBC, stool for occult blood (no need for daily monitoring in pts with normal presurgical coagulation parameters). Assess for any sign of bleeding (bleeding at surgical site, hematuria, blood in stool, bleeding from gums, petechiae, bruising/bleeding at injection sites). Monitor for DVT (extremity pain, swelling, redness), pulmonary embolism (chest pain, dyspnea, hypoxia, tachycardia).

Patient/family teaching

- Usual length of therapy is 5–10 days.
- Do not take any OTC medication (esp. aspirin) without consulting physician.
- Report bleeding, bruising, dizziness, light-headedness, rash, itching, fever, swelling, breathing difficulty.
- Rotate injection sites daily.
- Teach proper injection technique.
- Excessive bruising at injection site may be lessened by ice massage before injection.
- Monitor for symptoms of blood clots in the leg (extremity pain, swelling, redness) or blood clots in the lungs (chest pain, difficulty breathing, shortness of breath, fast heart rate).

dantrolene

dan-troe-leen

Dantrium

Revonto

Ryanodex

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Calcium release blocker.

CLINICAL: Skeletal muscle relaxant.

■ **BLACK BOX ALERT** ■ Potential for hepatotoxicity.

Do not confuse Dantrium with danazol or Daraprim, or Revonto with Revatio.

Uses

PO: Relief of symptoms of spasticity due to spinal cord injuries, stroke, cerebral palsy, multiple sclerosis, esp. flexor spasms, concomitant pain, clonus, muscular rigidity. Management of malignant hyperthermia (MH), prevention of MH in susceptible individuals. **Parenteral:** Management of malignant hyperthermia. Prevention of malignant hyperthermia (preoperative/postoperative administration). **OFF-LABEL:** Neuroleptic malignant syndrome.

Precautions

Contraindications: Hypersensitivity to dantrolene. **IV:** None known. **PO:** When spasticity used to maintain posture/balance during locomotion or to obtain increased motor function. Active hepatic disease. **Cautions:** Cardiac/pulmonary impairment, history of previous hepatic disease.

Action

Interferes with release of calcium from sarcoplasmic reticulum of skeletal muscle. **Therapeutic Effect:** Dissociates excitation-contraction coupling. Interferes with catabolic process associated with malignant hyperthermia.

Pharmacokinetics

Poorly absorbed from GI tract. Protein binding: High. Metabolized in liver. Primarily excreted in urine. **Half-life: IV:** 4–8 hrs; **PO:** 8.7 hrs.

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Breastfeeding not recommended. **Children:** No age-related precautions noted in pts 5 yrs and older. **Elderly:** No precautions specified.

Interactions

DRUG: CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depression with short-term use. **Hepatotoxic medications (e.g., acetaminophen, ketoconazole, methotrexate, simvastatin)** may increase risk of hepatic toxicity with chronic use. **CYP3A4 inhibitors (e.g., clarithromycin)** may increase concentration. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May alter serum ALT, AST.

Availability (Rx)

Capsules: 25 mg, 50 mg, 100 mg. **Injection, Powder for Reconstitution:** 20-mg vial. **Injection Suspension:** 250 mg powder.

Administration/handling

IV

Reconstitution

- Reconstitute 20-mg vial with 60 mL Sterile Water for Injection (**not** Bacteriostatic Water for Injection). (**Ryanodex**): 250-mg vial with 5 mL Sterile Water for Injection.

Rate of Administration

- For therapeutic or emergency dose, give IV over 2–3 min.
- For IV infusion, administer over 1 hr.
- Diligently monitor for extravasation (high pH of IV preparation). May produce severe complications. (**Ryanodex**): Do not dilute; infuse into IV catheter or indwelling catheter. Infuse over 1 min.

Storage

- Store at room temperature.
- Use within 6 hrs after reconstitution.

- Solution is clear, colorless. Discard if cloudy, precipitate forms.

PO

- Give without regard to food.

■ IV incompatibilities

D₅W, 0.9% NaCl.

Indications/routes/dosage

Spasticity

PO:ADULTS, ELDERLY: Initially, 25 mg once daily for 7 days; then 25 mg 3 times/day for 7 days; then 50 mg 3 times/day for 7 days; then 100 mg 3 times/day. **Maximum:** 400 mg/day. **CHILDREN:** Initially, 0.5 mg/kg/dose once daily for 7 days; then 0.5 mg/kg/dose 3 times/day for 7 days; then 1 mg/kg/dose 3 times/day for 7 days; then 2 mg/kg/dose 3 times/day. Some pts may require dosing 4 times/day. **Maximum:** 400 mg/day.

Perioperative Prophylaxis for Malignant Hyperthermic Crisis

PO:ADULTS, ELDERLY, CHILDREN: 4–8 mg/kg/day in 3–4 divided doses beginning 1–2 days before surgery; give last dose 3–4 hrs before surgery.

IV:ADULTS, ELDERLY, CHILDREN: 2.5 mg/kg about 1.25 hrs before surgery with additional doses as needed.

Management of Malignant Hyperthermic Crisis

IV:ADULTS, ELDERLY, CHILDREN: Initially, a minimum of 2.5 mg/kg rapid IV; may repeat up to total cumulative dose of 10 mg/kg. May follow with 4–8 mg/kg/day PO in 4 divided doses up to 3 days after crisis.

Dosage in Renal/Hepatic Impairment

No dose adjustment. Contraindicated with active hepatic disease.

Side effects

Frequent: Drowsiness, dizziness, weakness, general malaise, diarrhea (mild).
Occasional: Confusion, diarrhea (severe), headache, insomnia, constipation, urinary frequency.
Rare: Paradoxical CNS excitement or restlessness, paresthesia, tinnitus, slurred speech, tremor, blurred vision, dry mouth, nocturia, impotence, rash, pruritus.

Adverse effects/toxic reactions

Risk of hepatotoxicity, most notably in females, pts 35 yrs and older, pts taking other hepatotoxic medications concurrently. Overt hepatitis noted most frequently between 3rd and 12th mo of therapy. Overdose results in vomiting, muscular hypotonia, muscle twitching, respiratory depression, seizures.

Nursing considerations

Baseline assessment

Obtain baseline LFT. Record onset, type, location, duration of muscular spasm. Check for immobility, stiffness, swelling.

Intervention/evaluation

Assist with ambulation. For pts on long-term therapy, hepatic/renal function tests, CBC should be performed periodically. Assess for therapeutic response: relief of pain, stiffness, spasm.

Patient/family teaching

- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol/other depressants.
- Report continued weakness, fatigue, nausea, diarrhea, skin rash, itching, bloody/tarry stools.

DAPTOmycin

dap-toe-mye-sin

Cubicin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Lipopeptide antibacterial agent.

CLINICAL: Antibiotic.

Do not confuse Cubicin with Cleocin, or DAPTOMycin with DACTINomycin.

Uses

Treatment of complicated skin/skin structure infections caused by susceptible strains of gram-positive pathogens, including *S. aureus* (methicillin susceptible and methicillin resistant [MRSA]), *S. pyogenes*, *S. agalactiae*. Treatment of *S. aureus* systemic infections caused by methicillin-susceptible and methicillin-resistant *S. aureus*. **OFF-LABEL:** Severe infections caused by MRSA or vancomycin-resistant *Enterococcus* (VRE); treatment of prosthetic joint infection caused by staphylococci or *Enterococcus*.

Precautions

Contraindications: Hypersensitivity to daptomycin. **Cautions:** Severe renal impairment (CrCl less than 30 mL/min), concurrent use of other medications associated with myopathy (e.g., statins).

Action

Binds to bacterial membranes and causes rapid depolarization of membrane potential. Inhibits protein, DNA, RNA synthesis. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed. Protein binding: 90%. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. **Half-life:** 7–8 hrs (increased in renal impairment).

⌚ Lifespan considerations

Pregnancy/Lactation: Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-

related precautions noted.

Interactions

DRUG: Concurrent use with **HMG-CoA reductase inhibitors (e.g., simvastatin)** may cause myopathy. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase CPK, serum potassium. May alter LFT results.

Availability (Rx)

Injection, Powder for Reconstitution: 500 mg/vial.

Administration/handling

IV

Reconstitution

- Reconstitute 500-mg vial with 10 mL 0.9% NaCl to provide a concentration of 50 mg/mL. May further dilute in 0.9% NaCl.
- Do not shake or agitate vial.

Rate of Administration

- For IV injection, give over 2 min (concentration: 50 mg/mL).
- For intermittent IV infusion (piggyback), infuse over 30 min.

Storage

- Refrigerate.
- Appears as pale yellow to light brown lyophilized cake.
- Reconstituted solution is stable for 12 hrs at room temperature or up to 48 hrs if refrigerated.
- Discard if particulate forms.

IV incompatibilities

Diluents containing dextrose. If same IV line is used to administer different drugs, flush line with 0.9% NaCl.

IV Compatibilities

0.9% NaCl, lactated Ringer's, aztreonam (Azactam), DOPamine, fluconazole (Diflucan), gentamicin, heparin, levoFLOXacin (Levaquin).

Indications/routes/dosage

Complicated Skin/Skin Structure Infections

IV: ADULTS, ELDERLY: 4 mg/kg every 24 hrs for 7–14 days.

Systemic Infections

IV: ADULTS, ELDERLY: 6–8 mg/kg once daily for 2–6 wks.

Dosage in Renal Impairment

CrCl less than 30 mL/min, hemodialysis (HD), peritoneal dialysis (PD): Dosage is 4 mg/kg q48h for skin and soft tissue infections; 6 mg/kg q48h for staphylococcal bacteremia. **Hemodialysis (HD):** Give dose after dialysis. **Continuous renal replacement therapy: Continuous Venovenous Hemodialysis (CVVHD):** 8 mg/kg q48h, **Continuous Venovenous Hemofiltration (CVVH) or Continuous Venovenous Hemodiafiltration (CVVHDF):** 8 mg/kg q48h or 4–6 mg/kg q24h.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (6%–5%): Constipation, nausea, peripheral injection site reactions, headache, diarrhea. **Occasional (4%–3%):** Insomnia, rash, vomiting. **Rare (less than 3%):** Pruritus, dizziness, hypotension.

Adverse effects/toxic reactions

Skeletal muscle myopathy (muscle pain/weakness, particularly of distal extremities) occurs rarely. Antibiotic-associated colitis (abdominal cramps, severe diarrhea, fever), other superinfections may result from altered bacterial balance in GI/GU tract.

Nursing considerations

Baseline assessment

Obtain CPK, blood cultures before first dose (therapy may begin before results are known). Question history of renal impairment. Screen for concomitant use of statins.

Intervention/evaluation

Assess oral cavity for white patches on mucous membranes, tongue (thrush). Monitor for myopathy (muscle pain, weakness), CPK levels, renal function tests. Monitor daily pattern of bowel activity, stool consistency. Mild GI effects may be tolerable, but increasing severity may indicate onset of antibiotic-associated colitis. Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Monitor for dizziness; institute appropriate measures.

Patient/family teaching

- Report rash, headache, nausea, dizziness, constipation, diarrhea, muscle pain, or any other new symptom.

daratumumab

dar-a-toom-ue-mab

Darzalex

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Antineoplastic.

Do not confuse daratumumab with adalimumab, ofatumumab, panitumumab, or necitumumab.

Uses

Monotherapy for the treatment of pts with multiple myeloma who have received at least three prior lines of therapy including a proteasome inhibitor and an immunomodulatory agent or who are double-refractory to a proteasome inhibitor and an immunomodulatory agent. In combination with dexamethasone and either

lenalidomide or bortezomib for treatment of multiple myeloma in pts who have received at least one prior therapy. In combination with pomalidomide and dexamethasone for treatment of multiple myeloma in pts who have received at least two prior therapies including lenalidomide and a proteasome inhibitor.

Precautions

Contraindications: Hypersensitivity to daratumumab. **Cautions:** Obstructive pulmonary disorders (e.g., COPD, emphysema), baseline cytopenias, herpes zoster infection, elderly.

Action

Binds to cell surface glycoprotein CD38 on CD38-expressing tumor cells. Inhibits tumor cell proliferation and induces apoptosis. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis. Promotes tumor cell death.

Pharmacokinetics

Widely distributed. Metabolism not specified. Steady state reached approx. 5 mos into the q4wk dosing period (by 21st infusion). Elimination not specified. **Half-life:** 18 ± 9 days.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm/malformations. Monoclonal antibodies are known to cross the placenta. Females of reproductive potential should use effective contraception during treatment and up to 3 mos after discontinuation. Unknown if distributed in breast milk. However, human immunoglobulin G is present in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May decrease effect of **BCG vaccine**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** Drug may be detected on both serum protein electrophoresis and immunofixation assays used to monitor multiple myeloma endogenous M protein. May affect the determination of complete

response and disease progression of some pts with immunoglobulin G kappa myeloma protein. May cause positive Coombs' test. Expected to decrease Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs.

Availability (Rx)

Injection Solution: 100 mg/5 mL, 400 mg/20 mL.

Administration/handling

IV

Preparation for Administration

- Calculate the dose and number of vials required based on weight in kg.
- Solution should appear colorless to pale yellow. Do not use if opaque particles, discoloration, or foreign particles are observed.
- Remove a volume from the 0.9% NaCl infusion bag that is equal to the required volume of the dose solution.
- Dilute in 1000 mL (first infusion) or 500 mL (subsequent infusions) 0.9% NaCl bag.
- Mix by gentle inversion. Do not shake or agitate.
- Infusion bags must be made of polyvinylchloride, polypropylene, polyethylene, or polyolefin blend.
- Diluted solution may develop very small translucent to white proteinaceous particles; do not use if diluted solution is discolored or if visibly opaque or foreign particles are observed.
- Discard used portions of vials.

Infusion Guidelines

- Prior to administration, premedicate with an IV corticosteroid, acetaminophen, and an IV or oral antihistamine approx. 60 min before each infusion (see manufacturer guidelines).
- Infuse using an in-line, sterile, nonpyrogenic, low protein-binding polyethersulfone filter (0.22 or 0.2 μm).
- Infuse via dedicated line using infusion pump.
- Do not administer as IV push or bolus.
- Infusion should be completed within 15 hrs.
- If infusion cannot be completed for any reason, do not save unused portions for reuse.

- Postinfusion, administer an oral corticosteroid on the first and second day after each infusion to reduce risk of delayed infusion reactions (see manufacturer guidelines).
- In pts with a history of obstructive pulmonary disease, consider short-acting and long-acting bronchodilators and an inhaled corticosteroid postinfusion (may discontinue if no infusion reaction occurs after the first four infusions).

Rate of Administration

- **First infusion (1000 mL volume):** Infuse at 50 mL/hr for the first 60 min. Increase in increments of 50 mL/hr q1hr if no infusion reactions occur. **Maximum:** 200 mL/hr.
- **Second infusion (500 mL volume):** Infuse at 50 mL/hr for the first 60 min. Increase in increments of 50 mL/hr q1hr if there were no grade 1 or greater infusion reactions during the first 3 hrs of first infusion. **Maximum:** 200 mL/hr.
- **Subsequent infusions (500 mL volume):** Infuse at 100 mL/hr if there were no grade 1 or greater infusion reactions during a final infusion rate of greater than or equal to 100 mL/hr in the first two infusions. Increase in increments of 50 mL/hr q1hr if tolerated. **Maximum:** 200 mL/hr.

Storage

- Refrigerate unused vials.
- Do not shake.
- May refrigerate diluted solution up to 24 hrs.
- If diluted solution is refrigerated, allow solution to warm to room temperature before use.
- Protect from light.

IV incompatibilities

Do not mix with other medications.

Indications/routes/dosage

Multiple Myeloma

IV: ADULTS, ELDERLY: (Monotherapy or combination with lenalidomide or pomalidomide/dexamethasone) Wks 1–8: 16 mg/kg once wkly. **Wks 9–24:** 16 mg/kg once q2wks. **Wk 25 and beyond:** 16 mg/kg once q4wks until disease progression. **(Combination with bortezomib/dexamethasone) Wks 1–9):** 16

mg/kg once wkly. **Wks 10–24):** 16 mg/kg q3wks. **Wk 25 and beyond:** 16 mg/kg q4wks until disease progression.

Dose Modification

Infusion Reactions

Promptly interrupt infusion if any reaction occurs.

Grade 1 or 2 reaction: Once symptoms resolve, resume infusion at a decreased rate that is 50% (or less) of previous rate. If no further reactions are observed, may increase infusion rate as appropriate.

Grade 3 reaction: If symptoms resolve to grade 2 or less, consider resuming infusion at a decreased rate that is 50% (or less) of previous rate. If no further reactions are observed, may increase rate as appropriate. If a grade 3 reaction recurs, decrease rate as outlined earlier. If grade 3 reaction occurs for a third time, permanently discontinue.

Grade 4 reaction: Permanently discontinue.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment.

Moderate to severe impairment: Not specified; use caution.

Side effects

Frequent (37%–14%): Fatigue, back pain, nausea, pyrexia, cough, nasal congestion, arthralgia, diarrhea, dyspnea, decreased appetite, extremity pain, constipation, vomiting. **Occasional (12%–10%):** Headache, musculoskeletal chest pain, chills, hypertension.

Adverse effects/toxic reactions

Anemia, leukopenia, neutropenia, thrombocytopenia are expected responses to therapy. Infusion reactions occurred in approx. 50% of pts (mostly during first infusion). Infusion reactions can also occur with subsequent infusions (mainly

during the infusion or within 4 hrs of completion). Severe infusion reactions may include cough, dyspnea, bronchospasm, hypertension, hypoxia, laryngeal edema, pulmonary edema, wheezing. Less common reactions may include chills, headache, hypotension, rash, nausea, pruritus, urticaria, vomiting. Infections including pneumonia, upper respiratory tract infection, nasopharyngitis reported in 20%–11% of pts. Herpes zoster reported in 3% of pts. Thrombocytopenia may increase risk of bleeding.

Nursing considerations

Baseline assessment

Obtain CBC, blood type and screen; vital signs. Obtain pregnancy test in female pts of reproductive potential. Question history of COPD, emphysema, herpes infection; prior hypersensitivity reaction to any drug in treatment regimen; prior infusion reaction. Assess nutritional status. Screen for active infection. Offer emotional support.

Intervention/evaluation

Monitor CBC, vital signs periodically. Administer in an environment equipped to monitor for and manage infusion reactions. If infusion reaction of any grade/severity occurs, immediately interrupt infusion and manage symptoms. Accurately record characteristics of infusion reactions (severity, type, time of onset). Reactions may affect future infusion rates. To prevent herpes zoster reactivation in pts with prior history, consider antiviral prophylaxis within 1 wk of starting treatment and continue for 3 mos following discontinuation. Monitor for infection. Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching

- Blood levels will be monitored periodically.
- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Avoid pregnancy. Do not breastfeed.
- Effective contraception is recommended during treatment and for at least 3 mos after final dose.
- Severe infusion reactions can occur at any time. Immediately report symptoms

of infusion reactions such as chills, cough, difficulty breathing, headache, hives, itching, nausea, rash, stuffy or runny nose, throat tightness, vomiting, wheezing.

darbepoetin alfa

dar-be-poe-e-tin al-fa

TOP
100

Aranesp

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Erythropoiesis stimulating agent (ESA).

CLINICAL: Hematopoietic agent.

■ **BLACK BOX ALERT** ■ Increased risk of serious cardiovascular events, thromboembolic events, mortality, time-to-tumor progression when administered to a target hemoglobin greater than 11 g/dL. Shortened overall survival and/or increased risk of tumor progression has been reported with breast, cervical, head/neck, NSCL cancers.

Do not confuse Aranesp with Aricept, or darbepoetin with dalteparin or epoetin.

Uses

Treatment of anemia associated with chronic renal failure (including pts on dialysis and pts not on dialysis), treatment of anemia caused by concurrent myelosuppressive chemotherapy in pts planned to receive chemotherapy for minimum of 2 additional months. **OFF-LABEL:** Treatment of symptomatic anemia in myelodysplastic syndrome (MDS).

Precautions

Contraindications: Hypersensitivity to darbepoetin. Pure red cell aplasia that begins after treatment with darbepoetin alfa or other erythropoietin protein medication. **Cautions:** History of seizures, hypertension. Not recommended in pts with mild to moderate anemia and HF or CAD.

Action

Stimulates formation of RBCs in bone marrow. **Therapeutic Effect:** Induces

erythropoiesis, release of reticulocytes from bone marrow into bloodstream.

Pharmacokinetics

Well absorbed after subcutaneous administration. **Half-life:** 48.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Contraceptives (e.g., estradiol, levonorgestrel), estrogens may increase risk of thrombosis. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum ferritin, serum transferrin saturation.

Availability (Rx)

Injection Solution: 10 mcg/0.4 mL, 25 mcg/mL, 40 mcg/mL, 60 mcg/mL, 100 mcg/mL, 150 mcg/0.75 mL, 200 mcg/mL, 300 mcg/mL. **Prefilled Syringe:** 25 mcg/0.42 mL, 40 mcg/0.4 mL, 60 mcg/0.3 mL, 100 mcg/0.5 mL, 150 mcg/0.3 mL, 200 mcg/0.4 mL, 300 mcg/0.6 mL, 500 mcg/mL.

Administration/handling

IV

Preparation

- Avoid excessive agitation of vial; do not shake (will cause foaming). Do not dilute.

Rate of Administration

- May be given as IV bolus.

Storage

- Refrigerate.
- Do not shake. Vigorous shaking may denature medication, rendering it inactive.

Subcutaneous

- Use 1 dose per vial; do not reenter vial. Discard unused portion.

■ IV incompatibilities

Do not mix with other medications.

Indications/routes/dosage

Anemia in Chronic Renal Failure

◀ALERT▶ Individualize dosing and use lowest dose to reduce need for RBC transfusions. **ON DIALYSIS:** Initiate when Hgb less than 10 g/dL; reduce or stop dose when Hgb approaches or exceeds 11 g/dL. **NOT ON DIALYSIS:** Initiate when Hgb less than 10 g/dL and Hgb decline would likely result in RBC transfusion; reduce dose or stop if Hgb exceeds 10 g/dL.

IV, SQ: ADULTS, ELDERLY:ON DIALYSIS: Initially, 0.45 mcg/kg once wkly or 0.75 mcg/kg once q2wks. **NOT ON DIALYSIS:** 0.45 mcg/kg q4wks.

Decrease dose by 25%: If Hgb approaches 12 g/dL or increases greater than 1 g/dL in any 2-wk period.

Increase dose by 25%: If Hgb does not increase by 1 g/dL after 4 wks of therapy and Hgb is below target range (with adequate iron stores). Do not increase dose more frequently than every 4 wks.

Note: If pt does not attain Hgb range of 10–12 g/dL after appropriate dosing over 12 wks, do not increase dose and use minimum effective dose to maintain Hgb level that will avoid red blood cell transfusions. Discontinue treatment if responsiveness does not improve.

Anemia Associated with Chemotherapy

◀ALERT▶ Initiate only if Hgb less than 10 g/dL and anticipated duration of myelosuppression is 2 months or longer. Titrate dose to maintain Hgb level and avoid RBC transfusions. Discontinue upon completion of chemotherapy.

SQ:ADULTS, ELDERLY: 2.25 mcg/kg once wkly or 500 mcg every 3 wks.

Increase dose: If Hgb does not increase by 1 g/dL after 6 wks and remains below 10 g/dL, increase dose to 4.5 mcg/kg once wkly. No dose adjustment if using q3wk dosing.

Decrease dose: Decrease dose by 40% if Hgb increases greater than 1 g/dL in

any 2-wk period or Hgb reaches level that will avoid red blood cell transfusions. **Note:** Withhold dose when Hgb exceeds a level needed to avoid RBC transfusions; resume at dose 40% lower when Hgb approaches a level where transfusions may be required.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Myalgia, hypertension/hypotension, headache, diarrhea. **Occasional:** Fatigue, edema, vomiting, reaction at injection site, asthenia, dizziness.

Adverse effects/toxic reactions

Cardiovascular events, including CVA, MI, venous thromboembolism, vascular access device thrombosis, mortality, may occur when given to target hemoglobin greater than 11 g/dL or during rapid rise in hemoglobin. Hypersensitivity reactions, including anaphylaxis, may occur. Cases of anemia and pure red cell aplasia may occur in pts with chronic renal disease when given subcutaneously.

Nursing considerations

Baseline assessment

Establish baseline CBC (esp. note Hgb, Hct). Assess B/P before drug administration. B/P often rises during early therapy in pts with history of hypertension. Assess serum iron (transferrin saturation should be greater than 20%), serum ferritin (greater than 100 ng/mL) before and during therapy. Consider supplemental iron therapy.

Intervention/evaluation

Monitor CBC, Hgb, reticulocyte count, serum BUN, creatinine, ferritin, potassium, phosphate. Monitor B/P aggressively for increase (25% of pts taking medication require antihypertension therapy, dietary restrictions).

Patient/family teaching

- Frequent blood tests needed to determine correct dose.
- Report swollen extremities, breathing difficulty, extreme fatigue, or severe headache.
- Avoid tasks requiring alertness, motor skills until response to drug is established.

darifenacin

dare-i-**fen**-a-sin

Enablex

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Muscarinic receptor antagonist.

CLINICAL: Urinary antispasmodic.

Uses

Management of symptoms of bladder overactivity (urge incontinence, urinary urgency/frequency).

Precautions

Contraindications: Hypersensitivity to darifenacin. Uncontrolled narrow-angle glaucoma, paralytic ileus, GI/GU obstruction, urine retention. **Cautions:** Bladder outflow obstruction, hepatic impairment, nonobstructive prostatic hyperplasia, decreased GI motility, constipation, hiatal hernia, reflux esophagitis, ulcerative colitis, controlled narrow-angle glaucoma, myasthenia gravis, concurrent use of strong CYP3A4 inhibitors. Hot weather and/or exercise.

Action

Acts as a direct antagonist at muscarinic receptor sites in cholinergically innervated organs; limits bladder contractions. **Therapeutic Effect:** Reduces symptoms of bladder irritability/overactivity (urge incontinence, urinary urgency/frequency), improves bladder capacity.

Pharmacokinetics

Well absorbed following PO administration. Protein binding: 98%. Metabolized in liver. Excreted in urine (60%), feces (40%). **Half-life:** 13–19 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (clarithromycin, erythromycin, protease inhibitors) may increase concentration/effects. **Anticholinergics** may increase side effects (e.g., dry mouth, constipation). **HERBAL:** St. John's wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** None known.

Availability (Rx)

 **Tablets (Extended-Release):** 7.5 mg, 15 mg.

Administration/handling

PO

- Give without regard to food.
- Administer extended-release tablets whole; do not break, crush, dissolve, or divide tablet.

Indications/routes/dosage

Overactive Bladder

PO: ADULTS, ELDERLY: Initially, 7.5 mg once daily. If response is not adequate after at least 2 wks, may increase to 15 mg once daily. Do not exceed 7.5 mg once daily in moderate hepatic impairment or concurrent use with CYP3A4 inhibitors (e.g., clarithromycin, fluconazole, protease inhibitors).

Dosage in Renal Impairment

No dose adjustment.

Dosage Hepatic Impairment

Moderate impairment: Maximum dose: 7.5 mg. **Severe impairment:** Not recommended.

Side effects

Frequent (35%–21%): Dry mouth, constipation. **Occasional (8%–4%):** Dyspepsia, headache, nausea, abdominal pain. **Rare (3%–2%):** Asthenia, diarrhea, dizziness, ocular dryness.

Adverse effects/toxic reactions

UTI occurs occasionally.

Nursing considerations

Baseline assessment

Monitor voiding pattern, assess signs/symptoms of overactive bladder prior to therapy as baseline.

Intervention/evaluation

Monitor I&O. Palpate bladder and use bladder scanner to assess for urine retention. Monitor daily pattern of bowel activity, stool consistency for evidence of constipation. Dry mouth may be relieved with sips of water. Assess for relief of symptoms of overactive bladder (urge incontinence, urinary frequency/urgency).

Patient/family teaching

- Swallow tablet whole; do not chew, crush, dissolve, or divide.
- Increase fluid intake to reduce risk of constipation.
- Avoid tasks that require alertness, motor skills until response to drug is established.

dar-**ue**-na-veer

Prezista

Fixed-combination(s)

Prezcobix: Darunavir/cobicistat (antiretroviral booster): 800 mg/150 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Protease inhibitor.

CLINICAL: Antiretroviral.

Uses

Treatment of HIV infection in combination with ritonavir and other antiretroviral agents in adults and children 3 yrs and older.

Precautions

Contraindications: Hypersensitivity to darunavir. Concurrent therapy with alfuzosin, colchicine (in pts with renal and/or hepatic impairment), dihydroergotamine, dronedarone, ergonovine, ergotamine, lovastatin, lurasidone, methylergonovine, oral midazolam, pimozide, ranolazine, rifAMPin, sildenafil (for treatment of PAH), simvastatin, St. John's wort, triazolam. **Cautions:** Diabetes mellitus, hemophilia, known sulfonamide allergy, hepatic impairment.

Action

Binds to site of HIV-I protease activity, inhibiting cleavage of viral precursors into functional proteins required for infectious HIV. **Therapeutic Effect:** Prevents formation of mature viral cells.

Pharmacokinetics

Readily absorbed following PO administration. Protein binding: 95%. Metabolized in liver. Eliminated in feces (79.5%), urine (13.9%). Not significantly removed by hemodialysis. **Half-life:** 15 hrs.

⌚ Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May increase concentration/effects of **amiodarone, bepridil, lidocaine, desipramine, colchicine, beta blockers, midazolam, PARoxetine, sertraline, atorvastatin, clarithromycin, cycloSPORINE, felodipine, inhaled fluticasone, lovastatin, niCARDipine, NIFEdipine, pravastatin, simvastatin, sirolimus, tacrolimus, traZODone, sildenafil, tadalafil, vardenafil. CYP3A4 inhibitors (e.g., itraconazole, ketoconazole, voriconazole)** may increase concentration. May decrease effects of **methadone, oral contraceptives.** **HERBAL:** **St. John's wort** may lead to loss of virologic response, potential resistance to darunavir. **FOOD:** **Food** increases plasma concentration. **LAB VALUES:** May increase aPTT, PT, serum alkaline phosphatase, bilirubin, amylase, lipase, cholesterol, triglycerides, uric acid. May decrease lymphocytes/neutrophil count, platelets, WBC count; serum bicarbonate, albumin, calcium. May alter serum glucose, sodium.

Availability (Rx)

Suspension, oral (Prezista): 100 mg/mL

 **Tablets (Prezista):** 75 mg, 150 mg, 400 mg, 600 mg, 800 mg.

Administration/handling

PO

- Give with food (increases plasma concentration).
- Coadministration with ritonavir required.
- Do not break, crush, dissolve, or divide film-coated tablets.
- Shake suspension prior to each dose. Use provided oral dosing syringe.

Indications/routes/dosage

Note: Genotypic testing recommended in therapy-experienced pts.

HIV Infection, Treatment Experienced

PO: ADULTS, ELDERLY: *(With 1 or more darunavir resistance–associated substitution):* 600 mg administered twice daily with 100 mg ritonavir twice daily. *(With no darunavir resistance–associated substitutions):* 800 mg with 100 mg ritonavir or 150 mg cobicistat once daily.

HIV Infection, Treatment Naive

PO: ADULTS, ELDERLY: 800 mg administered with 100 mg ritonavir or 150 mg cobicistat once daily.

Usual Dosage During Pregnancy

PO: ADULTS: 600 mg administered twice daily with 100 mg ritonavir twice daily.

Usual Pediatric Dose

Treatment naive or treatment experienced with no darunavir resistance–associated substitutions: (Once-daily dosing) (Suspension only): 14 kg: 490 mg with 96 mg ritonavir. **13 kg:** 455 mg with 80 mg ritonavir. **12 kg:** 420 mg with 80 mg ritonavir. **11 kg:** 385 mg with 64 mg ritonavir. **10 kg:** 350 mg with 64 mg ritonavir.

(Suspension or Tablets): 40 kg or greater: 800 mg with 100 mg ritonavir. **30–39 kg:** 675 mg with 100 mg ritonavir. **15–29 kg:** 600 mg with 100 mg ritonavir.

Treatment Experienced with 1 or More Darunavir Resistance–Associated Substitution

Use Tablet or Suspension

PO: CHILDREN WEIGHING 40 KG OR MORE: 600 mg twice daily with 100 mg ritonavir. **WEIGHING 30–39 KG:** 450 mg twice daily with 60 mg ritonavir. **WEIGHING 15–29 KG:** 375 mg twice daily with 48 mg ritonavir.

Use Oral Suspension Only

14 KG TO LESS THAN 15 KG: 280 mg (48 mg ritonavir) twice daily. **13 KG TO LESS THAN 14 KG:** 260 mg (40 mg ritonavir) twice daily. **12 KG TO LESS THAN 13 KG:** 240 mg (40 mg ritonavir) twice daily. **11 KG TO LESS**

THAN 12 KG: 220 mg (32 mg ritonavir) twice daily. **10 KG TO LESS THAN 11 KG:** 200 mg (32 mg ritonavir) twice daily.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Not recommended in severe impairment.

Side effects

Frequent (19%–13%): Diarrhea, nausea, headache, nasopharyngitis. **Occasional (3%–2%):** Constipation, abdominal pain, vomiting. **Rare (less than 2%):** Allergic dermatitis, dyspepsia, flatulence, abdominal distention, anorexia, arthralgia, myalgia, paresthesia, memory impairment.

Adverse effects/toxic reactions

Hypertension, MI, transient ischemic attack occur in less than 2% of pts. Acute renal failure, diabetes mellitus, dyspnea, worsening of hepatic impairment, skin reactions (including Stevens-Johnson syndrome, toxic epidermal necrolysis) occur rarely.

Nursing considerations

Baseline assessment

Obtain baseline LFT before beginning therapy and at periodic intervals during therapy. Perform blood testing for HIV genotype and viral load. Offer emotional support. Obtain full medication history.

Intervention/evaluation

Closely monitor for GI discomfort. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash, other skin reactions, chemistries, laboratory abnormalities, particularly hepatic profile, glucose, cholesterol, triglycerides. Assess for opportunistic infections (onset of fever, oral mucosa changes, cough, other respiratory symptoms).

Patient/family teaching

- Take medication with food.
- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- Darunavir is not a cure for HIV infection, nor does it reduce risk of transmission to others.
- Pt may continue to experience illnesses, including opportunistic infections.
- Diarrhea can be controlled with OTC medication.
- Report any skin reactions.

dasatinib

da-sa-ti-nib

HIGH
ALERT

Sprycel

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Protein-tyrosine kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse dasatinib with erlotinib, imatinib, or lapatinib.

Uses

Chronic myeloid leukemia (CML): Treatment of adults with chronic, accelerated, myeloid or lymphoid blast phase of CML with resistance, intolerance to prior therapy, including imatinib. Treatment of Philadelphia chromosome–positive (Ph⁺) CML in chronic phase of newly diagnosed pt. **Acute lymphoblastic leukemia:** Treatment of adults with Ph⁺ acute lymphoblastic leukemia (ALL) with resistance or intolerance to prior therapy, including imatinib. **OFF-LABEL:** Post–stem cell transplant follow-up treatment of CML. Treatment of GI stromal tumor.

Precautions

Contraindications: Hypersensitivity to dasatinib. **Cautions:** Hepatic impairment, myelosuppression (particularly thrombocytopenia), pts prone to fluid retention, those with prolonged QT interval, cardiovascular/pulmonary disease. Concomitant use of anticoagulants, CYP3A4 inducers/inhibitors may increase risk of pulmonary arterial hypertension.

Action

Reduces activity of proteins responsible for uncontrolled growth of leukemia cells by binding to most imatinib-resistant BCR-ABL mutations of pts with CML or ALL. **Therapeutic Effect:** Inhibits proliferation, tumor growth of CML and ALL cancer cell lines.

Pharmacokinetics

Extensively distributed in extravascular space. Protein binding: 96%. Metabolized in liver. Eliminated primarily in feces. **Half-life:** 3–5 hrs.

Lifespan considerations

Pregnancy/Lactation: Has potential for severe teratogenic effects, fertility impairment. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, saquinavir) may increase concentration. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration. **Antacids** alter pH-dependent solubility of dasatinib. **Famotidine, omeprazole** may reduce dasatinib absorption. **HERBAL:** St. John's wort, echinacea may decrease concentration. **FOOD:** Grapefruit products may increase concentration/toxicity (increased risk of torsades, myelotoxicity). **LAB VALUES:** May decrease WBC, platelets, Hgb, Hct, RBC; serum calcium, phosphates. May increase serum ALT, AST, bilirubin, creatinine.

Availability (Rx)

 **Tablets (Film-Coated):** 20 mg, 50 mg, 70 mg, 80 mg, 100 mg, 140 mg.

Administration/handling

PO

- Give without regard to food.
- Take with food or large glass of water if GI upset occurs.
- Avoid grapefruit products.
- Do not break, crush, dissolve, or divide film-coated tablets.
- Do not give antacids either 2 hrs prior to or within 2 hrs after dasatinib administration.

Indications/routes/dosage

Note: CYP3A4 Inhibitors: Consider decreasing dose from 100 mg to 20 mg or 140 mg to 40 mg.

CYP3A4 Inducers: Consider increasing dose with monitoring.

CML (Resistant or Intolerant)

PO: ADULTS, ELDERLY:(Chronic phase): 100 mg once daily. May increase to 140 mg once daily in pts not achieving cytogenetic response. **(Accelerated or blast phase):** 140 mg once daily. May increase to 180 mg once daily in pts not achieving cytogenetic response.

CML (Newly Diagnosed in Chronic Phase)

PO: ADULTS, ELDERLY: 100 mg once daily. May increase to 140 mg/day in pts not achieving cytogenetic response. **CHILDREN (1 YR AND OLDER): 45 kg or greater:** 100 mg once daily. May increase to 120 mg once daily. **30–44 kg:** 70 mg once daily. May increase to 90 mg once daily. **20–29 kg:** 60 mg once daily. May increase to 70 mg once daily. **10–19 kg:** 40 mg once daily. May increase to 50 mg once daily.

Ph+ ALL

PO: ADULTS, ELDERLY: 140 mg once daily. May increase to 180 mg once daily in pts not achieving cytogenetic response.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (50%–32%): Fluid retention, diarrhea, headache, fatigue, musculoskeletal pain, fever, rash, nausea, dyspnea. **Occasional (28%–12%):** Cough, abdominal pain, vomiting, anorexia, asthenia, arthralgia, stomatitis, dizziness, constipation, peripheral neuropathy, myalgia. **Rare (less than 12%):** Abdominal distention, chills, weight increase, pruritus.

Adverse effects/toxic reactions

Pleural effusion occurred in 8% of pts, febrile neutropenia in 7%, GI bleeding, pneumonia in 6%, thrombocytopenia in 5%, dyspnea in 4%; anemia, cardiac failure in 3%.

Nursing considerations

Baseline assessment

Obtain CBC weekly for first mo, biweekly for second mo, and periodically thereafter. Monitor LFT before treatment begins and monthly thereafter. Obtain baseline weight. Offer emotional support.

Intervention/evaluation

Assess lower extremities for pedal edema, early evidence of fluid retention. Weigh daily, monitor for unexpected rapid weight gain. Offer antiemetics to control nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Assess oral mucous membranes for evidence of stomatitis. Monitor CBC for neutropenia, thrombocytopenia; monitor hepatic function tests for hepatotoxicity.

Patient/family teaching

- Avoid crowds, those with known infection.
 - Avoid contact with anyone who recently received live virus vaccine; do not receive vaccinations.
 - Antacids may be taken up to 2 hrs before or 2 hrs after taking dasatinib.
 - Avoid grapefruit products.
 - Do not chew, crush, dissolve, or divide tablets.
-

DAUNOrubicin

HIGH
ALERT

daw-noe-roo-bi-sin

Cerubidine

DaunoXome

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Anthracycline antibiotic.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Irreversible cardiotoxicity may occur. Myelosuppressant. Lipid component may cause infusion-related effects (back pain, flushing, chest tightness) within first 5 min of infusion. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Caution in renal impairment or hepatic dysfunction. Potent vesicant.

DO NOT CONFUSE DAUNOrubicin with DACTINomycin, DOXOrubicin, epiRUBicin, IDArubicin, or valrubicin.

Uses

Cerubidine: Treatment of leukemias (acute lymphocytic [ALL], acute myeloid [AML]) in combination with other agents. **DaunoXome:** Advanced HIV-related Kaposi's sarcoma.

Precautions

Contraindications: Hypersensitivity to DAUNOrubicin. **Cautions:** Preexisting heart disease or bone marrow suppression, hypertension, concurrent chemotherapeutic agents, elderly, infants, radiation therapy.

Action

Inhibits DNA and RNA synthesis by intercalation between DNA base pairs and by steric obstruction. Cell cycle-phase nonspecific. **Therapeutic Effect:** Prevents cell division.

Pharmacokinetics

Widely distributed. Protein binding: High. Does not cross blood-brain barrier. Metabolized in liver. Excreted in urine (40%); biliary excretion (40%). **Half-life:** 18.5 hrs; metabolite: 26.7 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Cardiotoxicity may be more frequent; reduced bone marrow reserves require caution. Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Previous use of **DOXOrubicin**, concurrent use of **cyclophosphamide** increases risk of cardiotoxicity. **Hepatotoxic medications (e.g., acetaminophen, ketoconazole, methotrexate, simvastatin)** increase risk of hepatotoxicity. **Bone marrow depressants** may enhance myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL: Echinacea** may decrease level/effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, uric acid, AST.

Availability (Rx)

Injection Solution (Cerubidine): 5 mg/mL. **Injection Solution (DaunoXome):** 2 mg/mL.

Administration/handling

IV

ALERT **Cerubidine:** Give by IV push or IV infusion. **DaunoXome:** Give by IV infusion. May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

Reconstitution

Cerubidine

- May further dilute with 100 mL D₅W or 0.9% NaCl.

DaunoXome

- Must dilute with equal part D₅W to provide concentration of 1 mg/mL.
- Do not use any other diluent.

Rate of Administration

Cerubidine

- For IV push, withdraw desired dose into syringe containing 10–15 mL 0.9% NaCl. Inject over 1–5 min into tubing of rapidly infusing IV solution of D₅W or 0.9% NaCl.
- For IV infusion, further dilute with 100 mL D₅W or 0.9% NaCl. Infuse over 15–30 min.
- Extravasation produces immediate pain, severe local tissue damage. Aspirate as much infiltrated drug as possible, then infiltrate area with hydrocortisone sodium succinate injection (50–100 mg hydrocortisone) and/or isotonic sodium thiosulfate injection or ascorbic acid injection (1 mL of 5% injection). Apply cold compresses.

DaunoXome

- Infuse over 60 min.
- Do not use in-line filter.

Storage

Cerubidine

- Refrigerate intact vials.
- Protect from light.
- Solutions prepared for infusion stable for 24 hrs at room temperature.

DaunoXome

- Refrigerate unopened vials.
- Reconstituted solution is stable for 6 hrs if refrigerated.
- Do not use if opaque.

■ IV incompatibilities

Allopurinol (Aloprim), aztreonam (Azactam), cefepime (Maxipime), dexamethasone (Decadron), heparin, piperacillin and tazobactam (Zosyn).

DaunoXome: Do not mix with any other solution, esp. NaCl or bacteriostatic agents (e.g., benzyl alcohol).

■ IV Compatibilities

Granisetron (Kytril), ondansetron (Zofran).

Indications/routes/dosage

◀ALERT▶ Refer to individual protocols. **Cerubidine:** Cumulative dose should not exceed 550 mg/m² in adults (increased risk of cardiotoxicity) or 400 mg/m² in those receiving chest irradiation.

Acute Lymphoblastic Leukemia

IV: (Cerubidine): ADULTS, ELDERLY: 45 mg/m² on days 1, 2, and 3 (in combination with vinCRISStine, predniSONE, asparaginase). **CHILDREN 2 YRS AND OLDER AND BODY SURFACE AREA 0.5 m² OR GREATER:** 25 mg/m² on day 1 of every wk for up to 4–6 cycles (in combination with vinCRISStine, predniSONE). **CHILDREN YOUNGER THAN 2 YRS, OR BODY SURFACE AREA LESS THAN 0.5 m²:** 1 mg/kg/dose on day 1 of every wk for up to 4 to 6 cycles (in combination with vinCRISStine, predniSONE).

Acute Myeloid Leukemia

IV: (Cerubidine): ADULTS YOUNGER THAN 60 YRS: 45 mg/m² on days 1, 2, and 3 of induction course, then on days 1 and 2 of subsequent courses (in combination with cytarabine). **ADULTS 60 YRS AND OLDER:** 30 mg/m² on days 1, 2, and 3 of induction course, then on days 1 and 2 of subsequent courses (in combination with cytarabine).

Kaposi's Sarcoma

IV: (DaunoXome): ADULTS: 40 mg/m² over 1 hr repeated q2wks until disease progression.

Dosage in Renal Impairment

Cerubidine: Serum creatinine greater than 3 mg/dL: 50% of normal dose.
DaunoXome: Serum creatinine greater than 3 mg/dL: 50% of normal dose.

Dosage in Hepatic Impairment

Cerubidine: Bilirubin 1.2–3 mg/dL: 75% of normal dose. **Bilirubin 3.1–5 mg/dL:** 50% of normal dose. **Bilirubin greater than 5 mg/dL:** DAUNOrubicin is not recommended for use in this pt population.

DaunoXome: Bilirubin 1.2–3 mg/dL: 75% of normal dose. **Bilirubin greater than 3 mg/dL:** 50% of normal dose.

Side effects

Frequent: Complete alopecia (scalp, axillary, pubic), nausea, vomiting (beginning a few hrs after administration and lasting 24–48 hrs). **DaunoXome:** Mild to moderate nausea, fatigue, fever. **Occasional:** Diarrhea, abdominal pain, esophagitis, stomatitis, transverse pigmentation of fingernails, toenails. **Rare:** Transient fever, chills.

Adverse effects/toxic reactions

Myelosuppression manifested as hematologic toxicity (severe leukopenia, anemia, thrombocytopenia). Decrease in platelet count, WBC count occurs in 10–14 days, returns to normal level by third week. Cardiotoxicity noted as either acute, transient, abnormal. EKG findings and/or cardiomyopathy manifested as HF (risk increases when cumulative dose exceeds 550 mg/m² in adults, 300 mg/m² in children 2 yrs and older, or total dosage greater than 10 mg/kg in children younger than 2 yrs).

Nursing considerations

Baseline assessment

Obtain WBC, platelet, erythrocyte counts before and at frequent intervals during therapy. EKG should be obtained before therapy. Antiemetics may be effective in preventing, treating nausea. Obtain accurate height and weight for dose calculation. Offer emotional support.

Intervention/evaluation

Monitor for stomatitis. May lead to ulceration within 2–3 days. Assess skin, nailbeds for hyperpigmentation. Monitor hematologic status, renal/hepatic function, serum uric acid. Monitor daily pattern of bowel activity, stool

consistency. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness).

Patient/family teaching

- Urine may turn reddish color for 1–2 days after beginning therapy.
- Hair loss is reversible, but new hair growth may have different color, texture.
- New hair growth resumes about 5 wks after last therapy dose.
- Maintain strict oral hygiene.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, yellowing of whites of eyes/skin, difficulty breathing.
- Increase fluid intake (may protect against hyperuricemia).
- Report for persistent nausea, vomiting.

deferasirox

dee-**fur**-a-sir-ox

Exjade

Jadenu

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Iron-chelating agent.

CLINICAL: Iron reduction agent.

■ **BLACK BOX ALERT** ■ May cause renal/hepatic failure, hepatotoxicity, gastrointestinal hemorrhage.

Do not confuse deferasirox with deferoxamine.

Uses

Treatment of chronic iron overload due to blood transfusions (transfusional hemosiderosis) or due to non–transfusion-dependent thalassemia syndrome.

Precautions

Contraindications: Hypersensitivity to deferasirox. Platelet counts less than 50,000 cells/mm³; poor performance status, high-risk myelodysplastic syndromes or advanced malignancies; CrCl less than 40 mL/min or serum creatinine greater than 2 times the upper limit of normal. **Cautions:** Renal/hepatic impairment, elderly, concurrent medications that may increase GI effects (e.g., NSAIDs).

Action

Selective for iron. Binds iron with high affinity in a 2:1 ratio. **Therapeutic Effect:** Induces iron excretion.

Pharmacokinetics

Well absorbed following PO administration. Protein binding: 99%. Metabolized in liver. Excreted in feces (84%), urine (8%). **Half-life:** 8–16 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended for pts younger than 2 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Antacids containing aluminium, cholestyramine, PHENobarbital, phenytoin, rifAMPin, ritonavir decrease concentration/effects. May decrease effects of cycloSPORINE, simvastatin, oral contraceptives. May increase concentration of cyclobenzaprine, OLANzapine, tiZANidine. **HERBAL:** None significant. **FOOD:** Bioavailability is variably increased when given with food. **LAB VALUES:** Decreases serum ferritin. May increase serum ALT, AST, creatinine; urine protein.

Availability (Rx)

Tablets (Jadenu): 90 mg, 180 mg, 360 mg. **Tablets, Soluble (Exjade):** 125 mg, 250 mg, 500 mg.

Administration/handling

PO

- Give on empty stomach 30 min before food.
- Do not give simultaneously with aluminum-containing antacids, cholestyramine.
- Tablets for suspension should not be chewed or swallowed whole.
- Disperse tablet by stirring in water, apple juice, orange juice until fine suspension is achieved.
- Dosage less than 1 g should be dispersed in 3.5 oz of liquid, dosage more than 1 g should be dispersed in 7 oz of liquid. If any residue remains in glass, resuspend with a small amount of liquid.
- Give regular tablets whole with water.

Indications/routes/dosage

Iron Overload Due to Transfusions

PO: ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER: (*Exjade*): Initially, 20 mg/kg once daily. **Maintenance:** (Titrate to individual response and goals.) Adjust dosage by 5 or 10 mg/kg/day every 3–6 mos based on serum ferritin levels. Consider holding for serum ferritin less than 500 mcg/L. **Maximum:** 40 mg/kg once daily. (*Jadenu*): Initially, 14 mg/kg once daily. **Maintenance:** (Titrate to individual response and goals.) Adjust dosage by 3.5 or 7 mg/kg/day based on serum ferritin levels. Consider holding for serum ferritin less than 500 mcg/L. **Maximum:** 28 mcg/kg once daily.

Thalassemia Syndromes

PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER: (*Exjade*): Initially, 10 mg/kg once daily. May increase to 20 mg/kg once daily after 4 wks if baseline iron is greater than 15 mg Fe/g dry wgt. (*Jadenu*): Initially, 7 mg/kg once daily. May increase to 14 mg/kg/day after 4 wks if baseline iron greater than 15 mg Fe/g dry wgt. **Maintenance: (*Exjade/Jadenu*):** Dose adjustments based on serum ferritin and hepatic iron concentrations.

Dosage in Renal Impairment

Note: See Contraindications.

ADULTS: For increase in serum creatinine greater than 33% on 2 consecutive measures, reduce daily dose by 10 mg/kg. **CHILDREN:** For increase in serum creatinine above age-appropriate upper limit of normal on 2 consecutive measures, reduce daily dose by 10 mg/kg. **CrCl 40–60 mL/min:** Reduce starting dose by 50%.

Dosage in Hepatic Impairment

For severe or persistent elevations in hepatic function tests, consider dose reduction or discontinuation. **Moderate impairment:** Reduce initial dose by 50%.

Side effects

Frequent (19%–10%): Fever, headache, abdominal pain, cough, nasopharyngitis, diarrhea, nausea, vomiting. **Occasional (9%–4%):** Rash, arthralgia, fatigue, back pain, urticaria. **Rare (1%):** Edema, sleep disorder, dizziness, anxiety.

Adverse effects/toxic reactions

Bronchitis, pharyngitis, acute tonsillitis, ear infection occur occasionally. Hepatitis, auditory disturbances, ocular abnormalities occur rarely. Acute renal failure, cytopenias (e.g., agranulocytosis, neutropenia, thrombocytopenia) may occur.

Nursing considerations

Baseline assessment

Obtain baseline serum CBC, ferritin, iron, creatinine, ALT, AST, urine protein, then monthly thereafter. Auditory, ophthalmic testing should be obtained before therapy and annually thereafter.

Intervention/evaluation

Treatment should be interrupted if serum ferritin levels are consistently less than 500 mcg/L. Suspend treatment if severe rash occurs.

Patient/family teaching

- Take on empty stomach 30 min before food.
- Do not chew or swallow soluble tablets; disperse tablet completely in water, apple juice, orange juice; drink resulting suspension immediately.
- Do not take aluminum-containing antacids concurrently.
- Report severe skin rash, changes in vision/hearing, or yellowing of skin/eyes.

delafloxacin

del-a-floks-a-sin

Baxdela

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Fluoroquinolone.

CLINICAL: Antibiotic.

■ **BLACK BOX ALERT** ■ May increase risk of tendonitis, tendon rupture, peripheral neuropathy, central nervous system effects. May exacerbate muscle weakness in pts with myasthenia gravis (avoid use).

Do not confuse delafloxacin with ciprofloxacin, gatifloxacin, moxifloxacin, norfloxacin, levofloxacin, or Baxdela with Pradaxa.

Uses

Treatment of adult pts with acute bacterial skin and skin structure infections (ABSSSI) caused by susceptible strains of gram-positive microorganisms including *S. aureus* (including methicillin-susceptible [MSSA] and methicillin-resistant [MRSA] strains), *S. haemolyticus*, *S. lugdunensis*, *S. agalactiae*, *S. anginosus* group (including *S. anginosus*, *S. intermedius*, *S. constellatus*), *S. pyogenes*, and *E. faecalis*; gram-negative microorganisms *E. coli*, *E. cloacae*, *K. pneumoniae*, *P. aeruginosa*.

Precautions

Contraindications: Known hypersensitivity to delafloxacin, other fluoroquinolones. **Cautions:** Pts with known or suspected CNS disorders, risk factors predisposing to seizures or lowering seizure threshold, diabetes, elderly,

renal impairment; pts at risk for tendon rupture, tendonitis (e.g., renal failure, concomitant use of corticosteroids; solid organ transplant recipient, elderly pts). Avoid use in pts who previously experienced peripheral neuropathy; pts with history of myasthenia gravis.

Action

Inhibits the DNA enzyme gyrase in susceptible microorganisms, interfering with bacterial cell replication and repair. **Therapeutic Effect:** Bactericidal.

Pharmacokinetics

Widely distributed following PO, IV administration. Protein binding: 84%. Peak plasma concentration: 1 hr. Excreted in urine (IV: 65%, PO: 50%), feces (IV: 28%, PO: 48%). Partially removed by hemodialysis. **Half-life:** IV: 3.7 hrs, PO: 4.2–8.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk; however, other fluoroquinolones are known to be distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of tendon rupture, tendonitis. Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Aluminum-, calcium-, or magnesium-containing antacids, iron preparations, sucralfate, or sevelamer may decrease absorption. May decrease concentration/effect of **BCG vaccine, didanosine; quinapril** may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, CPK, creatinine. May increase or decrease serum glucose.

Availability (Rx)

Injection, Powder for Reconstitution: 300 mg. **Tablets:** 450 mg.

Administration/handling

PO

- Do not give antacids (aluminum, magnesium), sucralfate, iron, multivitamin preparations with zinc, didanosine (buffered tablets for oral suspension, pediatric powder for oral solution) at least 2 hrs before or 6 hrs after administration (significantly reduces absorption).
- Give tablet with or without food.
- Administer tablets whole; do not cut, crush, or divide.
- If a dose is missed, administer as soon as possible up to 8 hrs before next scheduled dose. If less than 8 hrs remain until next scheduled dose or if vomiting occurs after administration, give dose at next regularly scheduled time.

IV

Reconstitution

- Reconstitute vial with 10.5 mL D₅W or 0.9% NaCl for a concentration of 300 mg/12 mL (25 mg/mL).
- Shake until completely dissolved.
- Visually inspect for particulate matter or discoloration. Solution should appear clear yellow to amber in color.
- Withdraw proper dose volume from vial (12 mL for 300-mg dose or 8 mL for 200-mg dose), and dilute in 250 mL D₅W or 0.9% NaCl.

Rate of Administration

- Infuse over 60 min.

Storage

- Store unused vials at room temperature.
- Reconstituted vials/diluted solution may be refrigerated or stored at room temperature for up to 24 hrs.
- Do not freeze.

IV incompatibilities

Do not infuse with other solutions containing calcium, magnesium, other multivalent cations. Do not infuse with other medications.

Indications/Routes/Dosage

Acute Bacterial Skin and Skin Structure Infections

IV: ADULTS, ELDERLY: 300 mg q12hrs for 5–14 days (or transition to PO for total of 5–14 days).

PO: ADULTS, ELDERLY: 450 mg q12hrs for total duration of 5–14 days (which includes switching from IV to PO).

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and severity of the infection.

GFR	Dosage
30–89 mL/min	PO/IV: No dose adjustment
15–29 mL/min	PO: No dose adjustment
	IV: 200 mg q12hrs or switch to 450 mg PO at physician discretion
Less than 15 mL/min, ESRD, HD, PD	PO/IV: Not recommended

Dosage in Hepatic Impairment

No dose adjustment.

Side Effects

Occasional (8%): Nausea, diarrhea. **Rare (3%-2%):** Headache, vomiting.

Adverse Effects/Toxic Reactions

C. difficile–associated diarrhea or colitis, with severity ranging from mild diarrhea to fatal colitis, was reported; may occur greater than 2 mos after discontinuation. May increase risk of development of drug-resistant bacteria when used in the absence of a proven or strongly suspected bacterial infection. Superinfection (genital/anal pruritus, ulceration/changes to oral mucosa, moderate to severe diarrhea) may occur from altered bacterial balance in GI tract. May increase risk of tendonitis, tendon rupture, irreversible peripheral neuropathy; CNS effects including agitation, anxiety, confusion, depression, dizziness, hallucinations, nightmares, paranoia, tremors, vertigo. May exacerbate muscle weakness in pts with myasthenia gravis. Hypersensitivity reactions, including anaphylaxis, have occurred in pts receiving fluoroquinolones.

Nursing Considerations

Baseline Assessment

Obtain BUN, serum creatinine; CrCl, GFR in pts with renal impairment; LFT in pts with hepatic impairment. Obtain bacterial culture and sensitivity prior to administration. Question pt's usual stool characteristics (color, frequency, consistency). Question medical history as listed in Precautions, esp. cardiac conduction disorders, CNS disorders; prior hypersensitivity reaction.

Intervention/Evaluation

Monitor for CNS reactions (agitation, anxiety, convulsions, depression, hallucinations, increased ICP, insomnia, nightmares, suicidal ideation and behavior), peripheral neuropathy; hypersensitivity reactions (angioedema, dyspnea, itching, hypotension, urticaria); muscle weakness, voice dystonia in pts with myasthenia gravis; pain, swelling, bruising, popping of tendons. Be alert for superinfections. Obtain EKG if palpitations occur or cardiac arrhythmia suspected. Observe daily pattern of bowel activity, stool consistency (increased severity may indicate antibiotic-associated colitis). If frequent diarrhea occurs, obtain *C. difficile* toxin screen, and initiate isolation precautions until test result confirmed. Antibacterial drugs that are not directed against *C. difficile* infection may need to be discontinued. Monitor I&O.

Patient/Family Teaching

- It is essential to complete drug therapy despite symptom improvement. Early discontinuation may result in antibacterial resistance or increase risk of recurrent infection.
- Report any episodes of diarrhea, esp. in the first few mos after final dose. Frequent abdominal pain, blood-streaked stool, foul-smelling diarrhea, fever may indicate infectious diarrhea, which may be contagious to others.
- Severe allergic reactions such as hives, palpitations, rash, shortness of breath, tongue swelling may occur.
- Tendon inflammation/swelling, tendon rupture may occur; report bruising, pain, swelling, snapping, or popping of tendons.
- Immediately report nervous system problems such as anxiety, confusion, dizziness, nervousness, nightmares, thoughts of suicide, seizures, tremors, trouble sleeping.

- Treatment may cause heart problems such as low heart rate, palpitations; permanent nerve damage such as burning, numbness, tingling, weakness.
- Do not take aluminum- or magnesium-containing antacids, multivitamins, zinc or iron products at least 2 hrs before or 6 hrs after dose.
- Drink plenty of fluids.

denosumab

den-oh-sue-mab

TOP
100

Prolia

Xgeva

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody (with affinity for RANKL).

CLINICAL: Bone-modifying agent.

Do not confuse denosumab with daclizumab, or Prolia with Avandia or Zebeta.

Uses

Prolia: Treatment of osteoporosis in postmenopausal women at high risk for fracture. Treatment to increase bone mass in men at high risk for fractures; treatment of bone loss in men receiving androgen deprivation therapy for nonmetastatic prostate cancer and in women at high risk for fractures receiving adjuvant aromatase inhibitor therapy for breast cancer. **Xgeva:** Prevention of skeletal-related events (e.g., fracture, spinal cord compression) in pts with bone metastases from solid tumor. Treatment of giant cell tumor of bone in adults and skeletally mature adolescents. Treatment of hypercalcemia of malignancy refractory to biphosphonate therapy. **OFF-LABEL:** Treatment of bone destruction caused by rheumatoid arthritis.

Precautions

Contraindications: Hypersensitivity to denosumab. **Prolia:** Preexisting hypocalcemia, pregnancy. **Cautions:** History of hypoparathyroidism,

thyroid/parathyroid surgery, malabsorption syndromes, excision of small intestine, immunocompromised pts. Pts with severe renal impairment or receiving dialysis (greater risk for developing hypocalcemia). Pts with impaired immune system or immunosuppressive therapy.

Action

Binds to RANK ligand (transmembrane protein), preventing osteoclast formation. **Therapeutic Effect:** Decreases bone resorption; increases bone mass in osteoporosis; decreases skeletal-related events and tumor-induced bone destruction in solid tumors. Inhibits tumor growth.

Pharmacokinetics

Serum level detected 1 hr after administration. **Half-life:** 32 days.

Lifespan considerations

Pregnancy/Lactation: Approved for use only in postmenopausal women. **Children:** Approved for use only in postmenopausal women. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum calcium. May increase serum cholesterol.

Availability (Rx)

Injection, Solution (Prolia): 60 mg/mL. **(Xgeva):** 120 mg/1.7 mL.

Administration/handling

Subcutaneous

- Administer in upper arm, upper thigh, or abdomen.

Storage

- Refrigerate. Use within 14 days once at room temperature.
- Solution appears as clear, colorless to pale yellow.

Indications/routes/dosage

Note: Administer calcium and vitamin D to prevent/treat hypocalcemia.

Prolia

Androgen Deprivation, Bone Loss, Osteoporosis

SQ: ADULTS, ELDERLY: 60 mg every 6 mos.

Xgeva

Prevention of Skeletal-Related Events from Solid Tumors

SQ: ADULTS, ELDERLY: 120 mg q4wks.

Xgeva

Giant Cell Tumor of Bone, Hypercalcemia of Malignancy

SQ: ADULTS, ELDERLY, MATURE ADOLESCENTS: 120 mg q4wks with additional doses on days 8 and 15 of first mo of therapy.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (35%–12%): Back pain, extremity pain. **Occasional (8%–5%):** Musculoskeletal pain, vertigo, peripheral edema, sciatica. **Rare (4%–2%):** Bone pain, upper abdominal pain, rash, insomnia, flatulence, pruritus, myalgia, asthenia, GI reflux.

Adverse effects/toxic reactions

Increases risk of infection, specifically cystitis, upper respiratory tract infection, pneumonia, pharyngitis, herpes zoster (shingles) occur in 2%–6% of pts. Osteonecrosis of the jaw (OJN) was reported. Suppression of bone turnover, pancreatitis have been reported.

Nursing considerations

Baseline assessment

Hypocalcemia must be corrected prior to treatment. Calcium 1,000 mg/day and vitamin D at least 400 international units/day should be given. Dental exam should be provided prior to treatment. Recommend baseline bone density scan.

Intervention/evaluation

Monitor serum magnesium, calcium, ionized calcium, phosphate. In pts predisposed with hypocalcemia and disturbances of mineral metabolism, clinical monitoring of calcium, mineral levels is highly recommended. Adequately supplement all pts with calcium and vitamin D. Monitor for delayed fracture healing.

Patient/family teaching

- Report rash, new-onset eczema.
- Seek prompt medical attention if signs, symptoms of severe infection (rash, itching, reddened skin, cellulitis) occur.
- Report muscle stiffness, numbness, cramps, spasms (signs of hypocalcemia); swelling or drainage from jaw, mouth, or teeth.

desmopressin

des-moe-press-in

Apo-Desmopressin 

DDAVP

DDAVP Rhinal Tube

Stimate

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Synthetic pituitary hormone.

CLINICAL: Antidiuretic.

Uses

DDAVP Nasal: (DDAVP Rhinal Tube): Antidiuretic replacement therapy in managing central cranial diabetes insipidus. Management of temporary polyuria and polydipsia following head trauma or surgery in the pituitary region. **Parenteral:** Antidiuretic replacement therapy in managing central cranial diabetes insipidus. Manage polyuria and polydipsia following head trauma or surgery in pituitary region. Maintain hemostasis and control bleeding in hemophilia A, von Willebrand's disease (type I). **Stimate intranasal:** Maintain hemostasis and control bleeding due to spontaneous or trauma-induced injuries in hemophilia A, von Willebrand's disease (type I). **PO:** Antidiuretic replacement therapy in managing central cranial diabetes insipidus, primary management of nocturnal enuresis, management of temporary polyuria, polydipsia following pituitary surgery or head trauma. **OFF-LABEL:** Uremic bleeding occurring with acute/chronic renal failure; prevent surgical bleeding in pts with uremia.

Precautions

Contraindications: Hypersensitivity to desmopressin. Hyponatremia, history of hyponatremia, moderate to severe renal impairment. **Cautions:** Predisposition to thrombus formation; conditions with fluid, electrolyte imbalance; coronary artery disease; hypertensive cardiovascular disease, elderly pts, cystic fibrosis, HF, renal impairment, polydipsia. Avoid use in hemophilia A with factor VIII levels less than 5%; hemophilia B; severe type I, type IIB, platelet-type von Willebrand's disease.

Action

Increases cAMP in renal tubular cells, which increases water permeability, decreasing urine volume. Increases levels of von Willebrand factor, factor VIII, tissue plasminogen activator (tPA). **Therapeutic Effect:** Shortens activated partial thromboplastin time (aPTT), bleeding time. Decreases urinary output.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	1 hr	2-7 hrs	8-12 hrs
IV	15-30 min	1.5-3 hrs	8-12 hrs

Intranasal	15 min–1 hr	1–5 hrs	8–12 hrs
------------	-------------	---------	----------

Poorly absorbed after PO, nasal administration. Metabolism: Unknown. **Half-life: PO:** 1.5–2.5 hrs. **Intranasal:** 3.3–3.5 hrs. **IV:** 0.4–4 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Caution in neonates, pts younger than 3 mos (increased risk of fluid balance problems). Careful fluid restrictions recommended in infants. **Elderly:** Increased risk of hyponatremia, water intoxication.

Interactions

DRUG: CarBAMazepine, lamoTRIGine, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), SSRIs (e.g., citalopram, sertraline), tricyclic antidepressants (e.g., amitriptyline, doxepin, nortriptyline) may increase effect. Demeclocycline, lithium may decrease effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

Availability (Rx)

Injection Solution (DDAVP): 4 mcg/mL. **Nasal Solution (DDAVP Rhinal Tube 0.01%):** 100 mcg/mL (10 mcg/spray). **Nasal Spray (Stimate):** 1.5 mg/mL (150 mcg/spray). **Tablets (DDAVP):** 0.1 mg, 0.2 mg.

Administration/handling

IV

Reconstitution

- For IV infusion, dilute in 10–50 mL 0.9% NaCl (10 mL for children 10 kg or less; 50 mL for adults, children greater than 10 kg).

Rate of Administration

- Infuse over 15–30 min.

Storage

- Refrigerate.

Subcutaneous

- Withdraw dose from vial. Further dilution not required.

Intranasal

- Refrigerate DDAVP Rhinal Tube solution, Stimate nasal spray.
- Rhinal Tube solution, Stimate nasal spray are stable for 3 wks at room temperature.
- DDAVP nasal spray is stable at room temperature.
- Calibrated catheter (rhinyle) is used to draw up measured quantity of desmopressin; with one end inserted in nose, pt blows on other end to deposit solution deep in nasal cavity.
- For infants, young children, obtunded pts, air-filled syringe may be attached to catheter to deposit solution.

Indications/routes/dosage

Primary Nocturnal Enuresis

PO: CHILDREN 6 YRS AND OLDER: 0.2–0.6 mg once before bedtime. Limit fluid intake 1 hr prior and at least 8 hrs after dose.

Central Cranial Diabetes Insipidus

◀ALERT▶ Fluid restriction should be observed.

PO: ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: Initially, 0.05 mg twice daily. Titrate to desired response. Range: 0.1–1.2 mg/day in 2–3 divided doses.

IV, SQ: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 2–4 mcg/day in 2 divided doses or 1/10 of maintenance intranasal dose.

Intranasal: (Use 100 mcg/mL Concentration): ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 10–40 mcg (0.1–0.4 mL) in 1–3 doses/day. Usual dose: 10 mcg 2 times/day. **CHILDREN 3 MOS–12 YRS:** Initially, 5 mcg (0.05 mL)/day. Range: 5–30 mcg (0.05–0.3 mL)/day as a single or 2 divided doses.

Hemophilia A, Von Willebrand's Disease (Type I)

IV Infusion: ADULTS, ELDERLY, CHILDREN: 0.3 mcg/kg as slow infusion.

Intranasal: (Use 1.5 mg/mL Concentration Providing 150 mcg/Spray): ADULTS, ELDERLY, CHILDREN WEIGHING MORE THAN 50 KG: 300 mcg; use 1 spray in each nostril. **ADULTS, ELDERLY, CHILDREN WEIGHING 50 KG OR LESS:** 150 mcg as a single spray. Repeat use based on clinical conditions/laboratory work.

Dosage in Renal Impairment

CrCl less than 50 mL/min: Not recommended.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional: IV: Pain, redness, swelling at injection site; headache, abdominal cramps, vulvular pain, flushed skin, mild B/P elevation, nausea with high dosages. **Nasal:** Rhinorrhea, nasal congestion, slight B/P elevation.

Adverse effects/toxic reactions

Water intoxication, hyponatremia (headache, drowsiness, confusion, decreased urination, rapid weight gain, seizures, coma) may occur in overhydration. Children, elderly pts, infants are esp. at risk.

Nursing considerations

Baseline assessment

Establish baselines for B/P, pulse, weight, serum electrolytes, urine specific gravity. Check lab values for factor VIII coagulant concentration for hemophilia A, von Willebrand's disease; bleeding times.

Intervention/evaluation

Check B/P, pulse with IV infusion. Monitor pt weight, fluid intake; urine volume, urine specific gravity, osmolality, serum electrolytes for diabetes insipidus. Assess factor VIII antigen levels, aPTT, factor VIII activity level for hemophilia.

Patient/family teaching

- Avoid overhydration.
- Follow guidelines for proper intranasal administration.
- Report headache, shortness of breath, heartburn, nausea, abdominal cramps.

dexamethasone

dex-a-meth-a-sone

Apo-Dexamethasone 

Dexamethasone Intensol

DexPak

Maxidex

Fixed-Combination(s)

Ciprodex Otic: dexamethasone/ciprofloxacin (antibiotic): 0.1%/0.3%.

Dexacidin, Maxitrol: dexamethasone/neomycin/polymyxin (anti-infectives): 0.1%/3.5 mg/10,000 units per g or mL.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Long-acting glucocorticoid.

CLINICAL: Corticosteroid.

Do not confuse Decadron with Percodan, or dexamethasone with dextroamphetamine, or Maxidex with Maxzide.

Uses

Used primarily as an anti-inflammatory or immunosuppressant agent in a variety of diseases (e.g., allergic, inflammatory, autoimmune). **OFF-LABEL:** Antiemetic, treatment of croup, dexamethasone suppression test (indicator consistent with suicide and/or depression), accelerate fetal lung maturation. Treatment of acute mountain sickness, high-altitude cerebral edema.

Precautions

Contraindications: Hypersensitivity to dexamethasone. Systemic fungal infections, cerebral malaria. **Cautions:** Thyroid disease, renal/hepatic impairment, cardiovascular disease, diabetes, glaucoma, cataracts, myasthenia gravis, pts at risk for seizures, osteoporosis, post-MI, elderly.

Action

Suppresses neutrophil migration, decreases production of inflammatory mediators, reverses increased capillary permeability. **Therapeutic Effect:** Decreases inflammation. Suppresses normal immune response.

Pharmacokinetics

Rapidly absorbed from GI tract after PO administration. Widely distributed. Protein binding: High. Metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 3–4.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. **Children:** Prolonged treatment with high-dose therapy may decrease short-term growth rate, cortisol secretion. **Elderly:** Higher risk for developing hypertension, osteoporosis.

Interactions

DRUG: **Amphotericin** may increase hypokalemia. May increase **digoxin** toxicity caused by hypokalemia. **CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin)** may decrease concentration. **CYP3A4 inhibitors (e.g., ketoconazole), macrolide antibiotics** may increase concentration. May decrease effects of **oral antidiabetic agents (e.g., glyburide, metformin)**. **Live virus vaccines** may decrease pt's antibody response to vaccine, increase vaccine side effects, potentiate virus replication. **HERBAL:** **Cat's claw, echinacea** may increase immunosuppressant effect. **FOOD:** Interferes with **calcium** absorption. **LAB VALUES:** May increase serum glucose, lipids, sodium levels. May decrease serum calcium, potassium, thyroxine, WBC.

Availability (Rx)

Elixir: 0.5 mg/5 mL. **Injection, Solution:** 4 mg/mL, 10 mg/mL. **Ophthalmic Solution:** 0.1%. **Ophthalmic Suspension (Maxidex):** 0.1%. **Solution, Oral:** 0.5 mg/5 mL. **Solution, Oral Concentrate (Dexamethasone Intensol):** 1 mg/mL. **Tablets:** 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg. **Tablets (TaperPak [DexPak]):** 1.5 mg (35 or 51 tablets on taper dose card).

Administration/handling

IV

 **ALERT** Dexamethasone sodium phosphate may be given by IV push or IV infusion. Rapid injection may cause genital burning sensation in females.

- For IV push, give over 1–4 min if dose is less than 10 mg.

- For IV infusion, mix with 50–100 mL 0.9% NaCl or D₅W and infuse over 15–30 min.
- For neonates, solution must be preservative free.
- IV solution must be used within 24 hrs.

IM

- Give deep IM, preferably in gluteus maximus.

PO

- Give with milk, food (to decrease GI effect).

Ophthalmic Solution, Suspension

- Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid.
- Place prescribed number of drops or 1/4–1/2 inch ointment into pocket.
- Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac).
- Instruct pt to apply digital pressure to lacrimal sac at inner canthus for 1–2 min to minimize systemic absorption.

❖ IV incompatibilities

Ciprofloxacin (Cipro), DAUNOrubicin (Cerubidine), IDArubicin (Idamycin), midazolam (Versed).

❖ IV Compatibilities

Cimetidine (Tagamet), CISplatin (Platinol), cyclophosphamide (Cytosan), cytarabine (Cytosar), DOCEtaxel (Taxotere), DOXOrubicin (Adriamycin), etoposide (VePesid), furosemide (Lasix), granisetron (Kytril), heparin, HYDRomorphine (Dilaudid), LORazepam (Ativan), morphine, ondansetron (Zofran), PACLitaxel (Taxol), palonosetron (Aloxi), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Anti-Inflammatory

PO, IV, IM: ADULTS, ELDERLY: 0.5–9 mg/day in divided doses q6–12h. **CHILDREN:** 0.08–0.3 mg/kg/day in divided doses q6–12h. **INTRA-ARTICULAR: ADULTS, ELDERLY:** 0.4–6 mg/day.

Cerebral Edema

IV: ADULTS, ELDERLY: Initially, 10 mg, then 4 mg (IV or IM) q6h. **PO, IV, IM: CHILDREN:** Loading dose of 1–2 mg/kg, then 1–1.5 mg/kg/day in divided doses q4–6h.

Nausea/Vomiting in Chemotherapy Pts

Note: Refer to individual protocols and emetogenic potential. **IV: ADULTS, ELDERLY:** 8–20 mg 15–30 min before treatment. **CHILDREN:** 6 mg/m²/dose on days of chemotherapy.

Physiologic Replacement

PO, IV, IM: ADULTS, ELDERLY, CHILDREN: 0.03–0.15 mg/kg/day in divided doses q6–12h.

Usual Ophthalmic Dosage, Ocular Inflammatory Conditions

ADULTS, ELDERLY, CHILDREN: (Solution): Initially, 2 drops q1h while awake and q2h at night for 1 day, then reduce to 3–4 times/day. **(Suspension):** 1–2 drops up to 4–6 times/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Inhalation: Cough, dry mouth, hoarseness, throat irritation. **Intranasal:** Burning, mucosal dryness. **Ophthalmic:** Blurred vision. **Systemic:** Insomnia, facial edema (cushingoid appearance ["moon face"]), moderate abdominal distention, indigestion, increased appetite, nervousness, facial flushing, diaphoresis. **Occasional: Inhalation:** Localized fungal infection (thrush). **Intranasal:** Crusting inside nose, epistaxis, sore throat, ulceration of

nasal mucosa. **Ophthalmic:** Decreased vision; lacrimation; eye pain; burning, stinging, redness of eyes; nausea; vomiting. **Systemic:** Dizziness, decreased/blurred vision. **Rare:** **Inhalation:** Increased bronchospasm, esophageal candidiasis. **Intranasal:** Nasal/pharyngeal candidiasis, eye pain. **Systemic:** Generalized allergic reaction (rash, urticaria); pain, redness, swelling at injection site; psychological changes; false sense of well-being; hallucinations; depression.

Adverse effects/toxic reactions

Long-term therapy: Muscle wasting (esp. arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer disease, HF. **Ophthalmic:** Glaucoma, ocular hypertension, cataracts. **Abrupt withdrawal following long-term therapy:** Severe joint pain, severe headache, anorexia, nausea, fever, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension.

Nursing considerations

Baseline assessment

Question for hypersensitivity to any corticosteroids. Obtain baselines for height, weight, B/P, serum glucose, electrolytes. Question medical history as listed in Precautions.

Intervention/evaluation

Monitor I&O, daily weight, serum glucose. Assess for edema. Evaluate food tolerance. Monitor daily pattern of bowel activity, stool consistency. Report hyperacidity promptly. Check vital signs at least twice daily. Be alert to infection (sore throat, fever, vague symptoms). Monitor serum electrolytes, esp. for hypercalcemia, hypokalemia, paresthesia (esp. lower extremities, nausea/vomiting, irritability), Hgb, occult blood loss. Assess emotional status, ability to sleep. Abrupt withdrawal may cause adrenal insufficiency; taper dose gradually.

Patient/family teaching

- Do not change dose/schedule or stop taking drug.

- **Must** taper off gradually under medical supervision.
- Report fever, sore throat, muscle aches, sudden weight gain, edema, exposure to measles/chickenpox.
- Severe stress (serious infection, surgery, trauma) may require increased dosage.
- Inform dentist, other physicians of dexamethasone therapy within past 12 mos.
- Avoid alcohol, limit caffeine.

dexmedetomidine

dex-med-e-**toe**-mye-deen

Precedex

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alpha₂ agonist.

CLINICAL: Nonbarbiturate sedative, hypnotic.

Do not confuse Precedex with Percocet or Peridex.

Uses

Sedation of initially intubated, mechanically ventilated adults in intensive care setting. Use in nonintubated pts requiring sedation before and/or during surgical and other procedures. **OFF-LABEL:** Treatment of shivering, use in children. Awake craniotomy.

Precautions

Contraindications: Hypersensitivity to dexmedetomidine. **Cautions:** Heart block, bradycardia, hepatic impairment, hypovolemia, diabetes, hypotension, chronic hypertension, severe ventricular dysfunction, elderly, use of vasodilators or drugs decreasing heart rate.

Action

Selective alpha₂-adrenergic agonist. Inhibits norepinephrine release. **Therapeutic Effect:** Produces analgesic, hypnotic, sedative effects.

Pharmacokinetics

Protein binding: 94%. Metabolized in liver. Excreted in urine. **Half-life:** 2 hrs.

Interactions

DRUG: Sedatives (e.g., midazolam, LORazepam), opioids (e.g., fentaNYL, morphine, HYDRomorphone), hypnotics (e.g., zolpidem, temazepam) may enhance effects. Antihypertensives (e.g., amlodipine, clonidine, lisinopril, valsartan) may increase risk of hypotension. Beta blockers (e.g., carvedilol, metoprolol), calcium channel blockers (e.g., diltiazem, verapamil) may increase risk of bradycardia, hypotension. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, potassium, ALT, AST.

Availability (Rx)

Injection Solution: 80 mcg/20 mL, 200 mcg/2 mL vials, 4 mcg/mL solutions (50 mL, 100 mL).

Administration/handling

IV

Reconstitution

- Dilute 2 mL of dexmedetomidine with 48 mL 0.9% NaCl.

Rate of Administration

- Individualized, titrated to desired effect. Use controlled infusion pump.

Storage

- Store at room temperature.

IV incompatibilities

Do not mix with any other medications.

IV Compatibilities

Amiodarone (Cordarone), bumetanide (Bumex), calcium gluconate, cisatracurium (Nimbex), dexamethasone, dobutamine, DOPamine, magnesium sulfate, norepinephrine (Levophed), propofol (Diprivan).

Indications/routes/dosage

Sedation

IV:ADULTS: Loading dose of 1 mcg/kg over 10 min followed by maintenance infusion of 0.2–0.7 mcg/kg/hr. **ELDERLY:** May require decreased dosage.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent (30%–11%): Hypotension, nausea. **Occasional (3%–2%):** Pain, fever, oliguria, thirst.

Adverse effects/toxic reactions

Bradycardia, atrial fibrillation, hypoxia, anemia, pain, pleural effusion may occur with too-rapid IV infusion.

Nursing considerations

Baseline assessment

Obtain baseline B/P, heart rate and assess mental status prior to initiation. Obtain full medication history; screen for medications known to cause hypotension, bradycardia, sedation.

Intervention/evaluation

Assess cardiac monitor for arrhythmia, pulse for bradycardia, B/P for hypotension, level of sedation. Assess respiratory rate, rhythm. Monitor ventilator settings. Discontinue once pt is extubated.

dex-troe-am-**fet**-ah-meen/am-**fet**-ah-meen

Adderall

Adderall-XR

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Amphetamine (**Schedule II**).

CLINICAL: CNS stimulant.

■ **BLACK BOX ALERT** ■ High potential for abuse. Prolonged administration may lead to drug dependence. Severe cardiovascular events including CVA/MI reported.

Do not confuse Adderall with Inderal.

Uses

Treatment of narcolepsy; treatment of ADHD.

Precautions

Contraindications: Hypersensitivity to dextroamphetamine, amphetamine, or sympathomimetics. Advanced arteriosclerosis, agitated mental states, glaucoma, history of alcohol or drug abuse, hypersensitivity to sympathomimetic amines, hyperthyroidism, moderate to severe hypertension, symptomatic cardiovascular disease, use of MAOIs within 14 days. **Cautions:** Elderly, debilitated pts, history of seizures, mild hypertension. Preexisting psychotic or bipolar disorder.

Action

Enhances action of dopamine, norepinephrine by blocking reuptake from synapses. Inhibits monoamine oxidase, facilitates release of catecholamines.

Therapeutic Effect: Increases motor activity, mental alertness; decreases drowsiness, fatigue; suppresses appetite.

Pharmacokinetics

Well absorbed following PO administration. Widely distributed including CNS.

Metabolized in liver. Excreted in urine. Removed by hemodialysis. **Half-life:** 10–13 hrs.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 3 yrs. **Elderly:** Age-related cardiovascular, cerebrovascular disease, hepatic/renal impairment may increase risk of side effects.

Interactions

DRUG: May enhance effects of **tricyclic antidepressants (e.g., amitriptyline, doxepin, nortriptyline)**, **sympathomimetics**. **MAOIs (e.g., phenelzine, selegiline)** may prolong, intensify effects. May antagonize effects of **hypotensive agents**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase plasma corticosteroid.

Availability (Rx)

Tablets (Adderall): 5 mg, 7.5 mg, 10 mg, 12.5 mg, 15 mg, 20 mg, 30 mg.

 **Capsules (Extended-Release [Adderall-XR]):** 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg.

Administration/handling

PO

- Give tablets at least 6 hrs before bedtime.
- Extended-release capsules should be swallowed whole; do not break, crush, or cut.
- Avoid afternoon doses to prevent insomnia.
- May open capsules and sprinkle on applesauce. Instruct pt not to chew sprinkled beads; take immediately.

Indications/routes/dosage

Narcolepsy

PO: ADULTS, CHILDREN OLDER THAN 12 YRS: Initially, 10 mg/day. Increase by 10 mg/day at wkly intervals until therapeutic response is achieved. **Maximum:** 60 mg/day given in 1–3 divided doses with interval of 4–6 hrs between doses. **CHILDREN 6–12 YRS:** Initially, 5 mg/day. Increase by 5 mg/day at wkly intervals until therapeutic response is achieved. **Maximum:** 60 mg/day given in 1–3 divided doses with interval of 4–6 hrs between doses.

ADHD

ADULTS, ELDERLY: (ADDERALL): Initially, 5 mg 1–2 times/day. May increase by 5-mg increments at wkly intervals. **Maximum:** 40 mg/day in 1–3 divided doses (usual intervals of 4–6 hrs). **(ADDERALL-XR):** Initially, 20 mg once daily in the morning. May increase up to 60 mg/day. **CHILDREN 13–17 YRS:(ADDERALL):** Initially, 5 mg 1–2 times/day. May increase by 5 mg at wkly intervals. **Maximum:** 40 mg/day in 1–3 divided doses (usual intervals of 4–6 hrs). **(ADDERALL-XR):** Initially, 10 mg once daily in the morning. May increase to 20 mg/day after 1 wk if symptoms are not controlled. May increase up to 60 mg/day. **CHILDREN 6–12 YRS:(ADDERALL):** Initially, 5 mg 1–2 times/day. May increase in 5-mg increments at wkly intervals until optimal response is obtained. **Maximum:** 40 mg/day given in 1–3 divided doses (use intervals of 4–6 hrs between additional doses). **(ADDERALL-XR):** Initially, 5–10 mg once daily in the morning. May increase daily dose in 5- to 10-mg increments at wkly intervals. **Maximum:** 30 mg/day. **CHILDREN 3–5 YRS: (ADDERALL):** Initially, 2.5 mg/day given every morning. May increase daily dose in 2.5-mg increments at wkly intervals until optimal response is obtained. **Maximum:** 40 mg/day given in 1–3 divided doses (use intervals of 4–6 hrs between additional doses). Not recommended in children younger than 3 yrs.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Increased motor activity, talkativeness, nervousness, mild euphoria, insomnia. **Occasional:** Headache, chills, dry mouth, GI distress, worsening depression in pts who are clinically depressed, tachycardia, palpitations, chest pain, dizziness, decreased appetite.

Adverse effects/toxic reactions

Overdose may produce skin pallor/flushing, arrhythmias, psychosis. Abrupt withdrawal after prolonged use of high doses may produce lethargy (may last for wks). Prolonged administration to children with ADHD may temporarily suppress normal weight/height pattern.

Nursing considerations

Baseline assessment

Assess attention span, impulse control, interaction with others. Screen for drug-seeking behavior, past drug abuse. Obtain baseline B/P. Assess sleep pattern.

Intervention/evaluation

Monitor for CNS overstimulation, increase in B/P, growth rate, change in pulse rate, respirations, weight loss. **Narcolepsy:** Observe/document frequency of narcoleptic episodes. **ADHD:** Observe for improved attention span.

Patient/family teaching

- Normal dosage levels may produce tolerance to drug's anorexic mood-elevating effects within a few wks.
- Dry mouth may be relieved with sugarless gum, sips of water.
- Take early in day.
- Do not break, chew, or crush extended-release capsules.
- May mask extreme fatigue.
- Report pronounced anxiety, dizziness, decreased appetite, dry mouth, new or worsening behavior, chest pain, palpitations.
- Avoid alcohol, caffeine.

diazePAM

dye-az-e-pam

Apo-Diazepam 🇨🇦

Diastat

DiazePAM Intensol

Novo-Dipam 

Valium

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Benzodiazepine (**Schedule IV**).

CLINICAL: Antianxiety, skeletal muscle relaxant, anticonvulsant.

Do not confuse diazePAM with diazoxide, diltiaZEM, Ditropan, or LORazepam, or Valium with Valcyte.

Uses

Short-term relief of anxiety symptoms, relief of acute alcohol withdrawal. Adjunct for relief of acute musculoskeletal conditions, treatment of seizures (IV route used for termination of status epilepticus). **Gel:** Control of increased seizure activity in refractory epilepsy in pts on stable regimens. **OFF-LABEL:** Treatment of panic disorder. Short-term treatment of spasticity in children with cerebral palsy. Sedation for mechanically vented pts in ICU.

Precautions

Contraindications: Hypersensitivity to diazepam. Acute narrow-angle glaucoma, untreated open-angle glaucoma, severe respiratory depression, severe hepatic insufficiency, sleep apnea syndrome, myasthenia gravis. Children younger than 6 mos (oral). **Cautions:** Pts receiving other CNS depressants or psychoactive agents, depression, history of drug and alcohol abuse, renal/hepatic impairment, respiratory disease, impaired gag reflex, concurrent use of strong CYP3A4 inhibitors or inducers.

Action

Depresses all levels of CNS by enhancing action of gamma-aminobutyric acid (GABA), a major inhibitory neurotransmitter in the brain. **Therapeutic Effect:** Produces anxiolytic effect, elevates seizure threshold, produces skeletal muscle relaxation.

Pharmacokinetics

Well absorbed from GI tract. Widely distributed. Protein binding: 98%. Excreted

in urine. Minimally removed by hemodialysis. **Half-life:** 20–70 hrs (increased in hepatic dysfunction, elderly).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. May increase risk of fetal abnormalities if administered during first trimester of pregnancy. Chronic ingestion during pregnancy may produce withdrawal symptoms, CNS depression in neonates. **Children/Elderly:** Use small initial doses with gradual increases to avoid ataxia, excessive sedation. Elderly at increased risk of impaired cognition, delirium, falls, fractures.

Interactions

DRUG: Alcohol, CNS depressants (e.g., gabapentin, morphine, zolpidem) may increase CNS depression. **CYP3A4 inducers** (e.g., carbamazepine, rifampin) may decrease concentration. **CYP3A4 inhibitors** (e.g., itraconazole, ketoconazole) may increase concentration. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. St. John's wort may decrease concentration/effects. **FOOD:** Grapefruit products may increase concentration/effects. **LAB VALUES:** None significant. **Therapeutic serum level:** 0.5–2 mcg/mL; **toxic serum level:** greater than 3 mcg/mL.

Availability (Rx)

Injection, Solution: 5 mg/mL. **Oral Concentrate (DiazePAM Intensol):** 5 mg/mL. **Oral Solution:** 5 mg/5 mL. **Rectal Gel (Diastat):** 2.5 mg, 10 mg, 20 mg. **Tablet (Valium):** 2 mg, 5 mg, 10 mg.

Administration/handling

IV

Rate of Administration

- Give by IV push into tubing of flowing IV solution as close as possible to vein insertion point.
- Administer directly into large vein (reduces risk of thrombosis/phlebitis). Do not use small veins (e.g., wrist/dorsum of hand).

- Administer IV at rate not exceeding 5 mg/min for adults. For children, give 1–2 mg/min (too-rapid IV may result in hypotension, respiratory depression).
- Monitor respirations q5–15 min for 2 hrs.

Storage

- Store at room temperature.

IM

- Injection may be painful. Inject deeply into large muscle mass.

PO

- Give without regard to meals.
- Dilute oral concentrate with water, juice, carbonated beverages; may be mixed in semisolid food (applesauce, pudding).
- Tablets may be crushed.

GEL

- Insert rectal tip and gently push plunger over 3 sec. Remove tip after 3 additional sec.
- Buttocks should be held together for 3 sec after removal.

■ IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), diltiazem (Cardizem), fluconazole (Diflucan), foscarnet (Foscavir), furosemide (Lasix), heparin, hydrocortisone (SOLU-Cortef), HYDROMORPHONE (Dilaudid), meropenem (Merrem IV), potassium chloride, propofol (Diprivan), vitamins.

■ IV Compatibilities

DOBUTAMINE (Dobutrex), fentanyl, morphine.

Indications/routes/dosage

Anxiety

PO: ADULTS: 2–10 mg 2–4 times/day. **ELDERLY:** Initially, 1–2 mg 1–2

times/day. **CHILDREN:** 0.12–0.8 mg/kg/day in divided doses q6–8h. **IV, IM: ADULTS:** 2–10 mg; may repeat in 3–4 hrs if needed. **CHILDREN:** 0.04–0.3 mg/kg/dose q2–4h. **Maximum:** 0.6 mg/kg within 8-hr period.

Skeletal Muscle Relaxation

PO: ADULTS: 2–10 mg 2–4 times/day. **ELDERLY:** Initially, 1–2 mg 1–2 times/day. **CHILDREN:** 0.12–0.8 mg/kg/day in divided doses q6–8h.

Alcohol Withdrawal

IM, IV: ADULTS, ELDERLY: Initially, 10 mg, then 5–10 mg 3–4 hrs later. **PO: ADULTS, ELDERLY:** 10 mg 3–4 times during first 24 hrs, then reduce to 5 mg 3–4 times/day as needed.

Status Epilepticus

IV: ADULTS, ELDERLY: 5–10 mg q10–15 min. **Maximum Total Dose:** 30 mg. May repeat in 2–4 hrs. **INFANTS, CHILDREN:** 0.1–0.3 mg/kg over 2 min; may repeat after 5–10 min. **Maximum:** 10 mg/dose.

Control of Increased Seizure Activity (Breakthrough Seizures) in Pts with Refractory Epilepsy Who Are on Stable Regimens of Anticonvulsants

PO: ADULTS, ELDERLY: 2–10 mg 2–4 times/day. **Note:** Do not use gel for more than 5 episodes/mo or more than 1 episode q5days. **Rectal Gel: ADULTS, CHILDREN 12 YRS AND OLDER:** 0.2 mg/kg; may be repeated in 4–12 hrs. **CHILDREN 6–11 YRS:** 0.3 mg/kg; may be repeated in 4–12 hrs. **CHILDREN 2–5 YRS:** 0.5 mg/kg; may be repeated in 4–12 hrs.

Dosage in Renal Impairment

Use caution.

Dosage in Hepatic Impairment

Use caution. Oral tablets contraindicated in severe hepatic impairment.

Side effects

Frequent: Pain with IM injection, drowsiness, fatigue, ataxia. **Occasional:** Slurred speech, orthostatic hypotension, headache, hypoactivity, constipation, nausea, blurred vision. **Rare:** Paradoxical CNS reactions (hyperactivity/nervousness in children, excitement/restlessness in elderly/debilitated pts) generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain.

Adverse effects/toxic reactions

IV route may produce pain, swelling, thrombophlebitis, carpal tunnel syndrome. Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal/muscle cramps, diaphoresis, vomiting, seizures. Abrupt withdrawal in pts with epilepsy may produce increase in frequency/severity of seizures. Overdose results in drowsiness, confusion, diminished reflexes, CNS depression, coma. **Antidote:** Flumazenil (see [Appendix J](#) for dosage).

Nursing considerations

Baseline assessment

Assess B/P, pulse, respirations immediately before administration. **Anxiety:** Assess autonomic response (cold, clammy hands; diaphoresis), motor response (agitation, trembling, tension). **Musculoskeletal spasm:** Record onset, type, location, duration of pain. Check for immobility, stiffness, swelling. **Seizures:** Review history of seizure disorder (length, intensity, frequency, duration, LOC). Observe frequently for recurrence of seizure activity.

Intervention/evaluation

Monitor heart rate, respiratory rate, B/P, mental status. Assess children, elderly for paradoxical reaction, particularly during early therapy. Evaluate for therapeutic response (decrease in intensity/frequency of seizures; calm facial expression, decreased restlessness; decreased intensity of skeletal muscle pain). **Therapeutic serum level:** 0.5–2 mcg/mL; **toxic serum level:** greater than 3 mcg/mL.

Patient/family teaching

- Avoid alcohol.
- Limit caffeine.
- May cause drowsiness; avoid tasks that require alertness, motor skills until response to drug is established.
- May be habit forming.
- Avoid abrupt discontinuation after prolonged use.

diclofenac

dye-**kloe**-fen-ak

Apo-Diclo 🇨🇦

Cambia

Cataflam

Dyloject

Flector

Pennsaid

Solaraze

Voltaren Gel

Zipsor

Zorvolex

Fixed-Combination(s)

Arthrotec: diclofenac/miSOPROStol (an antisecretory gastric protectant): 50 mg/200 mcg, 75 mg/200 mcg.

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: NSAID (nonselective).

CLINICAL: Analgesic, anti-inflammatory.

■ **BLACK BOX ALERT** ■ Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation of stomach, intestines. Contraindicated for treatment of perioperative pain in setting of CABG surgery.

Do not confuse Cataflam with Catapres, diclofenac with Diflucan or Duphalac, or Voltaren with traMADol, Ultram, or Verelan.

Uses

PO: (Immediate-release): Treatment of rheumatoid arthritis, osteoarthritis, mild to moderate pain, primary dysmenorrhea. **(Zipsor):** Mild to moderate pain. **(Zorvolex):** Mild to moderate pain, osteoarthritic pain. **(Delayed-release):** Treatment of rheumatoid arthritis, osteoarthritis, ankylosing spondylitis. **(Extended-release):** Treatment of rheumatoid arthritis, osteoarthritis. **Oral Solution (Cambia):** Treatment of migraine. **Injection:** Treatment of mild to moderate acute pain and moderate to severe acute pain in adults. **Topical Patch:** Treatment of acute pain due to minor strains, sprains, contusions. **OFF-LABEL:** Treatment of juvenile idiopathic arthritis.

Precautions

Contraindications: Hypersensitivity to diclofenac. Pts experiencing asthma, urticaria after taking aspirin, other NSAIDs. Pts with moderate to severe renal impairment in perioperative period who are at risk for volume depletion (injection only); perioperative pain in setting of CABG surgery. **Cautions:** HF, hypertension, renal/hepatic impairment, hepatic porphyria, history of GI disease (e.g., bleeding, ulcers), concomitant use of aspirin or anticoagulants, elderly, debilitated pts.

Action

Reversibly inhibits cyclo-oxygenase-1 and -2 (COX-1 and COX-2) enzymes, resulting in decreased formation of prostaglandin precursors. **Therapeutic Effect:** Produces analgesic, antipyretic, anti-inflammatory effects.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	30 min	2-3 hrs	Up to 8 hrs

Completely absorbed from GI tract. Protein binding: greater than 99%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Minimally

removed by hemodialysis. **Half-life:** 1.2–2 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Unknown if distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Safety and efficacy not established. **Elderly:** GI bleeding, ulceration more likely to cause serious adverse effects. Age-related renal impairment may increase risk of hepatic/renal toxicity; reduced dosage recommended.

Interactions

DRUG: May decrease effects of **acetylcholine, antihypertensives (e.g., amlodipine, hydralazine, valsartan), carbachol, diuretics (e.g., furosemide, HCTZ), Aspirin, other salicylates, warfarin** may increase risk of GI side effects/bleeding. **CYP2C9 inhibitors (e.g., voriconazole)** may increase concentration/risk of toxicity. **CYP2C9 inducers (e.g., rifAMPin)** may decrease effect. May increase **cycloSPORINE** concentration/toxicity. **Ophthalmic:** May decrease antiglaucoma effects of **antiglaucoma agents, EPINEPHrine.** **HERBAL:** **Cat's claw, dong quai, evening primrose, garlic, ginseng** may increase antiplatelet activity. **FOOD:** None known. **LAB VALUES:** May increase urine protein, serum BUN, alkaline phosphatase, creatinine, LDH, potassium, ALT, AST. May decrease serum uric acid.

Availability (Rx)

Adhesive Patch (Flector): 10×14-cm patch containing 180 mg diclofenac. **Capsules (Zipsor):** 25 mg. **(Zorvolex):** 18 mg, 35 mg. **Intravenous Solution (Dyloject):** 37.5 mg/mL. **Oral Solution (Cambia):** 50-mg packets. **Tablets:** 50 mg.

 **Tablets (Delayed-Release):** 25 mg, 50 mg, 75 mg.  **Tablets (Extended-Release):** 100 mg.

Administration/handling

PO

- Do not break, crush, dissolve, or divide enteric-coated tablets.
- May give with food, milk, antacids if GI distress occurs.
- **Cambia:** Mix one packet in 1–2 oz water, stir well, and instruct pt to drink immediately.

IV

Administer as IV bolus over 15 sec.

Transdermal Patch

- Apply to intact skin; avoid contact with eyes.
- Do not wear when bathing/showering.
- Wash hands after handling.

Indications/routes/dosage

Osteoarthritis

PO: (Immediate-Release): ADULTS, ELDERLY: 50 mg 2–3 times/day.

PO: (Extended-Release): ADULTS, ELDERLY: 100 mg/day as a single dose. May increase to 200 mg/day in 2 divided doses. **(Zorvolex):** 35 mg 3 times/day.

PO: (Delayed-Release): ADULTS, ELDERLY: 50 mg 2–3 times/day or 75 mg twice daily.

Rheumatoid Arthritis (RA)

PO: (Immediate-Release): ADULTS, ELDERLY: 50 mg 3–4 times/day.

PO: (Extended-Release): ADULTS, ELDERLY: 100 mg once daily. May increase to 200 mg/day in 2 divided doses.

PO: (Delayed-Release): ADULTS, ELDERLY: 50 mg 3–4 times/day or 75 mg twice daily.

Ankylosing Spondylitis

PO: (Delayed-Release): ADULTS, ELDERLY: 100–125 mg/day in 4–5 divided doses.

Primary Dysmenorrhea

PO: (Immediate-Release): ADULTS, ELDERLY: 50 mg 3 times/day.

Pain

PO: ADULTS, ELDERLY: (*Immediate-Release*):100 mg once, then 50 mg 3 times/day. (*Zipsor*):25 mg 4 times/day. (*Zorvolex*):18–35 mg 3 times/day.

IV: 37.5 mg q6h prn. **Maximum:** 150 mg/day.

Topical Patch: (*Flector*):Apply 2 times/day.

Migraine (Oral Solution)

PO: ADULTS, ELDERLY: 50 mg (one packet) once.

Dosage in Renal Impairment

Not recommended in severe impairment.

Dosage in Hepatic Impairment

May require dose adjustment. Use caution.

Side effects

Frequent (9%–4%): PO: Headache, abdominal cramps, constipation, diarrhea, nausea, dyspepsia. **Ophthalmic:** Burning, stinging on instillation, ocular discomfort. **Occasional (3%–1%): PO:** Flatulence, dizziness, epigastric pain. **Ophthalmic:** Ocular itching, tearing. **Rare (less than 1%): PO:** Rash, peripheral edema, fluid retention, visual disturbances, vomiting, drowsiness.

Adverse effects/toxic reactions

Overdose may result in acute renal failure. In pts treated chronically, peptic ulcer, GI bleeding, gastritis, severe hepatic reaction (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria), severe hypersensitivity reaction (bronchospasm, angioedema) occur rarely.

Nursing considerations

Baseline assessment

Obtain baseline B/P. **Anti-inflammatory:** Assess onset, type, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility,

deformities, skin condition.

Intervention/evaluation

Monitor CBC, renal function, LFT, urine output, occult blood test, B/P. Monitor for headache, dyspepsia. Monitor daily pattern of bowel activity, stool consistency. Assess for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength.

Patient/family teaching

- Swallow tablets whole; do not chew, crush, dissolve, or divide.
- Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
- If GI upset occurs, take with food, milk.
- Report skin rash, itching, weight gain, changes in vision, black stools, bleeding, jaundice, upper quadrant pain, persistent headache.
- **Ophthalmic:** Do not use hydrogel soft contact lenses.
- **Topical:** Avoid exposure to sunlight, sunlamps.
- Report rash.

digoxin

di-jox-in

Apo-Digoxin*

Digitek

Digox

Lanoxin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Cardiac glycoside.

CLINICAL: Antiarrhythmic, cardiotonic.

Do not confuse digoxin with Desoxyn or doxepin, or Lanoxin with Lasix, Levoxyl, Levsinex, Lonox, or Mefoxin.

HIGH
ALERT

Uses

Treatment of mild to moderate HF. Control ventricular response rate in pts with chronic atrial fibrillation. **OFF-LABEL:** Fetal tachycardia with or without hydrops; decrease ventricular rate in supraventricular tachyarrhythmias.

Precautions

Contraindications: Hypersensitivity to digoxin. Ventricular fibrillation. **Cautions:** Renal impairment, sinus nodal disease, acute MI (within 6 mos), second- or third-degree heart block (unless functioning pacemaker), concurrent use of strong inducers or inhibitors of P-glycoprotein (e.g., cyclosporine), hyperthyroidism, hypothyroidism, hypokalemia, hypocalcemia.

Action

HF: Inhibits sodium/potassium ATPase pump in myocardial cells. Promotes calcium influx. **Supraventricular Arrhythmias:** Suppresses AV node conduction. **Therapeutic Effect: HF:** Increases contractility. **Supraventricular Arrhythmias:** Increases effective refractory period/decreases conduction velocity, decreases heart rate.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	0.5–2 hrs	2–8 hrs	3–4 days
IV	5–30 min	1–4 hrs	3–4 days

Readily absorbed from GI tract. Widely distributed. Protein binding: 30%. Partially metabolized in liver. Primarily excreted in urine. Minimally removed by hemodialysis. **Half-life:** 36–48 hrs (increased in renal impairment, elderly).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. **Children:** Premature infants more susceptible to toxicity. **Elderly:** Age-related hepatic/renal impairment may require dosage adjustment. Increased risk of loss of appetite. Avoid use as first-line therapy for atrial fibrillation or HF.

Interactions

DRUG: Amiodarone may increase concentration/toxicity. **Beta blockers (e.g., metoprolol), calcium channel blockers (e.g., diltiazem)** may have additive effect on slowing AV nodal conduction. **Potassium-depleting diuretics (e.g., furosemide)** may increase toxicity due to hypokalemia. **Sympathomimetics**

(e.g., norepinephrine) may increase risk of arrhythmias. **HERBAL:** Ephedra may increase risk of arrhythmias. **Licorice** may cause sodium and water retention, loss of potassium. **FOOD:** Meals with increased fiber (bran) or high in pectin may decrease absorption. **LAB VALUES:** None known.

Availability (Rx)

Oral Solution (Lanoxin): 50 mcg/mL. **Injection Solution (Lanoxin):** 100 mcg/mL, 250 mcg/mL. **Tablets (Lanoxin):** 62.5 mcg, 125 mcg, 187.5 mcg, 250 mcg.

Administration/handling

⚠️ ALERT IM rarely used (produces severe local irritation, erratic absorption). If no other route possible, give deep into muscle followed by massage. Give no more than 2 mL at any one site.

IV

- May give undiluted or dilute with at least a 4-fold volume of Sterile Water for Injection or D₅W (less may cause precipitate).
- Use immediately.
- Give IV slowly over at least 5 min.

PO

- May give without regard to meals.
- Tablets may be crushed.

IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), fluconazole (Diflucan), foscarnet (Foscavir), propofol (Diprivan).

IV Compatibilities

Diltiazem (Cardizem), furosemide (Lasix), heparin, insulin regular, lidocaine, midazolam (Versed), milrinone (Primacor), morphine, potassium chloride.

Indications/routes/dosage

Note: Loading dose not recommended in HF.

Loading Dose

PO: ADULTS, ELDERLY: 0.75–1.5 mg. **CHILDREN 10 YRS AND OLDER:** 10–15 mcg/kg. **CHILDREN 5–9 YRS:** 20–35 mcg/kg. **CHILDREN 2–4 YRS:** 30–40 mcg/kg. **CHILDREN 1–23 MOS:** 35–60 mcg/kg. **NEONATE, FULL-TERM:** 25–35 mcg/kg. **NEONATE, PREMATURE:** 20–30 mcg/kg.

IV: ADULTS, ELDERLY: 0.5–1 mg. **CHILDREN 10 YRS AND OLDER:** 8–12 mcg/kg. **CHILDREN 5–9 YRS:** 15–30 mcg/kg. **CHILDREN 2–4 YRS:** 25–35 mcg/kg. **CHILDREN 1–23 MOS:** 30–50 mcg/kg. **NEONATES, FULL-TERM:** 20–30 mcg/kg. **NEONATES, PREMATURE:** 15–25 mcg/kg.

Maintenance Dosage

	PO	IV/IM
Preterm infant	5–7.5 mcg/kg	4–6 mcg/kg
Full-term infant	6–10 mcg/kg	5–8 mcg/kg
1 mo–2 yrs	10–15 mcg/kg	7.5–12 mcg/kg
2–5 yrs	7.5–10 mcg/kg	6–9 mcg/kg
5–10 yrs	5–10 mcg/kg	4–8 mcg/kg

Note: Avoid doses greater than 0.125 mg/day in elderly due to decreased renal clearance.

HF

PO: ADULTS, ELDERLY: 0.125–0.25 mg once daily.

Supraventricular Arrhythmias

PO: ADULTS, ELDERLY: Digitalizing dose: 0.125–1.5 mg. **Maintenance dose:** 0.125–0.5 mg once daily. **IV: Digitalizing dose:** 0.5–1 mg. **Maintenance dose:** 0.1–0.4 mg once daily.

Dosage in Renal Impairment

Dosage adjustment is based on creatinine clearance. **Loading dose:** Decrease by

50% in end-stage renal disease.

Maintenance Dose

eGFR	Dosage
10–50 mL/min	25%–75% of usual dose or q36h (0.0625 mg q24–36hrs)
Less than 10 mL/min (HD, PD, CRRT)	10%–25% of usual dose or q48h (0.0625 mg q48h)

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Dizziness, headache, diarrhea, rash, visual disturbances.

Adverse effects/toxic reactions

The most common early manifestations of digoxin toxicity are GI disturbances (anorexia, nausea, vomiting), neurologic abnormalities (fatigue, headache, depression, weakness, drowsiness, confusion, nightmares). Facial pain, personality change, ocular disturbances (photophobia, light flashes, halos around bright objects, yellow or green color perception) may occur. Sinus bradycardia, AV block, ventricular arrhythmias noted. **Antidote:** Digoxin immune FAB (see [Appendix J](#) for dosage).

Nursing considerations

Baseline assessment

Assess apical pulse. If pulse is 60 or less/min (70 or less/min for children), withhold drug, contact physician. Blood samples are best taken 6–8 hrs after dose or just before next dose.

Intervention/evaluation

Monitor pulse for bradycardia, EKG for arrhythmias for 1–2 hrs after administration (excessive slowing of pulse may be first clinical sign of toxicity). Assess for GI disturbances, neurologic abnormalities (signs of toxicity) q2–4h

during loading dose (daily during maintenance). Monitor serum potassium, magnesium, calcium, renal function. **Therapeutic serum level:** 0.8–2 ng/mL; **toxic serum level:** greater than 2 ng/mL.

Patient/family teaching

- Follow-up visits, blood tests are an important part of therapy.
- Follow guidelines to take apical pulse and report pulse of 60 or less/min (or as indicated by physician).
- Wear/carry identification of digoxin therapy and inform dentist, other physician of taking digoxin.
- Do not increase or skip doses.
- Do not take OTC medications without consulting physician.
- Report decreased appetite, nausea/vomiting, diarrhea, visual changes.

dihydroergotamine

dye-**hye**-droe-er-**got**-a-meen

D.H.E. 45

Migranal

Fixed-Combination(s)

Cafergot, Wigraine: ergotamine/cafeine (stimulant): 1 mg/100 mg, 2 mg/100 mg.

Do not confuse Cafergot with Carafate.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Ergotamine derivative.

CLINICAL: Antimigraine.

■ **BLACK BOX ALERT** ■ Concurrent use with CYP3A4 inhibitors (macrolide antibiotics, azole antifungals, protease inhibitors) increases risk of vasospasm, producing ischemia of brain and peripheral extremities.

Uses

Treatment of migraine headache with or without aura. Injection also used to treat

cluster headache.

Precautions

Contraindications: Hypersensitivity to dihydroergotamine. Uncontrolled hypertension, ischemic heart disease, coronary artery vasospasm (including Prinzmetal's angina), angina pectoris, history of MI following vascular surgery, concurrent use of peripheral and central vasoconstrictors, hemiplegic or basilar migraine, peripheral vascular disease, sepsis, severe renal/hepatic impairment, use of MAOIs within 14 days, use of sumatriptan, zolmitriptan, other serotonin agonists, or ergot-like agents within 24 hrs, potent CYP3A4 inhibitors (e.g., azole antifungals, macrolide antibiotics, protease inhibitors), pregnancy, breastfeeding. **Cautions:** Elderly.

Action

Directly stimulates vascular smooth muscle, resulting in peripheral and cerebral vasoconstriction. May have antagonist effects on serotonin. **Therapeutic Effect:** Suppresses vascular headaches, migraine headaches.

Pharmacokinetics

Slowly, incompletely absorbed from GI tract; rapidly and extensively absorbed after rectal administration. Protein binding: greater than 90%. Eliminated in feces by the biliary system. **Half-life:** 21 hrs.

Lifespan considerations

Pregnancy/Lactation: Contraindicated in pregnancy (produces uterine stimulant action, resulting in possible fetal death or retarded fetal growth); increases vasoconstriction of placental vascular bed. Drug distributed in breast milk. May produce diarrhea, vomiting in neonate. May prohibit lactation. **Children:** No precautions in pts 6 yrs and older, but use only when unresponsive to other medication. **Elderly:** Age-related occlusive peripheral vascular disease increases risk of peripheral vasoconstriction. Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Beta blockers (e.g., carvedilol, metoprolol), erythromycin may increase risk of peripheral vasoconstriction. Ergot alkaloids, 5-HT_B agonists (e.g., SUMAtriptan), systemic vasoconstrictors may increase vasopressor effect. **HERBAL:** None significant. **FOOD:** Coffee, cola, tea may increase absorption. **Grapefruit products** may increase concentration, toxicity. **LAB VALUES:** None significant.

Availability (Rx)

Dihydroergotamine Injection, Solution: 1 mg/mL. **Intranasal Spray, Solution (Migranal):** 4 mg/mL (0.5 mg/spray).

Indications/routes/dosage

Migraine Headache

IM/SQ: ADULTS, ELDERLY: 1 mg at onset of headache; repeat hourly. **Maximum:** 3 mg/day; 6 mg/wk.

IV: ADULTS, ELDERLY: (Give slowly over 2–3 min) 1 mg at onset of headache; repeat hourly. **Maximum:** 2 mg/day; 6 mg/wk.

Intranasal: ADULTS, ELDERLY: 1 spray (0.5 mg) into each nostril; repeat in 15 min up to a total of 4 sprays (2 mg). Do not exceed 6 sprays (3 mg) in 24-hr period or 8 sprays (4 mg) in a wk.

Dosage in Renal/Hepatic Impairment

Contraindicated in severe impairment.

Side effects

Occasional (5%–2%): Cough, dizziness. **Rare (less than 2%):** Myalgia, fatigue, diarrhea, upper respiratory tract infection, dyspepsia.

Adverse effects/toxic reactions

Prolonged administration, excessive dosage may produce ergotamine poisoning, manifested as nausea, vomiting, paresthesia of extremities, muscle pain/weakness, precordial pain, significant changes in pulse rate and blood

pressure. Vasoconstriction of peripheral arteries/arterioles may result in localized edema, pruritus; feet, hands will become cold, pale. Muscle pain will occur when walking and later, even at rest. Other rare effects include confusion, depression, drowsiness, seizures, gangrene.

Nursing considerations

Baseline assessment

Question for history of peripheral vascular disease, renal/hepatic impairment, possibility of pregnancy. Question onset, location, duration of migraine, possible precipitating symptoms. Obtain full medication history and screen for interactions. Obtain B/P.

Intervention/evaluation

Monitor closely for evidence of ergotamine overdose as result of prolonged administration or excessive dosage. Monitor B/P.

Patient/family teaching

- Initiate therapy at first sign of migraine headache.
- Report if there is need to progressively increase dose to relieve vascular headaches or if palpitations, nausea, vomiting, paresthesia, pain or weakness of extremities, chest pain. Avoid grapefruit products.
- Female pts should avoid pregnancy; if suspected, immediately report.
- Do not use triptans for 24 hrs after last dose of dihydroergotamine.

diltiazem

dil-tye-a-zem

Apo-Diltiaz 

Cardizem

Cardizem CD

Cardizem LA

Cartia XT

Dilt-XR

TOP
100

Matzim LA

Taztia XT

Tiazac

Fixed-Combination(s)

Teczem: diltiazEM/enalapril (ACE inhibitor): 180 mg/5 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Calcium channel blocker.

CLINICAL: Antianginal, antihypertensive, class IV antiarrhythmic.

Do not confuse Cardizem with Cardene or Cardene SR, Cartia XT with Procardia XL, diltiazEM with Calan, diazePAM, or Dilantin, or Tiazac with Ziac.

Uses

PO: Treatment of angina due to coronary artery spasm (Prinzmetal's variant angina), chronic stable angina (effort-associated angina). Treatment of hypertension. **Parenteral:** Temporary control of rapid ventricular rate in atrial fibrillation/flutter. Rapid conversion of paroxysmal supraventricular tachycardia (PSVT) to normal sinus rhythm.

Precautions

Contraindications: PO: Acute MI, pulmonary congestion, hypersensitivity to diltiazem, second- or third-degree AV block (except in presence of pacemaker), severe hypotension (less than 90 mm Hg, systolic), sick sinus syndrome (except in presence of pacemaker). **IV:** Hypersensitivity to diltiazEM. Sick sinus syndrome or second- or third-degree block (except with functioning pacemaker), cardiogenic shock, administration of IV beta blocker within several hours, atrial fibrillation/flutter associated with accessory bypass tract, severe hypotension, ventricular tachycardia. **Cautions:** Renal/hepatic impairment, HF, concurrent use with beta blocker, hypertrophic obstructive cardiomyopathy.

Action

Inhibits calcium movement across cardiac, vascular smooth-muscle cell membranes (causes dilation of coronary arteries, peripheral arteries, arterioles). **Therapeutic Effect:** Relaxes coronary vascular smooth muscle, increases myocardial oxygen delivery in pts with vasospastic angina, decreases heart rate.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	0.5–1 hr	N/A	N/A
PO (extended-release)	2–3 hrs	N/A	N/A
IV	3 min	N/A	N/A

Well absorbed from GI tract. Protein binding: 70%–80%. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–8 hrs.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Beta blockers (e.g., carvedilol, metoprolol), digoxin** may have additive effect on prolonging AV conduction. May increase concentration, risk of toxicity with **carBAMazepine, benzodiazepines**. May increase serum **digoxin** concentration. **RifAMPin** may decrease concentration/effects. May increase concentration of **statins** and risk of myopathy/rhabdomyolysis. **HERBAL:** **Ephedra** may worsen arrhythmias, hypertension. **Garlic** may increase antihypertensive effect. **Ginseng, yohimbe** may worsen hypertension. **St. John's wort** may decrease concentration. **FOOD:** None known. **LAB VALUES:** EKG: May increase PR interval.

Availability (Rx)

Injection, Solution: 25 mg/5 mL, 50 mg/10 mL, 125 mg/25 mL. **Tablets, Immediate-Release:** 30 mg, 60 mg, 90 mg, 120 mg.

 **Capsules, Extended-Release, 24 Hour:** 120 mg, 180 mg, 240 mg,

300 mg, 360 mg, 420 mg.  **Capsules, Extended-Release, 12 Hour:** 60 mg, 90 mg, 120 mg.  **Tablets, Extended-Release, 24 Hour:** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg.

Administration/handling

IV

Reconstitution

- Add 125 mg to 100 mL D₅W, 0.9% NaCl to provide concentration of 1 mg/mL.

Rate of Administration

- Infuse per dilution/rate chart provided by manufacturer.

Storage

- Refrigerate vials.
- After dilution, stable for 24 hrs.

PO

- Give immediate-release tablets before meals and at bedtime.
- Tablets may be crushed.
- Do not break, crush, dissolve, or divide sustained-release capsules or extended-release capsules or tablets.
- Taztia XT capsules may be opened and mixed with applesauce; follow with glass of water.
- Cardizem CD, Cardizem LA, Cartia XT, Matzim LA may be given without regard to meals.
- Dilacor XR, Dilt-XR to be given on empty stomach.

IV incompatibilities

AcetaZOLAMIDE (Diamox), acyclovir (Zovirax), ampicillin, ampicillin/sulbactam (Unasyn), diazePAM (Valium), furosemide (Lasix), heparin, insulin, nafcillin, phenytoin (Dilantin), rifAMPin (Rifadin), sodium bicarbonate.

IV Compatibilities

Albumin, aztreonam (Azactam), bumetanide (Bumex), ceFAZolin (Ancef),

cefotaxime (Claforan), cefTAZidime (Fortaz), cefTRIAxone (Rocephin), cefuroxime (Zinacef), ciprofloxacin (Cipro), clindamycin (Cleocin), dexmedetomidine (Precedex), digoxin (Lanoxin), DOBUTamine (Dobutrex), DOPamine (Intropin), gentamicin, HYDROmorphine (Dilaudid), lidocaine, LORazepam (Ativan), metoclopramide (Reglan), metroNIDAZOLE (Flagyl), midazolam (Versed), morphine, multivitamins, nitroglycerin, norepinephrine (Levophed), potassium chloride, potassium phosphate, tobramycin (Nebcin), vancomycin (Vancocin).

Indications/routes/dosage

Angina

PO: (Immediate-Release)ADULTS, ELDERLY: Initially, 30 mg 4 times/day. Range: 120–320 mg/day.

PO: (Extended-Release) (Cardizem CD, Cartia XT, DILT-XR): ADULTS, ELDERLY: Initially, 120–180 mg once daily. May increase at 7- to 14-day intervals. Range: 120–320 mg. **Maximum:** 480 mg/day.

(Extended-Release) (Tiazac, Taztia XT): ADULTS, ELDERLY: Initially, 120–180 mg once daily. May increase at 7- to 14-day intervals. Range: 120–320 mg/day. **Maximum:** 540 mg/day.

(Extended-Release) (Cardizem LA, Matzim LA): Initially, 180 mg/day. May increase at 7- to 14-day intervals. Range: 120–320 mg. **Maximum:** 360 mg daily.

Hypertension

PO Capsule Extended-Release (once-daily dosing): (Cardizem CD, Cartia XT): Initially, 180–240 mg/day. May increase after 14 days. Usual dose: 240–360 mg/day. **Maximum:** 480 mg/day. **(Dilt-XR):** Initially, 180–240 mg/day. May increase after 14 days. Usual dose: 240–360 mg/day. **Maximum:** 540 mg/day. **(Tiazac, Taztia XT):** Initially, 120–240 mg/day. Usual dose: 240–360 mg/day. **Maximum:** 540 mg/day.

PO Capsule Extended-Release (twice-daily dosing):ADULTS, ELDERLY: Initially, 60–120 mg twice daily. May increase at 14-day intervals. **Maintenance:** 240–360 mg/day.

POTablet Extended-Release(once-daily dosing): (Cardizem LA, Matzim LA): ADULTS, ELDERLY: Initially, 180–240 mg/day. May increase at 14-day

intervals. Range: 120–540 mg/day. 240–360 mg/day. **Maximum:** 540 mg/day.

Temporary Control of Rapid Ventricular Rate in Atrial Fibrillation/Flutter; Rapid Conversion of Paroxysmal Supraventricular Tachycardia to Normal Sinus Rhythm

IV Push: ADULTS, ELDERLY: Initially, 0.25 mg/kg (average dose: 20 mg) actual body weight over 2 min. May repeat in 15 min at dose of 0.35 mg/kg (average dose: 25 mg) actual body weight. Subsequent doses individualized.

IV Infusion: ADULTS, ELDERLY: After initial bolus injection, may begin infusion at 5–10 mg/hr; may increase by 5 mg/hr up to a maximum of 15 mg/hr. Continuous infusion longer than 24 hrs or infusion rate greater than 15 mg/hr are not recommended. Attempt conversion to PO therapy as soon as possible.

Dosage in Renal/Hepatic Impairment

Use with caution.

Side effects

Frequent (10%–5%): Peripheral edema, dizziness, light-headedness, headache, bradycardia, asthenia. **Occasional (5%–2%):** Nausea, constipation, flushing, EKG changes. **Rare (less than 2%):** Rash, micturition disorder (polyuria, nocturia, dysuria, frequency of urination), abdominal discomfort, drowsiness.

Adverse effects/toxic reactions

Abrupt withdrawal may increase frequency, duration of angina, HF; second- or third-degree AV block occurs rarely. Overdose produces nausea, drowsiness, confusion, slurred speech, profound bradycardia. **Antidote:** Glucagon, insulin drip with continuous calcium infusion (see [Appendix J](#) for dosage).

Nursing considerations

Baseline assessment

Record onset, type (sharp, dull, squeezing), radiation, location, intensity, duration of anginal pain, precipitating factors (exertion, emotional stress). Assess baseline renal/hepatic function tests. Assess B/P, apical pulse immediately before

drug is administered. Obtain baseline EKG in pts with history of arrhythmia.

Intervention/evaluation

Assist with ambulation if dizziness occurs. Assess for peripheral edema. Monitor pulse rate for bradycardia. Assess B/P, renal function, LFT, EKG with IV therapy. Question for asthenia, headache.

Patient/family teaching

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control anginal pain.
- To avoid postural dizziness, go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report palpitations, shortness of breath, pronounced dizziness, nausea, constipation.
- Avoid alcohol (may increase risk of hypotension or vasodilation).

dimethyl fumarate

dye-meth-il-fue-ma-rate

Tecfidera

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Fumaric acid ester.

CLINICAL: Multiple sclerosis agent.

TOP
100

Uses

Treatment of relapsing-remitting multiple sclerosis.

Precautions

Contraindications: Hypersensitivity to dimethyl fumarate. **Cautions:** Hepatic impairment (may increase hepatic transaminases, lymphopenia (may decrease lymphocyte count)).

Action

Exact mechanism of action unknown. May include anti-inflammatory action and cytoprotective properties. **Therapeutic Effect:** Modifies disease progression.

Pharmacokinetics

Undergoes rapid hydrolysis into active metabolite, monomethyl fumarate. Peak concentration: 2–21/2 hrs. Protein binding: 27%–45%. Extensively metabolized by esterases. Primarily eliminated as exhaled carbon dioxide (60%). **Half-life:** 1 hr.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None known. **HERBAL:** None known. **FOOD:** None significant. **LAB VALUES:** May decrease lymphocytes. May increase serum ALT, AST; eosinophils; urine albumin.

Availability (Rx)

Capsules, Delayed-Release: 120 mg, 240 mg.

Administration/handling

PO

- Give capsule whole; do not break, crush, dissolve, or divide.
- May give without regard to meal. May give with food to decrease flushing reaction and GI effects.
- Protect from light.

Indications/routes/dosage

Relapsing-Remitting Multiple Sclerosis

PO: ADULTS/ELDERLY: Initially, 120 mg twice daily for 7 days. Then, increase to 240 mg twice daily.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (40%): Flushing. **Occasional (18%–5%):** Abdominal pain, diarrhea, nausea, vomiting, dyspepsia, pruritus, rash, erythema.

Adverse effects/toxic reactions

Lymphopenia may increase risk for infection. Severe flushing may lead to noncompliance of therapy.

Nursing considerations

Baseline assessment

Obtain baseline CBC, CMP, urine pregnancy if applicable. Question any plans of breastfeeding. Assess hydration status (urine output, skin turgor). Question history of hepatic impairment, lymphopenia.

Intervention/evaluation

Monitor CBC, LFT. Encourage PO intake. Offer antiemetics for nausea, vomiting. Question any episodes of noncompliance due to flushing, GI symptoms. Monitor for infectious process (fever, malaise, chills, body aches, cough).

Patient/family teaching

- Pts will most likely experience abdominal pain, diarrhea, nausea, and flushing. Side effects may decrease over time.
- Take with meals to decrease flushing reaction.
- Swallow capsule whole; do not chew, crush, dissolve, or divide.
- Two dosage strengths will be provided for starting dose and maintenance dose.
- Report any yellowing of skin or eyes, upper abdominal pain, bruising, dark-

colored urine, fever, body aches, cough, dehydration.

dinutuximab

din-ue-tux-i-mab

Unituxin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: GD2-binding monoclonal antibody.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Life-threatening infusion-related reactions have occurred. Administer required prehydration and premedication, including antihistamines, prior to each infusion. Treatment causes severe neuropathic pain. Administer IV opioids prior to each infusion and for 2 hrs following completion of infusion. Severe peripheral sensory neuropathy occurred in pts with neuroblastoma. Severe motor neuropathy was observed. Discontinue therapy if severe unresponsive pain, severe sensory neuropathy, or moderate to severe peripheral motor neuropathy occurs.

Do not confuse dinutuximab with brentuximab, cetuximab, riTUXimab, or siltuximab

Uses

Used in combination with granulocyte-macrophage colony-stimulating factor (GM-CSF), interleukin-2 (IL-2), and 13-cis-retinoic acid, for the treatment of pediatric pts with high-risk neuroblastoma who achieve at least a partial response to prior fine-line multiagent, multimodality therapy.

Precautions

Contraindications: History of anaphylaxis to dinutuximab. **Cautions:** Active infection; baseline cytopenias; diabetes, dehydration, electrolyte imbalance, hepatic/renal impairment, peripheral or generalized edema; intolerance of opioids, antipyretics, antihistamines; history of arrhythmias, hypotension, neuropathy, optic disorders.

Action

Binds to glycolipid GD2 expressed on neuroblastoma cells and on normal cells of neuroectodermal origin, including CNS and peripheral nerves. Induces cell lysis of GD2-expressing cells through antibody-dependent cell-mediated cytotoxicity and complement-dependent cytotoxicity. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Widely distributed. Metabolism not specified. Protein binding: not specified. Elimination not specified. **Half-life:** 10 days.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm, esp. in third trimester. Unknown if distributed in breast milk. However, human immunoglobulin G is present in human breast milk. Must either discontinue drug or discontinue breastfeeding. Females of reproductive potential must use effective contraception during treatment and for at least 2 mos following discontinuation. **Children:** No age-related precautions noted. **Elderly:** Safety and efficacy not established.

Interactions

DRUG: None known (not studied). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease Hgb, Hct, lymphocytes, neutrophils, platelets, RBCs; serum albumin, calcium, magnesium, phosphate, potassium, sodium. May increase serum ALT, AST, bilirubin, creatinine, glucose; urine protein.

Availability (Rx)

Injection Solution: 17.5 mg/5 mL (3.5 mg/mL).

Administration/handling

 IV

Pretreatment Guidelines

IV Hydration

- Administer bolus of 0.9% NaCl 10 mL/kg IV over 1 hr prior to initiation.

Analgesics

- Administer morphine sulfate 50 mcg/kg IV immediately prior to initiation and then continue as morphine sulfate drip at rate of 20–50 mcg/kg/hr during and for 2 hrs following completion of infusion.
- Administer additional doses of morphine sulfate 25–50 mcg/kg IV once every 2 hrs as needed for pain, followed by an increase in morphine infusion rate, if clinically stable.
- Consider use of fentaNYL or HYDROmorphone if morphine sulfate not tolerated.
- If pain is inadequately controlled with opioids, consider use of gabapentin or lidocaine in addition with IV morphine.

Antihistamines and Antipyretics

- Administer an antihistamine such as diphenhydrAMINE 0.5–1 mg/kg (maximum dose 50 mg) IV over 10–15 min, starting 20 min prior to initiation and as tolerated every 4–6 hrs during infusion.
- Administer acetaminophen 10–15 mg/kg (maximum dose 650 mg) 20 minutes prior to each infusion and every 4–6 hrs as needed for fever/pain.
- May administer ibuprofen 5–10 mg/kg every 6 hrs as needed for persistent fever/pain.

Preparation of Infusion

- Visually inspect for particulate matter or discoloration. Do not use if solution is cloudy or contains particulate matter.
- Withdraw required volume from vial and inject into 100 mL 0.9% NaCl.
- Mix by gentle inversion. Do not shake or agitate.
- Discard unused portions of vial.

Rate of Administration

- Initiate infusion rate at 0.875 mg/m²/hr for 30 min via dedicated IV line. May gradually increase rate to maximum rate of 1.75/m²/hr as tolerated.
- Do not infuse as IV push or bolus.

Storage

- Refrigerate vials.
- Protect from light by storing in outer carton.
- May refrigerate diluted solution up to 4 hrs.
- Discard diluted solution 24 hrs after preparation.

■ IV incompatibilities

Do not mix with other medications.

Indications/routes/dosage

Neuroblastoma

IV: PEDIATRIC: 17.5 mg/m²/day over 10–20 hrs for 4 consecutive days for maximum of 5 cycles (Tables 1 and 2).

Table 1 Schedule Of Dinutuximab Administration For Cycles 1, 3, And 5

Cycle Day	1 through 3	4	5	6	7	8 through 24*
dinutuximab		X	X	X	X	

*Cycles 2 and 4 are 32 days in duration.

Table 2 Schedule Of Dinutuximab Administration For Cycles 2 And 4

Cycle Day	1 through 7	8	9	10	11	12 through 32*
dinutuximab		X	X	X	X	

*Cycles 2 and 4 are 32 days in duration.

Dose Modification

Infusion-Related Reactions

Mild to moderate adverse reactions such as transient rash, fever, rigors, or localized urticaria that respond promptly to symptomatic treatment: *Onset of Reaction:* Decrease infusion rate to 50% of the previous rate. *After Resolution:* Gradually increase infusion rate up to maximum rate 1.75 mg/m²/hr. **Prolonged or severe adverse reactions such as mild bronchospasm without other symptoms, angioedema that does not affect the airway:** *Onset of Reaction:* Immediately interrupt infusion. *After Resolution:* If symptoms resolve rapidly, restart infusion at 50% of the previous rate. *First Recurrence:* Discontinue treatment until the following day. If symptoms resolve and continued treatment is warranted, premedicate with hydrocortisone 1 mg/kg (maximum dose 50 mg) IV and administer dinutuximab infusion at a rate of 0.875 mg/m²/hr in an intensive care unit. *Second Recurrence:* Permanently

discontinue.

Capillary Leak Syndrome

Moderate to severe, non-life-threatening capillary leak syndrome: *Onset of Reaction:* Interrupt infusion. *After Resolution:* Resume infusion rate at 50% of previous rate. **Life-threatening capillary leak syndrome:** *Onset of Reaction:* Discontinue for the current cycle. *After Resolution:* In subsequent cycles, administer at 50% of the previous rate. *First Recurrence:* Permanently discontinue.

Hypotension Requiring Medical Intervention

Onset of Reaction: Interrupt infusion. *After Resolution:* Resume infusion at 50% of the previous rate. If blood pressure remains stable for at least 2 hrs, increase infusion rate as tolerated up to maximum rate of 1.75 mg/m²/hr.

Severe Systemic Infection or Sepsis

Onset of Reaction: Discontinue treatment until resolution of infection, then proceed with subsequent cycles of therapy.

Neurologic Disorders of the Eye

Onset of Reaction: Discontinue infusion until resolution of disorder. *After Resolution:* Reduce dose by 50%. *First Recurrence or if Accompanied by Visual Impairment:* Permanently discontinue.

Adverse Reactions Requiring Permanent Discontinuation (using CTCAE Grading 1–5)

Grade 3 or 4 anaphylaxis, serum sickness; grade 3 pain unresponsive to maximum supportive measures; grade 4 sensory neuropathy or grade 3 sensory neuropathy that interferes with daily activities for more than 2 wks; grade 2 peripheral motor neuropathy, subtotal or total vision loss; grade 4 hyponatremia despite appropriate fluid management.

Dosage in Renal/Hepatic Impairment

Not specified; use caution.

Side effects

Frequent (85%–24%): Pain (abdominal, back, bladder, bone, chest, neck, facial, gingival, musculoskeletal, oropharyngeal, extremity), arthralgia, myalgia, neuralgia, proctalgia, pyrexia, hypotension, vomiting, diarrhea, urticaria, hypoxia. **Occasional (19%–10%):** Tachycardia, edema, hypertension, peripheral neuropathy, weight gain, nausea.

Adverse effects/toxic reactions

Anemia, neutropenia, lymphopenia, thrombocytopenia are expected results of therapy. Severe bone marrow suppression occurred in up to 39% of pts. Serious infusion-related reactions, such as bronchospasm, dyspnea, facial and upper airway edema, hypotension, or stridor, may require urgent interventions, including bronchodilator therapy, blood pressure support, corticosteroids, infusion interruption, infusion rate reduction, or permanent treatment discontinuation. Severe infusion-related reactions were reported in 26% of pts. Infusion-related reactions usually occurred during or within 24 hrs of infusion completion. Other serious adverse effects may include: severe urticaria (13% of pts); anaphylaxis, cardiac arrest (1% or less of pts); pain despite pretreatment with analgesics including morphine sulfate infusion (85% of pts); grade 3 pain (51% of pts); grade 3 peripheral sensory/motor neuropathy (1% of pts); grade 3–5 capillary leak syndrome (23% of pts); grade 3 hypotension (16% of pts); grade 3 or 4 bacteremia requiring IV antibiotics or other urgent interventions (13% of pts); sepsis (18% of pts); neurologic disorders of the eye, including blurred vision, photophobia, mydriasis, fixed or unequal pupils, optic nerve disorder, eyelid ptosis, papilledema (2%–13% of pts); grade 3 or 4 electrolyte abnormalities, including hyponatremia, hypokalemia, hypocalcemia (37%–23% of pts); atypical hemolytic uremic syndrome resulting in anemia, electrolyte imbalance, hypertension, renal insufficiency. Bleeding events, including GI/rectal/renal/respiratory/urinary tract/catheter site hemorrhage, disseminated intravascular coagulation, epistaxis, hematemesis, hematochezia, hematuria, were reported. Immunogenicity (anti-dinutuximab antibodies) reported in 18% of pts.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT; serum magnesium, ionized calcium, prealbumin, phosphate triglyceride level; capillary blood glucose, urinalysis, urine protein, urine pregnancy test, vital signs. Verify that pts have adequate hematologic/hepatic/ophthalmic/respiratory/renal function and proper hydration status prior to start of each infusion. Ensure proper resuscitative equipment/medications are readily available. Obtain baseline visual acuity,

pupillary response, neurologic status. Question history of anaphylaxis; intolerance of opioids, antipyretics, antihistamines. Screen for active infection. Offer emotional support.

Intervention/evaluation

Frequently monitor CBC, BMP, LFT, other serum electrolytes, vital signs. Monitor I&O. Administer required prehydration and premedication with antihistamine, antipyretics, opioids prior to each infusion and during infusion as indicated. Diligently monitor for infusion-related reactions as listed in Adverse Effects/Toxic Reactions and institute medical support as needed. Monitor for bleeding events of any kind. Consider administration of naloxone if narcotic overdose is suspected. Routinely assess visual acuity, hydration status. Offer emotional support. Initiate fall precautions.

Patient/family teaching

- Serious infusion reactions, including anaphylaxis, difficulty breathing, facial swelling, itching, rash, and wheezing, may occur during or within 24 hrs of each infusion.
- Immediately report any allergic reactions; bleeding of any kind; decreased urine output or dark urine; disorders of the eye including blurry vision, double vision, unequal pupil size, sensitivity to light, eyelid drooping; fever; palpitations; seizures (related to electrolyte imbalance); severe nerve pain or loss of motor function; signs of low blood pressure such as confusion, fainting, pallor; swelling of face, arms, or legs.
- Moderate to severe generalized pain is an expected side effect. Medications for pain, fever, and mild allergic reactions will need to be provided before or during each infusion; report any intolerance to such medications.
- Therapy is expected to lower blood counts/immune system and may increase risk of bleeding or infection.
- Drink plenty of fluids.
- Treatment may be harmful to fetuses. Contraception is recommended during therapy and for at least 2 mos after discontinuation in females of childbearing potential.

diphenhydrAMINE

dye-fen-**hye**-dra-meen

Allerdryl 

Banophen

Benadryl

Benadryl Children's Allergy

Diphen

Diphenhist

Genahist

Nytol

Fixed-Combination(s)

Advil PM: diphenhydramine/ibuprofen (NSAID): 38 mg/200 mg. With calamine, an astringent, and camphor, a counterirritant (**Caladryl**).

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: PHARMACOTHERAPEUTIC: Histamine-1 antagonist, first generation.

CLINICAL: Antihistamine, anticholinergic, antipruritic, antitussive, antiemetic, antidyskinetic.

Do not confuse Benadryl with benazepril, Bentyl, or Benylin, or diphenhydrAMINE with desipramine, dicyclomine, or dimenhyDRINATE.

Uses

Treatment of allergic reactions, including nasal allergies and allergic dermatoses; parkinsonism, including drug-induced extrapyramidal symptoms; prevention/treatment of nausea, vomiting, or vertigo due to motion sickness; antitussive; short-term management of insomnia; adjunct to EPINEPHrine in treatment of anaphylaxis. Topical form used for relief of pruritus from insect bites, skin irritations.

Precautions

Contraindications: Hypersensitivity to diphenhydrAMINE. Neonates or

premature infants, breastfeeding. **Cautions:** Narrow-angle glaucoma, stenotic peptic ulcer, prostatic hypertrophy, pyloroduodenal/bladder neck obstruction, asthma, COPD, increased IOP, cardiovascular disease, hyperthyroidism, elderly.

Action

Competes with histamine for H-1 receptor site on effector cells in GI tract, blood vessels, respiratory tract. **Therapeutic Effect:** Produces anticholinergic, antipruritic, antitussive, antiemetic, antidyskinetic, sedative effects.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	15–30 min	1–4 hrs	4–6 hrs
IV, IM	Less than 15 min	1–4 hrs	4–6 hrs

Well absorbed after PO, parenteral administration. Protein binding: 98%–99%. Widely distributed. Metabolized in liver. Primarily excreted in urine. **Half-life:** 1–4 hrs. Adults: 7–12 hrs, elderly: 9–18 hrs, children: 4–7 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Detected in breast milk (may produce irritability in breastfed infants). Increased risk of seizures in neonates, premature infants if used during third trimester of pregnancy. May prohibit lactation. **Children:** Not recommended in newborns, premature infants (increased risk of paradoxical reaction, seizures). **Elderly:** Potentially inappropriate due to potent anticholinergic effects. Increased risk for dizziness, sedation, confusion, hypotension, hyperexcitability.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depressant effects. **Anticholinergics** may increase anticholinergic effects. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May suppress wheal/flare reactions to antigen skin testing unless drug is discontinued 4 days before testing.

Availability (OTC)

Capsules: 25 mg, 50 mg. **Cream:** 1%, 2%. **Injection Solution:** 50 mg/mL. **Syrup:** 12.5 mg/5 mL. **Tablets:** 25 mg, 50 mg. **Tablets, Chewable:** 12.5 mg.

Administration/handling

IV

- May be given undiluted.
- Give IV injection over at least 1 min. **Maximum rate:** 25 mg/min.

IM

- Give deep IM into large muscle mass.

PO

- Give with food to decrease GI distress.
- Scored tablets may be crushed.

IV incompatibilities

Allopurinol (Aloprim), cefepime (Maxipime), dexamethasone (Decadron), foscarnet (Foscavir).

IV Compatibilities

Atropine, cisplatin (Platinol), cyclophosphamide (Cytosan), cytarabine (Ara-C), fentaNYL, glycopyrrolate (Robinul), heparin, hydrocortisone (SOLU-Cortef), HYDROmorphine (Dilaudid), hydrOXYzine (Vistaril), lidocaine, metoclopramide (Reglan), ondansetron (Zofran), potassium chloride, promethazine (Phenergan), propofol (Diprivan).

Indications/routes/dosage

Allergic Reaction

PO: ADULTS, ELDERLY: 25–50 mg q4–8h. **Maximum:** 300 mg/day. **IM, IV:** 10–50 mg/dose. **Maximum:** 400 mg/day. **PO, IV, IM:CHILDREN:** 5

mg/kg/day in divided doses q6–8h. **Maximum:** 300 mg/day.

Motion Sickness

Note: When used for prophylaxis, give 30 min before motion.

PO: (Prophylaxis/treatment): ADULTS, ELDERLY: 25–50 mg q6–8h.

CHILDREN: 5 mg/kg/day in 3–4 divided doses. **Maximum:** 300 mg/day.

IV/IM: (Treatment): ADULTS, ELDERLY: 10–50 mg/dose. **Maximum:** 400 mg/day. **CHILDREN:** 5 mg/kg/day in 4 divided doses. **Maximum:** 300 mg/day.

Antitussive

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 25 mg q4h.
Maximum: 150 mg/day.

Nighttime Sleep Aid

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 25–50 mg at bedtime. **CHILDREN 2–11 YRS:** 1 mg/kg/dose. **Maximum Single Dose:** 50 mg.

Pruritus

Topical: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Apply 1% or 2% cream or spray 3–4 times/day. **CHILDREN 2–11 YRS:** Apply 1% cream or spray 3–4 times/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Drowsiness, dizziness, muscle weakness, hypotension, urinary retention, thickening of bronchial secretions, dry mouth, nose, throat, lips; in elderly: sedation, dizziness, hypotension. **Occasional:** Epigastric distress, flushing, visual/hearing disturbances, paresthesia, diaphoresis, chills.

Adverse effects/toxic reactions

Hypersensitivity reactions (eczema, pruritus, rash, cardiac disturbances,

photosensitivity) may occur. Overdose symptoms may vary from CNS depression (sedation, apnea, hypotension, cardiovascular collapse, death) to severe paradoxical reactions (hallucinations, tremors, seizures). Children, infants, neonates may experience paradoxical reactions (restlessness, insomnia, euphoria, nervousness, tremors). Overdosage in children may result in hallucinations, seizures, death.

Nursing considerations

Baseline assessment

If pt is having acute allergic reaction, obtain history of recently ingested foods, drugs, environmental exposure, emotional stress. Monitor B/P rate; depth, rhythm, type of respiration; quality, rate of pulse. Assess lung sounds for rhonchi, wheezing, rales.

Intervention/evaluation

Monitor B/P, esp. in elderly (increased risk of hypotension). Monitor children closely for paradoxical reaction. Monitor for sedation.

Patient/family teaching

- Tolerance to antihistaminic effect generally does not occur; tolerance to sedative effect may occur.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Dry mouth, drowsiness, dizziness may be an expected response to drug.
- Avoid alcohol.

diphenoxylate with atropine

dye-fen-ox-i-late at-roe-peen

Lomotil

Fixed-Combination(s)

Lomotil: diphenoxylate/atropine (anticholinergic, antispasmodic): 2.5 mg/0.025 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Opioid/anticholinergic (Schedule V).

CLINICAL: Antidiarrheal.

Do not confuse Lomotil with LaMICtal, LamISIL, Lamotrigine, Lanoxin, or Lasix

Uses

Adjunctive treatment of acute, chronic diarrhea.

Precautions

Contraindications: Hypersensitivity to diphenoxylate, atropine. Obstructive jaundice, diarrhea associated with pseudomembranous colitis or enterotoxin-producing bacteria. **Cautions:** Children (not recommended in children less than 2 yrs of age), acute ulcerative colitis, renal/hepatic impairment.

Action

Acts locally and centrally on gastric mucosa. **Therapeutic Effect:** Reduces excessive GI motility and GI propulsion.

Pharmacokinetics

	Onset	Peak	Duration
Antidiarrheal	45–60 min	—	3–4 hrs

Well absorbed from GI tract. Metabolized in liver. Primarily eliminated in feces.

Half-life: 2.5 hrs; metabolite: 12–24 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended (increased susceptibility to toxicity, including respiratory depression). **Elderly:** More susceptible to anticholinergic effects, confusion, respiratory depression.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depressant effects. **Anticholinergics** may increase effects of atropine. **MAOIs** (e.g., phenelzine, selegiline) may precipitate hypertensive crisis. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum amylase.

Availability (Rx)

Liquid (Lomotil): 2.5 mg diphenoxylate/ 0.025 mg atropine/5 mL. **Tablets (Lomotil):** 2.5 mg diphenoxylate/0.025 mg atropine.

Administration/handling

PO

- Give without regard to meals. If GI irritation occurs, give with food.
- Use liquid for children 2–12 yrs (use graduated dropper for administration of liquid medication).

Indications/routes/dosage

Diarrhea

PO: ADULTS, ELDERLY: Initially, 5 mg (2 tabs or 10 mL) 3–4 times/day. **Maximum:** 20 mg/day. Then reduce dose as needed. **CHILDREN:** 0.3–0.4 mg/kg/day in 4 divided doses (**Maximum:** 10 mg/day); then reduce dose as needed.

Dosage in Renal/Hepatic Impairment

No dose adjustment. Use caution with severe renal/hepatic disease.

Side effects

Frequent: Drowsiness, light-headedness, dizziness, nausea. **Occasional:** Headache, dry mouth. **Rare:** Flushing, tachycardia, urinary retention, constipation, paradoxical reaction (marked by restlessness, agitation), blurred vision.

Adverse effects/toxic reactions

Dehydration may predispose pt to diphenoxylate toxicity. Paralytic ileus, toxic megacolon (constipation, decreased appetite, abdominal pain with nausea/vomiting) occur rarely. Severe anticholinergic reaction (severe lethargy, hypotonic reflexes, hyperthermia) may result in severe respiratory depression, coma.

Nursing considerations

Baseline assessment

Check baseline hydration status: skin turgor, mucous membranes for dryness, urinary status. Assess usual stool frequency, consistency.

Intervention/evaluation

Encourage adequate fluid intake. Assess bowel sounds for peristalsis. Monitor daily pattern of bowel activity, stool consistency. Record time of evacuation. Assess for abdominal disturbances. Discontinue medication if abdominal distention occurs.

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report persistent fever, palpitations, diarrhea.
- Report abdominal distention.

DOBUTamine

doe-**bue**-ta-meen

HIGH
ALERT

Dobutrex 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Adrenergic agonist.

CLINICAL: Cardiac stimulant.

Do not confuse DOBUTamine with DOPamine.

Uses

Short-term management of cardiac decompensation.

Precautions

Contraindications: Hypersensitivity to dobutamine. Hypertrophic cardiomyopathy with outflow obstruction. **Cautions:** Atrial fibrillation, hypovolemia, post-MI, concurrent use of MAOIs, elderly.

Action

Direct-action inotropic agent acting primarily on beta₁-adrenergic receptors. **Therapeutic Effect:** Enhances myocardial contractility, increases heart rate.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	1–2 min	10 min	Length of infusion

Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2 min.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: Sympathomimetics (e.g., norepinephrine, phenylephrine) may increase effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium.

Availability (Rx)

Infusion (Ready-to-Use): 1 mg/mL (250 mL), 2 mg/mL (250 mL), 4 mg/mL (250 mL). **Injection Solution:** 12.5-mg/mL vial.

Administration/handling

◀ALERT▶ Correct hypovolemia with volume expanders before DOBUTamine infusion. Pts with atrial fibrillation should be digitalized before infusion. Administer by IV infusion only.

IV

Reconstitution

- Dilute vial in 0.9% NaCl or D₅W to maximum concentration of 5,000 mcg/mL (5 mg/mL).

Rate of Administration

- Use infusion pump to control flow rate.
- Titrate dosage to individual response.
- Infiltration causes local inflammatory changes.
- Extravasation may cause dermal necrosis.

Storage

- Store at room temperature.
- Pink discoloration of solution (due to oxidation) does not indicate significant loss of potency if used within recommended time period.
- Further diluted solution for infusion is stable for 48 hrs at room temperature, 7 days if refrigerated.

IV incompatibilities

Acyclovir (Zovirax), alteplase (Activase), amphotericin B complex (Abelcet, AmBisome, Amphotec), bumetanide (Bumex), cefepime (Maxipime), foscarnet (Foscavir), furosemide (Lasix), heparin, piperacillin/tazobactam (Zosyn), sodium bicarbonate.

IV Compatibilities

Amiodarone (Cordarone), calcium chloride, calcium gluconate, diltiazem (Cardizem), DOPamine (Intropin), enalapril (Vasotec), EPINEPHrine, famotidine (Pepcid), HYDROmorphine (Dilaudid), insulin (regular), lidocaine, LORazepam (Ativan), magnesium sulfate, midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, nitroprusside (Nipride), norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

◀ALERT▶ Dosage determined by severity of decompensation.

Cardiac Decompensation

IV Infusion: ADULTS, ELDERLY, CHILDREN: Initially, 0.5–2.5 mcg/kg/min. **Maintenance:** 2–20 mcg/kg/min titrated to desired response. May be infused at a rate of up to 40 mcg/kg/min to increase cardiac output. **NEONATES:** 2–20 mcg/kg/min titrated to desired response. (Also maintenance dose).

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (greater than 5%): Increased heart rate, B/P. **Occasional (5%–3%):** Pain at injection site. **Rare (3%–1%):** Nausea, headache, anginal pain, shortness of breath, fever.

Adverse effects/toxic reactions

Overdose may produce severe tachycardia, severe hypertension.

Nursing considerations

Baseline assessment

Pt must be on continuous cardiac monitoring. Determine weight (for dosage calculation). Obtain initial B/P, heart rate, respirations. Correct hypovolemia before drug therapy.

Intervention/evaluation

Continuously monitor for cardiac rate, arrhythmias. Maintain accurate I&O; measure urinary output frequently. Assess serum potassium, plasma DOBUTamine (therapeutic range: 40–190 ng/mL). Monitor B/P continuously (hypertension risk greater in pts with preexisting hypertension). Check cardiac

output, pulmonary wedge pressure/central venous pressure (CVP) frequently. Immediately notify physician of decreased urinary output, cardiac arrhythmias, significant increase in B/P, heart rate, or less commonly, hypotension.

DOCEtaxel

doe-se-tax-el

HIGH
ALERT

Docefrez

Taxotere

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Antimitotic agent, taxoid.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Avoid use with serum bilirubin more than upper limit of normal (ULN) or serum ALT, AST more than 1.5 times ULN in conjunction with serum alkaline phosphatase more than 2.5 times ULN. Severe hypersensitivity reaction (rash, hypotension, bronchospasm, anaphylaxis) may occur. Fluid retention syndrome (pleural effusions, ascites, edema, dyspnea at rest) has been reported. Pts with abnormal hepatic function, receiving higher doses, and pts with non–small-cell lung carcinoma (NSCLC) and history of prior platinum treatment receiving DOCEtaxel dose of 100 mg/m² at higher risk for mortality. Avoid use with ANC less than 1,500 cells/mm³.

Do not confuse DOCEtaxel with PACLitaxel or Taxotere with Taxol.

Uses

Treatment of locally advanced or metastatic breast carcinoma after failure of prior chemotherapy. Treatment of metastatic non–small-cell lung cancer. Treatment of metastatic prostate cancer, head and neck cancer (with predniSONE). Treatment of advanced gastric adenocarcinoma. **OFF-LABEL:** Bladder, esophageal, ovarian, small-cell lung carcinoma; soft tissue carcinoma, cervical cancer, Ewing’s sarcoma, osteosarcoma.

Precautions

Contraindications: Hypersensitivity to docetaxel. History of severe

hypersensitivity to drugs formulated with polysorbate 80, neutrophil count less than 1,500 cells/mm³. **Cautions:** Hepatic impairment, myelosuppression, concomitant CYP3A4 inhibitors/inducers, fluid retention, pulmonary disease, HF, active infection.

Action

Disrupts microtubular cell network, essential for cellular function. **Therapeutic Effect:** Inhibits cellular mitosis.

Pharmacokinetics

Widely distributed. Protein binding: 94%. Extensively metabolized in liver. Excreted in feces (75%), urine (6%). **Half-life:** 11.1 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 16 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (e.g., erythromycin, ketoconazole) may increase concentration/toxicity. CYP3A4 inducers (e.g., rifAMPin) may decrease concentration/effects. Live virus vaccines may potentiate replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea may decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST. Reduces neutrophil, platelet count, Hgb, Hct.

Availability (Rx)

Injection, Powder for Reconstitution: 20 mg, 80 mg. **Injection Solution:** 10 mg/mL, 20 mg/mL.

Administration/handling

IV

Reconstitution (Solution)

- Withdraw dose and add to 250–500 mL 0.9% NaCl or D₅W in glass or polyolefin container to provide a final concentration of 0.3–0.74 mg/mL.
- (Powder)** Add 1 mL diluent provided to 20-mg vial to provide a concentration of 20 mg/0.8 mL (4 mL to 80-mg vial to provide a concentration of 24 mg/mL). Shake well. Further dilute in 250 mL NaCl or D₅W to a final concentration of 0.3–0.74 mg/mL.

Rate of Administration

- Administer as a 1-hr infusion.
- Monitor closely for hypersensitivity reaction (flushing, localized skin reaction, bronchospasm [may occur within a few min after beginning infusion]).

Storage

- Store vials between 36°F–77°F.
- Protect from bright light.
- If refrigerated, stand vial at room temperature for 5 min before administering (do not store in PVC bags).
- Diluted solution should be used within 4 hrs (including infusion time).

IV incompatibilities

Amphotericin B (Fungizone), methylPREDNISolone (SOLU), nalbuphine (Nubain).

IV Compatibilities

Bumetanide (Bumex), calcium gluconate, dexamethasone (Decadron), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), furosemide (Lasix), granisetron (Kytril), heparin, HYDROmorphine (Dilaudid), LORazepam (Ativan), magnesium sulfate, mannitol, morphine, ondansetron (Zofran), palonosetron (Aloxi), potassium chloride.

Indications/routes/dosage

 Pt should be premedicated with oral corticosteroids (e.g., dexamethasone 16 mg/day for 5 days beginning day 1 before DOCETaxel therapy); reduces severity of fluid retention, hypersensitivity reaction.

Breast Carcinoma

IV:ADULTS: Locally advanced or metastatic: 60–100 mg/m² given over 1 hr q3wks as a single agent. Operable, node positive: 75 mg/m² q3wks for 6 courses (in combination with DOXOrubicin and cyclophosphamide).

Non–Small-Cell Lung Carcinoma

IV:ADULTS: 75 mg/m² q3wks (as monotherapy or in combination with CISplatin).

Prostate Cancer

IV:ADULTS, ELDERLY: 75 mg/m² q3wks with concurrent administration of predniSONE.

Head/Neck Cancer

IV:ADULTS, ELDERLY: 75 mg/m² q3wks (in combination with CISplatin and fluorouracil) for 3–4 cycles, followed by radiation therapy.

Gastric Adenocarcinoma

IV:ADULTS, ELDERLY: 75 mg/m² q3wks (in combination with CISplatin and fluorouracil).

Dose Modification for Gastric or Head/Neck Cancer

ALT, AST 2.5 to 5 times ULN and alkaline phosphatase less than or equal to 2.5 times ULN	80% of dose
ALT, AST 1.5 to 5 times ULN and alkaline phosphatase 2.5 to 5 times ULN	80% of dose
ALT, AST greater than 5 times ULN and/or alkaline phosphatase greater than 5 times ULN	Discontinue DOCEtaxel

Note: Toxicity includes febrile neutropenia, neutrophils less than 500 cells/mm³ for longer than 1 wk, severe cutaneous reactions. Also, for NSCLC, platelet nadir less than 25,000 cells/mm³, any CTCAE grade 3 or 4 nonhematologic toxicity.

Breast Cancer

Reduce dose to 75 mg/m²; if toxicity persists, reduce to 55 mg/m².

Breast Cancer Adjuvant

Administer when neutrophils are less than 1,500 cells/mm³. If toxicity persists, or grade 3 or 4 stomatitis, reduce dose to 60 mg/m².

Non–Small-Cell Lung Cancer

Monotherapy

Hold dose until toxicity resolves, then reduce dose to 55 mg/m². Discontinue if grade 3 or 4 neuropathy occurs.

Combination Therapy

Reduce dose to 65 mg/m²; may further reduce to 50 mg/m² if needed.

Prostate Cancer

Reduce dose to 60 mg/m²; discontinue if toxicity persists.

Gastric or Head and Neck Cancer

Reduce dose to 60 mg/m²; if neutropenic toxicity persists, further reduce to 45 mg/m². For grade 3 or 4 thrombocytopenia, reduce dose from 75 mg/m² to 60 mg/m²; discontinue if toxicity persists.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Total bilirubin more than ULN, or ALT, AST more than 1.5 times ULN with alkaline phosphatase more than 2.5 times ULN: Use not recommended.

Side effects

Frequent (80%–19%:) Alopecia, asthenia, hypersensitivity reaction (e.g., dermatitis), which is decreased in pts pretreated with oral corticosteroids; fluid retention, stomatitis, nausea, diarrhea, fever, nail changes, vomiting, myalgia.

Occasional: Hypotension, edema, anorexia, headache, weight gain, infection (urinary tract, injection site, indwelling catheter tip), dizziness. **Rare:** Dry skin, sensory disorders (vision, speech, taste), arthralgia, weight loss, conjunctivitis, hematuria, proteinuria.

Adverse effects/toxic reactions

In pts with normal hepatic function, neutropenia (ANC count less than 1,500 cells/mm³), leukopenia (WBC count less than 4,000 cells/mm³) occur in 96% of pts; anemia (hemoglobin level less than 11 g/dL) occurs in 90% of pts; thrombocytopenia (platelet count less than 100,000 cells/mm³) occurs in 8% of pts; infection occurs in 28% of pts. Neurosensory, neuromotor disturbances (distal paresthesia, weakness) occur in 54% and 13% of pts, respectively.

Nursing considerations

Baseline assessment

Obtain baseline ANC, CBC, serum chemistries. Offer emotional support to pt, family. Antiemetics may be effective in preventing, treating nausea/vomiting. Pt should be pretreated with corticosteroids to reduce fluid retention, hypersensitivity reaction.

Intervention/evaluation

Frequently monitor blood counts, particularly ANC count (less than 1,500 cells/mm³ requires discontinuation of therapy). Monitor LFT, serum uric acid levels. Observe for cutaneous reactions (rash with eruptions, mainly on hands, feet). Assess for extravascular fluid accumulation: rales in lungs, dependent edema, dyspnea at rest, pronounced abdominal distention (due to ascites).

Patient/family teaching

- Hair loss is reversible, but new hair growth may have different color or texture.
- New hair growth resumes 2–3 mos after last therapy dose.
- Maintain strict oral hygiene.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid those who have recently taken any live virus vaccine.
- Report persistent nausea, diarrhea, respiratory difficulty, chest pain, fever, chills, unusual bleeding, bruising.

dofetilide

doe-**fet**-i-lide

Tikosyn

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Potassium channel blocker.

CLINICAL: Antiarrhythmic: Class III.

■ **BLACK BOX ALERT** ■ Pt must be placed in a setting with continuous cardiac monitoring for minimum of 3 days and monitored by staff familiar with treatment of life-threatening arrhythmias.

Uses

Maintenance of normal sinus rhythm (NSR) in pts with chronic atrial fibrillation/atrial flutter of longer than 1-wk duration who have been converted to NSR. Conversion of atrial fibrillation/flutter to NSR.

Precautions

Contraindications: Hypersensitivity to dofetilide. Congenital or acquired prolonged QT syndrome (do not use if baseline QT interval or QTc is greater than 440 msec), severe renal impairment, concurrent use of drugs that may prolong QT interval, hypokalemia, hypomagnesemia, concurrent use with verapamil, dolutegravir, itraconazole, ketoconazole, prochlorperazine, megestrol, cimetidine, hydroCHLOROthiazide, trimethoprim. Severe renal impairment (CrCl less than 20 mL/min). **Cautions:** Severe hepatic impairment, renal impairment, pts previously taking amiodarone, elderly. Concurrent use of other agents that prolong QT interval. Pts with sick sinus syndrome or second- or third-degree heart block unless functional pacemaker in place.

Action

Prolongs repolarization without affecting conduction velocity by blocking one or more time-dependent potassium currents. No effect on sodium channels, alpha-adrenergic, beta-adrenergic receptors. **Therapeutic Effect:** Terminates reentrant tachyarrhythmias, preventing reinduction.

Pharmacokinetics

Well absorbed following PO administration. 80% eliminated in urine as unchanged drug, 20% excreted as minimally active metabolites. Protein binding: 60%–70%. **Half-life:** 2–3 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug is distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Cimetidine, verapamil, itraconazole, ketoconazole, trimethoprim, hydroCHLOROthiazide may increase concentration, toxicity. **HERBAL:** St. John's wort may decrease concentration. **Ephedra** may worsen arrhythmias. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Capsules: 125 mcg, 250 mcg, 500 mcg.

Administration/handling

PO

- Give without regard to meals.
- Do not break, crush, or open capsules.

Indications/routes/dosage

 **ALERT** EKG interval measurements (esp. QTc intervals), creatinine clearance, must be determined prior to first dose. Correct hypokalemia, hypomagnesemia prior to starting.

Antiarrhythmias

PO: ADULTS, ELDERLY: Initially, 500 mcg twice daily. Modify dose in response to QTc interval.

Dosage in Renal Impairment

Creatinine Clearance	Dosage
Greater than 60 mL/min	500 mcg twice daily
40–60 mL/min	250 mcg twice daily
20–39 mL/min	125 mcg twice daily
Less than 20 mL/min	Contraindicated

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Rare (less than 2%): Headache, chest pain, dizziness, dyspnea, nausea, insomnia, back/abdominal pain, diarrhea, rash.

Adverse effects/toxic reactions

Angioedema, bradycardia, cerebral ischemia, facial paralysis, serious arrhythmias (ventricular, various forms of block) have been noted.

Nursing considerations

Baseline assessment

Assess baseline serum electrolytes (esp. potassium, magnesium). Prior to initiating treatment, QTc intervals must be determined. Do not use if heart rate less than 50 beats/min. Provide continuous EKG monitoring, calculation of creatinine clearance, equipment for resuscitation available for minimum of 3 days. Anticipate proarrhythmic events.

Intervention/evaluation

Assess for conversion of cardiac dysrhythmias and absence of new arrhythmias. Constantly monitor EKG. Provide emotional support. Monitor renal function for electrolyte imbalance (prolonged or excessive diarrhea, sweating, vomiting, thirst).

Patient/family teaching

- Instruct pt on need for compliance and requirement for periodic monitoring of EKG and renal function.
- Do not break, crush, or open capsule.

donepezil

doe-**nep**-e-zil

Apo-**Donepezil** 

Aricept

Fixed-combination(s)

Namzaric: donepezil/memantine (NMDA receptor antagonist): 10 mg/14 mg, 10 mg/28 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Acetylcholinesterase inhibitor.

CLINICAL: Cholinergic.

Do not confuse Aricept with Aciphex, Ascriptin, or Azilect.

Uses

Treatment of mild, moderate, or severe dementia of Alzheimer's disease. **OFF-LABEL:** Treatment of behavioral syndromes in dementia, dementia associated with Parkinson's disease, Lewy body dementia.

Precautions

Contraindications: History of hypersensitivity to donepezil, other piperidine derivatives. **Cautions:** Asthma, COPD, bradycardia, bladder outflow obstruction, history of ulcer disease, those taking concurrent NSAIDs, supraventricular cardiac conduction disturbances (e.g., "sick sinus syndrome," Wolff-Parkinson-White syndrome), seizure disorder.

Action

Inhibits enzyme acetylcholinesterase, increasing concentration of acetylcholine

at cholinergic synapses, enhancing cholinergic function in CNS. **Therapeutic Effect:** Slows progression of Alzheimer's disease.

Pharmacokinetics

Well absorbed after PO administration. Protein binding: 96%. Extensively metabolized. Eliminated in urine, feces. **Half-life:** 70 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May decrease effect of **anticholinergics** (e.g., glycopyrrolate, scopolamine). May increase synergistic effects of **cholinergic agonists**, **neuromuscular blockers** (e.g., rocuronium, succinylcholine). Ketoconazole may inhibit metabolism. **CYP3A4 inducers** (e.g., carbamazepine, rifampin) may decrease concentration/effects. **HERBAL:** **St. John's wort** may decrease concentration. **Ginkgo** may increase adverse effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Tablets: 5 mg, 10 mg, 23 mg. **Tablets (Orally Disintegrating):** 5 mg, 10 mg.

Administration/handling

PO

- May be given at bedtime without regard to meals.
- Swallow tablets whole; do not break, crush, dissolve, or divide.
- Follow dose with water.

Indications/routes/dosage

Alzheimer's Disease

PO: ADULTS, ELDERLY: For mild to moderate, initially 5 mg/day at bedtime. May increase at 4- to 6-wk intervals to 10 mg/day at bedtime. Range: 5–10 mg/day. For moderate to severe Alzheimer's, a dose of 23 mg once daily can be administered once pt has been taking 10 mg once daily for at least 3 mos. Range: 10–23 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (11%–8%): Nausea, diarrhea, headache, insomnia, nonspecific pain, dizziness. **Occasional (6%–3%):** Mild muscle cramps, fatigue, vomiting, anorexia, ecchymosis. **Rare (3%–2%):** Depression, abnormal dreams, weight loss, arthritis, drowsiness, syncope, frequent urination.

Adverse effects/toxic reactions

Overdose may result in cholinergic crisis (severe nausea, increased salivation, diaphoresis, bradycardia, hypotension, flushed skin, abdominal pain, respiratory depression, seizures, cardiorespiratory collapse). Increasing muscle weakness may occur, resulting in death if muscles of respiration become involved. **Antidote:** Atropine sulfate 1–2 mg IV with subsequent doses based on therapeutic response.

Nursing considerations

Baseline assessment

Assess cognitive function (e.g., memory, attention, reasoning). Obtain baseline vital signs. Assess history for peptic ulcer, urinary obstruction, asthma, COPD, seizure disorder, cardiac conduction disturbances.

Intervention/evaluation

Monitor behavior, mood/cognitive function, activities of daily living. Monitor for cholinergic reaction (GI discomfort/cramping, feeling of facial warmth, excessive salivation/diaphoresis), lacrimation, pallor, urinary urgency, dizziness.

Monitor for nausea, diarrhea, headache, insomnia.

Patient/family teaching

- Report nausea, vomiting, diarrhea, diaphoresis, increased salivary secretions, severe abdominal pain, dizziness.
- May take without regard to food (best taken at bedtime).
- Not a cure for Alzheimer's disease but may slow progression of symptoms.

DOPamine

dope-a-meen

HIGH
ALERT

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Sympathomimetic (adrenergic agonist).

CLINICAL: Cardiac stimulant, vasopressor.

■ **BLACK BOX ALERT** ■ If extravasation occurs, infiltrate area with phentolamine (5–10 mL 0.9% NaCl) as soon as possible, no later than 12 hrs after extravasation.

Do not confuse DOPamine with DOBUTamine or Dopram.

Uses

Adjunct in treatment of shock (e.g., MI, trauma, renal failure, cardiac decompensation, open heart surgery, persisting after adequate fluid volume replacement). **OFF-LABEL:** Symptomatic bradycardia or heart block unresponsive to atropine or cardiac pacing.

Precautions

Contraindications: Hypersensitivity to dopamine, sulfites. Pheochromocytoma, ventricular fibrillation. Uncorrected tachyarrhythmias. **Cautions:** Ischemic heart disease, occlusive vascular disease, hypovolemia, recent use of MAOIs (within 2–3 weeks), ventricular arrhythmias, post-MI.

Action

Stimulates adrenergic and dopaminergic receptors. Effects are dose dependent. Lower dosage stimulates dopaminergic receptors, causing renal vasodilation.

Higher doses stimulate both dopaminergic and beta₁-adrenergic receptors, causing cardiac stimulation and renal vasodilation. Higher doses stimulate alpha-adrenergic receptors, causing vasoconstriction, increased B/P. **Therapeutic Effect: Low dosage (1–3 mcg/kg/min):** Increases renal blood flow, urinary flow, sodium excretion. **Low to moderate dosage (4–10 mcg/kg/min):** Increases myocardial contractility, stroke volume, cardiac output. **High dosage (greater than 10 mcg/kg/min):** Increases peripheral resistance, vasoconstriction, B/P.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	1–2 min	N/A	Less than 10 min

Widely distributed. Does not cross blood-brain barrier. Metabolized in liver, kidneys, plasma. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2 min.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Recommended close hemodynamic monitoring (gangrene due to extravasation reported). **Elderly:** No age-related precautions noted.

Interactions

DRUG: May have increased effects with **vasopressors (e.g., midodrine, norepinephrine, phenylephrine)**. **COMT inhibitors (e.g., entacapone, tolcapone)** may increase level/effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Injection Solution: 40 mg/mL, 80 mg/mL, 160 mg/mL. **Injection (Premix with Dextrose):** 0.8 mg/mL (250 mL, 500 mL), 1.6 mg/mL (250 mL, 500 mL), 3.2 mg/mL (250 mL).

Administration/handling

◀ALERT▶ Fluid volume depletion must be corrected before administering DOPamine (may be used concurrently with fluid replacement).

IV

Reconstitution

- Available prediluted in 250 or 500 mL D₅W or dilute in 250–500 mL 0.9% NaCl or D₅W, to maximum concentration of 3,200 mcg/mL (3.2 mg/mL).

Rate of Administration

- Administer into large vein (antecubital fossa, central line preferred) to prevent extravasation.
- Use infusion pump to control flow rate.
- Titrate drug to desired hemodynamic, renal response (optimum urinary flow determines dosage).

Storage

- Do not use solutions darker than slightly yellow or discolored to yellow, brown, pink to purple (indicates decomposition of drug).
- Stable for 24 hrs after dilution.

IV incompatibilities

Acyclovir (Zovirax), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), furosemide (Lasix), insulin, sodium bicarbonate.

IV Compatibilities

Amiodarone (Cordarone), calcium chloride, dexmedetomidine (Precedex), diltiazem (Cardizem), DOBUTamine (Dobutrex), enalapril (Vasotec), EPINEPHrine, heparin, HYDROMorphone (Dilaudid), labetalol (Trandate), levoFLOXacin (Levaquin), lidocaine, LORazepam (Ativan), methylPREDNISolone (Solu-Medrol), midazolam (Versed), milrinone (Primacor), morphine, niCARDipine (Cardene), nitroglycerin, norepinephrine (Levophed), piperacillin/tazobactam (Zosyn), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

◀ALERT▶ Effects of DOPamine are dose dependent. Titrate to desired response. Doses greater than 20 mcg/kg/min may not have beneficial effect on BP and may increase risk of tachyarrhythmias.

Hemodynamic Support

IV Infusion: ADULTS, ELDERLY, CHILDREN: Range: 2–20 mcg/kg/min. Titrate to desired response. May gradually increase by 5–10 mcg/kg/min increments. **Maximum:** 50 mcg/kg/min. **NEONATES:** 1–20 mcg/kg/min. Titrate to desired response.

Side effects

Frequent: Headache, arrhythmias, tachycardia, anginal pain, palpitations, vasoconstriction, hypotension, nausea, vomiting, dyspnea. **Occasional:** Piloerection (goose bumps), bradycardia, widening of QRS complex.

Adverse effects/toxic reactions

High doses may produce ventricular arrhythmias, tachycardia. Pts with occlusive vascular disease are at high risk for further compromise of circulation to extremities, which may result in gangrene. Tissue necrosis with sloughing may occur with extravasation of IV solution.

Nursing considerations

Baseline assessment

Pt must be on continuous cardiac monitoring. Determine weight (for dosage calculation). Obtain initial B/P, heart rate, respirations. Assess patency of IV access.

Intervention/evaluation

Continuously monitor for cardiac arrhythmias. Measure urinary output frequently. If extravasation occurs, immediately infiltrate affected tissue with 10–15 mL 0.9% NaCl solution containing 5–10 mg phentolamine mesylate. Monitor B/P, heart rate, respirations q15min during administration (more often if indicated). Assess cardiac output, pulmonary wedge pressure, or central venous

pressure (CVP) frequently. Assess peripheral circulation (palpate pulses, note color/temperature of extremities). Immediately notify physician of decreased urinary output, cardiac arrhythmias, significant changes in B/P, heart rate, or failure to respond to increase or decrease in infusion rate, decreased peripheral circulation (cold, pale, mottled extremities). Taper dosage before discontinuing (abrupt cessation of therapy may result in marked hypotension). Be alert to excessive vasoconstriction (decreased urine output, increased heart rate, arrhythmias, disproportionate increase in diastolic B/P, decrease in pulse pressure); slow or temporarily stop infusion, notify physician.

doripenem

dor-i-pen-em

Doribax

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Carbapenem.

CLINICAL: Antibiotic.

Do not confuse Doribax with Zovirax, or doripenem with ertapenem, imipenem, or meropenem.

Uses

Treatment of complicated intra-abdominal infections, complicated UTIs (including pyelonephritis) due to susceptible gram-positive, gram-negative (including *P. aeruginosa*), and anaerobic bacteria. **OFF-LABEL:** Treatment of intravascular catheter-related bloodstream infection due to ESBL-producing *E. coli* and *Klebsiella* spp. pneumonia, including ventilator-associated.

Precautions

Contraindications: History of serious hypersensitivity to doripenem or other carbapenems (meropenem, imipenem-cilastatin, ertapenem). Anaphylactic reactions to beta-lactam antibiotics. **Cautions:** Hypersensitivity to penicillins, cephalosporins. Pts with renal impairment, CNS disorders (e.g., stroke, history of seizures).

Action

Inactivates penicillin-binding proteins, resulting in inhibition of cell wall synthesis. **Therapeutic Effect:** Produces bacterial cell death.

Pharmacokinetics

Penetrates into body fluids, tissues. Widely distributed. Protein binding: 8%. Primarily excreted in urine. Removed by dialysis. **Half-life:** 1 hr.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Advanced renal insufficiency, end-stage renal insufficiency may require dosage adjustment.

Interactions

DRUG: Probenecid reduces renal excretion of doripenem. May decrease **valproic acid** concentration (do not use concurrently). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST. May decrease Hgb, Hct, platelet count; serum potassium.

Availability (Rx)

Injection, Powder for Reconstitution: 250 mg, 500 mg.

Administration/handling

IV

Reconstitution

- Reconstitute 250-mg or 500-mg vial with 10 mL Sterile Water for Injection or 0.9% NaCl.
- Shake well to dissolve.
- Further dilute with 100 mL 0.9% NaCl or D₅W.

Rate of Administration

- Give by intermittent IV infusion (piggyback).

- Do not give IV push.
- Infuse over 60 min.

Storage

- Stable for 12 hrs at room temperature, 72 hrs if refrigerated when diluted in 0.9% NaCl; 4 hrs at room temperature, 24 hrs if refrigerated when diluted in D₅W.

■ IV incompatibilities

DiazePAM (Valium), potassium phosphate, propofol (Diprivan).

■ IV Compatibilities

Amiodarone, bumetanide (Bumex), calcium gluconate, dexamethasone, diltiazEM (Cardizem), diphenhydrAMINE (Benadryl), furosemide (Lasix), heparin, hydrocortisone (SOLU-Cortef), HYDROmorphone (Dilaudid), insulin, labetalol (Trandate), LORazepam (Ativan), magnesium sulfate, methylPREDNISolone (SOLU-Medrol), metoclopramide (Reglan), milrinone, morphine, ondansetron (Zofran), pantoprazole (Protonix), potassium chloride.

Indications/routes/dosage

Intra-Abdominal Infections

IV: ADULTS, ELDERLY: 500 mg q8h for 5–14 days.

Urinary Tract Infections

IV: ADULTS, ELDERLY: 500 mg q8h for 10–14 days.

Dosage in Renal Impairment

Creatinine Clearance	Dosage
Greater than 50 mL/min	No adjustment
30–50 mL/min	250 mg q8h
11–29 mL/min	250 mg q12h
Hemodialysis	250 mg q24h; if treating infection caused by <i>Pseudomonas aeruginosa</i> : 500 mg q12h on day 1, then 500 g q24h
Continuous renal replacement	250 mg q12h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (10%–6%): Diarrhea, nausea, headache. **Occasional (5%–2%):** Altered mental status, insomnia, rash, abdominal pain, constipation, vomiting, edema, fever. **Rare (less than 2%):** Dizziness, cough, oral candidiasis, anxiety, tachycardia, phlebitis at IV site.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may occur. Anaphylactic reactions in pts receiving beta-lactams have occurred. Seizures may occur in those with CNS disorders (brain lesions, history of seizures) or with bacterial meningitis or severe impaired renal function.

Nursing considerations

Baseline assessment

Question pt for history of allergies, particularly to beta-lactams, penicillins, cephalosporins. Inquire about history of seizures.

Intervention/evaluation

Monitor for signs of hypersensitivity reaction during first dose. Monitor daily pattern of bowel activity, stool consistency. Monitor for nausea, vomiting. Evaluate hydration status. Evaluate for inflammation at IV injection site. Assess skin for rash. Check mental status; be alert to tremors, possible seizures. Assess sleep pattern for evidence of insomnia.

Patient/family teaching

- Report tremors, seizures, rash, diarrhea, or other new symptoms.

doxazosin

dox-a-zoe-sin

Apo-Doxazosin 

Cardura

Cardura XL

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alpha-adrenergic blocker.

CLINICAL: Anti-hypertensive.

Do not confuse Cardura with Cardene, Cordarone, Coumadin, K-Dur, or Ridaura, or doxazosin with doxapram, doxepin, or DOXOrubicin.

Uses

Cardura: Treatment of mild to moderate hypertension. Used alone or in combination with other antihypertensives. Treatment of urinary outflow obstruction and/or obstruction and irritation associated with benign prostatic hyperplasia (**BPH**). **Cardura XL:** Treatment of urinary outflow obstruction and/or obstruction and irritation associated with benign prostatic hyperplasia. **OFF-LABEL:** Pediatric hypertension. Facilitate distal ureteral stone expulsion. Erectile dysfunction in pts with BPH.

Precautions

Contraindications: Hypersensitivity to doxazosin or other quinazolines (prazosin, terazosin). **Cautions:** Constipation, ileus, GI obstruction, hepatic impairment.

Action

Hypertension: Selectively blocks α_1 -adrenergic receptors, decreasing peripheral vascular resistance. **BPH:** Inhibits postsynaptic alpha-adrenergic receptors in prostatic stromal and bladder neck tissues. **Therapeutic Effect: Hypertension:** Causes peripheral vasodilation, lowering B/P. **BPH:** Relaxes smooth muscle of bladder, prostate, reducing BPH symptoms.

Pharmacokinetics

Route	Onset	Peak	Duration
PO (antihypertensive)	1–2 hrs	2–6 hrs	24 hrs

Well absorbed from GI tract. Protein binding: 98%–99%. Metabolized in liver. Primarily eliminated in feces. Not removed by hemodialysis. **Half-life:** 19–22 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May be more sensitive to hypotensive effects.

Interactions

DRUG: NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease effect. **Hypotension-producing medications (e.g., antihypertensives, diuretics)** may increase effect. **CYP3A4 inhibitors (e.g., atazanavir, ketoconazole)** may increase hypotensive effect. **Phosphodiesterase inhibitors (e.g., sildenafil)** may produce additive hypotension. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may increase antihypertensive effect. Avoid **saw palmetto** (limited experience with this combination). **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Tablets: 1 mg, 2 mg, 4 mg, 8 mg.

 **Tablets, Extended-Release:** 4 mg, 8 mg.

Administration/handling

PO

- Give without regard to food.
- Do not break, crush, dissolve, or divide extended-release tablet.
- Immediate-release tablets given morning or evening; extended-release tablets given with morning meal.

Indications/routes/dosage

Hypertension

PO: (Immediate-Release): ADULTS, ELDERLY: Initially, 1 mg once daily. May be increased to 2 mg once daily. Thereafter, may increase upward over several weeks to a maximum of 16 mg/day.

Benign Prostatic Hyperplasia

PO: (Immediate-Release): ADULTS, ELDERLY: Initially, 1 mg/day. May be increased to 2 mg once daily. Thereafter, may increase q1–2wks. **Maximum:** 8 mg/day. **(Extended-Release):** Initially, 4 mg/day. May increase to 8 mg in 3–4 wks. **Note:** When switching to extended-release, omit evening dose prior to starting morning dose.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: Use caution. **Severe Impairment:** Avoid use.

Side effects

Frequent (20%–10%): Dizziness, asthenia, headache, edema. **Occasional (9%–3%):** Nausea, pharyngitis, rhinitis, pain in extremities, drowsiness. **Rare (2%–1%):** Palpitations, diarrhea, constipation, dyspnea, myalgia, altered vision, anxiety.

Adverse effects/toxic reactions

First-dose syncope (hypotension with sudden loss of consciousness) may occur 30–90 min following initial dose of 2 mg or greater, too-rapid increase in dosage, addition of another antihypertensive agent to therapy. First-dose syncope may be preceded by tachycardia (pulse rate 120–160 beats/min).

Nursing considerations

Baseline assessment

Give first dose at bedtime. If initial dose is given during daytime, pt must remain recumbent for 3–4 hrs. Assess B/P, pulse immediately before each dose and q15–30 min until B/P is stabilized (be alert to fluctuations).

Intervention/evaluation

Monitor B/P, I&O. Monitor pulse diligently (first-dose syncope may be preceded by tachycardia). Assess for edema, headache. Assist with ambulation if dizziness, light-headedness occurs.

Patient/family teaching

- Full therapeutic effect may not occur for 3–4 wks.
- May cause syncope (fainting); go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.

doxepin

dox-e-pin

Apo-Doxepin 

Novo-Doxepin 

Prudoxin

Silenor

SINEquan 

Zonalon

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tricyclic.

CLINICAL: Antidepressant, antianxiety, antineuralgic, antipruritic.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse doxepin with digoxin, doxapram, doxazosin, Doxidan, or

doxycycline, or SINEquan with SEROquel, or Singulair.

Uses

Treatment of depression and/or anxiety. **Silenor (only):** Treatment of insomnia in pts with difficulty staying asleep. **Topical:** Treatment of pruritus associated with atopic dermatitis. **OFF-LABEL:** Treatment of neurogenic pain, treatment of anxiety.

Precautions

Contraindications: Hypersensitivity to doxepin. Glaucoma, hypersensitivity to other tricyclic antidepressants, urinary retention, use of MAOIs within 14 days. **Cautions:** Cardiac/hepatic/renal disease, pts at risk for suicidal ideation, respiratory compromise, sleep apnea, history of bowel obstruction, increased IOP, glaucoma, history of seizures, history of urinary retention/obstruction, hyperthyroidism, prostatic hypertrophy, hiatal hernia, elderly.

Action

Increases synaptic concentrations of norepinephrine, serotonin. **Therapeutic Effect:** Produces antidepressant, anxiolytic effects.

Pharmacokinetics

PO: Rapidly absorbed from GI tract. Protein binding: 80%–85%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 6–8 hrs. **Topical:** Absorbed through skin. Distributed to body tissues. Metabolized to active metabolite. Excreted in urine.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Increased risk of toxicity (lower dosages recommended). Avoid doses greater than 6 mg/day due to anticholinergic effects, sedation, and orthostatic hypotension.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem) may increase CNS, respiratory depression, hypotensive effects. **Cimetidine** may increase concentration, risk of toxicity. **MAOIs (e.g., phenelzine, selegiline)** may increase risk of seizures, hyperpyrexia, hypertensive crisis (discontinue at least 2 wks prior to starting doxepin). **Phenothiazines** may increase anticholinergic, sedative effects. **HERBAL:** **Kava kava, SAME, St. John's wort, valerian** may increase sedation, risk of serotonin syndrome. **St. John's wort** may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May alter serum glucose, EKG readings. **Therapeutic serum level:** 110–250 ng/mL; **toxic serum level:** greater than 300 ng/mL.

Availability (Rx)

Capsules: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Cream (Prudoxin, Zonalon):** 5%. **Oral Concentrate:** 10 mg/mL. **Tablets (Silenor):** 3 mg, 6 mg.

Administration/handling

PO

- Give with food, milk if GI distress occurs.
- Dilute concentrate in 4-oz glass of water, milk, or orange, tomato, prune, pineapple juice. Incompatible with carbonated drinks.
- Give larger portion of daily dose at bedtime.

Topical

- Apply thin film of cream on affected areas of skin.
- Do not use for more than 8 days.
- Do not use occlusive dressing.

Indications/routes/dosage

Depression, Anxiety

PO: ADULTS: Initially, 25–50 mg/day at bedtime or in 2–3 divided doses. May increase gradually to usual dose of 150 mg–300 mg/day (single dose should not

exceed 150 mg). **ELDERLY:** Initially, 10–25 mg at bedtime. May increase by 10–25 mg/day every 3–7 days.

Insomnia (Silenor only)

PO: ADULTS: 3–6 mg. **ELDERLY:** 3 mg (give within 30 min of bedtime). May increase to 6 mg once daily.

Pruritus Associated with Atopic Dermatitis

Topical: ADULTS, ELDERLY: Apply thin film 4 times/day at 3- to 4-hr intervals. Not recommended for more than 8 days.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use lower initial dose; adjust gradually. **Silenor:** Initially, 3 mg once daily.

Side effects

Frequent: PO: Orthostatic hypotension, drowsiness, dry mouth, headache, increased appetite, weight gain, nausea, unusual fatigue, unpleasant taste.

Topical: Edema, increased pruritus, eczema, burning, tingling, stinging at application site, altered taste, dizziness, drowsiness, dry skin, dry mouth, fatigue, headache, thirst.

Occasional: PO: Blurred vision, confusion, constipation, hallucinations, difficult urination, eye pain, irregular heartbeat, fine muscle tremors, nervousness, impaired sexual function, diarrhea, diaphoresis, heartburn, insomnia.

Silenor: Nausea, upper respiratory infection. **Topical:** Anxiety, skin irritation/cracking, nausea.

Rare: PO: Allergic reaction, alopecia, tinnitus, breast enlargement. **Topical:** Fever, photosensitivity.

Adverse effects/toxic reactions

Abrupt or too-rapid withdrawal may result in headache, malaise, nausea, vomiting, vivid dreams. Overdose may produce confusion, severe drowsiness, agitation, tachycardia, arrhythmias, shortness of breath, vomiting.

Nursing considerations

Baseline assessment

Assess B/P, pulse, EKG (those with history of cardiovascular disease). Perform CBC, serum electrolyte tests before long-term therapy. Assess pt's appearance, behavior, level of interest, mood, suicidal ideation, sleep pattern.

Intervention/evaluation

Monitor B/P, pulse, weight. Perform CBC, serum electrolyte tests periodically to assess renal/hepatic function. Monitor mental status, suicidal ideation. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood. **Therapeutic serum level:** 110–250 ng/mL; **toxic serum level:** greater than 300 ng/mL.

Patient/family teaching

- Do not discontinue abruptly.
- Change positions slowly to avoid dizziness.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Do not cover affected area with occlusive dressing after applying cream.
- May cause dry mouth.
- Avoid alcohol, limit caffeine.
- May increase appetite.
- Avoid exposure to sunlight/artificial light source.
- Therapeutic effect may be noted within 2–5 days, maximum effect within 2–3 wks.
- Report worsening depression, suicidal ideation, unusual changes in behavior (esp. at initiation of therapy or with changes in dosage).

DOXOrubicin

dox-o-rue-bi-sin

Adriamycin

Caelyx 

Doxil

HIGH
ALERT

Lipodox

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Anthracycline antibiotic.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ May cause concurrent or cumulative myocardial toxicity. Acute allergic or anaphylaxis-like infusion reaction may be life threatening. Severe myelosuppression may occur. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. Secondary acute myelogenous leukemia and myelodysplastic syndrome have been reported. Potent vesicant.

Do not confuse DOXOrubicin with dactinomycin, DAUNOrubicin, doxazosin, epiRUBicin, IDArubicin, or valrubicin, or Adriamycin with Aredia or idamycin.

Uses

Adriamycin: Treatment of acute lymphocytic leukemia (ALL), acute myeloid leukemia (AML), Hodgkin's lymphoma, malignant lymphoma; breast, gastric, small-cell lung, ovarian, epithelial, thyroid, bladder carcinomas; neuroblastoma, Wilms tumor, osteosarcoma, soft tissue sarcoma. **Doxil, Lipodox:** Treatment of AIDS-related Kaposi's sarcoma, advanced ovarian cancer. Used with bortezomib to treat multiple myeloma in pts who have not previously received bortezomib and have received at least one previous treatment. **OFF-LABEL: Adriamycin:** Multiple myeloma, endometrial carcinoma, uterine sarcoma; head and neck cancer, liver, kidney cancer. **Doxil:** Metastatic breast cancer, Hodgkin's lymphoma, cutaneous T-cell lymphomas, advanced soft tissue sarcomas, recurrent or metastatic cervical cancer, advanced or metastatic uterine sarcoma.

Precautions

Contraindications: Hypersensitivity to DOXOrubicin. **Adriamycin:** Severe hepatic impairment, severe myocardial insufficiency, recent MI (within 4–6 wks), severe arrhythmias. Previous or concomitant treatment with high accumulative doses of DOXOrubicin, DAUNOrubicin, IDArubicin, or other anthracyclines or anthracenediones; severe, persistent drug-induced

myelosuppression or baseline ANC count less than 1,500 cells/mm³. **Doxil:** Breastfeeding (Canada). **Cautions:** Hepatic impairment. Cardiomyopathy, preexisting myelosuppression, severe HF. Pts who received radiation therapy.

Action

Inhibits DNA, DNA-dependent RNA synthesis by binding with DNA strands. Liposomal encapsulation increases uptake by tumors, prolongs drug action, may decrease toxicity. **Therapeutic Effect:** Prevents cell division.

Pharmacokinetics

Widely distributed. Protein binding: 74%–76%. Does not cross blood-brain barrier. Metabolized in liver. Primarily eliminated by biliary system. Not removed by hemodialysis. **Half-life:** 20–48 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. Breastfeeding not recommended. **Children/Elderly:** Cardiotoxicity may be more frequent in pts younger than 2 yrs or older than 70 yrs.

Interactions

DRUG: CycloSPORINE may increase risk of hematologic toxicity. **Bone marrow depressants** may increase myelosuppression. **DAUNOrubicin** may increase risk of cardiotoxicity. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** **St. John's wort** may decrease concentration. Avoid **black cohosh, dong quai** in estrogen-dependent tumors. **FOOD:** None known. **LAB VALUES:** May cause EKG changes, increase serum uric acid. May reduce neutrophil, RBC counts.

Availability (Rx)

Injection, Powder for Reconstitution: 10 mg, 20 mg, 50 mg. **Injection Solution (Adriamycin):** 2 mg/mL (5-mL, 10-mL, 25-mL, 100-mL vial). **Lipid Complex (Doxil, Lipodox):** 2 mg/mL (10 mL, 25 mL).

Administration/handling

◀ALERT▶ Wear gloves. If powder or solution comes into contact with skin, wash thoroughly. Avoid small veins; swollen/edematous extremities; areas overlying joints, tendons. **Doxil:** Do not use with in-line filter or mix with any diluent except D₅W. May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

IV

Reconstitution

- Reconstitute vials of powder with 0.9% NaCl to provide concentration of 2 mg/mL.
- Shake vial; allow contents to dissolve.
- Withdraw appropriate volume of air from vial during reconstitution (avoids excessive pressure buildup).
- May be further diluted with 50–1,000 mL D₅W or 0.9% NaCl and given as continuous infusion.
- **Doxil:** Dilute each dose in 250 mL D₅W (doses greater than 90 mg in 500 mL D₅W).

Rate of Administration (Adriamycin)

- For IV push, administer into tubing of freely running IV infusion of D₅W or 0.9% NaCl, preferably via butterfly needle over 3–5 min (avoids local erythematous streaking along vein and facial flushing).
- Must test for flashback q30sec to be certain needle remains in vein during injection. IV piggyback over 15–60 min or continuous infusion.
- Extravasation produces immediate pain, severe local tissue damage. Terminate administration immediately; withdraw as much medication as possible, obtain extravasation kit, follow protocol. **Doxil:** Give as infusion over 60 min. Do not use in-line filter.

Storage

- **Adriamycin powder:** Store at room temperature.
- Reconstituted vials stable for 7 days at room temperature, 15 days if refrigerated. Infusions stable for 48 hrs at room temperature.
- Protect from prolonged exposure to sunlight; discard unused solution.
- **Adriamycin solution:** Refrigerate vials. Solutions diluted in D₅W or 0.9% NaCl stable for 48 hrs at room temperature.
- **Doxil:** Refrigerate unopened vials. After solution is diluted, use within 24 hrs.

■ IV incompatibilities

DOXOrubicin: Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), furosemide (Lasix), ganciclovir (Cytovene), heparin, piperacillin/tazobactam (Zosyn), propofol (Diprivan).

Doxil: Do not mix with any other medications.

■ IV Compatibilities

Dexamethasone (Decadron), diphenhydrAMINE (Benadryl), granisetron (Kytril), HYDRORomphone (Dilaudid), LORazepam (Ativan), morphine, ondansetron (Zofran).

Indications/routes/dosage

◀ALERT▶ Refer to individual protocols.

Usual Dosage

IV: (Adriamycin): ADULTS: (Single-agent Therapy): 60–75 mg/m² as a single dose every 21 days, 20 mg/m² once wkly. **(Combination Therapy):** 40–75 mg/m² q21–28 days. Because of risk of cardiotoxicity, do not exceed cumulative dose of 550 mg/m² (400–450 mg/m² for those previously treated with related compounds or irradiation of cardiac region). **CHILDREN: (Single-agent Therapy):** 60–75 mg/m² q3wks. **(Combination Therapy):** 40–75 mg/m² q21–28 days.

Kaposi's Sarcoma

IV: (Doxil, Lipodox): ADULTS: 20 mg/m² q3wks infused over 30 min. Continue until disease progression or unacceptable toxicity.

Ovarian Cancer

IV: (Doxil, Lipodox): ADULTS: 50 mg/m² q4wks. Continue until disease progression or unacceptable toxicity.

Multiple Myeloma

IV: (Doxil, Lipodox): ADULTS: 30 mg/m²/dose on day 4 q3wks (in

combination with bortezomib). Continue until disease progression or unacceptable toxicity.

Dosage in Renal Impairment

No dose adjustment.

Dose Modifications

Adriamycin

Neutropenic Fever/Infection: Reduce dose to 75%. **ANC less than 1,000 cells/mm³:** Delay treatment until ANC 1,000 cells/mm³ or more. **Platelets less than 100,000/mm³:** Delay treatment until platelets 100,000 cells/mm³ or more.

Doxil

Adjustments for Hand-Foot Syndrome, Stomatitis, Hematologic Toxicities: Refer to manufacturer's guidelines.

Dosage in Hepatic Impairment

ADRIAMYCIN

Hepatic Function	Dosage
ALT, AST 2–3 times ULN	75% of normal dose
ALT, AST greater than 3 times ULN or bilirubin 1.2–3 mg/dL	50% of normal dose
Bilirubin 3.1–5 mg/dL	25% of normal dose
Bilirubin greater than 5 mg/dL	Not recommended

ULN = upper limit of normal.

DOXIL

Hepatic Function	Dosage
Bilirubin 1.2–3 mg/dL	50% of normal dose
Bilirubin greater than 3 mg/dL	25% of normal dose

Side effects

Frequent: Complete alopecia (scalp, axillary, pubic hair), nausea, vomiting, stomatitis, esophagitis (esp. if drug is given on several successive days), reddish urine. **Doxil:** Nausea. **Occasional:** Anorexia, diarrhea; hyperpigmentation of

nailbeds, phalangeal, dermal creases. **Rare:** Fever, chills, conjunctivitis, lacrimation.

Adverse effects/toxic reactions

Myelosuppression manifested as hematologic toxicity (principally leukopenia and, to lesser extent, anemia, thrombocytopenia) generally occurs within 10–15 days, returns to normal levels by third wk. Cardiotoxicity (either acute, manifested as transient EKG abnormalities, or chronic, manifested as HF) may occur.

Nursing considerations

Baseline assessment

Obtain ANC, CBC, erythrocyte counts before and at frequent intervals during therapy. Obtain EKG before therapy, LFT before each dose. Antiemetics may be effective in preventing, treating nausea. Offer emotional support.

Intervention/evaluation

Monitor for stomatitis (burning or erythema of oral mucosa at inner margin of lips, difficulty swallowing). Observe IV injection site for infiltration, vein irritation. May lead to ulceration of mucous membranes within 2–3 days. Assess dermal creases, nailbeds for hyperpigmentation. Monitor hematologic status, renal/hepatic function studies, serum uric acid levels. Monitor daily pattern of bowel activity, stool consistency. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness).

Patient/family teaching

- Hair loss is reversible, but new hair growth may have different color, texture. New hair growth resumes 2–3 mos after last therapy dose.
- Maintain strict oral hygiene.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Promptly report fever, sore throat, signs of local infection, unusual

bruising/bleeding from any site.

- Report persistent nausea/vomiting.
- Avoid alcohol (may cause GI irritation, a common side effect with liposomal DOXOrubicin).

doxycycline

dox-i-sye-kleen

TOP
100

Acticlate

Adoxa

Apo-Doxy 

Avidoxy

Doryx

Doxy-100

Monodox

Oracea

Vibramycin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tetracycline.

CLINICAL: Antibiotic.

Do not confuse doxycycline with dicyclomine or doxepin, Monodox with Maalox, Oracea with Orenzia, Vibramycin with Vancomycin or Vibativ, or Vibra-Tabs with Vibativ.

Uses

Treatment of susceptible infections due to *H. ducreyi*, *Pasteurella pestis*, *P. tularensis*, *Bacteroides* spp., *V. cholerae*, *Brucella* spp., *Rickettsiae*, *Y. pestis*, *Francisella tularensis*, *M. pneumoniae*, including brucellosis, chlamydia, cholera, granuloma inguinale, lymphogranuloma venereum, malaria prophylaxis, nongonococcal urethritis, pelvic inflammatory disease (PID), plague, psittacosis, relapsing fever, rickettsia infections, primary and secondary syphilis, tularemia. **(Oracea):** Treatment of inflammatory lesions in adults with rosacea. **OFF-LABEL:** Sclerosing agent for pleural effusion; vancomycin-resistant enterococci

(VRE); alternative for MRSA, treatment of refractory periodontitis, juvenile periodontitis.

Precautions

Contraindications: Hypersensitivity to doxycycline, other tetracyclines. **Cautions:** History or predisposition to oral candidiasis (Oracea). Avoid use during pregnancy, during tooth development in children. Avoid prolonged exposure to sunlight.

Action

Inhibits bacterial protein synthesis by binding to ribosomes. **Therapeutic Effect:** Bacteriostatic.

Pharmacokinetics

Rapidly absorbed after PO administration. Protein binding: 90%. Partially excreted in urine; partially eliminated in bile. **Half-life:** 15–24 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. **Children:** May cause permanent discoloration of teeth, enamel hypoplasia. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Antacids containing aluminum, calcium, magnesium; laxatives containing magnesium, oral iron preparations decrease absorption. **Barbiturates, carbamazepine, phenytoin** may decrease concentration. **Cholestyramine, colestipol** may decrease absorption. May decrease effects of **oral contraceptives**. **HERBAL:** **Dong quai, St. John's wort** may increase photosensitization. **St. John's wort** may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, amylase, bilirubin, ALT, AST. May alter CBC.

Availability (Rx)

Capsules: 40 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Injection, Powder for Reconstitution:** 100 mg. **Oral Suspension:** 25 mg/5 mL. **Syrup:** 50 mg/5 mL. **Tablets:** 20 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Tablets, delayed release:** 50 mg, 75 mg, 100 mg, 150 mg, 200 mg.

Administration/handling

 **ALERT** Do not administer IM or subcutaneous. Space doses evenly around clock.

IV

Reconstitution

- Reconstitute each 100-mg vial with 10 mL Sterile Water for Injection for concentration of 10 mg/mL.
- Further dilute each 100 mg with at least 100 mL D₅W, 0.9% NaCl, lactated Ringer's.

Rate of Administration

- Give by intermittent IV infusion (piggyback).
- Infuse over 1–4 hrs.

Storage

- After reconstitution, IV infusion (piggyback) is stable for 12 hrs at room temperature or 72 hrs if refrigerated.
- Protect from direct sunlight. Discard if precipitate forms.

PO

- Oral suspension is stable for 2 wks at room temperature.
- Give with full glass of fluid.
- Instruct pt to sit up for 30 min after taking to reduce risk of esophageal irritation and ulceration.
- Give without regard to food. Oracea should be given 1 hr before or 2 hrs after meals.
- Avoid concurrent use of antacids, milk; separate by 2 hrs.

IV incompatibilities

Allopurinol (Aloprim), heparin, piperacillin/tazobactam (Zosyn).

■ IV Compatibilities

Acyclovir (Zovirax), amiodarone (Cordarone), dexmedetomidine (Precedex), diltiazem (Cardizem), granisetron (Kytril), HYDROMORPHONE (Dilaudid), magnesium sulfate, meperidine (Demerol), morphine, ondansetron (Zofran), propofol (Diprivan).

Indications/routes/dosage

Usual Dosage

IV/PO: ADULTS, ELDERLY, CHILDREN OLDER THAN 8 YRS; WEIGHING MORE THAN 45 KG: 100–200 mg/day in 1–2 divided doses. **CHILDREN OLDER THAN 8 YRS; WEIGHING 45 KG OR LESS:** 2–4 mg/kg/day (**Maximum:** 200 mg/day) in 1–2 divided doses.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Anorexia, nausea, vomiting, diarrhea, dysphagia, photosensitivity (may be severe). **Occasional:** Rash, urticaria.

Adverse effects/toxic reactions

Superinfection (esp. fungal), benign intracranial hypertension (headache, visual changes) may occur. Hepatotoxicity, fatty degeneration of liver, pancreatitis occur rarely.

Nursing considerations

Baseline assessment

Question for history of allergies, esp. to tetracyclines, sulfites.

Intervention/evaluation

Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Monitor LOC due to potential for increased intracranial pressure (ICP). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema).

Patient/family teaching

- Avoid unnecessary exposure to sunlight.
- Do not take with antacids, iron products.
- Complete full course of therapy.
- After application of dental gel, avoid brushing teeth, flossing the treated areas for 7 days.
- Report severe diarrhea.
- May cause nausea, vomiting. If GI upset occurs, may take with small amount food; however, Oracea should be taken on an empty stomach.

dronabinol

droe-**nab**-i-nol

Marinol

Syndros

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Cannabinoid (**Schedule III**).

CLINICAL: Antinausea, antiemetic, appetite stimulant.

Do not confuse dronabinol with droperidol.

Uses

Prevention, treatment of nausea/vomiting due to cancer chemotherapy; appetite stimulant in AIDS. **OFF-LABEL:** Cancer-related anorexia.

Precautions

Contraindications: Hypersensitivity to dronabinol, sesame oil (capsule), alcohol (oral solution), tetrahydrocannabinol products, marijuana; receiving or recently received disulfiram- or metronidazole-containing products within 14 days (oral solution). **Cautions:** History of psychiatric illness, schizophrenia,

history of substance abuse, mania, depression, seizure disorder, hepatic impairment, elderly.

Action

Exact mechanism unknown. May inhibit endorphins in brain's emetic center, suppress prostaglandins synthesis or effect on cannabinoid receptor in CNS. **Therapeutic Effect:** Inhibits nausea/vomiting, stimulates appetite.

Pharmacokinetics

Well absorbed after PO administration, only 10%–20% reaches systemic circulation. Protein binding: 97%. Undergoes first-pass metabolism. Highly lipid soluble. Primarily excreted in feces. **Half-life:** 25–36 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta. Distributed in breast milk. **Children:** Not recommended. **Elderly:** Monitor carefully during therapy.

Interactions

DRUG: Alcohol, other CNS suppressants (e.g., lorazepam, morphine, zolpidem) may increase CNS depression. Sympathomimetics, tricyclic antidepressants (e.g., amitriptyline, doxepin, nortriptyline) may increase risk of hypertension, tachycardia. Anticholinergics (e.g., glycopyrrolate, scopolamine) may increase drowsiness, tachycardia. **HERBAL:** St. John's wort may decrease concentration. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Capsules (Gelatin [Marinol]): 2.5 mg, 5 mg, 10 mg. **Oral Solution (Syndros):** 5 mg/mL.

Administration/handling

PO

- Store in cool environment. May refrigerate capsules.
- May administer without regard to meals. Give before meals if used for appetite stimulant.
- **Oral solution:** Always use enclosed calibrated syringe. Take each dose with a full glass of water.

Indications/routes/dosage

Prevention of Chemotherapy-Induced Nausea and Vomiting

PO: ADULTS, ELDERLY, CHILDREN: (*Marinol*): Initially, 5 mg/m² 1–3 hrs before chemotherapy, then q2–4h after chemotherapy for total of 4–6 doses/day. May increase by 2.5 mg/m² up to 15 mg/m² per dose. (*Syndros*): Initially, 2.1–4.2 mg/m² 1–2 hrs prior to chemotherapy, then q2–4 hrs after chemotherapy for total of 4–6 doses/day. May increase in increments of 2.1 mg/m². **Maximum:** 12.6 mg/m²/dose and 4 to 6 doses per day.

Appetite Stimulant

PO: ADULTS, ELDERLY: (*Marinol*): Initially, 2.5 mg twice daily (before lunch and dinner). Range: 2.5–20 mg/day. (*Syndros*): Initially, 2.1 mg twice daily. May gradually increase dose in 2.1-mg increments. **Maximum:** 8.4 mg twice daily.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (24%–3%): Euphoria, dizziness, paranoid reaction, drowsiness.
Occasional (less than 3%–1%): Asthenia, ataxia, confusion, abnormal thinking, depersonalization.
Rare (less than 1%): Diarrhea, depression, nightmares, speech difficulties, headache, anxiety, tinnitus, flushed skin.

Adverse effects/toxic reactions

Mild intoxication may produce increased sensory awareness (taste, smell, sound), altered time perception, reddened conjunctiva, dry mouth, tachycardia.

Moderate intoxication may produce memory impairment, urinary retention. Severe intoxication may produce lethargy, decreased motor coordination, slurred speech, orthostatic hypotension.

Nursing considerations

Baseline assessment

Assess dehydration status if excessive vomiting occurs (skin turgor, mucous membranes, urinary output).

Intervention/evaluation

Supervise closely for serious mood, behavioral responses, esp. in pts with history of psychiatric illness. Monitor B/P, heart rate.

Patient/family teaching

- Change positions slowly to avoid dizziness.
- Relief from nausea/vomiting generally occurs within 15 min of drug administration.
- Do not take any other medications, including OTC, without physician approval.
- Avoid alcohol, barbiturates.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- For appetite stimulation, take before lunch and dinner.

dulaglutide

doo-la-gloo-tide

Trulicity

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: GLP-1 receptor agonist.

CLINICAL: Antidiabetic.

■ **BLACK BOX ALERT** ■ Contraindicated in pts with a personal/family history of medullary thyroid carcinoma (MTC) or in pts with multiple endocrine neoplasia syndrome type 2 (MEN2). Unknown if dulaglutide causes thyroid cell tumors in humans.

Do not confuse dulaglutide with albiglutide or liraglutide.

Uses

Adjunct to diet and exercise to improve glycemic control in pts with type 2 diabetes mellitus.

Precautions

Contraindications: Hypersensitivity to dulaglutide, other GLP-1 receptor agonists. Personal/family history of medullary thyroid carcinoma or multiple endocrine neoplasia syndrome type 2. **Cautions:** Pts with increased serum calcitonin, thyroid nodules, hx pancreatitis, renal/hepatic impairment. Not recommended in pts with severe GI disease, diabetic ketoacidosis, or type 1 diabetes.

Action

Activates GLP-1 receptors in pancreatic beta cells increasing intracellular cyclic AMP. **Therapeutic Effect:** Augments glucose-dependent insulin release, slows gastric emptying. Improves glycemic control.

Pharmacokinetics

Readily absorbed following subcutaneous administration. Degraded into amino acids by general protein catabolism. Peak plasma concentration: 24–72 hrs. Steady state reached in 2–4 wks. Elimination not specified. **Half-life:** 5 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Insulin, insulin secretagogues (e.g., glyBURIDE) may increase risk of

hypoglycemia. May reduce rate of absorption of oral medications. **HERBAL: Garlic**, other herbs with hypoglycemic activity may increase the risk of hypoglycemia. **FOOD:** None known. **LAB VALUES:** Expected to decrease serum glucose, Hgb A1c. May increase amylase, lipase.

Availability (Rx)

Prefilled Injector Pen or Syringe: 0.75 mg/0.5 mL, 1.5 mg/0.5 mL.

Administration/handling

Subcutaneous

- Administer any time of day, without regard to meals, on same day each week.
- May change administration day if last dose was given more than 3 days prior. If dose missed, administer within 3 days of missed dose. If more than 3 days have passed after missed dose, wait until next regularly scheduled dose to administer.

Administrations

- Subcutaneously insert needle into abdomen, thigh, or upper arm region and inject solution.
- Do not reuse needle.
- Rotate injection sites each week.

Storage

- Refrigerate unused pens/syringes; do not freeze.
- May store at room temperature for up to 14 days.
- Protect from light.

Indications/routes/dosage

Type 2 Diabetes Mellitus

SQ: ADULTS/ELDERLY: 0.75 mg once wkly. May increase to 1.5 mg once wkly if glycemic response inadequate. **Maximum:** 1.5 mg wkly.

Dose Modification

Concomitant Use with Insulin Secretagogue (e.g., Sulfonylurea) or Insulin: Consider reduced dose of insulin secretagogue or insulin based on glycemic goal.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution.

Side effects

Occasional (12%–6%): Nausea, diarrhea, vomiting, abdominal pain. **Rare (4% or less):** Decreased appetite, dyspepsia, fatigue, asthenia.

Adverse effects/toxic reactions

May increase risk of acute renal failure or worsening of chronic renal impairment (esp. with dehydration), severe gastroparesis, pancreatitis, thyroid C-cell tumors. May increase risk of hypoglycemia when used with other hypoglycemic agents or insulin. Dyspnea, pruritus, rash may indicate hypersensitivity reaction. May prolong PR interval by 2–3 msec or may rarely cause first-degree AV block, tachycardia. Immunogenicity (antidulaglutide antibody formation) reported. Some pts with antibody formation also tested positive for antibodies to GLP-1 and human albumin.

Nursing considerations

Baseline assessment

Obtain baseline fasting glucose level, Hgb A1c, BMP. Question history of medullary thyroid carcinoma, multiple endocrine neoplasia syndrome type 2, pancreatitis, renal impairment; first-degree AV block, PR interval prolongation. Receive full medication history and screen for use of other hypoglycemic agents or insulin. Assess pt's understanding of diabetes management, routine home glucose monitoring, medication self-administration. Assess hydration status.

Intervention/evaluation

Monitor capillary blood glucose levels, Hgb A1c; renal function test in pts with renal impairment reporting severe GI reactions, including diarrhea,

gastroparesis, vomiting. Screen for thyroid tumors (dysphagia, dyspnea, persistent hoarseness, neck mass). If tumor suspected, consider endocrinologist consultation. Clinical significance of serum calcitonin level or thyroid ultrasound with GLP-1–associated thyroid tumors is debated/unknown. Assess for hypoglycemia, hyperglycemia, hypersensitivity/allergic reaction. Screen for glucose-altering conditions: fever, stress, surgical procedures, trauma. Obtain dietary consult for nutritional education. Encourage PO intake.

Patient/family teaching

- Diabetes requires lifelong control. Diet and exercise are principal parts of treatment; do not skip or delay meals. Test blood sugar regularly. Monitor daily calorie intake.
- When taking additional medications to lower blood sugar or when glucose demands are altered (fever, infection, stress, trauma), have low blood sugar treatment available (glucagon, oral dextrose).
- Report suspected pregnancy or plans for breastfeeding.
- Therapy may increase risk of thyroid cancer; report lumps or swelling of the neck; hoarseness, shortness of breath, trouble swallowing.
- Persistent, severe abdominal pain that radiates to the back (with or without vomiting) may indicate acute pancreatitis.
- Rash, itching, hives may indicate allergic reaction.

DULoxetine

du-**lox**-e-teen

TOP
100

Apo-Duloxetine 🇨🇦

Cymbalta

Irenka

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Serotonin norepinephrine reuptake inhibitor (SNRI).

CLINICAL: Antidepressant.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse DULoxetine with FLUoxetine or PARoxetine.

Uses

Treatment of major depression. Management of pain associated with diabetic neuropathy or chronic musculoskeletal pain. Treatment of generalized anxiety disorder. **Cymbalta only:** Treatment of fibromyalgia. **OFF-LABEL:** Treatment of stress urinary incontinence in women.

Precautions

Contraindications: Hypersensitivity to DULoxetine. Uncontrolled narrow-angle glaucoma. Use of MAOI intended to treat psychiatric disorder (concurrent or within 14 days of discontinuing MAOI). Initiation of MAOI intended to treat psychiatric disorder within 5 days of discontinuing DULoxetine. Initiation of DULoxetine in pt receiving linezolid or IV methylene blue. **Cautions:** Renal impairment, history of alcoholism, chronic hepatic disease, history of mania, pts with suicidal ideation or behavior. Concurrent use with inhibitors of CYP1A2 or thioridazine, CNS depressants. Hypertension, controlled narrow-angle glaucoma, pts with impaired GI motility. Concomitant use of NSAIDs (may increase risk of bleeding), history of seizures. Use of medications that lower seizure threshold; elderly; pts at high risk for suicide.

Action

Appears to inhibit serotonin and norepinephrine reuptake at CNS neuronal presynaptic membranes; is a less potent inhibitor of DOPamine reuptake. **Therapeutic Effect:** Produces antidepressant effect.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: greater than 90%. Metabolized in liver. Excreted in urine (70%), feces (20%). **Half-life:** 8–17 hrs.

Lifespan considerations

Pregnancy/Lactation: May produce neonatal adverse reactions (constant crying, feeding difficulty, hyperreflexia, irritability). Unknown if distributed in

breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Caution required when increasing dosage.

Interactions

DRUG: Alcohol increases risk of hepatic injury. CYP1A2 and CYP2D6 inhibitors (e.g., FLUoxetine, fluvoxamine, PARoxetine, quinidine, quinolone antimicrobials) may increase plasma concentration. MAOIs may cause serotonin syndrome (autonomic hyperactivity, coma, diaphoresis, excitement, hyperthermia, rigidity). Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase risk of bleeding. May increase concentration, potential toxicity of tricyclic antidepressants. Serotonergic drugs (e.g., triptans, lithium, tramadol) may increase risk of serotonin syndrome. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. St. John's wort may increase risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May increase serum bilirubin, ALT, AST, alkaline phosphatase.

Availability (Rx)

 **Capsules (Delayed-Release, Enteric-Coated Pellets):** 20 mg, 30 mg, 40 mg, 60 mg.

Administration/handling

 Allow at least 14 days to elapse between use of MAOIs and DULoxetine.

PO

- Give without regard to meals. Give with food, milk if GI distress occurs.
- Do not break, crush, cut delayed-release capsules.
- Contents of capsule may be sprinkled on applesauce or mixed in apple juice and swallowed (without chewing) immediately.

Indications/routes/dosage

Fibromyalgia

PO: ADULTS, ELDERLY: Initially, 30 mg/day for 1 wk. Increase to 60 mg/day.

Major Depressive Disorder

PO: ADULTS, ELDERLY: Initially, 40–60 mg/day in 1 or 2 divided doses. For doses greater than 60 mg/day, titrate in increments of 30 mg/day over 1 wk. **Maximum:** 120 mg/day.

Diabetic Neuropathy Pain

PO: ADULTS, ELDERLY: 60 mg once daily. **Maximum:** 60 mg/day. Consider lower dose with renal impairment or if tolerability is a concern.

Generalized Anxiety Disorder

PO: ADULTS, ELDERLY: Initially, 30–60 mg once daily. May increase up to 120 mg/day in 30-mg increments wkly. **CHILDREN 7–17 YRS:** Initially, 30 mg once daily. After 2 wks, may increase to 60 mg once daily. May further increase in increments of 30 mg/day at wkly intervals. **Maximum:** 120 mg/day.

Chronic Musculoskeletal Pain

PO: ADULTS, ELDERLY: 30 mg once daily for 1 wk, then increase to 60 mg once daily. **Maximum:** 60 mg/day.

Dosage in Renal/Hepatic Impairment

Renal: Not recommended with CrCl less than 30 mL/min or ESRD. **Hepatic:** Not recommended.

Side effects

Frequent (20%–11%): Nausea, dry mouth, constipation, insomnia. **Occasional (9%–5%):** Dizziness, fatigue, diarrhea, drowsiness, anorexia, diaphoresis, vomiting. **Rare (4%–2%):** Blurred vision, erectile dysfunction, delayed or failed ejaculation, anorgasmia, anxiety, decreased libido, hot flashes.

Adverse effects/toxic reactions

May slightly increase heart rate. Colitis, dysphagia, gastritis, irritable bowel syndrome occur rarely.

Nursing considerations

Baseline assessment

Assess appearance, behavior, speech pattern, level of interest, mood, sleep pattern, suicidal tendencies. Question pain level, intensity, location of pain.

Intervention/evaluation

For pts on long-term therapy, serum chemistry profile to assess hepatic/renal function should be performed periodically. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor B/P, mental status, anxiety, social functioning, serum glucose levels.

Patient/family teaching

- Therapeutic effect may be noted within 1–4 wks.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Inform physician of intention of pregnancy or if pregnancy occurs.
- Report anxiety, agitation, panic attacks, worsening of depression.
- Avoid heavy alcohol intake (associated with severe hepatic injury).

durvalumab

dur-val-ue-mab

Imfinzi

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Anti- programmed death ligand-1 (PD-L1).
Monoclonal antibody.

CLINICAL: Antineoplastic.

Do not confuse durvalumab with daclizumab, dupilumab, or nivolumab.

Uses

Treatment of pts with locally advanced or metastatic urothelial carcinoma who have disease progression during or following platinum-containing chemotherapy

or have disease progression within 12 mos of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy.

Precautions

Contraindications: Hypersensitivity to durvalumab. **Cautions:** Active infection, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, renal failure, open wounds); corticosteroid intolerance, baseline hematologic cytopenias, elderly pts, hepatic impairment, interstitial lung disease, renal insufficiency; history of autoimmune disorders (Crohn's disease, demyelinating polyneuropathy, Guillain-Barré syndrome, Hashimoto's thyroiditis, hyperthyroidism, myasthenia gravis, rheumatoid arthritis, Type I diabetes, vasculitis); diabetes, pancreatitis.

Action

Blocks programmed cell death ligand 1 (PD-L1) binding to PD-1 and CD80 (B7.1). PD-L1 blockade increases T-cell activation allowing T-cells to kill tumor cells. Restores antitumor T-cell function. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Widely distributed. Metabolism not specified. Steady state reached in 16 wks. Excretion not specified. **Half-life:** 17 days.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm. Females of reproductive potential should use effective contraception during treatment and for at least 3 mos after discontinuation. Unknown if distributed in breast milk; however, human immunoglobulin G (IgG) is present in breast milk and is known to cross the placenta. Breastfeeding not recommended during treatment and for at least 3 mos after discontinuation. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of toxic reactions; use caution.

Interactions

DRUG: May enhance adverse effects/toxicity of **belimumab**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum albumin, alkaline phosphatase, ALT, AST, bilirubin, calcium, creatinine, glucose, magnesium. May decrease serum sodium; Hgb, Hct, lymphocytes, neutrophils, RBCs. May increase or decrease serum potassium.

Availability (Rx)

Injection: 120 mg/2.4 mL (50 mg/mL), 500 mg/10 mL (50 mg/mL).

Administration/handling

IV

Preparation

- Visually inspect vial for particulate matter or discoloration. Solution should appear clear to opalescent, colorless to slightly yellow in color.
- Do not use if solution is cloudy, discolored, or if visible particles are observed.
- Do not shake.
- Withdraw proper volume from vial and dilute in 0.9% NaCl or D₅W to a final concentration of 1–15 mg/mL.
- Gently invert to mix; do not shake.
- Diluted solution should appear clear, colorless, and free of particles.

Rate of Administration

- Infuse over 60 mins via dedicated IV line using a sterile, low protein-binding 0.2- or 0.22-micron in-line filter.

Storage

- Refrigerate unused vials in original carton.
- Protect from light. May refrigerate diluted solution for no more than 24 hrs or store at room temperature for no more than 4 hrs. If refrigerated, allow diluted solution to warm to room temperature before use.
- Do not freeze or shake.

IV incompatibilities

Do not infuse with other medications.

Indications/Routes/Dosage

Urothelial Carcinoma

IV: ADULTS, ELDERLY: 10 mg/kg q2wks. Continue until disease progression or unacceptable toxicity.

Dose Modification

Note: Withhold and/or discontinue durvalumab to manage adverse reactions. Based on severity of adverse reactions, withhold durvalumab and administer systemic corticosteroids. Initiate corticosteroid taper when adverse reactions improve to below grade 1, and continue taper over at least 1 mo. If treatment is not permanently discontinued due to adverse reactions, resume therapy when adverse reactions return to grade 1 or lower and the corticosteroid dose has been reduced to less than 10 mg prednisone (or equivalent) per day. No dose reductions of durvalumab are recommended.

Colitis (GI Toxicity)

Grade 2 diarrhea or colitis: Withhold dose. Start prednisone 1–2 mg/kg/day (or equivalent) followed by taper. **Grade 3 or 4 diarrhea or colitis:** Permanently discontinue. Start prednisone 1–2 mg/kg/day (or equivalent), followed by taper.

Dermatitis

Grade 2 rash or dermatitis (for greater than 1 wk); grade 3 rash or dermatitis: Withhold dose. Consider starting prednisone 1–2 mg/kg/day (or equivalent), followed by taper. **Grade 4 rash or dermatitis:** Permanently discontinue. Consider starting prednisone 1–2 mg/kg/day (or equivalent), followed by taper.

Endocrinopathies

Grade 2–4 adrenal insufficiency (hypophysitis, hypopituitarism): Withhold dose until clinically stable. Start prednisone 1–2 mg/kg/day (or equivalent), followed by taper. Consider hormone replacement therapy as clinically indicated. **Grade 2–4 hyperthyroidism:** Withhold dose until clinically stable and manage symptoms. **Grade 2–4 hypothyroidism:** Consider hormone replacement therapy. **Grade 2–4 type 1 diabetes:** Withhold dose until clinically

stable. Start insulin therapy as clinically indicated.

Hepatitis (Hepatotoxicity During Treatment)

Grade 2 hepatitis (serum ALT or AST greater than 3 and up to 5 times upper limit of normal [ULN] or serum bilirubin greater than 1.5 and up to 3 times ULN); grade 3 hepatitis (serum ALT or AST less than or equal to 8 times ULN or serum bilirubin less than or equal to 5 times ULN): Withhold dose. Start prednisone 1–2 mg/kg/day (or equivalent), followed by taper. **Grade 3 hepatitis (serum ALT or AST greater than 8 times ULN or serum bilirubin greater than 5 times ULN; transaminase elevation (concurrent serum ALT or AST greater than 3 times ULN and serum bilirubin greater than 2 times ULN) with no known cause:** Permanently discontinue. Start prednisone 1–2 mg/kg/day (or equivalent), followed by taper.

Infection

Grade 3 or 4 infection: Withhold dose and manage symptoms. Start anti-infectives for suspected or confirmed infections.

Infusion-Related Reactions

Grade 1 or 2 infusion reactions: Interrupt or decrease rate of infusion. Consider premedication for subsequent infusions. **Grade 3 or 4 infusion reactions:** Permanently discontinue.

Nephritis (Renal Toxicity During Treatment)

Grade 2 nephritis (serum creatinine greater than 1.5 and up to 3 times ULN): Withhold dose. Start prednisone 1–2 mg/kg/day (or equivalent), followed by taper. **Grade 3 nephritis (serum creatinine greater than 3 and up to 6 times ULN); grade 4 nephritis (serum creatinine greater than 6 times ULN):** Permanently discontinue. Start prednisone 1–2 mg/kg/day (or equivalent), followed by taper.

Other Toxic Reactions

Any other grade 3 reactions: Withhold dose and manage symptoms. **Any other grade 4 reactions:** Permanently discontinue. Start prednisone 1–4 mg/kg/day (or equivalent), followed by taper.

Pneumonitis

Grade 2 pneumonitis: Withhold dose. Start prednisone 1–2 mg/kg/day (or equivalent), followed by taper. **Grade 3 or grade 4 pneumonitis:** Permanently discontinue. Start prednisone 1–4 mg/kg/day (or equivalent) followed by taper.

Dosage in Renal/Hepatic Impairment (Prior to Treatment Initiation)

Not specified; use caution.

Side Effects

Frequent (39%–19%): Fatigue, asthenia, malaise, back/musculoskeletal/neck pain, myalgia, constipation, decreased appetite. **Occasional (16%–11%):** Nausea, peripheral edema, scrotal edema, lymphedema, abdominal/flank pain, diarrhea, pyrexia, dyspnea, cough, dermatitis, dermatitis acneiform, dermatitis psoriasiform, psoriasis, maculopapular rash, pustular rash, eczema, erythema, erythema multiforme, erythematous rash, acne, lichen planus.

Adverse Effects/Toxic Reactions

Anemia, neutropenia, lymphopenia are expected responses to therapy. May cause severe, sometimes fatal immune-mediated reactions such as adrenal insufficiency (1% of pts), colitis (2% of pts), hepatitis (1% of pts), hypothyroidism (9% of pts), hyperthyroidism (6% of pts), hypophysitis, nephritis (less than 1% of pts), pneumonitis (2% of pts), type 1 diabetes (less than 1% of pts), rash (15% of pts); aseptic meningitis, hemolytic anemia, keratitis, myocarditis, myositis, thrombocytopenic purpura, uveitis. Urinary tract infections including candiduria, cystitis, urosepsis occurred in 15% of pts. Immunogenicity (auto-durvalumab antibodies) reported in 3% of pts.

Nursing Considerations

Baseline Assessment

Obtain CBC, BMP, LFT, serum ionized calcium, magnesium; thyroid function test; urine pregnancy; vital signs. Question medical history as listed in Precautions; prior infusion reactions. Question intolerance to corticosteroids.

Verify use of effective contraception in females of reproductive potential. Screen for active infection. Assess nutritional/hydration status. Conduct neurologic/dermatologic exam. Offer emotional support.

Intervention/Evaluation

Monitor CBC, BMP, LFT, serum ionized calcium, magnesium; thyroid function test periodically. Monitor for infusion reactions including angioedema, back or neck pain, dyspnea, flushing, pruritus, pyrexia, rash, syncope. Consider increasing corticosteroid dose if toxic effects worsen or do not improve. Assess skin for rash, lesions. Diligently monitor for immune-mediated adverse effects as listed in Adverse Effects/Toxic Reactions. Notify physician if any CTCAE toxicities occur and initiate proper treatment. If immune-mediated reactions occur, consider referral to specialist. Obtain CXR if interstitial lung disease, pneumonitis suspected. Interrupt or discontinue treatment if serious infection, opportunistic infection, sepsis occurs, and initiate appropriate antimicrobial therapy. If corticosteroid therapy is started, monitor capillary blood glucose and screen for corticosteroid side effects or intolerance. Report neurologic changes including nuchal rigidity with fever, positive Kernig's sign, positive Brudzinski's sign, altered mental status, seizures (related to aseptic meningitis). Strictly monitor I&O. Encourage fluid intake.

Patient/Family Teaching

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Avoid pregnancy; treatment may cause birth defects. Do not breastfeed. Females of childbearing potential should use effective contraception during treatment and for at least 3 mos after final dose.
- Treatment may cause serious or life-threatening inflammatory reactions. Report signs and symptoms of treatment-related inflammatory events in the following body systems: brain (confusion, headache, fever, rigid neck, seizures), colon (severe abdominal pain or diarrhea), eye (blurry vision, double vision, unequal pupil size, sensitivity to light, drooping eyelid), lung (chest pain, cough, shortness of breath), liver (bruising easily, amber-colored urine, clay-colored/tarry stools, yellowing of skin or eyes), nerves (severe nerve pain or loss of motor function), pituitary (persistent or unusual headache, dizziness, extreme

weakness, fainting, vision changes), thyroid (trouble sleeping, high blood pressure, fast heart rate [overactive thyroid] or fatigue, goiter, weight gain [underactive thyroid]). Immediately report infusion reactions such as neck or back pain, dizziness, fever, flushing, itching, shortness of breath, swelling of the face.

- Treatment may cause severe diarrhea. Drink plenty of fluids.

 Canadian trade name

 Non-Crushable Drug

 High Alert drug

underlined underlined – top prescribed drug

E

edoxaban

e-**dox**-a-ban

Savaysa

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Factor Xa inhibitor.

CLINICAL: Anticoagulant.

■ **BLACK BOX ALERT** ■ Avoid use in nonvalvular atrial fibrillation pts with creatinine clearance (CrCl) greater than 95 mL/min (increased risk of ischemic stroke). Premature discontinuation of oral anticoagulant in the absence of alternative anticoagulation may increase risk of ischemic events. If treatment is discontinued for any reason other than pathologic bleeding or completion of course of therapy, consider coverage with another anticoagulant as described in transition guideline. Epidural or spinal hematomas may occur in pts who are receiving neuraxial anesthesia or undergoing spinal puncture, which may result in long-term or permanent paralysis.

Do not confuse edoxaban with apixaban or rivaroxaban.

Uses

To reduce risk of stroke and systemic embolism (SE) in pts with nonvalvular atrial fibrillation (NVAF). Treatment of deep vein thrombosis (DVT) and pulmonary embolism (PE) following 5–10 days of initial therapy with a parenteral anticoagulant.

Precautions

Contraindications: Hypersensitivity to edoxaban. Major active bleeding.
Cautions: Elderly, pts at increased risk of bleeding (e.g., prior CVA, thrombocytopenia, severe uncontrolled hypertension; history of bleeding ulcers, upper or lower GI bleeding), recent surgery, renal/hepatic impairment. Avoid concomitant use with aspirin, heparin, low molecular weight heparin (LMWH), NSAIDs, P-gp inducers (e.g., rifAMPin). Not recommended in pts with CrCl greater than 95 mL/min (increased risk of ischemic stroke); mechanical heart valves; moderate to severe mitral stenosis.

Action

Selectively blocks active site of factor Xa, a key factor in the intrinsic and extrinsic pathway of blood coagulation cascade. Inhibits platelet activation and fibrin clot formation. **Therapeutic Effect:** Inhibits blood coagulation.

Pharmacokinetics

Readily absorbed after PO administration. Peak plasma concentration: 1–2 hrs. Steady state reached within 3 days. Protein binding: 55%. Primarily excreted in urine (50%), biliary/intestinal excretion (remaining %). Not removed by hemodialysis. **Half-life:** 10–14 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May have increased risk of bleeding due to age-related renal impairment.

Interactions

DRUG: Anticoagulants (e.g., warfarin), antiplatelets (e.g., clopidogrel), NSAIDs (e.g., ibuprofen, ketorolac, naproxen), fibrinolytic therapy (e.g., TPA) may increase concentration/effect; may increase risk of bleeding. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum AST, ALT. May prolong aPTT, PT/INR.

Availability (Rx)

 **Tablets:** 15 mg, 30 mg, 60 mg.

Administration/handling

PO

- Give without regard to meals.
- Do not administer within 2 hrs of removal of epidural or intrathecal catheters.

Indications/routes/dosage

Nonvalvular Atrial Fibrillation

PO: ADULTS, ELDERLY: 60 mg once daily.

DVT/PE

PO: ADULTS, ELDERLY: 60 mg once daily following 5–10 days of initial therapy with a parenteral anticoagulant.

Dose Modification

Body weight less than or equal to 60 kg or concomitant use of certain P-gp inhibitors: 30 mg once daily.

Dosage in Renal Impairment

DVT/PE

CrCl 15–50 mL/min: 30 mg once daily. **CrCl less than 15 mL/min:** Not recommended.

NVAF

CrCl greater than 95 mL/min: Not recommended. **CrCl 51–95 mL/min:** No dose adjustment. **CrCl 15–50 mL/min:** 30 mg once daily. **CrCl less than 15 mL/min:** Not recommended.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Not

recommended.

Discontinuation for Surgery or Other Interventions

Discontinue at least 24 hrs before invasive surgical procedures. May restart as soon as adequate hemostasis is achieved, noting that the time of onset of pharmacodynamic effect is 1–2 hrs.

Transition Guideline to Edoxaban

From warfarin or other vitamin K antagonists: Discontinue warfarin and start edoxaban when INR is less than or equal to 2.5. **From oral anticoagulants other than warfarin or other vitamin K antagonists:** Discontinue current oral anticoagulant and start edoxaban at the time of the next scheduled dose of the other oral anticoagulant. **From LMWH:** Discontinue LMWH and start edoxaban at the time of the next scheduled dose of LMWH. **From low unfractionated heparin:** Discontinue infusion and start edoxaban 4 hrs later.

Transition Guideline from Edoxaban to Other Anticoagulant

To Warfarin: Oral option: For pts taking edoxaban 60 mg, reduce to 30 mg and begin warfarin concomitantly. For pts taking edoxaban 30 mg, reduce dose to 15 mg and begin warfarin concomitantly. Once stable INR greater than or equal to 2, discontinue edoxaban and continue warfarin. **Parenteral option:** Discontinue edoxaban and administer parenteral anticoagulant and warfarin at the time of next scheduled edoxaban dose. Once stable INR greater than or equal to 2, discontinue parenteral anticoagulant and continue warfarin. **To non-vitamin K-dependent oral anticoagulant or parenteral anticoagulant:** Discontinue edoxaban and start other oral anticoagulant at the time of the next scheduled dose.

Side effects

Rare (4%): Rash.

Adverse effects/toxic reactions

Hemorrhagic events including intracranial hemorrhage, hemorrhagic stroke, cutaneous/GI/GU/oral/pharyngeal/urethral/vaginal bleeding, epistaxis,

epidural/spinal hematoma (esp. with epidural catheters, spinal trauma) were reported. Discontinuation in the absence of other adequate anticoagulants may increase the risk of ischemic events, stroke. May increase risk of epidural or spinal hematomas, which can lead to long-term or permanent paralysis. Protamine sulfate, vitamin K, tranexamic acid are not expected to reverse anticoagulant effect. Interstitial lung disease was reported in less than 1% of pts.

Nursing considerations

Baseline assessment

Obtain baseline renal function test, esp. creatinine clearance; PT/INR in pts transitioning on or off warfarin therapy. Do not initiate if CrCl greater than 95 mL/min. Question history of bleeding disorders, recent surgery, spinal procedures, intracranial hemorrhage, bleeding ulcers, open wounds, anemia, renal/hepatic impairment, trauma. Receive full medication history including herbal products.

Intervention/evaluation

Monitor renal function test; occult urine/stool, urine output. Monitor for symptoms of hemorrhage: abdominal/back pain, headache, altered mental status, weakness, paresthesia, aphasia, vision changes, GI bleeding. Question for increase in menstrual bleeding/discharge. Assess peripheral pulses; skin for ecchymosis, petechiae. Assess urine output for hematuria.

Patient/family teaching

- Do not discontinue current blood thinning regimen or take any newly prescribed medication unless approved by physician who started anticoagulant therapy.
- Suddenly stopping therapy may increase risk of stroke or blood clots. Refill prescriptions so that next scheduled dose is not missed.
- Immediately report bleeding of any kind.
- Avoid alcohol, aspirin, NSAIDs.
- Consult physician before surgery/dental work.
- Use electric razor, soft toothbrush to prevent bleeding.
- Report any numbness, muscular weakness, signs of stroke (confusion, headache, one-sided weakness, trouble speaking), bloody stool or urine,

nosebleeds.

- Monitor changes in urine output.

efavirenz

e-fav-ir-enz

Sustiva

Fixed-combination(s)

Atripla: efavirenz/emtricitabine (an antiretroviral)/tenofovir (an antiretroviral): 600 mg/200 mg/300 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Nonnucleoside reverse transcriptase inhibitor.

CLINICAL: Antiretroviral.

Uses

Treatment of HIV infection, in combination with at least two other appropriate antiretroviral agents, in adults and children 3 mos and older weighing at least 3.5 kg.

Precautions

Contraindications: Hypersensitivity to efavirenz. **Cautions:** History of mental illness, seizures, suspected hepatitis B or C virus infection, history of substance abuse, hepatic impairment (class A). Avoid pregnancy.

Action

Binds to reverse transcriptase, blocking RNA and DNA-dependent DNA polymerase activity, including HIV-1 replication. **Therapeutic Effect:** Interrupts HIV replication, slowing progression of HIV infection.

Pharmacokinetics

Rapidly absorbed after PO administration. Protein binding: 99%. Metabolized in

liver. Excreted in feces (16%–61%), urine (14%–34%). **Half-life:** 40–55 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy during treatment and up to 12 wks after discontinuation. Breastfeeding not recommended. **Children:** Safety and efficacy not established in pts younger than 3 yrs; may have increased incidence of rash. **Elderly:** No age-related precautions noted.

Interactions

DRUG: **Ergot derivatives, midazolam, triazolam** may cause serious or life-threatening reactions (cardiac arrhythmias, prolonged sedation, respiratory depression). Decreases plasma concentrations of **amprenavir, atazanavir, boceprevir, telaprevir, indinavir, saquinavir**. Increases plasma concentrations of **ritonavir**. **CYP3A4 inducers (e.g., PHENobarbital, rifabutin, rifAMPin)** decrease concentration/effects. May alter **warfarin** plasma concentration. **HERBAL:** **St. John's wort** may decrease concentration/effects. **FOOD:High-fat meals** may increase drug absorption. **LAB VALUES:** May produce false-positive urine test results for cannabinoid. May increase serum ALT, AST, GGT, amylase, glucose, triglycerides, cholesterol. May decrease neutrophils.

Availability (Rx)

Capsules: 50 mg, 200 mg.

 **Tablets:** 600 mg.

Administration/handling

PO

- Give with water at bedtime (decreases CNS adverse effects).
- Avoid high-fat meals (may increase absorption).
- Capsules may be opened and added to small amount of food/liquid. Administer within 30 min.
- Do not break, crush, dissolve, or divide tablets.

Indications/routes/dosage

HIV Infection

PO: ADULTS, ELDERLY, CHILDREN WEIGHING 40 KG OR MORE: 600 mg once daily at bedtime. **CHILDREN WEIGHING 32.5 KG–LESS THAN 40 KG:** 400 mg once daily. **CHILDREN WEIGHING 25 KG–LESS THAN 32.5 KG:** 350 mg once daily. **CHILDREN WEIGHING 20 KG–LESS THAN 25 KG:** 300 mg once daily. **CHILDREN WEIGHING 15 KG–LESS THAN 20 KG:** 250 mg once daily. **CHILDREN WEIGHING 7.5 KG–LESS THAN 15 KG:** 200 mg once daily. **CHILDREN WEIGHING 5 KG–LESS THAN 7.5 KG:** 150 mg once daily. **CHILDREN WEIGHING 3.5 KG–LESS THAN 5 KG:** 100 mg once daily.

Dosage: Concurrent RifAMPin

PO: ONLY IF PT WEIGHS 50 KG OR GREATER: 800 mg once daily.

Dosage: Concurrent Voriconazole

PO: Reduce efavirenz to 300 mg once daily; increase voriconazole to 400 mg q12h.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: Use caution. **Moderate to severe impairment:** Not recommended.

Side effects

Frequent (52%): Mild to severe: Dizziness, vivid dreams, insomnia, confusion, impaired concentration, amnesia, agitation, depersonalization, hallucinations, euphoria. **Occasional: Mild to moderate:** Maculopapular rash (27%); nausea, fatigue, headache, diarrhea, fever, cough (less than 26%).

Adverse effects/toxic reactions

Serious adverse psychiatric experiences (aggressive reactions, agitation, delusions, emotional lability, mania, neurosis, paranoia, psychosis, suicide) have

been reported. Grade 4 rash, Stevens-Johnson syndrome, erythema multiforme occurs rarely. Hepatotoxicity with serum ALT, AST elevation greater than 5 times upper limit of normal reported in 5% of pts. May induce immune reconstitution syndrome (inflammatory response to dormant opportunistic infections or acceleration of autoimmune disorders).

Nursing considerations

Baseline assessment

Offer emotional support. Obtain baseline serum cholesterol, triglycerides; pregnancy test in females of reproductive potential before initiating therapy. Obtain LFT in pts with history of hepatitis B or C virus infection. Receive full medication history including herbal products (high risk of drug interaction).

Intervention/evaluation

Monitor for CNS, psychological symptoms: severe acute depression (including suicidal ideation or attempts), dizziness, impaired concentration, drowsiness, abnormal dreams, insomnia (begins during first or second day of therapy, generally resolves in 2–4 wks). Assess for evidence of rash (common side effect). Monitor LFT for abnormalities. Assess for headache, nausea, diarrhea. Obtain pregnancy test in females of reproductive potential at regular intervals during therapy.

Patient/family teaching

- Avoid high-fat meals during therapy.
- Report appearance of skin rash immediately.
- CNS, psychological symptoms occur in more than half of pts (dizziness, impaired concentration, delusions, depression).
- Take medication every day as prescribed.
- Do not alter dose or discontinue medication without informing physician.
- Do not chew, crush, dissolve, or divide tablets.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Efavirenz is not a cure for HIV infection, nor does it reduce risk of transmission to others.

- Recommend effective contraception during treatment and up to 12 wks after last dose. Do not breastfeed.

elbasvir/grazoprevir

el-bas-vir/graz-oh-pre-vir

Zepatier

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: NS5A inhibitor/protease inhibitor.

CLINICAL: Antihepaciviral.

Do not confuse elbasvir with daclatasvir, ombitasvir or grazoprevir with boceprevir or simeprevir.

Uses

Treatment of chronic hepatitis C virus genotypes 1 or 4 infection in adults, with or without ribavirin.

Precautions

Contraindications: Hypersensitivity to elbasvir or grazoprevir, decompensated hepatic cirrhosis, moderate or severe hepatic impairment; concomitant use of organic anion transporting polypeptides 1B1/3 (OATP1B1/3) inhibitors, strong CYP3A inducers. Concomitant use of atazanavir, carbamazepine, cycloSPORINE, darunavir, efavirenz, lopinavir, phenytoin, rifAMPin, saquinavir, St. John's wort, tipranavir. Any contraindications or hypersensitivity to ribavirin (if used with treatment regimen). **Cautions:** HIV infection, mild hepatic impairment. Safety and efficacy not established in pts with hepatitis B virus coinfection, liver transplant recipients.

Action

Elbasvir inhibits hepatitis C virus (HCV) NS5A protein, which is essential for viral RNA replication and virion assembly. Grazoprevir inhibits HCV NS3/4A protease needed for processing HCV-encoded polyproteins, which is essential for viral replication. **Therapeutic Effect:** Inhibits viral replication of hepatitis C virus.

Pharmacokinetics

Widely distributed. Metabolized in liver. Protein binding: elbasvir (99.9%), grazoprevir (98.8%). Peak plasma concentration: 3 hrs. Steady state reached in approx. 6 days. Excreted in feces (greater than 90%), urine (less than 1%). **Half-life:** elbasvir: 24 hrs; grazoprevir: 31 hrs.

Lifespan considerations

Pregnancy/Lactation: Use caution in pregnancy. Unknown if distributed in breast milk. When used with ribavirin, breastfeeding and pregnancy are contraindicated during treatment and up to 6 mos after discontinuation. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May have increased risk of hepatotoxicity.

Interactions

DRUG: Anticonvulsants (e.g., carbamazepine, phenytoin), antimycobacterials (e.g., rifabutin, rifampin), efavirenz may significantly decrease concentration/effect; use contraindicated. Atazanavir, darunavir, lopinavir, tipranavir, cycloSPORINE may significantly increase risk of hepatotoxicity; use contraindicated. Moderate CYP3A inducers (e.g., etravirine, modafinil, nafcillin) may decrease concentration/effect. Elvitegravir/cobicistat/emtricitabine/tenofovir (disoproxil or alafenamide), ketoconazole may increase concentration/effect. May increase concentration/effect of atorvastatin, fluvastatin, HYDROcodone, lovastatin, niMODipine, rosuvastatin, simvastatin, tacrolimus. Acetaminophen may increase risk of hepatotoxicity. **HERBAL:** St. John's wort may decrease concentration/effect; use contraindicated. **FOOD:** Grapefruit products may increase grazoprevir concentration/effect. **LAB VALUES:** May decrease Hgb. May increase serum ALT, bilirubin.

Availability (Rx)

Fixed-Dose Combination Tablets: elbasvir 50 mg/grazoprevir 100 mg.

Administration/handling

PO

- Give without regard to meals.

Indications/routes/dosage

Note: NS5A resistance testing recommended in HCV genotype 1a infected pts prior to initiating treatment with Zepatier.

Chronic Hepatitis C Virus Infection

PO:ADULTS, ELDERLY: 1 tablet once daily (with or without ribavirin).

Treatment Regimen and Duration

PO:ADULTS, ELDERLY: Genotype 1a:Treatment-naïve or peginterferon alfa (PegIFN)/ribavirin (RBV)–experienced without baseline NS5A polymorphisms: 1 tablet once daily for 12 wks. **Genotype 1a: Treatment-naïve or PegIFN/RBV–experienced with baseline NS5A polymorphisms:** 1 tablet once daily with ribavirin for 16 wks. **Genotype 1b:Treatment-naïve or PegIFV/RBV–experienced:** 1 tablet once daily for 12 wks. **Genotype 1a or 1b:PegIFV/RBV/protease inhibitor–experienced:** 1 tablet once daily with ribavirin for 12 wks. **Genotype 4:Treatment-naïve:** 1 tablet once daily for 12 wks. **Genotype 4:PegIFN/RBV–experienced:** 1 tablet once daily with ribavirin for 16 wks.

Treatment-Induced Hepatotoxicity

Consider discontinuation in pts with persistent serum ALT elevation greater than 10 times upper limit of normal (ULN). Permanently discontinue if serum ALT elevation is accompanied with elevated alkaline phosphatase, conjugated bilirubin, prolonged INR, or signs of acute hepatic inflammation.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Contraindicated.

Side effects

Occasional (11%–3%): Fatigue, headache, diarrhea, nausea, insomnia, dyspnea, rash, pruritus, irritability. **Rare (2%):** Abdominal pain, arthralgia.

Adverse effects/toxic reactions

Serum ALT elevation up to 5 times ULN reported in 1% of pts. Serum bilirubin elevation greater than 2.5 times ULN occurred in 6% of pts. Serum ALT elevation occurred more frequently in the elderly, female pts, and pts of Asian ancestry.

Nursing considerations

Baseline assessment

Obtain CBC, LFT, HCV-RNA level; pregnancy test in female pts of reproductive potential. Confirm hepatitis C genotype. In pts with HCV genotype 1a, recommend testing for the presence of NS5A resistance-associated polymorphisms prior to initiation. Receive full medication history including herbal products; screen for contraindications. Question history of chronic anemia, hepatitis B virus infection, HIV infection, liver transplantation.

Intervention/evaluation

Obtain LFT at wk 8, then as clinically indicated. For pts receiving 16 wks of therapy, obtain additional LFT at wk 12. Monitor CBC periodically; HCV-RNA levels at wks 4, 8, 12, 16 and as clinically indicated. Monitor for hepatotoxicity. Assess for anemia-related dizziness, exertional dyspnea, fatigue, weakness, syncope. Encourage nutritional intake. Assess for decreased appetite, weight loss. Obtain monthly pregnancy tests in females of reproductive potential if treated with ribavirin.

Patient/family teaching

- Blood levels will be drawn routinely.
- Treatment may be used in combination with ribavirin (inform pt of side effects/toxic reactions). If therapy includes ribavirin, female pts of reproductive potential should avoid pregnancy during treatment and up to 6 mos after last

dose.

- Do not take newly prescribed medication unless approved by the doctor who originally started treatment.
- Do not take herbal products, esp. St. John's wort.
- Avoid alcohol, grapefruit products.
- Report signs of treatment-induced liver injury such as abdominal pain, clay-colored stool, dark amber urine, decreased appetite, fatigue, weakness, yellowing of the skin or eyes.
- Maintain proper nutritional intake.

eletriptan

el-e-**trip**-tan

Relpax

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Serotonin receptor agonist.

CLINICAL: Antimigraine.

Uses

Treatment of acute migraine headache with or without aura.

Precautions

Contraindications: Hypersensitivity to eletriptan. Arrhythmias associated with conduction disorders, cerebrovascular syndrome including strokes and transient ischemic attacks (TIAs), coronary artery disease, hemiplegic or basilar migraine, ischemic heart disease, peripheral vascular disease including ischemic bowel disease, severe hepatic impairment, uncontrolled hypertension; use within 24 hrs of treatment with another 5-HT₁ agonist, an ergotamine-containing or ergot-type medication such as dihydroergotamine (DHE) or methysergide. Recent use (within 72 hrs) of strong CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, itraconazole, ritonavir). **Cautions:** Mild to moderate renal/hepatic impairment, controlled hypertension, history of CVA.

Action

Selective agonist for serotonin in cranial arteries; causes vasoconstriction and reduces inflammation. **Therapeutic Effect:** Relieves migraine headache.

Pharmacokinetics

Well absorbed after PO administration. Metabolized by liver. Excreted in urine. **Half-life:** 4.4 hrs (increased in hepatic impairment, elderly [older than 65 yrs]).

Lifespan considerations

Pregnancy/Lactation: May decrease possibility of ovulation. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Increased risk of hypertension in those older than 65 yrs.

Interactions

DRUG: CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may decrease metabolism. Ergotamine-containing medications may produce vasospastic reaction. SSRIs (e.g., escitalopram, paroxetine, sertraline), SNRIs (e.g., duloxetine, venlafaxine), tricyclic antidepressants (e.g., amitriptyline, nortriptyline), MAOIs (e.g., phenelzine, selegiline) may cause serotonin syndrome. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

 **Tablets:** 20 mg, 40 mg.

Administration/handling

PO

- May take without regard to food.
- Do not break, crush, dissolve, or divide film-coated tablets.

Indications/routes/dosage

Acute Migraine Headache

PO: ADULTS, ELDERLY: 20–40 mg. **Maximum:** 40 mg. If headache improves but then returns, dose may be repeated after 2 hrs. **Maximum:** 80 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment. Not recommended in severe hepatic impairment.

Side effects

Occasional (6%–5%): Dizziness, drowsiness, asthenia, nausea. **Rare (3%–2%):** Paresthesia, headache, dry mouth, warm or hot sensation, dyspepsia, dysphagia.

Adverse effects/toxic reactions

Cardiac reactions (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (hemorrhage, CVA) occur rarely, particularly in pts with hypertension, obesity, diabetes, strong family history of coronary artery disease; smokers; males older than 40 yrs; postmenopausal women. May cause GI ischemia, bowel infarction, non–cardiac-related vasospasms including peripheral vascular ischemia, Raynaud’s syndrome. Overuse may increase frequency, occurrence of headaches.

Nursing considerations

Baseline assessment

Question pt regarding onset, location, duration of migraine, possible precipitating symptoms. Obtain baseline B/P for evidence of uncontrolled hypertension (contraindication).

Intervention/evaluation

Assess for relief of migraine headache, potential for photophobia, phonophobia (sound sensitivity), nausea, vomiting. Monitor for cardiac arrhythmia, coronary events, hypertension, hypersensitivity reaction.

Patient/family teaching

- Take a single dose as soon as symptoms of an actual migraine attack appear.
- Medication is intended to relieve migraine headaches, not to prevent or reduce number of attacks.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Immediately report palpitations, pain/tightness in chest/throat, sudden or severe abdominal pain, pain/weakness of extremities.

elotuzumab

el-oh-tooz-ue-mab

Empliciti

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Antineoplastic.

Do not confuse elotuzumab with alemtuzumab, eculizumab, evolocumab, pertuzumab, gemtuzumab, trastuzumab.

Uses

Treatment of multiple myeloma (in combination with lenalidomide and dexamethasone) in pts who have received one to three prior therapies.

Precautions

Contraindications: Hypersensitivity to elotuzumab. **Cautions:** Diabetes, baseline cytopenias, hypertension; history of chronic opportunistic infections (esp. viral infections, fungal infections), conditions predisposing to infection (e.g., diabetes, kidney failure, open wounds). Concomitant use of medications known to cause bradycardia (e.g., antiarrhythmics, beta blockers, calcium channel blockers). Concomitant use of live vaccines not recommended during treatment and up to 3 mos after discontinuation. Avoid use during severe active infection.

Action

Binds to and specifically targets signaling lymphocytic activation molecule

family member 7 (SLAMF7), a protein that is expressed on most myeloma and natural killer cells. Directly activates natural killer cells and facilitates cellular death. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Widely distributed. Metabolism not specified. Elimination not specified. **Half-life:** Not specified; 97% of steady-state concentration is expected to be eliminated within 82 days.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy; may cause fetal harm/malformations/fetal demise when used with lenalidomide. Unknown if distributed in breast milk. However, immunoglobulin G (IgG) is present in breast milk. Breastfeeding contraindicated when used with concomitant lenalidomide treatment. **Men:** Lenalidomide is present in semen. Recommend use of barrier methods during sexual activity. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May increase immunosuppressant/toxic effects of immunosuppressants (e.g, fingolimod, leflunomide, nivolumab). Roflumilast may increase immunosuppressant effect. May enhance adverse/toxic effect of **live vaccines**; may decrease therapeutic effect of **vaccines**. **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May be detected on both serum protein electrophoresis and immunofixation assays used to monitor multiple myeloma endogenous M-protein. May affect the determination of complete response and disease progression of some pts with IgG kappa myeloma protein. Expected to decrease lymphocytes, leukocytes, platelets. May decrease serum albumin, bicarbonate, calcium. May increase serum alkaline phosphatase, ALT, AST, glucose, potassium.

Availability (Rx)

Injection, Powder for Reconstitution: 300 mg, 400 mg.

Administration/handling

IV

Reconstitution

- Calculate the dose and number of vials required based on weight in kg.
- Reconstitute the 300-mg vial with 13 mL of Sterile Water for Injection or the 400-mg vial with 17 mL of Sterile Water for Injection using an 18-g or lower (e.g., 17, 16, or 15) needle.
- Gently roll vial upright to mix. To dissolve any powder left on top of vial or stopper, gently invert vial several times.
- Do not shake or agitate.
- The powder should dissolve in less than 10 mins.
- After dissolution, allow vials to stand for 5–10 mins.
- Visually inspect solution for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow. Discard if solution is cloudy or discolored or if foreign particles are observed. Each vial contains an overfill volume to allow for a specific withdrawal of 12 mL (300-mg vial) or 16 mL (400-mg vial).
- Final concentration of withdrawn volume (without overfill) will equal 25 mg/mL.
- Dilute in 230 mL of 0.9% NaCl or 5% Dextrose injection in polyvinyl chloride or polyolefin infusion bag.
- Mix by gentle inversion; do not shake or agitate.
- The volume may be adjusted in order to not exceed 5 mL/kg of pt weight at any given dose.

Infusion Guidelines

- Prior to administration, premedicate with dexamethasone, acetaminophen, antihistamine (H₁ antagonist, plus H₂ antagonist) approx. 45–90 mins before each infusion (see manufacturer guidelines).
- Use an in-line, sterile, nonpyrogenic, low protein-binding filter (0.2–1.2 mm).
- Infuse via dedicated line using an infusion pump.

Rate of Administration

- **First Infusion (Cycle 1, Dose 1):** Infuse at 0.5 mL/min for the first 30 mins. If no infusion reactions occur, may increase to 1 mL/min for next 30 mins. If tolerated, may increase to 2 mL/min. **Maximum rate:** 2 mL/min.
- **Second Infusion (Cycle 1, Dose 2):** Initiate at 1 mL/min for first 30 mins if no

infusion reactions occurred during first infusion. If tolerated, may increase to 2 mL/min until infusion completed. **Maximum rate:** 2 mL/min.

• **Subsequent Infusions (Cycle 1, Doses 3 and 4, All Subsequent Infusions):** Initiate at 2 mL/min until completion if no infusion reactions occurred during prior infusion. **Maximum rate:** 2 mL/min. In pts who have received four cycles of treatment, infusion rate may be increased to maximum rate of 5 mL/min.

Storage

- Refrigerate intact vials until time of use.
- Do not freeze or shake.
- Refrigerate diluted solution up to 24 hrs.
- May store at room temperature up to 8 hrs (of the total 24 hrs).
- Diluted solution must be administered within 24 hrs of reconstitution.
- Protect from light.

IV incompatibilities

Do not mix with other medications.

Indications/routes/dosage

Multiple Myeloma

IV: ADULTS, ELDERLY: Cycles 1 and 2: 10 mg/kg once wkly on days 1, 8, 15, 22 of 28-day cycle (in combination with lenalidomide and dexamethasone).

Cycles 3 and beyond: 10 mg/kg once q2wks on days 1 and 15 of 28-day cycle (in combination with lenalidomide and dexamethasone). Continue until disease progression or unacceptable toxicity.

Dose Modification

Infusion Reactions

Grade 2 or higher reaction: Interrupt infusion until symptoms improve. Once resolved to Grade 1 or 0, resume infusion at 0.5 mL/min. If tolerated, increase in increments of 0.5 mL/min q30mins back to previous rate. May further increase rate as indicated if no reaction recurs. If infusion reaction recurs, stop infusion and do not restart for that day.

Dosage in Renal/Hepatic Impairment

Not specified; use caution.

Side effects

Frequent (61%–20%): Fatigue, diarrhea, pyrexia, constipation, cough, peripheral neuropathy, decreased appetite. **Occasional (16%–10%):** Extremity pain, headache, vomiting, decreased weight, oropharyngeal pain, hypoesthesia, mood change, night sweats.

Adverse effects/toxic reactions

All cases were reported in combination with lenalidomide and dexamethasone. Infusion reactions reported in 10% of pts. Most infusion reactions were Grade 3 and lower. Lymphopenia, leukopenia, thrombocytopenia are expected responses to therapy. Infections were reported in 81% of pts. Grade 3 or 4 infections occurred in 28% of pts. Nasopharyngitis (25% of pts), upper respiratory tract infection (23% of pts), opportunistic infection (22% of pts), herpes zoster (14% of pts), fungal infection (10% of pts), influenza; second primary malignancies, skin malignancies, solid tumors, malignant neoplasms; tachycardia, bradycardia, systolic or diastolic hypertension, hypotension; pulmonary embolism may occur. Hepatotoxicity with elevation of serum alkaline phosphatase greater than 2 times upper limit of normal (ULN), serum ALT/AST greater than 3 times ULN, total bilirubin greater than 2 times ULN reported in 3% of pts. Other adverse effects may include cataracts (12% of pts), hyperglycemia (89% of pts), hypersensitivity reaction (greater than 5% of pts). Immunogenicity (auto-elotuzumab antibodies) occurred in 19% of pts. Thrombocytopenia may increase risk of bleeding.

Nursing considerations

Baseline assessment

Obtain CBC, BMP, LFT; serum ionized calcium; capillary blood glucose, vital signs; pregnancy test in female pts of reproductive potential. Obtain baseline EKG in pts concurrently using medications known to cause bradycardia. Question history of chronic opportunistic infections, diabetes, hepatic impairment, pulmonary embolism; prior infusion or hypersensitivity reactions.

Screen for medications known to cause bradycardia, hyperglycemia. Screen for active infection. Offer emotional support.

Intervention/evaluation

Obtain CBC, BMP, LFT, ionized calcium periodically. Administer in an environment equipped to monitor for and manage infusion reactions. If infusion reaction of any grade/severity occurs, immediately interrupt infusion and manage symptoms. Accurately record characteristics of infusion reactions (severity, type, time of onset). Infusion reactions may affect future infusion rates. Monitor HR, BP q30mins during infusion and for at least 2 hrs after completion in pts with prior hemodynamic reactions. Cough, dyspnea, hypoxia, tachycardia may indicate pulmonary embolism. Monitor for bradycardia, cataracts, hyperglycemia, hyperkalemia, hypersensitivity reaction, hepatotoxicity, neuropathy, tachycardia. Assess for new primary malignancies (solid tumors, skin cancers); skin for new lesions, moles. Monitor daily pattern bowel activity, stool consistency. Obtain urine, serum pregnancy test periodically throughout therapy.

Patient/family teaching

- Blood levels, EKGs will be monitored routinely.
- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Therapy may decrease your heart rate, esp. in those taking medications that lower heart rate; report dizziness, chest pain, palpitations, or fainting.
- Avoid pregnancy. Do not breastfeed.
- Male pts should use condoms during sexual activity.
- Treatment includes a steroid that may raise blood sugar levels; report dehydration, blurry vision, confusion, frequent urination, increased thirst, fruity breath.
- Report allergic reactions of any kind.
- Abdominal pain, easy bruising, clay-colored stools, dark-amber urine, fatigue, loss of appetite, yellowing of skin or eyes may indicate liver problem.

eltrombopag

el-**trom**-boe-pag

Promacta

Revolade 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Thrombopoietin receptor agonist.

CLINICAL: Prevents thrombocytopenia.

■ **BLACK BOX ALERT** ■ May cause hepatotoxicity. Measure serum ALT, AST, bilirubin prior to initiation of eltrombopag, every 2 wks during dose adjustment phase, and monthly following establishment of a stable dose. If bilirubin is elevated, perform fractionation. Discontinue if serum ALT levels increase to 3 times or greater upper limit of normal and are progressive, persistent for 4 or more wks, accompanied by increased direct bilirubin, clinical symptoms of hepatic injury, or evidence of hepatic decompensation.

Uses

Treatment of thrombocytopenia in pts with chronic immune (idiopathic) thrombocytopenic purpura (ITP) with insufficient response with corticosteroids, immunoglobulins, or splenectomy. Use only in pts who are at increased risk for bleeding; should not be used to normalize platelet counts. Treatment of thrombocytopenia in pts with chronic hepatitis C virus infection to allow the initiation and maintenance of interferon-based therapy. Treatment of severe aplastic anemia in pts having an insufficient response to immunosuppressive therapy.

Precautions

Contraindications: Hypersensitivity to eltrombopag. **Cautions:** Preexisting hepatic impairment, renal impairment (any degree), myelodysplastic syndrome (may increase risk for hematologic malignancies). Pts with known risk for thromboembolism, risk for cataracts.

Action

Interacts with the human thrombopoietin receptor and initiates signaling

cascades. **Therapeutic Effect:** Induces proliferation and differentiation of megakaryocytes from bone marrow progenitor cells.

Pharmacokinetics

Readily absorbed from gastrointestinal tract. Primarily distributed in blood cells. Protein binding: 99%. Extensively metabolized including oxidation, conjugation with glucuronic acid or cysteine. Excreted primarily in feces. **Half-life:** 26–35 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Use caution due to increased frequency of hepatic, renal, cardiac dysfunction.

Interactions

DRUG: May increase concentration/toxicity of **atorvastatin, fluvastatin, methotrexate, nateglinide, pravastatin, repaglinide, rifAMPin, rosuvastatin. Aluminum, antacids, calcium, iron, magnesium** may decrease concentration/effects. **HERBAL:** None significant. **FOOD: Dairy products** may decrease concentration/effects. **LAB VALUES:** May increase serum ALT, AST.

Availability (Rx)

Tablets: 12.5 mg, 25 mg, 50 mg, 75 mg, 100 mg. **Oral Suspension:** 25 mg.

Administration/handling

PO

- Give on an empty stomach, either 1 hr before or 2 hrs after meal.
- Give at least 4 hrs before or 4 hrs after ingestion of antacids, food high in calcium or minerals, or calcium-fortified juices.

Indications/routes/dosage

Aplastic Anemia

PO: ADULTS, ELDERLY: 50 mg once daily (25 mg for pts of East Asian ancestry or hepatic impairment). Titrate dose based on platelet response. Adjust dose to maintain platelets more than 50,000/mm³. **Maximum:** 150 mg/day.

ITP

PO: ADULTS, ELDERLY, CHILDREN 6 YRS AND OLDER: Initially, 50 mg once daily (25 mg for pts of East Asian ancestry or moderate to severe hepatic insufficiency or children 1 to 5 yrs of age). Then, adjust dose (25 mg to 75 mg once daily) to achieve and maintain platelet count of 50,000 cells/mm³ or greater as necessary to reduce risk of bleeding. **Maximum:** 75 mg once daily.

Chronic Hepatitis C–associated Thrombocytopenia

PO: ADULTS, ELDERLY: Initially, 25 mg once daily. Titrate dose based on platelet response. **Maximum:** 100 mg once daily.

Dosage Adjustment Based on Platelet Response

Less than 50,000/mm ³ (after at least 2 wks)	Increase by 25 mg q2wks up to 100 mg/day
200,000/mm ³ or more and 400,000/mm ³ or less	Decrease by 25 mg
More than 400,000/mm ³	Withhold; when less than 150,000/mm ³ , resume with dose reduced by 25 mg
More than 400,000/mm ³ after 2 wks at lowest dose	Discontinue

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

ITP	
Mild to severe	Initial: 25 mg/day
East Asian ancestry	Initial: 12.5 mg/day

Chronic Hepatitis C

No dose adjustment.

Aplastic Anemia

Initial dose 25 mg once daily.

Side effects

Frequent (6%–4%): Nausea, vomiting, menorrhagia. **Occasional (3%–2%):** Myalgia, paresthesia, dyspepsia, ecchymosis, cataract, conjunctival hemorrhage.

Adverse effects/toxic reactions

May cause hepatotoxicity. Increases risk of reticulin fiber deposits within bone marrow (may lead to bone marrow fibrosis). May produce hematologic malignancies. May cause excessive increase in platelets, leading to thrombotic complications.

Nursing considerations

Baseline assessment

Assess CBC and peripheral blood smears, LFT. Examine peripheral blood smear to establish extent of RBC and WBC abnormalities. Conduct ocular examination. Screen for hepatic/renal impairment, myelodysplastic syndrome, history of thromboembolism. Question use of antacids or herbal products.

Intervention/evaluation

Monitor CBC, platelet counts, peripheral blood smears, LFT throughout and following discontinuation. Monitor for cataracts, hepatotoxicity during therapy.

Patient/family teaching

- Lab values will be closely monitored throughout therapy and for at least 4 wks after last dose.
- Report any yellowing of the skin or eyes, unusual darkening of the urine, unusual tiredness, pain in right upper stomach area.
- Do not take antacids, magnesium, or calcium products 4 hrs before or after dose.
- Report changes in vision.

eluxadoline

el-ux-ad-oh-leen

Viberzi

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Mu-opioid receptor agonist. Schedule IV.

CLINICAL: Antidiarrheal.

Uses

Treatment of irritable bowel syndrome with diarrhea in adults.

Precautions

Contraindications: Hypersensitivity to eluxadoline. Known or suspected biliary duct obstruction, sphincter of Oddi disease or dysfunction; pts without a gallbladder; severe hepatic impairment; severe constipation or sequelae from constipation, or known or suspected mechanical GI obstruction. History of alcoholism, alcohol abuse, alcohol addiction, or consumption of more than 3 alcoholic beverages/day. History of pancreatitis; structural disease of the pancreas, including known or suspected pancreatic duct obstruction.

Cautions: Mild to moderate hepatic impairment, respiratory disease.

Action

Affects mu-opioid receptors involved with gut motility, pain sensations, and secretion of liquids within the digestive tract. **Therapeutic Effect:** Reduces abdominal pain and diarrhea (without causing constipation).

Pharmacokinetics

Metabolism not specified. Protein binding: 81%. Peak plasma concentration: 1.5 hrs. Primarily excreted in feces (82%), urine (less than 1%). **Half-life:** 3.7–6 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: OATP1B1 inhibitors (e.g., cycloSPORINE, ritonavir, rifAMPin), strong CYP inhibitors (e.g., ciprofloxacin, gemfibrozil, fluconazole, clarithromycin) may increase concentration/effect. **Drugs that cause constipation** (e.g., alosetron, anticholinergics [e.g., diphenhydrAMINE], loperamide, opioids [e.g., morphine]) may increase risk of serious constipation-associated adverse effects. May increase concentration of **rosuvastatin**, increasing risk of myopathy/rhabdomyolysis. May increase effects of **CYP3A substrates with narrow therapeutic index** (e.g., cycloSPORINE, sirolimus, tacrolimus). **HERBAL:** None significant. **FOOD:** **High-fat meals** may decrease absorption. **LAB VALUES:** May increase serum ALT, AST, lipase.

Availability (Rx)

 **Tablets:** 75 mg, 100 mg.

Administration/handling

PO

- Administer with food.
- If scheduled dose is missed, give next dose at the regular time; do not give 2 doses at once.

Indications/routes/dosage

Irritable Bowel Syndrome–Associated Diarrhea

PO: ADULTS, ELDERLY: 100 mg twice daily. May decrease to 75 mg twice daily if unable to tolerate 100-mg dose.

Dose Modification

Pts who are unable to tolerate 100-mg dose, or are receiving concomitant OATP1B1 inhibitors: 75 mg twice daily.

Pts who develop severe constipation for more than 4 days: Permanently discontinue.

Dosage in Renal Impairment

Not specified; use caution.

Dosage in Hepatic Impairment

Mild to moderate impairment: 75 mg twice daily. **Severe impairment:** Contraindicated.

Side effects

Occasional (8%–4%): Constipation, nausea, abdominal pain (upper or lower), upper respiratory tract infection, vomiting. **Rare (3%–1%):** Abdominal distention, dizziness, flatulence, rash, urticaria, fatigue, sedation, somnolence, euphoric mood.

Adverse effects/toxic reactions

May increase risk of sphincter of Oddi spasm (esp. in pts without a gallbladder), resulting in pancreatitis or hepatic enzyme elevation that may be associated with or without acute abdominal pain, or nausea/vomiting; 80% of pts reported sphincter of Oddi spasm within the first week of treatment. May also increase risk of pancreatitis that is not associated with sphincter of Oddi spasm. Infectious processes including upper respiratory tract infection, bronchitis, nasopharyngitis, viral gastroenteritis were reported. May cause hypersensitivity reaction including asthma, bronchospasm, respiratory failure, wheezing. Recreational abuse may produce feelings of euphoria, which may lead to physical dependence.

Nursing considerations

Baseline assessment

Obtain baseline LFT in pts with baseline hepatic impairment. Receive full medication history and screen for interactions requiring lower dosage. Question pt's usual stool characteristics (color, frequency, consistency). Question history

of alcoholism, biliary duct obstruction, cholecystectomy, mechanical GI obstruction, hepatic impairment, hypersensitivity reaction, pancreatic disease, respiratory disease, sphincter of Oddi disease or spasm. Assess hydration status.

Intervention/evaluation

Monitor for abdominal pain that radiates to the back or shoulder, with or without nausea or vomiting (esp. during first few weeks of treatment). Obtain LFT, serum lipase level if acute pancreatitis, sphincter of Oddi spasm, biliary tract obstruction suspected. Monitor for hypersensitivity reaction including dyspnea, rash, wheezing. Observe and record daily pattern of bowel activity, stool consistency. Encourage PO intake. If an acute overdose occurs, a narcotic mu-opioid antagonist such as naloxone may be considered if reversal of overdose-related adverse effects is needed.

Patient/family teaching

- Therapy may cause inflammation of the pancreas (pancreatitis) or elevated liver-associated abdominal pain, esp. during the first few weeks of treatment. Report any new or worsening abdominal pain that radiates to the back or shoulder, with or without nausea/vomiting.
- Avoid chronic or acute excessive use of alcohol; may increase risk of liver or pancreas injury.
- If a dose is missed, take the next dose at the regular time; do not take 2 doses at once.
- Report constipation lasting longer than 4 days.
- Avoid medications that cause constipation (e.g., antidiarrheals, narcotics).
- Report signs of allergic reaction; respiratory problems such as worsening of asthma, bronchitis, wheezing.
- Drink plenty of fluids.

elvitegravir

el-vi-teg-ra-vir

Vitekta

Fixed-combination(s)

Genvoya, Stribild: elvitegravir (an integrase inhibitor)/cobicistat (an

antiretroviral booster)/emtricitabine/tenofovir (antiretroviral agents): 150 mg/150 mg/200 mg/300 mg.

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Integrase strand transfer inhibitor.

CLINICAL: Antiretroviral agent.

Do not confuse elvitegravir with dolutegravir or raltegravir.

Uses

Used in combination with an HIV protease inhibitor, coadministered with ritonavir and other antiretroviral medications for the treatment of HIV-1 infection in antiretroviral treatment-experienced adults.

Precautions

Contraindications: Hypersensitivity to elvitegravir. **Cautions:** Diabetes, hepatic impairment, hypercholesterolemia. Not recommended with a HIV protease inhibitor and cobicistat combination; coadministration of HIV-1 protease inhibitors other than atazanavir, darunavir, fosamprenavir, lopinavir, and tipranavir.

Action

Inhibits HIV integrase by preventing integration of HIV-1 DNA into host DNA, blocking formation of HIV-1 provirus. **Therapeutic Effect:** Interferes with HIV replication, slowing progression of HIV infection.

Pharmacokinetics

Readily absorbed after PO administration. Metabolized in liver. Protein binding: 98%–99%. Peak plasma concentration: 4 hrs. Excreted in feces (95%), urine (7%). **Half-life:** 8.7 hrs.

Lifespan considerations

Pregnancy/Lactation: Breastfeeding not recommend due to risk of postnatal HIV transmission. Unknown if distributed in human breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Safety

and efficacy not established in pts older than 65 yrs. May have increased risk of adverse reactions, hepatic impairment.

Interactions

DRUG: Antacids, aluminum/calcium/magnesium/iron supplements, antiretrovirals (e.g., efavirenz, nevirapine), corticosteroids (e.g., dexamethasone), anticonvulsants (e.g., carbamazepine, phenytoin), rifampin may decrease concentration/effect. May increase concentrations/effects of ketoconazole, rifampin. Antifungals (e.g., ketoconazole), atazanavir, lopinavir may increase concentration/effect. May decrease concentration/effect of hormonal contraceptives. **HERBAL:** St John's wort may decrease effectiveness. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, amylase bilirubin, cholesterol, creatine kinase (CK), GGT, glucose, lipase, triglycerides, urine glucose, urine RBC. May decrease neutrophils.

Availability (Rx)

 **Tablets:** 85 mg, 150 mg.

Administration/handling

PO

- Must be taken with food.
- Must be administered with a protease inhibitor, in combination with ritonavir and another antiretroviral drug.
- If pt receiving antacid, do not give aluminum- or magnesium-containing antacids within 2 hrs of dose.

Indications/routes/dosage

HIV Infection

PO: ADULTS, ELDERLY: (*Coadministered with darunavir/ritonavir, fosamprenavir/ritonavir or tipranavir/ritonavir*): 150 mg once daily. (*Coadministered with atazanavir/ritonavir or lopinavir/ritonavir*): **PO:**

ADULTS, ELDERLY: 85 mg once daily.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Not recommended.

Side effects

Occasional (7%–4%): Diarrhea, nausea. **Rare (3%):** Headache.

Adverse effects/toxic reactions

May induce immune recovery syndrome (inflammatory response to dormant opportunistic infections such as *Mycobacterium avium*, cytomegalovirus, *Pneumocystis carinii* pneumonia [PCP], tuberculosis, or acceleration of autoimmune disorders such as Graves' disease, polymyositis, Guillain-Barré). Pts co-infected with hepatitis B or C virus have increased risk for viral reactivation and worsening of hepatic function and may experience hepatic decompensation and/or failure if therapy is discontinued. Elevation of hepatic enzymes greater than 5 times upper limit of normal reported in 2% of pts.

Nursing considerations

Baseline assessment

Obtain BMP, CBC, lipid panel, LFT, urine glucose, vital signs; CD4+ count, viral load level. Screen for hepatitis B or C co-infection, hypercholesterolemia. Receive full medication history including herbal products. Question possibility of pregnancy; history of diabetes, hypercholesterolemia.

Intervention/evaluation

Monitor CBC, LFT, lipid levels. Monitor CD4+ count, viral load for treatment effectiveness. Cough, dyspnea, fever, excess of band cells on CBC may indicate acute infection (WBC count may be unreliable in pts with uncontrolled HIV

infection). Screen for immune reconstitution syndrome.

Patient/family teaching

- Offer emotional support.
- Take elvitegravir with an HIV protease inhibitor, combined with ritonavir at the same time each day with food (optimizes absorption).
- Antacids may decrease drug effectiveness; do not take within 2 hrs of dose
- Treatment regimen does not cure HIV infection, nor reduce risk of transmission.
- Drug resistance can form if therapy is interrupted; do not run out of supply.
- As immune system strengthens, it may respond to dormant infections hidden within the body. Report body aches, chills, cough, fever, night sweats, shortness of breath.
- Treatment may cause liver dysfunction; report abdominal pain, darkened urine, clay-colored stools, significant weight loss, or yellowing of skin or eyes.
- Do not take any new medications, including over-the-counter drugs or herbal products, unless approved by your doctor.
- Do not breastfeed.

empagliflozin

em-pa-gli-**floe**-zin

Jardiance

Fixed-combination(s)

Glyxambi: empagliflozin/linagliptin (an antidiabetic): 10 mg/5 mg, 25 mg/5 mg. **Synjardy:** Empagliflozin/metFORMIN (an antidiabetic): 5 mg/500 mg, 5 mg/1000 mg, 12.5 mg/500 mg, 12.5 mg/1000 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Sodium-glucose co-transporter 2 (SGLT2) inhibitor.

CLINICAL: Antidiabetic.

Do not confuse empagliflozin with canagliflozin or dapagliflozin.

Uses

Adjunctive treatment to diet and exercise to improve glycemic controls in pts with type 2 diabetes mellitus. Reduce risk of cardiovascular death in pts with type 2 diabetes and cardiovascular disease.

Precautions

Contraindications: History of hypersensitivity to empagliflozin, other SGLT2 inhibitors, severe renal impairment, end-stage renal disease, dialysis. **Cautions:** Not recommended in type 1 diabetes, diabetic ketoacidosis. Concurrent use of diuretics, other hypoglycemic medications, mild to moderate renal impairment, hypovolemia (dehydration/anemia), elderly, those with low systolic B/P, hyperlipidemia, history of genital mycotic infection. May cause ketoacidosis.

Action

Increases excretion of urinary glucose by inhibiting reabsorption of filtered glucose in kidney. Inhibits SGLT2 in proximal renal tubule. **Therapeutic Effect:** Lowers serum glucose levels.

Pharmacokinetics

Readily absorbed following PO administration. Metabolized in liver by glucuronidation. Peak plasma concentration: 1.5 hrs. Protein binding: 86%. Excreted in urine (54%) and feces (41%). **Half-life:** 12.4 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid use during second or third trimester. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May have increased risk for adverse reactions (e.g., hypotension, syncope, dehydration).

Interactions

DRUG: Diuretics (e.g., furosemide, HCTZ) may increase risk of hypotension/volume depletion. **Insulin, insulin secretagogues (e.g., glyBURIDE)** may increase risk of hypoglycemia. May increase

concentration/effect of **digoxin**. **HERBAL**: Fenugreek, garlic, ginger, ginseng, gotu may increase risk of hypoglycemia. **FOOD**: None known. **LAB VALUES**: May increase low-density lipoprotein cholesterol (LDL-C), serum creatinine. May decrease glomerular filtration rate.

Availability (Rx)

 **Tablets**: 10 mg, 25 mg.

Administration/handling

PO

May give without regard to food in the morning.

Indications/routes/dosage

Type 2 Diabetes Mellitus, Reduce Risk of Cardiovascular Death

PO: ADULTS/ELDERLY: Initially, 10 mg once daily in the morning. May increase to 25 mg once daily.

Dosage in Renal Impairment

GFR 45 mL/min or greater: No dose adjustment. **GFR less than 45 mL/min**: Discontinue. Do not initiate.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Rare (4%–1.1%): Increased urination, dyslipidemia, arthralgia, nausea.

Adverse effects/toxic reactions

Symptomatic hypotension (postural dizziness, orthostatic hypotension, syncope) may occur. Hypoglycemic events reported (concomitant use of hypoglycemic medications may increase hypoglycemic risk). Infections including urosepsis,

pyelonephritis, UTI, genital mycotic infections (male and female), upper respiratory tract infection may occur. May increase risk of acute kidney injury, renal impairment. Fatal cases of ketoacidosis have been reported.

Nursing considerations

Baseline assessment

Assess hydration status. Obtain serum chemistries, capillary blood glucose, hemoglobin A1c, LDL-C. Assess pt's understanding of diabetes management, routine home glucose monitoring. Receive full medication history including minerals, herbal products. Question history of co-morbidities, esp. renal or hepatic impairment.

Intervention/evaluation

Monitor serum cholesterol, blood glucose, renal function, LFT. Assess for hypoglycemia, infection (esp. sepsis, mycotic infections, UTI), decreased urinary output, amber-colored urine, edema, fever, flank pain, hypersensitivity reaction. Screen for glucose-altering conditions: fever, increased activity or stress, surgical procedures. Obtain dietary consult for nutritional education. Encourage fluid intake.

Patient/family teaching

- Diabetes mellitus requires lifelong control.
- Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Test blood sugar regularly. When taking combination drug therapy or when glucose demands are altered (fever, infection, trauma, stress), have low blood sugar treatment available (glucagon, oral dextrose).
- Report suspected pregnancy or plans of breastfeeding.
- Monitor daily calorie intake.
- Slowly go from lying to standing to prevent dizziness.
- Therapy may increase risk for dehydration/low blood pressure, which may cause kidney failure.
- Genital itching may indicate yeast infection. Report any signs of UTI (e.g., burning while urinating, cloudy urine, pelvic pain, back pain).

em-tri-sye-ta-bine

Emtriva

Fixed-Combination(s)

Descovy: emtricitabine/tenofovir alafenamide (TAF) (a nucleotide reverse transcriptase inhibitor): 200 mg/25 mg.

Atripla: emtricitabine/efavirenz (an antiretroviral)/tenofovir disoproxil fumarate (TDF) (an antiretroviral): 200 mg/600 mg/300 mg. **Complera:** emtricitabine/rilpivirine (an antiretroviral)/tenofovir disoproxil fumarate (TDF) (an antiretroviral): 200 mg/25 mg/300 mg. **Genvoya:** emtricitabine/elvitegravir (an integrase inhibitor)/cobicistat (a pharmacokinetic enhancer)/tenofovir alafenamide (TAF) (a nucleotide reverse transcriptase inhibitor): 200 mg/150 mg/150 mg/10 mg. **Truvada:** emtricitabine/tenofovir disoproxil fumarate (TDF) (an antiretroviral): 200 mg/300 mg. **Stribild:** emtricitabine/elvitegravir (an integrase inhibitor)/cobicistat (a pharmacokinetic enhancer)/tenofovir disoproxil fumarate (TDF) (a nucleotide reverse transcriptase inhibitor): 200 mg/150 mg/150 mg/300 mg.

Odefsey: emtricitabine/rilpivirine (non-nucleoside reverse transcriptase inhibitor [NNRTI])/tenofovir alafenamide (TAF) (a nucleotide reverse transcriptase inhibitor): 200 mg/25 mg/25 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Nucleoside reverse transcriptase inhibitor.

CLINICAL: Antiretroviral agent.

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal, hypersensitivity reaction, lactic acidosis, severe hepatomegaly with steatosis (fatty liver) have occurred. May exacerbate hepatitis B virus infection after completing treatment.

Uses

Used in combination with at least two other antiretroviral agents for treatment of HIV-1 infection.

Precautions

Contraindications: Hypersensitivity to emtricitabine. **Cautions:** Renal impairment, history of hepatitis, diabetes.

Action

Inhibits HIV-1 reverse transcriptase by incorporating itself into viral DNA, resulting in chain termination. **Therapeutic Effect:** Impairs HIV replication, slowing progression of HIV infection.

Pharmacokinetics

Rapidly, extensively absorbed from GI tract. Protein binding: less than 4%. Excreted primarily in urine. **Half-life:** 10 hrs.

Lifespan considerations

Pregnancy/Lactation: Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase, ALT, AST, triglycerides. May alter serum glucose.

Availability (Rx)

Capsules: 200 mg. **Oral Solution:** 10 mg/mL.

Administration/handling

PO

- Give without regard to food.

Indications/routes/dosage

HIV

Capsules

PO: ADULTS, ELDERLY, CHILDREN 3 MOS–17 YRS, WEIGHING MORE THAN 33 KG: 200 mg once daily.

Oral Solution

PO: ADULTS, ELDERLY: 240 mg once daily. **CHILDREN 3 MOS–17 YRS WEIGHING MORE THAN 33 KG:** 6 mg/kg once daily. **Maximum:** 240 mg once daily. **CHILDREN 0–3 MOS:** 3 mg/kg/day.

Dosage in Renal Impairment

Creatinine Clearance	Capsule	Oral Solution
30–49 mL/min	200 mg q48h	120 mg q24h
15–29 mL/min	200 mg q72h	80 mg q24h
Less than 15 mL/min; hemodialysis pts	200 mg q96h	60 mg q24h (administer after dialysis)

Administer after dialysis on dialysis days.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (23%–13%): Headache, rhinitis, rash, diarrhea, nausea. **Occasional (14%–4%):** Cough, vomiting, abdominal pain, insomnia, depression, paresthesia, dizziness, peripheral neuropathy, dyspepsia, myalgia. **Rare (3%–2%):** Arthralgia, abnormal dreams.

Adverse effects/toxic reactions

Lactic acidosis, hepatomegaly with steatosis (excess fat in liver) occur rarely; may be severe. May cause immune reconstitution syndrome, reactivation of hepatitis B virus infection.

Nursing considerations

Baseline assessment

Obtain LFT, serum triglycerides before beginning and at periodic intervals during therapy. Offer emotional support.

Intervention/evaluation

Monitor daily pattern of bowel activity, stool consistency. Question for evidence of nausea, pruritus. Assess skin for rash, urticaria. Monitor serum chemistry tests, LFT for marked abnormalities; signs/symptoms of lactic acidosis. Monitor for immune reconstitution syndrome, Hepatitis B virus reactivation.

Patient/family teaching

- May cause redistribution of body fat.
- Continue therapy for full length of treatment.
- Emtricitabine is not a cure for HIV infection, nor does it reduce risk of transmission to others.
- Pts may continue to acquire illnesses associated with advanced HIV infection.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report persistent or severe abdominal pain, nausea, vomiting, numbness.

enalapril

en-**al**-a-pril

Apo-Enalapril 

Epaned

Novo-Enalapril 

Vasotec

Fixed-Combination(s)

Lexxel: enalapril/felodipine (calcium channel blocker): 5 mg/2.5 mg, 5 mg/5 mg. **Teczem:** enalapril/diltiazEM (calcium channel blocker): 5 mg/180 mg. **Vaseretic:** enalapril/hydroCHLOROthiazide (diuretic): 5 mg/12.5 mg, 10 mg/25 mg.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Angiotensin-converting enzyme (ACE) inhibitor.

CLINICAL: Antihypertensive, vasodilator.

■ **BLACK BOX ALERT** ■ May cause fetal injury. Discontinue as soon as possible once pregnancy is detected.

Do not confuse enalapril with Anafranil, Elavil, Eldepryl, lisinopril, or ramipril.

Uses

Treatment of hypertension alone or in combination with other antihypertensives. Adjunctive therapy for symptomatic HF. Treatment of asymptomatic left ventricular dysfunction. **(Epaned):** Treatment of hypertension in adults and children older than 1 mo. **OFF-LABEL:** Proteinuria in steroid-resistant nephrotic syndrome.

Precautions

Contraindications: Hypersensitivity to enalapril. History of angioedema from previous treatment with ACE inhibitors. Idiopathic/hereditary angioedema. Concomitant use of aliskiren in pts with diabetes. **Cautions:** Renal impairment, hypertrophic cardiomyopathy with outflow tract obstruction; severe aortic stenosis; before, during, or immediately after major surgery. Concomitant use of potassium supplement; unstented unilateral or bilateral renal artery stenosis.

Action

Suppresses renin-angiotensin-aldosterone system (prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular, renal sites). Decreases plasma angiotensin II, increases plasma renin activity, decreases aldosterone secretion. **Therapeutic Effect:** In hypertension, reduces peripheral arterial resistance. In HF, increases cardiac output; decreases peripheral vascular resistance, B/P, pulmonary capillary wedge pressure, heart size.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	1 hr	4–6 hrs	24 hrs
IV	15 min	1–4 hrs	6 hrs

Readily absorbed from GI tract. Prodrug undergoes hepatic biotransformation to enalaprilat. Protein binding: 50%–60%. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 11 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. May cause fetal/neonatal mortality, morbidity. **Children:** Safety and efficacy not established. **Elderly:** May be more susceptible to hypotensive effects.

Interactions

DRUG: Alcohol, antihypertensives (e.g., amLODIPine, cloNIDine, valsartan), diuretics (e.g., furosemide, torsemide) may increase effects. NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may decrease antihypertensive effect, increase risk of possible acute renal failure. **Potassium-sparing diuretics** (e.g., spironolactone, triamterene), **potassium supplements** may cause hyperkalemia. May increase **lithium** concentration, toxicity. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may increase antihypertensive effect. **Licorice** may cause sodium/water retention, loss of potassium. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive ANA titer.

Availability (Rx)

Injection Solution: 1.25 mg/mL. **Powder for Oral Solution (Epaned):** 1 mg/mL (after reconstitution). **Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg.

Administration/handling

 IV

Reconstitution

- May give undiluted or dilute with D₅W or 0.9% NaCl.

Rate of Administration

- For IV push, give undiluted over 5 min.
- For IV piggyback, infuse over 10–15 min.

Storage

- Store parenteral form at room temperature.
- Use only clear, colorless solution.
- Diluted IV solution is stable for 24 hrs at room temperature.

PO

- Give without regard to food.
- Tablets may be crushed.

Epaned

- Reconstitute with 150 mL Ora-Sweet SF (provided) to produce a 1 mg/mL concentration. Stable for 60 days after reconstitution.

■ IV incompatibilities

Amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), phenytoin (Dilantin).

■ IV Compatibilities

Calcium gluconate, dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), heparin, lidocaine, magnesium sulfate, morphine, nitroglycerin, potassium chloride, potassium phosphate, propofol (Diprivan).

Indications/routes/dosage

Hypertension

PO: ADULTS, ELDERLY: Initially, 2.5–5 mg/day (2.5 mg if pt taking a diuretic). May increase at 1–2 wk intervals. Range: 10–40 mg/day in 1–2 divided doses. **CHILDREN 1 MO–16 YRS:** Initially, 0.08 mg/kg once daily. Adjust

dose based on pt response. **Maximum:** 5 mg/day. **NEONATES:** 0.04–0.1 mg/kg/day given q24h. **Epaned: ADULTS, ELDERLY:** Initially, 5 mg once daily. **CHILDREN:** Initially, 0.08 mg/kg once daily. Adjust dose on pt response. **Maximum:** 5 mg.

IV: ADULTS, ELDERLY: 0.625–1.25 mg q6h up to 5 mg q6h.

Adjunctive Therapy for HF

PO: ADULTS, ELDERLY: Initially, 2.5 mg twice daily. Titrate slowly at 1–2 wk intervals. Range: 5–40 mg/day in 2 divided doses. Target: 10–20 mg twice daily.

Asymptomatic Left Ventricular Dysfunction

PO: ADULTS, ELDERLY: 2.5 mg twice daily. Titrate up to 20 mg/day.

Dosage in Renal Impairment

CrCl greater than 30 mL/min: No dosage adjustment. **CrCl 30 mL/min or less: (HTN):** Initially, 2.5 mg/day. Titrate until B/P controlled. **(HF):** Initially, 2.5 mg twice daily. May increase by 2.5 mg/dose at greater than 4-day intervals. **Maximum:** 40 mg/day.

Hemodialysis: Initially, 2.5 mg on dialysis days; adjust dose on non-dialysis days depending on B/P.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (7%–5%): Headache, dizziness. **Occasional (3%–2%):** Orthostatic hypotension, fatigue, diarrhea, cough, syncope. **Rare (less than 2%):** Angina, abdominal pain, vomiting, nausea, rash, asthenia.

Adverse effects/toxic reactions

Excessive hypotension ("first-dose syncope") may occur in pts with HF, severe salt or volume depletion. Angioedema (facial, lip swelling), hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with renal impairment,

collagen vascular diseases (scleroderma, systemic lupus erythematosus). Nephrotic syndrome may be noted in those with history of renal disease.

Nursing considerations

Baseline assessment

Obtain BUN, serum creatinine, CrCL. Receive full medication history, esp. potassium-sparing diuretics. Obtain B/P immediately before each dose (be alert to fluctuations). In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes/immune response, CBC should be performed before beginning therapy, q2wks for 3 mos, then periodically thereafter.

Intervention/evaluation

Assist with ambulation if dizziness occurs. Monitor CBC, serum BUN, potassium, creatinine, B/P. Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching

- To reduce hypotensive effect, go from lying to standing slowly.
- Several wks may be needed for full therapeutic effect of B/P reduction.
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- Limit alcohol intake.
- Report vomiting, diarrhea, diaphoresis, persistent cough, difficulty in breathing; swelling of face, lips, tongue.

enoxaparin

en-ox-a-par-in

Lovenox

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Low molecular weight heparin.

CLINICAL: Anticoagulant.

■ **BLACK BOX ALERT** ■ Epidural or spinal anesthesia greatly increases potential for spinal or epidural hematoma, subsequent long-term or permanent paralysis.

Do not confuse Lovenox with Lasix, Levaquin, Lotronex, or Protonix, or enoxaparin with dalteparin or heparin.

Uses

DVT prophylaxis following hip or knee replacement surgery, abdominal surgery, or pts with severely restricted mobility during acute illness. Treatment of acute coronary syndrome (ACS): unstable angina, non-Q-wave MI, acute ST-segment elevation MI (STEMI). Treatment of DVT with or without pulmonary embolism (PE) (inpatient); without PE (outpatient). **OFF-LABEL:** DVT prophylaxis following moderate-risk general surgery, gynecologic surgery; management of venous thromboembolism (VTE) during pregnancy. Bariatric surgery, mechanical heart valve to bridge anticoagulation, percutaneous coronary intervention (PCI) adjunctive therapy.

Precautions

Contraindications: Hypersensitivity to enoxaparin. Active major bleeding, concurrent heparin therapy, hypersensitivity to heparin, pork products, thrombocytopenia associated with positive in vitro test for antiplatelet antibodies. Not for IM use. **Cautions:** Conditions with increased risk of hemorrhage, platelet defects, renal impairment (renal failure), elderly, uncontrolled arterial hypertension, history of recent GI ulceration or hemorrhage. When neuraxial anesthesia (epidural or spinal anesthesia) or spinal puncture is used, pts anticoagulated or scheduled to be anticoagulated with enoxaparin for prevention of thromboembolic complications are at risk for developing an epidural or spinal hematoma that can result in long-term or permanent paralysis. Bacterial endocarditis, hemorrhagic stroke, history of heparin-induced thrombocytopenia (HIT), severe hepatic disease.

Action

Potentiates action of antithrombin III, inactivates coagulation factor Xa. **Therapeutic Effect:** Produces anticoagulation. Does not significantly influence PT, aPTT.

Pharmacokinetics

Route	Onset	Peak	Duration
Subcutaneous	N/A	3–5 hrs	12 hrs

Well absorbed after subcutaneous administration. Excreted primarily in urine. Not removed by hemodialysis. **Half-life:** 4.5–7 hrs.

Lifespan considerations

Pregnancy/Lactation: Use with caution, particularly during third trimester, immediate postpartum period (increased risk of maternal hemorrhage). Unknown if distributed in breast milk. Pregnant women with mechanical heart valves (and their fetuses) may have increased risk of bleeding. **Children:** Safety and efficacy not established. **Elderly:** May be more susceptible to bleeding.

Interactions

DRUG: Antiplatelet agents (e.g., clopidogrel), aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), thrombolytics (e.g., tPA) may increase risk of bleeding. **HERBAL:** Cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng may increase antiplatelet action. **FOOD:** None known. **LAB VALUES:** Increases serum alkaline phosphatase, ALT, AST. May decrease Hgb, Hct, platelets, RBCs.

Availability (Rx)

Injection Solution: 30 mg/0.3 mL, 40 mg/0.4 mL, 60 mg/0.6 mL, 80 mg/0.8 mL, 100 mg/mL, 120 mg/0.8 mL, 150 mg/mL in prefilled syringes.

Administration/handling

 Do not mix with other injections, infusions. Do not give IM.

Subcutaneous

Preparation

- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to pale yellow in color. Do not use if solution is cloudy, discolored, or if visible particles are observed.

Administration

- Flick syringe so that the air bubble rises toward the plunger.
- Insert needle subcutaneously into abdomen or outer thigh and inject solution (including air bubble).
- Do not inject into areas of active skin disease or injury such as sunburns, skin rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.

Storage

- Store at room temperature.

Indications/routes/dosage

Prevention of Deep Vein Thrombosis (DVT) After Hip and Knee Surgery

SQ: ADULTS, ELDERLY: 30 mg twice daily, generally for 7–10 days, with initial dose given within 12–24 hrs following surgery. **Hip surgery:** An initial dose of 40 mg, given 9–15 hrs before surgery, may be considered for some pts. Following hip surgery, recommend continuing 40 mg once daily for 3 wks (if 40 mg dose was initially given).

Prevention of DVT After Abdominal Surgery

SQ: ADULTS, ELDERLY: 40 mg/day for 7–10 days, with initial dose given 2 hrs prior to surgery.

Prevention of DVT After Bariatric Surgery

BMI 50 or less (kg/m²): 40 mg q12h. **BMI greater than 50 kg/m²:** 60 mg q12h.

Prevention of Long-Term DVT in Nonsurgical Acute Illness

SQ: ADULTS, ELDERLY: 40 mg once daily; continue until risk of DVT has diminished (usually 6–11 days).

Prevention of Ischemic Complications of Unstable Angina, Non-Q-Wave MI (with Oral Aspirin Therapy)

SQ: ADULTS, ELDERLY: 1 mg/kg q12h (with oral aspirin).

STEMI

SQ: ADULTS YOUNGER THAN 75 YRS: 30 mg IV once plus 1 mg/kg q12h (**maximum:** 100 mg first 2 doses only). **ADULTS 75 YRS OR OLDER:** 0.75 mg/kg (**maximum:** 75 mg first 2 doses only) q12h.

Acute DVT

SQ: ADULTS, ELDERLY: (Inpatient): 1 mg/kg q12h or 1.5 mg/kg once daily. **(Outpatient):** 1 mg/kg q12h.

Usual Pediatric Dosage

SQ: CHILDREN 2 MOS AND OLDER: 0.5 mg/kg q12h (prophylaxis); 1 mg/kg q12h (treatment). **NEONATES, INFANTS YOUNGER THAN 2 MOS:** 0.75/mg/kg/dose q12h (prophylaxis); 1.5 mg/kg/dose q12h (treatment).

Dosage in Renal Impairment

Elimination is decreased when CrCl is less than 30 mL/min. Monitor and adjust dosage as necessary.

Use	Dosage
Abdominal surgery, pts with acute illness	30 mg once/day
Hip, knee surgery	30 mg once/day
DVT, angina, MI	1 mg/kg once/day
STEMI: (<75 yrs)	30 mg IV once plus 1 mg/kg q24h
STEMI (75 yrs or greater)	1 mg/kg q24h
NSTEMI	1 mg/kg q24h

Dosage in Hepatic Impairment

Use caution.

Side effects

Occasional (4%–1%): Injection site hematoma, nausea, peripheral edema.

Adverse effects/toxic reactions

May lead to bleeding complications ranging from local ecchymoses to major hemorrhage. May cause heparin-induced thrombocytopenia (HIT). **Antidote:** IV injection of protamine sulfate (1% solution) equal to dose of enoxaparin injected. 1 mg protamine sulfate neutralizes 1 mg enoxaparin. One additional dose of 0.5 mg protamine sulfate per 1 mg enoxaparin may be given if aPTT tested 2–4 hrs after first injection remains prolonged.

Nursing considerations

Baseline assessment

Obtain baseline CBC. Note platelet count. Question medical history as listed in Precautions. Ensure that pt has not received spinal anesthesia, spinal procedures. Assess for active bleeding. Assess pt's willingness to self-inject medication. Assess potential risk of bleeding.

Intervention/evaluation

Periodically monitor CBC, platelet count, stool for occult blood (no need for daily monitoring in pts with normal presurgical coagulation parameters). A decrease in the platelet count of more than 50% from baseline may indicate heparin-induced thrombocytopenia. Ensure active hemostasis of puncture site following PCI. Assess for any sign of bleeding (bleeding at surgical site, hematuria, blood in stool, bleeding from gums, petechiae, bruising, bleeding from injection sites).

Patient/family teaching

- Usual length of therapy is 7–10 days.
- A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Do not discontinue current blood thinning regimen or take any newly prescribed medications unless approved by the prescriber who originally started treatment.
- Suddenly stopping therapy may increase the risk of blood clots or stroke.

- Report bleeding of any kind (bloody urine, stool; nosebleeds; increased menstrual bleeding). If bleeding occurs, it may take longer to stop bleeding.
- Immediately report signs of stroke (confusion, headache, numbness, one-sided weakness, trouble speaking, loss of vision).
- Minor blunt force trauma to the head, chest, or abdomen can be life-threatening.
- Do not take aspirin, herbal supplements, OTC nonsteroidal anti-inflammatories (may increase risk of bleeding).
- Consult physician before any surgery/dental work.
- Use electric razor, soft toothbrush to prevent bleeding.

entecavir

en-**tek**-a-veer

Baraclude

Apo-Entecavir

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Reverse transcriptase inhibitor, nucleoside.

CLINICAL: Antihepadnaviral agent.

■ **BLACK BOX ALERT** ■ Serious, sometimes fatal hypersensitivity reaction, lactic acidosis, severe hepatomegaly with steatosis (fatty liver) have occurred. May cause HIV resistance in chronic hepatitis B pts. Severe acute exacerbations of hepatitis B virus infection may occur upon discontinuation of entecavir.

Uses

Treatment of chronic hepatitis B virus (HBV) infection with evidence of active viral replication and evidence of either persistent transaminase elevations or histologically active disease or evidence of decompensated hepatic disease.

OFF-LABEL: HBV reinfection prophylaxis, post–liver transplant, HIV/HBV coinfection.

Precautions

Contraindications: Hypersensitivity to entecavir. **Cautions:** Renal impairment, pts receiving concurrent therapy that may reduce renal function. Pts at risk for hepatic disease. Cross resistance may develop with lamivudine.

Action

Inhibits hepatitis B viral polymerase, an enzyme blocking reverse transcriptase activity. **Therapeutic Effect:** Interferes with viral DNA synthesis.

Pharmacokinetics

Poorly absorbed from GI tract. Protein binding: 13%. Extensively distributed into tissues. Partially metabolized in liver. Excreted primarily in urine. **Half-life:** 5–6 days (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 16 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Ganciclovir, ribavirin, valGANCiclovir may increase concentration. **HERBAL:** None significant. **FOOD:** Food delays absorption, decreases concentration. **LAB VALUES:** May increase serum amylase, lipase, bilirubin, ALT, AST, creatinine, glucose. May decrease serum albumin; platelets.

Availability (Rx)

Oral Solution: 0.05 mg/mL. **Tablets:** 0.5 mg, 1 mg.

Administration/handling

PO

- Administer tablets on an empty stomach (at least 2 hrs after a meal and 2 hrs before the next meal).
- Do not dilute, mix oral solution with water or any other liquid.

- Each bottle of oral solution is accompanied by a dosing spoon. Before administering, hold spoon in vertical position, fill it gradually to mark corresponding to prescribed dose.

Storage

- Store tablets, oral solution at room temperature.

Indications/routes/dosage

Chronic Hepatitis B Virus Infection (No Previous Nucleoside Treatment)

PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER: 0.5 mg once daily. **CHILDREN 2 YRS AND OLDER: (Weighing more than 30 kg):** 0.5 mg once daily (tablet or solution). **(27–30 kg):** 0.45 mg once daily (solution). **(24–26 kg):** 0.4 mg once daily (solution). **(21–23 kg):** 0.35 mg once daily (solution). **(18–20 kg):** 0.3 mg once daily (solution). **(15–17 kg):** 0.25 mg once daily (solution). **(12–14 kg):** 0.2 mg once daily (solution). **(10–11 kg):** 0.15 mg once daily (solution).

Chronic Hepatitis B Virus Infection (Receiving LamiVUDine, Known LamiVUDine Resistance, Decompensated Liver Disease)

PO: ADULTS, ELDERLY, CHILDREN 16 YRS AND OLDER: 1 mg once daily. **CHILDREN 2 YRS AND OLDER: (Weighing more than 30 kg):** 1 mg once daily (tablet or solution). **(27–30 kg):** 0.9 mg once daily (solution). **(24–26 kg):** 0.8 mg once daily (solution). **(21–23 kg):** 0.7 mg once daily (solution). **(18–20 kg):** 0.6 mg once daily (solution). **(15–17 kg):** 0.5 mg once daily (solution). **(12–14 kg):** 0.4 mg once daily (solution). **(10–11 kg):** 0.3 mg once daily (solution).

Dosage in Renal Impairment

Creatinine Clearance	Dosage
50 mL/min and greater	0.5 mg once daily
30–49 mL/min	0.25 mg once daily
10–29 mL/min	0.15 mg once daily
9 mL/min and less	0.05 mg once daily

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (4%–3%): Headache, fatigue. **Rare (less than 1%):** Diarrhea, dyspepsia, nausea, vomiting, dizziness, insomnia.

Adverse effects/toxic reactions

Lactic acidosis, severe hepatomegaly with steatosis have been reported. Severe, acute exacerbations of hepatitis B virus infection have been reported in pts who have discontinued therapy; reinitiation of antihepatitis B therapy may be required. Hematuria occurs occasionally. May cause development of HIV resistance if HIV untreated.

Nursing considerations

Baseline assessment

Obtain LFT before beginning therapy and at periodic intervals during therapy. Offer emotional support. Obtain full medication history.

Intervention/evaluation

Hepatic function should be monitored closely with both clinical and laboratory follow-up for at least several mos in pts who discontinue antihepatitis B therapy. For pts on therapy, closely monitor serum amylase, lipase, bilirubin, ALT, AST, creatinine, glucose, albumin; platelet count. Assess for evidence of GI discomfort.

Patient/family teaching

- Take medication at least 2 hrs after a meal and 2 hrs before the next meal.
- Avoid transmission of hepatitis B infection to others through sexual contact, blood contamination.
- Immediately report unusual muscle pain, abdominal pain with nausea/vomiting, cold feeling in extremities, dizziness (signs and symptoms

signaling onset of lactic acidosis).

enzalutamide

en-za-loo-ta-mide

XTANDI

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antiandrogen renal inhibitor.

CLINICAL: Antineoplastic.

Do not confuse enzalutamide with bicalutamide, flutamide, or nilutamide.

Uses

Treatment of metastatic castration-resistant prostate cancer.

Precautions

Contraindications: Hypersensitivity to enzalutamide. Women who are pregnant or may become pregnant (not indicated in female population). **Cautions:** History of seizure disorder, underlying brain injury with loss of consciousness, transient ischemic attack within past 12 mos, CVA, brain metastases, brain arteriovenous abnormality, use of concurrent medications that may lower seizure threshold.

Action

Inhibits androgen binding to androgen receptors in target tissue, and inhibits interaction with DNA. **Therapeutic Effect:** Decreases proliferation, induces cell death of prostate cancer cells.

Pharmacokinetics

Readily absorbed in GI tract. Maximum plasma concentration achieved in 0.5–3 hrs. Metabolized in liver. Protein binding: (97%–98%). Primarily excreted in urine. **Half-life:** 5.8 days (Range: 2.8–10.2 days).

Lifespan considerations

Pregnancy/Lactation: Not used in female population. **Children:** Safety and

efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Strong CYP2C8, CYP3A4 inhibitors (e.g., gemfibrozil, itraconazole) may increase concentration. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin. May decrease Hgb, Hct, platelets, WBC count.

Availability (Rx)

 **Capsules:** 40 mg.

Administration/handling

PO

- May give with or without food. Take at same time each day. Swallow whole.
- Do not break, crush, dissolve, or open capsules.

Indications/routes/dosage

Metastatic Castration-Resistant Prostate Cancer

PO: ADULTS, ELDERLY: 160 mg (4 × 40 mg capsules) given once daily.

Dose Modification

If CTCAE Grade 3 or greater toxicity or an intolerable side effect occurs, withhold dosing for 1 week or until symptoms improve to Grade 2 or less, then resume at same dose or a reduced dose (120 mg or 80 mg). **Concurrent use of strong CYP2C8 inhibitors:** Avoid use (if possible). If concurrent use is necessary, reduce the enzalutamide dose to 80 mg once daily. **Concurrent use of strong CYP3A4 inducers:** Increase dose to 240 mg once daily.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Common (51%): Asthenia. **Frequent (26%–15%):** Back pain, diarrhea, arthralgia, hot flashes, peripheral edema, musculoskeletal pain. **Occasional (12%–6%):** Headache, dizziness, insomnia, hematuria, paresthesia, anxiety, hypertension. **Rare (4%–2%):** Mental impairment disorders (includes amnesia, memory impairment, cognitive disorder, attention deficit), hematuria (includes pollakiuria, pruritus, dry skin).

Adverse effects/toxic reactions

Upper respiratory tract infection occurs in 11% of pts; lower respiratory tract and lung infection (includes pneumonia, bronchitis) occur in slightly less (9% of pts). Spinal cord compression and cauda equina syndrome occur in 7% of pts.

Nursing considerations

Baseline assessment

Offer emotional support. Obtain LFT at baseline and periodically throughout therapy. Assess bowel activity, stool consistency. If coadministered with warfarin (CYP2C9 substrate), perform additional INR monitoring.

Intervention/evaluation

Assess for peripheral edema. Question level of fatigue, weakness. Question presence of back pain, arthralgia, or headache. Assess level of anxiety. Monitor B/P for hypertension. Assess for hematuria. Question pt regarding sleeping pattern.

Patient/family teaching

- Sexually active men must wear condom during treatment and for 1 wk after treatment due to potential risks to fetus.
- Women who are pregnant or are planning pregnancy may not touch medication without gloves.
- Dizziness, headache, muscle weakness, leg swelling/discomfort should be

reported.

- Immediately report fever or cough.
- Routine lab testing will occur during treatment.

EPINEPHrine

HIGH
ALERT

ep-i-**nef**-rin

Adrenalin

EpiPen

EpiPen Jr.

Twinject

Fixed-Combination(s)

LidoSite: EPINEPHrine/lidocaine (anesthetic): 0.1%/10%.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Sympathomimetic (alpha-, beta-adrenergic agonist).

CLINICAL: Antiglaucoma, bronchodilator, cardiac stimulant, antiallergic, antihemorrhagic, priapism reversal agent.

DO NOT CONFUSE EPINEPHrine with ePHEDrine.

Uses

Treatment of allergic reactions (including anaphylactic reactions). Treatment of hypotension associated with septic shock. Added to local anesthetics to decrease systemic absorption and increase duration of activity of local anesthetic. Decreases superficial hemorrhage. **OFF-LABEL:** Ventricular fibrillation or pulseless ventricular tachycardia unresponsive to initial defibrillatory shocks; pulseless electrical activity, asystole, hypotension unresponsive to volume resuscitation; bradycardia/hypotension unresponsive to atropine or pacing; inotropic support.

Precautions

Contraindications: Hypersensitivity to EPINEPHrine. **Note:** There are no absolute contraindications with injectable EPINEPHrine in a life-threatening

situation. **IV:** Narrow-angle glaucoma, thyrotoxicosis, diabetes, hypertension, other cardiovascular disorders. **Inhalation:** Concurrent use or within 2 wks of MAOIs. **Cautions:** Elderly, diabetes mellitus, hypertension, Parkinson's disease, thyroid disease, cerebrovascular or cardiovascular disease, concurrent use of tricyclic antidepressants. History of prostate enlargement, urinary retention.

Action

Stimulates alpha-adrenergic receptors (vasoconstriction, pressor effects), beta₁-adrenergic receptors (cardiac stimulation), beta₂-adrenergic receptors (bronchial dilation, vasodilation). **Therapeutic Effect:** Relaxes smooth muscle of bronchial tree, produces cardiac stimulation, dilates skeletal muscle vasculature.

Pharmacokinetics

Route	Onset	Peak	Duration
IM	5–10 min	20 min	1–4 hrs
Subcutaneous	5–10 min	20 min	1–4 hrs
Inhalation	3–5 min	20 min	1–3 hrs

Well absorbed after parenteral administration; minimally absorbed after inhalation. Metabolized in liver, other tissues, sympathetic nerve endings. Excreted in urine. Ophthalmic form may be systemically absorbed as a result of drainage into nasal pharyngeal passages. Mydriasis occurs within several min and persists several hrs; vasoconstriction occurs within 5 min and lasts less than 1 hr.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk.
Children/Elderly: No age-related precautions noted.

Interactions

DRUG: May decrease effects of **beta blockers (e.g., carvedilol, metoprolol)**. **Digoxin, sympathomimetics (e.g., dopamine, norepinephrine)** may increase risk of arrhythmias. **Ergonovine, methergine, oxytocin** may increase vasoconstriction. **MAOIs (e.g., phenelzine, selegiline), tricyclic**

antidepressants (e.g., **amitriptyline**, **doxepin**, **nortriptyline**) may increase cardiovascular effects. **HERBAL**: **Ephedra**, **yohimbe** may increase CNS stimulation. **FOOD**: None known. **LAB VALUES**: May decrease serum potassium.

Availability (Rx)

Injection, Solution (Prefilled Syringes):

(EpiPen): 0.3 mg/0.3 mL, **(EpiPen Jr.)**: 0.15 mg/0.3 mL, **(Twinject)**: 0.15 mg/0.15 mL. **Injection, Solution**: 0.1 mg/mL (1:10,000), 1 mg/mL (1:1,000).

Solution for Oral Inhalation

(Adrenalin): 2.25% (0.5 mL).

Administration/handling

IV

Reconstitution

- For injection, dilute each 1 mg of 1:1,000 solution with 10 mL 0.9% NaCl to provide 1:10,000 solution and inject each 1 mg or fraction thereof over 1 min or more (except in cardiac arrest).
- For infusion, further dilute with 250–500 mL D₅W. Maximum concentration 64 mcg/mL.

Rate of Administration

- For IV infusion, give at 1–10 mcg/min (titrate to desired response).

Storage

- Store parenteral forms at room temperature.
- Do not use if solution appears discolored or contains a precipitate.

Subcutaneous

- Shake ampule thoroughly.
- Use tuberculin syringe for injection into lateral deltoid region.
- Massage injection site (minimizes vasoconstriction effect). Use only 1:1,000 solution.

Nebulizer

- No more than 10 drops Adrenalin Chloride solution 1:100 should be placed in reservoir of nebulizer.
- Place nozzle just inside pt's partially opened mouth.
- As bulb is squeezed once or twice, instruct pt to inhale deeply, drawing vaporized solution into lungs.
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness).
- When nebulizer is not in use, replace stopper, keep in upright position.

■ IV incompatibilities

Ampicillin, pantoprazole (Protonix), sodium bicarbonate.

■ IV Compatibilities

Calcium chloride, calcium gluconate, dexmedetomidine (Precedex), diltiazem (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), fentanyl (Sublimaze), heparin, HYDROMorphone (Dilaudid), LORazepam (Ativan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Anaphylaxis

IM, SQ: ADULTS, ELDERLY: 0.2–0.5 mg (0.2–0.5 mL of 1:1,000 solution). May repeat q5–15 min if anaphylaxis persists. **CHILDREN:** 0.01 mg/kg (0.01 mL/kg of a 1:1,000 solution) q5–15 min. **Maximum single dose:** 0.3 mg.

Hypotension (Shock)

IV INFUSION: ADULTS, ELDERLY: 0.05–2 mcg/kg/min. Titrate to desired mean arterial pressure (MAP). May adjust dose by 0.05–0.2 mcg/kg/min.

Cardiac Arrest

IV: ADULTS, ELDERLY: Initially, 1 mg. May repeat q3–5min as needed.

CHILDREN: Initially, 0.01 mg/kg (0.1 mL/kg of a 1:10,000 solution). May repeat q3–5min as needed.

Endotracheal: ADULTS, ELDERLY: 2–2.5 mg q3–5 min as needed.

CHILDREN: 0.1 mg/kg (0.1 mL/kg of a 1:1,000 solution). May repeat q3–5min as needed.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Systemic: Tachycardia, palpitations, anxiety. **Ophthalmic:** Headache, eye irritation, watering of eyes. **Occasional: Systemic:** Dizziness, light-headedness, facial flushing, headache, diaphoresis, increased B/P, nausea, trembling, insomnia, vomiting, fatigue. **Ophthalmic:** Blurred/decreased vision, eye pain. **Rare: Systemic:** Chest discomfort/pain, arrhythmias, bronchospasm, dry mouth/throat.

Adverse effects/toxic reactions

Excessive doses may cause acute hypertension, arrhythmias. Prolonged/excessive use may result in metabolic acidosis due to increased serum lactic acid. Metabolic acidosis may cause disorientation, fatigue, hyperventilation, headache, nausea, vomiting, diarrhea.

Nursing considerations

Intervention/evaluation

Monitor changes of B/P, HR. Assess lung sounds for rhonchi, wheezing, rales. Monitor ABGs. In cardiac arrest, adhere to ACLS protocols.

Patient/family teaching

- Avoid excessive use of caffeine.
- Report any new symptoms (tachycardia, shortness of breath, dizziness) immediately: may be systemic effects.

eplerenone

ep-ler-e-none

Inspra

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Aldosterone receptor antagonist.

CLINICAL: Antihypertensive.

Do not confuse Inspra with Spiriva.

Uses

Treatment of hypertension alone or in combination with other antihypertensive agents. Treatment of HF following acute myocardial infarction (AMI).

Precautions

Contraindications: Hypersensitivity to eplerenone. Concurrent use with strong CYP3A4 inhibitors (e.g., ketoconazole, itraconazole), CrCl less than 30 mL/min, serum potassium level greater than 5.5 mEq/L at initiation. **Hypertension (Additional):** Type 2 diabetes with microalbuminuria; CrCl less than 50 mL/min; serum creatinine greater than 2 mg/dL in men, greater than 1.8 mg/dL in women; concomitant use of potassium supplements or potassium-sparing diuretics. **Cautions:** Hyperkalemia, HF, post-MI, diabetes, mild renal impairment.

Action

Binds to mineralocorticoid receptors in kidney, heart, blood vessels, brain, blocking binding of aldosterone. **Therapeutic Effect:** Reduces B/P.

Pharmacokinetics

Absorption unaffected by food. Protein binding: 50%. Metabolized in liver. Excreted in urine (67%), feces (32%). Not removed by hemodialysis. **Half-life:** 4–6 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: ACE inhibitors (e.g., enalapril, lisinopril), angiotensin II antagonists (e.g., losartan, valsartan), potassium-sparing diuretics (e.g., spironolactone), potassium supplements increase risk of hyperkalemia. CYP3A4 inhibitors (e.g., itraconazole, ketoconazole) increase concentration five-fold (use is contraindicated). NSAIDs may decrease antihypertensive effect. **HERBAL:** St. John's wort decreases effectiveness. **FOOD:** Grapefruit products may increase potential for hyperkalemia, arrhythmias. **LAB VALUES:** May increase serum potassium, ALT, AST, cholesterol, triglycerides, serum creatinine, uric acid. May decrease serum sodium.

Availability (Rx)

 **Tablets:** 25 mg, 50 mg.

Administration/handling

- Do not break, crush, dissolve, or divide film-coated tablets.
- May give without regard to food.

Indications/routes/dosage

Hypertension

PO: ADULTS, ELDERLY: Initially, 50 mg once daily. If 50 mg once daily produces an inadequate B/P response, may increase dosage to 50 mg twice daily. If pt is concurrently receiving CYP3A4 inhibitors (e.g., erythromycin, saquinavir, verapamil, or fluconazole), reduce initial dose to 25 mg once daily.

HF Following MI

PO: ADULTS, ELDERLY: Initially, 25 mg once daily. If tolerated, titrate up to 50 mg once daily within 4 wks.

Dosage Adjustment for Serum Potassium Concentrations in HF

Less than 5 mEq/L: Increase dose from 25 mg daily to 50 mg daily or increase dose from 25 mg every other day to 25 mg daily.

5–5.4 mEq/L: No adjustment needed.

5.5–5.9 mEq/L: Decrease dose from 50 mg daily to 25 mg daily or from 25 mg daily to 25 mg every other day. Decrease dose from 25 mg every other day to withhold medication.

6 mEq/L or Greater: Withhold medication until potassium is less than 5.5 mEq/L, then restart at 25 mg every other day.

Dosage in Renal Impairment

Contraindicated in pts with hypertension with CrCl less than 50 mL/min or serum creatinine greater than 2 mg/dL in males or greater than 1.8 mg/dL in females. All other indications, CrCl less than 30 mL/min, use is contraindicated.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Rare (3%–1%): Dizziness, diarrhea, cough, fatigue, flu-like symptoms, abdominal pain.

Adverse effects/toxic reactions

Hyperkalemia may occur, particularly in pts with type 2 diabetes mellitus and microalbuminuria.

Nursing considerations

Baseline assessment

Obtain serum potassium level. Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). If excessive reduction in B/P occurs, place pt in supine position, feet slightly elevated.

Intervention/evaluation

Assist with ambulation if dizziness occurs. Monitor serum potassium levels. Assess B/P for hypertension/hypotension. Monitor daily pattern of bowel activity, stool consistency. Assess for evidence of flu-like symptoms.

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established (possible dizziness effect).
- Hypertension requires lifelong control.
- Avoid exercising during hot weather (risk of dehydration, hypotension).
- Do not use salt substitutes containing potassium.

epoetin alfa

e-poe-e-tin al-fa

Epogen

Eprex 

Procrit

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Erythropoiesis-stimulating agent (ESA).

CLINICAL: Erythropoietin.

■ **BLACK BOX ALERT** ■ Increased risk of serious cardiovascular events, thromboembolic events, mortality, time-to-tumor progression in pts with head and neck cancer, metastatic breast cancer, non-small-cell lung cancer when administered to a target hemoglobin of more than 11 g/dL. Increases rate of deep vein thrombosis in perioperative pts not receiving anticoagulant therapy.

Do not confuse epoetin with darbepoetin, or Epogen with Neupogen.

Uses

Treatment of anemia in pts receiving or who have received myelosuppressive chemotherapy for a planned minimum of 2 mos of chemotherapy; pts with chronic renal failure to decrease need for RBC transfusion; HIV-infected pts on

zidovudine (AZT) therapy when endogenous erythropoietin levels are 500 mUnits/mL or less; pts scheduled for elective noncardiac, nonvascular surgery, reducing need for allogenic blood transfusions when perioperative Hgb is greater than 10 or less than or equal to 13 g/dL and high risk for blood loss. **OFF-LABEL:** Anemia in myelodysplastic syndromes.

Precautions

Contraindications: Hypersensitivity to epoetin. Pure red cell aplasia, uncontrolled hypertension. **Cautions:** History of seizures or controlled hypertension. **Cancer pts:** Tumor growth, shortened survival may occur when Hgb levels of 11 g/dL or greater are achieved with epoetin alfa. **Chronic renal failure pts:** Increased risk for serious cardiovascular reactions (e.g., stroke, MI) when Hgb levels greater than 11 g/dL are achieved with epoetin alfa.

Action

Stimulates division, differentiation of erythroid progenitor cells in bone marrow. **Therapeutic Effect:** Induces erythropoiesis, releases reticulocytes from bone marrow.

Pharmacokinetics

Well absorbed after subcutaneous administration. Following administration, an increase in reticulocyte count occurs within 10 days, and increases in Hgb, Hct, and RBC count are seen within 2–6 wks. **Half-life:** 4–13 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts 12 yrs and younger. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, phosphorus, potassium, creatinine, uric acid, sodium. May decrease bleeding time, iron concentration, serum

ferritin.

Availability (Rx)

Injection Solution (Epogen, Procrit): 2,000 units/mL, 3,000 units/mL, 4,000 units/mL, 10,000 units/mL, 20,000 units/mL, 40,000 units/mL.

Administration/handling

 **ALERT** Avoid excessive agitation of vial; do not shake (foaming).

IV

Reconstitution

- No reconstitution necessary.

Rate of Administration

- May be given as an IV bolus.

Storage

- Refrigerate.
- Vigorous shaking may denature medication, rendering it inactive.

Subcutaneous

- Mix in syringe with bacteriostatic 0.9% NaCl with benzyl alcohol 0.9% (bacteriostatic saline) at a 1:1 ratio (benzyl alcohol acts as local anesthetic; may reduce injection site discomfort).
- Use 1 dose per vial; do not reenter vial. Discard unused portion.

IV incompatibilities

Do not mix injection form with other medications.

Indications/routes/dosage

Anemia Associated with Chemotherapy

 **ALERT** Begin therapy only if Hgb less than 10 g/dL and anticipated duration of myelosuppressive chemotherapy is greater than 2 mos. Use minimum effective dose to maintain Hgb level that will avoid red blood cell transfusions. Discontinue upon completion of chemotherapy.

SQ: ADULTS, ELDERLY: Initially, 150 units/kg 3 times/wk (commonly used dose of 10,000 units 3 times/wk) or 40,000 units once wkly. **IV: CHILDREN 5 YRS AND OLDER:** 600 units/kg once wkly. **Maximum:** 40,000 units.

Increase dose:ADULTS, ELDERLY: If Hgb does not increase by greater than 1 g/dL and remains below 10 g/dL after initial 4 wks, may increase to 300 units/kg 3 times/wk or 60,000 units once wkly. **CHILDREN:** If Hgb does not increase by greater than 1 g/dL and remains less than 10 g/dL after initial 4 wks of once-wkly dosing, may increase dose to 900 units/kg/wk. **Maximum:** 60,000 units once wkly.

Decrease dose: Decrease dose by 25% if Hgb increases greater than 1 g/dL in any 2-wk period or Hgb level reaches level that will avoid red blood cell transfusions.

Reduction of Allogenic Blood Transfusions in Elective Surgery

SQ: ADULTS, ELDERLY: 300 units/kg/day for 10 days before and 4 days after surgery or 600 units/kg once weekly for 4 doses given 21, 14, 7 days before surgery and on the day of surgery.

Anemia in Chronic Renal Failure

◀ALERT▶ Individualize dose, using lowest dose to reduce need for RBC transfusions. **ON DIALYSIS:** Initiate when Hgb less than 10 g/dL; reduce dose or discontinue if Hgb approaches or exceeds 11 g/dL. **NOT ON DIALYSIS:** Initiate when Hgb less than 10 g/dL; reduce dose or stop if Hgb exceeds 10 g/dL. **IV, SQ: ADULTS, ELDERLY:** 50–100 units/kg 3 times/wk. **CHILDREN:** 50 units/kg 3 times/wk.

Maintenance: Decrease dose by 25%: If Hgb increases greater than 1 g/dL in any 2-wk period. **Increase dose by 25%:** If Hgb does not increase by greater than 1 g/dL after 4 wks of therapy. Do not increase dose more frequently than every 4 wks.

Note: If pt does not attain adequate response after appropriate dosing over 12 wks, do not continue to increase dose, and use minimum effective dose to maintain Hgb level that will avoid red blood cell transfusions.

HIV Infection in Pts Treated with Zidovudine (AZT)

IV, SQ: ADULTS: Initially, 100 units/kg 3 times/wk for 8 wks; may increase by 50–100 units/kg 3 times/wk. Evaluate response q4–8wks thereafter. Adjust

dosage by 50–100 units/kg 3 times/wk. If dosages larger than 300 units/kg 3 times/wk are not eliciting response, it is unlikely pt will respond. **Maintenance:** Titrate to maintain desired Hgb level. Hgb levels should not exceed 12 g/dL. If Hgb greater than 12 g/dL, resume treatment with 25% dose reduction when Hgb drops below 11 g/dL. Discontinue if Hgb increase not attained with 300 units/kg for 8 wks.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Pts Receiving Chemotherapy

Frequent (20%–17%): Fever, diarrhea, nausea, vomiting, edema. **Occasional (13%–11%):** Asthenia, shortness of breath, paresthesia. **Rare (5%–3%):** Dizziness, trunk pain.

Pts with Chronic Renal Failure

Frequent (24%–11%): Hypertension, headache, nausea, arthralgia. **Occasional (9%–7%):** Fatigue, edema, diarrhea, vomiting, chest pain, skin reactions at administration site, asthenia, dizziness.

Pts with HIV Infection Treated with AZT

Frequent (38%–15%): Fever, fatigue, headache, cough, diarrhea, rash, nausea. **Occasional (14%–9%):** Shortness of breath, asthenia, skin reaction at injection site, dizziness.

Adverse effects/toxic reactions

Hypertensive encephalopathy, thrombosis, cerebrovascular accident, MI, seizures occur rarely. Hyperkalemia occurs occasionally in pts with chronic renal failure, usually in those who do not comply with medication regimen, dietary guidelines, frequency of dialysis regimen.

Nursing considerations

Baseline assessment

Assess B/P before initiation (80% of pts with chronic renal failure have history of hypertension). B/P often rises during early therapy in pts with history of hypertension. Consider that all pts eventually need supplemental iron therapy. Assess serum iron (should be greater than 20%), serum ferritin (should be greater than 100 ng/mL) before and during therapy. Establish baseline CBC (esp. note Hct).

Intervention/evaluation

Assess CBC routinely (esp. Hgb, Hct). Monitor aggressively for increased B/P (25% of pts require antihypertensive therapy, dietary restrictions). Monitor temperature, esp. in cancer pts on chemotherapy and zidovudine-treated HIV pts. Monitor serum BUN, uric acid, creatinine, phosphorus, potassium, esp. in chronic renal failure pts.

Patient/family teaching

- Frequent laboratory assessments needed to determine correct dosage.
- Immediately report any severe headache.
- Avoid potentially hazardous activity during first 90 days of therapy (increased risk of seizures in pts with chronic renal failure during first 90 days).
- Specific dietary regimen must be maintained.

eprosartan

ep-roe-sar-tan

Teveten

Fixed-combination(s)

Teveten HCT: eprosartan/hydroCHLOROthiazide (a diuretic): 400 mg/12.5 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Angiotensin II receptor antagonist.

CLINICAL: Antihypertensive.

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Uses

Treatment of hypertension (alone or in combination with other medications).

Precautions

Contraindications: Hypersensitivity to eprosartan. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Unstented unilateral/bilateral renal artery stenosis, preexisting renal insufficiency. Concomitant use of potassium-sparing medications (e.g., spironolactone), potassium supplements, pts who are volume depleted.

Action

Potent vasodilator. Blocks vasoconstrictor, aldosterone-secreting effects of angiotensin II, inhibiting binding of angiotensin II to AT₁ receptors. **Therapeutic Effect:** Causes vasodilation, decreases peripheral resistance, decreases B/P.

Pharmacokinetics

Rapidly absorbed after PO administration. Protein binding: 98%. Minimally metabolized in liver. Primarily excreted via urine, biliary system. Minimally removed by hemodialysis. **Half-life:** 5–9 hrs.

Lifespan considerations

Pregnancy/Lactation: Has caused fetal and neonatal morbidity and mortality. Potential for adverse effects on breastfeeding infant. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Potassium-sparing diuretics (e.g., spironolactone, triamterene), potassium supplements may increase risk of hyperkalemia. May produce

additive effect with **antihypertensive agents** (e.g., **amlodipine, clonidine, lisinopril**). **HERBAL: Ephedra, ginseng, yohimbe** may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, ALT, AST. May decrease Hgb, Hct.

Availability (Rx)

 **Tablets:** 400 mg, 600 mg.

Administration/handling

PO

- Give without regard to food.
- Do not break, crush, dissolve, or divide tablets.

Indications/routes/dosage

Hypertension

PO: ADULTS, ELDERLY: Initially, 600 mg/day. Range: 400–800 mg/day as single dose or 2 divided doses.

Dosage in Renal Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment: Maximum:** 600 mg/day.

Dosage in Hepatic Impairment

No dose adjustment. **Severe impairment: Maximum:** 600 mg/day.

Side effects

Occasional (5%–2%): Headache, cough, dizziness. **Rare (less than 2%):** Muscle pain, fatigue, diarrhea, upper respiratory tract infection, dyspepsia.

Adverse effects/toxic reactions

Overdosage may manifest as hypotension, tachycardia. Bradycardia occurs less often.

Nursing considerations

Baseline assessment

Obtain B/P, apical pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Question for possibility of pregnancy, history of hepatic/renal impairment, renal artery stenosis. Obtain urine pregnancy test. Assess medication history (esp. diuretics).

Intervention/evaluation

Monitor B/P, pulse, serum BUN, creatinine, electrolytes, urinalysis.

Patient/family teaching

- Inform female pt regarding consequences of second- and third-trimester exposure to medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Restrict sodium, alcohol intake.
- Follow diet, control weight.
- Do not stop taking medication; hypertension requires lifelong control.
- Check B/P regularly.
- Do not chew, crush, dissolve, or divide tablets; take whole.

epitibatide

ep-ti-fye-ba-tide

HIGH
ALERT

Integrilin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Glycoprotein IIb/IIIa inhibitor.

CLINICAL: Antiplatelet, antithrombotic.

Uses

Treatment of pts with acute coronary syndrome (ACS), including those managed

medically and those undergoing percutaneous coronary intervention (PCI). **OFF-LABEL:** Support PCI during ST-elevation myocardial infarction (STEMI).

Precautions

Contraindications: Hypersensitivity to eptifibatide. Active abnormal bleeding within previous 30 days; history of bleeding diathesis; history of stroke within 30 days or history of hemorrhagic stroke; severe hypertension (systolic B/P greater than 200 mm Hg or diastolic B/P greater than 110 mm Hg); major surgery within previous 6 wks; dependency on hemodialysis. **Cautions:** Renal impairment, hemorrhagic retinopathy, platelet count less than 100,000 cells/mm³, elderly, history of bleeding disorder. Medications that increase risk of bleeding (e.g., oral anticoagulants, NSAIDs).

Action

Blocks platelet glycoprotein IIb/IIIa receptor (binding site for fibrinogen, von Willebrand factor). **Therapeutic Effect:** Prevents thrombus formation within coronary arteries. Prevents platelet aggregation.

Lifespan considerations

Pregnancy/Lactation: Unknown if excreted in breast milk. **Children/Elderly:** No age-related precautions noted.

Pharmacokinetics

Protein binding: 25%. Excreted in urine. **Half-life:** 2.5 hrs.

Interactions

DRUG: Anticoagulants (e.g., warfarin), heparin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), antiplatelets (e.g., clopidogrel), thrombolytic agents (e.g., alteplase) may increase risk of bleeding. **HERBAL:** Cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng may increase antiplatelet effects. **FOOD:** None known. **LAB VALUES:** Increases PT, aPTT. Decreases platelet count. Prolongs clotting time.

Availability (Rx)

Injection Solution: 0.75 mg/mL, 2 mg/mL.

Administration/handling

IV

Reconstitution

- Withdraw bolus dose from 10-mL vial (2 mg/mL); for IV infusion, withdraw from 100-mL vial (0.75 mg/mL).
- IV push and infusion administration may be given undiluted.

Rate of Administration

- Give bolus dose IV push over 1–2 min.

Storage

- Store vials in refrigerator.
- Solution appears clear, colorless.
- Do not shake.
- Discard any unused portion left in vial; discard if preparation contains any opaque particles.

IV incompatibilities

Administer via dedicated line; do not add other medications to infusion solution.

IV Compatibilities

Amiodarone (Cordarone), argatroban, bivalirudin, metoprolol (Lopressor).

Indications/routes/dosage

Adjunct to Percutaneous Coronary Intervention (PCI)

IV Bolus, IV Infusion: ADULTS, ELDERLY: 180 mcg/kg (**maximum:** 22.6 mg) before PCI initiation; then continuous drip of 2 mcg/kg/min and a second 180 mcg/kg (**maximum:** 22.6 mg) bolus 10 min after the first. **Maximum:** 15 mg/hr. Continue until hospital discharge or for up to 18–24 hrs. Minimum 12 hrs is recommended. Concurrent aspirin and heparin therapy is recommended.

Acute Coronary Syndrome (ACS)

IV Bolus, IV Infusion: ADULTS, ELDERLY: 180 mcg/kg over 1–2 min (**maximum:** 22.6 mg) bolus then 2 mcg/kg/min until discharge or coronary artery bypass graft, up to 72 hrs. **Maximum:** 15 mg/hr. Concurrent aspirin and heparin therapy is recommended.

Dosage in Renal Impairment

CrCl Less than 50 mL/min: Use 180 mcg/kg bolus (**maximum:** 22.6 mg) and 1 mcg/kg/min infusion (**maximum:** 7.5 mg/hr). **End-Stage Renal Disease (Dialysis):** Contraindicated.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (7%): Hypotension.

Adverse effects/toxic reactions

Minor to major bleeding complications may occur, most commonly at arterial access site for cardiac catheterization.

Nursing considerations

Baseline assessment

Assess platelet count, Hgb, Hct before treatment and during therapy. If platelet count less than 90,000 cells/mm³, additional platelet counts should be obtained routinely to avoid thrombocytopenia.

Intervention/evaluation

Diligently monitor for potential bleeding, particularly at other arterial, venous puncture sites. If possible, urinary catheters, nasogastric tubes should be avoided.

eriBULin

er-i-bue-lin

Halaven

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Microtubule inhibitor.

CLINICAL: Antineoplastic.

Do not confuse eriBULin with epiRUBicin or erlotinib.

Uses

Treatment of metastatic breast cancer in pts who previously received at least 2 chemotherapeutic regimens for treatment. Treatment of metastatic liposarcoma in pts who received a prior anthracycline-containing regimen.

Precautions

Contraindications: Hypersensitivity to eriBULin. **Cautions:** Prolonged QTc (congenital, other medications that prolong QT interval), hypokalemia, hypomagnesemia, hepatic/renal impairment, moderate to severe neuropathy, HF.

Action

Binds directly on microtubules during active stage of G₂ and M phases of cell cycle, preventing formation of microtubules, an essential part of process of separation of chromosomes. **Therapeutic Effect:** Blocks cells in mitotic phase of cell division, leading to cell death.

Pharmacokinetics

Extensively metabolized in liver. Protein binding: 49%–65%. Excreted in feces (82%), urine (9%). **Half-life:** 40 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause embryo-fetal toxicity. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than

18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **FOOD:** None known. **HERBAL:** None significant. **LAB VALUES:** May decrease WBC, Hgb, Hct, platelet count, potassium. May increase ALT.

Availability (Rx)

Injection, Solution: 1 mg/2 mL (0.5-mg/mL).

Administration/handling

IV

Reconstitution

- May administer undiluted or dilute in 100 mL 0.9% NaCl.

Rate of Administration

- Administer over 2–5 min.

Storage

- Store at room temperature.
- Once diluted, syringe or diluted solution may be stored for up to 4 hrs at room temperature or up to 24 hrs if refrigerated.

IV incompatibilities

Do not dilute with D₅W or administer through IV line containing solutions with dextrose or in same IV line with other medications.

Indications/routes/dosage

Metastatic Breast Cancer, Liposarcoma

IV: ADULTS, ELDERLY: 1.4 mg/m² over 2–5 min on days 1 and 8 of 21-day cycle.

Dosage in Renal Impairment

Mild: No dose adjustment. **Moderate to severe impairment (CrCl 15–49 mL/min):** 1.1 mg/m²/dose.

Dosage in Hepatic Impairment

Mild: 1.1 mg/m²/dose. **Moderate impairment:** 0.7 mg/m²/dose. **Severe impairment:** Use not recommended.

Recommended Dose Delays

Do not administer day 1 or day 8 of treatment for any of the following: ANC less than 1,000 cells/mm³, platelets less than 75,000 cells/mm³, Grade 3 or 4 nonhematologic toxicities. Day 8 dose may be delayed for maximum of 1 wk. If toxicities do not resolve or improve to Grade 2 severity by day 15, omit dose. If toxicities resolve or improve to Grade 2 severity by day 15, continue treatment at reduced dose and initiate next cycle no sooner than 2 wks later. Do not re-escalate dose after it has been reduced.

Side effects

Common (54%–35%): Fatigue, asthenia, alopecia, peripheral sensory neuropathy, nausea. **Frequent (25%–18%):** Constipation, arthralgia/myalgia, decreased weight, anorexia, pyrexia, headache, diarrhea, vomiting. **Occasional (16%–9%):** Back pain, dyspnea, cough, bone pain, extremity pain, urinary tract infection, oral mucosal inflammation.

Adverse effects/toxic reactions

Neutropenia occurs in 82% of pts, with 57% developing grade 3 neutropenia. Severe neutropenia (ANC less than 500 cells/mm³) lasting more than 1 wk occurred in 12%. Anemia occurs in 58% of pts. Peripheral neuropathy occurs in 8% of pts but is the most common adverse reaction requiring discontinuation of therapy. Prolonged QTc may be noted on or after day 8 of treatment.

Nursing considerations

Baseline assessment

Question for possibility of pregnancy. Obtain baseline CBC, serum chemistries

before treatment begins. Obtain CBC prior to each dose. Offer emotional support.

Intervention/evaluation

Diligently monitor for neutropenia, peripheral neuropathy (most frequent cause of drug discontinuation). Monitor for symptoms of neuropathy (burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, neuropathic pain). Assess hands, feet for erythema. Monitor CBC for evidence of neutropenia, thrombocytopenia. Assess mouth for stomatitis (erythema, ulceration, mucosal burning).

Patient/family teaching

- Avoid crowds, those with known infection.
- Avoid contact with anyone who recently received live virus vaccine.
- Do not have immunizations without physician's approval (drug lowers body resistance).
- Promptly report fever over 100.5°F, chills, cough, burning or pain urinating, numbness, tingling, burning sensation, erythema of hands/feet.
- Women of reproductive potential should use effective contraception during and for 2 wks following last dose of eribulin; males with female partners of reproductive potential should use effective contraception during and for 3.5 mos following last dose of eribulin.

erlotinib

er-**loe**-ti-nib

HIGH
ALERT

Tarceva

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Epidermal growth factor receptor (EGFR) inhibitor; kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse erlotinib with dasatinib, eriBULin, gefitinib, imatinib, or lapatinib.

Uses

Treatment of locally advanced or metastatic non–small-cell lung cancer

(NSCLC) after failure of at least one prior chemotherapy regimen (as monotherapy). First-line treatment of locally advanced, unresectable, or metastatic pancreatic cancer (in combination with gemcitabine).

Precautions

Contraindications: Hypersensitivity to erlotinib. **Cautions:** Severe hepatic/renal impairment, cardiovascular disease. Concurrent use of strong CYP3A4 inhibitors and inducers or CYP1A2 inhibitors, pts at risk for GI perforation (e.g., peptic ulcer disease, diverticular disease). Total serum bilirubin greater than 3 times upper limit of normal.

Action

Reversibly inhibits overall epidermal growth factor receptor (EGFR)–tyrosine kinase activity. **Therapeutic Effect:** Produces tumor cell death.

Pharmacokinetics

About 60% is absorbed after PO administration; bioavailability is increased by food to almost 100%. Protein binding: 93%. Extensively metabolized in liver. Primarily excreted in feces (83%), urine (8%). **Half-life:** 24–36 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (e.g., atazanavir, clarithromycin, ketoconazole, ritonavir) may increase concentration/effects. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration/effects. **Proton pump inhibitors (e.g., omeprazole), H₂ antagonists (e.g., ranitidine)** may decrease absorption/effects. (Avoid use of **proton pump inhibitors**. Give erlotinib 10 hrs after or 2 hrs prior to **H₂ antagonists**.) **HERBAL:** St. John's wort may decrease concentration/effects. **FOOD:** Grapefruit products may

increase potential for myelotoxicity. **LAB VALUES:** May increase serum bilirubin, ALT, AST.

Availability (Rx)

Tablets: 25 mg, 100 mg, 150 mg.

Administration/handling

PO

- Give at least 1 hr before or 2 hrs after ingestion of food.
- Avoid grapefruit products.
- May dissolve in 3–4 oz water and give orally or via feeding tube.

Indications/routes/dosage

◀ALERT▶ Dosage adjustment for toxicity: Reduce dose in 50-mg increments.

NSCLC

PO: ADULTS, ELDERLY: 150 mg/day until disease progression or unacceptable toxicity occurs.

Pancreatic Cancer

PO: ADULTS, ELDERLY: 100 mg/day, in combination with gemcitabine, until disease progression or unacceptable toxicity occurs.

Dosage in Renal Impairment

Interrupt dosing for Grade 3 or 4 renal toxicity during treatment.

Dosage in Hepatic Impairment

Use extreme caution. Reduce starting dose to 75 mg and individualize dose escalation if tolerated.

Side effects

Frequent (greater than 10%): Fatigue, anxiety, headache, depression,

insomnia, rash, pruritus, dry skin, erythema, diarrhea, anorexia, nausea, vomiting, mucositis, constipation, dyspepsia, weight loss, dysphagia, abdominal pain, arthralgia, dyspnea, cough. **Occasional (10%–1%):** Keratitis. **Rare (less than 1%):** Corneal ulceration.

Adverse effects/toxic reactions

UTI occurs occasionally. Pneumonitis, GI bleeding occur rarely.

Nursing considerations

Baseline assessment

Obtain CBC, serum electrolytes, hepatic enzyme levels before beginning therapy. Obtain pregnancy test. Offer emotional support.

Intervention/evaluation

Assess LFT and CBC, renal function, serum electrolytes, hydration status periodically.

Patient/family teaching

- Take drug on empty stomach.
- Report rash, blood in stool, diarrhea, irritated eyes, fever.
- Avoid grapefruit products.
- Do not breastfeed.
- Use effective contraception during therapy and for at least 1 mo after final dose.

ertapenem

er-ta-**pen**-em

INVanz

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Carbapenem.

CLINICAL: Antibiotic.

Do not confuse ertapenem with doripenem, imipenem, or meropenem, or INVanz with AVINza.

Uses

Treatment of susceptible infections due to *S. aureus* (methicillin-susceptible only), *S. agalactiae*, *S. pneumoniae* (penicillin-susceptible only), *S. pyogenes*, *E. coli*, *H. influenzae* (beta-lactamase negative strains only), *K. pneumoniae*, *M. catarrhalis*, *Bacteroides* spp., *C. clostridioforme*, *Peptostreptococcus* spp., including moderate to severe intra-abdominal, skin/skin structure infections; community-acquired pneumonia; complicated UTI; acute pelvic infection; adult diabetic foot infections without osteomyelitis. Prevention of surgical site infection. **OFF-LABEL:** Treatment of IV catheter-related bloodstream infection; prosthetic joint infection.

Precautions

Contraindications: Hypersensitivity to ertapenem. History of anaphylactic hypersensitivity to beta-lactams (e.g., imipenem and cilastatin, meropenem), hypersensitivity to amide-type local anesthetics (IM). **Cautions:** Hypersensitivity to penicillins, cephalosporins, renal impairment, CNS disorders (brain lesions or history of seizure disorder), elderly.

Action

Penetrates bacterial cell wall of microorganisms, binds to penicillin-binding proteins, inhibiting cell wall synthesis. **Therapeutic Effect:** Produces bacterial cell death.

Pharmacokinetics

Almost completely absorbed after IM administration. Protein binding: 85%–95%. Widely distributed. Primarily excreted in urine (80%), feces (10%). Removed by hemodialysis. **Half-life:** 4 hrs.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Advanced or end-stage renal insufficiency may require dosage adjustment.

Interactions

DRUG: Probenecid may increase concentration/effect. May decrease concentration/effect of valproic acid. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine, glucose, PT, aPTT, sodium. May decrease platelet count, Hgb, Hct, WBC.

Availability (Rx)

Injection, Powder for Reconstitution: 1 g.

Administration/handling

IV

Reconstitution

- Dilute 1-g vial with 10 mL 0.9% NaCl or Bacteriostatic Water for Injection.
- Shake well to dissolve.
- Further dilute with 50 mL 0.9% NaCl (**maximum concentration:** 20 mg/mL).

Rate of Administration

- Give by intermittent IV infusion (piggyback). Do not give IV push.
- Infuse over 30 min.

Storage

- Solution appears colorless to yellow (variation in color does not affect potency).
- Discard if solution contains precipitate.
- Reconstituted solution is stable for 6 hrs at room temperature or 24 hrs if refrigerated.

IM

- Reconstitute with 3.2 mL 1% lidocaine HCl injection (without EPINEPHrine).
- Shake vial thoroughly.
- Inject deep in large muscle mass (gluteal or lateral part of thigh).
- Administer suspension within 1 hr after preparation.

IV incompatibilities

Do not mix or infuse with any other medications. Do not use diluents or IV solutions containing dextrose.

■ IV Compatibilities

Heparin, potassium chloride, tigecycline (Tygacil), Sterile Water for Injection, 0.9% NaCl.

Indications/routes/dosage

Usual Dosage Range

IM, IV: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER: 1 g/day.
CHILDREN 3 MOS–12 YRS: 15 mg/kg 2 times/day. **Maximum:** 1 g/day.

Dosage in Renal Impairment

CrCl 30 mL/min or less	500 mg once daily
Hemodialysis	If daily dose given within 6h prior to HD, give 150 mg dose after HD.
Peritoneal dialysis	500 mg once daily

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (10%–6%): Diarrhea, nausea, headache. **Occasional (5%–2%):** Altered mental status, insomnia, rash, abdominal pain, constipation, chest pain, vomiting, edema, fever. **Rare (less than 2%):** Dizziness, cough, oral candidiasis, anxiety, tachycardia, phlebitis at IV site.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever) may result from altered bacterial balance in GI tract. Anaphylactic reactions have been reported. Seizures may occur in pts with CNS disorders (brain lesions, history of seizures), bacterial meningitis, severe renal

impairment.

Nursing considerations

Baseline assessment

Question for history of allergies, particularly to beta-lactams, penicillins, cephalosporins. Inquire about history of seizures.

Intervention/evaluation

Monitor WBC count. Monitor renal/hepatic function. Monitor daily pattern of bowel activity, stool consistency. Monitor for nausea, vomiting. Evaluate hydration status. Evaluate for inflammation at IV injection site. Assess skin for rash. Observe mental status; be alert to tremors, possible seizures. Assess sleep pattern for evidence of insomnia.

Patient/family teaching

- Report tremors, seizures, rash, prolonged diarrhea, chest pain, other new symptoms.

erythromycin

er-**ith**-roe-**mye**-sin

Akne-Mycin

Apo-Erythro Base 

EES

Erybid 

Eryc

EryDerm

EryPed

Ery-Tab

Erythrocin

PCE Dispertab

Fixed-Combination(s)

Eryzole, Pediazole: erythromycin/sulfisoxazole (sulfonamide): 200 mg/600 mg per 5 mL.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Macrolide.

CLINICAL: Antibiotic, antiacne.

Do not confuse Eryc with Emcyt, or erythromycin with azithromycin or clarithromycin.

Uses

Treatment of susceptible infections due to *S. pyogenes*, *S. pneumoniae*, *S. aureus*, *M. pneumoniae*, *Legionella*, *Chlamydia*, *N. gonorrhoeae*, *E. histolytica*, including syphilis, nongonococcal urethritis, diphtheria, pertussis, chancroid, *Campylobacter* gastroenteritis. **Topical:** Treatment of acne vulgaris. **Ophthalmic:** Prevention of gonococcal ophthalmia neonatorum, superficial ocular infections. **OFF-LABEL: Systemic:** Treatment of acne vulgaris, chancroid, *Campylobacter* enteritis, gastroparesis, Lyme disease, preoperative gut sterilization. **Topical:** Treatment of minor bacterial skin infections. **Ophthalmic:** Treatment of blepharitis, conjunctivitis, keratitis, chlamydial trachoma.

Precautions

Contraindications: Hypersensitivity to erythromycin. Concomitant administration with ergot derivatives, lovastatin, pimozone, simvastatin. **Cautions:** Elderly, myasthenia gravis, strong CYP3A4 inhibitor, hepatic impairment, pts with prolonged QT intervals, uncorrected hypokalemia or hypomagnesemia, concurrent use of class IA or III antiarrhythmics.

Action

Penetrates bacterial cell membranes, reversibly binds to bacterial ribosomes, inhibiting protein synthesis. **Therapeutic Effect:** Bacteriostatic.

Pharmacokinetics

Variably absorbed from GI tract (depending on dosage form used). Protein binding: 70%–90%. Widely distributed. Metabolized in liver. Primarily eliminated in feces by bile. Not removed by hemodialysis. **Half-life:** 1.4–2 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. Erythromycin estolate may increase hepatic enzymes in pregnant women. **Children/Elderly:** No age-related precautions noted. High dosage in pts with decreased hepatic/renal function increases risk of hearing loss.

Interactions

DRUG: May increase concentration of **busPIRone**, **cycloSPORINE**, **calcium channel blockers** (e.g., **diltiaZEM**, **verapamil**), **statins** (e.g., **atorvastatin**, **simvastatin**). May inhibit metabolism of **carBAMazepine**. **Hepatotoxic medications** (e.g., **acetaminophen**, **ketoconazole**, **methotrexate**, **simvastatin**) may increase risk of hepatotoxicity. May increase risk of **theophylline** toxicity. May increase effects of **warfarin**. **HERBAL:** **St. John's wort** may decrease concentration. **FOOD:** **Grapefruit** may increase potential for torsades. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST.

Availability (Rx)

Gel, Topical: 2%. **Injection, Powder for Reconstitution:** 500 mg, 1 g. **Ointment, Ophthalmic:** 0.5%. **Ointment, Topical (Akne-Mycin):** 2%. **Oral Suspension (EES, EryPed):** 100 mg/2.5 mL, 200 mg/5 mL, 400 mg/5 mL. **Tablet as Base:** 250 mg, 333 mg, 500 mg. **Tablet as Ethylsuccinate (EES):** 400 mg.

 **Capsules, Delayed-Release (Eryc):**

 **Capsules, Delayed-Release (Eryc):** 250 mg. **Tablets, Delayed-Release (Ery-Tab):** 250 mg, 333 mg, 500 mg.

Administration/handling

 **IV**

Reconstitution

- Reconstitute each 500 mg with 10 mL Sterile Water for Injection without preservative to provide a concentration of 50 mg/mL.
- Further dilute with 100–250 mL D₅W or 0.9% NaCl to maximum concentration of 5 mg/mL.

Rate of Administration

- For intermittent IV infusion (piggyback), infuse over 20–60 min.

Storage

- Store parenteral form at room temperature.
- Initial reconstituted solution in vial is stable for 2 wks refrigerated or 24 hrs at room temperature.
- Diluted IV solution stable for 8 hrs at room temperature or 24 hrs if refrigerated.
- Discard if precipitate forms.

PO

- May give with food to decrease GI upset. Do not give with milk or acidic beverages.
- Oral suspension is stable for 35 days at room temperature.
- Do not crush delayed-release capsules, tablets.

Ophthalmic

- Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid.
- Place 1/4–1/2 inch of ointment into pocket.
- Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac) and to roll eyeball to increase contact area of drug to eye.

■ IV incompatibilities

Fluconazole (Diflucan), furosemide (Lasix), heparin, metoclopramide (Reglan).

■ IV Compatibilities

Amiodarone (Cordarone), diltiazem (Cardizem), HYDROMorphone (Dilaudid), lidocaine, LORazepam (Ativan), magnesium sulfate, midazolam (Versed),

morphine, multivitamins, potassium chloride.

Indications/routes/dosage

Usual Dosage Range

PO: ADULTS, ELDERLY:BASE: 250–500 mg q6–12h. **CHILDREN:** 30–50 mg/kg/day in 2–4 divided doses. **Maximum:** 2 g/day.
ETHYLSUCCINATE:ADULTS, ELDERLY: 400–800 mg q6–12h. **Maximum:** 4 g/day. **CHILDREN:** 30–50 mg/kg/day in divided doses. **Maximum:** 3.2 g/day. **NEONATES:** 10 mg/kg/dose q8–12h.
IV: ADULTS, ELDERLY: 15–20 mg/kg/day divided q6h. **Maximum:** 4 g/day. **CHILDREN, INFANTS:** 15–20 mg/kg/day divided q6h. **Maximum:** 4 g/day. **NEONATES:** 10 mg/kg/dose q8–12h.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: IV: Abdominal cramping/discomfort, phlebitis/thrombophlebitis.
Topical: Dry skin (50%). **Occasional:** Nausea, vomiting, diarrhea, rash, urticaria. **Rare: Ophthalmic:** Sensitivity reaction with increased irritation, burning, itching, inflammation. **Topical:** Urticaria.

Adverse effects/toxic reactions

Antibiotic-associated colitis, other superinfections (abdominal cramps, severe watery diarrhea, fever), reversible cholestatic hepatitis may occur. High dosage in pts with renal impairment may lead to reversible hearing loss. Anaphylaxis occurs rarely. Ventricular arrhythmias, prolonged QT interval occur rarely with IV form.

Nursing considerations

Baseline assessment

Question for history of allergies (particularly erythromycins), hepatitis. Receive full medication history and screen for interactions.

Intervention/evaluation

Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Assess for hepatotoxicity (malaise, fever, abdominal pain, GI disturbances). Be alert for superinfection: fever, vomiting, diarrhea, anal/genital pruritus, oral mucosal changes (ulceration, pain, erythema). Check for phlebitis (heat, pain, red streaking over vein). Monitor for high-dose hearing loss.

Patient/family teaching

- Continue therapy for full length of treatment.
- Doses should be evenly spaced.
- Take medication with 8 oz water 1 hr before or 2 hrs following food or beverage.
- **Ophthalmic:** Report burning, itching, inflammation.
- **Topical:** Report excessive skin dryness, itching, burning.
- Improvement of acne may not occur for 1–2 mos; maximum benefit may take 3 mos; therapy may last mos or yrs.
- Use caution if using other topical acne preparations containing peeling or abrasive agents, medicated or abrasive soaps, cosmetics containing alcohol (e.g., astringents, aftershave lotion).

escitalopram

es-sye-tal-o-pram

Apo-Escitalopram

Cipralex 

Lexapro

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Selective serotonin reuptake inhibitor.

CLINICAL: Antidepressant.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Uses

Treatment of major depressive disorder. Treatment of generalized anxiety disorder (GAD). **OFF-LABEL:** Seasonal affective disorder (SAD) in children and adolescents, pervasive developmental disorders (e.g., autism), vasomotor symptoms associated with menopause.

Precautions

Contraindications: Hypersensitivity to escitalopram. Use of MAOI intended to treat psychiatric disorders (concurrent or within 14 days of discontinuing either escitalopram or MAOI). Initiation in pts receiving linezolid or IV methylene blue. Concurrent use with pimozide. **Cautions:** Hepatic/renal impairment, history of seizure disorder, concurrent use of CNS depressants, pts at high risk of suicide, concomitant aspirin, NSAIDs, warfarin (may potentiate bleeding risk), elderly, metabolic disease; recent history of MI, cardiovascular disease.

Action

Blocks uptake of neurotransmitter serotonin at neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. **Therapeutic Effect:** Antidepressant effect.

Pharmacokinetics

Well absorbed after PO administration. Protein binding: 56%. Primarily metabolized in liver. Primarily excreted in feces, with a lesser amount eliminated in urine. **Half-life:** 35 hrs.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. **Children:** May cause increased anticholinergic effects or hyperexcitability. **Elderly:** More sensitive to anticholinergic effects (e.g., dry mouth), more likely to experience dizziness, sedation, confusion, hypotension, hyperexcitability.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. Linezolid, aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), warfarin may increase risk of bleeding. MAOIs may cause serotonin syndrome (autonomic hyperactivity, diaphoresis, excitement, hyperthermia, rigidity, neuroleptic malignant syndrome, coma). SUMAtriptan may cause weakness, hyperreflexia, poor coordination. **HERBAL:** Gotu kola, kava kava, SAME, St. John's wort, valerian may increase CNS depression. Ginkgo biloba, St. John's wort may increase risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium.

Availability (Rx)

 **Oral Solution:** 5 mg/5 mL.

Tablets: 5 mg, 10 mg, 20 mg.

Administration/handling

PO

- Give without regard to food.
- Do not break, crush, dissolve, or divide tablets.

Indications/routes/dosage

Depression

PO: ADULTS: Initially, 10 mg once daily in the morning or evening. May increase to 20 mg after a minimum of 1 wk. **ELDERLY:** 10 mg/day. **CHILDREN 12–17 YRS:** Initially, 10 mg once daily. May increase to 20 mg/day after at least 3 wks. **Maximum:** 20 mg once daily. Recommended: 10 mg once daily.

Generalized Anxiety Disorder

PO: ADULTS: Initially, 10 mg once daily in morning or evening. May increase to 20 mg after minimum of 1 wk. **ELDERLY:** 10 mg/day.

Dosage in Renal Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use caution in pts with CrCl less than 20 mL/min.

Dosage in Hepatic Impairment

10 mg/day.

Side effects

Frequent (21%–11%): Nausea, dry mouth, drowsiness, insomnia, diaphoresis. **Occasional (8%–4%):** Tremor, diarrhea, abnormal ejaculation, dyspepsia, fatigue, anxiety, vomiting, anorexia. **Rare (3%–2%):** Sinusitis, sexual dysfunction, menstrual disorder, abdominal pain, agitation, decreased libido.

Adverse effects/toxic reactions

Overdose manifested as dizziness, drowsiness, tachycardia, confusion, seizures.

Nursing considerations

Baseline assessment

For pts on long-term therapy, LFT, renal function tests, blood counts should be performed periodically. Observe, record behavior. Assess psychological status, thought content, sleep pattern, appearance, interest in environment.

Intervention/evaluation

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, suicide potential increases). Assess appearance, behavior, speech pattern, level of interest, mood. Monitor for suicidal ideation (esp. at beginning of therapy or when doses are increased or decreased), social interaction, mania, panic attacks.

Patient/family teaching

- Do not stop taking medication or increase dosage.
- Avoid alcohol.

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report worsening depression, suicidal ideation, unusual changes in behavior.

esmolol

es-moe-lol

HIGH
ALERT

Brevibloc

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Beta₁-adrenergic blocker.

CLINICAL: Antiarrhythmic.

Do not confuse Brevibloc with Bumex or Buprenex, or esmolol with Osmitol.

Uses

Rapid, short-term control of ventricular rate in supraventricular tachycardia (SVT), atrial fibrillation or flutter; treatment of tachycardia and/or hypertension (esp. intraop or postop). Treatment of noncompensatory sinus tachycardia. **OFF-LABEL:** Postoperative hypertension or SVT in children. Arrhythmia and/or rate control in ACS, intubation, thyroid storm, pheochromocytoma, electroconvulsive therapy.

Precautions

Contraindications: Hypersensitivity to esmolol. Cardiogenic shock, uncompensated cardiac failure, second- or third-degree heart block (except in pts with pacemaker), severe sinus bradycardia, sick sinus syndrome, IV administration of calcium blockers in close proximity to esmolol, pulmonary hypertension. **Cautions:** Compensated HF; concurrent use of digoxin, verapamil, diltiazem. Diabetes, myasthenia gravis, renal impairment, history of anaphylaxis to allergens. Hypovolemia, hypertension, bronchospastic disease, peripheral vascular disease, Raynaud's disease.

Action

Selectively blocks beta₁-adrenergic receptors. **Therapeutic Effect:** Slows sinus heart rate, decreases cardiac output, reducing B/P.

Pharmacokinetics

Rapidly metabolized primarily by esterase in cytosol of red blood cells. Protein binding: 55%. Less than 1%–2% excreted in urine. **Half-life:** 9 min.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Opioids (e.g., fentaNYL, morphine), calcium channel blockers (e.g., diltiaZEM, verapamil), MAOIs (e.g., phenelzine, selegiline) may increase level/effects. **HERBAL:** Yohimbe may decrease effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Injection Solution: 10 mg/mL (10 mL, 250 mL), 20 mg/mL (100 mL).

Administration/handling

 Give by IV infusion. Avoid butterfly needles, very small veins (can cause thrombophlebitis).

IV

Rate of Administration

- Administer by controlled infusion device; titrate to tolerance and response.
- Infuse IV loading dose over 1–2 min.
- Hypotension (systolic B/P less than 90 mm Hg) is greatest during first 30 min of IV infusion.

Storage

- Use only clear and colorless to light yellow solution.
- Discard solution if discolored or precipitate forms.

IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), furosemide (Lasix).

■ IV Compatibilities

Amiodarone (Cordarone), dexmedetomidine (Precedex), diltiazem (Cardizem), DOPamine (Intropin), heparin, magnesium, midazolam (Versed), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Rate Control in Supraventricular Arrhythmias

IV: ADULTS, ELDERLY: Initially, loading dose of 500 mcg/kg/min for 1 min, followed by 50 mcg/kg/min for 4 min. If optimum response is not attained in 5 min, give second loading dose of 500 mcg/kg/min for 1 min, followed by infusion of 100 mcg/kg/min for 4 min. A third (and final) loading dose can be given and infusion increased by 50 mcg/kg/min, up to 200 mcg/kg/min, for 4 min. Once desired response is attained, increase infusion by no more than 25 mcg/kg/min. Infusion usually administered over 24–48 hrs in most pts. Range: 50–200 mcg/kg/min (average dose 100 mcg/kg/min).

Intraop/Postop Tachycardia Hypertension (Immediate Control)

IV: ADULTS, ELDERLY: Initially, 1,000 mcg/kg over 30 sec, then 150 mcg/kg/min infusion up to 300 mcg/kg/min.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Generally well tolerated, with transient, mild side effects. **Frequent:** Hypotension (systolic B/P less than 90 mm Hg) manifested as dizziness, nausea, diaphoresis, headache, cold extremities, fatigue. **Occasional:** Anxiety, drowsiness, flushed skin, vomiting, confusion, inflammation at injection site, fever.

Adverse effects/toxic reactions

Overdose may produce profound hypotension, bradycardia, dizziness, syncope,

drowsiness, breathing difficulty, bluish fingernails or palms of hands, seizures. May potentiate insulin-induced hypoglycemia in diabetic pts.

Nursing considerations

Baseline assessment

Assess B/P, apical pulse immediately before drug is administered (if pulse is 60 or less/min or systolic B/P is 90 mm Hg or less, withhold medication, contact physician).

Intervention/evaluation

Monitor B/P for hypotension, EKG, heart rate, respiratory rate, development of diaphoresis, dizziness (usually first sign of impending hypotension). Assess pulse for quality, irregular rate, bradycardia, extremities for coldness. Assist with ambulation if dizziness occurs. Assess for nausea, diaphoresis, headache, fatigue.

esomeprazole

es-o-mep-ra-zole

Apo-Esomeprazole 

NexIUM

NexIUM 24 HR

Nexium IV

Fixed-Combination(s)

Vimovo: esomeprazole/naproxen (NSAID): 20 mg/375 mg, 20 mg/500 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Proton pump inhibitor.

CLINICAL: Gastric acid inhibitor.

Do not confuse esomeprazole with ARIPiprazole or omeprazole, or NexIUM with NexAVAR.

Uses

PO: Short-term treatment (4–8 wks) of erosive esophagitis; maintenance treatment of healing of erosive esophagitis; symptomatic gastroesophageal reflux disease (GERD). Treatment of pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. Used in triple therapy with amoxicillin and clarithromycin for treatment of *H. pylori* infection in pts with duodenal ulcer. Reduces risk of NSAID-induced gastric ulcer. **OTC:** Treatment of frequent heartburn (2 or more days/wk). **IV:** Treatment of GERD with erosive esophagitis. Reduce risk of ulcer re-bleeding postprocedures.

Precautions

Contraindications: Hypersensitivity to esomeprazole, other proton pump inhibitors. **Cautions:** May increase risk of hip, wrist, spine fractures; hepatic impairment; elderly; Asian populations. Concurrent use of CYP3A4 inducers (e.g., rifAMPin).

Action

Converted to active metabolites that irreversibly bind to, inhibit enzymes on surface of gastric parietal cells. Inhibits hydrogen ion transport into gastric lumen. **Therapeutic Effect:** Increases gastric pH; reduces gastric acid secretion.

Pharmacokinetics

Well absorbed after PO administration. Protein binding: 97%. Extensively metabolized in liver. Primarily excreted in urine. **Half-life:** 1–1.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May decrease concentration/effects of **atazanavir, digoxin, iron, ketoconazole**. May increase effect of **warfarin**. May decrease effect of

clopidogrel. CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifAMPin) may decrease concentration/effects. **HERBAL: St. John's wort** may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Injection, Powder for Reconstitution: 20 mg, 40 mg. **Oral Suspension, Delayed-Release Packets:** 2.5 mg, 5 mg, 10 mg, 20 mg, 40 mg.

 **Capsules (Delayed-Release [NexIUM]):** 20 mg, 40 mg. **[NexIUM 24 HR]:** 20 mg.

Administration/handling

IV

Reconstitution

- For IV push, add 5 mL of 0.9% NaCl to esomeprazole vial.

Infusion

- For IV infusion, dissolve contents of one vial in 50 mL 0.9% NaCl, or D₅W.

Rate of Administration

- For IV push, administer over not less than 3 min. For intermittent infusion (piggyback) infuse over 10–30 min.
- Flush line with 0.9% NaCl, or D₅W, both before and after administration.

Storage

- Use only clear and colorless to very slightly yellow solution.
- Discard solution if particulate forms.
- IV infusion stable for 12 hrs in 0.9% NaCl or lactated Ringer's; 6 hrs in D₅W.

PO (Capsules)

- Give 1 hr or more before eating (best before breakfast).
- Do not crush, cut capsule; administer whole.
- For pts with difficulty swallowing capsules, open capsule and mix pellets with 1 tbsp applesauce. Swallow immediately without chewing.

PO (Oral Suspension)

- Empty contents into 5 mL water for 2.5 mg, 5 mg; 15 mL for 10 mg, 20 mg, 40 mg and stir.

- Let stand 2–3 min to thicken.
- Stir and drink within 30 min.

■ IV incompatibilities

Do not mix esomeprazole with any other medications through the same IV line or tubing.

■ IV Compatibilities

Ceftaroline (Teflaro), doripenem (Doribax).

Indications/routes/dosage

Erosive Esophagitis

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 20–40 mg once daily for 4–8 wks. May continue for additional 4–8 wks. **CHILDREN 1–11 YRS, WEIGHING 20 KG OR MORE:** 10–20 mg/day for up to 8 wks. **WEIGHING LESS THAN 20 KG:** 10 mg/day for up to 8 wks. **CHILDREN 1–11 MONTHS: (GREATER THAN 7.5 kg–12 kg):** 10 mg/day for up to 6 wks. **(6–7.5 kg):** 5 mg/day for up to 6 wks. **(3–5 kg):** 2.5 mg/day for up to 6 wks.

Maintenance Therapy for Erosive Esophagitis

PO: ADULTS, ELDERLY: 20 mg/day.

Treatment of NSAID-Induced Gastric Ulcers

PO: ADULTS, ELDERLY: 20 mg/day for 4–8 wks.

Prevention of NSAID-Induced Gastric Ulcer

PO: ADULTS, ELDERLY: 20–40 mg once daily for up to 6 mos.

Gastroesophageal Reflux Disease (GERD)

IV: ADULTS, ELDERLY: 20 or 40 mg once daily for up to 10 days. **CHILDREN 1–17 YRS, WEIGHING 55 KG OR MORE:** 20 mg once daily; **1–17 YRS, WEIGHING LESS THAN 55 KG:** 10 mg once daily; **1 MO TO**

LESS THAN 1 YR: 0.5 mg/kg once daily.

PO: ADULTS, ELDERLY, CHILDREN, 12–17 YRS: 20 mg once daily for up to 8 wks. **CHILDREN 1–11 YRS:** 10 mg/day for up to 8 wks.

Zollinger-Ellison Syndrome

PO: ADULTS, ELDERLY: 40 mg 2 times/day. Doses up to 240 mg/day have been used.

Duodenal Ulcer Caused by *Helicobacter Pylori*

PO: ADULTS, ELDERLY: 40 mg (esomeprazole) once daily, with amoxicillin 1,000 mg and clarithromycin 500 mg twice daily for 10 days.

Heartburn (OTC)

PO: ADULTS, ELDERLY: 20 mg/day for 14 days. May repeat after 4 mos if needed.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Doses should not exceed 20 mg/day.

Side effects

Frequent (7%): Headache. **Occasional (3%–2%):** Diarrhea, abdominal pain, nausea. **Rare (less than 2%):** Dizziness, asthenia, vomiting, constipation, rash, cough.

Adverse effects/toxic reactions

Pancreatitis, hepatotoxicity, interstitial nephritis occur rarely.

Nursing considerations

Baseline assessment

Assess epigastric/abdominal pain. Question history of hepatic impairment, pathologic bone fractures.

Intervention/evaluation

Evaluate for therapeutic response (relief of GI symptoms). Question if GI discomfort, nausea, diarrhea occur. Monitor for occult blood, observe for hemorrhage in pts with peptic ulcer.

Patient/family teaching

- Report headache.
- Take at least 1 hr before eating.
- If swallowing capsules is difficult, open capsule and mix pellets with 1 tbsp applesauce. Swallow immediately without chewing.

estradiol

es-tra-**dye**-ole

Alora

Climara

Delestrogen

Depo-Estradiol

Divigel

Elestrin

Estrogel

Evamist

Femring

Menostar

Minivelle

Vivelle-Dot

Fixed-Combination(s)

Activella: estradiol/norethindrone (hormone): 1 mg/0.5 mg. **Climara PRO:** estradiol/levonorgestrel (progestin): 0.045 mg/24 hr, 0.015 mg/24 hr. **Combi-patch:** estradiol/norethindrone (hormone): 0.05 mg/0.14 mg, 0.05 mg/0.25 mg. **Femhrt:** estradiol/norethindrone (hormone): 5 mcg/1 mg. **Lunelle:** estradiol/medroxy-progesterone (progestin): 5 mg/25 mg per 0.5 mL.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Estrogen.

CLINICAL: Estrogen, antineoplastic.

■ **BLACK BOX ALERT** ■ Increased risk of dementia when given to women 65 yrs and older. Use of estrogen without progestin increases risk of endometrial cancer in postmenopausal women with intact uterus. Increased risk of invasive breast cancer in postmenopausal women using conjugated estrogens with medroxyPROGESTERone. Do not use to prevent cardiovascular disease or dementia.

Do not confuse Alora with Aldara, or Estraderm with Testoderm.

Uses

Treatment of moderate to severe vasomotor symptoms associated with menopause, vulvar and vaginal atrophy associated with menopause, hypoestrogenism (due to castration, hypogonadism, primary ovarian failure), metastatic breast cancer (palliation) in men and postmenopausal women, advanced prostate cancer (palliation), prevention of osteoporosis in postmenopausal women.

Precautions

Contraindications: Hypersensitivity to estradiol, angioedema, hepatic dysfunction or disease, undiagnosed abnormal vaginal bleeding, active or history of arterial thrombosis, estrogen-dependent cancer (known, suspected, or history of), known or suspected breast cancer (except for pts being treated for metastatic disease), pregnancy, thrombophlebitis or thromboembolic disorders (current or history of), known protein C, protein S, antithrombin deficiency or other known thrombophilic disorder. **Cautions:** Renal insufficiency, diabetes mellitus,

endometriosis, severe hypocalcemia, hyperlipidemias, asthma, epilepsy, migraines, SLE, hypertension, hypocalcemia, hypothyroidism, history of jaundice due to past estrogen use or pregnancy, cardiovascular disease, obesity, porphyria, severe hypocalcemia.

Action

Modulates pituitary secretion of gonadotropins; follicle-stimulating hormone (FSH), luteinizing hormone (LH). **Therapeutic Effect:** Promotes normal growth/development of female sex organs.

Pharmacokinetics

Well absorbed from GI tract. Widely distributed. Protein binding: 50%–80%. Metabolized in liver. Primarily excreted in urine. **Half-life:** Unknown.

Lifespan considerations

Pregnancy/Lactation: Contraindicated during pregnancy. Breastfeeding not recommended. **Children:** Caution in pts for whom bone growth is not complete (may accelerate epiphyseal closure). **Elderly:** May increase risk of new-onset dementia.

Interactions

DRUG: CYP3A4 inducers (e.g., carbamazepine, rifampin) may decrease concentration/effects. CYP3A4 inhibitors (e.g., ketoconazole, ritonavir) may increase concentration/effect. **HERBAL:** Avoid black cohosh, dong quai, saw palmetto; may enhance toxic/adverse effects. St. John's wort may decrease concentration/effects of estrogens. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, calcium, HDL, triglycerides. May decrease serum cholesterol, LDL. May affect metoprolol testing, thyroid function tests.

Availability (Rx)

Cream, Topical: 0.4%, 0.6%. **Emulsion, Topical (Estrasorb):** 4.35 mg estradiol/1.74 g pouch (contents of 2 pouches deliver estradiol 0.05 mg/day). **Gel, Topical:(Divigel):** 0.1% (0.25-g packet delivers estradiol 0.25 mg, 0.5 g-

packet delivers estradiol 0.5 mg, 1-g packet delivers 1 mg). **(Elestrin):** 0.06% delivers 0.52 mg estradiol/actuation. **(Estrogel):** 0.06% delivers 0.75 mg/actuation. **Injection (Cypionate):Depo-Estradiol:** 5 mg/mL. **(Valerate):Delestrogen:** 10 mg/mL, 20 mg/mL, 40 mg/mL. **Tablets:** 0.5 mg, 1 mg, 2 mg. **Topical Spray (Evamist):** 1.53 mg/spray. **Transdermal System (Alora):** twice wkly: 0.025 mg/24 hrs, 0.05 mg/24 hrs, 0.075 mg/24 hrs, 0.1 mg/24 hrs. **Transdermal System (Climara):** once wkly: 0.025 mg/24 hrs, 0.0375 mg/24 hrs, 0.05 mg/24 hrs, 0.06 mg/24 hrs, 0.075 mg/24 hrs, 0.1 mg/24 hrs. **Transdermal System (Menostar):** once wkly: 0.014 mg/24 hrs. **Transdermal System (Minivelle, Vivelle-Dot):** twice wkly: 0.025 mg/24 hrs, 0.0375 mg/24 hrs, 0.05 mg/24 hrs, 0.075 mg/24 hrs, 0.1 mg/24 hrs. **Vaginal Cream (Estrace):** 0.1 mg/g. **Vaginal Ring (Estring):** 2 mg (releases 7.5 mcg/day over 90 days). **Vaginal Ring (Femring):** 0.05 mg/day (total estradiol 12.4 mg-release 0.05 mg/day over 3 mos); 0.1 mg/day (total estradiol 24.8 mg-release 0.1 mg/day over 3 mos). **Vaginal Tablet (Vagifem):** 10 mcg.

Administration/handling

IM

- Rotate vial to disperse drug in solution.
- Inject deep IM in large muscle mass.

PO

- Administer at same time each day.
- Administer with food.

Transdermal

- Remove old patch; select new site (buttocks are alternative application site).
- Peel off protective strip to expose adhesive surface.
- Apply to clean, dry, intact skin on trunk of body (area with as little hair as possible).
- Press in place for at least 10 sec (do not apply to breasts or waistline).

Vaginal

- Apply at bedtime for best absorption.
- Insert end of filled applicator into vagina, directed slightly toward sacrum;

push plunger down completely.

- Avoid skin contact with cream (prevents skin absorption).

Indications/routes/dosage

Prostate Cancer

IM (*Delestrogen*):ADULTS, ELDERLY: 30 mg or more q1–2wks.

PO: ADULTS, ELDERLY: 1–2 mg tid for at least 3 mos.

Breast Cancer

PO: ADULTS, ELDERLY: 10 mg 3 times/day for at least 3 mos.

Osteoporosis Prophylaxis in Postmenopausal Females

PO: ADULTS, ELDERLY: 0.5 mg/day cyclically (3 wks on, 1 wk off).

Transdermal (*Climara*):ADULTS, ELDERLY: Initially, 0.025 mg/24 hrs wkly; adjust dose as needed.

Transdermal (*Alora, Minivelle, Vivelle-Dot*):ADULTS, ELDERLY: Initially, 0.025 mg/24 hrs patch twice wkly; adjust dose as needed.

Transdermal (*Menostar*):ADULTS, ELDERLY: 0.014 mg/24 hrs patch wkly.

Female Hypoestrogenism

PO: ADULTS, ELDERLY: 1–2 mg/day; adjust dose as needed.

IM (*Depo-Estradiol*):ADULTS, ELDERLY: 1.5–2 mg monthly.

IM (*Delestrogen*):ADULTS, ELDERLY: 10–20 mg q4wks.

Transdermal (*Alora, Climara, Vivelle-Dot*): See dose in Availability section.

Vasomotor Symptoms Associated with Menopause

PO: ADULTS, ELDERLY: 1–2 mg/day cyclically (3 wks on, 1 wk off); adjust dose as needed.

IM (*Depo-Estradiol*):ADULTS, ELDERLY: 1–5 mg q3–4wks.

IM (*Delestrogen*):ADULTS, ELDERLY: 10–20 mg q4wks.

Topical Emulsion (*Estrasorb*):ADULTS, ELDERLY: 3.48 g (contents of 2 pouches) once daily in the morning.

Topical Gel (*Estrogel*):ADULTS, ELDERLY: 1.25 g/day.

Transdermal Spray (*Evamist*): Initially, 1 spray daily. May increase to 2–3

sprays daily.

Transdermal (*Climara*):ADULTS, ELDERLY: 0.025 mg/24 hrs wkly. Adjust dose as needed.

Transdermal: ADULTS, ELDERLY: (*Alora*): 0.05 mg/24 hrs twice wkly.
(*Vivelle-Dot*): 0.0375 mg/24 hrs twice wkly.

Vaginal Ring (*Femring*):ADULTS, ELDERLY: 0.05 mg. May increase to 0.1 mg if needed.

Vulvar and Vaginal Atrophy Associated with Menopause

IM (*Delestrogen*): ADULTS, ELDERLY: 10–20 mg q4wks.

Vaginal Ring (*Femring*): Initially 0.05 mg. Usual dose: 0.05–0.1 mg q3mos.

PO (*Estrace*): 1–2 mg/day 3 wks on and 1 wk off.

Topical Gel (*Estrogel*): 1.25 g/day at same time each day.

Transdermal (*Alora, Climara, Vivelle-Dot*): See dose in availability section).

Vaginal Ring (*Estring*):ADULTS, ELDERLY: 2 mg.

Vaginal Cream (*Estrace*): Insert 2–4 g/day intravaginally for 2 wks, then reduce dose to half of initial dose for 2 wks, then maintenance dose of 1 g 1–3 times/wk.

Vaginal Tablet (*Vagifem*):ADULTS, ELDERLY: Initially, 1 tablet/day for 2 wks. **Maintenance:** 1 tablet twice wkly.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Contraindicated.

Side effects

Frequent: Anorexia, nausea, swelling of breasts, peripheral edema marked by swollen ankles and feet. **Transdermal:** Skin irritation, redness. **Occasional:** Vomiting (esp. with high doses), headache (may be severe), intolerance to contact lenses, hypertension, glucose intolerance, brown spots on exposed skin. **Vaginal:** Local irritation, vaginal discharge, changes in vaginal bleeding (spotting, breakthrough, prolonged bleeding). **Rare:** Chorea (involuntary movements), hirsutism (abnormal hairiness), loss of scalp hair, depression.

Adverse effects/toxic reactions

Prolonged administration increases risk of gallbladder disease, thromboembolic disease, breast/cervical/vaginal/endometrial/hepatic carcinoma. Cholestatic jaundice occurs rarely.

Nursing considerations

Baseline assessment

Assess frequency/severity of vasomotor symptoms. Question medical history as listed in Precautions. Question for possibility of pregnancy (contraindicated).

Intervention/evaluation

Monitor B/P, weight, serum calcium, glucose, LFT. Monitor for loss of vision, sudden onset of proptosis, diplopia, migraine, thromboembolic disorders.

Patient/family teaching

- Limit alcohol, caffeine.
- Avoid grapefruit products.
- Immediately report sudden headache, vomiting, disturbance of vision/speech, numbness/weakness of extremities, chest pain, calf pain, shortness of breath, severe abdominal pain, mental depression, unusual bleeding.
- Avoid smoking.
- Report abnormal vaginal bleeding.
- Never place patch on breast or waistline.

eszopiclone

e-zop-i-klone

TOP
100

Lunesta

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Nonbenzodiazepine (Schedule IV).

CLINICAL: Hypnotic.

Do not confuse Lunesta with Neulasta.

Uses

Treatment of insomnia.

Precautions

Contraindications: Hypersensitivity to eszopiclone. **Cautions:** Hepatic impairment, compromised respiratory function, COPD, sleep apnea, clinical depression, suicidal ideation, history of drug dependence; concomitant CNS depressants, strong CYP3A4 inhibitors (e.g., ketoconazole); elderly.

Action

May interact with GABA-receptor complexes at binding domains located close to or allosterically coupled to benzodiazepine receptors. **Therapeutic Effect:** Prevents insomnia, difficulty maintaining normal sleep.

Pharmacokinetics

Rapidly absorbed following PO administration. Protein binding: 52%–59%. Metabolized in liver. Excreted in urine. **Half-life:** 5–6 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Pts with impaired motor or cognitive performance may require dosage adjustment.

Interactions

DRUG: Alcohol, anticonvulsants (e.g., carbamazepine, phenytoin), antihistamines (e.g., diphenhydramine), other CNS depressants may increase CNS depression. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration/toxicity. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** Onset of action may be reduced if taken with or immediately after a high-fat meal. **LAB VALUES:** None known.

Availability (Rx)

 **Tablets, Film-Coated:** 1 mg, 2 mg, 3 mg.

Administration/handling

PO

- Should be administered immediately before bedtime.
- Do not give with or immediately following a high-fat or heavy meal.
- Do not break, crush, dissolve, or divide tablet.

Indications/routes/dosage

Insomnia

PO: ADULTS: 1 mg before bedtime. **Maximum:** 3 mg. **Concurrent use with CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, azole antifungals):** 1 mg before bedtime; if needed, dose may be increased to 2 mg. **ELDERLY, DEBILITATED PTS:** Initially, 1 mg before bedtime. **Maximum:** 2 mg.

Sleep Maintenance Difficulty

PO: ADULTS: 2 mg before bedtime.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution. Initially, 1 mg immediately before bedtime. **Maximum:** 2 mg.

Side effects

Frequent (34%–21%): Unpleasant taste, headache. **Occasional (10%–4%):** Drowsiness, dry mouth, dyspepsia, dizziness, nervousness, nausea, rash, pruritus, depression, diarrhea. **Rare (3%–2%):** Hallucinations, anxiety, confusion, abnormal dreams, decreased libido, neuralgia.

Adverse effects/toxic reactions

Chest pain, peripheral edema occur occasionally.

Nursing considerations

Baseline assessment

Assess B/P, pulse, respirations. Raise bed rails, provide call light. Provide environment conducive to sleep (quiet environment, low or no lighting). Question usual sleep patterns. Initiate fall precautions. Screen for other conditions affecting sleep (e.g., stress, depression, hyperactivity, drug abuse).

Intervention/evaluation

Assess sleep pattern of pt. Evaluate for therapeutic response (decrease in number of nocturnal awakenings, increase in length of sleep).

Patient/family teaching

- Take only when experiencing insomnia. Do not take when insomnia is not present.
- Do not break, chew, crush, dissolve, or divide tablet. Take whole.
- Avoid alcohol.
- At least 8 hrs must be devoted for sleep time before daily activity begins.
- Take immediately before bedtime.
- Report insomnia that worsens or persists longer than 7–10 days, abnormal thoughts or behavior, memory loss, anxiety.

etanercept

e-tan-er-sept

TOP
100

Enbrel

Enbrel SureClick

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Protein, TNF inhibitor.

CLINICAL: Antiarthritic.

■ **BLACK BOX ALERT** ■ Serious, potentially fatal infections, including bacterial sepsis, tuberculosis, have occurred. Lymphomas, other malignancies may occur (reported in children/adolescents).

Do not confuse Enbrel with Levbid.

Uses

Treatment of moderate to severely active rheumatoid arthritis (RA). Treatment of moderately to severely active polyarticular juvenile idiopathic arthritis (JIA), ankylosing spondylitis, psoriatic arthritis. Treatment of chronic, moderate to severe plaque psoriasis. **OFF-LABEL:** Treatment of acute graft-versus-host disease.

Precautions

Contraindications: Hypersensitivity to etanercept. Serious active infection or sepsis. **Cautions:** History of recurrent infections, illnesses that predispose to infection (e.g., diabetes, travel from areas of endemic mycosis). History of HF, decreased left ventricular function, significant hematologic abnormalities; moderate to severe alcoholic hepatitis, elderly, preexisting or recent-onset CNS demyelinating disorder.

Action

Binds to tumor necrosis factor (TNF), blocking its interaction with cell surface receptors. Elevated levels of TNF, involved in inflammatory and immune responses, are found in synovial fluid of rheumatoid arthritis pts. **Therapeutic Effect:** Relieves symptoms of arthritis, psoriasis, spondylitis.

Pharmacokinetics

Well absorbed after subcutaneous administration. **Half-life:** 72–132 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** No age-related precautions noted in pts 4 yrs and older. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Anakinra may increase risk of infection. Use of **live virus vaccines** may potentiate virus replication, increase vaccine side effect, decrease pt's antibody response to vaccine. **HERBAL: Echinacea** may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin.

Availability (Rx)

Injection, Solution (Prefilled Syringe): 25 mg/0.5 mL, 50 mg/mL. **Injection, Solution (Autoinjector):** 50 mg/mL. **Solution, Reconstituted:** 25 mg.

Administration/handling

◀ALERT▶ Do not add other medications to solution. Do not use filter during reconstitution or administration.

Subcutaneous

- Refrigerate prefilled syringes.
- Inject into thigh, abdomen, upper arm. Rotate injection sites.
- Give new injection at least 1 inch from an old site and never into area where skin is tender, bruised, red, hard.
- Once reconstituted, may be stored in vial for up to 14 days refrigerated.

Indications/routes/dosage

Rheumatoid Arthritis (RA), Psoriatic Arthritis, Ankylosing Spondylitis

SQ: ADULTS, ELDERLY: 25 mg twice wkly given 72–96 hrs apart or 50 mg once wkly. **Maximum:** 50 mg/wk.

Juvenile Rheumatoid Arthritis (JIA)

SQ: CHILDREN 2–17 YRS: (63 kg or greater): 50 mg once weekly. (Less than 63 kg): 0.8 mg/kg once weekly. **Maximum:** 50 mg/dose.

Plaque Psoriasis

SQ: ADULTS, ELDERLY: 50 mg twice wkly (give 3–4 days apart) for 3 mos.

(25 mg or 50 mg once wkly have also been used.) **Maintenance:** 50 mg once wkly. **CHILDREN 4 YRS AND OLDER (63 kg or greater):** 50 mg once weekly. **(Less than 63 kg):** 0.8 mg/kg once wkly. **Maximum dose:** 50 mg/wk.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (37%): Injection site erythema, pruritus, pain, swelling; abdominal pain, vomiting (more common in children than adults). **Occasional (16%–4%):** Headache, rhinitis, dizziness, pharyngitis, cough, asthenia, abdominal pain, dyspepsia. **Rare (less than 3%):** Sinusitis, allergic reaction.

Adverse effects/toxic reactions

Infection (pyelonephritis, cellulitis, osteomyelitis, wound infection, leg ulcer, septic arthritis, diarrhea, bronchitis, pneumonia) occurs in 29%–38% of pts. Rare adverse effects include heart failure, hypertension, hypotension, pancreatitis, GI hemorrhage.

Nursing considerations

Baseline assessment

Assess onset, type, location, duration of pain, inflammation. If significant exposure to varicella virus has occurred during treatment, therapy should be temporarily discontinued and treatment with varicella-zoster immune globulin should be considered. Screen for active infection. Question history as listed in Precautions. Question travel history.

Intervention/evaluation

Assess for improvement of joint swelling, pain, tenderness. Monitor erythrocyte sedimentation rate (ESR), C-reactive protein level, CBC with differential, platelet count. Observe for signs of infection.

Patient/family teaching

- Instruct pt in subcutaneous injection technique, including areas of body acceptable as injection sites.
- Injection site reaction generally occurs in first mo of treatment and decreases in frequency during continued therapy.
- Do not receive live vaccines during treatment.
- Report persistent fever, bruising, bleeding, pallor.

ethambutol

eth-**am**-bue-tol

Etibi 

Myambutol

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Isonicotinic acid derivative.

CLINICAL: Antitubercular.

Uses

In conjunction with other antitubercular agents for treatment of pulmonary tuberculosis. **OFF-LABEL:** Treatment of atypical mycobacterial infections (e.g., *Mycobacterium avium* complex [MAC]).

Precautions

Contraindications: Hypersensitivity to ethambutol. Optic neuritis (risk-versus-benefit decision). Use in young children, unconscious pts, or anyone unable to report visual changes. **Cautions:** Renal/hepatic dysfunction, ocular defects (diabetic retinopathy, cataracts), recurrent ocular inflammatory conditions. Not recommended for children 13 yrs and younger (unless benefit outweighs risk).

Action

Inhibits arabinosyl transferase, causing impaired mycobacterial cell wall synthesis. **Therapeutic Effect:** Suppresses multiplication of mycobacteria.

Pharmacokinetics

Rapidly, well absorbed from GI tract. Protein binding: 20%–30%. Widely distributed. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 3–4 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 13 yrs. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Aluminum hydroxide may decrease concentration/effect. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum uric acid.

Availability (Rx)

Tablets: 100 mg, 400 mg.

Administration/handling

PO

- May be crushed and mixed with apple juice or applesauce.
- Administer at least 4 hrs before giving aluminum hydroxide.
- Give with food (decreases GI upset).

Indications/routes/dosage

Tuberculosis

PO: ADULTS, ELDERLY: Initially, 15 mg/kg once daily. (**maximum:** 1.5 g/day). Retreatment: 25 mg/kg once daily (**maximum:** 2.5 g/day) for 60 days or until bacteriologic smears/cultures become negative, then 15 mg/kg once daily. **CHILDREN: (HIV negative):** 15–20 mg/kg/day (**maximum:** 1 g/day) or 50 mg/kg twice wkly (**maximum:** 2.5 g/dose). **(HIV exposed/infected):** 15–25 mg/kg/day. **Maximum:** 2.5 g/day.

Dosage in Renal Impairment

Dosage interval is modified based on creatinine clearance.

Creatinine Clearance	Dosage
10–50 mL/min	q24–36h
Less than 10 mL/min	q48h
Hemodialysis	Administer post HD
Peritoneal dialysis	Administer q48h
Continuous renal replacement therapy	Administer q24–36h

Dosage in Hepatic Impairment

Use caution.

Side effects

Occasional: Acute gouty arthritis (chills, pain, swelling of joints with hot skin), confusion, abdominal pain, nausea, vomiting, anorexia, headache. **Rare:** Rash, fever, blurred vision, red-green color blindness.

Adverse effects/toxic reactions

Optic neuritis (more common with high-dosage, long-term therapy), peripheral neuritis, thrombocytopenia, anaphylactoid reaction occur rarely.

Nursing considerations

Baseline assessment

Evaluate baseline CBC, renal function, LFT, and monitor periodically. Obtain baseline visual acuity.

Intervention/evaluation

Assess for vision changes (altered color perception, decreased visual acuity may be first signs). Give with food if GI distress occurs. Monitor serum uric acid. Assess for hot, painful, swollen joints, esp. great toe, ankle, knee (gout). Report numbness, tingling, burning of extremities (peripheral neuritis).

Patient/family teaching

- Do not skip doses; take for full length of therapy (may take mos or yrs).
- Immediately report any visual changes (visual effects generally reversible with discontinuation of etoposide but in rare cases may take up to 1 yr to disappear or may be permanent).
- Promptly report swelling or pain of joints, numbness or tingling/burning of extremities, fever, chills.

etoposide, VP-16

e-toe-poe-side

HIGH
ALERT

Etopophos

Toposar

VePesid

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Topoisomerase II inhibitor.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Severe myelosuppression with resulting infection, bleeding may occur. Must be administered by personnel trained in administration/handling of chemotherapeutic agents.

Do not confuse etoposide with etidronate, or VePesid with Pepcid or Versed.

Uses

Treatment of refractory testicular tumors, small-cell lung carcinoma. **OFF-LABEL:** Acute lymphocytic, acute nonlymphocytic leukemias; Ewing's and Kaposi's sarcoma; Hodgkin's and non-Hodgkin's lymphomas; endometrial, gastric, non-small-cell lung carcinomas; multiple myeloma; myelodysplastic syndromes; neuroblastoma; osteosarcoma; ovarian germ cell tumors; primary brain, gestational trophoblastic tumors; soft tissue sarcomas; Wilms tumor.

Precautions

Contraindications: Hypersensitivity to etoposide. **Cautions:** Hepatic/renal

impairment, myelosuppression, elderly, pts with low serum albumin.

Action

Induces single- and double-stranded breaks in DNA. Cell cycle–dependent and phase-specific; most effective in S and G₂ phases of cell division. **Therapeutic Effect:** Inhibits, alters DNA synthesis.

Pharmacokinetics

Variably absorbed from GI tract. Rapidly distributed, low concentrations in CSF. Protein binding: 97%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–12 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Bone marrow depressants may increase myelosuppression. **Live-virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea, St. John's wort may decrease concentration. **FOOD:** None known. **LAB VALUES:** Expected decrease of leukocytes, platelets, RBC, Hgb, Hct.

Availability (Rx)

Capsules: 50 mg. **Injection, Powder for Reconstitution (Etopophos):** 100 mg. **Injection Solution (Toposar):** 20 mg/mL (5 mL, 25 mL, 50 mL).

Administration/handling

 Administer by slow IV infusion. Wear gloves when preparing solution. If powder or solution comes in contact with skin, wash immediately and thoroughly with soap, water. May be carcinogenic, mutagenic, teratogenic.

Handle with extreme care during preparation, administration.

IV

Reconstitution

Toposar

- Dilute to a concentration of 0.2–0.4 mg/mL in D₅W or 0.9% NaCl.

Etopophos

- Reconstitute each 100 mg with 5–10 mL Sterile Water for Injection, D₅W, or 0.9% NaCl to provide concentration of 20 mg/mL or 10 mg/mL, respectively.
- May give without further dilution or further dilute to concentration as low as 0.1 mg/mL with 0.9% NaCl or D₅W.

Rate of administration

Toposar

- Infuse slowly, at least 30–60 min (rapid IV may produce marked hypotension) at a rate not to exceed 100 mg/m²/hr.
- Monitor for anaphylactic reaction during infusion (chills, fever, dyspnea, diaphoresis, lacrimation, sneezing, throat, back, chest pain).

Etopophos

- May give over as little as 5 min up to 210 min.

Storage

Toposar

- Store injection at room temperature before dilution.
- Concentrate for injection is clear, yellow.
- Diluted solution is stable at room temperature for 96 hrs at 0.2 mg/mL, 24 hrs at 0.4 mg/mL.
- Discard if crystallization occurs.

Etopophos

- Refrigerate vials.
- Stable at room temperature for 24 hrs or for 7 days if refrigerated after reconstitution.

PO

Storage

- Refrigerate gelatin capsules.

■ IV incompatibilities

VePesid: Cefepime (Maxipime), filgrastim (Neupogen). **Etopophos:** Amphotericin B (Fungizone), cefepime (Maxipime), chlorproMAZINE (Thorazine), methylPREDNISolone (Solu-Medrol), prochlorperazine (Compazine).

■ IV Compatibilities

VePesid: CARBOplatin (Paraplatin), CISplatin (Platinol), cytarabine (Cytosar), DAUNOrubicin (Cerubidine), DOXOrubicin (Adriamycin), granisetron (Kytril), mitoXANTRONE (Novantrone), ondansetron (Zofran). **Etopophos:** CARBOplatin (Paraplatin), CISplatin (Platinol), cytarabine (Cytosar), dacarbazine (DTIC-Dome), DAUNOrubicin (Cerubidine), dexamethasone (Decadron), diphenhydrAMINE (Benadryl), DOXOrubicin (Adriamycin), granisetron (Kytril), magnesium sulfate, mannitol, mitoXANTRONE (Novantrone), ondansetron (Zofran), potassium chloride.

Indications/routes/dosage

◀ALERT▶ Dosage individualized based on clinical response, tolerance to adverse effects. Treatment repeated at 3- to 4-wk intervals. Refer to individual protocols.

Refractory Testicular Tumors

IV: ADULTS: 50–100 mg/m²/day on days 1–5, or 100 mg/m²/day on days 1, 3, 5 (as combination therapy). Give q3–4wks for 3–4 courses.

Small-Cell Lung Carcinoma

PO: ADULTS: Twice the IV dose rounded to nearest 50 mg. Give once daily for doses 200 mg or less, in divided doses for dosages greater than 200 mg.

IV: ADULTS: 35 mg/m²/day for 4 consecutive days up to 50 mg/m²/day for 5 consecutive days q3–4wks (as combination therapy).

Dosage in Renal Impairment

Creatinine Clearance	Dosage
15–50 mL/min	75% of normal dose

Less than 15 mL/min	Consider further dose reduction.
---------------------	----------------------------------

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (66%–43%): Mild to moderate nausea/vomiting, alopecia.

Occasional (13%–6%): Diarrhea, anorexia, stomatitis. **Rare (2% or less):**

Hypotension, peripheral neuropathy.

Adverse effects/toxic reactions

Myelosuppression manifested as hematologic toxicity, principally anemia, leukopenia (occurring 7–14 days after drug administration), thrombocytopenia (occurring 9–16 days after administration), and, to lesser extent, pancytopenia. Bone marrow recovery occurs by day 20. Hepatotoxicity occurs occasionally.

Nursing considerations

Baseline assessment

Obtain CBC before and at frequent intervals during therapy. Antiemetics readily control nausea, vomiting. Offer emotional support.

Intervention/evaluation

Monitor CBC, B/P, hepatic/renal function tests. Monitor daily pattern of bowel activity, stool consistency. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bruising/bleeding from any site), symptoms of anemia (excessive fatigue, weakness). Assess for paresthesia (peripheral neuropathy). Monitor for stomatitis.

Patient/family teaching

- Hair loss is reversible, but new hair growth may have different color, texture.
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.

- Promptly report fever, sore throat, signs of local infection, unusual bruising or bleeding from any site, burning or pain with urination, numbness in extremities, yellowing of skin or eyes.

everolimus

e-veer-oh-li-mus

TOP
100

Afinitor

Afinitor Disperz

Zortress

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Enzyme inhibitor.

CLINICAL: Antineoplastic, immunosuppressant.

■ **BLACK BOX ALERT** ■ Immunosuppressant (may result in infection, malignancy including lymphoma or skin cancer); increased risk of nephrotoxicity in renal transplants (avoid standard doses of cycloSPORINE); increased risk of renal arterial or venous thrombosis in renal transplants.

Do not confuse Afinitor with Lipitor, or everolimus with sirolimus, tacrolimus, or temsirolimus.

Uses

Afinitor: Treatment of advanced renal cell carcinoma after failure of treatment with SUNItinib or SORAFenib. Treatment of subependymal giant cell astrocytoma (SEGA) associated with tuberous sclerosis. Treatment of progressive neuroendocrine tumors of pancreatic origin and progressive, well-differentiated, non-functional neuroendocrine tumors of GI or lung origin. Treatment of advanced hormone receptor–positive, HER2-negative breast cancer in postmenopausal women. Treatment of tuberous sclerosis complex (TSC) not requiring immediate surgery. **Afinitor Disperz:** Treatment of SEGA associated with TSC requiring intervention but that cannot be curatively resected. **Zortress:** Prophylaxis of organ rejection after kidney/liver transplant at low to moderate immunologic risk. **OFF-LABEL:** Relapsed or refractory Waldenström’s macroglobulinemia. Treatment of progressive advanced carcinoid tumors.

Precautions

Contraindications: Hypersensitivity to everolimus, sirolimus, other rapamycin derivatives. **Cautions:** Noninfectious pneumonitis; viral, fungal, or bacterial infection; oral ulceration; mucositis; current immunosuppression; hereditary galactose intolerance; renal/hepatic impairment; hyperlipidemia; concurrent use of CYP3A4 inducers and inhibitors. Medications known to cause angioedema.

Action

Binds to the FK binding protein, reducing protein synthesis and cell proliferation. Also reduces lipoma volume. **Therapeutic Effect:** Reduces cell proliferation, produces cell death.

Pharmacokinetics

Peak concentration occurs in 1–2 hrs following administration, with steady-state levels achieved in 2 wks. Undergoes extensive hepatic metabolism. Protein binding: 74%. Eliminated in feces (80%), urine (5%). **Half-life:** 30 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy during treatment and for up to 8 wks after discontinuation. Breastfeeding not recommended during treatment and for up to 2 wks after discontinuation. May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, ritonavir) may increase concentration. CYP3A4 inducers (e.g., carbamazepine, dexamethasone, phenytoin, rifampin) may decrease concentration. P-gp inhibitors (e.g., cyclosporine) may increase everolimus concentration, toxicity. Statins (e.g., simvastatin) may increase risk of rhabdomyolysis. **FOOD:** High-fat meals may reduce plasma concentration. Grapefruit products may increase concentration (potential for myelotoxicity, nephrotoxicity). **HERBAL:** St. John's wort may decrease plasma

concentration. **LAB VALUES:** May increase serum BUN, creatinine, glucose, triglycerides, lipids. May decrease neutrophils, Hgb, platelets.

Availability (Rx)

Tablets (Zortress): 0.25 mg, 0.5 mg, 0.75 mg. **Tablets (Afinitor):** 2.5 mg, 5 mg, 7.5 mg, 10 mg. **Tablets for Oral Suspension (Afinitor Disperz):** 2 mg, 3 mg, 5 mg.

Administration/handling

- Give without regard to food.
- Swallow tablets whole; do not crush/cut Afinitor or Zortress.
- If pt unable to swallow Afinitor tablets, may disperse in water with gentle stirring; give immediately.
- Administer Afinitor Disperz as suspension only. Disperse in water until dissolved.
- Avoid direct contact of dispersed tablet or oral solution with skin or mucous membranes.

Indications/routes/dosage

ALERT If pt requires coadministration of a strong CYP3A4 inducer (e.g., carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin), consider doubling the dose. If strong inducer is discontinued, reduce everolimus to dose used prior to initiation. If moderate CYP3A4 inhibitors are required, reduce dose by 50%.

Renal Carcinoma, Neuroendocrine Tumors, Breast Cancer, TSC

PO: ADULTS, ELDERLY: (Afinitor): 10 mg once daily. **Coadministration with CYP3A4 inhibitors or P-gp inhibitors:** 2.5 mg once daily. May increase to 5 mg/day. **Coadministration with CYP3A4 inducers:** Increase by 5-mg increments up to 20 mg/day.

Renal Transplant Rejection Prophylaxis

PO: ADULTS, ELDERLY: (Zortress): Initially, 0.75 mg 2 times/day. Give in combination with basiliximab and concurrently with reduced doses of

cycloSPORINE and corticosteroids.

Liver Transplant Rejection Prophylaxis (begin at least 30 days post-transplant)

PO: ADULTS, ELDERLY: (Zortress): Initially, 1 mg 2 times/day. Adjust dose at 4–5-day intervals based on serum concentration, tolerability, and response.

SEGA

PO: ADULTS, ELDERLY: Initially, 4.5 mg/m² once daily, titrated to attain trough concentration of 5–15 ng/mL. **If trough greater than 15 ng/mL:** reduce dose by 2.5 mg/day (tablets) or 2 mg/day (tablets for oral suspension). **If trough less than 15 ng/mL:** increase dose by 2.5 mg/day (tablets) or 2 mg/day (tablets for oral suspension).

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

	Mild	Moderate	Severe
Breast Cancer PNET, RCC, renal angiomyolipoma	7.5 mg/day or 5 mg/day	5 mg/day or 2.5 mg/day	2.5 mg/day
Liver/Renal transplant	Reduce dose by 33%	Reduce dose by 50%	Reduce dose by 50%
SEGA	No change	No change	Initial dose 2.5 mg/m ² /day

Side effects

Common (44%–26%): Stomatitis, asthenia. Diarrhea, cough, rash, nausea.
Frequent (25%–20%): Peripheral edema, anorexia, dyspnea, vomiting, pyrexia.
Occasional (19%–10%): Mucosal inflammation, headache, epistaxis, pruritus, dry skin, epigastric distress, extremity pain. **Rare (less than 10%):** Abdominal pain, insomnia, dry mouth, dizziness, paresthesia, eyelid edema, hypertension, nail disorder, chills.

Adverse effects/toxic reactions

Noninfectious pneumonitis characterized as hypoxia, pleural effusion, cough, or dyspnea was reported in 14% of pts; Grade 3 noninfectious pneumonitis reported in 4%. Localized and systemic infections, including pneumonia, other bacterial infections, and invasive fungal infections, have occurred due to everolimus immunosuppressive properties. Renal failure occurs in 3% of pts.

Nursing considerations

Baseline assessment

Assess medical history, esp. renal function, use of other immunosuppressants. Obtain CBC, BMP, LFT before treatment begins and routinely thereafter. Offer emotional support.

Intervention/evaluation

Offer antiemetics to control nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Assess skin for evidence of rash, edema. Monitor CBC, particularly Hgb, platelet, neutrophil count; BUN, creatinine, LFT. Monitor for shortness of breath, fatigue, hypertension. Assess mouth for stomatitis, mucositis.

Patient/family teaching

- Take dose at same time each day.
- Avoid crowds, those with known infection.
- Avoid contact with anyone who recently received live virus vaccine.
- Do not have immunizations without physician's approval (drug lowers body resistance).
- Promptly report fever, unusual bruising/bleeding from any site.
- Avoid direct contact of crushed tablets with skin or mucous membrane (wash thoroughly if contact occurs).
- Avoid grapefruit products.

exemestane

ex-e-**mes**-tane

Aromasin

◆ **CLASSIFICATION**

**HIGH
ALERT**

PHARMACOTHERAPEUTIC: Aromatase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse Aromasin with Arimidex, or exemestane with estramustine.

Uses

Treatment of advanced breast cancer in postmenopausal women whose disease has progressed following tamoxifen therapy. Adjuvant treatment of postmenopausal women with estrogen-receptor positive early breast cancer after 2–3 yrs of tamoxifen therapy for completion of 5 consecutive yrs of adjuvant hormonal therapy. **OFF-LABEL:** Reduces risk of invasive breast cancer in postmenopausal women; treatment of endometrial cancer, uterine sarcoma.

Precautions

Contraindications: Hypersensitivity to exemestane. **Cautions:** Not indicated for use in premenopausal women. Concomitant use of estrogen-containing agents, strong CYP3A4 inducers.

Action

Inactivates aromatase, the principal enzyme that converts androgens to estrogens in both premenopausal and postmenopausal women, lowering circulating estrogen level. **Therapeutic Effect:** Inhibits growth of breast cancers stimulated by estrogens.

Pharmacokinetics

Rapidly absorbed after PO administration. Protein binding: 90%. Distributed extensively into tissues. Metabolized in liver. Excreted in urine and feces. **Half-life:** 24 hrs.

Lifespan considerations

Pregnancy/Lactation: Indicated for postmenopausal women. **Children:** Not indicated for use in this pt population. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inducers (e.g., PHENobarbital, rifAMPin) may decrease concentration/effect. **HERBAL:** St. John's wort may decrease concentration. Avoid black cohosh, dong quai in estrogen-dependent tumors. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST.

Availability (Rx)

Tablets: 25 mg.

Administration/handling

PO

- Give after meals.

Indications/routes/dosage

Breast Cancer (Early)

PO: POSTMENOPAUSAL WOMEN: 25 mg once daily after a meal (following 2–3 yrs tamoxifen therapy) for total duration of 5 yrs (in absence of recurrence or contralateral breast cancer).

Breast Cancer (Advanced)

PO: POSTMENOPAUSAL WOMEN: 25 mg once daily after a meal. 50 mg/day when used concurrently with potent CYP3A4 inducers (e.g., rifAMPin, phenytoin). Continue until tumor progression.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (22%–10%): Fatigue, nausea, depression, hot flashes, pain, insomnia, anxiety, dyspnea. **Occasional (8%–5%):** Headache, dizziness, vomiting, peripheral edema, abdominal pain, anorexia, flu-like symptoms, diaphoresis,

constipation, hypertension. **Rare (4%):** Diarrhea.

Adverse effects/toxic reactions

MI has been reported.

Nursing considerations

BASELINE ASSESSMENT

Question history of cardiac disease. Receive full medication history and screen for interactions. Offer emotional support.

Intervention/evaluation

Monitor for onset of depression. Assess sleep pattern. Monitor for and assist with ambulation if dizziness occurs. Assess for headache. Offer antiemetic for nausea/vomiting.

Patient/family teaching

- Report if nausea, hot flashes become unmanageable.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Best taken after meals and at same time each day.

exenatide

ex-**en**-a-tide

HIGH
ALERT

Bydureon

Bydureon BCise

Byetta

5 mcg Pen

10 mcg Pen

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Glucagon-like peptide-1 (GLP-1) receptor agonist.

CLINICAL: Antidiabetic.

■ **BLACK BOX ALERT** ■ (Bydureon): Risk of thyroid C-cell tumors.

Uses

Adjunct to diet, exercise to improve glycemic control in pts with type 2 diabetes mellitus.

Precautions

Contraindications: Hypersensitivity to exenatide. Bydureon only: History of medullary thyroid carcinoma. Pts with multiple endocrine neoplasia syndrome type 2 (MEN2). **Cautions:** Diabetic ketoacidosis, type 1 diabetes mellitus. Pts with renal transplantation or moderate renal impairment. Not recommended in severe renal impairment, severe GI disease, pancreatitis.

Action

Stimulates release of insulin from beta cells of pancreas, mimics enhancement of glucose-dependent insulin secretion, suppresses elevated glucagon secretion, slows gastric emptying (central action increases satiety). **Therapeutic Effect:** Improves glycemic control by increasing postmeal insulin secretion, decreasing postmeal glucagon levels, delaying gastric emptying, and increasing satiety.

Pharmacokinetics

Minimal systemic metabolism. Eliminated by glomerular filtration with subsequent proteolytic degradation. **Half-life:** 2.4 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May decrease effects of **digoxin, lovastatin**. May increase bleeding time, risk of bleeding when used with **warfarin**. **HERBAL:** None significant.

FOOD: None known. **LAB VALUES:** None known.

Availability (Rx)

Injection, Solution (Prefilled Pen): (Byetta) 10 mcg/0.04 mL (2.4 mL); 5 mcg/0.02 mL (1.2 mL). **Injection, Suspension (Bydureon):** 2 mg. **Injection Pre-filled single dose Auto-injector (Bydureon BCise):** 2 mg in 0.85 ml vehicle.

Administration/handling

Subcutaneous

- May be given in thigh, abdomen, upper arm.
- Rotation of injection sites is essential; maintain careful injection site record.
- Give within 60 min before morning and evening meals. Give suspension immediately after powder is suspended.

Storage

- Refrigerate prefilled pens.
- Discard if freezing occurs.
- May be stored at room temperature after first use.
- Discard pen 30 days after initial use.

Indications/route/dosage

Diabetes Mellitus

SQ: ADULTS, ELDERLY: (Byetta) 5 mcg per dose given twice daily at any time within the 60-min period before the morning and evening meals. Dose may be increased to 10 mcg twice daily after 1 mo of therapy. (Bydureon): 2 mg once q7days.

Dosage in Renal Impairment

Mild impairment: No dose adjustment. **Moderate impairment:** Use caution. **Severe impairment (CrCl less than 30 mL/min or ESRD):** Not recommended.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

(Byetta) Frequent (44%): Nausea. **Occasional (13%–6%):** Diarrhea, vomiting, dizziness, anxiety, dyspepsia. **Rare (less than 6%):** Weakness. **(Bydureon) 5% or greater:** Nausea, diarrhea, headache, constipation, vomiting, dyspepsia, injection site pruritus or nodule.

Adverse effects/toxic reactions

With concurrent sulfonylurea, hypoglycemia occurs in 36% when given a 10-mcg dose of exenatide, 16% when given a 5-mcg dose. May cause acute pancreatitis.

Nursing considerations

Baseline assessment

Check serum glucose before administration. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management, glucose-testing technique. At least 1 mo should elapse to assess response to drug before new dose adjustment is made.

Intervention/evaluation

Monitor serum glucose, food intake, renal function. Assess for hypoglycemia (cool wet skin, tremors, dizziness, anxiety, headache, tachycardia, numbness in mouth, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity or stress, surgical procedure).

Patient/family teaching

- Diabetes mellitus requires lifelong control.
- Prescribed diet and exercise are principal parts of treatment. Do not skip, delay meals.

- Continue to adhere to dietary instructions, regular exercise program, regular testing of serum glucose.
- When taking combination therapy with a sulfonylurea, have source of glucose available to treat symptoms of hypoglycemia.
- Report any unexplained severe abdominal pain with or without nausea or vomiting.

ezetimibe

e-zet-i-mib

TOP
100

Apo-Ezetimibe

Ezetrol 

Zetia

Fixed-Combination(s)

Liptruzet: ezetimibe/atorvastatin (statin): 10 mg/10 mg, 10 mg/20 mg, 10 mg/40 mg, 10 mg/80 mg. **Vytorin:** ezetimibe/simvastatin (statin): 10 mg/10 mg, 10 mg/20 mg, 10 mg/40 mg, 10 mg/80 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antihyperlipidemic.

CLINICAL: Anticholesterol agent.

Do not confuse Zetia with Zebeta or Zestril.

Uses

Adjunct to diet for treatment of primary hypercholesterolemia (monotherapy or in combination with HMG-CoA reductase inhibitors [statins]), homozygous sitosterolemia, homozygous familial hypercholesterolemia (combined with atorvastatin or simvastatin). Mixed hyperlipidemia (in combination with fenofibrate).

Precautions

Contraindications: Hypersensitivity to ezetimibe. Concurrent use of an HMG-CoA reductase inhibitor (atorvastatin, fluvastatin, lovastatin, pravastatin, simvastatin) in pts with active hepatic disease or unexplained persistent

elevations in serum transaminase; pregnancy and breastfeeding (when used with a statin). **Cautions:** Severe renal or mild hepatic impairment. Not recommended in those with moderate or severe hepatic impairment.

Action

Inhibits cholesterol absorption in brush border of small intestine, leading to decrease in delivery of intestinal cholesterol to liver. **Therapeutic Effect:** Reduces total serum cholesterol, LDL, triglycerides; increases HDL.

Pharmacokinetics

Well absorbed following PO administration. Protein binding: greater than 90%. Metabolized in small intestine and liver. Excreted in feces (78%), urine (11%). **Half-life:** 22 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts 10 yrs or younger. **Elderly:** Age-related mild hepatic impairment may require dosage adjustment.

Interactions

DRUG: Antacids containing aluminum or magnesium, cycloSPORINE, fenofibrate, gemfibrozil increase concentration. Cholestyramine resin decreases effectiveness. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST.

Availability (Rx)

Tablets: 10 mg.

Administration/handling

- Give without regard to food.
- May give at same time as statins. Give at least 2 hrs before or 4 hrs after bile acid sequestrants.

Indications/routes/dosage

Hypercholesterolemia

PO: ADULTS, ELDERLY, CHILDREN 10 YRS AND OLDER: Initially, 10 mg once daily, given with or without food. If pt is also receiving a bile acid sequestrant, give ezetimibe at least 2 hrs before or at least 4 hrs after bile acid sequestrant.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Not recommended.

Side effects

Occasional (4%–3%): Back pain, diarrhea, arthralgia, sinusitis, abdominal pain. **Rare (2%):** Cough, pharyngitis, fatigue, depression.

Adverse effects/toxic reactions

Hepatitis, hypersensitivity reaction, myopathy, rhabdomyolysis occur rarely.

Nursing considerations

Baseline assessment

Obtain diet history, esp. fat consumption. Obtain serum cholesterol, triglycerides, hepatic function tests, blood counts during initial therapy and periodically during treatment. Treatment should be discontinued if hepatic enzyme levels persist more than 3 times normal limit. Receive full medication history and screen for interactions. Question history of hepatic/renal impairment.

Intervention/evaluation

Monitor daily pattern of bowel activity, stool consistency. Question pt for

signs/symptoms of back pain, abdominal disturbances. Monitor serum cholesterol, triglycerides for therapeutic response.

Patient/family teaching

- Periodic laboratory tests are essential part of therapy.
- Do not stop medication without consulting physician.
- Report muscular or bone pain.
- May take at same time as statins. Take at least 2 hrs before or 4 hrs after cholestyramine, colestipol, colesevelam.

ezogabine

e-**z**og-a-bine

Potiga

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Potassium channel opener (**Schedule V**).

CLINICAL: Anticonvulsant.

■ **BLACK BOX ALERT** ■ Retinal abnormalities may progress to vision loss.

Uses

Adjunctive therapy for treatment of partial-onset seizures in pts 18 yrs of age and older.

Precautions

Contraindications: Hypersensitivity to ezogabine. **Cautions:** Hepatic/renal impairment, BPH, urinary retention, chronic cognitive impairment, prolonged QT interval, psychiatric history, pts at risk for suicide. Hypokalemia, hypomagnesemia, familial long-QT syndrome, medications that prolong QT interval, hypothyroidism, HF, ventricular arrhythmias, elderly.

Action

Binds to voltage-gated potassium channels, stabilizing the channels in open formation and enhancing the M current. **Therapeutic Effect:** Regulates neuronal excitability, suppressing seizure activity.

Pharmacokinetics

Rapidly absorbed after PO administration. Peak concentration: 0.5–2 hrs. Protein binding: 80%. Metabolized by glucuronidation and acetylation. Primarily excreted in urine (85%), feces (14%). **Half-life:** 7–11 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Must either discontinue breastfeeding or discontinue drug regimen. **Children:** Safety and efficacy not established in pts under 18 yrs of age. **Elderly:** Dosage adjustment recommended for pts older than 65 yrs.

Interactions

DRUG: Phenytoin, carbamazepine may decrease plasma concentration/effects. Alcohol may increase concentration/adverse effects. May inhibit clearance of digoxin. **HERBAL:** None known. **FOOD:** None significant. **LAB VALUES:** May create falsely elevated urine bilirubin level.

Availability (Rx)

Tablets: 50 mg, 200 mg, 300 mg, 400 mg.

Administration/handling

- May give without regard to food. Swallow tablets whole.

Indications/routes/dosage

Partial Seizures

 Increase at wkly intervals by no more than 50 mg 3 times daily (150 mg/day).

PO: ADULTS: Initially, 100 mg 3 times daily. May increase to maintenance

dose of 200–400 mg 3 times daily (600–1,200 mg daily). **Maximum:** 1,200 mg/day. **ELDERLY:** Initially, 50 mg 3 times/day. May increase wkly to therapeutic level. **Maximum:** 250 mg 3 times/day (750 mg/day). Discontinuation: Reduce gradually over period of at least 3 wks.

Dosage in Renal Impairment

CrCl less than 50 mL/min or ESRD: 50 mg 3 times/day for 7 days, then increase dose to therapeutic level. **Maximum:** 200 mg 3 times/day (600 mg/day).

Dosage in Hepatic Impairment

Mild Impairment (Child-Pugh score less than 9): 50 mg 3 times/day for 7 days, then increase dose to therapeutic level. **Maximum:** 250 mg 3 times/day (750 mg/day). **Severe Hepatic Impairment (Child-Pugh score greater than 9):** 50 mg 3 times/day for 7 days, then increase dose to therapeutic level. **Maximum:** 200 mg 3 times/day (600 mg/day).

Side effects

Frequent (23%–15%): Dizziness, somnolence, fatigue. **Occasional (8%–4%):** Tremor, vertigo, abnormal coordination, nausea, diplopia, attention disturbance, memory impairment, asthenia, blurred vision, gait disturbance, aphasia, dysarthria, balance disorder. **Rare (3%–1%):** Constipation, anxiety, weight gain, dyspepsia, amnesia, dysphasia, disorientation, dysuria, urinary hesitation, hematuria, urine discoloration, psychotic behavior.

Adverse effects/toxic reactions

Urinary retention requiring catheterization, prolonged QT interval, myoclonus, peripheral edema, hypokinesia, dysphasia, hyperhidrosis, malaise reported in less than 2% of pts. Hydronephrosis associated with baseline renal impairment, increased risk of psychosis, hallucinations, suicidal ideation, depression, aggression, mania noted.

Nursing considerations

Baseline assessment

Review history of seizure disorder (intensity, frequency, duration, LOC). Question history of BPH, urinary retention, cognitive impairment, psychiatric disorder, hepatic/renal impairment, alcoholism, prolonged QT syndrome. Obtain full medication history including digoxin, antiarrhythmics, adjunct anticonvulsant therapy. Obtain baseline EKG, digoxin level if applicable. Question possibility of pregnancy or current breastfeeding.

Intervention/evaluation

Initiate seizure precautions and observe for seizure activity. Assist with ambulation if dizziness occurs. Monitor for depression, suicidal ideation, unusual behavior, mania, anxiety. Routinely monitor digoxin levels. Monitor QT interval for pts with HF, ventricular hypertrophy, hypokalemia, hypomagnesemia.

Patient/family teaching

- Monitor closely for seizure activity.
- Immediately report any new medications, trouble urinating, palpitations, pregnancy, or plans to breastfeed.
- Avoid alcohol.
- Report any thoughts of suicide, aggressive behavior, depression, anxiety, trouble sleeping, impulsiveness, unusual behavior.
- Noncompliance may lead to increased risk of seizures.

 Canadian trade name

 Non-Crushable Drug

 High Alert drug

underlined underlined – top prescribed drug

F

famciclovir

fam-sye-klo-veer

Apo-Famciclovir 

Famvir

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Synthetic nucleoside.

CLINICAL: Antiviral.

Do not confuse famciclovir with acyclovir, ganciclovir, or valGANCiclovir; or Famvir with Femara.

Uses

Treatment of acute herpes zoster (shingles) in immunocompetent pts, treatment and suppression of recurrent genital herpes in immunocompetent pts, treatment of recurrent mucocutaneous herpes simplex in HIV-infected pts. Treatment of recurrent herpes labialis (cold sores) in immunocompetent pts.

Precautions

Contraindications: Hypersensitivity to famciclovir, penciclovir. **Cautions:** Renal impairment. Avoid use in galactose intolerance, severe lactose deficiency, or glucose-galactose malabsorption syndromes.

Action

Inhibits HSV-2 polymerase, inhibiting herpes viral DNA synthesis and replication. **Therapeutic Effect:** Suppresses replication of herpes simplex virus, varicella-zoster virus. Shortens healing time of herpes zoster lesions. Reduces

symptom severity of genital herpes.

Pharmacokinetics

Rapidly absorbed. Protein binding: 20%–25%. Rapidly metabolized to penciclovir by enzymes in GI tract, liver, plasma. Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 2–3 hrs (increased in severe renal failure).

Lifespan considerations

Pregnancy/Lactation: Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Probenecid, methotrexate may increase adverse effects. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, amylase, bilirubin, lipase. May decrease neutrophils, platelets.

Availability (Rx)

Tablets: 125 mg, 250 mg, 500 mg.

Administration/handling

PO

- Give without regard to meals.
- Give with food to decrease GI distress.

Indications/routes/dosage

Herpes Zoster (Shingles)

PO:ADULTS: 500 mg q8h for 7 days. Begin as soon as possible after diagnosis and within 72 hrs of rash onset. **(HIV pts):** 500 mg 3 times/day for 7–10 days.

Genital Herpes Simplex (Initial)

PO:ADULTS: 250 mg 3 times/day for 7–10 days.

Genital Herpes Simplex (Recurrence)

PO:ADULTS: 1,000 mg twice daily for 1 day; or 125 mg 2 times/day for 5 days; or 500 mg once, then 250 mg 2 times/day for 2 days.

Genital Herpes Simplex (Suppression)

PO:ADULTS: 250 mg twice daily for up to 1 yr.

Genital Herpes Simplex in HIV Pts

PO:ADULTS: 500 mg twice daily for 7 days or 5–10 days.

Herpes Labialis (Cold Sores)

PO:ADULTS, ELDERLY:(Immunocompetent): 1,500 mg as a single dose. Initiate at first sign or symptoms. **(HIV pts):** 500 mg 2 times/day for 5–10 days.

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance and disease process.

Creatinine Clearance	Herpes Zoster	Recurrent Genital Herpes (single-day regimen)	Recurrent Genital Herpes (suppression)	Recurrent Herpes Labialis Treatment (single-day regimen)	Recurrent Orolabial or Genital Herpes in HIV Pts
40–59 mL/min	500 mg q12h	500 mg q12h	—	750 mg	—
20–39 mL/min	500 mg q24h	500 mg	125 mg q12h	500 mg	500 mg q24h
Less than 20 mL/min	250 mg q24h	250 mg	125 mg q24h	250 mg	250 mg q24h
Hemodialysis	250 mg after each hemodialysis session	250 mg after each hemodialysis session	125 mg after each hemodialysis session	250 mg after each hemodialysis session	250 mg after each hemodialysis session

Dosage in Hemodialysis Pts

Herpes zoster: 250 mg after each dialysis treatment. **Genital herpes:** 125 mg after each dialysis treatment.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (23%–12%): Headache, nausea. **Occasional (10%–2%):** Dizziness, drowsiness, paresthesia (esp. feet), diarrhea, vomiting, constipation, decreased appetite, fatigue, fever, pharyngitis, sinusitis, pruritus. **Rare (less than 2%):** Insomnia, abdominal pain, dyspepsia, flatulence, back pain, arthralgia.

Adverse effects/toxic reactions

Urticaria, severe skin rash, hallucinations, confusion (delirium, disorientation occur predominantly in elderly) has been reported.

Nursing considerations

Baseline assessment

Obtain baseline chemistry tests, esp. renal function. Question history of galactose intolerance, severe lactose deficiency, glucose-galactose malabsorption, renal impairment. Assess herpetic lesions.

Intervention/evaluation

Evaluate cutaneous lesions. Be alert to neurologic effects: headache, dizziness. Provide analgesics, comfort measures. Monitor renal function, hepatic enzymes, CBC.

Patient/family teaching

- Drink adequate fluids.
- Fingernails should be kept short, hands clean.
- Do not touch lesions with fingers to avoid spreading infection to new site.
- **Genital herpes:** Continue therapy for full length of treatment.
- Avoid contact with lesions during duration of outbreak to prevent cross-contamination.
- Use condoms during sexual activity.

- Report if lesions recur or do not improve.
- Slowly go from lying to standing to avoid dizziness.
- Avoid tasks that require alertness, motor skills until response to drug is established.

famotidine

fa-**moe**-ta-deen

Acid Reducer Maximum Strength

Apo-Famotidine 🇨🇦

Pepcid

Ulcidine 🇨🇦

Fixed-Combination(s)

Duexis: famotidine/ibuprofen (an NSAID): 26.6 mg/800 mg. **Pepcid**

Complete: famotidine/calcium chloride/magnesium hydroxide (antacids): 10 mg/800 mg/165 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: H₂ receptor antagonist.

CLINICAL: Antiulcer, gastric acid secretion inhibitor.

Do not confuse famotidine with cimetidine, ranitidine, fluoxetine, or furosemide.

Uses

Short-term treatment of active duodenal ulcer. Prevention, maintenance of duodenal ulcer recurrence. Treatment of active benign gastric ulcer, pathologic GI hypersecretory conditions. Short-term treatment of gastroesophageal reflux disease (GERD). OTC formulation for relief of heartburn, acid indigestion, sour stomach. **OFF-LABEL:** *H. pylori* eradication, risk reduction of duodenal ulcer recurrence (part of multidrug regimen), stress ulcer prophylaxis in critically ill pts, relief of gastritis.

Precautions

Contraindications: Hypersensitivity to famotidine, other H₂ antagonists.
Cautions: Renal/hepatic impairment, elderly, thrombocytopenia.

Action

Inhibits histamine action of H₂ receptors of parietal cells. **Therapeutic Effect:** Inhibits gastric acid secretion (fasting, nocturnal, or stimulated by food, caffeine, insulin).

Pharmacokinetics

Route	Onset	Peak	Duration
PO	1 hr	1–4 hrs	10–12 hrs
IV	0.5 hr	0.5–3 hrs	10–12 hrs

Rapidly, incompletely absorbed from GI tract. Protein binding: 15%–20%. Partially metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2.5–3.5 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** No age-related precautions noted. **Elderly:** Confusion more likely to occur, esp. in pts with renal/hepatic impairment.

Interactions

DRUG: May decrease absorption of **atazanavir, itraconazole, ketoconazole.**
HERBAL: None significant. **FOOD:** None known. **LAB VALUES:** Interferes with skin tests using allergen extracts. May increase serum alkaline phosphatase, ALT, AST. May decrease platelet count.

Availability (Rx)

Infusion, Premix: 20 mg in 50 mL 0.9% NaCl. **Injection, Solution:** 10 mg/mL (2-mL vial). **Powder for Oral Suspension:** 40 mg/5 mL. **Tablets:** 10 mg, 20 mg, 40 mg.

Administration/handling

IV

Reconstitution

- For IV push, dilute 20 mg with 5–10 mL 0.9% NaCl.
- For intermittent IV infusion (piggyback), dilute with 50–100 mL D₅W, or 0.9% NaCl.

Rate of Administration

- Give IV push over at least 2 min.
- Infuse piggyback over 15–30 min.

Storage

- Refrigerate unused vials.
- IV solution appears clear, colorless.
- After dilution, IV solution is stable for 48 hrs if refrigerated.

PO

- Store tablets, suspension at room temperature.
- Following reconstitution, oral suspension is stable for 30 days at room temperature.
- Give without regard to meals.
- Shake suspension well before use.

IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), piperacillin/tazobactam (Zosyn).

IV Compatibilities

Calcium gluconate, dexamethasone (Decadron), dexmedetomidine (Precedex), DOBUTamine (Dobutrex), DOPamine (Intropin), DOXOrubicin (Adriamycin), furosemide (Lasix), heparin, HYDRORmorphone (Dilaudid), insulin (regular), lidocaine, LORazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), potassium chloride, potassium phosphate, propofol (Diprivan).

Indications/routes/dosage

Duodenal Ulcer

PO:ADULTS, ELDERLY:Acute therapy: 40 mg/day at bedtime or 20 mg twice daily for 4–8 wks. **Maintenance:** 20 mg/day at bedtime.

Peptic Ulcer

PO:CHILDREN 1–16 YRS: 0.5 mg/kg/day at bedtime or 2 divided doses. **Maximum:** 40 mg/day.

Gastric Ulcer

PO:ADULTS, ELDERLY:(Acute therapy): 40 mg/day at bedtime.

Gastroesophageal Reflux Disease (GERD)

PO:ADULTS, ELDERLY: 20 mg twice daily for 6 wks. **CHILDREN 1–16 YRS:** 1 mg/kg/day in 2 divided doses. **Maximum:** 40 mg 2 times/day. **CHILDREN 3 MOS–11 MOS:** 0.5 mg/kg/dose twice daily. **CHILDREN YOUNGER THAN 3 MOS, NEONATES:** 0.5 mg/kg/dose once daily.

Esophagitis

PO:ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 20–40 mg twice daily for up to 12 wks.

Hypersecretory Conditions

PO:ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 20 mg q6h. May increase up to 160 mg q6h.

Acid Indigestion, Heartburn (OTC Use)

PO:ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 10–20 mg q12h. May take 15–60 min before eating. **Maximum:** 2 doses/day.

Usual Parenteral Dosage

IV:ADULTS, ELDERLY, CHILDREN OLDER THAN 12 YRS: 20 mg q12h. **CHILDREN 1–12 YRS:** 0.25–0.5 mg/kg q12h. **Maximum:** 40 mg/day.

Dosage in Renal Impairment

Creatinine Clearance	Dosage
Less than 50 mL/min	50% normal dose or increase dosing interval to 48 hrs

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional (5%): Headache. **Rare (2% or less):** Confusion, constipation, diarrhea, dizziness.

Adverse effects/toxic reactions

Agranulocytosis, pancytopenia, thrombocytopenia occur rarely.

Nursing considerations

Baseline assessment

Assess epigastric/abdominal pain. Verify platelet count in critically ill pts.

Intervention/evaluation

Monitor daily pattern of bowel activity, stool consistency. Monitor for headache. Assess for confusion in elderly. Consider interrupting treatment in pts who develop thrombocytopenia.

Patient/family teaching

- May take without regard to meals, antacids.
- Report headache.
- Avoid excessive amounts of coffee, aspirin.
- Report persistent symptoms of heartburn, acid indigestion, sour stomach.

febuxostat

fe-**bux**-oh-stat

Uloric

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Xanthine oxidase inhibitor.

CLINICAL: Antigout agent.

Do not confuse febuxostat with panobinostat or Femstat.

Uses

Management of hyperuricemia in pts with gout. Not recommended for treatment of asymptomatic hyperuricemia.

Precautions

Contraindications: Hypersensitivity to febuxostat. Concomitant use with azathioprine, mercaptopurine. **Cautions:** Severe renal/hepatic impairment, history of heart disease or stroke. Hypersensitivity to allopurinol. Pts at risk for urate formation.

Action

Decreases uric acid production by inhibiting the enzyme xanthine oxidase. **Therapeutic Effect:** Reduces uric acid concentrations in serum and urine.

Pharmacokinetics

Well absorbed from GI tract. Widely distributed. Protein binding: 99%. Metabolized in liver. Excreted in urine (49%), feces (45%). Removed by hemodialysis. **Half-life:** 5–8 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May increase concentration, toxicity of **azaTHIOprine,**

mercaptapurine, theophylline. HERBAL:None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, LDH, amylase, sodium, potassium, cholesterol, triglycerides, BUN, creatinine. May decrease platelets, Hgb, Hct, neutrophils. May prolong prothrombin time.

Availability (Rx)

Tablets: 40 mg, 80 mg.

Administration/handling

PO

- Give without regard to meals or antacids.

Indications/routes/dosage

◀ALERT▶ Recommended concomitant NSAID or colchicine with initiation of therapy and continue for up to 6 mos to prevent exacerbations of gout.

Hyperuricemia

PO:ADULTS, ELDERLY: Initially, 40 mg once daily. If pt does not achieve serum uric acid level less than 6 mg/dL after 2 wks with 40 mg, may give 80 mg once daily. **Maximum:** 120 mg/day.

Dosage in Renal/Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use caution.

Side effects

Rare (1%): Nausea, arthralgia, rash, dizziness.

Adverse effects/toxic reactions

Hepatic function abnormalities occur in 6% of pts. May increase risk of thromboembolic events including CVA, MI.

Nursing considerations

Baseline assessment

Assess baseline renal function, LFT; concomitant use with azaTHIOprine, mercaptopurine, theophylline (contraindicated).

Intervention/evaluation

Discontinue medication immediately if rash appears. Encourage high fluid intake (3,000 mL/day). Monitor I&O (output should be at least 2,000 mL/day). Monitor CBC, serum uric acid, renal function, LFT. Assess urine for cloudiness, unusual color, odor. Assess for therapeutic response (reduced joint tenderness, swelling, redness, limitation of motion). Monitor for symptoms of CVA, MI.

Patient/family teaching

- Encourage drinking 8–10 (8-oz) glasses of fluid daily while taking medication.
- Report rash, chest pain, shortness of breath, symptoms suggestive of stroke.
- Gout attacks may occur for several months after starting treatment (medication is not a pain reliever).
- Continue taking even if gout attack occurs.

felodipine

fe-**lo**-di-**peen**

Plendil 

Fixed-Combination(s)

Lexxel: felodipine/enalapril (ACE inhibitor): 2.5 mg/5 mg, 5 mg/5 mg.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Calcium channel blocker.

CLINICAL: Antihypertensive.

Do not confuse Plendil with Isordil, Pletal, PriLOSEC, or Prinivil, or Renedil with Prinivil.

Uses

Management of hypertension. May be used alone or with other antihypertensives. **OFF-LABEL:** Management of pediatric hypertension.

Precautions

Contraindications: Hypersensitivity to felodipine or other calcium channel blocker. **Cautions:** Severe left ventricular dysfunction, HF, hepatic impairment, hypertrophic cardiomyopathy with outflow tract obstruction, peripheral edema, severe aortic stenosis, elderly. Concomitant CYP3A4 inhibitors.

Action

Inhibits calcium movement across cardiac, vascular smooth muscle cell membranes. **Therapeutic Effect:** Relaxes coronary vascular smooth muscle and causes vasodilation. Increases myocardial oxygen delivery.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	2–5 hrs	N/A	24 hrs

Rapidly, completely absorbed from GI tract. Protein binding: greater than 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 11–16 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** May experience greater hypotensive response. Constipation may be more problematic.

Interactions

DRUG:CYP3A4 inhibitors (e.g., ketoconazole, erythromycin, cimetidine) may increase concentration. **HERBAL:**St. John's wort may decrease concentration. **Ephedra, ginseng, yohimbe** may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:**Grapefruit products may increase absorption, concentration. **LAB VALUES:** None significant.

Availability (Rx)

 **Tablets (Extended-Release):** 2.5 mg, 5 mg, 10 mg.

Administration/handling

PO

- Give with or without food.
- Do not break, crush, dissolve, or divide extended-release tablets. Swallow whole.

Indications/routes/dosage

Hypertension

PO:ADULTS: Initially, 5 mg once daily. Increase by 5 mg at 2-wk intervals. Usual dose: 5–10 mg once daily. **ELDERLY:** Initially, 2.5 mg/day. Adjust dosage at no less than 2-wk intervals. Usual dose: 2.5–10 mg once daily. **CHILDREN 6 YRS AND OLDER:** Initially, 2.5 mg once daily. May increase at 2-wk intervals. **Maximum:** 10 mg/day.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Initially, 2.5 mg once daily. Titrate carefully.

Side effects

Frequent (22%–18%): Headache, peripheral edema. **Occasional (6%–4%):** Flushing, respiratory infection, dizziness, light-headedness, asthenia. **Rare (less than 3%):** Angina, gingival hyperplasia, paresthesia, abdominal discomfort, anxiety, muscle cramping, cough, diarrhea, constipation.

Adverse effects/toxic reactions

Overdose produces nausea, drowsiness, confusion, slurred speech, hypotension,

bradycardia.

Nursing considerations

Baseline assessment

Assess B/P, apical pulse immediately before drug administration (if pulse is 60 or less/min or systolic B/P is less than 90 mm Hg, withhold medication, contact physician). Question history of HF, hepatic impairment, valvular disease.

Intervention/evaluation

Assist with ambulation if dizziness occurs. Assess for peripheral edema. Monitor pulse rate for bradycardia. Assess skin for flushing. Monitor hepatic function. Question for headache, asthenia.

Patient/family teaching

- Do not abruptly discontinue medication.
- Compliance with therapy regimen is essential to control hypertension.
- To avoid hypotensive effect, go from lying to standing slowly.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report palpitations, shortness of breath, pronounced dizziness, nausea.
- Swallow tablet whole; do not chew, crush, dissolve, or divide.
- Avoid grapefruit products, alcohol.
- Report exacerbation of angina.

fenofibrate

fen-o-fye-brate

Antara

Apo-Fenofibrate⁺

Fenoglide

Fibricor

Lipofen

Lofibra

TOP
100

Novo-Fenofibrate 

Tricor

Triglide

Trilipix

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Fibric acid derivative.

CLINICAL: Antihyperlipidemic.

Do not confuse Tricor with Fibracor or Tracleer.

Uses

Adjunct to diet for reduction of low-density lipoprotein cholesterol (LDL-C), total cholesterol, triglycerides (types IV and V hyperlipidemia), apo-lipoprotein B, and to increase high-density lipoprotein cholesterol (HDL-C) in pts with primary hypercholesterolemia, mixed dyslipidemia.

Precautions

Contraindications: Hypersensitivity to fenofibrate. Active hepatic disease, preexisting gallbladder disease, severe renal/hepatic dysfunction (including primary biliary cirrhosis, unexplained persistent hepatic function abnormality), breastfeeding. **Cautions:** Anticoagulant therapy (e.g., warfarin), history of hepatic disease, venous thromboembolism, mild to moderate renal impairment, substantial alcohol consumption, statin or colchicine therapy (increased risk of myopathy, rhabdomyolysis), elderly.

Action

Downregulates apoprotein C-III and upregulates apoprotein A-I, increasing VLDL catabolism. **Therapeutic Effect:** Decreases triglycerides, increases HDL.

Pharmacokinetics

Well absorbed from GI tract. Absorption increased when given with food. Protein binding: 99%. Metabolized in liver. Excreted in urine (60%), feces (25%). Not removed by hemodialysis. **Half-life:** 10–35 hrs.

Lifespan considerations

Pregnancy/Lactation: Safety in pregnancy not established. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Potentiates effects of **anticoagulants (e.g., warfarin)**. **Bile acid sequestrants** may impede absorption. **CycloSPORINE** may increase concentration, risk of nephrotoxicity. **Colchicine, HMG-CoA reductase inhibitors (statins)** may increase risk of severe myopathy, rhabdomyolysis, acute renal failure. **HERBAL:** None significant. **FOOD:** **All foods** increase absorption. **LAB VALUES:** May increase serum creatine kinase (CK), ALT, AST. May decrease Hgb, Hct, WBC; serum uric acid.

Availability (Rx)

Capsules:(*Antara*): 30 mg, 90 mg. (*Lipofen*): 50 mg, 150 mg. (*Lofibra*): 67 mg, 134 mg, 200 mg. (*Trilipix*): 45 mg, 135 mg. **Tablets:**(*Fenoglide*): 40 mg, 120 mg. (*Fibricor*): 35 mg, 105 mg. (*Lofibra*): 54 mg, 160 mg. (*Tricor*): 48 mg, 145 mg. (*Triglide*): 160 mg.

Administration/handling

PO

- Give Fenoglide, Lipofen, Lofibra with meals.
- Antara, Fibricor, Tricor, Triglide, and Trilipix may be given without regard to food. Antara, Fenoglide, Lipofen: Swallow whole; do not open (capsules), crush, dissolve, or cut.

Indications/routes/dosage

Hypertriglyceridemia

PO (*Antara*):ADULTS, ELDERLY: 30–90 mg/day.

PO (*Fenoglide*):ADULTS, ELDERLY: 40–120 mg/day with meals.

PO (*Fibricor*):ADULTS, ELDERLY: 35–105 mg/day.

PO (Lipofen):ADULTS, ELDERLY: 50–150 mg/day with meals.
PO (Lofibra):ADULTS, ELDERLY: 67–200 mg/day with meals.
PO (Tricor):ADULTS, ELDERLY: 48–145 mg/day.
PO (Triglide):ADULTS, ELDERLY: 160 mg/day.
PO (Trilipix):ADULTS, ELDERLY: 45–135 mg/day.

Hypercholesterolemia, Mixed Hyperlipidemia

PO (Antara):ADULTS, ELDERLY: 90 mg/day.
PO (Fenoglide):ADULTS, ELDERLY: 120 mg/day with meals.
PO (Fibricor):ADULTS, ELDERLY: 105 mg/day.
PO (Lipofen):ADULTS, ELDERLY: 150 mg/day with meals.
PO (Lofibra):ADULTS, ELDERLY: 200 mg/day with meals.
PO (Tricor):ADULTS, ELDERLY: 145 mg/day.
PO (Triglide):ADULTS, ELDERLY: 160 mg/day.
PO (Trilipix):ADULTS, ELDERLY: 135 mg/day.

Dosage in Renal Impairment

Monitor renal function before adjusting dose. Decrease dose or increase dosing interval for pts with renal failure.

Initial doses:	Antara: 30 mg/day	Lofibra: 67 mg/day
	Fenoglide: 40 mg/day	Tricor: 48 mg/day
	Lipofen: 50 mg/day	Triglide: 50 mg/day

Dosage in Hepatic Impairment

Contraindicated.

Side effects

Frequent (8%–4%): Pain, rash, headache, asthenia, fatigue, flu-like symptoms, dyspepsia, nausea/vomiting, rhinitis. **Occasional (3%–2%):** Diarrhea, abdominal pain, constipation, flatulence, arthralgia, decreased libido, dizziness, pruritus. **Rare (less than 2%):** Increased appetite, insomnia, polyuria, cough, blurred vision, eye floaters, earache.

Adverse effects/toxic reactions

May increase cholesterol excretion into bile, leading to cholelithiasis. Pancreatitis, hepatitis, thrombocytopenia, agranulocytosis occur rarely.

Nursing considerations

Baseline assessment

Obtain diet history, esp. fat consumption. Obtain serum cholesterol, triglycerides, LFT, CBC during initial therapy and periodically during treatment. Treatment should be discontinued if hepatic enzyme levels persist greater than 3 times normal limit. Question medical history as listed in Precautions.

Intervention/evaluation

For pts on concurrent therapy with HMG-CoA reductase inhibitors, monitor for complaints of myopathy (muscle pain, weakness). Monitor serum creatine kinase (CK). Monitor serum cholesterol, triglyceride for therapeutic response.

Patient/family teaching

- Report severe diarrhea, constipation, nausea.
- Report skin rash/irritation, insomnia, muscle pain, tremors, dizziness.

fentaNYL TOP HIGH
100 ALERT

fen-ta-nil

Abstral

Actiq

Apo-FentaNYL 

Duragesic

Fentora

Ionsys

Lazanda

Sublimaze

Subsys

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Opioid, narcotic agonist (**Schedule II**).

CLINICAL: Analgesic.

■ **BLACK BOX ALERT** ■ Physical and psychological dependence may occur with prolonged use. Must be alert to abuse, misuse, or diversion. May cause life-threatening hypoventilation, respiratory depression, or death. Use with strong or moderate CYP3A4 inhibitors may result in potentially fatal respiratory depression. **Buccal:** Tablet and lozenge contain enough medication to potentially be fatal to children. **Transdermal patch:** Serious or life-threatening hypoventilation has occurred. Limit use to children 2 yrs of age and older. Exposure to direct heat source increases drug release, resulting in overdose/death.

Do not confuse fentaNYL with alfentanil or SUFentanil.

Uses

Injection: (FentaNYL): Pain relief, preop medication; adjunct to general or regional anesthesia. **Abstral:** Treatment of breakthrough pain in cancer pts 18 yrs of age and older. **Actiq:** Treatment of breakthrough pain in chronic cancer or AIDS-related pain. **Duragesic:** Management of chronic pain (*transdermal*). **Fentora:** Breakthrough pain in pts on chronic opioids. **Ionsys:** Short-term management of acute postoperative pain in adults. **Lazanda:** Management of breakthrough pain in cancer. **Onsolis:** Breakthrough pain in pts with cancer currently receiving opioids and tolerant to opioid therapy. **Subsys:** Treatment of breakthrough cancer pain.

Precautions

Contraindications: Hypersensitivity to fentaNYL. **Transdermal: Device (additional):** Significant respiratory depression, acute/severe bronchial asthma, paralytic ileus, GI obstruction. **Transdermal patch (additional):** Significant respiratory depression, acute/severe bronchial asthma, paralytic ileus, short-term therapy for acute or postoperative pain, pts who are not opioid tolerant. **Transmucosal buccal, buccal films, lozenges, sublingual tablets/spray, nasal spray (additional):** Management of acute or postoperative pain, pts who are not opioid tolerant. **Cautions:** Bradycardia; renal, hepatic, respiratory disease; head

injuries; altered LOC; biliary tract disease; acute pancreatitis; cor pulmonale; significant COPD; increased ICP; use of MAOIs within 14 days; elderly; morbid obesity.

Action

Binds to opioid receptors in CNS, reducing stimuli from sensory nerve endings; inhibits ascending pain pathways. **Therapeutic Effect:** Alters pain reception, increases pain threshold.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	1–2 min	3–5 min	0.5–1 hr
IM	7–15 min	20–30 min	1–2 hrs
Transdermal	6–8 hrs	24 hrs	72 hrs
Transmucosal	5–15 min	20–30 min	1–2 hrs

Well absorbed after IM or topical administration. Transmucosal form absorbed through buccal mucosa and GI tract. Protein binding: 80%–85%. Metabolized in liver. Primarily excreted by biliary system. **Half-life:** 2–4 hrs IV; 17 hrs transdermal; 6.6 hrs transmucosal.

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Unknown if distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother received opiates during labor. **Children:** Neonates more susceptible to respiratory depressant effects. Patch: Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** May be more susceptible to respiratory depressant effects. Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: CYP3A4 inducers (e.g., rifAMPin, modafinil) may decrease concentration, effects. **Alcohol, CNS depressant** (e.g., LORazepam,

gabapentin, zolpidem) may increase CNS depression. **CYP3A4 inhibitors** (e.g., **erythromycin, ketoconazole, protease inhibitors** [e.g., **ritonavir**]) may increase effects and potential for respiratory depression. **HERBAL:Gotu kola, kava kava, St. John's wort, valerian** may increase CNS depression. **St. John's wort** may decrease concentration, effects. **FOOD:Grapefruit products** may increase potential for respiratory depression with oral, transmucosal forms. **LAB VALUES:** May increase serum amylase, lipase.

Availability (Rx)

Buccal Tablet (Fentora): 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg. **Buccal Soluble Film (Onsolis):** 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg. **Injection Solution:** 50 mcg/mL. **Nasal Spray (Lazanda):** 100 mcg/spray, 400 mcg/spray. **Sublingual Tablets (Abstral):** 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, 800 mcg. **Sublingual Spray (Subsys):** 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg. **Transdermal Patch (Duragesic):** 12 mcg/hr, 25 mcg/hr, 50 mcg/hr, 75 mcg/hr, 100 mcg/hr. **Transmucosal Lozenges (Actiq):** 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg, 1,600 mcg.

Administration/handling

IV

Rate of Administration

- Give by slow IV injection (over 1–2 min).
- Too-rapid injection increases risk of severe adverse reactions (skeletal/thoracic muscle rigidity resulting in apnea, laryngospasm, bronchospasm, peripheral circulatory collapse, anaphylactoid effects, cardiac arrest).

Storage

- Store parenteral form at room temperature.
- Opiate antagonist (naloxone) should be readily available.

Transdermal

- Apply to hairless area of intact skin of upper torso.
- Use flat, nonirritated site.
- Firmly press evenly and hold for 30 sec, ensuring that adhesion is in full contact with skin and that edges are completely sealed.

- Use only water to cleanse site before application (soaps, oils may irritate skin).
- Rotate sites of application.
- Carefully fold used patches so that system adheres to itself; discard in toilet.
- If patch becomes loose, cover with a transparent adhesive dressing; if patch comes off, apply new patch, rotating sites (this starts a new dosing interval). Normal exposure to water may loosen the adhesive.

Buccal Film

- Wet inside of cheek.
- Place film inside mouth with pink side of unit against cheek.
- Press film against cheek and hold for 5 sec.
- Leave in place until dissolved (15–30 min).
- Do not chew, swallow, cut film.
- Liquids may be given after 5 min of application; food after film dissolves.

Buccal Tablets

- Place tablet above a rear molar between upper cheek and gum.
- Dissolve over 30 min.
- Swallow remaining pieces with water.
- Do not split tablet.

Sublingual Spray

- Open blister pack with scissors immediately prior to use.
- Spray contents underneath tongue.

Sublingual Tablets

- Place under tongue.
- Dissolves rapidly.
- Do not suck, chew, or swallow tablet.

Nasal

- Prime device before use by spraying into pouch.
- Insert nozzle about 1/2 inch into nose, pointing toward bridge of nose, tilting bottle slightly.
- Press down firmly until hearing a "click" and number on counting window advances by one. Do not blow nose for at least 30 min following administration.

Transmucosal

- Suck lozenge vigorously.
- Allow to dissolve over 15 min.
- Do not chew.

■ IV incompatibilities

Azithromycin (Zithromax), pantoprazole (Protonix), phenytoin (Dilantin).

■ IV Compatibilities

Atropine, bupivacaine (Marcaine, Sensorcaine), cloNIDine (Duraclon), dexmedetomidine (Precedex), diltiaZEM (Cardizem), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), droperidol (Inapsine), heparin, HYDROmorphine (Dilaudid), ketorolac (Toradol), LORazepam (Ativan), metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Note: Doses titrated to desired effect dependent upon degree of analgesia, pt status.

Acute Pain Management (FentaNYL)

IM/IV:ADULTS, ELDERLY: 25–100 mcg/dose q0.5–2h as needed.
CHILDREN: 0.5–2 mcg/kg/dose q1–2h as needed. **INFANTS (IV push):** 1–4 mcg/kg/dose q2–4h.

Continuous IV Infusion (FentaNYL)

ADULTS, ELDERLY: 1–2 mcg/kg/hr. **CHILDREN:** 0.5–3 mcg/kg/hr.

Usual Buccal Dose (Fentora)

ADULTS, ELDERLY: Initially, 100 mcg. Titrate dose, providing adequate analgesia with tolerable side effects.

Usual Buccal Soluble Film Dose (Onsolis)

Note: All pts must initiate with 200 mcg.

ADULTS, ELDERLY: Initially, 200 mcg up to 1,200 mcg. **Maximum:** No more than 4 doses/day; separate by at least 2 hrs.

Usual Nasal Dose (Lazanda)

Nasal:ADULTS, ELDERLY: Initially, 100 mcg. Titrate from 100 mcg to 200 mcg to 400 mcg to 800 mcg (**maximum**). Wait at least 2 hrs between doses; no more than 4 doses in 24 hrs.

Usual Sublingual Tablet Dose (Abstral)

ADULTS, ELDERLY: Initially, 100 mcg, then titrate to desired dose/effect. Wait at least 2 hrs between doses; no more than 4 doses in 24 hrs.

Usual Sublingual Spray Dose (Subsys)

ADULTS, ELDERLY: Initially, 100 mcg. May repeat in 30 min if pain not relieved. Must wait at least 4 hours before treating another episode of pain.

Usual Transdermal Dose (Duragesic)

ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 12–25 mcg/hr. May increase after 3 days.

Usual Transmucosal Dose (Actiq)

ADULTS, CHILDREN: 200–1200 mcg for breakthrough pain. Limit to 4 applications/day.

Dosage in Renal/Hepatic Impairment

Injection: No dose adjustment.

Transdermal patch:Mild to moderate

impairment: Reduce dose by 50%.

Severe impairment: Not recommended.

Side effects

Frequent:IV: Postop drowsiness, nausea, vomiting. **Transdermal (10%–3%):**

Headache, pruritus, nausea, vomiting, diaphoresis, dyspnea, confusion, dizziness, drowsiness, diarrhea, constipation, decreased appetite. **Occasional:IV:** Postop confusion, blurred vision, chills, orthostatic hypotension, constipation, difficulty urinating. **Transdermal (3%–1%):** Chest pain, arrhythmias, erythema, pruritus, syncope, agitation, skin irritations.

Adverse effects/toxic reactions

Overdose or too-rapid IV administration may produce severe respiratory depression, skeletal/thoracic muscle rigidity (may lead to apnea, laryngospasm, bronchospasm, cold/clammy skin, cyanosis, coma). Tolerance to analgesic effect may occur with repeated use. **Antidote:** Naloxone (see [Appendix J](#) for dosage). Abrupt stoppage of prolonged high-dose, continuous infusions may induce opiate withdrawal.

Nursing considerations

Baseline assessment

Resuscitative equipment, opiate antagonist (naloxone 0.5 mcg/kg) should be available for initial use. Establish baseline B/P, respirations. Assess type, location, intensity, duration of pain. Determine daily morphine equivalency in cancer pts who are being transitioned to chronic therapy.

Intervention/evaluation

Assist with ambulation. Encourage postop pt to turn, cough, deep breathe q2h. Monitor respiratory rate, B/P, heart rate, oxygen saturation. Assess for relief of pain. In pts with prolonged high-dose, continuous infusions (critical care, ventilated pts), consider weaning drip gradually or transition to a fentanyl patch to decrease symptoms of opiate withdrawal.

Patient/family teaching

- Avoid alcohol; do not take other medications without consulting physician.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Teach pt proper transdermal, buccal, lozenge administration.
- **Transdermal:** Avoid saunas (increases drug release time).

- Use as directed to avoid overdose; potential for physical dependence with prolonged use.
- Report constipation, absence of pain relief.
- Taper slowly after long-term use.

ferric gluconate

Apo-Ferrous Gluconate 

Ferate

ferrous sulfate

fer-us **sul**-fate

Apo-Ferrous Sulfate 

Fer-In-Sol

Fer-Iron

Slow-Fe

CLASSIFICATION

PHARMACOTHERAPEUTIC: Enzymatic mineral.

CLINICAL: Iron preparation.

Uses

Ferrous fumarate, gluconate, sulfate: Prevention, treatment of iron deficiency anemia. **Ferric gluconate:** Treatment of microcytic, hypochromic anemia in combination with erythropoietin in HD pts when iron administration is not feasible or is ineffective.

Precautions

Contraindications: Hypersensitivity to iron salts. Hemochromatosis, hemolytic anemias. **Cautions:** Peptic ulcer, regional enteritis, ulcerative colitis, pts receiving frequent blood transfusions.

Action

Essential component in formation of Hgb, myoglobin, enzymes. Promotes effective erythropoiesis and transport, utilization of oxygen. **Therapeutic Effect:** Prevents iron deficiency.

Pharmacokinetics

Absorbed in duodenum and upper jejunum. Ten percent absorbed in pts with normal iron stores; increased to 20%–30% in pts with inadequate iron stores. Primarily bound to serum transferrin. Excreted in urine, sweat, sloughing of intestinal mucosa, menses. **Half-life:** 6 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG:Antacids, calcium supplements, pancreatin, pancrelipase may decrease absorption of ferrous compounds. May decrease absorption of etidronate, quinolones, tetracyclines. **HERBAL:**None significant. **FOOD:**Cereal, coffee, dietary fiber, eggs, milk, tea decrease absorption. **LAB VALUES:** May increase serum bilirubin, iron. May decrease serum calcium.

Availability (OTC)

Ferric Gluconate

Injection, solution: 12.5 mg/mL.

Ferrous Fumarate

Tablets: 90 mg (29.5 mg elemental iron), 324 mg (106 mg elemental iron).

Ferrous Gluconate

Tablets: 240 mg (27 mg elemental iron) (Fergon), 325 mg (36 mg elemental iron).

Ferrous Sulfate

Oral Solution: 75 mg/mL (15 mg/mL elemental iron). **Tablets:** 325 mg (65 mg elemental iron). **Syrup:** 300 mg/5 mL (60 mg elemental iron per 5 mL).

 **Tablets (Timed-Release):** 160 mg (50 mg elemental iron).

Administration/handling

PO

- Store all forms (tablets, capsules, suspension, drops) at room temperature.
- Ideally, give between meals with water or juice but may give with meals if GI discomfort occurs.
- Transient staining of mucous membranes, teeth occurs with liquid iron preparation. To avoid staining, place liquid on back of tongue with dropper or straw.
- Do not give with milk or milk products.
- Do not break, crush, dissolve, or divide timed-release tablets.

Indications/routes/dosage

Iron Deficiency Anemia

Dosage is expressed in terms of milligrams of elemental iron. Assess degree of anemia, pt weight, presence of any bleeding. Expect to use periodic hematologic

determinations as guide to therapy.

IV(Ferric Gluconate):ADULTS, ELDERLY: 125 mg/dose. Usual dose: 1,000 mg given over 8 sessions.

PO (Ferrous Fumarate):ADULTS, ELDERLY: 100–200 mg/day in 2–3 divided doses. **CHILDREN:** 3–6 mg/kg/day in 2–3 divided doses.

PO (Ferrous Gluconate):ADULTS, ELDERLY: 100–200 mg/day in 2–3 divided doses. **CHILDREN:** 3–6 mg/kg/day in 2–3 divided doses.

PO (Ferrous Sulfate):ADULTS, ELDERLY: 100–200 mg/day in 2–3 divided doses. **CHILDREN:** 3–6 mg/kg/day in 2–3 divided doses.

Prevention of Iron Deficiency

PO (Ferrous Fumarate):ADULTS, ELDERLY: 60 mg/day. **CHILDREN:** 30 mg/day with folic acid.

PO (Ferrous Gluconate):ADULTS, ELDERLY: 60 mg/day. **CHILDREN:** 30 mg/day with folic acid.

PO (Ferrous Sulfate):ADULTS, ELDERLY: 60 mg/day. **CHILDREN:** 30 mg/day with folic acid.

Side effects

 **Occasional:** Mild, transient nausea. **Rare:** Heartburn, anorexia, constipation, diarrhea.

Adverse effects/toxic reactions

Large doses may aggravate existing GI tract disease (peptic ulcer, regional enteritis, ulcerative colitis). Severe iron poisoning occurs most often in children, manifested as vomiting, severe abdominal pain, diarrhea, dehydration, followed by hyperventilation, pallor, cyanosis, cardiovascular collapse.

Nursing considerations

Baseline assessment

Assess nutritional status, dietary history. Question history of hemochromatosis, hemolytic anemia, ulcerative colitis. Question use of antacids, calcium supplements.

Intervention/evaluation

Monitor serum iron, total iron-binding capacity, reticulocyte count, Hgb, ferritin. Monitor daily pattern of bowel activity, stool consistency. Assess for clinical improvement, record relief of iron deficiency symptoms (fatigue, irritability, pallor, paresthesia of extremities, headache).

Patient/family teaching

- Expect stool color to darken.
- Oral liquid may stain teeth.
- To prevent mucous membrane and teeth staining with liquid preparation, use dropper or straw and allow solution to drop on back of tongue.
- If GI discomfort occurs, take after meals or with food.
- Do not take within 2 hrs of other medication or eggs, milk, tea, coffee, cereal.
- Do not take antacids or OTC calcium supplements.

fesoterodine

fes-oh-**ter**-oh-deen

Toviaz

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Muscarinic receptor antagonist.

CLINICAL: Antispasmodic.

Do not confuse fesoterodine with fexofenadine or tolterodine.

Uses

Treatment of overactive bladder with symptoms including urinary incontinence, urgency, frequency.

Precautions

Contraindications: Hypersensitivity to fesoterodine. Gastric retention, uncontrolled narrow-angle glaucoma, urinary retention. **Cautions:** Severe renal impairment, severe hepatic impairment, clinically significant bladder outflow obstruction (risk of urinary retention), GI obstructive disorders (e.g., pyloric stenosis [risk of gastric retention], treated narrow-angle glaucoma, myasthenia

gravis, concurrent therapy with strong CYP3A4 inhibitors, elderly, use in hot weather.

Action

Exhibits antimuscarinic activity by interceding via cholinergic muscarinic receptors, thereby mediating urinary bladder contraction. **Therapeutic Effect:** Decreases urinary frequency, urgency.

Pharmacokinetics

Well absorbed following PO administration. Protein binding: 50%. Rapidly and extensively hydrolyzed to its active metabolite. Primarily excreted in urine. **Half-life:** 7 hours.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Increased incidence of antimuscarinic adverse events, including dry mouth, constipation, dyspepsia; increase in residual urine, dizziness, urinary tract infections higher in pts 75 yrs of age and older.

Interactions

DRUG:CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, ketoconazole) may increase concentration. **HERBAL:** None significant. **FOOD:Grapefruit products** may increase potential for urinary retention, constipation. **LAB VALUES:** May increase serum ALT, GGT.

Availability (Rx)

 **Tablets, Extended-Release:** 4 mg, 8 mg.

Administration/handling

PO

- May be administered with or without food.

- Swallow whole; do not break, crush, dissolve, or divide tablet.

Indications/routes/dosage

Overactive Bladder

PO:ADULTS, ELDERLY: Initially, 4 mg once daily. May increase to 8 mg once daily. Maximum dose for pts with concurrent use of strong CYP3A4 inhibitors (e.g., erythromycin, ketoconazole) is 4 mg once daily.

Dosage in Renal Impairment

PO:ADULTS, ELDERLY:Maximum dose: 4 mg with CrCl less than 30 mL/min.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Not recommended.

Side effects

Frequent (34%–18%): Dry mouth. **Occasional (6%–3%):** Constipation, urinary tract infection, dry eyes. **Rare (2% or less):** Nausea, dysuria, back pain, rash, insomnia, peripheral edema.

Adverse effects/toxic reactions

Severe anticholinergic effects including abdominal cramps, facial warmth, excessive salivation/lacrimation, diaphoresis, pallor, urinary urgency, blurred vision.

Nursing considerations

Baseline assessment

Assess urinary pattern (e.g., urinary frequency, urgency). Obtain baseline chemistries. Question history as listed in Precautions. Receive full medication history.

Intervention/evaluation

Assist with ambulation if dizziness occurs. Question for visual changes. Monitor incontinence, postvoid residuals. Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching

- May produce constipation and urinary retention.
- Blurred vision may occur; use caution until drug effects have been determined.
- Heat prostration (due to decreased sweating) can occur if used in a hot environment.
- Do not ingest grapefruit products.

fexofenadine

fex-oh-fen-a-deen

Allegra

Allegra Allergy

Allegra Children's

Fixed-Combination(s)

Allegra-D 12 Hour: fexofenadine/pseudoephedrine (sympathomimetic): 60 mg/120 mg. **Allegra-D 24 Hour:** fexofenadine/pseudoephedrine (sympathomimetic): 180 mg/240 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Histamine H₁ antagonist.

CLINICAL: CLINICAL: Antihistamine.

Do not confuse Allegra with Viagra, or fexofenadine with fesoterodine.

Uses

Relief of symptoms associated with hayfever or other upper respiratory allergies.

Precautions

Contraindications: Hypersensitivity to fexofenadine. **Cautions:** Renal

impairment, hypertension (if drug combined with pseudoephedrine). Orally disintegrating tablet not recommended in children younger than 6 yrs.

Action

Competes with histamine-1 receptor site on effector cells in GI tract, blood vessels, and respiratory tract. **Therapeutic Effect:** Relieves hayfever/upper respiratory symptoms.

Pharmacokinetics

	Onset	Peak	Duration
PO	60 min	—	12 hrs or greater

Rapidly absorbed after PO administration. Protein binding: 60%–70%. Does not cross blood-brain barrier. Minimally metabolized. Excreted in feces (80%), urine (11%). Not removed by hemodialysis. **Half-life:** 14.4 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Aluminum- and magnesium- containing antacids may decrease absorption if given within 15 min of fexofenadine. May increase concentrations of erythromycin, ketoconazole. **HERBAL:** St. John's wort may decrease concentration. **FOOD:** Fruit juices may decrease bioavailability. **LAB VALUES:** May suppress wheal, flare reactions to antigen skin testing unless drug is discontinued at least 4 days before testing.

Availability (Rx)

Oral Suspension: 30 mg/5 mL. **Tablets:** 60 mg, 180 mg. **Tablets (Orally Disintegrating):** 30 mg.

Administration/handling

PO

- Give without regard to food.
- Avoid giving with fruit juices (apple, grapefruit, orange). Administer with water only.
- Shake suspension well before use.

PO (Orally Disintegrating Tablet)

- Take on empty stomach.
- Remove from blister pack; immediately place on tongue.
- May take with or without liquid.
- Do not split or cut.

Indications/routes/dosage

Hayfever, Upper Respiratory Symptoms

PO:ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 60 mg twice daily or 180 mg once daily. **CHILDREN 2–11 YRS:** 30 mg twice daily.

Dosage in Renal Impairment

PO:ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 60 mg once daily. **CHILDREN 2–11 YRS:** 30 mg once daily. **CHILDREN 6 MOS–LESS THAN 2 YRS:** 15 mg once daily.

CrCl	Adults	Children
>50 mL/min	No adjustment	No adjustment
10–50 mL/min	60 mg q24h	60 mg q24h
<10 mL/min	30 mg q24h	30 mg q24h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Rare (less than 2%): Drowsiness, headache, fatigue, nausea, vomiting, abdominal distress, dysmenorrhea.

Adverse effects/toxic reactions

Hypersensitivity reaction occurs rarely.

Nursing considerations

Baseline assessment

Assess severity of congestion, rhinitis, urticaria, watery eyes. If pt is having an allergic reaction, obtain history of recently ingested foods, drugs, environmental exposure, emotional stress. Monitor rate, depth, rhythm, type of respiration; quality, rate of pulse. Assess lung sounds for rhonchi, wheezing, rales.

Intervention/evaluation

Assess for therapeutic response; relief from allergy: itching, red, watery eyes, rhinorrhea, sneezing.

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol during antihistamine therapy.
- Coffee, tea may help reduce drowsiness.
- Do not take with any fruit juices.

fidaxomicin

fye-**dax**-oh-**mye**-sin

Dificid

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Macrolide.

CLINICAL: Antibiotic.

Uses

Treatment of *C. difficile*–associated diarrhea.

Precautions

Contraindications: Hypersensitivity to fidaxomicin. **Cautions:** History of anemia, neutropenia, macrolide allergy.

Action

Binds to ribosomal sites of susceptible organisms, inhibiting RNA-dependent protein synthesis by RNA polymerase. **Therapeutic Effect:** Bactericidal against *C. difficile*.

Pharmacokinetics

Minimal systemic absorption following PO administration. Mainly confined to GI tract. Excreted primarily in feces (92%). **Half-life:** 9 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG:CycloSPORINE may increase serum concentration, effects. **HERBAL:** None known. **FOOD:** None significant. **LAB VALUES:** May increase serum ALT, AST, bilirubin, alkaline phosphatase.

Availability (Rx)

Tablets: 200 mg.

Administration/handling

- Give without regard to food.

Indications/routes/dosage

***Clostridium Difficile*–Associated Diarrhea**

PO:ADULTS: 200 mg twice daily for 10 days.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (62%–33%): Nausea, vomiting, abdominal pain. **Rare (less than 2%):** Pruritus, rash.

Adverse effects/toxic reactions

Less than 2% reported events most likely related to diarrhea-associated illness including volume loss, dehydration, GI bleeding, bloating, megacolon, abdominal distention/tenderness, flatulence, dyspepsia, dysphagia, intestinal obstruction, bicarbonate loss, hyperglycemia, metabolic acidosis, and increased hepatic function tests. GI tract infection may cause bleeding, decreased platelets, decreased RBC count.

Nursing considerations

Baseline assessment

Verify positive *C. difficile* toxin test before initiating treatment. Implement infection control measures. Obtain baseline CBC, electrolytes, renal function, fecal occult blood test. Assess abdominal pain, bowel sounds, and stool characteristics (color, frequency, consistency). Assess hydration status.

Intervention/evaluation

Monitor for volume loss, dehydration, hypotension, abdominal pain, pyrexia. Encourage nutrition/fluid intake. Monitor daily pattern of bowel activity, stool consistency. Routinely assess bowel sounds. Screen for intestinal obstruction (increased nausea, abdominal pain, hyperactive bowel sounds) and consider abdominal X-ray if suspected.

Patient/family teaching

- Complete drug therapy, despite symptom improvement. Early discontinuation may result in antibacterial resistance and increased risk of recurrent infection.
- Report weakness, fatigue, pale skin, dizziness, or red/dark, tarry stools relating to GI bleeding.
- *C. difficile* infection is extremely contagious to others. Wash hands frequently with soap and water, esp. after bowel movements. *C. difficile* spores can live on objects for months. Use bleach products to cleanse bathroom, doorknobs, other high-touch surfaces. If possible, use a separate bathroom away from others.
- Drink plenty of fluids.

filgrastim

fil-gras-tim

Granix

Neupogen

Zarxio

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Biologic modifier.

CLINICAL: CLINICAL: Granulocyte colony-stimulating factor (G-CSF).

Do not confuse Neupogen with Epogen, Neulasta, Neumega, or Nutramigen.

TOP
100

Uses

Granix: Decreases duration of severe neutropenia in pts with malignancies receiving chemotherapy associated with severe neutropenia, fever. **Neupogen, Zarxio:** Reduces neutropenia duration, sequelae in pts with nonmyeloid malignancies having myeloablative therapy followed by bone marrow transplant (BMT). Mobilization of hematopoietic progenitor cells into peripheral blood for collection by apheresis. Treatment of chronic, severe neutropenia. Decreases incidence of infection in pts with malignancies receiving chemotherapy associated with increased incidence of severe neutropenia with fever. Reduces time to neutrophil recovery/duration of fever after induction/consolidation chemotherapy in AML pts. **Neupogen:** Increases survival in pts acutely exposed to myelosuppressive doses of radiation. **OFF-LABEL:** Treatment of AIDS-

related neutropenia in pts receiving zidovudine; drug-induced neutropenia; anemia in myelodysplastic syndrome; hepatitis C virus infection treatment-associated neutropenia.

Precautions

Contraindications: Hypersensitivity to filgrastim. **Neupogen, Zarxio (additional):** History of serious allergic reaction to human granulocyte colony-stimulating factors. **Cautions:** Malignancy with myeloid characteristics (due to G-CSF's potential to act as growth factor), gout, psoriasis, neutrophil count greater than 50,000 cells/mm³, sickle cell disease, concomitant use of other drugs that may result in thrombocytopenia. Do not use 24 hrs before or after cytotoxic chemotherapy.

Action

Stimulates production, maturation, activation of neutrophils. **Therapeutic Effect:** Increases migration and cytotoxicity of neutrophils.

Pharmacokinetics

Readily absorbed. Onset of action: 24 hrs (plateaus in 3–5 days). WBC return to normal in 4–7 days. Not removed by hemodialysis. **Half-life:** 3.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase LDH, leukocyte alkaline phosphatase (LAP) scores, serum alkaline phosphatase, uric acid.

Availability (Rx)

Injection Solution: (Neupogen): 300 mcg/mL, 480 mcg/1.6 mL **Injection,**

Prefilled Syringe: (Granix, Neupogen, Zarxio): 300 mcg/0.5 mL, 480 mcg/0.8 mL.

Administration/handling

 May be given by subcutaneous injection, short IV infusion (15–30 min), or continuous IV infusion. Do not dilute with normal saline.

IV

Reconstitution

- Allow vial to warm to room temperature (approx. 30 mins).
- Visually inspect for particulate matter or discoloration.
- Dilute in D₅W from concentration of 300 mcg/mL to 5 mcg/mL (do not dilute to a final concentration less than 5 mcg/mL). Diluted solutions of 5–15 mcg/mL should have addition of albumin to a final concentration of 2 mg/mL.
- Do not dilute with saline.

Rate of Administration

- For intermittent infusion (piggyback), infuse over 15–30 min.
- For continuous infusion, give single dose over 4–24 hrs.
- In all situations, flush IV line with D₅W before and after administration.

Storage

- Refrigerate vials and syringes.
- Stable for up to 24 hrs at room temperature (provided vial contents are clear and contain no particulate matter).

Subcutaneous

- Aspirate syringe before injection (avoid intra-arterial administration).

Storage

- Store in refrigerator, but remove before use and allow to warm to room temperature.

IV incompatibilities

Amphotericin (Fungizone), cefepime (Maxipime), cefotaxime (Claforan), cefOXitin (Mefoxin), ceftizoxime (Cefizox), cefTRIAxone (Rocephin), clindamycin (Cleocin), DACTINomycin (Cosmegen), etoposide (VePesid), fluorouracil, furosemide (Lasix), heparin, mannitol, methylPREDNISolone

(Solu-Medrol), mitoMYcin (Mutamycin), prochlorperazine (Compazine).

■ IV Compatibilities

Bumetanide (Bumex), calcium gluconate, HYDROmorphine (Dilaudid), LORazepam (Ativan), morphine, potassium chloride.

Indications/routes/dosage

◀ALERT▶ Begin therapy at least 24 hrs after last dose of chemotherapy and at least 24 hrs after bone marrow infusion. Dosing based on actual body weight.

Chemotherapy-Induced Neutropenia

Neupogen, Zarxio

IV or SQ Infusion, SQ Injection:ADULTS, ELDERLY, CHILDREN: Initially, 5 mcg/kg/day. May increase by 5 mcg/kg for each chemotherapy cycle based on duration/severity of neutropenia; continue for up to 14 days or until absolute neutrophil count (ANC) reaches 10,000 cells/mm³.

Granix

SQ:ADULTS, ELDERLY: 5 mcg/kg/day. Continue until nadir has passed and neutrophil count recovered to normal range.

Bone Marrow Transplant

IV or SQ Infusion: (Neupogen, Zarxio) ADULTS, ELDERLY, CHILDREN:10 mcg/kg/day. Administer >24 hrs after chemotherapy or bone marrow transfusion. Adjust dosage daily during period of neutrophil recovery based on neutrophil response.

Mobilization of Progenitor Cells

IV or SQ Infusion:(Neupogen, Zarxio) ADULTS: 10 mcg/kg/day in donors beginning at least 4 days before first leukapheresis and continuing until last leukapheresis (usually for 6–7 days). Discontinue for WBC greater than 100,000 cells/mm³.

Chronic Neutropenia, Congenital Neutropenia

SQ:(Neupogen, Zarxio) ADULTS, CHILDREN: Initially, 6 mcg/kg/dose twice daily. Adjust dose based on ANC/clinical response.

Idiopathic or Cyclic Neutropenia

SQ:(Neupogen, Zarxio) ADULTS, CHILDREN: Initially, 5 mcg/kg/dose once daily. Adjust dose based on ANC/clinical response.

Radiation Injury Syndrome

SQ: ADULTS, ELDERLY: 10 mcg/kg once daily. Continue until ANC remains greater than 1,000 cells/mm³ for 3 consecutive CBCs or ANC exceeds 10,000 cells/mm³ after radiation-induced nadir.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (57%–11%): Nausea/vomiting, mild to severe bone pain (more frequent with high-dose IV form, less frequent with low-dose subcutaneous form), alopecia, diarrhea, fever, fatigue. **Occasional (9%–5%):** Anorexia, dyspnea, headache, cough, rash. **Rare (less than 5%):** Psoriasis, hematuria, proteinuria, osteoporosis.

Adverse effects/toxic reactions

Long-term administration occasionally produces chronic neutropenia, splenomegaly. Acute respiratory distress syndrome, alveolar hemorrhage and hemoptysis (pts undergoing peripheral blood progenitor cell collection mobilization), capillary leak syndrome, cutaneous vasculitis, glomerulonephritis, leukocytosis, MI, thrombocytopenia, sickle cell crisis, splenic rupture may occur.

Nursing considerations

Baseline assessment

CBC, platelet count should be obtained before therapy initiation and twice wkly thereafter.

Intervention/evaluation

In septic pts, be alert for adult respiratory distress syndrome. Closely monitor those with preexisting cardiac conditions. Monitor B/P (transient decrease in B/P may occur), temperature, CBC with differential, platelet count, serum uric acid, hepatic function tests.

Patient/family teaching

- Report fever, chills, severe bone pain, chest pain, palpitations, difficulty breathing; left upper abdominal pain/tightness; flank pain.

finasteride

fin-as-ter-ide

Apo-Finasteride 

Propecia

Proscar

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: PHARMACOTHERAPEUTIC: Androgen hormone inhibitor.

CLINICAL: Benign prostatic hyperplasia agent.

Do not confuse finasteride with furosemide, or Proscar with ProSom, Provera, or PROzac.

Uses

Proscar: Reduces risk of acute urinary retention, need for surgery in symptomatic benign prostatic hyperplasia (BPH) alone or in combination with doxazosin (Cardura). **Propecia:** Treatment of male pattern hair loss. **OFF-LABEL:** Treatment of female hirsutism.

Precautions

Contraindications: Hypersensitivity to finasteride, pregnancy or women of

child-bearing potential. **Cautions:** Hepatic impairment, urinary outflow obstruction, urinary retention. Women who are attempting to conceive should avoid exposure to crushed or broken tablets.

Action

Inhibits 5-alpha reductase, an intracellular enzyme that converts testosterone into dihydrotestosterone (DHT) in prostate gland, resulting in decreased serum DHT. **Therapeutic Effect:** Reduces size of prostate gland.

Pharmacokinetics

Route	Onset	Peak	Duration
PO (reduction of DHT)	8 hrs	—	24 hrs

Rapidly absorbed from GI tract. Protein binding: 90%. Widely distributed. Metabolized in liver. **Half-life:** 6–8 hrs. Onset of clinical effect: 3–6 mos of continued therapy.

Lifespan considerations

Pregnancy/Lactation: Physical handling of tablet by those who are or may become pregnant may produce abnormalities of external genitalia of male fetus. **Children:** Not indicated for use in children. **Elderly:** No age-related precautions noted.

Interactions

DRUG: None significant. **HERBAL:** **St. John's wort** may decrease concentration. Avoid concurrent use with **saw palmetto** (not adequately studied). **FOOD:** None known. **LAB VALUES:** Decreases serum prostate-specific antigen (PSA) level, even in presence of prostate cancer. Decreases dihydrotestosterone (DHT). Increases follicle-stimulating hormone (FSH), luteinizing hormone (LH), testosterone.

Availability (Rx)

 **Tablets:** 1 mg (Propecia), 5 mg (Proscar).

Administration/handling

PO

- Do not break, crush, dissolve, or divide film-coated tablets.
- Give without regard to meals.

Indications/routes/dosage

Benign Prostatic Hyperplasia (BPH)

PO:ADULTS, ELDERLY:(Proscar): 5 mg once daily (as single agent or in combination with doxazosin). 6 months of treatment usually needed to assess benefit.

Hair Loss

PO:ADULTS:(Propecia): 1 mg/day.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution.

Side effects

Rare (4%–2%): Gynecomastia, sexual dysfunction (impotence, decreased libido, decreased volume of ejaculate).

Adverse effects/toxic reactions

Hypersensitivity reaction, circumoral swelling, testicular pain occur rarely.

Nursing considerations

Baseline assessment

Digital rectal exam, serum prostate-specific antigen (PSA) determination should be performed in pts with benign prostatic hyperplasia (BPH) before initiating therapy and periodically thereafter. Assess usual urinary characteristics (frequency, ability to empty bladder, urinary flow). Assess degree of urinary retention with baseline bladder scan.

Intervention/evaluation

Diligently monitor I&O, esp. in pts with large residual urinary volume, severely diminished urinary flow, or obstructive uropathy. Obtain periodic bladder scan to assess treatment effectiveness (or to assess for acute urinary retention).

Patient/family teaching

- Treatment may cause impotence, decreased volume of ejaculate.
- May not notice improved urinary flow even if prostate gland shrinks.
- Must take medication longer than 6 mos, and it is unknown if medication decreases need for surgery.
- Because of potential risk to male fetus, women who are or may become pregnant should not handle tablets or be exposed to pt's semen.
- Immediately report inability to urinate or severe bladder pain.

fingolimod

fin-**goe**-li-mod

Gilenya

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Immunomodulator.

CLINICAL: Multiple sclerosis agent.

TOP
100

Uses

Treatment of pts with relapsing forms of multiple sclerosis (MS) to reduce frequency of clinical exacerbations, delay accumulation of physical disability.

Precautions

Contraindications: Hypersensitivity to fingolimod. Sick sinus syndrome, second-degree or higher conduction block (unless pt has functioning

pacemaker). Baseline QT interval 500 msec or greater. Concurrent use of class Ia or III antiarrhythmic. Recent (within 6 mos) MI, unstable angina, stroke, TIA, decompensated requiring hospitalization or NYHA class III/IV HF. **Cautions:** Concomitant use of antiarrhythmics, beta blockers, calcium channel blockers, immunosuppressants, immune modulators, antineoplastics, QT interval–prolonging medications (e.g., amiodarone, ciprofloxacin); bradycardia, severe hepatic impairment, ischemic heart disease, diabetes, hypokalemia, hypomagnesemia; history of syncope, uveitis; pts at risk for developing bradycardia or heart block.

Action

Blocks capacity of lymphocytes to move out from lymph nodes, reducing number of lymphocytes available to the CNS. **Therapeutic Effect:** May involve reduction of lymphocyte migration into central nervous system, which reduces central inflammation.

Pharmacokinetics

Metabolized by the enzyme sphingosine kinase to active metabolite. Highly distributed in red blood cells (85%). Minimally metabolized in liver. Protein binding: 99.7%. Primarily excreted in urine. **Half-life:** 6–9 days.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** Age-related severe hepatic impairment may increase risk of adverse reactions.

Interactions

DRUG: Beta blockers (e.g., carvedilol, metoprolol), bretylium, calcium channel blockers (e.g., diltiazem, verapamil), ceritinib, esmolol, lacosamide may increase risk of bradycardia. May increase effects of antiarrhythmics (e.g., amiodarone, sotalol). CarBAMazepine may decrease concentration/effect. Ketoconazole may increase concentration/effect. May increase effects of QT interval–prolonging medications (e.g., amiodarone, azithromycin,

ciprofloxacin, haloperidol). May increase toxic effects of **denosumab, leflunomide, natalizumab, tacrolimus.** May decrease effect of **nivolumab, sipuleucel-T, tertomotide.** May increase immunosuppressive effect of **tofacitinib, other immunosuppressants.** May increase neutropenic effect of **trastuzumab.** May decrease therapeutic effect of **vaccines,** increase toxic effects of **live vaccines.**

HERBALS:Echinacea may decrease concentration. **FOOD:** None known.

LAB VALUES: Expect decrease in neutrophil count. May increase serum alkaline phosphatase, ALT, AST, bilirubin, triglycerides. May reduce diagnostic effect of *Coccidioides immitis* skin test.

Availability (Rx)

Capsules: 0.5 mg.

Administration/handling

PO

- May give without regard to food.

Indications/routes/dosage

Multiple Sclerosis

PO:ADULTS 18 YRS AND OLDER, ELDERLY: 0.5 mg once daily.

Dosage in Renal/Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use caution.

Side effects

Frequent (25%–10%): Headache, diarrhea, back pain, cough. **Occasional (8%–5%):** Dyspnea, clinical depression, dizziness, hypertension, migraine, paresthesia, decreased weight. **Rare (4%–2%):** Blurred vision, alopecia, eye pain, asthenia, eczema, pruritus.

Adverse effects/toxic reactions

May increase risk of infections (influenza, herpes viral infection, bronchitis, sinusitis, gastroenteritis, ear infection) in 13%–4% of pts. Pts with diabetes or history of uveitis are at increased risk for developing macular edema. Cases of skin cancer, lymphoma, basal cell carcinoma have been reported. Progressive multifocal leukoencephalopathy (PML) (weakness, paralysis, vision loss, aphasia, cognition impairment) may occur. Neurotoxicity, posterior reversible encephalopathy may evolve into cerebral hemorrhage, CVA. May increase risk of hypertension.

Nursing considerations

Baseline assessment

Obtain baseline CBC, serum chemistries prior to initial treatment. At initial treatment (within first 4–6 hrs after dose), medication reduces heart rate, AV conduction, followed by progressive increase after first day of treatment. Obtain baseline vitals, with particular attention to pulse rate. Perform ophthalmologic evaluation prior to treatment and 3–4 mos after initiation of treatment. Question medical history as listed in Precautions. Obtain full medication history and screen for interactions.

Intervention/evaluation

Monitor for bradycardia for 6 hrs after first dose, then as appropriate. Periodically monitor CBC, serum chemistries, particularly lymphocyte count (expected to decrease approximately 80% from baseline with continued treatment). Monitor for signs of systemic or local infection. Diligently monitor for hypersensitivity reaction, neurological changes, symptoms of posterior reversible encephalopathy (altered mental status, seizures, visual disturbances), PML, QT interval prolongation. Assess for new skin lesions, malignancies. Conduct ophthalmologic exams q3–4 mos after initiation, during treatment, and with any changes in vision.

Patient/family teaching

- Obtain regular eye examinations during and for 2 mos following treatment.
- Use effective methods of contraception during and for 3 mos following

treatment.

- Immediately report neurological changes such as confusion, severe headache, seizure activity, vision changes, trouble speaking, one-sided weakness, paralysis.
- Treatment may increase risk of certain cancers; report new skin lesions, fever, chills, night sweats, generalized weakness, weight loss, or pain or swelling of the lymph nodes.
- Report allergic reactions such as itching, rash, swelling of the face or tongue.
- Report symptoms of infection, visual changes, yellowing of skin, eyes, dark urine.
- Due to high risk for drug interactions, do not take newly prescribed medication unless approved by prescriber who originally started treatment.

fluconazole

flu-**kon**-a-zole

Apo-Fluconazole 

Diflucan

Novo-Fluconazole 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Synthetic azole.

CLINICAL: Systemic antifungal.

Do not confuse Diflucan with diclofenac, Diprivan, or disulfiram, or fluconazole with itraconazole, ketoconazole, omeprazole, or pantoprazole.

Uses

Antifungal prophylaxis in pts undergoing bone marrow transplant; candidiasis (esophageal, oropharyngeal, urinary tract, vaginal); systemic Candida infections (e.g., candidemia); treatment of cryptococcal meningitis. **OFF-LABEL:** Cryptococcal pneumonia, candidal intertrigo.

Precautions

Contraindications: Hypersensitivity to fluconazole. Concomitant administration of QT-prolonging medications (e.g., erythromycin, pimozide).

Cautions: Hepatic/renal impairment, hypokalemia, hypersensitivity to other

triazoles (e.g., itraconazole, terconazole), imidazoles (e.g., butoconazole, ketoconazole). Medications or conditions known to cause arrhythmias.

Action

Interferes with cytochrome P-450 activity, an enzyme necessary for ergosterol formation. **Therapeutic Effect:** Directly damages fungal membrane, altering its function. Fungistatic.

Pharmacokinetics

Well absorbed from GI tract. Widely distributed, including to CSF. Protein binding: 11%. Partially metabolized in liver. Excreted unchanged primarily in urine. Partially removed by hemodialysis. **Half-life:** 20–30 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Secreted in human breast milk. Use caution in breastfeeding females. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Increases concentration/effect of **calcium channel blockers (e.g., amlodipine, nifedipine, verapamil), celecoxib, cyclosporine, midazolam, methadone, NSAIDS (e.g., ibuprofen, ketorolac, naproxen), rifabutin, sirolimus, tacrolimus, theophylline, tofacitinib, zidovudine.** May increase concentration/effect, risk of myopathy of **HMG-CoA reductase inhibitors (e.g. atorvastatin, simvastatin).** **HCTZ** may increase concentration/effect. **Cimetidine, rifampin** may decrease concentration/effect. May increase concentration/effect of **oral hypoglycemics (e.g., glipizide, glyburide), phenytoin.** May further prolong prothrombin time of **warfarin.** **Quinidine** may increase QT prolongation; risk of torsades de pointes. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, ALT, AST.

Availability (Rx)

Injection, Solution, Pre-Mix: 100 mg (50 mL), 200 mg (100 mL), 400 mg (200 mL). **Powder for Oral Suspension:** 10 mg/mL, 40 mg/mL. **Tablets:** 50 mg, 100 mg, 150 mg, 200 mg.

Administration/handling

IV

Rate of Administration

- Do not exceed maximum flow rate of 200 mg/hr.

Storage

- Store at room temperature.
- Do not remove from outer wrap until ready to use.
- Squeeze inner bag to check for leaks.
- Do not use parenteral form if solution is cloudy, precipitate forms, seal is not intact, or it is discolored.
- Do not add supplementary medication.

PO

- Give without regard to meals.

IV incompatibilities

Amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), calcium gluconate, cefotaxime (Claforan), cefTRIAxone (Rocephin), cefuroxime (Zinacef), chloramphenicol (Chloromycetin), clindamycin (Cleocin), co-trimoxazole (Bactrim), diazePAM (Valium), digoxin (Lanoxin), erythromycin (Erythrocin), furosemide (Lasix), haloperidol (Haldol), hydrOXYzine (Vistaril), imipenem and cilastatin (Primaxin).

IV Compatibilities

Dexmedetomidine (Precedex), diltiazEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), heparin, lipids, LORazepam (Ativan), midazolam (Versed), propofol (Diprivan).

Indications/routes/dosage

◀ALERT▶ PO and IV therapy equally effective; IV therapy recommended for pt intolerant of drug or unable to take orally. Oral suspension stable for 14 days at room temperature or refrigerated.

Usual Dosage

Note: Duration and dose dependent on location/severity of infection.

PO/IV:ADULTS, ELDERLY: 150 mg once or **loading dose:** 200–800 mg.

Maintenance dose: 200–800 mg once daily. **CHILDREN AND NEONATES:**

Loading dose: 6–12 mg/kg. **Maintenance dose:** 3–12 mg/kg once daily.

Maximum: 600 mg/day.

Dosage in Renal Impairment

After a loading dose of 400 mg, daily dosage is based on creatinine clearance.

Creatinine Clearance	Dosage
Greater than 50 mL/min	100%
50 mL/min or less	50%
Dialysis	50%
CCRT	400–800 mg as loading dose
CVVH	then 200–800 mg/day
CVVHDF	400–800 mg as loading dose, then 400–800 mg/day

Dosage in Hepatic Impairment

Use caution.

Side effects

Occasional (4%–1%): Hypersensitivity reaction (chills, fever, pruritus, rash), dizziness, drowsiness, headache, constipation, diarrhea, nausea, vomiting, abdominal pain.

Adverse effects/toxic reactions

Exfoliative skin disorders, serious hepatic injury, blood dyscrasias (eosinophilia, thrombocytopenia, anemia, leukopenia) have been reported rarely. May increase

risk of QT prolongation, torsades de pointes. Skin disorders including Stevens-Johnson syndrome, toxic epidermal necrolysis may occur.

Nursing considerations

Baseline assessment

Obtain CBC, LFT; serum potassium in critically ill pts. Receive full medication history and screen for interactions. Assess areas of infection. Assess infected area.

Intervention/evaluation

Assess for hypersensitivity reaction (chills, fever). Monitor CBC, BMP, LFT. Report rash, itching promptly. Monitor temperature at least daily. Monitor daily pattern of bowel activity, stool consistency. Assess for dizziness; provide assistance as needed.

Patient/family teaching

- Report dark urine, pale stool, jaundiced skin or sclera of eyes, rash, pruritus.
- Pts with oropharyngeal infections should maintain fastidious oral hygiene.
- Consult physician before taking any other medication.

fluorouracil, 5-FU

flure-oh-ue-ra-sil

HIGH
ALERT

Adrucil

Carac

Efudex

Fluoroplex

Tolak

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antimetabolite.

CLINICAL: Antineoplastic.

- **BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents.

Do not confuse Efudex with Efidac.

Uses

Parenteral: Treatment of carcinoma of colon, rectum, breast, stomach, pancreas.

Topical: Treatment of multiple actinic or solar keratoses, superficial basal cell carcinomas. **OFF-LABEL:Parenteral:** Treatment of carcinoma of: bladder, cervical, endometrial, head/neck, anal, esophageal, renal cell, unknown primary cancer.

Precautions

Contraindications: Hypersensitivity to fluorouracil. Myelosuppression, poor nutritional status, potentially serious infections. **Cautions:** History of high-dose pelvic irradiation, hepatic/renal impairment, palmar-plantar erythrodysesthesia syndrome (hand and foot syndrome), previous use of alkylating agents. Pts with widespread metastatic marrow involvement.

Action

Blocks formation of thymidylic acid. Cell cycle–specific for S phase of cell division. **Therapeutic Effect:** Inhibits DNA, RNA synthesis. **Topical:** Destroys rapidly proliferating cells.

Pharmacokinetics

Widely distributed. Crosses blood-brain barrier. Metabolized in liver. Primarily excreted by lungs as carbon dioxide. Removed by hemodialysis. **Half-life:** 16 min.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Bone marrow depressants may increase risk of myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** Echinacea may decrease effects. Avoid use of **black cohosh, dong quai** in pts with estrogen-dependent tumors. **FOOD:** None known. **LAB VALUES:** May decrease serum albumin. **Topical:** May cause eosinophilia, leukocytosis, thrombocytopenia, toxic granulation.

Availability (Rx)

Cream, Topical (Carac): 0.5%. **(Tolak):** 4%, **(Efudex):** 5%. **(Fluoroplex):** 1%. **Injection Solution (Adrucil):** 50 mg/mL. **Solution, Topical (Efudex):** 2%, 5%.

Administration/handling

 Give by IV injection or IV infusion. Do not add to other IV infusions. Avoid small veins, swollen/edematous extremities, areas overlying joints, tendons. May be carcinogenic, mutagenic, teratogenic. Handle with extreme care during preparation/administration.

IV

Reconstitution

- IV push does not need to be diluted or reconstituted.
- Inject through Y-tube or 3-way stopcock of free-flowing solution.
- For IV infusion, further dilute with 50–1,000 mL D₅W or 0.9% NaCl.

Rate of Administration

- Give IV push slowly over 1–2 min.
- IV infusion is administered over 30 min–24 hrs (refer to individual protocols).
- Extravasation produces immediate pain, severe local tissue damage.

Storage

- Store at room temperature.
- Solution appears colorless to faint yellow. Slight discoloration does not adversely affect potency or safety.
- If precipitate forms, redissolve by heating, shaking vigorously; allow to cool to body temperature.
- Diluted solutions stable for 72 hrs at room temperature.

■ IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), filgrastim (Neupogen), ondansetron (Zofran), vinorelbine (Navelbine).

■ IV Compatibilities

Granisetron (Kytril), heparin, HYDROMORPHONE (Dilaudid), leucovorin, morphine, potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Note: Refer to individual protocols.

Usual Range

IV Bolus:ADULTS, ELDERLY: 200–1000 mg/m²/day for 1–21 days or 500–600 mg/m²/dose q3–4wks.

IV Infusion:ADULTS, ELDERLY: 15 mg/kg/day or 500 mg/m²/day over 4 hrs for 5 days or 800–1200 mg/m² over 24–120 hrs.

Multiple Actinic or Solar Keratoses

Topical (Carac):ADULTS, ELDERLY: Apply once daily for up to 4 wks.

Topical (Efudex): ADULTS, ELDERLY: Apply twice daily for 2–4 wks.

Topical (Fluoroplex):Apply twice daily for 2–6 wks.

Topical (Tolak): Apply once daily for 4 wks.

Basal Cell Carcinoma

Topical (Efudex 5%): ADULTS, ELDERLY: Apply twice daily for 3–6 wks up to 10–12 wks.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use extreme caution.

Side effects

Parenteral: Frequent (greater than 10%): Alopecia, dermatitis, anorexia, diarrhea, esophagitis, dyspepsia, stomatitis. **Occasional (10%–1%):** Cardiotoxicity (angina, EKG changes), skin dryness, epithelial fissuring, nausea, vomiting, excessive lacrimation, blurred vision. **Rare (less than 1%):** Headache, photosensitivity, somnolence, allergic reaction, dyspnea, hypotension, MI, pulmonary edema. **Topical: Occasional:** Erythema, skin ulceration, pruritus, hyperpigmentation, dermatitis, insomnia, stomatitis, irritability, photosensitivity, excessive lacrimation, blurred vision.

Adverse effects/toxic reactions

Earliest sign of toxicity (4–8 days after beginning therapy) is stomatitis (dry mouth, burning sensation, mucosal erythema, ulceration at inner margin of lips). Most common dermatologic toxicity is pruritic rash (generally on extremities, less frequently on trunk). Leukopenia (WBC less than 3500 cells/mm³) generally occurs within 9–14 days after drug administration but may occur as late as 25th day. Thrombocytopenia (platelets less than 100,000 cells/mm³) occasionally occurs within 7–17 days after administration. Pancytopenia, agranulocytosis occur rarely.

Nursing considerations

Baseline assessment

Obtain baseline CBC with differential, serum renal function, LFT and monitor during therapy. Question history of hypersensitivity reaction, hepatic/renal impairment.

Intervention/evaluation

Monitor for rapidly falling WBC, platelet count; intractable diarrhea, GI bleeding (bright red or tarry stool). Assess oral mucosa for stomatitis. Drug should be discontinued if intractable diarrhea, stomatitis, GI bleeding occurs. Assess skin for rash.

Patient/family teaching

- Maintain strict oral hygiene.
- Report signs/symptoms of infection, unusual bruising/bleeding, visual changes, nausea, vomiting, diarrhea, chest pain, palpitations.
- Avoid sunlight, artificial light sources; wear protective clothing, sunglasses, sunscreen.
- **Topical:** Apply only to affected area.
- Do not use occlusive coverings.
- Be careful near eyes, nose, mouth.
- Wash hands thoroughly after application.
- Treated areas may be unsightly for several weeks after therapy.

FLUoxetine

floo-ox-e-teen

Apo-FLUoxetine 

Novo-FLUoxetine 

PROzac

PROzac Weekly

Sarafem

Fixed-Combination(s)

Symbyax: FLUoxetine/OLANzapine (an antipsychotic): 25 mg/6 mg, 25 mg/12 mg, 50 mg/6 mg, 50 mg/12 mg.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Selective serotonin reuptake inhibitor (SSRI).

CLINICAL: Antidepressant, antiobsessional agent, antibulimic.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal thinking and behavior in children, adolescents, young adults 18–24 yrs of age with major depressive disorder, other psychiatric disorders.

Do not confuse FLUoxetine with DULOxetine, famotidine, fluvastatin, fluvoxaMINE, furosemide, or PARoxetine, or PROzac with Paxil, PriLOSEC, Prograf, Proscar, or ProSom, or Sarafem with Serophene.

Uses

Treatment of major depressive disorder (MDD), obsessive-compulsive disorder (OCD), binge-eating and vomiting in moderate to severe bulimia nervosa, premenstrual dysphoric disorder (PMDD), panic disorder with or without agoraphobia. Treatment of resistant or bipolar 1 depression (with OLANzapine). **OFF-LABEL:** Treatment of fibromyalgia, post-traumatic stress disorder (PTSD), Raynaud's phenomena, social anxiety disorder, selective mutism.

Precautions

Contraindications: Hypersensitivity to FLUoxetine. Use of MAOIs within 5 wks of discontinuing FLUoxetine or within 14 days of discontinuing MAOIs. Initiation in pts receiving linezolid or methylene blue. Use with pimozide or thioridazine. **Note:** Do not initiate thioridazine until 5 wks after discontinuing fluoxetine. **Cautions:** Seizure disorder, cardiac dysfunction (e.g., history of MI), diabetes, pts with risk factors for QT prolongation, concurrent use of medication that increases QT interval, renal/hepatic impairment, pts at high risk for suicide, in pts where weight loss is undesirable, elderly. Pts at risk of acute narrow-angle glaucoma or with increased intraocular pressure.

Action

Selectively inhibits serotonin uptake in CNS, enhancing serotonergic function. **Therapeutic Effect:** Relieves depression; reduces obsessive-compulsive, bulimic behavior.

Pharmacokinetics

Well absorbed from GI tract. Crosses blood-brain barrier. Protein binding: 94%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–3 days; metabolite, 7–9 days.

Lifespan considerations

Pregnancy/Lactation: Unknown whether drug crosses placenta or is distributed in breast milk. **Children:** May be more sensitive to behavioral side effects (e.g., insomnia, restlessness). **Elderly:** No age-related precautions noted.

Interactions

DRUG:NSAIDs (e.g., ibuprofen, ketorolac, naproxen), antiplatelets (e.g., clopidogrel), anticoagulants (e.g., warfarin) may increase risk of bleeding. **Alcohol, other CNS depressants (e.g., lorazepam, morphine, zolpidem)** may increase CNS depression. **MAOIs (e.g., phenelzine, selegiline)** may produce serotonin syndrome and neuroleptic malignant syndrome. May increase concentration/toxicity of **phenytoin, tricyclic antidepressants (e.g., amitriptyline, doxepin, nortriptyline)**. **HERBAL:**Gotu kola, kava kava, **St. John's wort, valerian** may increase CNS depression. **St. John's wort** may increase effects, risk of serotonin syndrome. **FOOD:** None known. **LAB VALUES:** May decrease serum sodium. May increase serum ALT, AST.

Availability (Rx)

Capsules: 10 mg, 20 mg, 40 mg. **Oral Solution:** 20 mg/5 mL. **Tablets:** 10 mg, 20 mg, 60 mg.

 **Capsules (Delayed-Release):** 90 mg.

Administration/handling

PO

- Give without regard to food, but give with food, milk if GI distress occurs.
- **Bipolar disorder:** Give once daily in evening.
- **Depression, OCD:** Give once daily in morning or twice daily (morning and noon).
- **Bulimia:** Give once daily in morning.

Indications/routes/dosage

 Use lower or less frequent doses in pts with renal/hepatic impairment, pts with concurrent disease or multiple medications, the elderly.

Depression

PO:ADULTS, ELDERLY: Initially, 5–20 mg each morning. May increase after several wks by 20 mg/day. **Maximum:** 80 mg/day as single or 2 divided doses. **PROzac Weekly:** 90 mg/wk, begin 7 days after last dose of 20 mg in pts

maintained on 20 mg/day. **CHILDREN 8–18 YRS:** Initially, 10–20 mg/day. Lower-weight children may be started at 10 mg/day and increased to 20 mg/day after 1 wk if needed.

Panic Disorder

PO:ADULTS, ELDERLY: Initially, 10 mg/day. May increase to 20 mg/day after 1 wk. May further increase dose after several wks. **Maximum:** 60 mg/day.

Bulimia Nervosa

PO:ADULTS: 60 mg each morning. May titrate to 60 mg over several days.

Obsessive-Compulsive Disorder (OCD)

PO:ADULTS, ELDERLY: Initially, 20 mg/day. May increase after several wks. Usual dose: 20–60 mg/day. **Maximum:** 80 mg/day. **CHILDREN 7–18 YRS:** Initially, 10 mg/day. May increase to 20 mg/day after 2 wks. Range: 20–60 mg/day.

Depression Associated with Bipolar Disorder

PO:ADULTS, ELDERLY, CHILDREN 10–17 YRS: (with OLANzapine):Initially, 20 mg/day. May increase after several wks. Range: 20–50 mg/day.

Premenstrual Dysphoric Disorder (PMDD) (Sarafem)

PO:ADULTS: 20 mg/day continuously **or** 20 mg/day beginning 14 days prior to menstruation and continuing through first full day of menses (repeated with each cycle).

Dosage in Renal/Hepatic Impairment

Use caution.

Side effects

Frequent (greater than 10%): Headache, asthenia, insomnia, anxiety, drowsiness, nausea, diarrhea, decreased appetite. **Occasional (9%–2%):** Dizziness, tremor, fatigue, vomiting, constipation, dry mouth, abdominal pain,

nasal congestion, diaphoresis, rash. **Rare (less than 2%):** Flushed skin, lightheadedness, impaired concentration.

Adverse effects/toxic reactions

May increase risk of suicide. Agitation, coma, diarrhea, delirium, hallucinations, hyperreflexia, hyperthermia, tachycardia, seizures may indicate life-threatening serotonin syndrome.

Nursing considerations

Baseline assessment

Assess appearance, behavior, mood, suicidal tendencies. For pts on long-term therapy, baseline renal function, LFT, blood counts should be performed at baseline and periodically thereafter.

Intervention/evaluation

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor mental status, anxiety, social functioning, appetite, nutritional intake. Monitor daily pattern of bowel activity, stool consistency. Assess skin for rash. Monitor serum LFT, glucose, sodium; weight.

Patient/family teaching

- Maximum therapeutic response may require 4 or more wks of therapy.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- To avoid insomnia, take last dose of drug before 4 PM.

fluticasone

floo-**tik**-a-sone

Apo-Fluticasone 

Arnuity Ellipta

TOP
100

Cutivate

Flonase

Flonase Allergy Relief

Flovent Diskus

Flovent HFA

VeramystXhance

Fixed-Combination(s)

Advair, Advair Diskus, Advair HFA: fluticasone/salmeterol (bronchodilator): 100 mcg/50 mcg, 250 mcg/50 mcg, 500 mcg/50 mcg. **Breo Ellipta:** fluticasone/vilanterol (bronchodilator): 100 mcg/25 mcg. **Dymista:** fluticasone/azelastine (an antihistamine): 50 mcg/137 mcg per spray. **Trelegy Ellipta:** fluticasone/umeclidium (anticholinergic)/vilanterol (bronchodilator): 100 mcg/62.5 mcg/25 mcg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Corticosteroid.

CLINICAL: Anti-inflammatory, antipruritic.

Do not confuse Cutivate with Ultravate, or Flonase with Flovent, Beconase.

Uses

Nasal: (Flonase): Management of nasal symptoms of perennial nonallergic rhinitis in adults and children 4 yrs and older. **(Veramyst):** Management of seasonal and perennial allergic rhinitis in adults, children 2 yrs and older. **Topical:** Relief of inflammation/pruritus associated with steroid-responsive disorders (e.g., contact dermatitis, eczema), atopic dermatitis. **Inhalation:** Maintenance treatment of bronchial asthma. Assists in reducing, discontinuing oral corticosteroid therapy.

Precautions

Contraindications: Hypersensitivity to fluticasone. (Arnuity Ellipta, Flovent Diskus): Severe hypersensitivity to milk proteins or lactose. **Inhalation:** Primary

treatment of status asthmaticus, acute exacerbation of asthma, other acute asthmatic conditions. **Cautions:** Untreated systemic ocular herpes simplex; untreated fungal, bacterial infection; active or quiescent tuberculosis. Thyroid disease, cardiovascular disease, diabetes, glaucoma, hepatic/renal impairment, cataracts, myasthenia gravis, seizures, GI disease, risk for osteoporosis, untreated localized infection of nasal mucosa. Following acute MI; concurrent use with strong CYP3A4 inhibitors.

Action

Controls rate of protein synthesis, depresses migration of polymorphonuclear leukocytes, reverses capillary permeability, stabilizes lysosomal membranes. **Therapeutic Effect:** Prevents, controls inflammation.

Pharmacokinetics

Inhalation/intranasal: Protein binding: 91%. Metabolized in liver. Excreted in urine. **Half-life:** 3–7.8 hrs. **Topical:** Amount absorbed depends on affected area and skin condition (absorption increased with fever, hydration, inflamed or denuded skin).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 4 yrs. Children 4 yrs and older may experience growth suppression with prolonged or high doses. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (carbamazepine, ketoconazole, phenytoin, rifampin) may increase concentration. Ritonavir may reduce serum cortisol concentration. **HERBAL:** Echinacea, St. John's wort may decrease concentration/effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Aerosol for Oral Inhalation (Flovent HFA): 44 mcg/inhalation, 110

mcg/inhalation, 220 mcg/inhalation. **Cream (Cutivate):** 0.05%. **Ointment (Cutivate):** 0.005%. **Powder for Oral Inhalation (Flovent Diskus):** 50 mcg/blister, 100 mcg/blister, 250 mcg/blister. **(Arnuity Ellipta):** 100 mcg/actuation, 200 mcg/actuation. **Suspension Intranasal Spray:(Flonase, Flonase Allergy Relief):** 50 mcg/inhalation. **(Veramyst):** 27.5 mcg/spray. **(Xhance):** 93 mcg/actuation.

Administration/handling

Inhalation

Flovent HFA

- Shake container well. Prime before first use. Instruct pt to exhale completely. Place mouthpiece fully into mouth, inhale, and hold breath as long as possible before exhaling.
- Allow 30–60 seconds between inhalations.
- Rinsing mouth after each use decreases dry mouth, hoarseness.

Flovent Diskus

- Do not shake or prime before use. Place mouthpiece fully into mouth, inhale quickly and deeply, remove device, and hold breath up to 10 seconds.

Arnuity Ellipta

- Do not shake or prime before use; put mouthpiece between lips, breathe deeply and slowly through the mouth, remove inhaler, and hold breath for 3–4 seconds.

Intranasal

- Instruct pt to clear nasal passages as much as possible before use (topical nasal decongestants may be needed 5–15 min before use).
- Tilt head slightly forward.
- Insert spray tip into 1 nostril, pointing toward inflamed nasal turbinates, away from nasal septum.
- Pump medication into 1 nostril while pt holds other nostril closed, concurrently inspires through nose.

Indications/routes/dosage

Allergic Rhinitis

Intranasal (*Flonase*): ADULTS, ELDERLY: Initially, 200 mcg (2 sprays in each nostril once daily or 1 spray in each nostril q12h). **Maintenance:** 1 spray in each nostril once daily. May increase to 100 mcg (2 sprays) in each nostril. **Maximum:** 200 mcg/day. **CHILDREN 4 YRS AND OLDER:** Initially, 100 mcg (1 spray in each nostril once daily). **Maximum:** 200 mcg/day (2 sprays each nostril).

(*Veramyst*): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 110 mcg (2 sprays in each nostril) once daily. **Maintenance:** 55 mcg (1 spray in each nostril) once daily. **CHILDREN 2–11 YRS:** 55 mcg (1 spray in each nostril) once daily. May increase to 110 mcg (2 sprays each nostril) once daily.

(*Xhance*):ADULTS, ELDERLY: 93 mcg (1 spray) per nostril twice daily. May increase to 2 sprays twice daily.

Usual Topical Dosage

Note: Ointment for adults only.

Topical:ADULTS, ELDERLY, CHILDREN 3 MOS AND OLDER: Apply sparingly to affected area once or twice daily.

Maintenance Treatment of Asthma

Inhalation Powder (*Arnuity Ellipta*):ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 100–200 mcg once daily. **Maximum:** 200 mcg/day.

Maintenance Treatment for Asthma (Previously Treated with Bronchodilators)

Inhalation Powder (*Flovent Diskus*):ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 100 mcg twice daily. **Maximum:** 500 mcg twice daily.

Inhalation (*Flovent HFA*):ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 88 mcg twice daily. **Maximum:** 440 mcg twice daily.

Maintenance Treatment for Asthma (Previously Treated with Inhaled Steroids)

Inhalation Powder (*Flovent Diskus*):ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: Initially, 100–250 mcg twice daily. **Maximum:** 500 mcg twice daily.

Inhalation (*Flovent HFA*): ADULTS, ELDERLY, CHILDREN 12 YRS AND

OLDER: 88–220 mcg twice daily. **Maximum:** 440 mcg twice daily.

Maintenance Treatment for Asthma (Previously Treated with Oral Steroids)

Inhalation Powder (*Flovent Diskus*): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 500–1,000 mcg twice daily.

Inhalation (*Flovent HFA*): ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 440–880 mcg twice daily.

Usual Pediatric Dose (4–11 Yrs)

Flovent Diskus: Initially, 50 mcg twice daily. May increase to 100 mcg twice daily. **Flovent HFA:** 88 mcg twice daily.

Dosage in Renal/Hepatic Impairment

No dose adjustment. (*Arnuity Ellipta*): Use caution in hepatic impairment.

Side effects

Frequent:Inhalation: Throat irritation, hoarseness, dry mouth, cough, temporary wheezing, oropharyngeal candidiasis (particularly if mouth is not rinsed with water after each administration). **Intranasal:** Mild nasopharyngeal irritation, nasal burning, stinging, dryness, rebound congestion, rhinorrhea, altered sense of taste. **Occasional:Inhalation:** Oral candidiasis. **Intranasal:** Nasal/pharyngeal candidiasis, headache. **Topical:** Stinging, burning of skin.

Adverse effects/toxic reactions

None known.

Nursing considerations

Baseline assessment

Establish baseline history of skin disorder, asthma, rhinitis. Question hypersensitivity, esp. milk products or lactose. Question medical history as listed in Precautions.

Intervention/evaluation

Monitor rate, depth, rhythm, type of respiration; quality/rate of pulse. Assess lung sounds for rhonchi, wheezing, rales. Assess oral mucous membranes for evidence of candidiasis. Monitor growth in pediatric pts. **Topical:** Assess involved area for therapeutic response to irritation.

Patient/family teaching

- Pts receiving bronchodilators by inhalation concomitantly with steroid inhalation therapy should use bronchodilator several min before corticosteroid aerosol (enhances penetration of steroid into bronchial tree).
- Do not change dose/schedule or stop taking drug; must taper off gradually under medical supervision.
- Maintain strict oral hygiene.
- Rinse mouth with water immediately after inhalation (prevents mouth/throat dryness, oral fungal infection).
- Increase fluid intake (decreases lung secretion viscosity).
- **Intranasal:** Clear nasal passages before use.
- Report if no improvement in symptoms or if sneezing/nasal irritation occurs.
- Improvement noted in several days.
- **Topical:** Rub thin film gently into affected area.
- Use only for prescribed area and no longer than ordered.
- Avoid contact with eyes.

fluvoxamine

floo-vox-a-meen

Apo-Fluvoxamine 

Luvox CR

Novo-Fluvoxamine 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Selective serotonin reuptake inhibitor.

CLINICAL: Antidepressant, antiobsessive.

■ **BLACK BOX ALERT** ■ Increased risk of suicidal ideation and behavior in children, adolescents, young adults 18–24 yrs with major depressive disorder, other psychiatric disorders.

Do not confuse fluvoxamine with flavoxate or fluoxetine, or Luvox with Lasix, Levoxyl, or Lovenox.

Uses

Immediate-Release: Treatment of obsessive-compulsive disorder (OCD) in adults and children 8–17 yrs of age. **Extended-Release:** Treatment of OCD in adults. **OFF-LABEL:** Treatment of social anxiety disorder (SAD), post-traumatic stress disorder (PTSD).

Precautions

Contraindications: Hypersensitivity to fluvoxamine. Use of MAOIs concurrently or within 14 days of discontinuing MAOIs or fluvoxamine. Concomitant use with alosetron, pimozide, ramelteon, thioridazine, or tiZANidine. Initiation of fluvoxamine in pts receiving linezolid or methylene blue. **Cautions:** Renal/hepatic impairment; elderly; impaired platelet aggregation; concurrent use of NSAIDs, aspirin; seizure disorder; pts that are volume depleted; third trimester of pregnancy; pts with high suicide risk; risk of bleeding or receiving concurrent anticoagulant therapy. May precipitate a shift to mania or hypomania in pts with bipolar disorder.

Action

Selectively inhibits neuronal reuptake of serotonin. **Therapeutic Effect:** Relieves depression, symptoms of obsessive-compulsive disorder (OCD).

Pharmacokinetics

Well absorbed following PO administration. Protein binding: 77%. Metabolized in liver. Excreted in urine. **Half-life:** 15–20 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses the placenta; distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 8 yrs. **Elderly:** Potential for reduced serum clearance; maintain caution.

Interactions

DRUG: May increase concentration, risk of toxicity of **benzodiazepines (e.g., ALPRAZolam, LORazepam), carBAMazepine, cloZAPine, theophylline. Lithium, tryptophan** may enhance fluvoxaMINE's serotonergic effects. **MAOIs (e.g., phenelzine, selegiline)** may increase risk of serotonin syndrome (hyperthermia, rigidity, myoclonus). **Tricyclic antidepressants (e.g., amitriptyline)** may increase concentration. May increase effects of **warfarin. HERBAL: Valerian, St. John's wort, SAME, kava kava** may increase risk of serotonin syndrome or CNS depression. Avoid **herbs with antiplatelet activity (e.g., cat's claw, feverfew, ginger).** **FOOD:**None known. **LAB VALUES:** May decrease serum sodium.

Availability (Rx)

Tablets: 25 mg, 50 mg, 100 mg.

 **Capsules (Extended-Release):** 100 mg, 150 mg.

Administration/handling

- Do not break, crush, dissolve, or divide extended-release capsules.
- May give with or without food.

Indications/routes/dosage

Obsessive-Compulsive Disorder (OCD)

PO (Immediate-Release): ADULTS: Initially, 50 mg at bedtime; may increase by 50 mg every 4–7 days. Dosages greater than 100 mg/day should be given in 2 divided doses with larger dose given at bedtime. Usual dose: 100–300 mg/day. **Maximum:** 300 mg/day. **(Extended-Release)** Initially, 100 mg once daily at bedtime. May increase by 50 mg at no less than 1-wk intervals. Range: 100–300 mg/day. **Maximum:** 300 mg/day. **CHILDREN 8–17 YRS (Immediate-Release):**Initially, 25 mg at bedtime; may increase by 25 mg every 4–7 days. Dosages greater than 50 mg/day should be given in 2 divided doses with larger dose given at bedtime. **Maximum: (CHILDREN 8–11 YRS):** 200 mg/day. **(CHILDREN 12–17 YRS):** 300 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (40%–21%): Nausea, headache, drowsiness, insomnia. **Occasional (14%–8%):** Dizziness, diarrhea, dry mouth, asthenia, dyspepsia, constipation, abnormal ejaculation. **Rare (6%–3%):** Anorexia, anxiety, tremor, vomiting, flatulence, urinary frequency, sexual dysfunction, altered taste.

Adverse effects/toxic reactions

Agitation, coma, diarrhea, delirium, hallucinations, hyperreflexia, hyperthermia, tachycardia, seizures may indicate life-threatening serotonin syndrome.

Nursing considerations

Baseline assessment

Obtain LFT, BUN, serum creatinine; CrCl; urine/serum pregnancy test. Receive full medication history in screen for interactions, esp. contraindicated use of concomitant medications. Question history of seizure disorder. Assess hydration status.

Intervention/evaluation

Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Assess appearance, behavior, speech pattern, level of interest, mood. Assist with ambulation if dizziness, drowsiness occurs. Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching

- Maximum therapeutic response may require 4 wks or more of therapy.
- Dry mouth may be relieved by sugarless gum, sips of water.
- Do not abruptly discontinue medication.
- Avoid tasks that require alertness, motor skills until response to drug is

established.

folic acid

foe-lik as-id

Apo-Folic 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Vitamin, water soluble.

CLINICAL: Nutritional supplement.

Do not confuse folic acid with folinic acid.

Uses

Treatment of megaloblastic and macrocytic anemias due to folate deficiency. Treatment of anemias due to folate deficiency in pregnant women. Folate supplementation during periconceptual period decreases risk of neural tube defects.

Precautions

Contraindications: Hypersensitivity to folic acid. **Cautions:** Anemias (aplastic, normocytic, pernicious, refractory) when anemia present with vitamin B₁₂ deficiency.

Action

Stimulates production of platelets, RBCs, WBCs in folate deficiency anemia. **Therapeutic Effect:** Essential for nucleoprotein synthesis, maintenance of normal erythropoiesis.

Pharmacokinetics

PO form almost completely absorbed from GI tract (upper duodenum). Protein binding: High. Metabolized in liver. Excreted in urine. Removed by hemodialysis.

Lifespan considerations

Pregnancy/Lactation: Distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: May decrease effects of **PHENobarbital, phenytoin, primidone, raltitrexed.** **HERBAL:**Green tea may increase concentration. **FOOD:** None known. **LAB VALUES:** May decrease vitamin B₁₂ concentration.

Availability (Rx)

Capsules: 0.8 mg, 5 mg, 20 mg. **Injection Solution:** 5 mg/mL. **Tablets:** 0.4 mg (OTC), 0.8 mg (OTC), 1 mg.

Administration/handling

PO

- May give without regard to food.

IV

May give 5 mg or less undiluted over at least 1 min, or dilute with 50 mL 0.9% NaCl or D₅W and infuse over 30 min.

Indications/routes/dosage

Anemia

IM/IV/SQ/PO:ADULTS, ELDERLY, CHILDREN 4 YRS AND OLDER: 0.4 mg/day. **CHILDREN YOUNGER THAN 4 YRS:** Up to 0.3 mg/day. **INFANTS:** 0.1 mg/day. **PREGNANT/LACTATING WOMEN:** 0.8 mg/day.

Prevention of Neural Tube Defects

PO:WOMEN OF CHILDBEARING AGE: 400–800 mcg/day. **WOMEN AT HIGH RISK OR FAMILY HISTORY OF NEURAL TUBE DEFECTS:** 4 mg/day.

Side effects

None known.

Adverse effects/toxic reactions

Allergic hypersensitivity occurs rarely with parenteral form. Oral folic acid is nontoxic.

Nursing considerations

Baseline assessment

Pernicious anemia should be ruled out with Schilling test and vitamin B₁₂ blood level before initiating therapy (may produce irreversible neurologic damage). Resistance to treatment may occur if decreased hematopoiesis, alcoholism, antimetabolic drugs, deficiency of vitamin B₆, B₁₂, C, E is evident.

Intervention/evaluation

Assess for therapeutic improvement: improved sense of well-being, relief from iron deficiency symptoms (fatigue, shortness of breath, sore tongue, headache, pallor).

Patient/family teaching

- Eat foods rich in folic acid, including fruits, vegetables, organ meats.

fondaparinux

fon-**dap**-a-rin-ux

Arixtra

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Factor Xa inhibitor.

CLINICAL: Antithrombotic.

■ **BLACK BOX ALERT** ■ Epidural or spinal anesthesia greatly increases potential for spinal or epidural hematoma, subsequent long-term or permanent paralysis.

HIGH
ALERT

Uses

Prevention of venous thromboembolism in pts undergoing total hip replacement, hip fracture surgery, knee replacement surgery, abdominal surgery. Treatment of acute deep vein thrombosis (DVT), acute pulmonary embolism. **OFF-LABEL:** Prophylaxis of DVT in pts with history of heparin-induced thrombocytopenia (HIT), acute symptomatic superficial vein thrombosis of the legs.

Precautions

Contraindications: Hypersensitivity to fondaparinux, active major bleeding, bacterial endocarditis, prophylaxis treatment in pts with body weight less than 50 kg, severe renal impairment (CrCl less than 30 mL/min), thrombocytopenia associated with antiplatelet antibody formation in presence of fondaparinux.

Cautions: Conditions with increased risk of bleeding, bacterial endocarditis, active ulcerative GI disease, hemorrhagic stroke; shortly after brain, spinal, or ophthalmologic surgery; concurrent platelet inhibitors, severe uncontrolled hypertension, history of CVA, history of heparin-induced thrombocytopenia, renal/hepatic impairment, elderly, indwelling epidural catheter use.

Action

Factor Xa inhibitor that selectively binds to antithrombin and increases its affinity for factor Xa, inhibiting factor Xa, stopping blood coagulation cascade.

Therapeutic Effect: Indirectly prevents formation of thrombin and subsequently fibrin clot.

Pharmacokinetics

Well absorbed after subcutaneous administration. Undergoes minimal, if any, metabolism. Highly bound to antithrombin III. Distributed mainly in blood and to a minor extent in extravascular fluid. Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 17–21 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Use with caution, particularly during third trimester, immediate postpartum period (increased risk of maternal hemorrhage).

Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Age-related renal impairment may increase risk of bleeding.

Interactions

DRUG:Anticoagulants (e.g., heparin, warfarin), antiplatelet medications (e.g., clopidogrel), aspirin, drotrecogin alfa, NSAIDs (e.g., ibuprofen, ketorolac, naproxen), thrombolytics may increase risk of bleeding. **HERBAL:**Cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, red clover, Omega-3 may increase antiplatelet activity. **FOOD:** None known. **LAB VALUES:** May cause reversible increases in serum creatinine, ALT, AST. May decrease Hgb, Hct, platelet count.

Availability (Rx)

Injection, Solution: 2.5 mg/0.5 mL, 5 mg/0.4 mL, 7.5 mg/0.6 mL, 10 mg/0.8 mL.

Administration/handling

Subcutaneous

- Parenteral form appears clear, colorless. Discard if discoloration or particulate matter is noted.
- Store at room temperature.
- Do not expel air bubble from prefilled syringe before injection.
- Insert needle subcutaneously into upper arms, outer thigh, or abdomen and inject solution.
- Do not inject into areas of active skin disease or injury such as sunburns, rashes, inflammation, skin infections, or active psoriasis.
- Rotate injection sites.

Indications/routes/dosage

◀ALERT▶ For subcutaneous administration only.

Prevention of Venous Thromboembolism

SQ:ADULTS WEIGHING 50 KG OR MORE: 2.5 mg once daily for 5–9 days after surgery (up to 10 days following abdominal surgery; 11 days following hip or knee replacement). Initial dose should be given no earlier than 6–8h after surgery. Initiate dose once hemostasis established. **WEIGHING LESS THAN 50 KG:** Contraindicated.

Treatment of Venous Thromboembolism, Pulmonary Embolism

Note: Start warfarin on first treatment day and continue fondaparinux until INR reaches 2 to 3 for at least 24 hr. Usual duration of fondaparinux: 5–9 days.

SQ:ADULTS, ELDERLY WEIGHING MORE THAN 100 KG: 10 mg once daily. **ADULTS, ELDERLY WEIGHING 50–100 KG:** 7.5 mg once daily. **ADULTS, ELDERLY WEIGHING LESS THAN 50 KG:** 5 mg once daily.

Dosage in Renal Impairment

CrCl greater than 50 mL/min: No dose adjustment. **CrCl 30–50 mL/min:** Use caution (50% dose reduction or use of low-dose heparin). **CrCl less than 30 mL/min:** Contraindicated.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use caution.

Side effects

Frequent (19%–11%): Anemia, fever, nausea. **Occasional (10%–4%):** Edema, constipation, rash, vomiting, insomnia, increased wound drainage, hypokalemia. **Rare (less than 4%):** Dizziness, hypotension, confusion, urinary retention, injection site hematoma, diarrhea, dyspepsia, headache.

Adverse effects/toxic reactions

Accidental overdose may lead to bleeding complications ranging from local ecchymoses to major hemorrhage. Thrombocytopenia occurs rarely.

Nursing considerations

Baseline assessment

Assess CBC, renal function test. Evaluate potential risk for bleeding. Question history of recent surgery, trauma, intracranial hemorrhage, GI bleeding. Question medical history as listed in Precautions. Ensure that pt has not received spinal anesthesia, spinal procedures.

Intervention/evaluation

Periodically monitor CBC, esp. platelet count, stool for occult blood (no need for daily monitoring in pts with normal presurgical coagulation parameters). Assess for any signs of bleeding: bleeding at surgical site, hematuria, blood in stool, bleeding from gums, petechiae, ecchymosis, bleeding from injection sites. Monitor B/P, pulse; hypotension, tachycardia may indicate bleeding, hypovolemia.

Patient/family teaching

- Usual length of therapy is 5–9 days.
- Do not take any OTC medication (esp. aspirin, NSAIDs).
- Report swelling of hands/feet, unusual back pain, unusual bleeding/bruising, weakness. Treatment may increase risk of bleeding into the brain; report confusion, one-sided weakness, trouble speaking, seizures. Treatment may increase risk of GI bleeding; report bloody stool, vomiting up blood; dark, tarry stools.

fosinopril

foe-**sin**-oh-pril

Apo-Fosinopril 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: ACE inhibitor.

CLINICAL: Antihypertensive.

■ **BLACK BOX ALERT** ■ May cause fetal injury, mortality. Discontinue as soon as possible once pregnancy is detected.

Do not confuse fosinopril with Fosamax or lisinopril, or Monopril with Accupril, minoxidil, moexipril, or ramipril.

Uses

Treatment of hypertension, used alone or in combination with other antihypertensives. Treatment of HF.

Precautions

Contraindications: Hypersensitivity to fosinopril. History of angioedema from previous treatment with ACE inhibitors. Concomitant use with aliskiren in pts with diabetes. **Cautions:** Renal/hepatic impairment, pts with sodium depletion or on diuretic therapy, dialysis, hypovolemia, hypertrophic cardiomyopathy with outflow tract obstruction, hyperkalemia, concomitant use of potassium supplements, unstented unilateral/bilateral renal stenosis, diabetes, severe aortic stenosis. Before, during, or immediately after major surgery.

Action

Suppresses renin-angiotensin-aldosterone system (prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may inhibit angiotensin II at local vascular, renal sites). Decreases plasma angiotensin II, increases plasma renin activity, decreases aldosterone secretion. **Therapeutic Effect:** Reduces B/P.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	1 hr	2–6 hrs	24 hrs

Slowly absorbed from GI tract. Protein binding: 97%–98%. Metabolized in liver and GI mucosa. Primarily excreted in urine. Minimal removal by hemodialysis. **Half-life:** 11.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. May cause

fetal or neonatal mortality or morbidity. **Children:** Safety and efficacy not established. Neonates, infants may be at increased risk for oliguria, neurologic abnormalities. **Elderly:** May be more sensitive to hypotensive effects.

Interactions

DRUG:Alcohol, antihypertensive agents (e.g., amLODIPine, valsartan), diuretics (e.g., furosemide, HCTZ), NSAIDs may increase effects. **Potassium-sparing diuretics (e.g., spironolactone), potassium supplements** may cause hyperkalemia. May increase **lithium** concentration/toxicity. **Antacids** may decrease absorption. **HERBAL:**Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may increase antihypertensive effect. **Licorice** may cause sodium/water retention, loss of potassium. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, potassium, ALT, AST. May decrease serum sodium. May cause positive antinuclear antibody titer (ANA).

Availability (Rx)

Tablets: 10 mg, 20 mg, 40 mg.

Administration/handling

PO

- Give without regard to food.
- Tablets may be crushed.

Indications/routes/dosage

Hypertension

PO:ADULTS, ELDERLY: Initially, 10 mg once daily. **Maintenance:** 20–40 mg once daily. **Maximum:** 80 mg once daily. **CHILDREN 6–16 YRS WEIGHING MORE THAN 50 KG:** Initially, 5–10 mg once daily. **Maximum:** 40 mg once daily.

HF

PO:ADULTS, ELDERLY: Initially, 5–10 mg once daily. May increase dose over several wks. **Maintenance:** 20–40 mg once daily. **Maximum:** 40 mg once daily.

Dosage in Renal Impairment

Reduce initial dose to 5 mg in pts with HF.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (12%–9%): Dizziness, cough. **Occasional (4%–2%):** Hypotension, nausea, vomiting, upper respiratory tract infection.

Adverse effects/toxic reactions

Excessive hypotension ("first-dose syncope") may occur in pts with HF, severely salt/volume depleted. Angioedema (swelling of face/lips), hyperkalemia occur rarely. Agranulocytosis, neutropenia may be noted in pts with renal impairment, collagen vascular disease (scleroderma, systemic lupus erythematosus). Nephrotic syndrome may be noted in those with history of renal disease.

Nursing considerations

Baseline assessment

Obtain B/P immediately before each dose, in addition to regular monitoring (be alert to fluctuations). Renal function tests should be performed before beginning therapy. In pts with renal impairment, autoimmune disease, or taking drugs that affect leukocytes or immune response, CBC, differential count should be performed before therapy begins and q2wks for 3 mos, then periodically thereafter. Question medical history as listed in Precautions. Question history of hypersensitivity reaction, angioedema.

Intervention/evaluation

If excessive reduction in B/P occurs, place pt in supine position with legs

elevated. Assist with ambulation if dizziness occurs. Assess for urinary frequency. Auscultate lung sounds for rales, wheezing in pts with HF. Monitor renal function tests, CBC, urinalysis for proteinuria. Observe for angioedema (swelling of face, lips, tongue). Monitor serum potassium in those on concurrent diuretic therapy.

Patient/family teaching

- Report any sign of infection (sore throat, fever).
- Several wks may be needed for full therapeutic effect of B/P reduction.
- Skipping doses or voluntarily discontinuing drug may produce severe rebound hypertension.
- To reduce hypotensive effect, go from lying to standing slowly.
- Immediately report swelling of face, lips, tongue, difficulty breathing, vomiting, excessive perspiration, persistent cough.
- Avoid potassium salt substitutes.

fosphenytoin

fos-**fen**-i-toyn

Cerebyx

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Hydantoin.

CLINICAL: Anticonvulsant.

Do not confuse Cerebyx with CeleBREX or CeleXA, or fosphenytoin with fospropofol.

Uses

Acute treatment, control of generalized convulsive status epilepticus; prevention, treatment of seizures occurring during neurosurgery; short-term substitution for oral phenytoin.

Precautions

Contraindications: Hypersensitivity to fosphenytoin, phenytoin, other hydantoins. Adams-Stokes syndrome; second- or third-degree AV block; sinus bradycardia; SA block; concurrent use of delavirdine. **Cautions:** Porphyria,

diabetes, hypothyroidism, hypotension, severe myocardial insufficiency, renal/hepatic disease, hypoalbuminemia.

Action

Stabilizes neuronal membranes, limits spread of seizure activity. Decreases sodium, calcium ion influx into neurons. Decreases post-tetanic potentiation, repetitive discharge. **Therapeutic Effect:** Decreases seizure activity.

Pharmacokinetics

Completely absorbed after IM administration. Protein binding: 95%–99%. Rapidly and completely hydrolyzed to phenytoin after IM or IV administration. Time of complete conversion to phenytoin: 4 hrs after IM injection; 2 hrs after IV infusion. **Half-life:** 8–15 min (for conversion to phenytoin). (Phenytoin: 12–29 hrs.)

Lifespan considerations

Pregnancy/Lactation: May increase frequency of seizures during pregnancy. Increased risk of congenital malformations. Unknown if excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Lower dosage recommended.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., LORazepam, morphine, zolpidem) may increase CNS depression. Amiodarone, anticoagulants (e.g., warfarin), cimetidine, disulfiram, FLUoxetine, isoniazid, sulfonamides may increase concentration/effects, risk of toxicity. CYP3A4 inhibitors (e.g., fluconazole, ketoconazole, miconazole) may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, GGT, alkaline phosphatase.

Availability (Rx)

Injection Solution: 75 mg/mL (equivalent to 50 mg phenytoin equivalents (PE)/mL phenytoin).

Administration/handling

IV

Reconstitution

- Dilute in D₅W or 0.9% NaCl to a concentration ranging from 1.5–25 mg PE/mL.

Rate of Administration

- Administer at rate less than 150 mg PE/min (decreases risk of hypotension, arrhythmias). Children: 1–3 mg PE/kg/min. **Maximum:** 150 mg PE/min.

Storage

- Refrigerate.
- Do not store at room temperature for longer than 48 hrs.
- After dilution, solution is stable for 8 hrs at room temperature or 24 hrs if refrigerated.

IV incompatibility

Midazolam (Versed).

IV Compatibilities

LORazepam (Ativan), PHENobarbital, potassium chloride.

Indications/routes/dosage

 150 mg fosphenytoin yields 100 mg phenytoin. Dosage, concentration solution, infusion rate of fosphenytoin are expressed in terms of phenytoin equivalents (PE).

Status Epilepticus

IV:ADULTS:Loading dose: 15–20 mg PE/kg infused at rate of 100–150 mg PE/min. Follow with maintenance dose of either fosphenytoin or phenytoin.

Nonemergent Seizures

IV, IM:ADULTS:Loading dose: 10–20 mg PE/kg. **Maintenance:** 4–6 mg PE/kg/day in divided doses.

Short-Term Substitution for Oral Phenytoin

IV, IM:ADULTS: May substitute for oral phenytoin at same total daily dose.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Dizziness, paresthesia, tinnitus, pruritus, headache, drowsiness.

Occasional: Morbilliform rash.

Adverse effects/toxic reactions

Toxic fosphenytoin serum concentration may produce ataxia (muscular incoordination), nystagmus (rhythmic oscillation of eyes), diplopia, lethargy, slurred speech, nausea, vomiting, hypotension. As drug level increases, extreme lethargy may progress to coma.

Nursing considerations

Baseline assessment

Review history of seizure disorder (intensity, frequency, duration, LOC). Initiate seizure precautions. Obtain vital signs, medication history (esp. use of phenytoin, other anticonvulsants). Observe clinically.

Intervention/evaluation

Monitor EKG, measure cardiac function, respiratory function, B/P during and immediately following infusion (10–20 min). Discontinue if skin rash appears. Interrupt or decrease rate if hypotension, arrhythmias are detected. Assess pt postinfusion (may feel dizzy, ataxic, drowsy). Monitor free and total dilantin levels (2 hrs after IV infusion or 4 hrs after IM injection).

Patient/family teaching

- If noncompliance is cause of acute seizures, discuss and address reasons for noncompliance.

- Avoid tasks that require alertness, motor skills until response to drug is established.

frovatriptan

froe-va-**trip**-tan

Frova

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Serotonin 5-HT₁ receptor agonist.

CLINICAL: Antimigraine.

Uses

Acute treatment of migraine headache with or without aura in adults.

Precautions

Contraindications: Hypersensitivity to frovatriptan. Management of basilar or hemiplegic migraine, cerebrovascular or peripheral vascular disease, coronary artery disease, ischemic heart disease (angina pectoris, history of MI, silent ischemia, Prinzmetal's angina), severe hepatic impairment (Child-Pugh grade C), uncontrolled hypertension, use within 24 hrs of ergotamine-containing preparations or another serotonin receptor agonist. **Cautions:** Mild to moderate hepatic impairment, pt profile suggesting cardiovascular risks. History of seizures or structural brain lesions.

Action

Selective agonist for serotonin in cranial arteries causing vasoconstriction and reduction of inflammation. **Therapeutic Effect:** Relieves migraine headache.

Pharmacokinetics

Well absorbed after PO administration. Protein binding: 15%. Metabolized in liver. Primarily eliminated in feces (62%), urine (32%). **Half-life:** 26 hrs (increased in hepatic impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug is excreted in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Not recommended for use in this pt population.

Interactions

DRUG: Ergotamine-containing medications may produce vasospastic reaction. **SSRI, SNRI (e.g., DULoxetine, FLUoxetine, fluvoxamine, PARoxetine, sertraline, venlafaxine)** may produce weakness, hyperreflexia, uncoordination. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

 **Tablets:** 2.5 mg.

Administration/handling

PO

- Give with fluids as soon as symptoms appear.
- Do not break, crush, dissolve, or divide film-coated tablets.

Indications/routes/dosage

Acute Migraine Headache

PO:ADULTS, ELDERLY: Initially, 2.5 mg. If headache improves but then returns, dose may be repeated after at least 2 hrs. **Maximum:** 7.5 mg/day.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild to moderate impairment: No dose adjustment. **Severe impairment:** Use caution.

Side effects

Occasional (8%–4%): Dizziness, paresthesia, fatigue, flushing. **Rare (3%–2%):** Hot/cold sensation, dry mouth, dyspepsia.

Adverse effects/toxic reactions

Cardiac reactions (ischemia, coronary artery vasospasm, MI), noncardiac vasospasm-related reactions (cerebral hemorrhage, CVA) occur rarely, particularly in pts with hypertension, obesity, smokers, diabetes, strong family history of coronary artery disease; males older than 40 yrs; postmenopausal women.

Nursing considerations

Baseline assessment

Question for history of peripheral vascular disease, renal/hepatic impairment, possibility of pregnancy. Question regarding onset, location, duration of migraine, possible precipitating factors.

Intervention/evaluation

Assess for relief of migraine headache, potential for photophobia, phonophobia (sound sensitivity), nausea, vomiting.

Patient/family teaching

- Take a single dose as soon as symptoms of an actual migraine attack appear.
- Medication is intended to relieve migraine headaches, not to prevent or reduce number of attacks.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Immediately report palpitations, pain, tightness in chest or throat, sudden or severe abdominal pain, pain or weakness of extremities.

furosemide

fur-oh-se-myde

Apo-Furosemide 

**HIGH
ALERT**

Lasix

Novo-Semide 

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Loop diuretic.

CLINICAL: Diuretic.

■ **BLACK BOX ALERT** ■ Large amounts can lead to profound diuresis with water and electrolyte depletion.

Do not confuse furosemide with famotidine, finasteride, fluconazole, FLUoxetine, loperamide, or torsemide, or Lasix with Lidex, Lovenox, Luvox, or Luxiq.

Uses

Treatment of edema associated with HF and renal/hepatic disease; acute pulmonary edema. Treatment of hypertension (not recommended as initial treatment).

Precautions

Contraindications: Hypersensitivity to furosemide. Anuria. **Cautions:** Hepatic cirrhosis, hepatic coma, severe electrolyte depletion, prediabetes, diabetes, systemic lupus erythematosus. Pts with prostatic hyperplasia/urinary stricture.

Action

Enhances excretion of sodium, chloride, potassium by direct action at ascending limb of loop of Henle. **Therapeutic Effect:** Produces diuresis, lowers B/P.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	30–60 min	1–2 hrs	6–8 hrs
IV	5 min	20–60 min	2 hrs
IM	30 min	N/A	N/A

Moderately absorbed from GI tract. Protein binding: greater than 98%. Partially metabolized in liver. Primarily excreted in urine (nonrenal clearance increases in severe renal impairment). Not removed by hemodialysis. **Half-life:** 30–90 min (increased in renal/hepatic impairment, neonates).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. **Children:** Half-life increased in neonates; may require increased dosage interval. **Elderly:** May be more sensitive to hypotensive, electrolyte effects, developing circulatory collapse, thromboembolic effect. Age-related renal impairment may require dosage adjustment.

Interactions

DRUG:Amphotericin B, nephrotoxic ototoxic medications (e.g., lisinopril, IV contrast dye, vancomycin) may increase risk of nephrotoxicity, ototoxicity. May increase risk of lithium toxicity. **Other medications causing hypokalemia (e.g., HCTZ, laxatives)** may increase risk of hypokalemia. **HERBAL:**Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, BUN, uric acid. May decrease serum calcium, chloride, magnesium, potassium, sodium.

Availability (Rx)

Injection Solution: 10 mg/mL. **Oral Solution:** 10 mg/mL, 40 mg/5 mL. **Tablets:** 20 mg, 40 mg, 80 mg.

Administration/handling

IV

Rate of Administration

- May give undiluted but is compatible with D₅W or 0.9% NaCl.
- May be diluted for infusion to 1–2 mg/mL (**maximum:** 10 mg/mL).
- Administer each 40 mg or fraction by IV push over 1–2 min. Do not exceed administration rate of 4 mg/min for short-term intermittent infusion.

Storage

- Solution appears clear, colorless.
- Discard yellow solutions.
- Stable for 24 hrs at room temperature when mixed with 0.9% NaCl or D₅W.

IM

- Temporary pain at injection site may be noted.

PO

- Administer on empty stomach.
- Give with food to avoid GI upset, preferably with breakfast (may prevent nocturia).
- Food may decrease diuretic effect.

■ IV incompatibilities

Ciprofloxacin (Cipro), diltiazEM (Cardizem), DOBUTamine (Dobutrex), DOPamine (Intropin), DOXOrubicin (Adriamycin), droperidol (Inapsine), esmolol (Brevibloc), famotidine (Pepcid), filgrastim (Neupogen), fluconazole (Diflucan), gemcitabine (Gemzar), gentamicin (Garamycin), IDArubicin (Idamycin), labetalol (Trandate), metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), niCARdipine (Cardene), ondansetron (Zofran), quiNIDine, thiopental (Pentothal), vinBLASine (Velban), vinCRISine (Oncovin), vinorelbine (Navelbine).

■ IV Compatibilities

Amiodarone (Cordarone), bumetanide (Bumex), calcium gluconate, cimetidine (Tagamet), dexmedetomidine (Precedex), heparin, HYDROmorphine (Dilaudid), lidocaine, lipids, morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Edema, HF

PO:ADULTS, ELDERLY: Initially, 20–80 mg/dose; may increase by 20–40

mg/dose q6–8h. May titrate up to 600 mg/day in severe edematous states. **CHILDREN:** Initially, 2 mg/kg/dose. May increase by 1–2 mg/kg/dose at 6–8 hr intervals. **Maximum:** 6 mg/kg/dose. **NEONATES:** 1 mg/kg/dose 1–2 times/day.

IV, IM:ADULTS, ELDERLY: 20–40 mg/dose; may increase by 20 mg/dose q1–2h. **Maximum single dose:** 160–200 mg. **CHILDREN:** Initially, 1 mg/kg/dose. May increase by 1 mg/kg/dose no sooner than 2 hrs after previous dose. **Maximum:** 6 mg/kg/dose. **NEONATES:** 1–2 mg/kg/dose q12–24h.

IV Infusion:ADULTS, ELDERLY: Loading dose bolus of 40–100 mg over 1–2 min, followed by infusion of 10–40 mg/hr; repeat loading dose before increasing infusion rate. **Maximum:** 80–160 mg/hr. **CHILDREN:** 0.05 mg/kg/hr; titrate to desired effect. **NEONATES:** Initially, 0.2 mg/kg/hr. May increase by 0.1 mg/kg/hr q12–24h. **Maximum:** 0.4 mg/kg/hr.

Hypertension

PO: ADULTS, ELDERLY: 40 mg twice daily

Dosage in Renal Impairment

Avoid use in oliguric states.

Dosage in Hepatic Impairment

No dose adjustment. Decreased effect, increased sensitivity to hypokalemia/volume depletion in cirrhosis.

Side effects

Expected: Increased urinary frequency/volume. **Frequent:** Nausea, dyspepsia, abdominal cramps, diarrhea or constipation, electrolyte disturbances. **Occasional:** Dizziness, light-headedness, headache, blurred vision, paresthesia, photosensitivity, rash, fatigue, bladder spasm, restlessness, diaphoresis. **Rare:** Flank pain.

Adverse effects/toxic reactions

Vigorous diuresis may lead to profound water loss/electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration. Sudden volume depletion

may result in increased risk of thrombosis, circulatory collapse, sudden death. Acute hypotensive episodes may occur, sometimes several days after beginning therapy. Ototoxicity (deafness, vertigo, tinnitus) may occur, esp. in pts with severe renal impairment. Can exacerbate diabetes mellitus, systemic lupus erythematosus, gout, pancreatitis. Blood dyscrasias have been reported.

Nursing considerations

Baseline assessment

Check vital signs, esp. B/P, pulse, for hypotension before administration. Assess baseline renal function, serum electrolytes, esp. serum sodium, potassium. Assess skin turgor, mucous membranes for hydration status; observe for edema. Assess muscle strength, mental status. Note skin temperature, moisture. Obtain baseline weight. Initiate I&O monitoring. Auscultate lung sounds. In pts with hepatic cirrhosis and ascites, consider giving initial doses in a hospital setting.

Intervention/evaluation

Monitor B/P, vital signs, serum electrolytes, I&O, weight. Note extent of diuresis. Watch for symptoms of electrolyte imbalance: Hypokalemia may result in changes in muscle strength, tremor, muscle cramps, altered mental status, cardiac arrhythmias; hyponatremia may result in confusion, thirst, cold/clammy skin. Consider potassium supplementation if hypokalemia occurs.

Patient/family teaching

- Expect increased frequency, volume of urination.
- Report palpitations, signs of electrolyte imbalances (noted previously), hearing abnormalities (sense of fullness in ears, tinnitus).
- Eat foods high in potassium such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
- Avoid sunlight, sunlamps.

 Canadian trade name

 Non-Crushable Drug

 High Alert drug

underlined underlined – top prescribed drug

G

gabapentin

ga-ba-pen-tin

Apo-Gabapentin 

Fanatrex FusePaq

Gralise

Horizant

Neurontin

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Gamma-aminobutyric acid analogue.

CLINICAL: Anticonvulsant, antineuralgic.

Do not confuse Neurontin with Motrin, Neoral, nitrofurantoin, Noroxin, or Zarontin.

Uses

Neurontin: Adjunct in treatment of partial seizures (with or without secondary generalized seizures) in children 13 yrs and older and adults. Adjunct to treatment of partial seizures in children 3–12 yrs; management of postherpetic neuralgia (PHN). **Horizant:** Treatment of moderate to severe primary restless legs syndrome (RLS), PHN. **Gralise:** Management of PHN. **OFF-LABEL:** Treatment of neuropathic pain, diabetic peripheral neuropathy, vasomotor symptoms, fibromyalgia, postoperative pain adjunct.

Precautions

Contraindications: Hypersensitivity to gabapentin. **Cautions:** Severe renal

impairment, elderly, history of suicidal behavior; substance abuse.

Action

Binds to gabapentin binding sites in brain and may modulate release of excitatory neurotransmitters, which participates in epileptogenesis and nociception. **Therapeutic Effect:** Reduces seizure activity, neuropathic pain.

Pharmacokinetics

Well absorbed from GI tract (not affected by food). Protein binding: less than 5%. Widely distributed. Crosses blood-brain barrier. Primarily excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 5–7 hrs (increased in renal impairment, elderly).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta, excreted in breast milk. **Children:** Safety and efficacy not established in pts 3 yrs and younger. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Antacids decrease absorption. **Benzodiazepines (e.g., alprazolam, Lorazepam), opiates (e.g., morphine, fentanyl), other CNS depressants (e.g., carisoprodol, zolpidem)** may increase CNS depression. **HERBAL:** Evening primrose may decrease seizure threshold. **Gotu kola, kava kava, St. John's wort, valerian** may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May alter serum glucose; WBC count. May increase serum alkaline phosphatase, ALT, AST, bilirubin.

Availability (Rx)

Capsules: 100 mg, 300 mg, 400 mg. **Oral Solution:** 250 mg/5 mL. **Oral Suspension (Fanatrex FusePaq):** 25 mg/mL. **Tablets:** 600 mg, 800 mg. **Tablets (Gralise):** 300 mg, 600 mg. **Tablets, Extended-Release: (Horizant)** 300 mg, 600 mg.

Administration/handling

PO

Immediate-Release/Solution

- Give without regard to meals; may give with food to avoid, reduce GI upset.
- Swallow extended-release tablets whole; do not break, crush, dissolve, or divide. Take with evening meal.

Indications/routes/dosage

Note: When given 3 times/day, maximum time between doses should not exceed 12 hrs. If treatment is discontinued or anticonvulsant therapy is added, do so gradually over at least 1 wk (reduces risk of loss of seizure control).

Adjunctive Therapy for Seizure Control

PO: ADULTS, ELDERLY, CHILDREN 13 YRS AND OLDER: Initially, 300 mg 3 times/day. May titrate dosage. Range: 900–1,800 mg/day in 3 divided doses. **Maximum:** 3,600 mg/day. **CHILDREN 3–12 YRS:** Initially, 10–15 mg/kg/day in 3 divided doses. May titrate up to 25–35 mg/kg/day (for children 5–12 yrs) and 40 mg/kg/day (for children 3–4 yrs). **Maximum:** 50 mg/kg/day.

Adjunctive Therapy for Neuropathic Pain

PO: ADULTS, ELDERLY: Initially, 100 mg 3 times/day; may increase by 300 mg/day at wkly intervals. **Maximum:** 3,600 mg/day in 3 divided doses. **CHILDREN:** Initially, 5 mg/kg/dose at bedtime, followed by 5 mg/kg/dose for 2 doses on day 2, then 5 mg/kg/dose for 3 doses on day 3. **Maximum:** 300 mg. Range: 8–35 mg/kg/day in 3 divided doses.

Postherpetic Neuralgia

PO: ADULTS, ELDERLY: (Neurontin): 300 mg once on day 1, 300 mg twice daily on day 2, and 300 mg 3 times/day on day 3 as needed. Range: 1,800–3,600 mg/day. **(Gralise):** 300 mg once on day 1; 600 mg once on day 2; 900 mg once daily on days 3–6; 1,200 mg once daily on days 7–10; 1,500 mg once daily on days 11–14; then 1,800 mg once daily. **(Horizant):** 600 mg once daily in AM for 3 days, then increase to 600 mg twice daily.

RLS

PO: ADULTS, ELDERLY (HORIZANT): 600 mg once daily at about 5 pm.

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance:

Creatinine Clearance	Neurontin Dosage (Immediate-release)	Gralise Dosage (Extended-release)	Horizant Dosage	
			RLS	PHN
30–59 mL/min	200–700 mg q12h	600–1,800 mg once/day	300–600 mg/day	Same
16–29 mL/min	200–700 mg once daily	Not recommended	300 mg/day	Same
Less than 16 mL/min	100–300 mg once daily	Not recommended	300 mg q48 h	Same
Hemodialysis	125–350 mg following HD	Not recommended	Not recommended	300–600 mg following HD

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (19%–10%): Fatigue, drowsiness, dizziness, ataxia. **Occasional (8%–3%):** Nystagmus, tremor, diplopia, rhinitis, weight gain, peripheral edema. **Rare (less than 2%):** Anxiety, dysarthria, memory loss, dyspepsia, pharyngitis, myalgia.

Adverse effects/toxic reactions

Abrupt withdrawal may increase seizure frequency, increase risk of suicidal behavior/thoughts. Overdosage may result in slurred speech, drowsiness, lethargy, diarrhea. Drug reaction with eosinophilia and systemic symptoms (multiorgan hypersensitivity) was reported. Hypersensitivity reaction, including anaphylaxis and angioedema, can occur at any time.

Nursing considerations

Baseline assessment

Review history of seizure disorder (type, onset, intensity, frequency, duration, LOC). Assess location, intensity of neuralgia/neuropathic pain. Question history of renal impairment.

Intervention/evaluation

Provide safety measures as needed. Monitor seizure frequency/duration, renal function, weight, behavior in children. Monitor for signs/symptoms of depression, suicidal tendencies, other unusual behavior; hypersensitivity reaction.

Patient/family teaching

- Use only as prescribed; do not abruptly stop taking drug (may increase seizure frequency).
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Carry identification card/bracelet to note seizure disorder/anticonvulsant therapy.
- Report suicidal ideation, depression, unusual behavioral changes (esp. with changes in dosage), worsening of seizure activity or loss of seizure control. Seek medical attention for allergic reactions including difficulty breathing, coughing, wheezing, throat tightness, swelling of face or tongue.

galantamine

gal-**an**-ta-meen

Razadyne

Razadyne ER

Reminyl ER 

 **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Cholinesterase inhibitor.

CLINICAL: Antidementia.

Uses

Treatment of mild to moderate dementia of Alzheimer's type. **OFF-LABEL:** Diabetic neuropathy, neuropathic pain, postoperative pain (adjunct), hot flashes.

Precautions

Contraindications: Hypersensitivity to galantamine. **Cautions:** Moderate renal/hepatic impairment (not recommended in severe impairment), history of ulcer disease, asthma, COPD, bladder outflow obstruction, supraventricular cardiac conduction conditions (except with pacemaker), seizure disorder, concurrent medications that slow cardiac conduction through SA or AV node. Elderly with low body weight and/or serious co-morbidities.

Action

Elevates acetylcholine concentrations by slowing degeneration of acetylcholine released by still intact cholinergic neurons. May increase serotonin levels. **Therapeutic Effect:** Slows progression of Alzheimer's disease.

Pharmacokinetics

Rapidly, completely absorbed from GI tract. Protein binding: 18%. Distributed to blood cells; binds to plasma proteins, mainly albumin. Metabolized in liver. Excreted in urine. **Half-life:** 7 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not prescribed for this pt population. **Elderly:** No age-related precautions noted, but use is not recommended in those with severe hepatic/renal impairment (CrCl less than 9 mL/min).

Interactions

DRUG: **Anticholinergic agents** may decrease levels/effects. **HERBAL:** **St. John's wort** may decrease concentration. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Oral Solution (Razadyne): 4 mg/mL. **Tablets (Razadyne):** 4 mg, 8 mg, 12 mg.
 **Capsules (Extended-Release [Razadyne ER]):** 8 mg, 16 mg, 24 mg.

Administration/handling

PO

- Give tablet or solution with morning and evening meals.
- Mix oral solution with nonalcoholic beverage, take immediately.
- Extended-release capsule should be given with breakfast. Swallow whole. Do not break, crush, cut, or divide.

Indications/routes/dosage

Note: If therapy interrupted for 3 or more days, restart at lowest dose; then increase gradually.

Alzheimer's Disease

PO (Immediate-Release Tablets, Oral Solution): ADULTS, ELDERLY: Initially, 4 mg twice daily (8 mg/day). After a minimum of 4 wks (if well tolerated), may increase to 8 mg twice daily (16 mg/day). After another 4 wks, may increase to 12 mg twice daily (24 mg/day). Range: 16–24 mg/day in 2 divided doses.

PO (Extended-Release): ADULTS, ELDERLY: Initially, 8 mg once daily for 4 wks; then increase to 16 mg once daily for 4 wks or longer. If tolerated, may increase to 24 mg once daily. Range: 16–24 mg once daily.

Dosage in Renal/Hepatic Impairment

Moderate impairment: Maximum dosage is 16 mg/day. **Severe impairment:** Not recommended.

Side effects

Frequent (17%–7%): Nausea, vomiting, diarrhea, anorexia, weight loss.

Occasional (5%–4%): Abdominal pain, insomnia, depression, headache, dizziness, fatigue, rhinitis. **Rare (less than 3%):** Tremors, constipation, confusion, cough, anxiety, urinary incontinence.

Adverse effects/toxic reactions

Overdose may cause cholinergic crisis (increased salivation, lacrimation, urination, defecation, bradycardia, hypotension, muscle weakness). Treatment aimed at generally supportive measures, use of anticholinergics (e.g., atropine).

Nursing considerations

Baseline assessment

Assess cognitive, behavioral, functional deficits of pt. Obtain baseline serum renal function, LFT. Question history as listed in Precautions, esp. cardiac conduction disorders.

Intervention/evaluation

Monitor cognitive, behavioral, functional status of pt. Evaluate EKG, periodic rhythm strips in pts with underlying arrhythmias. Assess for evidence of GI disturbances (nausea, vomiting, diarrhea, anorexia, weight loss).

Patient/family teaching

- Take with meals (reduces risk of nausea).
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Report persistent GI disturbances, excessive salivation, diaphoresis, excessive tearing, excessive fatigue, insomnia, depression, dizziness, increased muscle weakness, palpitations.

ganciclovir

gan-sye-kloe-veer

Cytovene

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Synthetic nucleoside.

CLINICAL: Antiviral.

- **BLACK BOX ALERT** ■ Toxicity presents as neutropenia, thrombocytopenia, anemia. Studies suggest carcinogenic and teratogenic

effects, inhibition of spermatogenesis.

Do not confuse Cytovene with Cytosar, or ganciclovir with famciclovir or acyclovir.

Uses

Treatment of cytomegalovirus (CMV) retinitis in immunocompromised pts (e.g., HIV), prophylaxis of CMV infection in transplant pts. **OFF-LABEL:** CMV retinitis.

Precautions

Contraindications: Hypersensitivity to acyclovir, ganciclovir. **Cautions:** Neutropenia, thrombocytopenia, renal impairment, children (long-term safety not determined due to potential for long-term carcinogenic, adverse reproductive effects), pregnancy. Absolute neutrophil count less than 500 cells/mm³, platelet count less than 25,000 cells/mm³.

Action

Competes with viral DNA polymerase and incorporation into growing viral DNA chains. **Therapeutic Effect:** Interferes with DNA synthesis, viral replication.

Pharmacokinetics

Widely distributed (including CSF and ocular tissue). Protein binding: 1%–2%. Excreted primarily in urine. Removed by hemodialysis. **Half-life:** 1.7–5.8 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy. Female pts of reproductive potential should use effective contraception during treatment and for 30 days after discontinuation; male pts should use a barrier contraceptive during and for at least 90 days after discontinuation. Do not breastfeed. May resume breastfeeding no sooner than 72 hrs after the last dose. **Children:** Safety and efficacy not established in pts younger than 12 yrs. **Elderly:** Age-related renal impairment

may require dosage adjustment.

Interactions

DRUG: Bone marrow depressants may increase myelosuppression. **Imipenem** may increase risk for seizures. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, ALT, AST, bilirubin, BUN, creatinine.

Availability (Rx)

Injection, Powder for Reconstitution (Cytovene): 500 mg.

Administration/handling

IV

Reconstitution

- Reconstitute 500-mg vial with 10 mL Sterile Water for Injection to provide concentration of 50 mg/mL; do **not** use Bacteriostatic Water (contains parabens, which is incompatible with ganciclovir).
- Further dilute with 100 mL D₅W, 0.9% NaCl to provide a concentration of 10 mg/mL or less for infusion.

Rate of Administration

- Administer only by IV infusion over at least 1 hr.
- Do not give by IV push or rapid IV infusion (increases risk of toxicity). Flush line with 0.9% NaCl before and after administration.

Storage

- Store vials at room temperature. Do not refrigerate.
- Reconstituted solution in vial is stable for 12 hrs at room temperature.
- After dilution, use within 24 hrs.
- Discard if precipitate forms, discoloration occurs.
- Avoid exposure to skin, eyes, mucous membranes.
- Use latex gloves, safety glasses during preparation/handling of solution.
- Avoid inhalation.
- If solution contacts skin or mucous membranes, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

■ IV incompatibilities

Aldesleukin (Proleukin), amifostine (Ethyol), aztreonam (Azactam), cefepime (Maxipime), cytarabine (ARA-C), DOXOrubicin (Adriamycin), fludarabine (Fludara), foscarnet (Foscavir), gemcitabine (Gemzar), ondansetron (Zofran), piperacillin and tazobactam (Zosyn), sargramostim (Leukine), vinorelbine (Navelbine).

■ IV Compatibilities

Amphotericin B, enalapril (Vasotec), filgrastim (Neupogen), fluconazole (Diflucan), granisetron (Kytril), propofol (Diprivan).

Indications/routes/dosage

Cytomegalovirus (CMV) Retinitis

IV: ADULTS, CHILDREN 3 MOS AND OLDER: 5 mg/kg/dose q12h for 14–21 days, then 5 mg/kg/day as a single daily dose or 6 mg/kg 5 days/wk.

Prevention of CMV in Transplant Pts

IV: ADULTS, CHILDREN: 5 mg/kg/dose q12h for 7–14 days, then 5 mg/kg/day as a single daily dose or 6 mg/kg 5 days/wk. Duration dependent on clinical condition and degree of immunosuppression.

Congenital CMV

IV: NEONATES: 6 mg/kg/dose q12h for 6 wks (if HIV positive, longer duration may be considered).

Dosage in Renal Impairment

Dosage and frequency are modified based on creatinine clearance (see table).

Creatinine Clearance	Dosage	
	IV Induction	IV Maintenance
50–69 mL/min	2.5 mg/kg q12h	2.5 mg/kg q24h
25–49 mL/min	2.5 mg/kg q24h	1.25 mg/kg q24h
10–24 mL/min	1.25 mg/kg q24h	0.625 mg/kg q24h

Less than 10 mL/min	1.25 mg/kg 3 times/wk	0.625 mg/kg 3 times/wk
Hemodialysis (give after HD on HD days)	1.25 mg/kg q48–72h	0.625 mg/kg q48–72h
Peritoneal dialysis	1.25 mg/kg 3 times/wk	0.625 mg/kg 3 times/wk
Continuous renal replacement therapy		
Continuous venovenous hemofiltration	2.5 mg/kg q24h	1.25 mg/kg q24h
Continuous venovenous hemodialysis/continuous venovenous hemodiafiltration	2.5 mg/kg q12h	2.5 mg/kg q24h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (41%–13%): Diarrhea, fever, nausea, abdominal pain, vomiting.

Occasional (11%–6%): Diaphoresis, infection, paresthesia, flatulence, pruritus.

Rare (4%–2%): Headache, stomatitis, dyspepsia, phlebitis.

Adverse effects/toxic reactions

Hematologic toxicity occurs commonly: leukopenia (41%–29% of pts), anemia (25%–19% of pts). Intraocular implant occasionally results in visual acuity loss, vitreous hemorrhage, retinal detachment. GI hemorrhage occurs rarely.

Nursing considerations

Baseline assessment

Obtain baseline CBC, BMP, LFT. Perform baseline ophthalmic exam. Obtain specimens for support of differential diagnosis (urine, feces, blood, throat) since retinal infection is usually due to hematogenous dissemination.

Intervention/evaluation

Monitor I&O, ensure adequate hydration (minimum 1,500 mL/24 hrs). Diligently evaluate hematology reports for neutropenia, thrombocytopenia, leukopenia. Obtain periodic ophthalmic examinations. Question pt regarding visual acuity, therapeutic improvement, complications. Assess for rash, pruritus.

Patient/family teaching

- Ganciclovir provides suppression, not cure, of cytomegalovirus (CMV) retinitis.
- Frequent blood tests, eye exams are necessary during therapy due to toxic nature of drug.
- Report any new symptom promptly.
- May temporarily or permanently inhibit sperm production in men, suppress fertility in women.
- Barrier contraception should be used during and for 90 days after therapy due to mutagenic potential.

gefitinib

ge-fi-ti-nib

Iressa

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Tyrosine kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse gefitinib with erlotinib, dasatinib, imatinib, or lapatinib.

Uses

First-line treatment of metastatic non–small-cell lung cancer (NSCLC) whose tumors have epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 substitution mutations.

Precautions

Contraindications: Hypersensitivity to gefitinib. **Cautions:** Hepatic impairment, lung disease, ocular disease, concurrent administration of CYP3A4 inducers and inhibitors.

Action

Inhibits epidermal growth factor receptor–tyrosine kinase (EGFR-TK), a key driver in tumor cell growth. Interrupts angiogenesis and metastasis. **Therapeutic Effect:** Inhibits tumor cell proliferation and survival.

Pharmacokinetics

Slowly absorbed following PO administration. Peak plasma levels in 3–7 hrs. Protein binding: 90%. Metabolized in liver. Excreted primarily in feces (86%). **Half-life:** 48 hrs.

Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy. Use effective contraception during treatment and for at least 2 wks after discontinuation. Unknown if crosses placenta or distributed in breast milk. Must either discontinue breastfeeding or discontinue therapy. **Children:** Safety and efficacy not established in those younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase concentration. CYP3A4 inducers (e.g., phenytoin, rifAMPin) may decrease concentration. H₂ antagonists (e.g., famotidine), proton pump inhibitors (e.g., pantoprazole) may decrease concentration. May increase bleeding risk with warfarin. **HERBAL:** St. John's wort may decrease effectiveness. **FOOD:** Avoid grapefruit products. **LAB VALUES:** May increase serum AST, ALT, bilirubin, urine protein.

Availability (Rx)

Tablets: 250 mg.

Administration/handling

- May give without regard to meals.
- Avoid grapefruit products.
- Do not crush or cut. Swallow whole or administer as dispersion in water. Gently swirl glass for up to 20 min and immediately ingest once dispersed.

Indications/routes/dosage

NSCLC

PO:ADULTS, ELDERLY: 250 mg once daily, with or without food. (Concurrent CYP3A4 inducers: consider increasing dose to 500 mg once daily.) Continue until disease progression or unacceptable toxicity.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: No dose adjustment. **Moderate to severe impairment:** Use with caution.

Side effects

Frequent (47%–15%): Skin reactions (e.g., acne, pruritus, rash, xeroderma), diarrhea, decreased appetite, vomiting. **Occasional (7%–5%):** Stomatitis, conjunctivitis, blepharitis, dry eye, nail disorders (e.g., infection).

Adverse effects/toxic reactions

Hepatotoxicity, interstitial lung disease, gastrointestinal perforation, severe or persistent diarrhea, ocular disorders including keratitis, bullous and exfoliative skin disorders.

Nursing considerations

Baseline assessment

Obtain baseline CBC with differential, serum chemistries, LFT, thyroid function test, PT/INT (if taking warfarin), EGFR mutation serostatus. Question possibility of pregnancy or plans of breastfeeding. Receive full medication history including vitamins, minerals, herbal products. Assess visual acuity.

Intervention/evaluation

Assess vital signs, oxygen saturation routinely. Routinely monitor CBC with differential, LFT. Worsening cough, fever, or shortness of breath may indicate interstitial lung disease. Consider ophthalmologic evaluation for vision changes. Monitor for bruising, hematuria, jaundice, right upper abdominal pain, weight

loss, or acute infection (fever, diaphoresis, lethargy, productive cough). Monitor for skin lesions.

Patient/family teaching

- Blood levels will be drawn routinely. Report urine changes, bloody or clay-colored stools, upper abdominal pain, nausea, vomiting, bruising, fever, cough, difficulty breathing.
- Immediately report any newly prescribed medications, suspected pregnancy, vision changes (eye pain, bleeding, sensitivity to light), or persistent diarrhea, dehydration.
- Avoid alcohol.
- Avoid grapefruit products.

gemcitabine

jem-sye-ta-been

HIGH
ALERT

Gemzar

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Antimetabolite.

CLINICAL: Antineoplastic.

Do not confuse gemcitabine with gemtuzumab, Gemzar with Zinecard.

Uses

Metastatic breast cancer in combination with PACLitaxel. Treatment of locally advanced (stage II, III) or metastatic (stage IV) adenocarcinoma of pancreas. In combination with CISplatin for treatment of locally advanced or metastatic non-small-cell lung cancer (NSCLC). Treatment of advanced ovarian cancer (in combination with CARBOplatin) that has relapsed. **OFF-LABEL:** Treatment of biliary tract carcinoma, bladder carcinoma, germ cell tumors (e.g., testicular), Hodgkin's lymphoma, non-Hodgkin's lymphoma, cervical cancer.

Precautions

Contraindications: Hypersensitivity to gemcitabine. **Cautions:** Renal/hepatic impairment, pregnancy, elderly, concurrent radiation therapy, impaired pulmonary function.

Action

Inhibits ribonucleotide reductase, the enzyme necessary for catalyzing DNA synthesis. Cell-cycle specific for the S-phase. **Therapeutic Effect:** Produces death of cells undergoing DNA synthesis.

Pharmacokinetics

Not extensively distributed after IV infusion (increased with length of infusion). Protein binding: less than 10%. Metabolized intracellularly by nucleoside kinases. Excreted primarily in urine. **Half-life:** Influenced by duration of infusion. Infusion 1 hr or less: 42–94 min; infusion 3–4 hrs: 4–10.5 hrs.

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. May cause fetal harm. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of hematologic toxicity.

Interactions

DRUG: Bone marrow depressants may increase risk of myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL: Echinacea** may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, alkaline phosphatase, bilirubin, creatinine, ALT, AST. May decrease Hgb, Hct, leukocyte count, platelet count.

Availability (Rx)

Injection, Powder for Reconstitution: 200-mg, 1-g, 2-g vials. **Injection, Solution:** 38 mg/mL.

Administration/handling

 IV

Reconstitution

- Use gloves when handling/preparing.
- Reconstitute with 0.9% NaCl injection without preservative to provide concentration of 38 mg/mL.
- Shake to dissolve. Further diluted with 50–500 mL 0.9% NaCl to a concentration as low as 0.1 mg/mL.

Rate of Administration

- Infuse over 30 min.
- Infusion time greater than 60 min increases toxicity.

Storage

- Store at room temperature (refrigeration may cause crystallization).
- Reconstituted vials or diluted solutions are stable for 24 hrs at room temperature. Do not refrigerate.

IV incompatibilities

Acyclovir (Zovirax), amphotericin B (Fungizone), cefotaxime (Claforan), furosemide (Lasix), ganciclovir (Cytovene), imipenem/cilastatin (Primaxin), irinotecan (Camptosar), methotrexate, methylPREDNISolone (**Solu-Medrol**), mitoMYcin (Mutamycin), piperacillin/tazobactam (Zosyn), prochlorperazine (Compazine).

IV Compatibilities

Bumetanide (Bumex), calcium gluconate, dexamethasone (Decadron), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), granisetron (Kytril), heparin, hydrocortisone (Solu-Cortef), LORazepam (Ativan), ondansetron (Zofran), potassium chloride.

Indications/routes/dosage

◀ALERT▶ Dosage is individualized based on clinical response, tolerance to adverse effects. When used in combination therapy, consult specific protocols for optimum dosage, sequence of drug administration.

Breast Cancer

IV: ADULTS, ELDERLY:(in combination with PACLitaxel): 1,250 mg/m² over 30 min on days 1 and 8 of each 21-day cycle.

Non–Small-Cell Lung Cancer (NSCLC)

IV: ADULTS, ELDERLY, CHILDREN:(in combination with CISplatin): 1,000 mg/m² on days 1, 8, and 15, repeated every 28 days; or 1,250 mg/m² on days 1 and 8. Repeat every 21 days.

Ovarian Cancer

IV: ADULTS, ELDERLY:(in combination with CARBOplatin): 1,000 mg/m² on days 1 and 8 of each 21-day cycle.

Pancreatic Cancer

IV: ADULTS: 1,000 mg/m² once wkly for up to 7 wks or until toxicity necessitates decreasing dosage or withholding the dose, followed by 1 wk of rest. Subsequent cycles should consist of once-wkly dose for 3 consecutive wks out of every 4 wks.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Dosage Reduction Guidelines

Pancreatic Cancer, Non–Small-Cell Lung Cancer (NSCLC)

Dosage adjustments should be based on granulocyte count and platelet count, as follows:

Absolute Granulocyte Counts (cells/mm ³)	Platelet Count (cells/mm ³)	% of Full Dose
1,000	100,000	100
500–999	50,000–99,000	75
Less than 500 or	Less than 50,000	Hold

Breast Cancer

Absolute Granulocyte Counts (cells/mm ³)	Platelet Count (cells/mm ³)	% of Full Dose
Equal to or greater than 1,200 and	Greater than 75,000	100
1,000–1,199 or	50,000–75,000	75
700–999 and	Equal to or greater than 50,000	50
Less than 700 or	Less than 50,000	Hold

Ovarian Cancer

Absolute Granulocyte Counts (cells/mm ³)	Platelet Count (cells/mm ³)	% of Full Dose
1,500 or greater and	100,000 or greater	100
1,000–1,499 and/or	75,000–99,999	50
Less than 1,000 and/or	Less than 75,000	Hold

Side effects

Frequent (69%–20%): Nausea, vomiting, generalized pain, fever, mild to moderate pruritic rash, mild to moderate dyspnea, constipation, peripheral edema. **Occasional (19%–10%):** Diarrhea, petechiae, alopecia, stomatitis, infection, drowsiness, paresthesia. **Rare:** Diaphoresis, rhinitis, insomnia, malaise.

Adverse effects/toxic reactions

Severe myelosuppression (anemia, thrombocytopenia, leukopenia) occurs commonly.

Nursing considerations

Baseline assessment

Obtain baseline CBC, renal function, LFT, and periodically thereafter (CBC, platelets before each dose). Drug should be suspended or dosage modified if myelosuppression is detected. Question history of pulmonary disease, hepatic/renal impairment. Offer emotional support.

Intervention/evaluation

Assess all lab results prior to each dose. Monitor for dyspnea, fever, pruritic rash, dehydration. Assess oral mucosa for erythema, ulceration at inner margin of lips, sore throat, difficulty swallowing (stomatitis). Assess skin for rash. Monitor daily pattern of bowel activity, stool consistency. Provide antiemetics as needed.

Patient/family teaching

- Avoid crowds, exposure to infection.
- Maintain strict oral hygiene.
- Promptly report fever, sore throat, signs of local infection, easy bruising, rash, yellowing of skin or eyes.
- Report nausea or vomiting that continues at home.

gemfibrozil

jem-fye-broe-zil

Apo-Gemfibrozil 

Lopid

Novo-Gemfibrozil 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Fibric acid derivative.

CLINICAL: Antihyperlipidemic.

Do not confuse Lopid with Levbid, Lipitor, Lodine, or Slo-Bid.

Uses

Treatment of hypertriglyceridemia in types IV and V hyperlipidemia in pts who are at greater risk for pancreatitis and those who have not responded to dietary intervention. Reduce risk of coronary heart disease (CHD) development in pts without symptoms who have decreased HDL, increased LDL, increased triglycerides.

Precautions

Contraindications: Hypersensitivity to gemfibrozil. Hepatic impairment (including primary biliary cirrhosis), preexisting gallbladder disease, severe renal impairment, concurrent use with dasabuvir, repaglinide or simvastatin.

Cautions: Concurrent use with statins, mild to moderate renal impairment, anticoagulant therapy (e.g., warfarin).

Action

Exact mechanism of action unknown. Can inhibit lipolysis of fat in adipose

tissue, decrease hepatic uptake of free fatty acids (reduces hepatic triglyceride production), or inhibit hepatic secretion of very low-density lipoprotein (VLDL). **Therapeutic Effect:** Lowers serum cholesterol, triglycerides (decreases VLDL, LDL; increases HDL).

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1.5 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Decision to discontinue breastfeeding or drug should be based on potential for serious adverse effects. **Children:** Not recommended in pts younger than 2 yrs (cholesterol necessary for normal development). **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Statins (e.g., atorvastatin, simvastatin)** may increase risk for myopathy/rhabdomyolysis. May increase effects of **repaglinide, warfarin**. **Bile acid-binding resins (e.g., colestipol)** may decrease concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, bilirubin, creatine kinase, LDH, ALT, AST. May decrease Hgb, Hct, leukocyte counts, serum potassium.

Availability (Rx)

Tablets: 600 mg.

Administration/handling

PO

- Give 30 min before morning and evening meals.

Indications/routes/dosage

Hyperlipidemia/Hypertriglyceridemia

PO: ADULTS, ELDERLY: 600 mg twice daily 30 min before breakfast and dinner.

Dosage in Renal Impairment

Use caution. Contraindicated in severe impairment.

Dosage in Hepatic Impairment

Contraindicated.

Side effects

Frequent (20%): Dyspepsia. **Occasional (10%–2%):** Abdominal pain, diarrhea, nausea, vomiting, fatigue. **Rare (less than 2%):** Constipation, acute appendicitis, vertigo, headache, rash, pruritus, altered taste.

Adverse effects/toxic reactions

Cholelithiasis, cholecystitis, acute appendicitis, pancreatitis, malignancy occur rarely.

Nursing considerations

Baseline assessment

Obtain diet history, esp. fat/alcohol consumption. Obtain serum glucose, triglyceride, cholesterol, LFT. Question history of hepatic/renal impairment, cholecystectomy. Receive full medication history and screen for contraindications.

Intervention/evaluation

Monitor LDL, VLDL, serum triglycerides, cholesterol lab results for therapeutic response. Monitor daily pattern of bowel activity, stool consistency. Assess for rash, pruritus. Question for headache, dizziness. Monitor LFT, hematology tests. Assess for abdominal pain, esp. right upper quadrant or epigastric pain suggestive of adverse gallbladder effects. Monitor serum glucose in pts receiving

insulin, oral antihyperglycemics.

Patient/family teaching

- Follow special diet (important part of treatment).
- Take before meals.
- Periodic lab tests are essential part of therapy.
- Report pronounced dizziness, blurred vision, abdominal pain, diarrhea, nausea, vomiting.

gentamicin

jen-ta-mye-sin

Gentak

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Aminoglycoside.

CLINICAL: Antibiotic.

■ **BLACK BOX ALERT** ■ Aminoglycoside antibiotics may cause neurotoxicity, nephrotoxicity. Risk of ototoxicity directly proportional to dosage, duration of treatment; ototoxicity usually is irreversible, precipitated by tinnitus, vertigo. May cause fetal harm if given during pregnancy.

Do not confuse gentamicin with vancomycin.

Uses

Parenteral: Treatment of infections susceptible to *Pseudomonas*, *Proteus*, *Serratia*, and other gram-negative organisms and gram-positive *Staphylococcus* including skin/skin structure, bone, joint, respiratory tract, intra-abdominal, complicated urinary tract, acute pelvic infections; burns; septicemia; meningitis.

Ophthalmic: Ophthalmic infections caused by susceptible bacteria. **OFF-LABEL:** Surgical (preoperative) prophylaxis.

Precautions

Contraindications: Hypersensitivity to gentamicin, other aminoglycosides (cross-sensitivity) or their components. **Cautions:** Elderly, neonates due to renal

insufficiency or immaturity, neuromuscular disorders (potential for respiratory depression), vestibular or cochlear impairment, renal impairment, hypocalcemia, myasthenia gravis. Pediatric pts on extracorporeal membrane oxygenation.

Action

Irreversibly binds to protein of bacterial ribosomes. **Therapeutic Effect:** Interferes with protein synthesis of susceptible microorganisms. Bactericidal.

Pharmacokinetics

Rapid, complete absorption after IM administration. Protein binding: less than 30%. Widely distributed (does not cross blood-brain barrier, low concentrations in CSF). Excreted unchanged in urine. Removed by hemodialysis. **Half-life:** 2–4 hrs (increased in renal impairment, neonates; decreased in cystic fibrosis, burn, or febrile pts).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta; unknown if distributed in breast milk. **Children:** Caution in neonates: Immature renal function increases half-life and toxicity. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Nephrotoxic (e.g., lisinopril, IV contrast dye), ototoxic medications (e.g., CISplatin, furosemide) may increase risk of nephrotoxicity, ototoxicity. May increase neuromuscular blockade with concurrent use of **neuromuscular blockers** (e.g., succinylcholine). **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, bilirubin, LDH, ALT, AST. May decrease serum calcium, magnesium, potassium, sodium. **Therapeutic serum level:** peak: 4–10 mcg/mL; trough: 0.5–2 mcg/mL. **Toxic serum level:** peak: greater than 10 mcg/mL; trough: greater than 2 mcg/mL.

Availability (Rx)

Injection, Infusion: 60 mg/50 mL, 80 mg/50 mL, 80 mg/100 mL, 100 mg/50

mL, 100 mg/100 mL, 120 mg/100 mL. **Injection, Solution:** 10 mg/mL, 40 mg/mL. **Ointment, Ophthalmic:** 0.3%. **Solution, Ophthalmic (Gentak):** 0.3%.

Administration/handling

IV

Reconstitution

- Dilute with 50–100 mL D₅W or 0.9% NaCl. Amount of diluent for infants, children depends on individual needs.

Rate of Administration

- Infuse over 30–60 min for adults, older children; over 60–120 min for infants, young children.

Storage

- Store vials at room temperature.
- Solution appears clear or slightly yellow.
- Intermittent IV infusion (piggyback) is stable for 48 hrs at room temperature or refrigerated.
- Discard if precipitate forms.

IM

- To minimize discomfort, give deep IM slowly.
- Less painful if injected into gluteus maximus than lateral aspect of thigh.

Ophthalmic

- Place gloved finger on lower eyelid and pull out until a pocket is formed between eye and lower lid.
- Place prescribed number of drops or 1/4–1/2 inch ointment into pocket. Instruct pt to close eye gently for 1–2 min (so that medication will not be squeezed out of the sac).
- **Solution:** Instruct pt to apply digital pressure to lacrimal sac at inner canthus for 1 min to minimize systemic absorption.
- **Ointment:** Instruct pt to roll eyeball to increase contact area of drug to eye.
- Remove excess solution or ointment around eye with tissue.

IV incompatibilities

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), furosemide (Lasix), heparin, heta-starch (Hespan), IDArubicin (Idamycin), indomethacin (Indocin), propofol (Diprivan).

■ IV Compatibilities

Amiodarone (Cordarone), dexmedetomidine (Precedex), diltiazem (Cardizem), enalapril (Vasotec), filgrastim (Neupogen), HYDROMORPHONE (Dilaudid), insulin, LORAZEPAM (Ativan), magnesium sulfate, midazolam (Versed), morphine, multivitamins.

Indications/routes/dosage

⚠️ ALERT Space parenteral doses evenly around the clock. Dosage based on ideal body weight. Peak, trough levels are determined periodically to maintain desired serum concentrations and minimize risk of toxicity.

Usual Parenteral Dosage

IM, IV: ADULTS, ELDERLY: (Conventional): 3–5 mg/kg/day in divided doses q8h. **(Once Daily):** 5–7 mg/kg/dose q24h. **CHILDREN 5 YRS AND OLDER:** 2–2.5 mg/kg/dose q8h. **INFANTS, CHILDREN YOUNGER THAN 5 YRS:** 2.5 mg/kg/dose q8h. **NEONATES (GREATER THAN 2 KG)PNA 8–28 days:** 4–5 mg/kg/dose q24h; **PNA 7 days or less:** 4 mg/kg/dose q24h. **(1–2 KG)PNA 8–28 days:** 5 mg/kg/dose q36h; **PNA 7 days or less:** 5 mg/kg/dose q48h. **(LESS THAN 1 KG)PNA 15–28 days:** 5 mg/kg/dose q36h; **PNA 14 days or less:** 5 mg/kg/dose q48h.

Hemodialysis (HD)

Note: Administer after HD on dialysis days.

Loading dose: 2–3 mg/kg, then 1 mg/kg q48–72h for mild UTI or synergy (consider redose for pre- or post-HD concentrations less than 1 mg/L); 1–1.5 mg/kg q48–72h for moderate to severe UTI (consider redose for pre-HD concentration less than 1.5–2 mg/L or post-HD concentrations less than 1 mg/L); 1.5–2 mg/kg q48–72h for systemic gram-negative rod infection (consider redose for pre-HD concentration less than 3–5 mg/L or post-HD concentrations less than 2 mg/L).

Continuous Renal Replacement Therapy (CRRT)

Loading dose: 2–3 mg/kg, then 1 mg/kg q24–36h for mild UTI or synergy (redose when concentration less than 1 mg/L); 1–1.5 mg/kg q24–36h for moderate to severe UTI (redose when concentration less than 1.5–2 mg/L); 1.5–2 mg/kg q24–48h for systemic gram-negative infection (redose when concentration less than 3–5 mg/L).

Usual Ophthalmic Dosage

Ophthalmic Ointment: ADULTS, ELDERLY: Apply 1/2-inch strip to conjunctival sac 2–3 times/day.

Ophthalmic Solution: ADULTS, ELDERLY, CHILDREN: 1–2 drops q2–4h up to 2 drops/hr.

Dosage in Renal Impairment

Adults

Creatinine Clearance	Conventional Dosage	Once-Daily Dosage
Greater than 60 mL/min	q8h	q24h
41–60 mL/min	q12h	q36h
20–40 mL/min	q24h	q48h
Less than 20 mL/min	Loading dose, then monitor levels to determine dosage interval	Monitor levels

Children

Creatinine Clearance	Conventional Dosage
Greater than 50 mL/min	q8h
30–50 mL/min	q12–18h
10–29 mL/min	q18–24h
Less than 10 mL/min	q48–72h

Dosage in Hepatic Impairment

Monitor plasma concentrations.

Side effects

Occasional: IM: Pain, induration at injection site. **IV:** Phlebitis, thrombophlebitis, hypersensitivity reactions (fever, pruritus, rash, urticaria).

Ophthalmic: Burning, tearing, itching, blurred vision. **Rare:** Alopecia, hypertension, fatigue.

Adverse effects/toxic reactions

Nephrotoxicity (increased serum BUN, creatinine; decreased creatinine clearance) may be reversible if drug is stopped at first sign of symptoms. Irreversible ototoxicity (tinnitus, dizziness, diminished hearing), neurotoxicity (headache, dizziness, lethargy, tremor, visual disturbances) occur occasionally. Risk increases with higher dosages, prolonged therapy, or if solution is applied directly to mucosa. Superinfections, particularly with fungi, may result from bacterial imbalance via any route of administration. Ophthalmic application may cause paresthesia of conjunctiva, mydriasis.

Nursing considerations

Baseline assessment

Dehydration must be treated before beginning parenteral therapy. Establish baseline hearing acuity. Question for history of allergies, esp. aminoglycosides, sulfites (parabens for topical/ophthalmic routes). Screen for risk of acute kidney injury, esp. pts at risk for renal failure (baseline renal insufficiency, elderly, HF, hypertension, septic shock).

Intervention/evaluation

Monitor I&O (maintain hydration), urinalysis, BUN, creatinine. Be alert to ototoxic, neurotoxic symptoms (see Adverse Effects/Toxic Reactions). Check IM injection site for induration. Evaluate IV site for phlebitis (heat, pain, red streaking over vein). Assess for rash (**Ophthalmic:** redness, burning, itching, tearing). Be alert for superinfection (genital/anal pruritus, changes in oral mucosa, diarrhea). When treating pts with neuromuscular disorders, assess respiratory response carefully. **Therapeutic serum level:** peak: 4–10 mcg/mL; peak levels are 2–3 times greater with once-daily dosing; trough: 0.5–2 mcg/mL. **Toxic serum level:** peak: greater than 10 mcg/mL; trough: greater than 2 mcg/mL.

Patient/family teaching

- Discomfort may occur with IM injection.
- Blurred vision, tearing may occur briefly after each ophthalmic dose.
- Report any hearing, visual, balance, urinary problems, even after therapy is completed.
- **Ophthalmic:** Report if tearing, redness, irritation continues.

glatiramer

gla-**tir**-a-mer

TOP
100

Copaxone, Glatopa

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Immunosuppressive.

CLINICAL: Neurologic agent for multiple sclerosis.

Do not confuse Copaxone with Compazine.

Uses

Treatment of relapsing, remitting multiple sclerosis.

Precautions

Contraindications: Hypersensitivity to glatiramer, mannitol. **Cautions:** Pts exhibiting immediate postinjection reaction (flushing, chest pain, palpitations, anxiety, dyspnea, urticaria).

Action

Induces/activates T-lymphocyte suppressor cells specific to myelin antigens. May also interfere with the antigen-presenting function of immune cells. **Therapeutic Effect:** Slows progression of multiple sclerosis.

Pharmacokinetics

Substantial fraction of glatiramer is hydrolyzed locally. Some fraction of injected material enters lymphatic circulation, reaching regional lymph nodes; some may enter systemic circulation intact.

⌚ Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Safety and efficacy not established.

Interactions

DRUG: None significant. **HERBAL:** **Echinacea** may decrease effects. **FOOD:** None known. **LAB VALUES:** None significant.

Availability (Rx)

Injection Solution:(Copaxone, Glatopa) 20 mg/mL in prefilled syringes, (Copaxone) 40 mg/mL in prefilled syringes.

Administration/handling

Subcutaneous

- Refrigerate syringes (bring to room temperature before use).
- May be stored at room temperature for up to 1 mo.
- Avoid heat, intense light.
- Inject into deltoid region, abdomen, gluteus maximus, or lateral aspect of thigh.
- Prefilled syringe suitable for single use only; discard unused portions.

Indications/routes/dosage

Multiple Sclerosis

SQ: ADULTS, ELDERLY: 20 mg once daily or 40 mg 3 times/wk.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Expected (73%–40%): Pain, erythema, inflammation, pruritus at injection site, asthenia. **Frequent (27%–18%):** Arthralgia, vasodilation, anxiety, hypertonia, nausea, transient chest pain, dyspnea, flu-like symptoms, rash, pruritus. **Occasional (17%–10%):** Palpitations, back pain, diaphoresis, rhinitis, diarrhea,

urinary urgency. **Rare (less than 9%):** Anorexia, fever, neck pain, peripheral edema, ear pain, facial edema, vertigo, vomiting.

Adverse effects/toxic reactions

Infection occurs commonly. Lymphadenopathy occurs occasionally.

Nursing considerations

Baseline assessment

Assess baseline muscle strength, gait, voice quality, pain level; ability to conduct activities of daily living. Question other baseline symptoms including bowel/bladder dysfunction, depression, dizziness, fatigue, paresthesia, spasticity, sexual dysfunction, tremors.

Intervention/evaluation

Observe injection site for reaction. Monitor for fever, chills (evidence of infection). Observe for improvement of symptoms, neurologic function.

Patient/family teaching

- Report difficulty in breathing/swallowing, rash, itching, swelling of lower extremities, fatigue.
- Avoid pregnancy.

glimepiride

glye-**mep**-ir-ide

Amaryl

Apo-Glimepiride 

Novo-Glimepiride 

HIGH
ALERT

Fixed-Combination(s)

Avandaryl: glimepiride/rosiglitazone (an antidiabetic): 1 mg/4 mg, 2 mg/4 mg, 4 mg/4 mg.

Duetact: glimepiride/pioglitazone (an antidiabetic): 2 mg/30 mg, 4 mg/30 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Sulfonylurea.

CLINICAL: Antidiabetic agent.

Do not confuse Amaryl with Altace, Amerge, or Reminyl, or Avandaryl with Benadryl, or glimepiride with glipiZIDE or glyBURIDE.

Uses

Adjunct to diet, exercise in the management of type 2 diabetes mellitus.

Precautions

Contraindications: Hypersensitivity to glimepiride, sulfonamides. Diabetic ketoacidosis (with or without coma). **Cautions:** Renal/hepatic impairment, glucose-altering conditions (fever, trauma, infection), G6PD deficiency, elderly, malnourished. Allergy to sulfa.

Action

Promotes release of insulin from beta cells of pancreas, decreases glucose output from liver, increases insulin sensitivity at peripheral sites. **Therapeutic Effect:** Lowers serum glucose.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	N/A	2–3 hrs	24 hrs

Completely absorbed from GI tract. Protein binding: greater than 99%. Metabolized in liver. Excreted in urine (60%), feces (40%). **Half-life:** 5–9.2 hrs.

🕒 Lifespan considerations

Pregnancy/Lactation: Avoid pregnancy. Unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Hypoglycemia may be difficult to recognize. Age-related renal impairment may increase sensitivity to glucose-lowering effect.

Interactions

DRUG: Beta blockers (e.g., carvedilol, metoprolol) may increase hypoglycemic effect, mask signs of hypoglycemia. **Cimetidine, ciprofloxacin, fluconazole, ranitidine, large doses of salicylates** may increase effect. **Corticosteroids (e.g., dexamethasone, prednisone), thiazide diuretics (e.g., HCTZ)** may decrease effect. **HERBAL:** Garlic may worsen hypoglycemia. **FOOD:** Alcohol may cause rare disulfiram reaction. **LAB VALUES:** May increase LDH concentrations, serum alkaline phosphatase, ALT, AST, bilirubin, C-peptide.

Availability (Rx)

Tablets: 1 mg, 2 mg, 4 mg.

Administration/handling

PO

- Give with breakfast or first main meal.

Indications/routes/dosage

Diabetes Mellitus

PO: ADULTS: Initially, 1–2 mg once daily with breakfast or first main meal. May increase by 1–2 mg q1–2wks, based on serum glucose response. **Maximum:** 8 mg/day. **ELDERLY:** Initially, 1 mg/day. Titrate dose to avoid hypoglycemia.

Dosage in Renal Impairment

Initially, 1 mg/day, then titrate dose based on fasting serum glucose levels.

Dosage in Hepatic Impairment

No dose adjustment (not studied).

Side effects

Rare (less than 3%): Altered taste, dizziness, drowsiness, weight gain, constipation, diarrhea, heartburn, nausea, vomiting, stomach fullness, headache, photosensitivity, peeling of skin, pruritus, rash.

Adverse effects/toxic reactions

Overdose or insufficient food intake may produce hypoglycemia (esp. with increased glucose demands). GI hemorrhage, cholestatic hepatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, aplastic or hemolytic anemia occur rarely.

Nursing considerations

Baseline assessment

Check serum glucose level. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management or serum glucose testing technique.

Intervention/evaluation

Monitor serum glucose level, food intake. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep or rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity or stress, trauma, surgical procedure).

Patient/ family teaching

- Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Avoid alcohol.
- Carry candy, sugar packets, other quick-acting sugar supplements for immediate response to hypoglycemia.
- Wear medical alert identification.
- Check with physician when glucose demands are altered (fever, infection, trauma, stress, heavy physical activity).
- Avoid direct exposure to sunlight.

glipiZIDE

HIGH
ALERT

glip-i-zide

Glucotrol

Glucotrol XL

Fixed-Combination(s)

GlipiZIDE/metFORMIN (an antidiabetic): 2.5 mg/250 mg, 2.5 mg/500 mg, 5 mg/500 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Sulfonylurea.

CLINICAL: Antidiabetic agent.

Do not confuse glipiZIDE with glimepiride or glyBURIDE, or Glucotrol with Glucophage or Glucotrol XL.

Uses

Adjunct to diet, exercise in management of type 2 diabetes mellitus.

Precautions

Contraindications: Hypersensitivity to glipiZIDE, sulfonamides. Diabetic ketoacidosis with or without coma, type 1 diabetes mellitus. **Cautions:** Elderly, malnourished, concomitant use of beta blockers, pts with G6PD deficiency, hepatic/renal impairment. Avoid use of extended-release tablets in pts with stricture/narrowing of GI tract.

Action

Promotes release of insulin from beta cells of pancreas, decreases glucose output from liver, increases insulin sensitivity at peripheral sites. **Therapeutic Effect:** Lowers serum glucose.

Pharmacokinetics

Route	Onset	Peak	Duration
-------	-------	------	----------

PO	15–30 min	2–3 hrs	12–24 hrs
Extended-release	2–3 hrs	6–12 hrs	24 hrs

Well absorbed from GI tract. Protein binding: 92%–99%. Metabolized in liver. Excreted in urine. **Half-life:** 2–4 hrs.

Lifespan considerations

Pregnancy/Lactation: Agents other than glipizide are recommended to treat diabetes in pregnant women. GlipiZIDE given within 1 mo of delivery may produce neonatal hypoglycemia. Drug crosses placenta. Distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** Hypoglycemia may be difficult to recognize. Age-related renal impairment may increase sensitivity to glucose-lowering effect.

Interactions

DRUG: Beta blockers (e.g., carvedilol, metoprolol) may increase hypoglycemic effect, mask signs of hypoglycemia. **Corticosteroids (e.g., dexamethasone, predniSONE), thiazide diuretics (e.g., HCTZ)** may decrease effect. **HERBAL:** Garlic may worsen hypoglycemia. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, LDH, ALT, AST, bilirubin, C-peptide.

Availability (Rx)

Tablets: 5 mg, 10 mg.

 **Tablets (Extended-Release):** 2.5 mg, 5 mg, 10 mg.

Administration/handling

PO

- Give immediate-release tablets 30 min before meals. Give extended-release tablets with breakfast.
- Do not crush, cut, dissolve, or divide extended-release tablets.

Indications/routes/dosage

Diabetes Mellitus

PO: ADULTS: (Immediate-Release): Initially, 5 mg/day. Adjust dosage in 2.5- to 5-mg increments at intervals of several days. Immediate-release: **Maximum once-daily dose:** 15 mg. **Maximum dose/day:** 40 mg. **(Extended-Release):** Initially, 5 mg/day. May increase dose no more frequently than q7days. **Maximum dose:** 20 mg/day. **ELDERLY: (Immediate-Release):** Initially, 2.5–5 mg/day. May increase by 2.5–5 mg/day q1–2wks. **(Extended-Release):** Initially, 2.5 mg/day. Dosing should be on lower end of adult dosing.

Dosage in Renal Impairment

For CrCl of 50 mL/min or less, reduce dose by 50%.

Dosage in Hepatic Impairment

(Immediate-Release): Initial dose: 2.5 mg/day.

Side effects

Rare (less than 3%): Altered taste, dizziness, drowsiness, weight gain, constipation, diarrhea, heartburn, nausea, vomiting, headache, photosensitivity, peeling of skin, pruritus, rash.

Adverse effects/toxic reactions

Overdose or insufficient food intake may produce hypoglycemia (esp. with increased glucose demands). GI hemorrhage, cholestatic hepatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, aplastic or hemolytic anemia occur rarely.

Nursing considerations

Baseline assessment

Check serum glucose level. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management or serum glucose testing technique.

Intervention/evaluation

Monitor serum glucose level, food intake. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia), hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep or rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity or stress, trauma, surgical procedure).

Patient/ family teaching

- Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Avoid alcohol.
- Carry candy, sugar packets, other quick-acting sugar supplements for immediate response to hypoglycemia.
- Wear medical alert identification.
- Check with physician when glucose demands are altered (fever, infection, trauma, stress, heavy physical activity).
- Avoid direct exposure to sunlight.

glucagon

gloo-ka-gon

GlucaGen

GlucaGen Diagnostic Kit

Glucagon Emergency Kit

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Glucose elevating agent.

CLINICAL: Antidote for hypoglycemia, diagnostic agent.

Uses

Treatment of severe hypoglycemia in diabetic pts. Diagnostic aid in radiographic examination to temporarily inhibit GI tract movement. **OFF-LABEL:** Hypoglycemia secondary to insulin or oral hypoglycemic therapy. Toxicity associated with beta blockers, calcium channel blockers.

Precautions

Contraindications: Hypersensitivity to glucagon. Known insulinoma, pheochromocytoma, glucagonoma (except GlucaGen). **Cautions:** History of insulinoma, pheochromocytoma, prolonged fasting, starvation, adrenal insufficiency, chronic hypoglycemia. Avoid use in pts with hereditary galactose intolerance.

Action

Promotes hepatic glycogenolysis, gluconeogenesis. Stimulates cAMP, an enzyme, resulting in increased serum glucose concentration. **Therapeutic Effect:** Increases serum glucose level.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	5–20 min	—	60–90 min
IM	30 min	—	60–90 min
SQ	30–45 min	—	60–90 min

Metabolized in liver. **Half-life:** 3–10 min.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children/Elderly:** No age-related precautions noted.

Interactions

DRUG: May increase effects of **anticoagulants**. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May decrease serum potassium.

Availability (Rx)

Injection Powder (GlucaGen, GlucaGen Diagnostic Kit, Glucagon Emergency Kit): 1 mg.

Administration/handling

◀ALERT▶ Place pt in side-lying position to prevent aspiration (glucagon, hypoglycemia may produce nausea/vomiting).

IV, IM, SQ

Reconstitution

- Reconstitute with 1 mL sterile diluent to provide concentration of 1 mg/mL.

Rate of Administration

- Pt usually awakens in 5–20 min. Although 1–2 additional doses may be administered, concern for effects of continuing cerebral hypoglycemia requires consideration of parenteral glucose.
- When pt awakens, give supplemental carbohydrate to restore hepatic glycogen and prevent secondary hypoglycemia. If pt fails to respond to glucagon, IV dextrose is necessary.

Storage

- Store vial at room temperature.
- After reconstitution, is stable for 48 hrs if refrigerated. If reconstituted with Sterile Water for Injection, use immediately. Do not use glucagon solution unless clear.

■ IV incompatibilities

Do not mix glucagon with any other medications.

Indications/routes/dosage

Hypoglycemia

◀ALERT▶ Administer IV dextrose if pt fails to respond to glucagon.

IV, IM, SQ: ADULTS, ELDERLY, CHILDREN WEIGHING MORE THAN 20 KG: 1 mg. May repeat in 15 min. **CHILDREN WEIGHING 20 KG OR LESS:** 0.5 mg. May repeat in 15 min. **NEONATES:** 0.02–0.2 mg/kg/dose. **Maximum:** 1 mg. May repeat in 20 min if needed.

Diagnostic Aid

IV: ADULTS, ELDERLY: 0.25–2 mg 10 min prior to procedure. **IM:** 1–2 mg 10 minutes prior to procedure.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Nausea, vomiting. **Rare:** Allergic reaction (urticaria, respiratory distress, hypotension).

Adverse effects/toxic reactions

Overdose may produce persistent nausea/vomiting, hypokalemia (severe fatigue, decreased appetite, palpitations, muscle cramps).

Nursing considerations

Baseline assessment

Obtain immediate assessment, including history, clinical signs/symptoms. If presence of hypoglycemic coma is established, give glucagon promptly. Immediately evaluate for other life-threatening conditions that mimic hypoglycemia (CVA, delirium, postictal state, toxicity).

Intervention/evaluation

Monitor serum glucose, B/P, pulse, mental status. Monitor response time carefully. Have IV dextrose readily available in event pt does not respond. Assess for possible allergic reaction (urticaria, respiratory difficulty, hypotension). When pt is conscious, give oral carbohydrate.

Patient/family teaching

- Identify symptoms of low blood sugar (pale, cool skin; anxiety, confusion, difficulty concentrating, headache, nausea, passing out, seizures, sweating).
- Report any episodes of low blood sugar to health care provider; medications, diet, lifestyle may need to be changed.
- If symptoms of hypoglycemia develop, give sugar form first (orange juice, honey, hard candy, sugar cubes, table sugar dissolved in water or juice) followed by cheese and crackers, half a sandwich, glass of milk.

glyBURIDE

glye-bue-ride

Apo-GlyBURIDE 

DiaBeta 

Euglucon 

Glynase

TOP
100 HIGH
ALERT

Fixed-Combination(s)

Glucovance: glyBURIDE/metFORMIN (an antidiabetic): 1.25 mg/250 mg, 2.5 mg/500 mg, 5 mg/500 mg.

CLASSIFICATION

PHARMACOTHERAPEUTIC: Sulfonylurea.

CLINICAL: Antidiabetic agent.

Do not confuse DiaBeta with Zebeta, glyBURIDE with glimepiride, glipiZIDE, or Glucotrol.

Uses

Adjunct to diet, exercise in management of stable, mild to moderately severe type 2 diabetes mellitus.

Precautions

Contraindications: Hypersensitivity to glyBURIDE. Diabetic ketoacidosis with or without coma, type 1 diabetes mellitus, concurrent use with bosentan.

Cautions: Stress, elderly, debilitated pts, malnourished, severe hepatic/renal impairment, G6PD deficiency, adrenal and/or pituitary insufficiency.

Action

Promotes release of insulin from beta cells of pancreas, decreases glucose output from liver, increases insulin sensitivity at peripheral sites. **Therapeutic Effect:** Lowers serum glucose level.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	0.25–1 hr	1–2 hrs	12–24 hrs

Well absorbed from GI tract. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 5–16 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. May produce neonatal hypoglycemia if given within 2 wks of delivery. **Children:** Safety and efficacy not established. **Elderly:** Hypoglycemia may be difficult to recognize. Age-related renal impairment may increase sensitivity to glucose-lowering effect.

Interactions

DRUG: **Beta blockers (e.g., carvedilol, metoprolol)** may increase hypoglycemic effect, mask signs of hypoglycemia. **Corticosteroids (e.g., dexamethasone, predniSONE), thiazide diuretics (e.g., HCTZ)** may decrease effect. **HERBAL:** **Garlic**, other herbs with hypoglycemic properties may enhance effect. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, LDH, ALT, AST, bilirubin, C-peptide.

Availability (Rx)

Tablets: 1.25 mg, 2.5 mg, 5 mg. **Tablets, Micronized:** 1.5 mg, 3 mg, 6 mg.

Administration/handling

PO

- May give with food at same time each day.

Indications/routes/dosage

Diabetes Mellitus

PO (Tablets): ADULTS: Initially, 1.25–5 mg. May increase by 2.5 mg/day at wkly intervals. **Maintenance:** 1.25–20 mg/day as single or divided doses. **Maximum:** 20 mg/day. **ELDERLY:** Initially, 1.25 mg daily. Conservative initial and maintenance doses are recommended to avoid hypoglycemic reactions.

PO (Tablets, Micronized):ADULTS: Initially 0.75–3 mg/day. May increase by 1.5 mg/day at wkly intervals. **Maintenance:** 0.75–12 mg/day as a single dose or in divided doses. **Maximum:** 12 mg/day.

ELDERLY: Initially, 0.75 mg daily. Conservative initial and maintenance doses are recommended to avoid hypoglycemic reactions.

Dosage in Renal Impairment

Not recommended for pts with CrCl less than 60 mL/min.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Rare (less than 3%): Altered taste, dizziness, drowsiness, weight gain, constipation, diarrhea, heartburn, nausea, vomiting, headache, photosensitivity, peeling of skin, pruritus, rash.

Adverse effects/toxic reactions

Overdose or insufficient food intake may produce hypoglycemia (esp. in pts with increased glucose demands). Cholestatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, aplastic or hemolytic anemia occur rarely.

Nursing considerations

Baseline assessment

Check serum glucose level. Discuss lifestyle to determine extent of learning, emotional needs. Ensure follow-up instruction if pt or family does not thoroughly understand diabetes management or glucose testing technique.

Intervention/evaluation

Monitor serum glucose level, food intake. Assess for hypoglycemia (cool/wet skin, tremors, dizziness, anxiety, headache, tachycardia, perioral numbness, hunger, diplopia); hyperglycemia (polyuria, polyphagia, polydipsia, nausea, vomiting, dim vision, fatigue, deep or rapid breathing). Be alert to conditions that alter glucose requirements (fever, increased activity or stress, trauma, surgical procedure).

Patient/ family teaching

- Diet and exercise are principal parts of treatment; do not skip or delay meals.
- Avoid alcohol.
- Carry candy, sugar packets, other quick-acting sugar supplements for immediate response to hypoglycemia.
- Wear medical alert identification.
- Check with physician when glucose demands are altered (fever, infection, trauma, stress, heavy physical activity).
- Avoid direct exposure to sunlight.

golimumab

goe-**lim**-ue-mab

Simponi

Simponi Aria

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Monoclonal antibody.

CLINICAL: Immune modulator, antirheumatic, tumor necrosis factor (TNF) blocking agent.

■ **BLACK BOX ALERT** ■ Tuberculosis (TB), invasive fungal infections, other opportunistic infections reported. Discontinue treatment if active infection or sepsis occurs. Test for TB prior to and during treatment, regardless of initial result; if positive, start treatment for TB prior to initiating therapy. Lymphoma, other malignancies reported in pts treated with tumor necrosis factor blockers.

Do not confuse Simponi (subcutaneous) with Simponi Aria (intravenous).

Uses

Simponi, Simponi Aria: Used alone or in combination with methotrexate for the treatment of adult pts with active psoriatic arthritis. Used in combination with methotrexate for the treatment of adult pts with moderately to severely active rheumatoid arthritis. Used alone or in combination with methotrexate for the treatment of adult pts with active ankylosing spondylitis. **Simponi:** Treatment of moderate to severe active ulcerative colitis in pts with corticosteroid dependence or who are refractory/intolerant to aminosalicylates, oral steroids, azathioprine, or 6-mercaptopurine.

Precautions

Contraindications: Hypersensitivity to golimumab. **Cautions:** Elderly, concomitant immunosuppressants, co-morbid conditions predisposing to infections (e.g., diabetes). Residence or travel from areas of endemic mycosis; tuberculosis, underlying hematologic disorders, preexisting or recent-onset demyelinating disorders (e.g., multiple sclerosis, polyneuropathy), pts with HF or decreased left ventricular function. Avoid concomitant use with live vaccines, abatacept, or anakinra (increased incidence of serious infections). Do not start during an active infection.

Action

Binds specifically to tumor necrosis factor (TNF) alpha, blocking its interaction with cell surface TNF receptors. **Therapeutic Effect:** Alters biologic activity of TNF alpha, reduces inflammation, may alter pathophysiology of rheumatoid arthritis.

Pharmacokinetics

Serum concentration reaches steady state by wk 12. Elimination pathway not specified. **Half-life:** 12–14 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. Must either discontinue drug or discontinue breast-feeding. **Children:** Safety and efficacy

not established in pts younger than 18 yrs. **Elderly:** May have increased risk of serious infections, malignancy.

Interactions

DRUG: Anakinra, abatacept, ritUXimab, natalizumab, immunosuppressive therapy may increase risk of infections. May decrease efficacy of immune response of vaccines. **HERBAL:** Echinacea may decrease effects. **FOOD:** None known. **LAB VALUES:** May increase ALT, AST. May decrease Hgb, leukocytes, neutrophils, platelets.

Availability (Rx)

Injection Solution (Simponi): 50 mg/0.5 mL, 100 mg/mL in single-dose prefilled autoinjector or prefilled syringe. **Injection Solution (Simponi Aria):** 50 mg/4 mL per single-use vial (12.5 mg/mL).

Administration/handling

Simponi Subcutaneous

- Remove prefilled syringe or autoinjector from refrigerator. Allow to sit at room temperature for 30 min; do not warm in any other way.
- Avoid areas where skin is scarred, tender, bruised, red, scaly, hard. Recommended injection site is front of middle thighs, although lower abdomen 2 inches below navel or outer, upper arms are acceptable.
- Inject within 5 min after cap has been removed.

Autoinjector

- Push open end of autoinjector firmly against skin at 90-degree angle.
- Do not pull autoinjector away from skin until a first "click" sound is heard and then a second "click" sound (injection is finished and needle is pulled back). This usually takes 3 to 6 sec but may take up to 15 sec for the second "click" to be heard. If autoinjector is pulled away from skin before injection is completed, full dose may not be administered.

Prefilled Syringe

- Gently pinch skin and hold firmly. Use a quick, dart-like motion to insert needle into pinched skin at a 45-degree angle.

Storage

- Refrigerate; do not freeze. Do not shake.
- Solution appears slightly opalescent, colorless to light yellow. Discard if cloudy or contains particulate.

Simponi Aria

 Use in-line 0.22-micron filter.

IV

Reconstitution

- Calculate dosage and number of vials needed based on pt weight.
- Visually inspect for particulate matter.
- Dilute in 100 mL 0.9% NaCl.
- Prior to mixing, withdraw and discard volume of 0.9% NaCl equal to the volume of patient-dosed solution.
- Slowly inject solution into bag and gently mix.
- Do not shake.

Rate of Administration

- Infuse over 30 min using an in-line low protein-binding 0.22-micron filter.

Storage

- Refrigerate vials, prefilled syringes
- Vial solution should be colorless to light yellow and opalescent.
- It is normal for solution to develop fine translucent particles since drug is a protein.
- Do not use if opaque particles, discoloration, or other foreign particles are present.
- May store diluted solution at room temperature up to 4 hrs.

IV incompatibilities

Do not infuse concomitantly with other drugs.

Indications/routes/dosage

Active Psoriatic Arthritis

SQ: (*Simponi*): ADULTS, ELDERLY: 50 mg once monthly. Use alone or in combination with methotrexate or other nonbiologic DMARD.

IV Infusion: (*Simponi Aria*): ADULTS, ELDERLY: 2 mg/kg at wk 0, 4 then q8wks thereafter.

Moderate to Severe Active Rheumatoid Arthritis (with Methotrexate)

SQ: (*Simponi*):ADULTS, ELDERLY: 50 mg once monthly.

IV Infusion: (*Simponi Aria*): ADULTS, ELDERLY: 2 mg/kg at wk 0 and wk 4. Then, decrease frequency to q8wks.

Active Ankylosing Spondylitis

SQ: (*Simponi*): ADULTS, ELDERLY: 50 mg once monthly. Use alone or in combination with methotrexate or other nonbiologic DMARD.

IV Infusion: (*Simponi Aria*): ADULTS, ELDERLY: 2 mg/kg at wk 0, 4 then q8wks thereafter.

Ulcerative Colitis

SQ: (*Simponi*): ADULTS, ELDERLY: Initially, 200 mg, then 100 mg 2 wks later, and then 100 mg q4wks thereafter.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (13%): Laryngitis, nasopharyngitis, pharyngitis, rhinitis, upper respiratory tract infection. **Occasional (3%–2%):** Bronchitis, hypertension, rash, pyrexia. **Rare (less than 1%):** Dizziness, paresthesia, constipation.

Adverse effects/toxic reactions

Neutropenia, lymphopenia may increase risk of infection. New-onset psoriasis, exacerbation of preexisting psoriasis have been reported. Serious infections including sepsis, pneumonia, cellulitis, TB, invasive fungal infections reported.

May increase risk of lymphoma, melanoma, new malignancies. New onset or exacerbation of CNS demyelinating disorders, including multiple sclerosis, or worsening of HF have occurred. Viral reactivation of herpes zoster, HIV, hepatitis B virus infection may occur. Pts who receive TNF blockers have risk of autoantibody formation (immunogenicity). Hypersensitivity reactions including anaphylaxis reported. May induce lupus-like symptoms (butterfly rash, new joint pain, peripheral edema, UV sensitivity).

Nursing considerations

Baseline assessment

Obtain baseline LFT, CBC, vital signs, urine pregnancy. Obtain B-type natriuretic peptide (BNP) level and review echocardiogram in pts with history of HF. Do not initiate therapy if active infection suspected. Evaluate for active TB and test for latent infection prior to and during treatment. Induration of 5 mm or greater with tuberculin skin test should be considered a positive result when assessing for latent TB. Antifungal therapy should be considered for those who reside or travel to regions where mycoses are endemic. Question history of anemia, HF, CNS disorders, hepatic impairment, HIV, malignancies. Assess skin for moles, lesions. Receive full medication history including herbal products.

Intervention/evaluation

Monitor CBC, LFT every 4–8 wks, then periodically. Screen pts for TB (night sweats, hemoptysis, weight loss, fever) regardless of baseline tuberculin skin test result. Monitor hepatitis B virus carriers during treatment and several mos after treatment. If any viral reactivation occurs, interrupt treatment and consider antiviral therapy. Discontinue treatment if acute infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Routinely assess skin for new lesions. Peripheral edema, difficulty breathing, coarse crackles on lung auscultation, elevated BNP may indicate worsening HF. Monitor for hypersensitivity reactions.

Patient/family teaching

- Treatment may depress your immune system and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.

- Do not receive live vaccines.
- Report history of HIV, fungal infections, HF, hepatitis B, multiple sclerosis, TB, or close relatives who have active TB. Report travel plans to possible endemic areas. Blood levels, TB screening will be routinely monitored.
- Hives, swelling of face, difficulty breathing may indicate allergic reaction.
- Do not breastfeed.
- Abdominal pain, yellowing of skin or eyes, dark-amber urine, clay-colored stools, fatigue, loss of appetite may indicate liver problems.
- Decreased platelet count may increase risk of bleeding.
- Swelling of hands or feet, difficulty breathing may indicate HF.

goserelin

goe-se-rel-in

HIGH
ALERT

Zoladex

Zoladex LA 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Gonadotropin-releasing hormone analogue.

CLINICAL: Antineoplastic.

Uses

Treatment of locally confined prostate cancer. Palliative treatment of advanced carcinoma of prostate as alternative when orchiectomy, estrogen therapy is either not indicated or unacceptable. In combination with an antiestrogen before and during radiation therapy for early stages of prostate cancer. Management of endometriosis. Treatment of advanced breast cancer in premenopausal and perimenopausal women. Endometrial thinning before ablation for dysfunctional uterine bleeding.

Precautions

Contraindications: Hypersensitivity to goserelin. Pregnancy (except when used for palliative treatment of advanced breast cancer). **Cautions:** Women of childbearing potential until pregnancy has been excluded. Pts at risk for decreased bone density; diabetes.

Action

Stimulates release of luteinizing hormone (LH) and follicle-stimulating hormone (FSH) from anterior pituitary. **Therapeutic Effect:** In females, reduces ovarian, uterine, mammary gland size; regresses hormone-responsive tumors. In males, decreases testosterone level, reduces growth of abnormal prostate tissue.

Pharmacokinetics

Protein binding: 27%. Metabolized in liver. Excreted in urine. **Half-life:** 4.2 hrs (male); 2.3 hrs (female).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; unknown if distributed in breast milk. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Anticoagulants (e.g., rivaroxaban, warfarin) may increase risk of severe injection site injury. **Medications prolonging the QT interval (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin)** may increase risk of QT interval prolongation, cardiac arrhythmias. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum prostatic acid phosphatase, testosterone, calcium; Hgb A1c.

Availability (Rx)

Injection, Implant (Zoladex): 3.6 mg, 10.8 mg.

Administration/handling

Subcutaneous Implant

- Administer implant by inserting needle at 30- to 45-degree angle into anterior abdominal wall below the navel line. Do not attempt to eliminate air bubbles or aspirate prior to injection. Do not penetrate into muscle or peritoneum.

Indications/routes/dosage

Prostatic Carcinoma, Advanced

SQ: ADULTS OLDER THAN 18 YRS, ELDERLY: 3.6 mg every 28 days or 10.8 mg q12wks subcutaneously into upper abdominal wall.

Prostate Carcinoma, Locally Confined

SQ: ADULTS, ELDERLY:(in combination with an antiestrogen and radiotherapy, begin 8 wks prior to radiotherapy): 3.6 mg once. 28 days after initial dose, give 10.8 mg or 3.6 mg q28days for 4 doses.

Breast Carcinoma, Endometriosis

SQ: ADULTS: 3.6 mg every 28 days subcutaneously into upper abdominal wall.

Endometrial Thinning

SQ: ADULTS: 3.6 mg subcutaneously into upper abdominal wall as a single dose or in 2 doses 4 wks apart.

Endometriosis

SQ: ADULTS: 3.6 mg every 28 days for 6 mos.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent (60%–13%): Headache, hot flashes, depression, diaphoresis, sexual dysfunction, impotence, lower urinary tract symptoms. **Occasional (10%–5%):** Pain, lethargy, dizziness, insomnia, anorexia, nausea, rash, upper respiratory tract infection, hirsutism, abdominal pain. **Rare:** Pruritus.

Adverse effects/toxic reactions

Arrhythmias, HF, hypertension occur rarely. Ureteral obstruction, spinal cord compression have been observed (immediate orchiectomy may be necessary).

Hypersensitivity reactions, including anaphylaxis, may occur. Hyperglycemia, new-onset diabetes occurred in men taking GnRH antagonists. Increased risk of MI, sudden cardiac death was reported. Injection site injuries including hematoma, hemorrhage, hemorrhagic shock may require blood transfusion or surgical intervention.

Nursing considerations

Baseline Assessment

Question history of diabetes, cardiovascular disease, recent MI, prior hypersensitivity reaction. Receive full medication history; screen for QT interval–prolonging medications, anticoagulant medications. Screen for conditions predisposing to QT interval prolongation. In males, question history of urethral obstruction, urinary retention, spinal cord compression, spinal stenosis. Obtain urine pregnancy. If applicable, obtain bone density test.

Intervention/evaluation

Monitor pt closely for worsening signs/symptoms of prostatic cancer, esp. during first mo of therapy.

Patient/family teaching

- Use nonhormonal methods of contraception during therapy.
- Report suspected pregnancy or if regular menstruation does not cease.
- Breakthrough menstrual bleeding may occur if dose is missed.
- Immediately report sudden weakness, paralysis, numbness, tingling; difficulty urinating, bladder distention.
- Do not take newly prescribed medications unless approved by prescriber who originally started treatment.
- Severe bleeding may occur at the injection site, esp. in pts who take blood-thinning medication.
- Pts with heart disease are at an increased risk of heart attack or sudden death.

granisetron

gra-nis-e-tron

Sancuso

Sustol

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Serotonin receptor antagonist (5-HT₃).

CLINICAL: Antiemetic.

Do not confuse granisetron with dolasetron, ondansetron, or palonosetron.

Uses

Prevention of nausea/vomiting associated with emetogenic cancer therapy and cancer radiation therapy. **OFF-LABEL:** Prevention, treatment of postop nausea, vomiting. Breakthrough treatment of chemotherapy-associated nausea/vomiting.

Precautions

Contraindications: Hypersensitivity to granisetron. Hypersensitivity to other 5-HT₃ receptor antagonists. **Cautions:** Congenital QT prolongation, concomitant administration of medications that prolong QT interval, electrolyte abnormalities, cumulative high-dose anthracycline therapy. Following abdominal surgery or in chemotherapy-induced nausea, vomiting (may mask progressive ileus or gastric distention), hepatic disease.

Action

Selectively blocks serotonin stimulation at receptor sites at chemoreceptor trigger zone, vagal nerve terminals. **Therapeutic Effect:** Prevents nausea/vomiting.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	1–3 min	N/A	24 hrs

Rapidly, widely distributed to tissues. Protein binding: 65%. Metabolized in liver. Excreted in urine (48%), feces (38%). **Half-life:** 10–12 hrs (increased in elderly).

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk. **Children:** Safety and efficacy not established in pts younger than 2 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: QT interval–prolonging medications (e.g., amiodarone, azithromycin, ceritinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, cardiac arrhythmias. **SSRIs** (e.g., escitalopram, paroxetine, sertraline), **SNRIs** (e.g., duloxetine, venlafaxine) may increase risk of serotonin syndrome.

HERBAL: None significant. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST.

Availability (Rx)

Injection, Extended Release (Sustol): 10 mg/0.4 mL single-dose syringe. **Injection Solution:** 0.1 mg/mL, 1 mg/mL. **Tablets:** 1 mg. **Transdermal Patch (Sancuso):** 52-cm² patch containing 34.3 mg granisetron delivering 3.1 mg/24 hrs.

Administration/handling

IV

Reconstitution

- May be given undiluted or dilute with 20–50 mL 0.9% NaCl or D₅W. Do not mix with other medications.

Rate of Administration

- May give undiluted as IV push over 30 sec.
- For IV piggyback, infuse over 5–10 min depending on volume of diluent used.

Storage

- Appears as a clear, colorless solution.
- Store at room temperature.
- After dilution, stable for 3 days at room temperature or 7 days if refrigerated.
- Inspect for particulates, discoloration.

PO

- Give 30 min to 1 hr prior to initiating chemotherapy.

Subcutaneous

Administer in skin of back of upper arm, abdomen (at least 1 inch away from umbilicus). Avoid areas of compromised skin. Administer over 20–30 sec.

Transdermal

- Apply to clean, dry intact skin on upper outer arm.
- Remove immediately from pouch before application.
- Do not cut patch.

■ IV incompatibility

Amphotericin B (Fungizone).

■ IV Compatibilities

Allopurinol (Aloprim), bumetanide (Bumex), calcium gluconate, CARBOplatin (Paraplatin), CISplatin (Platinol), cyclophosphamide (Cytosan), cytarabine (Ara-C), dacarbazine (DTIC-Dome), dexamethasone (Decadron), dexmedetomidine (Precedex), diphenhydramine (Benadryl), DOCEtaxel (Taxotere), DOXOrubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), magnesium, mitoXANTRONE (Novantrone), PACLitaxel (Taxol), potassium.

Indications/routes/dosage

Prevention of Chemotherapy-Induced Nausea/Vomiting

PO: ADULTS, ELDERLY: 2 mg up to 1 hr before chemotherapy or 1 mg up to 1 hr before chemotherapy, with a second dose 12 hrs later.

IV: ADULTS, ELDERLY, CHILDREN 2 YRS AND OLDER: 10 mcg/kg/dose (**Maximum:** 1 mg/dose) within 30 min of chemotherapy.

Maximum: 1 mg.

Subcutaneous: ADULTS, ELDERLY: (In combination with dexamethasone): 10 mg at least 30 min before chemotherapy. Do not repeat

more frequently than 7 days.

Transdermal: ADULTS, ELDERLY: Apply 24–48 hrs prior to chemotherapy. Remove minimum 24 hrs after completion of chemotherapy. May be worn up to 7 days, depending on chemotherapy duration.

Prevention of Radiation-Induced Nausea/Vomiting

PO: ADULTS, ELDERLY: 2 mg once daily, given 1 hr before radiation therapy.

Postop Nausea/Vomiting

IV: ADULTS, ELDERLY: 0.35–3 mg (5–20 mcg/kg) given at end of surgery.

Dosage in Renal/Hepatic Impairment

No dose adjustment. **(Sustol) Moderate:** No more frequently than 14 days. **Severe:** Not recommended.

Side effects

Frequent (21%–14%): Headache, constipation, asthenia. **Occasional (8%–6%):** Diarrhea, abdominal pain. **Rare (less than 2%):** Altered taste, fever.

Adverse effects/toxic reactions

Hypersensitivity reaction, hypertension, hypotension, arrhythmias (sinus bradycardia, atrial fibrillation, AV block, ventricular ectopy), EKG abnormalities occur rarely. Increased risk of serotonin syndrome reported in pts taking concomitant serotonergic drugs (e.g., SSRIs, SNRIs). May prolong QTc interval.

Nursing considerations

Baseline assessment

Assess hydration status. Ensure that granisetron is given within 30 min of starting chemotherapy. Receive full medication history and screen for interactions. Screen for QT interval–prolonging conditions.

Intervention/evaluation

Monitor for therapeutic effect. Assess for headache. Monitor for dehydration due to recurrent vomiting. Monitor daily pattern of bowel activity, stool consistency.

Patient/family teaching

- Granisetron is effective shortly following administration; prevents nausea/vomiting.
- Transitory taste disorder may occur.

guselkumab

gue-sel-**koo**-mab

Tremfya

◆ **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Interleukin-23 inhibitor. Monoclonal antibody.

CLINICAL: Antipsoriasis agent.

Do not confuse guselkumab with golimumab, infliximab, secukinumab.

Uses

Treatment of moderate to severe plaque psoriasis in adult pts who are candidates for systemic therapy or phototherapy.

Precautions

Contraindications: Hypersensitivity to guselkumab. **Cautions:** Hepatic impairment, active infection until resolved, history of chronic or recurrent infections, conditions predisposing to infection (e.g., diabetes, immunocompromised pts, open wounds), prior tuberculosis exposure (do not give to pts with active TB infection). Concomitant use of live vaccines not recommended.

Action

Selectively binds to interleukin-23 receptor reducing levels of IL-17A, IL-17F,

IL-22. IL-23 is a cytokine that is involved in inflammatory and immune responses. **Therapeutic Effect:** Inhibits release of pro-inflammatory cytokines and chemokines.

Pharmacokinetics

Widely distributed. Degraded into small peptides and amino acids via catabolic pathways. Peak plasma concentration: 5.5 days. Elimination not specified. **Half-life:** 15–18 days.

Lifespan considerations

Pregnancy/Lactation: Unknown if distributed in breast milk; however, human immunoglobulin G (IgG) is present in breast milk and is known to cross placenta. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** No age-related precautions noted.

Interactions

DRUG: May enhance adverse/toxic effects, diminish therapeutic effects of **vaccines (live and attenuated)**. May decrease therapeutic effect of **BCG**. May increase adverse effects/toxicity of **natalizumab, pimecrolimus, tacrolimus**. **HERBAL:** Echinacea may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST.

Availability (Rx)

Injection, Solution: 100 mg/mL in prefilled syringe.

Administration/handling

Subcutaneous

Preparation

- Remove prefilled syringe from refrigerator and allow to warm to room temperature (approx. 30 mins) with needle cap intact.
- Visually inspect for particulate matter or discoloration. Solution should appear clear, colorless to slightly yellow in color; may contain small translucent particles. Do not use if solution is cloudy, discolored, or if large particles are

observed.

- Discard unused portions.

Administration

- Insert needle subcutaneously into back of upper arms, front of thighs, or into lower abdomen (except for 2 inches around navel), and inject solution.
- Do not inject into areas of the skin where it is tender, bruised, red, hard, thick, scaly, or affected by psoriasis.
- Rotate injection sites.

Storage

- Refrigerate prefilled syringes in original carton until time of use.
- Do not freeze.
- Do not shake.
- Protect from light.

Indications/Routes/Dosage

Plaque Psoriasis

SQ: ADULTS, ELDERLY: 100 mg at wk 0, wk 4, and then q8wks thereafter.

Dosage in Renal/Hepatic Impairment

Not specified; use caution.

Side Effects

Occasional (5%–2%): Headache, tension headache, arthralgia, diarrhea.

Adverse Effects/Toxic Reactions

May increase risk of tuberculosis infection. Other infections including upper respiratory tract infection, nasopharyngitis, pharyngitis, viral upper respiratory tract infection (14% of pts), gastroenteritis, viral gastroenteritis (1% of pts), tinea infections (1% of pts), herpes simplex virus (1% of pts) may occur. Mild to moderate elevated serum ALT, AST reported in 3% of pts. Immunogenicity (auto-guselkumab antibodies) occurred in 6% of pts.

Nursing Considerations

Baseline Assessment

Obtain LFT in pts with hepatic impairment. Question history of hepatic impairment, herpes zoster infection, parasitic infection. Screen for active infection. Pts should be evaluated for active tuberculosis and tested for latent infection prior to initiating treatment and periodically during therapy. Induration of 5 mm or greater with tuberculin skin testing should be considered a positive test result when assessing if treatment for latent tuberculosis is necessary. Conduct dermatologic exam; record characteristics of psoriatic lesions. Assess pt's willingness to self-inject medication.

Intervention/Evaluation

Monitor LFT periodically. Monitor for symptoms of tuberculosis, including those who tested negative for latent tuberculosis infection prior to initiating therapy. Interrupt or discontinue treatment if serious infection, opportunistic infection, or sepsis occurs, and initiate appropriate antimicrobial therapy. Assess skin for improvement of lesions.

Patient/Family Teaching

- A health care provider will show you how to properly prepare and inject your medication. You must demonstrate correct preparation and injection techniques before using medication at home.
- Treatment may depress your immune system response and reduce your ability to fight infection. Report symptoms of infection such as body aches, chills, cough, fatigue, fever. Avoid those with active infection.
- Do not receive live vaccines.
- Expect frequent tuberculosis screening. Report travel plans to possible endemic areas.
- Report liver problems such as abdominal pain, bruising, clay-colored stool, yellowing of the skin or eyes.

 Canadian trade name

 Non-Crushable Drug

 High Alert drug

underlined underlined – top prescribed drug

H

haloperidol

hal-o-per-i-dol

Apo-Haloperidol 

Haldol

Haldol Decanoate

Novo-Peridol 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: First-generation (typical) antipsychotic.

CLINICAL: Antipsychotic, antiemetic, antidyskinetic.

■ **BLACK BOX ALERT** ■ Increased risk of mortality in elderly pts with dementia-related psychosis with use of injections.

Do not confuse Haldol with Halcion or Stadol.

Uses

Treatment of schizophrenia, Tourette's disorder (controls tics and vocal utterances), severe behavioral problems in children with combative explosive hyperexcitability without immediate provocation. Management of psychotic disorder, short-term treatment of hyperactive children. **OFF-LABEL:** Treatment of nonschizophrenic psychosis, alcohol dependence, psychosis/agitation related to Alzheimer's dementia, emergency sedation of severely agitated/psychotic pts.

Precautions

Contraindications: Hypersensitivity to haloperidol, CNS depression, coma,

Parkinson's disease, severe cardiac/hepatic disease. **Cautions:** Renal/hepatic impairment, cardiovascular disease, history of seizures, prolonged QT syndrome, medications that prolong QT interval, hypothyroidism, thyrotoxicosis, electrolyte imbalance (e.g., hypokalemia, hypomagnesemia), EEG abnormalities, narrow-angle glaucoma, elderly, pts at risk for pneumonia, decreased GI motility, urinary retention, BPH, visual disturbances, myelosuppression. Pts at risk for orthostatic hypotension (e.g., cerebrovascular disease).

Action

Competitively blocks postsynaptic DOPamine receptors in brain. **Therapeutic Effect:** Produces tranquilizing effect. Strong extrapyramidal, antiemetic effects; weak anticholinergic, sedative effects.

Pharmacokinetics

Readily absorbed from GI tract. Protein binding: 92%. Metabolized in liver. Excreted in urine. Not removed by hemodialysis. **Half-life:** 20 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in breast milk. **Children:** More susceptible to dystonias; not recommended in pts younger than 3 yrs. **Elderly:** More susceptible to orthostatic hypotension, anticholinergic effects, sedation; increased risk for extrapyramidal effects. Decreased dosage recommended.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., diphenhydrAMINE, gabapentin, LORazepam, morphine) may increase CNS depression. CYP3A4 inducers (e.g., carBAMazepine) may decrease concentration. **Medications prolonging QT interval** (e.g., amiodarone, ciprofloxacin, ondansetron) may increase risk of QT prolongation. **Medications producing extrapyramidal symptoms (EPS)** (e.g., diphenhydrAMINE, benztropine) may increase EPS. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** None significant. **Therapeutic serum level:** 0.2–1 mcg/mL; **toxic serum level:** Greater than 1

mcg/mL.

Availability (Rx)

Injection, Oil (Decanoate): 50 mg/mL, 100 mg/mL. **Injection, Solution (Lactate):** 5 mg/mL. **Oral Concentrate:** 2 mg/mL. **Tablets:** 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg.

Administration/handling

IV

◀ALERT▶ Only haloperidol lactate is given IV.

Note: For IV administration, ECG monitoring for QT prolongation/arrhythmias is recommended.

Reconstitution

- May give undiluted.
- May add to 50–100 mL of D₅W.

Rate of Administration

- Give IV push at rate of 5 mg/min.
- Infuse IV piggyback over 30 min.
- For IV infusion, up to 25 mg/hr has been used (titrated to pt response).

Storage

- Discard if precipitate forms, discoloration occurs.
- Store at room temperature; do not freeze.
- Protect from light.

IM

Parenteral Administration

- Pt should remain recumbent for 30–60 min to minimize hypotensive effect.
- Prepare Decanoate IM injection using 21-gauge needle.
- Do not exceed maximum volume of 3 mL per IM injection site.
- Inject slow, deep IM into upper outer quadrant of gluteus maximus.

PO

- Give without regard to meals.
- Scored tablets may be crushed.

- Dilute oral concentrate with water or juice.
- Avoid skin contact with oral concentrate; may cause contact dermatitis.

■ IV incompatibilities

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), fluconazole (Diflucan), foscarnet (Foscavir), heparin, nitroprusside (Nipride), piperacillin/tazobactam (Zosyn).

■ IV Compatibilities

DOBUTamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), HYDROmorphine (Dilaudid), lidocaine, LORazepam (Ativan), midazolam (Versed), morphine, nitroglycerin, norepinephrine (Levophed), propofol (Diprivan).

Indications/routes/dosage

Usual Dosage

IM (*Lactate*): ADULTS, ELDERLY: 2–5 mg q1–8 as needed. **CHILDREN 6–12 YRS:** 1–3 mg/dose q4–8h as needed. **Maximum:** 0.15 mg/kg/day. Change to PO as soon as possible. **(*Decanoate*): ADULTS, ELDERLY:** Initially, 10–20 times stabilized oral dose. **Maximum:** 100 mg. **Maintenance:** 10–15 times daily oral dose or 50–200 mg q4wks.

PO: ADULTS: 0.5–5 mg 2–3 times/day. **Usual dose:** 5–20 mg/day. **Maximum:** 100 mg/day. **ELDERLY:** 0.2–2 mg/day. **Usual dose:** 5–20 mg/day. **Maximum:** 100 mg/day. **CHILDREN WEIGHING MORE THAN 40 KG, ADOLESCENTS:** 0.5–15 mg/day in 2–3 divided doses. May increase at no less than 5–7 days. **Maximum:** 15 mg/day. **CHILDREN 3–12 YRS (15–40 KG):** 0.5 mg/day. May increase by 0.5 mg q5–7days. Range: 0.05–0.15 mg/kg/day in 2–3 divided doses. **Maximum:** 15 mg/day.

Tourette's Disorder

PO: CHILDREN 3–12 YRS: 15–40 KG: Initially, 0.25–0.5 mg/day in 2–3 divided doses. May increase by 0.5 mg/day every 5–7 days to usual dose of 1–4 mg/day. **CHILDREN GREATER THAN 40 KG, ADOLESCENTS:** Initially,

0.25–0.5 mg/day in 2–3 divided doses. May increase as needed every 5–7 days to usual dose of 1–4 mg/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Blurred vision, constipation, orthostatic hypotension, dry mouth, swelling or soreness of female breasts, peripheral edema. **Occasional:** Allergic reaction, difficulty urinating, decreased thirst, dizziness, diminished sexual function, drowsiness, nausea, vomiting, photosensitivity, lethargy.

Adverse effects/toxic reactions

Extrapyramidal symptoms (EPS) appear to be dose related and typically occur in first few days of therapy. Marked drowsiness/lethargy, excessive salivation, fixed stare may be mild to severe in intensity. Less frequently noted are severe akathisia (motor restlessness), acute dystonias: torticollis (neck muscle spasm), opisthotonos (rigidity of back muscles), oculogyric crisis (rolling back of eyes). Tardive dyskinesia (tongue protrusion, puffing of cheeks, chewing/puckering of the mouth) may occur during long-term therapy or after drug discontinuance and may be irreversible. Elderly female pts have greater risk of developing this reaction. May increase risk of QT interval prolongation, cardiac arrhythmias.

Nursing considerations

Baseline assessment

Assess behavior, appearance, emotional status, response to environment, speech pattern, thought content. Assess LOC. Screen for co-morbidities as listed in Precautions (esp. seizure disorder, long QT syndrome).

Intervention/evaluation

Monitor B/P, heart rate/rhythm, QT interval. Supervise suicidal-risk pt closely during early therapy (as depression lessens, energy level improves, increasing suicide potential). Monitor for rigidity, tremor, mask-like facial expression, fine

tongue movement. Assess for therapeutic response (interest in surroundings, improvement in self-care, increased ability to concentrate, relaxed facial expression). Monitor EKG and QT interval. **Therapeutic serum level:** 0.2–1 mcg/mL; **toxic serum level:** greater than 1 mcg/mL.

Patient/family teaching

- Full therapeutic effect may take up to 6 wks.
- Do not abruptly withdraw from long-term drug therapy.
- Sugarless gum, sips of water may relieve dry mouth.
- Drowsiness generally subsides during continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Avoid alcohol.
- Report muscle stiffness.
- Avoid exposure to sunlight, overheating, dehydration (increased risk of heatstroke).

heparin

hep-a-rin

HIGH
ALERT

Hepalean Leo 

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Blood modifier.

CLINICAL: Anticoagulant.

Do not confuse heparin with Hesperin.

Uses

Prophylaxis and treatment of thromboembolic disorders and thromboembolic complications associated with atrial fibrillation; anticoagulant for extracorporeal and dialysis procedures; maintain patency of IV devices. **OFF-LABEL:** STEMI, non-STEMI, unstable angina, anticoagulant used during percutaneous coronary intervention.

Precautions

Contraindications: Hypersensitivity to heparin. Severe thrombocytopenia,

uncontrolled active bleeding (unless secondary to disseminated intravascular coagulation [DIC]), history of heparin-induced thrombocytopenia (HIT), heparin-induced thrombocytopenia with thrombosis (HITT), or pts who test positive for HIT antibody. **Cautions:** Allergy to pork. Pts at risk for bleeding (e.g., congenital/acquired bleeding disorders, active GI ulcerative disease, hemophilia, concomitant platelet inhibitors, severe hypertension, menses, recent lumbar puncture or spinal anesthesia; recent major surgery, trauma). Use of preservative-free heparin recommended in neonates, infants, pregnant or nursing mothers.

Action

Interferes with blood coagulation by blocking conversion of prothrombin to thrombin and fibrinogen to fibrin. **Therapeutic Effect:** Prevents further extension of existing thrombi or new clot formation. No effect on existing clots.

Pharmacokinetics

Well absorbed following subcutaneous administration. Protein binding: Very high. Metabolized in liver. Removed from circulation via uptake by reticuloendothelial system. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 1–6 hrs.

Lifespan considerations

Pregnancy/Lactation: Use with caution, particularly during last trimester, immediate postpartum period (increased risk of maternal hemorrhage). Does not cross placenta. Not distributed in breast milk. **Children:** No age-related precautions noted. Benzyl alcohol preservative may cause gasping syndrome in infants. **Elderly:** More susceptible to hemorrhage. Age-related renal impairment may increase risk of bleeding.

Interactions

DRUG: Other anticoagulants (e.g., dabigatran, warfarin), platelet aggregation inhibitors (e.g., aspirin, clopidogrel), thrombolytics (e.g., tissue plasminogen activator [TPA]) may increase risk of bleeding. **HERBAL:** Cat's claw, dong quai, evening primrose, feverfew, garlic, ginkgo, ginseng, horse

chestnut, red clover have additional antiplatelet activity. **FOOD:** None known. **LAB VALUES:** May increase free fatty acids, serum ALT, AST; aPTT. May decrease serum cholesterol.

Availability (Rx)

Injection Solution: 10 units/mL, 100 units/mL, 1,000 units/mL, 5,000 units/mL, 10,000 units/mL, 20,000 units/mL. **Premix Solution for Infusion:** 25,000 units/250 mL infusion, 25,000 units/500 mL infusion.

Administration/handling

 Do not give by IM injection (pain, hematoma, ulceration, erythema).

IV

 Used in full-dose therapy. Intermittent IV dosage produces higher incidence of bleeding abnormalities. Continuous IV route preferred.

Reconstitution

- Premix solution requires no reconstitution.

Rate of Administration

- Infuse and titrate per protocol using infusion pump.

Storage

- Store at room temperature.

Subcutaneous

 Used in low-dose therapy.

- After withdrawal of heparin from vial, change needle before injection (prevents leakage along needle track).
- Inject above iliac crest or in abdominal fat layer. Do not inject within 2 inches of umbilicus or any scar tissue.
- Withdraw needle rapidly, apply prolonged pressure at injection site. Do not massage or apply heat/cold to injection site.
- Rotate injection sites.

IV incompatibilities

Amiodarone (Cordarone), amphotericin B complex (Abelcet, AmBisome,

Amphotec), ciprofloxacin (Cipro), dacarbazine (DTIC), diazepam (Valium), DOBUTamine (Dobutrex), DOXOrubicin (Adriamycin), filgrastim (Neupogen), gentamicin (Garamycin), haloperidol (Haldol), IDArubicin (Idamycin), labetalol (Trandate), niCARdipine (Cardene), phenytoin (Dilantin), quiNIDine, tobramycin (Nebcin), vancomycin (Vancocin).

■ IV Compatibilities

Ampicillin/sulbactam (Unasyn), aztreonam (Azactam), calcium gluconate, ceFAZolin (Ancef), cefTAZidime (Fortaz), cefTRIAxone (Rocephin), dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazEM (Cardizem), DOPamine (Intropin), enalapril (Vasotec), famotidine (Pepcid), fentaNYL (Sublimaze), furosemide (Lasix), HYDRomorphone (Dilaudid), insulin, lidocaine, LORazepam (Ativan), magnesium sulfate, methylPREDNISolone (Solu-Medrol), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), oxytocin (Pitocin), piperacillin/tazobactam (Zosyn), procainamide (Pronestyl), propofol (Diprivan).

Indications/routes/dosage

Line Flushing

IV: ADULTS, ELDERLY, CHILDREN: 100 units as needed. **INFANTS WEIGHING LESS THAN 10 KG:** 10 units as needed.

Acute Coronary Syndrome

IV Infusion: ADULTS, ELDERLY: 60 units/kg bolus (**Maximum:** 4,000 units), then 12 units/kg/hr (**Maximum:** 1,000 units/hr).

Treatment of DVT/PE

IV Infusion: ADULTS, ELDERLY: 80 units/kg bolus (**Maximum:** 5,000 units), then 18 units/kg/hr adjusted according to aPTT.

Usual Pediatric/Neonatal Dose

IV Infusion: 75 units/kg bolus over 10 min, then initial maintenance dose of 28 units/kg/hr. Adjust to maintain aPTT of 60–85 sec.

Thromboembolic Prophylaxis

SQ: ADULTS, ELDERLY: 5,000 units q8–12h.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Pruritus, burning (particularly on soles of feet) caused by vasospastic reaction. **Rare:** Pain, cyanosis of extremity 6–10 days after initial therapy lasting 4–6 hrs, hypersensitivity reaction (chills, fever, pruritus, urticaria, asthma, rhinitis, lacrimation, headache).

Adverse effects/toxic reactions

Bleeding complications ranging from local ecchymoses to major hemorrhage (cutaneous/GI/genitourinary/intracranial/nasal/oral/pharyngeal/urethral/vaginal bleeding) occur more frequently in high-dose therapy, intermittent IV infusion, women 60 yrs and older. HIT can cause life-threatening thromboembolism such as CVA, MI, DVT, pulmonary embolism, renal artery thrombosis, mesenteric thrombosis. **Antidote:** Protamine sulfate 1–1.5 mg IV for every 100 units heparin subcutaneous within 30 min of overdose, 0.5–0.75 mg for every 100 units heparin subcutaneous if within 30–60 min of overdose, 0.25–0.375 mg for every 100 units heparin subcutaneous if 2 hrs have elapsed since overdose, 25–50 mg if heparin was given by IV infusion.

Nursing considerations

Baseline assessment

Obtain CBC, PT/INR, aPTT. Cross-check dose with co-worker. Assess for bleeding risk. Question history of recent trauma, head injuries, GI/GU bleeding. Ensure that pt has not received spinal anesthesia, spinal procedures.

Intervention/evaluation

Monitor CBC, PT/INR daily. Obtain aPTT 6 hrs after initiation or any change in

dosage (or per clinical standards) until maintenance dose is established, then check aPTT q24hrs (or clinical standards). In long-term therapy, monitor 1–2 times/mo. Diligently assess for bleeding. If platelet count decreases more than 50% from baseline, obtain stat HIT antibody test. If HIT antibody positive, discontinue heparin and consider treatment with direct thrombin inhibitor (e.g., argatroban); avoid all heparin products and place heparin allergy on chart. Monitor urine and stool for occult blood. Assess for decrease in B/P, increase in pulse rate, complaint of abdominal/back pain, severe headache (may be evidence of hemorrhage). Question for increase in amount of discharge during menses. Assess peripheral pulses; skin for ecchymosis, petechiae. Check for excessive bleeding from minor cuts, scratches. Assess gums for erythema, gingival bleeding. Assess urine output for hematuria. Avoid IM injections due to potential for hematomas. When converting to warfarin (Coumadin) therapy, monitor PT/INR results (will be 10%–20% higher while heparin is given concurrently).

Patient/family teaching

- Use electric razor, soft toothbrush to prevent bleeding.
- Report red or dark urine, black or red stool, coffee-ground vomitus, blood-tinged mucus from cough, signs of stroke, nosebleeds, or increase in menstruation.
- Do not use any OTC medication without physician approval (may interfere with platelet aggregation).
- Wear or carry identification that notes anticoagulant therapy.
- Inform dentist, other physicians of heparin therapy.
- Limit alcohol.

hydrALAZINE

hye-**dr**-a-zeen

Apresoline 

Fixed-Combination(s)

Apresazide: hydrALAZINE/hydroCHLOROthiazide (a diuretic): 25 mg/25 mg, 50 mg/50 mg, 100 mg/50 mg. **BiDil:** hydrALAZINE/isosorbide (a nitrate): 37.5 mg/20 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Vasodilator.

CLINICAL: Antihypertensive.

Do not confuse hydrALAZINE with hydrOXYzine.

Uses

Management of moderate to severe hypertension. **OFF-LABEL:** Hypertension secondary to eclampsia, preeclampsia. Treatment of HF with reduced ejection fraction, postoperative hypertension.

Precautions

Contraindications: Hypersensitivity to hydrALAZINE. Coronary artery disease, mitral valvular rheumatic heart disease. **Cautions:** Advanced renal impairment, cerebrovascular accident, suspected coronary artery disease. Pts with mitral valvular disease, positive ANA titer, pulmonary hypertension.

Action

Direct vasodilating effects on arterioles. **Therapeutic Effect:** Decreases B/P, systemic vascular resistance.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	20–30 min	N/A	Up to 8 hrs
IV	5–20 min	N/A	1–4 hrs

Well absorbed from GI tract. Widely distributed. Protein binding: 85%–90%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–7 hrs (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Drug crosses placenta. Unknown if distributed in breast milk. Thrombocytopenia, leukopenia, petechial bleeding, hematomas have occurred in newborns (resolved within 1–3 wks). **Children:** No age-related precautions noted. **Elderly:** More sensitive to hypotensive effects. Age-related

renal impairment may require dosage adjustment.

Interactions

DRUG: Diuretics (e.g., furosemide, HCTZ), other antihypertensives (e.g., amlodipine, clonidine, lisinopril, valsartan) may increase hypotensive effect. **HERBAL:** Ephedra, ginseng, yohimbe may worsen hypertension. **Garlic** may increase antihypertensive effect. **FOOD:** Any **foods** may increase absorption. **LAB VALUES:** May produce positive direct Coombs' test.

Availability (Rx)

Injection Solution: 20 mg/mL. **Tablets:** 10 mg, 25 mg, 50 mg, 100 mg.

Administration/handling

IV

Rate of Administration

- May give undiluted.
- Administer slowly: maximum rate 5 mg/min (0.2 mg/kg/min for children).

Storage

- Store at room temperature.

PO

- Best given with food at regularly spaced meals.
- Tablets may be crushed.

IV incompatibilities

Ampicillin (Polycillin), furosemide (Lasix).

IV Compatibilities

DOBUTamine (Dobutrex), heparin, hydrocortisone (Solu-Cortef), nitroglycerin, potassium chloride.

Indications/routes/dosage

Hypertension

PO: ADULTS, ELDERLY: Initially, 10 mg 4 times/day for first 2–4 days. May increase to 25 mg 4 times/day balance of first wk. May increase by 10–25 mg/dose gradually q2–5 days to 50 mg 4 times/day. Usual range: 25–100 mg in 2–3 divided doses. **Maximum:** 300 mg/day in divided doses. **CHILDREN:** Initially, 0.75 mg/kg/day in 2–4 divided doses. May increase over 3–4 wks. **Maximum:** 7.5 mg/kg/day (7.5 mg/kg/day in infants). **Maximum daily dose:** 200 mg/day in divided doses.

IV, IM: ADULTS, ELDERLY: Initially, 10–20 mg/dose q4–6h. May increase to 40 mg/dose. **CHILDREN:** Initially, 0.1–0.2 mg/kg/dose (**Maximum:** 20 mg) q4–6h, as needed, up to 1.7–3.5 mg/kg/day in 4–6 divided doses.

Dosage in Renal Impairment

Dosage interval is based on creatinine clearance.

Creatinine Clearance	Dosage
10–50 mL/min	q8h
Less than 10 mL/min	q12–24h

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Occasional: Headache, anorexia, nausea, vomiting, diarrhea, palpitations, tachycardia, angina pectoris. **Rare:** Constipation, ileus, edema, peripheral neuritis (paresthesia), dizziness, muscle cramps, anxiety, hypersensitivity reactions (rash, urticaria, pruritus, fever, chills, arthralgia), nasal congestion, flushing, conjunctivitis.

Adverse effects/toxic reactions

High dosage may produce lupus erythematosus–like reaction (fever, facial rash, muscle/joint aches, glomerulonephritis, splenomegaly). Severe orthostatic

hypotension, skin flushing, severe headache, myocardial ischemia, cardiac arrhythmias may develop. Profound shock may occur with severe overdose.

Nursing considerations

Baseline assessment

Obtain B/P, pulse immediately before each dose, in addition to regular monitoring (be alert to fluctuations).

Intervention/evaluation

Monitor B/P, pulse. Monitor for headache, palpitations, tachycardia. Assess for peripheral edema of hands, feet.

Patient/family teaching

- To reduce hypotensive effect, go from lying to standing slowly.
- Report muscle/joint aches, fever (lupus-like reaction), flu-like symptoms.
- Limit alcohol use.

hydroCHLOROthiazide

hye-dro-klor-oh-thy-ah-zide

Apo-Hydro 

Microzide

Fixed-Combination(s)

Accuretic: hydroCHLOROthiazide/quinapril (an angiotensin-converting enzyme [ACE] inhibitor): 12.5 mg/10 mg, 12.5 mg/20 mg, 25 mg/20 mg.

Aldactazide: hydroCHLOROthiazide/spironolactone (a potassium-sparing diuretic): 25 mg/25 mg, 50 mg/50 mg. **Aldoril:**

hydroCHLOROthiazide/methyldopa (an antihypertensive): 15 mg/250 mg, 25 mg/250 mg, 30 mg/500 mg, 50 mg/500 mg. **Amturnide:**

hydroCHLOROthiazide/aliskiren (renin inhibitor)/amLODIPine (calcium channel blocker): 12.5 mg/150 mg/5 mg, 12.5 mg/300 mg/5 mg, 25 mg/300 mg/5 mg, 12.5 mg/300 mg/10 mg, 25 mg/300 mg/10 mg. **Apresazide:**

hydroCHLOROthiazide/hydrALAZINE (a vasodilator): 25 mg/25 mg, 50

mg/50 mg, 50 mg/100 mg. **Atacand HCT:** hydroCHLOROthiazide/candesartan (an angiotensin II receptor antagonist): 12.5 mg/16 mg, 12.5 mg/32 mg. **Avalide:** hydroCHLOROthiazide/irbesartan (an angiotensin II receptor antagonist): 12.5 mg/150 mg, 12.5 mg/300 mg, 25 mg/300 mg. **Benicar HCT:** hydroCHLOROthiazide/olmesartan (an angiotensin II receptor antagonist): 12.5 mg/20 mg, 12.5 mg/40 mg, 25 mg/40 mg. **Capozide:** hydroCHLOROthiazide/captopril (an ACE inhibitor): 15 mg/25 mg, 15 mg/50 mg, 25 mg/25 mg, 25 mg/50 mg. **Diovan HCT:** hydroCHLOROthiazide/valsartan (an angiotensin II receptor antagonist): 12.5 mg/80 mg, 12.5 mg/160 mg. **Dutoprol:** hydroCHLOROthiazide/metoprolol (a beta blocker): 12.5 mg/25 mg, 12.5 mg/50 mg, 12.5 mg/100 mg. **Dyazide/Maxide:** hydroCHLOROthiazide/triamterene (a potassium-sparing diuretic): 25 mg/37.5 mg, 25 mg/50 mg, 50 mg/75 mg. **Exforge HCT:** hydroCHLOROthiazide/amLODIPine (a calcium channel blocker)/valsartan (an angiotensin II receptor blocker): 12.5 mg/5 mg/160 mg, 25 mg/5 mg/160 mg, 12.5 mg/10 mg/160 mg, 25 mg/10 mg/160 mg, 25 mg/10 mg/320 mg. **Hyzaar:** hydroCHLOROthiazide/losartan (an angiotensin II receptor antagonist): 12.5 mg/50 mg, 12.5 mg/100 mg, 25 mg/100 mg. **Inderide:** hydroCHLOROthiazide/propranolol (a beta blocker): 25 mg/40 mg, 25 mg/80 mg, 50 mg/80 mg, 50 mg/120 mg, 50 mg/160 mg. **Lopressor HCT:** hydroCHLOROthiazide/metoprolol (a beta blocker): 25 mg/50 mg, 25 mg/100 mg, 50 mg/100 mg. **Lotensin HCT:** hydroCHLOROthiazide/benazepril (an ACE inhibitor): 6.25 mg/5 mg, 12.5 mg/10 mg, 12.5 mg/20 mg, 25 mg/20 mg. **Micardis HCT:** hydroCHLOROthiazide/telmisartan (an angiotensin II receptor antagonist): 12.5 mg/40 mg, 12.5 mg/80 mg. **Moduretic:** hydroCHLOROthiazide/aMILoride (a potassium-sparing diuretic): 50 mg/5 mg. **Normozide:** hydroCHLOROthiazide/labetalol (a beta blocker): 25 mg/100 mg, 25 mg/300 mg. **Prinzide/Zestoretic:** hydroCHLOROthiazide/lisinopril (an ACE inhibitor): 12.5 mg/10 mg, 12.5 mg/20 mg, 25 mg/20 mg. **Tekturna HCT:** hydroCHLOROthiazide/aliskiren (a renin inhibitor): 12.5 mg/150 mg, 25 mg/300 mg. **Teveten HCT:** hydroCHLOROthiazide/eprosartan (an angiotensin II receptor antagonist): 12.5 mg/600 mg, 25 mg/600 mg. **Timolide:** hydroCHLOROthiazide/timolol (a beta blocker): 25 mg/10 mg. **Tribenzor:** hydroCHLOROthiazide/olmesartan/amLODIPine: 12.5 mg/20 mg/5 mg, 12.5 mg/40 mg/5 mg, 25 mg/40 mg/5 mg, 12.5 mg/40 mg/10 mg, 25 mg/40 mg/10 mg. **Uniretic:** hydroCHLOROthiazide/moexipril (an ACE inhibitor): 12.5

mg/7.5 mg, 25 mg/15 mg. **Vaseretic:** hydroCHLOROthiazide/enalapril (an ACE inhibitor): 12.5 mg/5 mg, 25 mg/10 mg. **Ziac:** hydroCHLOROthiazide/bisoprolol (a beta blocker): 6.25 mg/5 mg, 6.25 mg/10 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Sulfonamide derivative.

CLINICAL: Thiazide diuretic, antihypertensive.

Do not confuse Microzide with Maxzide.

Uses

Treatment of mild to moderate hypertension, edema in HF, hepatic cirrhosis, renal dysfunction (e.g., nephrotic syndrome). **OFF-LABEL:** Treatment of calcium nephrolithiasis.

Precautions

Contraindications: Hypersensitivity to hydroCHLOROthiazide. Anuria, history of hypersensitivity to sulfonamides or thiazide diuretics. **Cautions:** Severe renal/hepatic impairment, prediabetes or diabetes, elderly or debilitated, history of gout, moderate to high serum cholesterol, hypercalcemia, hypokalemia.

Action

Inhibits sodium reabsorption in distal renal tubules, causing excretion of sodium, potassium, hydrogen ions, water. **Therapeutic Effect:** Promotes diuresis; reduces B/P.

Pharmacokinetics

Route	Onset	Peak	Duration
PO (diuretic)	2 hrs	4–6 hrs	6–12 hrs

Variably absorbed from GI tract. Primarily excreted unchanged in urine. Not removed by hemodialysis. **Half-life:** 5.6–14.8 hrs.

⌚ Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Small amount distributed in breast milk. Breastfeeding not recommended. **Children:** No age-related precautions noted, except jaundiced infants may be at risk for hyperbilirubinemia. **Elderly:** May be more sensitive to hypotensive, electrolyte effects. Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: **Cholestyramine, colestipol** may decrease absorption, effects. **Antihypertensives (e.g., amLODIPine, cloNIDine, lisinopril, valsartan)** may increase hypotensive effect. May increase risk of **digoxin** toxicity associated with hydroCHLOROthiazide-induced hypokalemia. May increase risk of **lithium** toxicity. **HERBAL:** **Ephedra, ginseng, yohimbe** may diminish effect. **Black cohosh, periwinkle** may increase antihypertensive effect. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, cholesterol, LDL, bilirubin, calcium, creatinine, uric acid, triglycerides. May decrease urinary calcium, serum magnesium, potassium, sodium.

Availability (Rx)

Capsules (Microzide): 12.5 mg. **Tablets:** 12.5 mg, 25 mg, 50 mg.

Administration/handling

PO

- May take with or without food. If GI upset occurs, give with food or milk, preferably with breakfast (may prevent nocturia).
- Give last dose no later than 6 pm unless instructed otherwise.

Indications/routes/dosage

Edema

PO: ADULTS: 25–100 mg/day in 1–2 divided doses. May give on alternate days or on 3–5 days/wk.

Hypertension

PO: ADULTS: Initially, 12.5–25 mg once daily. May increase up to 50 mg/day in 1–2 divided doses.

Usual Elderly Dosage

PO: 12.5–25 mg once daily. Titrate in 12.5-mg increments.

Usual Pediatric Dosage (Edema/HTN)

PO: CHILDREN 2–12 YRS: 1–2 mg/kg/day. **Maximum:** 100 mg/day. **CHILDREN 6 MOS–2 YRS:** 1–2 mg/kg/day in 1–2 divided doses. **Maximum:** 37.5 mg/day. **CHILDREN YOUNGER THAN 6 MOS:** 1–3 mg/kg/day in 2 divided doses. **Maximum:** 37.5 mg/day.

Dosage in Renal Impairment

CrCl less than 30 mL/min: Generally not effective. Avoid use with CrCl less than 10 mL/min.

Dosage in Hepatic Impairment

Use caution.

Side effects

Expected: Increased urinary frequency (diminishes with continued use), urine volume. **Frequent:** Potassium depletion. **Occasional:** Orthostatic hypotension, headache, GI disturbances, photosensitivity.

Adverse effects/toxic reactions

Vigorous diuresis may lead to profound water loss/electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration. Acute hypotensive episodes may occur. Hyperglycemia may occur during prolonged therapy. Pancreatitis, blood dyscrasias, pulmonary edema, allergic pneumonitis, dermatologic reactions occur rarely. Overdose can lead to lethargy, coma without changes in electrolytes or hydration.

Nursing considerations

Baseline assessment

Check vital signs, esp. B/P for hypotension, before administration. Assess baseline electrolytes, esp. for hypokalemia. Evaluate skin turgor, mucous membranes for hydration status. Evaluate for peripheral edema. Assess muscle strength, mental status. Note skin temperature, moisture. Obtain baseline weight. Monitor I&O.

Intervention/evaluation

Continue to monitor B/P, vital signs, electrolytes, I&O, daily weight. Note extent of diuresis. Watch for changes from initial assessment (hypokalemia may result in weakness, tremor, muscle cramps, nausea, vomiting, altered mental status, tachycardia; hyponatremia may result in confusion, thirst, cold/clammy skin). Be esp. alert for potassium depletion in pts taking digoxin (cardiac arrhythmias). Potassium supplements are frequently ordered. Check for constipation (may occur with exercise diuresis).

Patient/family teaching

- Expect increased frequency (diminishes with continued use), volume of urination.
- To reduce hypotensive effect, go from lying to standing slowly.
- Eat foods high in potassium, such as whole grains (cereals), legumes, meat, bananas, apricots, orange juice, potatoes (white, sweet), raisins.
- Protect skin from sun, ultraviolet light (photosensitivity may occur).

HYDROcodone

Vitussin: HYDROcodone/guaiFENesin (an expectorant): 5 mg/100 mg.
Norco: HYDROcodone/acetaminophen: 5 mg/325 mg, 7.5 mg/325 mg, 10 mg/325 mg. **Reprexain CIII:** HYDROcodone/ibuprofen (an NSAID): 5 mg/200 mg. **Rezira:** HYDROcodone/pseudoephedrine (a nasal decongestant): 5 mg/60 mg per 5 mL. **Tussend:** HYDROcodone/pseudoephedrine (a sympathomimetic)/guaiFENesin (an expectorant): 2.5 mg/30 mg/100 mg per 5 mL. **Vicodin:** HYDROcodone/acetaminophen: 5 mg/300 mg. **Vicodin ES:** HYDROcodone/acetaminophen: 7.5 mg/300 mg. **Vicodin HP:** HYDROcodone/acetaminophen: 10 mg/300 mg. **Vicoprofen:** HYDROcodone/ibuprofen (an NSAID): 7.5 mg/200 mg. **Xodol:** HYDROcodone/acetaminophen: 5 mg/300 mg, 7.5 mg/300 mg, 10 mg/300 mg. **Zutripro:** HYDROcodone/chlorpheniramine (an antihistamine)/pseudoephedrine (a nasal decongestant): 5 mg/4 mg/60 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Opioid agonist (**Schedule III**).

CLINICAL: Narcotic analgesic, antitussive.

Do not confuse Hycodan with Vicodin.

Uses

Relief of moderate to moderately severe pain, nonproductive cough. **Hysingla ER, Zohydro ER:** Around-the-clock management of moderate to severe chronic pain.

Precautions

Contraindications: Hypersensitivity to HYDROcodone. Significant respiratory depression, acute or severe bronchial asthma or hypercarbia, paralytic ileus.

Cautions: Adrenal insufficiency, biliary tract disease, pancreatitis, CNS depression/coma, acute alcoholism, hypothyroidism; severe renal, hepatic, or pulmonary impairment; urinary stricture, prostatic hypertrophy, seizures, elderly, debilitated, other CNS depressants, history of substance abuse.

Action

Binds with opioid receptors in CNS. **Therapeutic Effect:** Reduces intensity of incoming pain stimuli from sensory nerve endings, altering pain perception,

emotional response to pain; suppresses cough reflex.

Pharmacokinetics

Route	Onset	Peak	Duration
PO (analgesic)	10–20 min	30–60 min	4–6 hrs
PO (antitussive)	N/A	N/A	4–6 hrs

Well absorbed from GI tract. Metabolized in liver. Primarily excreted in urine. **Half-life:** 3.8 hrs (increased in elderly).

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother received opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures) in the neonate. **Children:** Pts younger than 2 yrs may be more susceptible to respiratory depression. **Elderly:** May be more susceptible to respiratory depression, may cause paradoxical excitement. Age-related renal impairment, prostatic hypertrophy or obstruction may increase risk of urinary retention; dosage adjustment recommended.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., diphenhydrAMINE, gabapentin, haloperidol LORazepam, morphine) may increase CNS or respiratory depression, hypotension. MAOIs (e.g., phenelzine, selegiline), tricyclic antidepressants (e.g., amitriptyline, doxepin) may alter effect of HYDROcodone. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole) may increase or prolong opioid effects. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

Availability (Rx)

 **Capsules, Extended-Release (Zohydro ER):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg. **Tablets, Extended-Release (Hysingla ER):** 20 mg, 30 mg, 40 mg, 60 mg, 80 mg, 100 mg, 120 mg.

Administration/handling

PO

- Give without regard to meals.
- Extended-release capsules/tablets must be swallowed whole. Do not cut, crush, or dissolve.

Indications/routes/dosage

Analgesia (Combination Products)

PO: ADULTS, CHILDREN WEIGHING 50 KG OR MORE: Initially, 5–10 mg q3–4h as needed. **ADULTS, CHILDREN WEIGHING LESS THAN 50 KG:** Initially, 0.1–0.2 mg/kg q3–4h as needed. **ELDERLY:** 2.5–5 mg q4–6h.

Analgesia (Extended-Release)

PO: ADULTS, ELDERLY: (Zohydro ER): Initially, 10 mg q12h. May increase by 10 mg q12h q3–7 days to achieve adequate analgesia. **(Hysingla ER):** Initially, 20 mg q24h. May titrate q3–5 days.

Cough (Combination Products)

PO: ADULTS, ELDERLY: 5–10 mg q4–6h as needed. **Maximum:** 15 mg/dose. **CHILDREN:** 0.6 mg/kg/day in 3–4 divided doses at intervals of at least 4 hrs. **Maximum single dose:** 10 mg (children older than 12 yrs), 5 mg (children 2–12 yrs), 1.25 mg (children younger than 2 yrs).

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution.

Side effects

Frequent: Lethargy, hypotension, diaphoresis, facial flushing, dizziness, drowsiness. **Occasional:** Urine retention, blurred vision, constipation, dry mouth, headache, nausea, vomiting, difficult/painful urination, euphoria, dysphoria.

Adverse effects/toxic reactions

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Tolerance to analgesic effect, physical dependence may occur with repeated use. Prolonged duration of action, cumulative effect may occur in those with hepatic/renal impairment. **Antidote:** Naloxone (see [Appendix J](#)).

Nursing considerations

Baseline assessment

Obtain vital signs. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. **Analgesic:** Assess onset, type, location, duration of pain. Effect of medication is reduced if full pain recurs before next dose. **Antitussive:** Assess type, severity, frequency of cough.

Intervention/evaluation

Palpate bladder for urinary retention. Monitor daily pattern of bowel activity, stool consistency. Initiate deep breathing and coughing exercises, particularly in pts with pulmonary impairment. Assess for clinical improvement; record onset of relief of pain, cough. Monitor LOC.

Patient/family teaching

- Go from lying to standing slowly to avoid orthostatic hypotension.
 - Avoid tasks that require alertness, motor skills until response to drug is established.
 - Avoid alcohol.
 - Tolerance or dependence may occur with prolonged use at high dosages.
 - Report nausea, vomiting, constipation, shortness of breath, difficulty breathing.
-

hydrocortisone

hye-droe-**kor**-ti-sone

Anusol HC

Caldecort

Colocort

Cortaid

SOLU-Cortef

Cortenema

Cortizone-10

Preparation H Hydrocortisone

Proctocort

Westcort.

Fixed-Combination(s)

Cortisporin: hydrocortisone/neomycin/polymyxin (an anti-infective): 5 mg/10,000 units/5 mg, 10 mg/10,000 units/5 mg. **Lipsovir:** hydrocortisone/acyclovir (an antiviral): 1%/5%.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Adrenal corticosteroid.

CLINICAL: Glucocorticoid.

Do not confuse hydrocortisone with hydroCHLOROthiazide, HYDROcodone, or hydroxychloroquine, Cortef with Coreg, or SOLU-Cortef with SOLU-medrol.

Uses

Systemic: Management of adrenocortical insufficiency, anti-inflammatory, immunosuppressive. **Topical:** Inflammatory dermatoses, adjunctive treatment of ulcerative colitis, atopic dermatitis, inflamed hemorrhoids. **OFF-LABEL:** Management of septic shock. Treatment of thyroid storm.

Precautions

Contraindications: Hypersensitivity to hydrocortisone. Fungal, tuberculosis, viral skin lesions; serious infections, IM administration in idiopathic thrombocytopenia purpura. **Cautions:** Thyroid dysfunction, cirrhosis, hypertension, osteoporosis, thromboembolic tendencies or thrombophlebitis, HF, seizure disorders, diabetes, respiratory tuberculosis, untreated systemic infections, renal/hepatic impairment, acute MI, myasthenia gravis, glaucoma, cataracts, increased intraocular pressure, elderly, immunocompromised pts.

Action

Inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release, synthesis and/or release of mediators of inflammation. Reverses increased capillary permeability. **Therapeutic Effect:** Prevents/suppresses cell-mediated immune reactions. Decreases/prevents tissue response to inflammatory process.

Pharmacokinetics

Route	Onset	Peak	Duration
IV	N/A	4–6 hrs	8–12 hrs

Well absorbed after IM administration. Widely distributed. Metabolized in liver. **Half-life:** Plasma, 1.5–2 hrs; biologic, 8–12 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. May produce cleft palate if used chronically during first trimester. Breastfeeding not recommended. **Children:** Prolonged treatment or high dosages may decrease short-term growth rate, cortisol secretion. **Elderly:** May be more susceptible to developing hypertension or osteoporosis.

Interactions

DRUG: May decrease effects of **diuretics (e.g., furosemide), insulin, oral hypoglycemics (e.g., glimepiride, metFORMIN, SITagliptin), potassium**

supplements. **CYP3A4 inducers** (e.g., carbamazepine, phenytoin, rifampin) may decrease effects. **Live virus vaccines** may decrease pt's antibody response to vaccine, increase vaccine side effects, potentiate virus replication. **HERBAL: St. John's wort** may decrease concentration. **Cat's claw, echinacea** may increase immunostimulant properties. **FOOD:** None known. **LAB VALUES:** May increase serum glucose, lipids, sodium. May decrease serum calcium, potassium, thyroxine; WBC count.

Availability (Rx)

Cream, Rectal (Cortizone-10, Preparation H Hydrocortisone): 1%, 2.5%. **Cream, Topical:** 0.5%, 1%, 2.5%. **Injection, Powder for Reconstitution (Solu-Cortef):** 100 mg, 250 mg, 500 mg, 1 g. **Ointment, Topical:** 0.5%, 1%, 2.5%. **Suppository (Anusol HC):** 25 mg. **Suspension, Rectal (Colocort, Cortenema):** 100 mg/60 mL. **Tablets (Cortef):** 5 mg, 10 mg, 20 mg.

Administration/handling

IV

Hydrocortisone Sodium Succinate

Reconstitution

- Initially, reconstitute vial per manufacturer's instructions.
- May further dilute with D₅W or 0.9% NaCl. For IV push, dilute to 50 mg/mL; for intermittent infusion, dilute to 1 mg/mL. **Note:** 100–3,000 mg may be added to 50 mL D₅W or 0.9% NaCl.

Rate of Administration

- Administer IV push over 3–5 min (over 10 min for doses 500 mg or greater). Give intermittent infusion over 20–30 min.

Storage

- Store at room temperature.
- Once reconstituted, stable for 3 days at room temperature. Once further diluted with 0.9% NaCl or D₅W, stability is concentration dependent: 1 mg/mL (24 hrs), 2–60 mg/mL (4 hrs).

PO

- Give with food or milk if GI distress occurs.

Rectal

- Shake homogeneous suspension well.
- Instruct pt to lie on left side with left leg extended, right leg flexed.
- Gently insert applicator tip into rectum, pointed slightly toward navel (umbilicus). Slowly instill medication.

Topical

- Gently cleanse area before application.
- Use occlusive dressings only as ordered.
- Apply sparingly; rub into area thoroughly.

■ IV incompatibilities

Ciprofloxacin (Cipro), diazepam (Valium), midazolam (Versed), phenytoin (Dilantin).

■ IV Compatibilities

Amphotericin, calcium gluconate, cefepime (Maxipime), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dopamine (Intropin), insulin, lidocaine, lorazepam (Ativan), magnesium sulfate, morphine, norepinephrine (Levophed), procainamide (Pronestyl), potassium chloride, propofol (Diprivan).

Indications/routes/dosage

Acute Adrenal Insufficiency

IV: ADULTS, ELDERLY: 100 mg IV bolus, then 50–75 mg q6h for 24 hrs, then taper slowly. **CHILDREN:** 1–2 mg/kg IV bolus, then 150–250 mg/day in divided doses q6–8h. **INFANTS:** 1–2 mg/kg/dose IV bolus, then 25–150 mg/day in divided doses q6–8h.

Anti-Inflammation, Immunosuppression

IV, IM: ADULTS, ELDERLY: 100–500 mg/dose at intervals of 2 hrs, 4 hrs, or

6 hrs. **CHILDREN:** 1–5 mg/kg/day in divided doses q12h.

PO: ADULTS, ELDERLY: 15–240 mg q12h. **CHILDREN:** 2.5–10 mg/kg/day in divided doses q6–8h.

Physiologic Replacement

PO: CHILDREN: 8–10 mg/m²/day in 3 divided doses.

Adjunctive Treatment of Ulcerative Colitis

Rectal (Enema): ADULTS, ELDERLY: 100 mg at bedtime for 21 nights or until clinical and proctologic remission occurs (may require 2–3 mos of therapy).

Rectal Foam: ADULTS, ELDERLY: 1 applicator 1–2 times/day for 2–3 wks, then every second day until therapy ends.

Usual Topical Dosage: ADULTS, ELDERLY: Apply sparingly 2–4 times/day.

Dosage in Renal/Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Insomnia, heartburn, anxiety, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea or constipation. **Occasional:** Headache, edema, change in skin color, frequent urination. **Topical:** Pruritus, redness, irritation. **Rare:** Tachycardia, allergic reaction (rash, hives), psychological changes, hallucinations, depression. **Topical:** Allergic contact dermatitis, purpura. **Systemic:** Absorption more likely with use of occlusive dressings or extensive application in young children.

Adverse effects/toxic reactions

Long-term therapy: Hypocalcemia, hypokalemia, muscle wasting (esp. arms, legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer, HF. **Abrupt withdrawal after long-term therapy:** Nausea, fever, headache, sudden severe joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, orthostatic hypotension.

Nursing considerations

Baseline assessment

Obtain baseline weight, B/P, serum glucose, cholesterol, electrolytes. Screen for infections including fungal infections, TB, viral skin lesions. Question medical history as listed in Precautions.

Intervention/evaluation

Assess for edema. Be alert to infection (reduced immune response): sore throat, fever, vague symptoms. Monitor daily pattern of bowel activity, stool consistency. Monitor electrolytes, B/P, weight, serum glucose. Monitor for hypocalcemia (muscle twitching, cramps), hypokalemia (weakness, paresthesia [esp. lower extremities], nausea/vomiting, irritability, EKG changes). Assess emotional status, ability to sleep.

Patient/family teaching

- Report fever, sore throat, muscle aches, sudden weight gain, swelling, visual disturbances, behavioral changes.
- Do not take aspirin or any other medication without consulting physician.
- Limit caffeine; avoid alcohol.
- Inform dentist, other physicians of cortisone therapy now or within past 12 mos.
- Caution against overusing joints injected for symptomatic relief.
- **Topical:** Apply after shower or bath for best absorption.
- Do not cover or use occlusive dressings unless ordered by physician; do not use tight diapers, plastic pants, coverings.
- Avoid contact with eyes.

HYDRomorphone

hye-droe-mor-fone

Apo-HYDRomorphone 

Dilaudid

Exalgo

Hydromorph Contin 

HIGH
ALERT

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Opioid agonist (**Schedule II**).

CLINICAL: Narcotic analgesic, antitussive.

■ **BLACK BOX ALERT** ■ High abuse potential, respiratory depression risk. Other opioids, alcohol, CNS depressants increase risk of potentially fatal respiratory depression. Highly concentrated (Dilaudid HP, 10 mg/mL) form not to be interchanged with less concentrated (Dilaudid) form; overdose, death may result. Exalgo: For use in opioid-tolerant pts. Do not crush, break, chew, or dissolve. Swallow whole.

Do not confuse Dilaudid with Demerol or Dilantin, or HYDROmorphone with HYDROcodone or morphine.

Uses

Relief of moderate to severe pain. Extended-release tablet (Exalgo): Around the clock, continuous analgesia for extended period.

Precautions

Contraindications: Hypersensitivity to HYDROmorphone. Acute or severe asthma, severe respiratory depression. **Additional Product-Specific Contraindications:** **Dilaudid liquids and tablets:** Obstetric analgesia. **Dilaudid injection:** Opioid-intolerant pts, pts at risk of developing GI obstruction. **Exalgo:** Opioid-intolerant pts, preexisting GI surgery/diseases causing GI narrowing, GI obstruction, paralytic ileus. **Cautions:** Severe hepatic, renal, respiratory disease; hypothyroidism, adrenal cortical insufficiency, seizures, acute alcoholism, head injury, intracranial lesions, increased intracranial pressure, prostatic hypertrophy, Addison's disease, urethral stricture, pancreatitis, biliary tract disease, cardiovascular disease, morbid obesity, delirium tremens, toxic psychosis, pts with CNS depression or coma, pts with depleted blood volume, obstructive bowel disorder.

Action

Binds to opioid receptors in CNS, reducing intensity of pain stimuli from

sensory nerve endings. **Therapeutic Effect:** Alters perception, emotional response to pain; suppresses cough reflex.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	30 min	90–120 min	4 hrs
IV	10–15 min	15–30 min	2–3 hrs
IM	15 min	30–60 min	4–5 hrs
SQ	15 min	30–90 min	4 hrs
Rectal	15–30 min	N/A	N/A

Well absorbed from GI tract after IM administration. Widely distributed. Metabolized in liver. Excreted in urine. **Half-life:** 2.6–4 hrs.

Lifespan considerations

Pregnancy/Lactation: Readily crosses placenta. Unknown if distributed in breast milk. May prolong labor if administered in latent phase of first stage of labor or before cervical dilation of 4–5 cm has occurred. Respiratory depression may occur in neonate if mother receives opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in the neonate (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, seizures). **Children:** Pts younger than 2 yrs may be more susceptible to respiratory depression. **Elderly:** May be more susceptible to respiratory depression, may cause paradoxical excitement. Age-related renal impairment, prostatic hypertrophy or obstruction may increase risk of urinary retention; dosage adjustment recommended.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., diphenhydrAMINE, gabapentin, LORazepam, morphine) may increase CNS, respiratory depression, hypotension. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May increase serum amylase, lipase.

Availability (Rx)

Injection, Solution: 1 mg/mL, 2 mg/mL, 4 mg/mL, 10 mg/mL. **Liquid, Oral:** 1 mg/mL. **Suppository:** 3 mg. **Tablets:** 2 mg, 4 mg, 8 mg.

Tablets, Extended-Release (Exalgo): 8 mg, 12 mg, 16 mg, 32 mg.

Administration/handling

IV

◀ALERT▶ High-concentration injection (10 mg/mL) should be used only in pts tolerant to opiate agonists, currently receiving high doses of another opiate agonist for severe, chronic pain due to cancer.

Reconstitution

- May give undiluted.
- May further dilute with 5 mL Sterile Water for Injection or 0.9% NaCl.

Rate of Administration

- Administer IV push very slowly (over 2–3 min).
- Rapid IV increases risk of severe adverse reactions (chest wall rigidity, apnea, peripheral circulatory collapse, anaphylactoid effects, cardiac arrest).

Storage

- Store at room temperature; protect from light.
- Slight yellow discoloration of parenteral form does not indicate loss of potency.

IM, SQ

- Subcutaneously or intramuscularly insert needle and inject solution. Pulling back the plunger before IM injection may ensure that drug is not delivered directly into bloodstream (however, this topic is currently debated).
- Administer slowly; rotate injection sites.
- Pts with circulatory impairment experience higher risk of overdose due to delayed absorption of repeated administration.

PO

- Give without regard to meals.
- Tablets may be crushed.
- Extended-release tablets must be swallowed whole; do not break, crush, dissolve, or divide.

Rectal

- Refrigerate suppositories.
- Moisten suppository with cold water before inserting well up into rectum.

■ IV incompatibilities

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ceFAZolin (Ancef, Kefzol), diazePAM (Valium), PHENobarbital, phenytoin (Dilantin).

■ IV Compatibilities

Dexmedetomidine (Precedex), diltiazEM (Cardizem), diphenhydrAMINE (Benadryl), DOBUTamine (Dobutrex), DOPamine (Intropin), fentaNYL (Sublimaze), furosemide (Lasix), heparin, LORazepam (Ativan), magnesium sulfate, metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), morphine, propofol (Diprivan).

Indications/routes/dosage

Analgesia (Acute, Moderate to Severe)

PO: ADULTS: (Immediate-Release): Initially 2–4 mg q4–6h prn (tablets) or 2.5–10 mg q3–6h prn (liquid). **ELDERLY:** Use with caution; initiating at the low end of the dosage range is recommended. **CHILDREN, ADOLESCENTS WEIGHING MORE THAN 50 KG:** 1–2 mg q3–4h. **CHILDREN OLDER THAN 6 MOS AND WEIGHING LESS THAN 50 KG:** 0.03–0.08 mg/kg/dose q3–4h.

IV: ADULTS, ELDERLY: (For use in opiate-naïve pts) 0.2–1 mg q2–3h (pts with prior opioid exposure may require higher doses). **CHILDREN, ADOLESCENTS WEIGHING MORE THAN 50 KG:** 0.2–0.6 mg/dose q2–4h as needed. **CHILDREN WEIGHING 50 KG OR LESS:** 0.015 mg/kg/dose q3–6h as needed.

Rectal: ADULTS, ELDERLY: 3 mg q6–8h.

Patient-Controlled Analgesia (PCA)

IV: ADULTS, ELDERLY: (Usual concentration: 0.2 mg/mL). Demand dose: Initially, 0.1–0.2 mg. Range: 0.05–0.4 mg. Lockout interval: 6 min. Range: 5–10

min.

Epidural: ADULTS, ELDERLY: Bolus dose of 0.4–1 mg; infusion rate: 0.03–0.3 mg/hr; demand dose: 0.02–0.05 mg. Lockout interval: 10–15 min.

Dosage in Renal/Hepatic Impairment

Decrease initial dose; use with caution.

Side effects

Frequent: Drowsiness, dizziness, hypotension (including orthostatic hypotension), decreased appetite. **Occasional:** Confusion, diaphoresis, facial flushing, urinary retention, constipation, dry mouth, nausea, vomiting, headache, pain at injection site. **Rare:** Allergic reaction, depression.

Adverse effects/toxic reactions

Overdose results in respiratory depression, skeletal muscle flaccidity, cold/clammy skin, cyanosis, extreme drowsiness progressing to seizures, stupor, coma. Tolerance to analgesic effect, physical dependence may occur with repeated use. Prolonged duration of action, cumulative effect may occur in those with hepatic/renal impairment. **Antidote:** Naloxone (see [Appendix J](#)).

Nursing considerations

Baseline assessment

Obtain vital signs. If respirations are 12/min or less (20/min or less in children), withhold medication, contact physician. **Analgesic:** Assess onset, type, location, duration of pain. Effect of medication is reduced if full pain recurs before next dose. **Antitussive:** Assess type, severity, frequency of cough.

Intervention/evaluation

Monitor vital signs; assess for pain relief, cough. To prevent pain cycles, instruct pt to request pain medication as soon as discomfort begins. Monitor daily pattern of bowel activity, stool consistency (esp. in long-term use). Initiate deep breathing and coughing exercises, particularly in pts with pulmonary impairment. Assess for clinical improvement; record onset of relief of pain,

cough.

Patient/family teaching

- Avoid alcohol.
- Avoid tasks that require alertness/motor skills until response to drug is established.
- Tolerance or dependence may occur with prolonged use at high dosages.
- Change positions slowly to avoid orthostatic hypotension.
- Do not chew, crush, dissolve, or divide extended-release tablets.

hydroxyurea

hye-**drox**-ee-yoo-**ree**-ah

Apo-Hydroxyurea 

Droxia

Hydrea

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Synthetic urea analogue.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Must be administered by personnel trained in administration/handling of chemotherapeutic agents or in treatment of sickle cell anemia. Carcinogenic risk; secondary leukemias reported with long-term treatment.

Do not confuse hydroxyurea with hydrOXYzine.

Uses

Treatment of melanoma, resistant chronic myelocytic leukemia, recurrent, metastatic, inoperable ovarian carcinoma. Used in combination with radiation therapy for local control of primary squamous cell carcinoma of head/neck, excluding lip. Treatment of sickle cell anemia with at least 3 painful crises in previous 12 mos. **OFF-LABEL:** Treatment of hematologic conditions (e.g., polycythemia vera), cervical cancer, essential thrombocythemia, hyperleukocytosis due to AML, treatment of meningiomas.

Precautions

Contraindications: Hypersensitivity to hydroxyurea. **Cautions:** WBC count less than 2,500 cells/mm³ or platelet count less than 100,000 cells/mm³, severe anemia. Previous irradiation therapy, concurrent use with other cytotoxic drugs, renal/hepatic impairment, elderly; pts with sickle cell anemia if neutrophils less than 2,000 cells/mm³, platelets less than 80,000 cells/mm³, Hgb less than 4.5 g/dL, or reticulocytes less than 80,000 cells/mm³ when Hgb less than 9 g/dL.

Action

Inhibits DNA synthesis without interfering with RNA synthesis or protein. In sickle cell anemia, increases RBC, Hgb levels, thereby decreasing concentration of sickled cells; alters adhesion of RBCs to endothelium. **Therapeutic Effect:** Interferes with normal repair process of cancer cells damaged by irradiation.

Pharmacokinetics

Well absorbed from GI tract. Protein binding: 75%–80%. Metabolized in liver. Excreted in urine as urea and unchanged drug. **Half-life:** 3–4 hrs.

Lifespan considerations

Pregnancy/Lactation: Crosses placenta; distributed in breast milk. May cause fetal harm. **Children:** Safety and efficacy not established. **Elderly:** More sensitive to hydroxyurea effects; may require lower dosage.

Interactions

DRUG: Bone marrow depressants (e.g., alemtuzumab, methotrexate) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease the pt's antibody response to vaccine. **HERBAL:** **Echinacea** may decrease effect. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, creatinine, uric acid.

Availability (Rx)

Capsules: 200 mg (Droxia), 300 mg (Droxia), 400 mg (Droxia), 500 mg

(Hydrea).

Administration/handling

Do not open capsules.

Indications/routes/dosage

◀ALERT▶ Antineoplastic therapy interrupted when platelet count less than 100,000 cells/mm³ or WBC count less than 2,500 cells/mm³. Resume when counts return to normal.

Sickle cell anemia therapy interrupted when neutrophils less than 2,000 cells/mm³, platelets less than 80,000 cells/mm³, Hgb less than 4.5 g/dL, or reticulocytes less than 80,000 cells/mm³ with Hgb less than 9 g/dL. Reduce dose by 2.5 mg/kg/day following recovery.

CML, Head and Neck Cancer

PO: ADULTS, ELDERLY: 15 mg/kg/day. Adjust dose based on tumor type, disease state, response, pt risk factors. May give alone or in combination with other agents.

Sickle Cell Anemia

PO: ADULTS, ELDERLY: Initially, 15 mg/kg once daily. May increase by 5 mg/kg/day every 12 wks. **Maximum:** 35 mg/kg/day. **CHILDREN 6 MOS AND OLDER:** 20 mg/kg/dose once daily; increase by 5 mg/kg/day q8wk until mild myelosuppression is achieved. **Maximum:** 35 mg/kg/day.

Dosage in Renal Impairment

Reduce dose to 7.5 mg/kg/day for CrCl 60 mL/min or less.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent: Nausea, vomiting, anorexia, constipation or diarrhea. **Occasional:**

Mild, reversible rash; facial flushing, pruritus, fever, chills, malaise. **Rare:** Alopecia, headache, drowsiness, dizziness, disorientation.

Adverse effects/toxic reactions

Myelosuppression manifested as hematologic toxicity (leukopenia and, to a lesser extent, thrombocytopenia, anemia).

Nursing considerations

Baseline assessment

Obtain bone marrow studies, renal function, LFT before therapy begins, periodically thereafter. Obtain Hgb, WBC, platelet count, serum uric acid at baseline and wkly during therapy. Pts with marked renal impairment may develop visual or auditory hallucinations, marked hematologic toxicity.

Intervention/evaluation

Monitor CBC with differential, renal/hepatic function, uric acid. Monitor daily pattern of bowel activity, stool consistency. Monitor for hematologic toxicity (fever, sore throat, signs of local infection, unusual bleeding/bruising at any site), symptoms of anemia (excessive fatigue, weakness). Assess skin for rash, erythema.

Patient/family teaching

- Promptly report fever, sore throat, signs of local infection, unusual bleeding/bruising at any site.

hydrOXYzine

hye-**drox**-ee-zeen

Apo-HydrOXYzine 🍁

Atarax 🍁

Novo-Hydroxyzin 🍁

Vistaril

🍁 **CLASSIFICATION**

PHARMACOTHERAPEUTIC: Histamine H₁ antagonist.

CLINICAL: Antihistamine, antianxiety, antispasmodic, antiemetic, antipruritic.

Do not confuse hydrOXYzine with hydrALAZINE or hydroxyurea, or Vistaril with Restoril, Versed, or Zestril.

Uses

Antiemetic, treatment of anxiety/agitation, antipruritic.

Precautions

Contraindications: Hypersensitivity to hydrOXYzine. Early pregnancy; subcutaneous, intravenous administration; pts with prolonged QT interval.

Cautions: Narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, asthma, COPD, elderly.

Action

Competes with histamine for receptor sites in GI tract, blood vessels, respiratory tract. **Therapeutic Effect:** Produces anxiolytic, anticholinergic, antihistaminic, analgesic effects; relaxes skeletal muscle; controls nausea, vomiting.

Pharmacokinetics

Route	Onset	Peak	Duration
PO	15–30 min	N/A	4–6 hrs

Well absorbed from GI tract and after parenteral administration. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 3–7 hrs (increased in elderly, hepatic impairment).

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. **Children:** Not recommended in newborns or premature infants (increased risk of anticholinergic effects). Paradoxical excitement may occur.

Elderly: Increased risk of dizziness, sedation, confusion. Hypotension,

hyperexcitability may occur.

Interactions

DRUG: Alcohol, other CNS depressants (e.g., diphenhydramine, gabapentin, lorazepam, morphine) may increase CNS depressant effects. QT interval-prolonging medications (e.g., amiodarone, azithromycin, certinib, haloperidol, moxifloxacin) may increase risk of QT interval prolongation, torsades de pointes. **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **FOOD:** None known. **LAB VALUES:** May cause false-positive urine 17-hydroxycorticosteroid determinations.

Availability (Rx)

Oral Solution: 10 mg/5 mL. **Syrup:** 10 mg/5 mL. **Tablets:** 10 mg, 25 mg, 50 mg.

 **Capsules:** 25 mg, 50 mg, 100 mg.

Administration/handling

PO

- May give without regard to food.
- Shake oral suspension well.
- Scored tablets may be crushed; do not break, crush, or open capsule.

Indications/routes/dosage

Anxiety

Note: Initiate elderly dose at the lower end of recommended dosage.

PO: ADULTS, ELDERLY: 50–100 mg 4 times/day or 37.5–75 mg/day in divided doses.

Pruritus

PO: ADULTS, ELDERLY: 25 mg 3–4 times/day. **CHILDREN 6 YRS AND**

OLDER: 50–100 mg/day in divided doses. **CHILDREN YOUNGER THAN 6 YRS:** 50 mg/day in divided doses.

Dosage in Renal/Hepatic Impairment

No dose adjustment. Change dosing interval to q24h in pts with primary biliary cirrhosis.

Side effects

Side effects are generally mild, transient. **Frequent:** Drowsiness, dry mouth, marked discomfort with IM injection. **Occasional:** Dizziness, ataxia, asthenia, slurred speech, headache, agitation, increased anxiety. **Rare:** Paradoxical reactions (hyperactivity, anxiety in children; excitement, restlessness in elderly or debilitated pts) generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain.

Adverse effects/toxic reactions

Hypersensitivity reaction (wheezing, dyspnea, chest tightness) may occur. QT interval prolongation, torsades de pointes have been reported. Acute generalized exanthematous pustulosis (AGEP) may occur.

Nursing considerations

Baseline assessment

Anxiety: Offer emotional support. Assess motor responses (agitation, trembling, tension), autonomic responses (cold/clammy hands, diaphoresis). **Antiemetic:** Assess for dehydration (poor skin turgor, dry mucous membranes, longitudinal furrows in tongue).

Intervention/evaluation

For pts on long-term therapy, CBC, BMP, LFT should be performed periodically. Monitor lung sounds for signs of hypersensitivity reaction. Monitor serum electrolytes in pts with severe vomiting. Assess for paradoxical reaction, particularly during early therapy. Assist with ambulation if drowsiness, light-headedness occur. Obtain EKG if palpitations occur or cardiac arrhythmia is

suspected. Assess skin for rash, pustules.

Patient/family teaching

- Marked discomfort may occur with IM injection.
- Sugarless gum, sips of water may relieve dry mouth.
- Drowsiness usually diminishes with continued therapy.
- Avoid tasks that require alertness, motor skills until response to drug is established.
- Treatment may cause life-threatening heart arrhythmias; report chest pain, difficulty breathing, palpitations, passing out. Do not take newly prescribed medications unless approved by prescriber who originally started treatment.

 Canadian trade name

 Non-Crushable Drug

 High Alert drug

underlined underlined – top prescribed drug

I

ibandronate

eye-**ban**-droe-nate

Boniva

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Bisphosphonate.

CLINICAL: Calcium regulator.

Uses

Treatment/prevention of osteoporosis in postmenopausal women. **OFF-LABEL:** Hypercalcemia of malignancy; reduces bone pain and skeletal complications from metastatic bone disease due to breast cancer.

Precautions

Contraindications: Hypersensitivity to ibandronate, other bisphosphonates; oral tablets in pts unable to stand or sit upright for at least 60 min; pts with abnormalities of the esophagus that would delay emptying (e.g., stricture, achalasia), hypocalcemia. **Cautions:** GI diseases (duodenitis, dysphagia, esophagitis, gastritis, ulcers [drug may exacerbate these conditions]), renal impairment with CrCl less than 30 mL/min.

Action

Inhibits bone resorption via activity on osteoclasts. **Therapeutic Effect:** Reduces rate of bone resorption, resulting in increased bone mineral density.

Pharmacokinetics

Absorbed in upper GI tract. Extent of absorption impaired by food, beverages (other than plain water). Protein binding: 85%–99%. Rapidly binds to bone. Unabsorbed portion excreted in urine. **Half-life: PO:** 37–157 hrs; **IV:** 5–25 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm/malformations. Unknown if distributed in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** No age-related precautions noted.

Interactions

DRUG: Vitamin D, antacids containing aluminum, calcium, magnesium decrease absorption. Aspirin, NSAIDs (e.g., ibuprofen, ketorolac, naproxen) may increase GI irritation. **HERBAL:** None significant. **FOOD:** Beverages (other than plain water), dietary supplements, dairy products, food interfere with absorption. **LAB VALUES:** May decrease serum alkaline phosphatase. May increase serum cholesterol.

Availability (Rx)

Injection Solution: 3 mg/3 mL syringe. **Tablets:** 150 mg.

Administration/handling

PO

- Give 60 min before first food or beverage of the day, on an empty stomach with 6–8 oz plain water (not mineral water) while pt is standing or sitting in upright position.
- Pt cannot lie down for 60 min following administration.
- Instruct pt to swallow whole; do not break, crush, dissolve, or divide tablet (potential for oropharyngeal ulceration).

IV

- Give over 15–30 sec.
- Give over 1 hr for metastatic bone disease; over 1–2 hrs for hypercalcemia of malignancy.

Indications/routes/dosage

Note: May consider discontinuing after 3–5 yrs in pts at low risk for fracture.

Osteoporosis

PO (Prevention/Treatment): ADULTS, ELDERLY: 150 mg once monthly.

IV (Treatment): ADULTS, ELDERLY: 3 mg q3mos.

Dosage in Renal Impairment

Not recommended for pts with CrCl less than 30 mL/min.

Dosage in Hepatic Impairment

No dose adjustment.

Side effects

Frequent (13%–6%): Back pain, dyspepsia, peripheral discomfort, diarrhea, headache, myalgia. **IV:** Abdominal pain, dyspepsia, constipation, nausea, diarrhea. **Occasional (4%–3%):** Dizziness, arthralgia, asthenia. **Rare (2% or less):** Vomiting, hypersensitivity reaction.

Adverse effects/toxic reactions

Upper respiratory infection occurs occasionally. Overdose results in hypocalcemia, hypophosphatemia, significant GI disturbances.

Nursing considerations

Baseline assessment

Hypocalcemia, vitamin D deficiency must be corrected before beginning therapy. Obtain laboratory baselines, esp. serum chemistries, renal function. Obtain results of bone density study.

Intervention/evaluation

Monitor electrolytes, esp. serum calcium, phosphate. Monitor renal function tests.

Patient/family teaching

- Expected benefits occur only when medication is taken with full glass (6–8 oz) of plain water, first thing in the morning and at least 60 min before first food, beverage, medication of the day. Any other beverage (mineral water, orange juice, coffee) significantly reduces absorption of medication.
- Do not chew, crush, dissolve, or divide tablets; swallow whole.
- Do not lie down for at least 60 min after taking medication (potentiates delivery to stomach, reduces risk of esophageal irritation).
- Report swallowing difficulties, pain when swallowing, chest pain, new/worsening heartburn.
- Consider weight-bearing exercises; modify behavioral factors (e.g., cigarette smoking, alcohol consumption).
- Calcium and vitamin D supplements should be taken if dietary intake inadequate.

ibrutinib

eye-**broo**-ti-nib

Imbruvica

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse ibrutinib with axitinib, dasatinib, erlotinib, gefitinib, imatinib, nilotinib, PONATinib, SORAFenib, SUNItinib, or vandetanib.

Uses

Treatment of pts with mantle cell lymphoma (MCL) who have received at least one prior therapy, chronic lymphocytic leukemia (CLL) with at least one prior therapy or with 17p deletion, first-line treatment of CLL. Waldenström's macroglobulinemia (WM). Marginal zone lymphoma (MZL) requiring systemic therapy and having received at least one prior anti-CD-20 based therapy. Chronic graft versus host disease (CGVHD) after failure of at least one line of systemic therapy.

Precautions

Contraindications: Hypersensitivity to ibrutinib. **Cautions:** Hepatic/renal impairment, elderly, pregnancy, history of GI disease (e.g., bleeding, ulcers).

Action

Inhibits enzymatic activity of Bruton's tyrosine kinase (BTK), a signaling molecule that promotes malignant B-cell proliferation and survival. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Readily absorbed following PO. Metabolized in liver. Peak plasma concentration: 1–2 hrs. Protein binding: 97%. Excreted in feces (80%), urine (10%). **Half-life:** 4–6 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Avoid pregnancy. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established. **Elderly:** Increased risk of cardiac events (atrial fibrillation, hypertension), infections (pneumonia, cellulitis), GI events (diarrhea, dehydration, bleeding).

Interactions

DRUG: Strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin) may increase plasma concentration/effect; avoid use. Strong CYP3A4 inducers (e.g., rifAMPin, phenytoin) may decrease plasma concentration/effect; avoid use. Anticoagulants (e.g., warfarin), antiplatelets (e.g., aspirin, clopidogrel), NSAIDs may increase risk of bleeding. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** Grapefruit products, Seville oranges may increase concentration/effect. All foods may increase absorption/concentration. **LAB VALUES:** May decrease Hgb, Hct, neutrophils, platelets.

Availability (Rx)

 Capsules: 140 mg.

Administration/handling

PO

- Give with water.
- Do not break, crush, or open capsule.

Indications/routes/dosage

MCL, MZL

PO: ADULTS/ELDERLY: 560 mg (4 × 140-mg capsules) once daily. Continue until disease progression or unacceptable toxicity.

CLL, WM, CGVHD

PO: ADULTS, ELDERLY: 420 mg (3 × 140 mg) once daily. Continue until disease progression or unacceptable toxicity.

Dose Modification

Based on Common Terminology Criteria for Adverse Events (CTCAE).

Any Grade 3 or Greater Nonhematologic Event, Grade 3 or Greater Neutropenia with Infection or Fever, or Any Grade 4 Hematologic Toxicities

Interrupt treatment until resolution to grade 1 or baseline, then restart at initial dose. If toxicity reoccurs, interrupt treatment until resolution to grade 1 or baseline, then reduce dose to 420 mg daily (one capsule less). If toxicity reoccurs, interrupt treatment until resolution to grade 1 or baseline, then reduce dose to 280 mg once daily (one capsule less). If toxicity still occurs at 280 mg dose, discontinue treatment.

Concomitant Use of Moderate CYP3A4 Inhibitors (e.g., Fluconazole, Diltiazem, Verapamil)

Start at reduced dose of 140 mg daily. If toxicity occurs, either discontinue treatment or find alternate agent with less CYP3A inhibition.

Concomitant Short-Term Use of Strong CYP3A4 Inhibitors (7 days or less) (e.g., Antifungals, Antibiotics)

Interrupt treatment until strong CYP3A medications no longer needed.

Concomitant Chronic Use of Strong CYP3A4 Inhibitors or Inducers

Treatment not recommended.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: Decrease dose to 140 mg. **Moderate to severe impairment:** Avoid use.

Side effects

Frequent (51%–23%): Diarrhea, fatigue, musculoskeletal pain, peripheral edema, nausea, bruising, dyspnea, constipation, rash, abdominal pain, vomiting.

Occasional (21%–11%): Decreased appetite, cough, pyrexia, stomatitis, asthenia, dizziness, muscle spasms, dehydration, headache, dyspepsia, petechiae, arthralgia.

Adverse effects/toxic reactions

Anemia, lymphopenia, neutropenia, thrombocytopenia is expected response to therapy. Treatment-emergent myelosuppression (grade 3–4 CTCAE) reported in 41% of pts: neutropenia (29%), thrombocytopenia (17%), anemia (9%). Infections including upper respiratory tract infection, UTI, pneumonia, skin infection, sinusitis were reported. Hemorrhagic events including epistaxis, GI bleeding, hematuria, intracranial hemorrhage, subdural hematoma reported in 5% of pts. Serious and fatal cases of renal toxicity reported: increased serum creatinine 1.5 times upper limit of normal (ULN) (67% of pts), increased serum creatinine 1.53 times ULN (9% of pts). Second primary malignancies including skin cancer (4%), other carcinomas (1%) occurred.

Nursing considerations

Baseline assessment

Obtain baseline vital signs, CBC, serum chemistries, LFT, PT/INR if on anticoagulants. Question history of arrhythmias, HF, GI bleed, hepatic/renal impairment, peripheral edema, pulmonary disease. Obtain negative urine pregnancy before initiating treatment. Assess hydration status. Receive full medication history including herbal products. Assess skin for open/unhealed wounds, lesions, moles. Conduct baseline neurologic exam. Offer emotional support.

Intervention/evaluation

Monitor CBC monthly; LFT, serum chemistries, renal function routinely. Monitor stool frequency, consistency, characteristics. Immediately report hemorrhagic events: epistaxis, hematuria, hemoptysis, melena. Encourage PO intake. Obtain EKG for arrhythmias, dyspnea, palpitations. Screen for possible intracranial hemorrhage: altered mental status, aphasia, hemiparesis, unequal pupils, homonymous hemianopsia (blindness of one half of vision on same side of both eyes). Monitor for renal toxicity (anuria, hypertension, generalized edema, flank pain). Assess skin for new lesions.

Patient/family teaching

- Blood levels will be monitored routinely.
- Difficulty breathing, fever, cough, burning with urination, body aches, chills may indicate acute infection.
- Avoid pregnancy.
- Report any black/tarry stools, bruising, nausea, RUQ abdominal pain, yellowing of skin or eyes, palpitations, nose bleeds, blood in urine or stool, decreased urine output.
- Avoid alcohol.
- Do not take herbal products.
- Do not ingest grapefruit products.
- Severe diarrhea may lead to dehydration.
- Contact physician before any planned surgical/dental procedures.
- Immediately report neurological changes: confusion, one-sided paralysis, difficulty speaking, partial blindness.

- Do not receive live vaccines.
- Do not break, crush, or open capsule.

ibuprofen

eye-bue-**pro**-fen

Advil

Apo-Ibuprofen 🇨🇦

Caldolor

Motrin

NeoProfen

Novo-Profen 🇨🇦

Fixed-Combination(s)

Children's Advil Cold: ibuprofen/pseudoephedrine (a nasal decongestant): 100 mg/15 mg per 5 mL. **Combunox:** ibuprofen/oxyCODONE (a narcotic analgesic): 400 mg/5 mg. **Duexis:** ibuprofen/famotidine (an H₂ antagonist): 800 mg/26.6 mg. **Reprexain CIII:** ibuprofen/HYDROcodone (a narcotic analgesic): 200 mg/5 mg. **Vicoprofen:** ibuprofen/HYDROcodone (a narcotic analgesic): 200 mg/7.5 mg.

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: NSAID.

CLINICAL: Antirheumatic, analgesic, antipyretic, antidysmenorrheal, vascular headache suppressant.

■ **BLACK BOX ALERT** ■ Increased risk of serious cardiovascular thrombotic events, including myocardial infarction, CVA. Increased risk of severe GI reactions, including ulceration, bleeding, perforation.

Do not confuse Motrin with Neurontin, or Advil with Aleve.

Uses

Oral: Treatment of fever, rheumatoid disorders, osteoarthritis, mild to moderate

pain, primary dysmenorrhea. **Caldolor:** Mild to moderate pain; severe pain in combination with an opioid analgesic; fever. **NeoProfen:** Induces closure in clinically significant patent ductus arteriosus (PDA) in premature infants weighing between 500 and 1,500 g who are no more than 32 wks gestational age when usual medical management is ineffective. **OFF-LABEL:** Treatment of cystic fibrosis, pericarditis. Juvenile idiopathic arthritis.

Precautions

Contraindications: History of hypersensitivity to ibuprofen, aspirin, other NSAIDs. Treatment of perioperative pain in coronary artery bypass graft (CABG) surgery. Aspirin triad (bronchial asthma, aspirin intolerance, rhinitis). **NeoProfen:** Infants with proven or suspected untreated infection, elevated total bilirubin, congenital heart disease in whom patency of the patent ductus arteriosus is necessary for satisfactory pulmonary or systemic blood flow (e.g., pulmonary atresia), bleeding, thrombocytopenia, coagulation defects, suspected necrotizing enterocolitis, significant renal impairment. **Cautions:** Pts with fluid retention, HF, dehydration, coagulation disorders, concurrent use with aspirin, anticoagulants, steroids; history of GI disease (e.g., bleeding, ulcers), smoking, use of alcohol, elderly, debilitated pts, hepatic/renal impairment, asthma.

Action

Reversibly inhibits COX-1 and COX-2 enzymes, resulting in decreased formation of prostaglandin precursors. **Therapeutic Effect:** Produces analgesic, anti-inflammatory effects; decreases fever.

Pharmacokinetics

Route	Onset	Peak	Duration
PO (analgesic)	0.5 hr	N/A	4–6 hrs
PO (antirheumatic)	2 days	1–2 wks	N/A

Rapidly absorbed from GI tract. Protein binding: 90%–99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. **Half-life:** 2–4 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is distributed in breast milk. Avoid use during third trimester (may adversely affect fetal cardiovascular system: premature closure of ductus arteriosus). **Children:** Safety and efficacy not established in pts younger than 6 mos. **Elderly:** GI bleeding, ulceration more likely to cause serious adverse effects. Age-related renal impairment may increase risk of hepatic/renal toxicity; reduced dosage recommended.

Interactions

DRUG: May decrease effects of **antihypertensives (e.g., amLODIPine, lisinopril, valsartan), diuretics (e.g., furosemide). Aspirin, other salicylates** may increase risk of GI side effects, bleeding. May increase effects of **oral anticoagulants (e.g., warfarin)**. May increase concentration, risk of toxicity of **lithium, methotrexate**. **HERBAL:** Cat's claw, dong quai, evening primrose, feverfew, garlic, ginkgo, ginseng, horse chestnut, red clover may increase antiplatelet activity. **FOOD:** None known. **LAB VALUES:** May prolong bleeding time. May alter serum glucose level. May increase serum BUN, creatinine, potassium, ALT, AST. May decrease serum calcium, glucose; Hgb, Hct, platelets.

Availability (Rx)

Capsules: 200 mg. **Injection, Solution (NeoProfen):** 10 mg/mL. **(Caldolor):** 100 mg/mL. **Suspension, Oral:** 100 mg/5 mL. **Suspension, Oral Drops:** 40 mg/mL. **Tablets:** 200 mg, 400 mg, 600 mg, 800 mg. **Tablets, Chewable:** 100 mg.

Administration/handling

IV (Caldolor)

Reconstitution

- Dilute with D₅W or 0.9% NaCl to final concentration of 4 mg/mL or less.

Rate of Administration

- Infuse over at least 30 min.

Storage

- Store at room temperature.
- Stable for 24 hrs after dilution.

IV (Neoprofen)

Reconstitution

- Dilute to appropriate volume with D₅W or 0.9% NaCl.
- Discard any remaining medication after first withdrawal from vial.

Rate of Administration

- Administer via IV port nearest the insertion site.
- Infuse continuously over 15 min.

Storage

- Store at room temperature.
- Stable for 30 min after dilution.

PO

- Give with food, milk, antacids if GI distress occurs.

Indications/routes/dosage

Fever

PO: ADULTS, ELDERLY: 200–400 mg q4–6h prn. **CHILDREN 6 MOS AND OLDER:** 5–10 mg/kg q6–8h. **Maximum:** 400 mg/dose; 1,200 mg/day.

IV: ADULTS, ELDERLY: 400 mg q4–6h or 100–200 mg q4h prn. **Maximum:** 3.2 g/day.

CHILDREN 12–17 YRS: 400 mg q4–6h prn. **Maximum:** 2,400 mg/day.

CHILDREN 6 MOS–11 YRS: 10 mg/kg q4–6h prn. **Maximum/dose:** 400 mg. **Maximum:** 40 mg/kg up to 2,400 mg/day.

Osteoarthritis, Rheumatoid Disorders

PO: ADULTS, ELDERLY: 400–800 mg 3–4 times/day. **Maximum:** 3.2 g/day.

Pain

PO: ADULTS, ELDERLY, CHILDREN 12 YRS AND OLDER: 200–400 mg q4–6h prn. **CHILDREN 6 MOS–11 YRS:** 4–10 mg/kg q6–8h prn. **Maximum:**

40 mg/kg/day (400 mg/dose).

IV: ADULTS, ELDERLY: 400–800 mg q6h prn. **Maximum:** 3.2 g/day.

Primary Dysmenorrhea

PO: ADULTS: 200–800 mg q4–6h prn. **Maximum:** 1,200 mg/day.

Patent Ductus Arteriosus (PDA)

IV: INFANTS: Initially, 10 mg/kg then 2 doses of 5 mg/kg, after 24 hrs and 48 hrs. All doses based on birth weight.

Dosage in Renal Impairment

Hold if anuria or oliguria evident. Avoid use in severe impairment.

Dosage in Hepatic Impairment

Avoid use in severe impairment.

Side effects

Occasional (9%–3%): Nausea, vomiting, dyspepsia, dizziness, rash. **Rare (less than 3%):** Diarrhea or constipation, flatulence, abdominal cramps or pain, pruritus, increased B/P.

Adverse effects/toxic reactions

Overdose may result in metabolic acidosis. Rare reactions with long-term use include peptic ulcer, GI bleeding, gastritis, severe hepatic reaction (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), severe hypersensitivity reaction (particularly in pts with systemic lupus erythematosus or other collagen diseases). **NeoProfen:** Hypoglycemia, hypocalcemia, respiratory failure, UTI, edema, atelectasis may occur. **Caldolor:** Abdominal pain, anemia, cough, dizziness, dyspnea, edema, hypertension, nausea, vomiting have been reported.

Nursing considerations

Baseline assessment

Assess onset, type, location, duration of pain, inflammation. Inspect appearance of affected joints for immobility, deformities, skin condition. Assess temperature. Question medical history as listed in Precautions.

Intervention/evaluation

Monitor for evidence of nausea, dyspepsia. Assess skin for rash. Observe for bleeding, bruising, occult blood loss. Evaluate for therapeutic response: relief of pain, stiffness, swelling; increased joint mobility; reduced joint tenderness; improved grip strength. Monitor for fever.

Patient/family teaching

- Avoid aspirin, alcohol during therapy (increases risk of GI bleeding).
- If GI upset occurs, take with food, milk, antacids.
- May cause dizziness.
- Report ringing in ears, persistent stomach pain, respiratory difficulty, unusual bruising/bleeding, swelling of extremities, chest pain/palpitations.

idelalisib

eye-~~del~~-a-lis-ib

Zydelig

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Kinase inhibitor.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Fatal and/or serious hepatotoxicity may occur. Monitor LFT prior to and during treatment. Fatal and/or serious and severe diarrhea or colitis may occur. Monitor for GI symptoms. Fatal and serious pneumonitis may occur. Monitor for pulmonary symptoms and bilateral interstitial infiltrates. Interrupt, then reduce or discontinue treatment if hepatotoxicity, severe diarrhea, or pneumonitis occurs. Fatal and serious intestinal perforation may occur. Discontinue if perforation suspected.

Uses

Treatment of relapsed chronic lymphocytic leukemia (CLL), in combination with rituximab, in pts for whom rituximab alone would not be considered appropriate therapy due to other co-morbidities. Treatment of relapsed follicular B-cell non-Hodgkin's lymphoma (FL) or relapsed small lymphocytic lymphoma (SLL) in pts who have received at least two prior systemic therapies.

Precautions

Contraindications: History of serious allergic reactions to idelalisib (e.g., anaphylaxis, toxic epidermal necrolysis). **Cautions:** Baseline anemia, leukopenia, neutropenia, thrombocytopenia; GI bleeding, hepatic impairment. Pts with active infection, high tumor burden. Avoid concomitant use of hepatotoxic or promotility medications.

Action

Inhibits several cell signaling pathways including B-cell receptor signaling and CXCR4 and CXCR5 signaling, which are involved in trafficking B cells to lymph nodes and bone marrow. **Therapeutic Effect:** Inhibits tumor cell growth and metastasis.

Pharmacokinetics

Well absorbed following PO administration. Metabolized in liver. Protein binding: 84%. Peak plasma concentration: 1.5 hrs. Excreted in feces (78%), urine (14%). **Half-life:** 8.3 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm; avoid pregnancy. Use effective contraception during treatment and for at least 1 mo after discontinuation. Unknown if distributed in breast milk. Must either discontinue drug or discontinue breastfeeding. **Children:** Safety and efficacy not established in pts younger than 18 yrs. **Elderly:** May have increased risk of side effects/adverse reactions.

Interactions

DRUG: Strong CYP3A4 inducers (e.g., rifAMPin, phenytoin) may decrease concentration/effect. Strong CYP3A4 inhibitors (ketoconazole, ritonavir) may increase concentration/effect. **HERBAL:** St. John's wort may decrease concentration/effect. **FOOD:** None known. **LAB VALUES:** May increase serum ALT, AST, bilirubin, GGT; triglycerides. May decrease Hgb, neutrophils, platelets, serum sodium. May increase or decrease lymphocytes, serum glucose.

Availability (Rx)

Tablets: 100 mg, 150 mg.

Administration/handling

PO

- Give without regard to meals.
- Swallow tablets whole.

Indications/routes/dosage

Chronic Lymphocytic Leukemia (in Combination with RiTUXimab), Follicular B-cell Non-Hodgkin's Lymphoma, Small Lymphocytic Lymphoma

PO: ADULTS/ELDERLY: 150 mg twice daily. Continue until disease progression or unacceptable toxicity.

Dose Modification

Hepatotoxicity

Elevated Serum ALT, AST

3–5 Times Upper Limit of Normal (ULN): Maintain dose. **5–20 Times ULN:** Monitor serum ALT, AST wkly. Withhold until ALT, AST less than 1 times ULN, then resume at 100 mg twice daily. **Greater Than 20 Times ULN:** Permanently discontinue.

Elevated Serum Bilirubin

1.5–3 Times ULN: Monitor serum bilirubin wkly. Maintain dose.

3–10 Times ULN: Monitor serum bilirubin wkly. Withhold until bilirubin less than 1 times ULN, then resume at 100-mg dose.

Greater Than 10 Times ULN: Permanently discontinue.

Diarrhea

Moderate Diarrhea: Maintain dose.

Severe Diarrhea or Hospitalization: Withhold until resolved, then resume at 100-mg dose. **Life-Threatening Diarrhea:** Permanently discontinue.

Neutropenia

ANC 1,000–1,500 cells/mm³: Maintain dose. **ANC 500–1,000 cells/mm³:** Monitor ANC wkly and maintain dose. **ANC Less Than 500 cells/mm³:** Permanently discontinue.

Thrombocytopenia

Platelets 50,000–75,000 cells/mm³: Maintain dose. **Platelets 25,000–50,000 cells/mm³:** Monitor platelet count wkly and maintain dose. **Platelets Less Than 25,000 cells/mm³:** Monitor platelet count wkly. Withhold until platelets greater than 25,000 cells/mm³, then resume at 100-mg dose.

Pneumonitis

Any Symptoms: Permanently discontinue.

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Use caution. See dose modification.

Side effects

CLL

Frequent (35%–21%): Pyrexia, nausea, diarrhea, chills. **Occasional (10%–5%):** Headache, vomiting, generalized pain, arthralgia, stomatitis, gastric reflux, nasal congestion.

Non-Hodgkin’s Lymphoma

Frequent (47%–21%): Diarrhea, fatigue, nausea, cough, pyrexia, abdominal pain, rash. **Occasional (17%–10%):** Dyspnea, decreased appetite, vomiting,

asthenia, night sweats, insomnia, headache, peripheral edema.

Adverse effects/toxic reactions

Thrombocytopenia, neutropenia, leukopenia, lymphopenia are expected responses to therapy, but more severe reactions, including bone marrow failure, febrile neutropenia, may occur. Fatal and/or serious events including hepatotoxicity (14% of pts), severe diarrhea or colitis (14% of pts), hypersensitivity reactions (including anaphylaxis), pneumonitis, intestinal perforation were reported. Neutropenia occurred in 31% of pts, which may greatly increase risk of infection. Severe skin reactions including toxic epidermal necrolysis, generalized rash, exfoliative rash were reported. Other infections may include bronchitis, *C.difficile* colitis, pneumonia, sepsis, UTI. Fatal and/or serious intestinal perforation may occur.

Nursing considerations

Baseline assessment

Obtain ANC, CBC, BMP, LFT, PT/INR, vital signs, urine pregnancy. Receive full medication history including herbal products. Question possibility of pregnancy, current breastfeeding status, use of contraceptive measures in female pts of reproductive potential. Question history of hypersensitivity reaction or acute skin reactions to drug class. Perform full dermatologic exam with routine assessment. Offer emotional support.

Intervention/evaluation

Diligently monitor blood counts (esp. ANC, CBC, platelet count) frequently. Any interruption of therapy or dosage change may require wkly lab monitoring until symptoms resolve. Obtain *C. difficile* toxin PCR if severe diarrhea occurs. Screen for acute cutaneous reactions, allergic reactions, other acute infections (sepsis, UTI), hepatic impairment, pulmonary events (dyspnea, pneumonitis, pneumonia), or tumor lysis syndrome (electrolyte imbalance, uric acid nephropathy, acute renal failure). Monitor strict I&O, hydration status, stool frequency and consistency.

Patient/family teaching

- Blood levels will be routinely monitored. Any change in dose or interruption of therapy may require blood draws every week.
- Avoid pregnancy; do not breastfeed.
- Report abdominal pain, amber or bloody urine, bruising, black/tarry stools, persistent diarrhea, yellowing of skin or eyes.
- Fever, cough, burning with urination, body aches, chills may indicate acute infection.
- Avoid alcohol.
- Immediately report difficult breathing, severe coughing, chest tightness.
- Therapy may cause severe allergic reactions, intestinal tearing, or skin rashes or severe diarrhea related to an infected colon.
- Do not take any over-the-counter medications including herbal products unless approved by your doctor.

ifosfamide

eye-**fos**-fa-mide

HIGH
ALERT

Ifex

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Alkylating agent.

CLINICAL: Antineoplastic.

■ **BLACK BOX ALERT** ■ Hemorrhagic cystitis may occur. Severe myelosuppressant. May cause CNS toxicity, including confusion, coma. Must be administered by personnel trained in administration/handling of chemotherapeutic agents. May cause severe nephrotoxicity, resulting in renal failure.

Do not confuse ifosfamide with cyclophosphamide.

Uses

Treatment of germ cell testicular carcinoma (used in combination with other chemotherapy agents and with concurrent mesna for prophylaxis of hemorrhagic cystitis). **OFF-LABEL:** Small-cell lung, non-small-cell lung, ovarian, cervical, bladder cancer; soft tissue sarcomas, Hodgkin's, non-Hodgkin's lymphomas; osteosarcoma; head and neck, Ewing's sarcoma.

Precautions

Contraindications: Hypersensitivity to ifosfamide. Urinary outflow obstruction.

Cautions: Renal/hepatic impairment, compromised bone marrow reserve, active urinary tract infection, preexisting cardiac disease, prior radiation therapy. Avoid use in pts with WBCs less than 2,000 cells/mm³ and platelets less than 50,000 cells/mm³.

Action

Inhibits DNA, RNA protein synthesis by cross-linking with DNA, RNA strands, preventing cell growth. Cell cycle–phase nonspecific. **Therapeutic Effect:** Interferes with DNA, RNA function.

Pharmacokinetics

Metabolized in liver. Protein binding: Negligible. Crosses blood-brain barrier (to a limited extent). Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 11–15 hrs (high dose); 4–7 hrs (low dose).

Lifespan considerations

Pregnancy/Lactation: If possible, avoid use during pregnancy, esp. first trimester. Males must use effective contraception and not conceive a child during treatment and for at least 6 months after discontinuation. May cause fetal harm. Distributed in breast milk. Breastfeeding not recommended. **Children:** Not intended for this pt population. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: Bone marrow depressants (e.g., alemtuzumab, methotrexate) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. **HERBAL:** St. John's wort may decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum BUN, bilirubin, creatinine, uric acid, ALT, AST.

Availability (Rx)

Injection, Powder for Reconstitution (Ifex): 1 g, 3 g. **Injection, Solution:** 50 mg/mL.

Administration/handling

◀ALERT▶ Hemorrhagic cystitis occurs if mesna is not given concurrently. Mesna should always be given with ifosfamide.

IV

Reconstitution

- Reconstitute vial with Sterile Water for Injection or Bacteriostatic Water for Injection to provide concentration of 50 mg/mL. Shake to dissolve.
- Further dilute with 50–1,000 mL D₅W or 0.9% NaCl to provide concentration of 0.6–20 mg/mL.

Rate of Administration

- Infuse over minimum of 30 min.
- Give with at least 2,000 mL PO or IV fluid (prevents bladder toxicity).
- Give with protectant against hemorrhagic cystitis (i.e., mesna).

Storage

- Store vials of powder at room temperature.
- Refrigerate vials of solution.
- After reconstitution with Bacteriostatic Water for Injection, vials and diluted solutions stable for 24 hrs if refrigerated.

IV incompatibilities

Cefepime (Maxipime), methotrexate.

IV Compatibilities

Granisetron (Kytril), ondansetron (Zofran).

Indications/routes/dosage

◀ALERT▶ Dosage individualized based on clinical response, tolerance to adverse effects. When used in combination therapy, consult specific protocols for

optimum dosage, sequence of drug administration.

Germ Cell Testicular Carcinoma

IV: ADULTS: 1,200 mg/m²/day for 5 consecutive days. Repeat q3wks or after recovery from hematologic toxicity. Administer with mesna (to prevent bladder toxicity).

Dosage in Renal/Hepatic Impairment

Use caution.

Side effects

Frequent (83%–58%): Alopecia, nausea, vomiting. **Occasional (15%–5%):** Confusion, drowsiness, hallucinations, infection. **Rare (less than 5%):** Dizziness, seizures, disorientation, fever, malaise, stomatitis (mucosal irritation, glossitis, gingivitis).

Adverse effects/toxic reactions

Hemorrhagic cystitis with hematuria, dysuria occurs frequently if protective agent (mesna) is not used. Myelosuppression (leukopenia, thrombocytopenia) occurs frequently. Pulmonary toxicity, hepatotoxicity, nephrotoxicity, cardiotoxicity, CNS toxicity (confusion, hallucinations, drowsiness, coma) may require discontinuation of therapy.

Nursing considerations

Baseline assessment

Obtain urinalysis before each dose. If hematuria occurs (greater than 10 RBCs per field), therapy should be withheld until resolution occurs. Obtain WBC, platelet count, Hgb before each dose. Offer emotional support.

Intervention/evaluation

Monitor hematologic studies, urinalysis, renal function, LFT. Assess for fever, sore throat, signs of local infection, unusual bruising/bleeding from any site, symptoms of anemia (excessive fatigue, weakness). Monitor for toxicities.

Patient/family teaching

- Alopecia is reversible, but new hair growth may have a different color or texture.
- Drink plenty of fluids (protects against cystitis).
- Do not have immunizations without physician's approval (drug lowers resistance).
- Avoid contact with those who have recently received live virus vaccine.
- Avoid crowds, those with infections.
- Report unusual bleeding/bruising, fever, chills, sore throat, joint pain, sores in mouth or on lips, yellowing skin or eyes.

iloperidone

eye-loe-**per**-i-doan

Fanapt

Fanapt Titration Pack

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Second-generation (atypical) antipsychotic.

CLINICAL: Antipsychotic.

■ **BLACK BOX ALERT** ■ Elderly pts with dementia-related psychosis are at increased risk for mortality due to cerebrovascular events.

Do not confuse iloperidone with amiodarone or dronedarone.

Uses

Acute treatment of schizophrenia in adults.

Precautions

Contraindications: Hypersensitivity to iloperidone. **Cautions:** Cardiovascular disease (HF, history of MI, ischemia, cardiac conduction abnormalities), cerebrovascular disease (increases risk of CVA in pts with dementia, seizure disorders). Pts at risk for orthostatic hypotension. Pts with bradycardia, hypokalemia, hypomagnesemia may be at greater risk for torsades de pointes. History of seizures, conditions lowering seizure threshold, high risk of suicide,

risk of aspiration pneumonia, congenital QT syndrome, concurrent use of medications that prolong QT interval, decreased GI motility, urinary retention, BPH, xerostomia, visual problems, hepatic impairment, narrow-angle glaucoma, diabetes, elderly.

Action

Exact mechanism mediated through combination of DOPamine type 2 (D₂) and serotonin type 2 (5-HT₂) antagonisms. **Therapeutic Effect:** Diminishes symptoms of schizophrenia and reduces incidence of extrapyramidal side effects.

Pharmacokinetics

Steady-state concentration occurs in 3–4 days. Well absorbed from GI tract (unaffected by food). Protein binding: 95%. Metabolized in liver. Primarily excreted in urine, with a lesser amount excreted in feces. **Half-life:** 18–33 hrs.

Lifespan considerations

Pregnancy/Lactation: Unknown if drug crosses placenta or is excreted in breast milk. Breastfeeding not recommended. **Children:** Safety and efficacy not established. **Elderly:** More susceptible to postural hypotension. Increased risk of cerebrovascular events, mortality, including stroke in elderly pts with psychosis.

Interactions

DRUG: Alcohol, CNS depressants (e.g., diphenhydrAMINE, LORazepam, morphine) may increase CNS depression. **Strong CYP3A4 inhibitors** (e.g., clarithromycin, ketoconazole) or **strong CYP2D6 inhibitors** (e.g., FLUoxetine, PARoxetine) may increase concentration. **Medications causing prolongation of QT interval** (e.g., amiodarone, dofetilide, sotalol) may increase effects on cardiac conduction, leading to malignant arrhythmias (torsades de pointes). **HERBAL:** Gotu kola, kava kava, St. John's wort, valerian may increase CNS depression. **St. John's wort** may decrease concentration. **FOOD:** None known. **LAB VALUES:** May increase serum prolactin levels.

Availability (Rx)

Tablets: 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg.

Administration/handling

PO

- Give without regard to food.
- Tablets may be crushed.

Indications/routes/dosage

Note: Titrate to the proper dose range with dosage adjustments not to exceed 2 mg twice daily (4 mg/day).

Schizophrenia

PO: ADULTS: To avoid orthostatic hypotension, begin with 1 mg twice daily, then adjust dosage to 2 mg twice daily, 4 mg twice daily, 6 mg twice daily, 8 mg twice daily, 10 mg twice daily, and 12 mg twice daily on days 2, 3, 4, 5, 6, and 7, respectively, to reach target daily dose of 12–24 mg/day in 2 divided doses.

Note: Reduce dose by 50% when receiving strong CYP2D6 or CYP3A4 inhibitors or poor metabolizers of CYP2D6 (see Interactions).

Dosage in Renal Impairment

No dose adjustment.

Dosage in Hepatic Impairment

Mild impairment: No adjustment. **Moderate impairment:** Use caution. **Severe impairment:** Not recommended.

Side effects

Frequent (20%–12%): Dizziness, drowsiness, tachycardia. **Occasional (10%–4%):** Nausea, dry mouth, nasal congestion, weight increase, diarrhea, fatigue, orthostatic hypotension. **Rare (3%–1%):** Arthralgia, musculoskeletal stiffness, abdominal discomfort, nasopharyngitis, tremor, hypotension, rash, ejaculatory

failure, dyspnea, blurred vision, lethargy.

Adverse effects/toxic reactions

Extrapyramidal disorders, including tardive dyskinesia (protrusion of tongue, puffing of cheeks, chewing/puckering of the mouth), occur in 4% of pts. Upper respiratory infection occurs in 3% of pts. QT interval prolongation may produce torsades de pointes, a form of ventricular tachycardia. Neuroleptic malignant syndrome (e.g., hyperpyrexia, muscle rigidity, altered mental status, irregular pulse or B/P) has been noted.

Nursing considerations

Baseline assessment

Assess pt's behavior, appearance, emotional status, response to environment, speech pattern, thought content. EKG should be obtained to assess for QT prolongation before instituting medication. Question medical history as listed in Precautions.

Intervention/evaluation

Monitor for orthostatic hypotension; assist with ambulation. Monitor for fine tongue movement (may be first sign of tardive dyskinesia, possibly irreversible). Monitor serum potassium, magnesium in pts at risk for electrolyte disturbances. Assess for therapeutic response (greater interest in surroundings, improved self-care, increased ability to concentrate, relaxed facial expression).

Patient/family teaching

- Avoid tasks that require alertness, motor skills until response to drug is established.
- Be alert to symptoms of orthostatic hypotension; slowly go from lying to standing.
- Report if feeling faint, if experiencing heart palpitations, or if fever or muscle rigidity occurs.
- Report extrapyramidal symptoms (e.g., involuntary muscle movements, tics) immediately.

imatinib

im-at-in-ib

Gleevec

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Protein tyrosine kinase inhibitor.

CLINICAL: Antineoplastic.

Do not confuse imatinib with dasatinib, erlotinib, lapatinib, nilotinib, SORafenib, or SUNItinib.

Uses

Newly diagnosed chronic-phase Philadelphia chromosome positive chronic myeloid leukemia (Ph⁺ CML) in children and adults. Pts in blast crisis, accelerated phase, or chronic phase Ph⁺ CML who have already failed interferon therapy. Adults with relapsed or refractory Ph⁺ acute lymphoblastic leukemia (ALL). Treatment in children with Ph⁺ ALL. Adults with myelodysplastic/myeloproliferative disease (MDS/MPD) associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements. Adults with aggressive systemic mastocytosis (ASM) without mutation of the D816V c-Kit or unknown mutation status of the c-Kit. Adults with hypereosinophilic syndrome (HES) and/or chronic eosinophilic leukemia (CEL) with positive, negative, or unknown FIP1L1-PDGFR fusion kinase. Adults with dermatofibrosarcoma protuberans (DFSP) that is unresectable, recurrent, and/or metastatic. Pts with malignant gastrointestinal stromal tumors (GIST) that are unresectable and/or metastatic. Prevention of cancer recurrence in pts following surgical removal of GIST. **OFF-LABEL:** Treatment of desmoid tumors (soft tissue sarcoma). Post-stem cell transplant (allogeneic), follow-up treatment in recurrent CML. Treatment of advanced or metastatic melanoma.

Precautions

Contraindications: Hypersensitivity to imatinib. **Cautions:** Hepatic/renal impairment, thyroidectomy pts, hypothyroidism, gastric surgery pts. Pts in whom fluid accumulation is poorly tolerated (e.g., HF, hypertension, pulmonary disease).

Action

Inhibits Bcr-Abl tyrosine kinase, an enzyme created by Philadelphia chromosome abnormality found in pts with chronic myeloid leukemia.

Therapeutic Effect: Suppresses tumor growth during the three stages of CML: blast crisis, accelerated phase, chronic phase. Induces apoptosis.

Pharmacokinetics

Well absorbed after PO administration. Protein binding: 95%. Metabolized in liver. Eliminated in feces (68%), urine (13%). **Half-life:** 18 hrs; metabolite, 40 hrs.

Lifespan considerations

Pregnancy/Lactation: May cause fetal harm. Breastfeeding not recommended.

Children: Safety and efficacy not established. **Elderly:** Increased frequency of fluid retention.

Interactions

DRUG: CYP3A4 inducers (e.g., carbamazepine, phenytoin, rifampin) may decrease concentration. CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, ketoconazole) may increase concentration. **Bone marrow depressants** (e.g., alemtuzumab, methotrexate) may increase myelosuppression. **Live virus vaccines** may potentiate virus replication, increase vaccine side effects, decrease pt's antibody response to vaccine. May reduce effect of **warfarin**. **HERBAL:** **St. John's wort** decreases concentration. **FOOD:** **Grapefruit products** may increase concentration. **LAB VALUES:** May increase serum bilirubin, ALT, AST, creatinine. May decrease platelet count, RBC, WBC count; serum potassium, albumin, calcium.

Availability (Rx)

Tablets: 100 mg, 400 mg.

Administration/handling

PO

- Give with a meal and large glass of water.
- Tablets may be dispersed in water or apple juice (stir until dissolved; give immediately). Do not crush or chew tablets.

Indications/routes/dosage

Ph+ Chronic Myeloid Leukemia (CML) (Chronic Phase)

PO: ADULTS, ELDERLY: 400 mg once daily; may increase to 600 mg/day. **Maximum:** 800 mg. **CHILDREN:** 340 mg/m²/day. **Maximum:** 600 mg.

Ph+ CML (Accelerated Phase)

PO: ADULTS, ELDERLY: 600 mg once daily. May increase to 800 mg/day in 2 divided doses (400 mg twice daily). **CHILDREN:** 340 mg/m²/day. **Maximum:**600 mg.

Ph+ Acute Lymphoblastic Leukemia (ALL)

PO: ADULTS, ELDERLY: 600 mg once daily.

Gastrointestinal Stromal Tumors (GIST) (Following Complete Resection)

PO: ADULTS, ELDERLY: 400 mg once daily for 3 yrs.

GIST (Unresectable)

PO: ADULTS, ELDERLY: 400 mg once daily. May increase up to 400 mg twice daily.

Aggressive Systemic Mastocytosis (ASM) with Eosinophilia

PO: ADULTS, ELDERLY: Initially, 100 mg/day. May increase up to 400 mg/day.

ASM without Mutation of the D816V C-Kit or Unknown Mutation Status of C-Kit

PO: ADULTS, ELDERLY: 400 mg once daily.

Dermatofibrosarcoma Protuberans (DFSP)

PO: ADULTS, ELDERLY: 400 mg twice daily.

Hypereosinophilic Syndrome (HES)/Chronic Eosinophilic Leukemia (CEL)

PO: ADULTS, ELDERLY: 400 mg once daily.

HES/CEL with Positive or Unknown FIP1L1-PDGFR Fusion Kinase

PO: ADULTS, ELDERLY: Initially, 100 mg/day. May increase up to 400 mg/day.

Myelodysplastic/Myeloproliferative Disease (MDS/MPD)

PO: ADULTS, ELDERLY: 400 mg once daily.

Usual Dosage for Children (2 Yrs and Older)

Ph+ CML (Chronic Phase, Recurrent or Resistant)

PO: 340 mg/m²/day. **Maximum:** 600 mg/day.

Ph+ CML (Chronic Phase, Newly Diagnosed, Ph+ ALL)

PO: 340 mg/m²/day. **Maximum:** 600 mg/day.

Dosage with Strong CYP3A4 Inducers

Increase dose by 50% with careful monitoring.

Dosage in Renal Impairment

Creatinine Clearance	Maximum Dose
40–59 mL/min	600 mg
20–39 mL/min	400 mg
Less than 20 mL/min	100 mg

Dosage in Hepatic Impairment

Mild to moderate impairment: No adjustment. **Severe impairment:** Reduce dosage by 25%.

Side effects

Frequent (68%–24%): Nausea, diarrhea, vomiting, headache, fluid retention, rash, musculoskeletal pain, muscle cramps, arthralgia. **Occasional (23%–10%):** Abdominal pain, cough, myalgia, fatigue, fever, anorexia, dyspepsia, constipation, night sweats, pruritus, dizziness, blurred vision, somnolence. **Rare (less than 10%):** Nasopharyngitis, petechiae, asthenia, epistaxis.

Adverse effects/toxic reactions

Severe fluid retention (pleural effusion, pericardial effusion, pulmonary edema, ascites), hepatotoxicity occur rarely. Neutropenia, thrombocytopenia are expected responses to the therapy. Respiratory toxicity is manifested as dyspnea, pneumonia. Heart damage (left ventricular dysfunction, HF) may occur.

Nursing considerations

Baseline assessment

Obtain baseline CBC, serum chemistries, renal function test. Monitor LFT before beginning treatment, monthly thereafter. Offer emotional support.

Intervention/evaluation

Assess periorbital area, lower extremities for early evidence of fluid retention. Monitor for unexpected, rapid weight gain. Offer antiemetics to control nausea, vomiting. Monitor daily pattern of bowel activity, stool consistency. Monitor CBC wkly for first mo, biweekly for second mo, periodically thereafter for evidence of neutropenia, thrombocytopenia; assess hepatic function tests for hepatotoxicity. Monitor renal function, serum electrolytes. Duration of neutropenia or thrombocytopenia ranges from 2–4 wks.

Patient/family teaching

- Avoid crowds, those with known infection.
- Avoid contact with anyone who recently received live virus vaccine; do not

receive vaccinations.

- Take with food and a full glass of water.
- Avoid grapefruit products.
- Report chest pain, swelling of extremities, weight gain greater than 5 lb, easy bruising/bleeding.
- Avoid tasks that require alertness, motor skills until response to drug is established.

imipenem/cilastatin

im-i-pen-em/sye-la-stat-in

Primaxin

◆ CLASSIFICATION

PHARMACOTHERAPEUTIC: Fixed-combination carbapenem.

CLINICAL: Antibiotic.

Do not confuse imipenem with doripenem, ertapenem, or meropenem, or Primaxin with Premarin or Primacor.

Uses

Treatment of susceptible infections due to gram-negative (ESBL *E. coli* and *Klebsiella*, *Enterobacter* spp. PsAs), gram-positive (MSSA, *Streptococcus* spp.), anaerobic organisms including respiratory tract, skin/skin structure, gynecologic, bone, joint, intra-abdominal, complicated or uncomplicated UTIs; endocarditis (caused by *S. aureus*); polymicrobial infections; septicemia; serious nosocomial infections. **OFF-LABEL:** Hepatic abscess, neutropenic fever, melioidosis.

Precautions

Contraindications: Hypersensitivity to imipenem/cilastatin. **Cautions:** CNS disorders (e.g., brain lesions and history of seizures), sensitivity to beta-lactams (e.g., penicillins, cephalosporins), renal impairment, elderly.

Action

Imipenem: Penetrates bacterial cell membrane, inhibiting cell wall synthesis.

Cilastatin: Competitively inhibits the enzyme dehydropeptidase, preventing

renal metabolism of imipenem. **Therapeutic Effect:** Produces bacterial cell death.

Pharmacokinetics

Readily absorbed after IM administration. Protein binding: **Imipenem:** 20%; **Cilastatin:** 40%. Widely distributed. Metabolized in kidneys. Primarily excreted in urine. Removed by hemodialysis. **Half-life:** 1 hr (increased in renal impairment).

Lifespan considerations

Pregnancy/Lactation: Crosses placenta. Distributed in cord blood, amniotic fluid, breast milk. **Children:** No precautions noted. **Elderly:** Age-related renal impairment may require dosage adjustment.

Interactions

DRUG: May decrease concentration of **valproic acid**. **Ganciclovir, probenecid** may increase concentration. **HERBAL:** None significant. **FOOD:** None known. **LAB VALUES:** May increase serum alkaline phosphatase, BUN, bilirubin, creatinine, LDH, ALT, AST. May decrease Hgb, Hct.

Availability (Rx)

Injection, Powder for Reconstitution (Primaxin): 250 mg, 500 mg.

Administration/handling

IV

Reconstitution

- Dilute each 250- or 500-mg vial with 100–250 mL D₅W or 0.9% NaCl. Final concentration not to exceed 5 mg/mL.

Rate of Administration

- Give by intermittent IV infusion (piggyback).
- Do not give IV push.
