NOTE: As new scientific information becomes available through basic and clinical research, recommended treatments and drug therapies undergo changes. The authors and publisher have done everything possible to make this book accurate, up to date, and in accord with accepted standards at the time of publication. However, the reader is advised always to check product information (package inserts) for changes and new information regarding dose and contraindications before administering any drug. Caution is especially urged when using new or infrequently ordered drugs.

DEDICATION

To my son, Ben, whose sensitivity and sense of humor make even the toughest day easier.
To my daughter, Katharine, whose dedication and passion in seeking her goals I admire.
Watching you both grow to become wonderful young adults gives me such pride and joy. Your support of my work inspires me. Thank you for sharing so much of your lives with me. I love you.

AHV

To my wonderful mother, Geraldine, who has provided her continual love, support, and wisdom as I continue to pursue all of my personal and professional goals.

CAS

ACKNOWLEDGMENTS

We offer our thanks to the students and nurses who have used our book for more than 30 years. We hope our book provides you with the current knowledge of pharmacotherapeutics you need to continue to give quality care in our rapidly changing health-care environment.

April and Cindy

HOW TO USE *DAVIS'S DRUG GUIDE FOR NURSES*

Davis's Drug Guide for Nurses provides comprehensive, up-to-date drug information in well-organized, nursing-focused monographs. It also includes extensive supplemental material in 16 appendices, thoroughly addresses the issue of safe medication administration, and educates the reader about 50 different therapeutic classes of drugs. In this 16th edition, we have continued the tradition of focusing on safe medication administration by including **Medication Safety Tools** and even more information about health care's most vulnerable patients: children, the elderly, pregnant women, and breast feeding mothers. Look for more **Pedi**, **Geri**, **OB**, and **Lactation** headings throughout the monographs. In addition, we've included information relevant to Canadian students and nurses. You'll find an appendix comparing Canadian and U.S. pharmaceutical practices, more Canada-only combination drugs in the Combination Drugs appendix, and additional Canadian brand names in the drug monographs. To help you find this information quickly, we've also added a maple leaf icon (🍁) in the index next to each Canadian entry. We have added pharmacogenomic information throughout numerous monographs to guide the nurse in selecting and monitoring various drug therapies. To help you find this information quickly, we've added a double helix icon (🌀) to denote this information as it applies to specific drugs. Use this book to enhance your competence in implementing and evaluating medication therapies. The following sections describe the organization of *Davis's Drug Guide for Nurses* and explain how to quickly find the information you need.

Safe Medication Use Articles

"Medication Errors: Improving Practices and Patient Safety," "Detecting and Managing Adverse Drug Reactions," "Overview of Risk Evaluation and Mitigation Systems (REMS)," "Special Dosing Considerations," and "Educating Patients About Safe Medication Use" comprise the safe medication use articles and provide an overview of the medication safety issues that confront practitioners and patients. Leading off this series, the medication errors article familiarizes you with the systems issues and clinical situations repeatedly implicated in medication errors and suggests practical means to avoid them. It also teaches you about *high alert* medications, which have a greater potential to cause patient harm than other medications. "Detecting and Managing Adverse Drug Reactions" explains the different types of adverse reactions and provides guidance on how to detect and manage them. "Risk Evaluation and Mitigation Strategies (REMS)" explains strategies developed by the pharmaceutical industry and required by the Food and Drug Administration (FDA) to minimize adverse drug reactions from potentially dangerous drugs. We have highlighted the drugs that currently have approved REMS programs associated with their use by adding a REMS label at the top of applicable drug monographs. "Special Dosing Considerations" identifies the patient populations, such as neonates and patients with renal impairment, who require careful dose adjustments to ensure optimal therapeutic outcomes. "Educating Patients About Medication Use" reviews the most important teaching points for nurses to discuss with their patients and their families. In addition to these safety articles, other critical information is highlighted in red throughout the drug monographs. This allows the reader to quickly identify important information and to see how nursing practice, including assessment, implementation, and patient teaching, relates to it.

Classifications Profile

Medications in the same therapeutic class often share similar mechanisms of action, assessment guidelines, precautions, and interactions. The Classifications Profile provides summaries of the major therapeutic classifications used in *Davis's Drug Guide for Nurses*. It also provides patient teaching information common to all agents within the class and a list of drugs within each class.

Medication Safety Tools

Updated for this edition is a section with tables and charts that nurses can use for a quick but thorough reference to information that will help them avoid making medication errors. It includes lists of drugs that are associated with adverse reactions and falls in the elderly; proper dosing for pediatric intravenous medications; confused drug names; FDA-approved Tall Man letters and more.

Drug Monographs

Drug monographs are organized in the following manner:

High Alert Status: Some medications, such as chemotherapeutic agents, anticoagulants, and insulins, have a greater potential for harm than others. These medications have been identified by the *Institute for Safe Medication Practices* as **high alert drugs**. *Davis's Drug Guide for Nurses* includes a high alert tab in the upper right corner of the monograph header in appropriate medications to alert the nurse to the medication's risk. The term "high alert" is used in other parts of the monograph as well, to help the nurse administer these medications safely. See the article "Medication Errors: Improving Practices and Patient Safety" for a complete list of high alert medications in *Davis's Drug Guide for Nurses*. Refer to ISMP.org for all solutions, groups, and individual high alert drugs.

Generic/Brand Name: The generic name appears first, with a pronunciation key, followed by an alphabetical list of trade names. Canadian trade names are preceded by a maple leaf (☸). Brand names that have been discontinued have a slash through them (**Decadron**). Common names, abbreviations, and selected foreign names are also included.

Classification: The therapeutic classification, which categorizes drugs by the disease state they are used to treat, appears first, followed by the pharmacologic classification, which is based on the drug's mechanism of action.

Controlled Substance Schedule: All drugs regulated by federal law are placed into one of five schedules, based on the drug's medicinal value, harmfulness, and potential for abuse or addiction. Schedule I drugs, the most dangerous and having no medicinal value, are not included in *Davis's Drug Guide for Nurses*. (See Appendix I for a description of the Schedule of Controlled Substances.)

Pregnancy Category: The FDA recently recommended discontinuation of the Pregnancy Category system (A, B, C, D, and X) since this categorization may not appropriately communicate the risk that a drug may have during pregnancy or breast feeding. Based on this guidance, the Pregnancy Categories have been removed from each of the drug monographs. These pregnancy letter categories have been replaced in drug prescribing information with a narrative summary that describes the potential risk of using the drug during pregnancy and breast feeding as well as in women and men of reproductive potential. The drug monographs have been enhanced with this detailed information in these patient populations.

Indications: Medications are approved by the FDA for specific disease states. This section identifies the diseases or conditions for which the drug is commonly used and includes significant unlabeled uses as well.

Action: This section contains a concise description of how the drug produces the desired therapeutic effect.

Pharmacokinetics: Pharmacokinetics refers to the way the body processes a medication by absorption, distribution, metabolism, and excretion. This section also includes information on the drug's half-life.

Absorption: Absorption describes the process that follows drug administration and its subsequent delivery to systemic circulation. If only a small fraction is absorbed following oral administration (diminished bioavailability), then the oral dose must be much greater than the parenteral dose.

Absorption into systemic circulation also follows other routes of administration such as topical, transdermal, intramuscular, subcutaneous, rectal, and ophthalmic routes. Drugs administered intravenously are 100% bioavailable.

Distribution: This section comments on the drug's distribution in body tissues and fluids. Distribution becomes important in choosing one drug over another, as in selecting an antibiotic that will penetrate the central nervous system to treat meningitis or in avoiding drugs that cross the placenta or concentrate in breast milk. Information on protein binding is included for drugs that are >95% bound to plasma proteins, which has implications for drug-drug interactions.

Metabolism and Excretion: Drugs are primarily eliminated from the body either by hepatic conversion to active or inactive compounds (metabolism or biotransformation) and subsequent excretion by the kidneys, or by renal elimination of unchanged drug. Therefore, drug metabolism and excretion information is important in determining dosage regimens and intervals for patients with impaired renal or hepatic function. The creatinine clearance (CCr) helps quantify renal function and guides dosage adjustments. Formulas to estimate CCr are included in Appendix F.

Half-Life: The half-life of a drug is the amount of time it takes for the drug concentration to decrease by 50% and roughly correlates with the drug's duration of action. Half-lives are given for drugs assuming the patient has normal renal or hepatic function. Conditions that alter the half-life are noted.

Time/Action Profile: The time/action profile table provides the drug's onset of action, peak effect, and duration of activity. This information can aid in planning administration schedules and allows the reader to appreciate differences in choosing one route over another.

Contraindications and Precautions: Situations in which drug use should be avoided are listed as contraindications. In general, most drugs are contraindicated in pregnancy or lactation, unless the potential benefits outweigh the possible risks to the mother or baby (e.g., anticonvulsants, antihypertensives, and antiretrovirals). Contraindications may be absolute (i.e., the drug in question should be avoided completely) or relative, in which certain clinical situations may allow cautious use of the drug. The precautions portion includes disease states or clinical situations in which drug use involves particular risks or in which dosage modification may be necessary. Extreme cautions are noted separately to draw attention to conditions under which use of the drug results in serious, potentially life-threatening consequences.

Adverse Reactions and Side Effects: Although it is not possible to include all reported reactions, major side effects for all drugs are included. Life-threatening adverse reactions or side effects are **CAPITALIZED**, and the most frequent side effects are underlined. Those underlined generally have an incidence of 10% or greater. Those not underlined occur in fewer than 10% but more than 1% of patients. Although life-threatening reactions may be rare (fewer than 1%), they are included because of their significance. The following abbreviations are used for body systems:

CNS: central nervous system

EENT: eye, ear, nose, and throat

Resp: respiratory

CV: cardiovascular

GI: gastrointestinal

GU: genitourinary

Derm: dermatologic

Endo: endocrinologic

F and E: fluid and electrolyte

Hemat: hematologic

Local: local

Metab: metabolic

MS: musculoskeletal

Neuro: neurologic

Misc: miscellaneous

Rep: reproductive

Interactions: Drug interactions are a significant risk for patients. As the number of medications a patient receives increases, so does the likelihood of drug-drug interactions. This section provides the most important drug-drug interactions and their physiological effects. Significant drug-food and drug-

natural product interactions are also noted as are recommendations for avoiding or minimizing these interactions.

Route and Dosage: Routes of administration are grouped together and include recommended doses for adults, children, and other more specific age groups (such as geriatric patients). Dosage units are expressed in the terms in which they are usually prescribed. For example, penicillin G dosage is given in units rather than in milligrams. Dosing intervals also are provided in the manner in which they are frequently ordered. If a specific clinical situation (indication) requires a different dose or interval, this is listed separately for clarity. Specific dosing regimens for hepatic or renal impairment are also included.

Availability: This section lists the strengths and concentrations of available dose forms. Such information is useful in planning more convenient regimens (fewer tablets/capsules, less injection volume) and in determining whether certain dosage forms are available (suppositories, oral concentrates, sustained- or extended-release forms). Flavors of oral liquids and chewable tablets have been included to improve compliance and adherence in pediatric patients. General availability and average wholesale prices of commonly prescribed drugs have also been added as an aid to nurses with prescriptive authority.

Nursing Implications: This section helps the nurse apply the nursing process to pharmacotherapeutics. The subsections provide a step-by-step guide to clinical assessment, implementation (drug administration), and evaluation of the outcomes of pharmacologic therapy.

Assessment: This section includes guidelines for assessing patient history and physical data before and during drug therapy. Assessments specific to the drug's various indications are also included. The **Lab Test Considerations** section provides the nurse with information regarding which laboratory tests to monitor and how the results may be affected by the medication. It also includes dose modifications required for changes in lab values. **Toxicity and Overdose** alerts the nurse to therapeutic serum drug concentrations that must be monitored and signs and symptoms of toxicity. The antidote and treatment for toxicity or overdose of appropriate medications also are included.

Potential Nursing Diagnoses: The two or three most pertinent North American Nursing Diagnoses Association (NANDA) diagnoses that potentially apply to a patient receiving the medication are listed. Each diagnosis includes the pharmacologic effect from which the diagnosis has been derived. For instance, the patient receiving immunosuppressant drugs should be diagnosed with Risk for Infection. The diagnosis is followed by the term Side Effects in parentheses. Since patient education is fundamental to all nurse-patient interactions, the diagnosis Deficient Knowledge should be assumed to be a nursing diagnosis applicable to all drugs.

Implementation: Guidelines specific for medication administration are discussed in this subsection. **High Alert** information, i.e., information that directly relates to preventing medication errors with inherently dangerous drugs, is included first if applicable. Sound-alike look-alike name confusion alerts are also included here. Other headings in this section provide data regarding routes of administration. **PO** describes when and how to administer the drug, whether tablets may be crushed or capsules opened, and when to administer the medication in relation to food. In addition, we have identified which opioids have *abuse deterrent* properties and describe the mechanism of these properties within the monograph. The **IV Administration** section includes specific information about administering the medication intravenously. This section has been thoroughly updated and contains a prominent IV Administration heading that introduces this section. Bold, red headings are included to highlight the recommended **diluents** and **concentrations**. These headings complement the **rate** heading and make this critical information easy to find. Several subsections comprise the IV Administration section. The first section, **IV Push**, which refers to administering medications from a syringe directly into a saline lock, Y-site of IV tubing, or a 3-way stopcock, provides details for reconstitution, concentration, dilution, and rate.

Rate is also included in both other methods of IV administration, direct or intermittent infusion. **Intermittent Infusion** and **Continuous Infusion** specify standard dilution solutions and amounts, stability information, and rates. In addition, a quick reference for information about dilution amounts in neonates and infants, who are extremely sensitive to excess fluids, is contained in the new **Medication Safety Tools** section. **Y-Site Compatibility/Incompatibility** identifies medications compatible or incompatible with each drug when administered via Y-site injection or 3-way stopcock in IV tubing. **Additive Compatibility/Incompatibility** identifies medications compatible or incompatible when admixed in solution. Compatibility of diluted medications administered through a Y-site for continuous or intermittent infusion is usually limited to 24 hours. **Solution Compatibility/Incompatibility** identifies compatible or incompatible solutions for dilution for administration purposes. Compatibility information is compiled from *Micromedex* and the manufacturer's package insert.

Patient/Family Teaching: This section includes information that should be taught to patients and/or families of patients. Side effects that should be reported, information on minimizing and managing side effects, details on administration, and follow-up requirements are presented. The nurse also should refer to the **Implementation** section for specific information to teach to the patient and family about taking the medication. **Home Care Issues** discusses aspects to be considered for medications taken in the home setting.

Evaluation: Outcome criteria for determination of the effectiveness of the medication are provided.

EVIDENCE-BASED PRACTICE AND PHARMACOTHERAPEUTICS: Implications for Nurses

Note: The content below is an excerpt from an article written exclusively for the 12th edition of **Davis's Drug Guide for Nurses**. To access the full article, visit **DavisPlus**, F.A. Davis's online center for student and instructor ancillaries, at <http://davisplus.fadavis.com>.

The purpose of evidence-based practice is to improve the outcomes of treatment for patients. How pharmacologic agents affect patients is often the subject of research; such research is required by the Food and Drug Administration (FDA) before and after drug approval. Any medication can be the subject of an evidence-based clinical review article. But what does "evidence-based" mean and how does it relate to nursing?

According to Ingersoll, "Evidence-based nursing practice is the conscientious, explicit, and judicious use of theory-derived, research-based information in making decisions about care delivery to individuals or groups of patients and in consideration of individual needs and preferences" (2000, p. 152). Still subject to debate are questions about the sufficiency and quality of evidence. For example, what kind of evidence is needed? How much evidence is necessary to support, modify, or change clinical practice? And, were the studies reviewed of "good" quality and are their results valid?

In general, clinicians use **hierarchy of evidence** schemas to rank types of research reports from the most valuable and scientifically rigorous to the least useful. The hierarchy makes clear that some level of evidence about the effect of a particular treatment or condition exists, even if the evidence is considered weak. Figure 1 illustrates a hierarchy of evidence pyramid with widely accepted rankings: the most scientifically rigorous at the top, the least scientifically rigorous at the bottom. Practitioners and clinicians should look for the highest level of available evidence to answer their clinical questions. However, it is important that clinicians also apply the second fundamental principle of EBP, which is that evidence alone is not sufficient to make clinical decisions. Decision makers must always trade off the benefits and risks, and the costs associated with alternative treatment options, and by doing so, consider the patients' values and preferences.

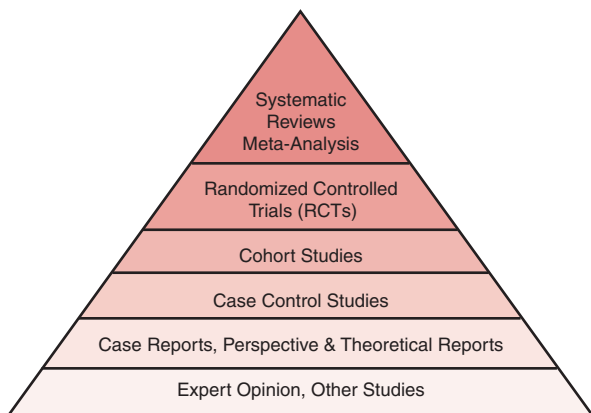

Figure 1: Hierarchy of Scientific Evidence Pyramid

Evidence-Based Practice and Its Importance in Pharmacology

Evidence-based practices in pharmacology generally are derived from well-designed randomized controlled trials (RCTs) or other experimental designs that investigate drugs' therapeutic and non-therapeutic effects. However, although FDA-approved pharmacologic agents have undergone rigorous testing through RCTs, nurses have the responsibility to evaluate the findings for the best scientific evidence available and to determine the most appropriate, safest, and efficacious drugs for their patients.

While numerous databases are available through Internet searches, two valuable and quickly accessible resources for evaluating the current highest level of pharmacologic evidence are 1) the Cochrane Database of Systematic Reviews and the Central Register of Controlled Trials and 2) the National Guidelines Clearinghouse (NGC), supported by the Agency for Healthcare Research and Quality (AHRQ). The Cochrane library and databases provide full text of high-quality, regularly updated systematic reviews, protocols, and clinical trials. The Web address is <http://www.cochrane.org/reviews.clbintro.htm>.

AHRQ's Evidence-Based Practice Centers (EPCs) provide evidence reports and technology assessments that can assist nurses in their efforts to provide the highest quality and safest pharmacologic health care available. The EPCs systematically review the relevant scientific literature, conduct additional analyses (when appropriate) prior to developing their reports and assessments, and provide guideline comparisons. The Web address is <http://www.guideline.gov>.

Evidence-based systematic reports and guidelines provide nurses with instantaneous access to the most current knowledge, enabling them to critically appraise the scientific evidence and its appropriateness to their patient population. This is especially important given the need for nurses to keep abreast of the rapidly changing pharmacologic agents in use. New drugs are approved each month, compelling nurses to know these drugs' intended uses, therapeutic effects, interactions, and adverse effects.

Evidence-based practice requires a shift from the traditional paradigm of clinical practice—grounded in intuition, clinical experience, and pathophysiologic rationale—to a paradigm in which nurses must combine clinical expertise, patient values and preferences, and clinical circumstances with the integration of the best scientific evidence in order to make conscientious, well-informed, research-based decisions that affect nursing patient care.

PHARMACOGENOMICS

Introduction

Multiple variables influence the selection and optimization of drug therapy for each individual patient. Pharmacogenomics, the study of the influence of individual genetic variations on drug response in patients, may yield additional information to further enhance safe and effective medication use. Whereas the field originally focused on the effects of specific variants within individual genes on drug response (i.e., pharmacogenetics), efforts increasingly examine the role of multiple variants across the genome and their potential relationship to drug therapy outcomes.

As our understanding of pharmacogenomics and the biological relevance of specific genetic variants in individuals' drug metabolizing enzymes, drug transporter proteins, and drug target receptors to certain drug responses has increased, we have learned that multiple variations across the genome can contribute to significant and relatively predictable treatment outcomes. Virtually every therapeutic area involving medication use includes a drug for which documented genetic variability has the potential to affect drug response. Some of this information is included in the FDA-approved package insert prescribing information. For some agents, the suitability of a specific drug or the determination of an appropriate initial dose for an individual patient based on pharmacogenetic information has been incorporated into dosing algorithms and patient care. As such, it is essential that health care professionals can interpret and utilize this information to facilitate safer and more effective use of medications for individual patients.

Genetic Variation within the Human Genome

The human genome is comprised of approximately 3 billion nucleotide base pair sequences that encode for molecular DNA with, except for identical twins, each individual having his/her own unique human genome sequence. Four nucleotide bases (adenine, guanine, cytosine, and thymine) are responsible for constituting the sequence of each single strand of DNA. Variations in nucleotide sequences can occur, and contribute to alterations in the expression and activities of certain genes. The location of these variations within a DNA sequence on a particular chromosome can have a profound impact on the ultimate biological activity or characteristic of that gene or lead to little or unknown consequences.

Proteins are involved in most enzymatic, structural, and biologic functions associated with drug disposition and effects. The processes involved in DNA replication, RNA transcription, and translation to synthesized proteins are complex. Each of these processes is potentially susceptible to consequences of DNA sequence variations.

Genetic variations can take many forms, including single nucleotide base substitutions (e.g., a cytosine substituted for an adenine), insertions or deletions of a nucleotide base within a sequence, and deletions or extra copies of entire DNA sequences. Variations in DNA that occur at a frequency of greater than 1% in the population are called polymorphisms. The most common genetic variations in humans are referred to as single nucleotide polymorphisms (SNPs) and result from the substitution of one nucleotide base for another. The specific location of a SNP within a gene is important. As mentioned previously, genetic variations can be of unknown or no clinical consequence or they can lead to a truncated, dysfunctional, or complete lack of protein product that is associated with an alteration in drug response.

Clinical Significance of Genetic Polymorphisms

SNPs and other genetic variations influence drug response at different levels through alterations in the activities of enzymes or proteins involved in drug absorption, transport, metabolism, elimination, or at the drug target receptor (site of drug action). Clinically relevant polymorphisms have been identified for genes that encode for most of the common enzymes involved in drug metabolism. Most enzymes

are localized intracellularly throughout a wide variety of tissues in the body, including the enterocytes that line the intestine and within hepatocytes. Variants that cause diminished or absent enzyme activity decrease drug metabolism processes. In this case, if the drug is metabolized to an inactive product, then the prolonged persistence of the parent drug in the body could result in excessive pharmacologic effects and potential toxicities may occur. If the drug requires enzymatic conversion to a pharmacologically active metabolite, drug response may be reduced or absent. In contrast, if the variation is due to extra copies of a gene that results in increased enzymatic activity, opposite effects on drug metabolism and response can occur.

Similar outcomes can be associated with polymorphisms in genes that encode for membrane transporter proteins that are responsible for drug transport into cells (influx), as well as proteins that participate in energy-dependent processes that export drugs out of cells (efflux transporters). Polymorphisms in drug transport proteins can influence drug response by altering drug gastrointestinal absorption, uptake and distribution in tissues, exposure to intracellular drug metabolizing enzymes, and elimination via the bile or urine. Finally, some genes that encode for certain drug receptors are highly polymorphic, resulting in attenuated or exaggerated drug responses. The number of polymorphic genes responsible for variations in drug response at drug receptors is relatively small compared to those associated with drug metabolizing enzymes or transport proteins; however, this area has undergone the least amount of study to date.

Incorporating Pharmacogenomic Information into Clinical Practice

Most drugs are initiated in individual patients based on knowledge about their safety and effectiveness within the general population. Information regarding patient characteristics (e.g., age, ethnicity, renal/hepatic function, concomitant disease, etc.) known to contribute to variability in drug response, when available, is considered at this time. Currently, there are more than 50 drugs with pharmacogenomic information included in the package insert. For selected agents, dosing recommendations based on an individual's genetic information (i.e., genotype) for specific drugs and drug classes are also considered. Genomic biomarkers can play an important role in identifying responders and non-responders, avoiding drug toxicity, and adjusting the dose of drugs to optimize their efficacy and safety. However, the typical strategy for most drug therapy is to monitor the patient's response to treatment and modify regimens as necessary. Patients who develop exaggerated pharmacologic responses or elicit no pharmacologic effect may be expressing a phenotype suggestive of altered drug disposition or target receptor effect that could be associated with an underlying genetic polymorphism. As we continue to learn more about these associations and can incorporate pharmacogenomic information into decisions regarding drug therapy for individual patients, the ultimate goal is to improve therapeutic outcomes by limiting drug exposure to patients that are most likely to derive no therapeutic benefit and/or experience toxic drug effects.

For example, some genetic variants are associated with hypersensitivity reactions to a specific drug. A prescriber who is contemplating initiating that drug for a patient may determine whether the patient possesses that variant in his or her DNA. If that specific variant is present, the prescriber might select an alternate agent, thereby avoiding a potentially life-threatening hypersensitivity reaction. In another example, patients who are determined to have a genetic variant that results in an inactive metabolizing enzyme would not be appropriate candidates for an analgesic drug that requires that enzyme to convert the drug to the active analgesia-producing form. On the other hand, if that metabolizing enzyme is responsible for conversion of an active parent drug to an inactive metabolite, the starting dose of the drug may be reduced or perhaps an alternate drug might be selected.

Several Clinical Laboratory Improvement Amendment (CLIA)-approved laboratories offer pharmacogenetic testing to identify relevant genetic polymorphisms that predict drug response and can be used to initiate appropriate drugs and dosing regimens for individual patients. Some of these tests, while recommended in drug prescribing information, are costly and may not be covered by insurance. Patients may not fully understand the utility of undergoing genetic testing and providing a specimen for DNA analysis, which is typically performed on a blood, saliva, buccal swab, or other tissue collection. On the other hand, patients who are engaged in their medical care may be familiar

with the concept of “personalized medicine” and seek information about available tests to “individualize” their own drug therapy. Currently, four drugs are required to have pharmacogenetic testing performed before they are prescribed: cetuximab, trastuzumab, maraviroc, and dasatinib. Other drugs have labeling that include “test recommended” or “for information only.” Health care professionals will need to be familiar with pharmacogenetic tests that are recommended for specific drug therapies, how to interpret the results of those tests, and how to incorporate pharmacogenetic data with other clinical information to optimize patient drug therapy and health care outcomes.

MEDICATION ERRORS: Improving Practices and Patient Safety

It is widely acknowledged that medication errors result in thousands of adverse drug events, preventable reactions, and deaths per year. Nurses, physicians, pharmacists, patient safety organizations, the Food and Drug Administration, the pharmaceutical industry, Health Canada, and other parties share in the responsibility for determining how medication errors occur and designing strategies to reduce error.

One impediment to understanding the scope and nature of the problem has been the reactive “blaming, shaming, training” culture that singled out one individual as the cause of the error. Also historically, medication errors that did not result in patient harm—near-miss situations in which an error could have but didn’t happen—or errors that did not result in serious harm were not reported. In contrast, serious errors often instigated a powerful punitive response in which one or a few persons were deemed to be at fault and, as a result, lost their jobs and sometimes their licenses.

In 1999, the Institute of Medicine (IOM) published *To Err Is Human: Building a Safer Health System*, which drew attention to the problem of medication errors. It pointed out that excellent health care providers do make medication errors, that many of the traditional processes involved in the medication-use system were error-prone, and that other factors, notably drug labeling and packaging, contributed to error. Furthermore, the IOM report, in conjunction with other groups such as the United States Pharmacopeia (USP) and the Institute for Safe Medication Practices (ISMP), called for the redesign of error-prone systems to include processes that anticipated the fallibility of humans working within the system. This initiative is helping shift the way the health care industry addresses medication errors from a single person/bad apple cause to a systems issue.

The National Coordinating Council for Medication Error Reporting and Prevention (NCC-MERP) developed the definition of a medication error that reflects this shift and captures the scope and breadth of the issue:

“A medication error is any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the health care professional, patient, or consumer. Such events may be related to professional practice, health care products, procedures, and systems, including prescribing; order communication; product labeling, packaging, and nomenclature; compounding; dispensing; distribution; administration; education; monitoring; and use.”

Inherent in this definition’s mention of related factors are the human factors that are part of the medication use system. For example, a nurse or pharmacist may automatically reach into the bin where dobutamine is usually kept, see “do” and “amine” but select dopamine instead of dobutamine. Working amidst distractions, working long hours or shorthanded, and working in a culture where perfection is expected and questioning is discouraged are other examples of the human factors and environmental conditions that contribute to error.

The goal for the design of any individual or hospital-wide medication use system is to determine where systems are likely to fail and to build in safeguards that minimize the potential for error. One way to begin that process is to become familiar with medications or practices that have historically been shown to be involved in serious errors.

High Alert Medications

Some medications, because of a narrow therapeutic range or inherent toxic nature, have a high risk of causing devastating injury or death if improperly ordered, prepared, stocked, dispensed, administered, or monitored. Although these medications may not be involved in more errors, they require special attention due to the potential for serious, possibly fatal consequences. These have been termed **high-alert medications**, to communicate the need for extra care and safeguards. Many of these drugs are used commonly in the general population or are used frequently in urgent clinical situations. The Joint Commission (TJC) monitors the use of frequently prescribed high-alert medications, which include insulin, opiates and narcotics, injectable potassium chloride (or phosphate) concentrate, intravenous anticoagulants (such as heparin), sodium chloride solutions above 0.9 percent, and others. See the High

Alert Drugs table in the **Medication Safety Tools** section, and Table 1 in this article for a complete list of the high alert meds found in *Davis's Drug Guide for Nurses*. (Visit the Institute for Safe Medication Practices at www.ismp.org for more information on high alert drugs.)

Causes of Medication Errors

Many contributing factors and discrete causes of error have been identified, including failed communication, poor drug distribution practices, dose miscalculations, drug packaging and drug-device related problems, incorrect drug administration, and lack of patient education.

Failed Communication: Failed communication covers many of the errors made in the ordering phase, and although ordering is performed by the prescriber, the nurse, the clerk, and the pharmacist who interpret that order are also involved in the communication process.

- **Poorly handwritten or verbal orders.** Handwriting is a major source of error and has led to inaccurate interpretations of the drug intended, the route of administration, the frequency, and dose. Telephone and verbal orders are likewise prone to misinterpretation.
- **Drugs with similar-sounding or similar-looking names.** Similar sounding names, or names that look similar when handwritten, are frequently confused. Amiodarone and amrinone (now renamed inamrinone to help prevent confusion), or Zebeta® and Diabeta® are two examples. The USP has identified over 700 “sound-alike, look-alike” drugs. Mix-ups are more likely when each drug has similar dose ranges and frequencies.

Several of the sound-alike/look-alike drugs were targeted for labeling intervention by the FDA, which requested manufacturers of 33 drugs with look-alike names to voluntarily revise the appearance of the established names. The revision visually differentiates the drug names by using “tall man” letters (capitals) to highlight distinguishing syllables (ex.: acetoHEXAMIDE versus acetaZOLAMIDE or buPROPion versus busPIRone). See the TALL MAN Lettering table in the **Medication Safety Tools** section for the list of the pairs of drugs that are commonly confused, often with serious consequences.

- **Misuse of zeroes in decimal numbers.** Massive, ten-fold overdoses are traceable to not using a leading zero (.2 mg instead of 0.2 mg) or adding an unnecessary trailing zero (2.0 mg instead of 2 mg) in decimal expressions of dose. Similar overdoses are found in decimal expressions in which the decimal point is obscured by poor handwriting, stray marks, or lined orders sheets (e.g., reading 3.1 grams as 31 grams). Under-dosing also may occur by the same mechanism and prevent a desired, perhaps life-saving effect.
- **Use of apothecary measures (grains, drams) or package units (amps, vials, tablets) instead of metric measures (grams, milligrams, milliequivalents).** Apothecary measurements are poorly understood and their abbreviations are easily confused with other units of measurement. Use of such measures should be abandoned. Errors also occur when dosage units are used instead of metric weight. For example, orders for 2 tablets, 1 1/2 vials, or 2 ampules can result in overdose or underdose when the medications ordered come in various strengths.
- **Misinterpreted abbreviations.** Abbreviations can be misinterpreted or, when used in the dosage part of the order, can result in incorrect dosage of the correct medication. For example, lower or uppercase “U” for units has been read as a zero, making 10 u of insulin look like 100 units when handwritten. The Latin abbreviation “QOD” for every other day has been misinterpreted as QID (4 times per day). See Table 2 for a list of confusing abbreviations and safer alternatives.
- **Ambiguous or incomplete orders.** Orders that do not clearly specify dose, route, frequency, or indication do not communicate complete information and are open to misinterpretation.

Poor Distribution Practices: Poor distribution includes error-prone storing practices such as keeping similar-looking products next to each other. Dispensing multidose floor stock vials of potentially dangerous drugs instead of unit doses is also associated with error as is allowing non-pharmacists to dispense medications in the absence of the pharmacist.

Dose Miscalculations: Dose miscalculations are a prime source of medication error. Also, many medications need to be dose-adjusted for renal or hepatic impairment, age, height and weight, and body composition (i.e., correct for obesity). Complicated dosing formulas provide many opportunities to

introduce error. Often vulnerable populations, such as premature infants, children, the elderly, and those with serious underlying illnesses, are at greatest risk.

Drug Packaging and Drug Delivery Systems: Similar packaging or poorly designed packaging encourages error. Drug companies may use the same design for different formulations, or fail to highlight information about concentration or strength. Lettering, type size, color, and packaging methods can either help or hinder drug identification.

Drug delivery systems include infusion pumps and rate controllers. Some models do not prevent free flow of medication, leading to sudden high dose infusion of potent and dangerous medications. The lack of safeguards preventing free flow and programming errors are among the problems encountered with infusion control devices.

Incorrect Drug Administration: Incorrect drug administration covers many problems. Misidentification of a patient, incorrect route of administration, missed doses, or improper drug preparation are types of errors that occur during the administration phase.

Lack of Patient Education: Safe medication use is enhanced in the hospital and the home when the patient is well informed. The knowledgeable patient can recognize when something has changed in his or her medication regimen and can question the health care provider. At the same time, many issues related to medication errors, such as ambiguous directions, unfamiliarity with a drug, and confusing packaging, affect the patient as well as the health care provider, underscoring the need for careful education. Patient education also enhances adherence, which is a factor in proper medication use.

Prevention Strategies

Since medication use systems are complex and involve many steps and people, they are error-prone. On an individual basis, nurses can help reduce the incidence of error by implementing the following strategies:

- Clarify any order that is not obviously and clearly legible. Ask the prescriber to print orders using block style letters.
- Do not accept orders with the abbreviation “u” or “IU” for units. Clarify the dosage and ask the prescriber to write out the word units.
- Clarify any abbreviated drug name or the abbreviated dosing frequencies q.d., QD, q.o.d., QOD, and q.i.d or QID. Suggest abandoning Latin abbreviations in favor of spelling out dosing frequency.
- Do not accept doses expressed in package units or volume instead of metric weight. Clarify any order written for number of ampules, vials, or tablets (e.g., calcium chloride, 1 ampule or epinephrine, 1 Bristojet).
- Decimal point errors can be hard to see. Suspect a missed decimal point and clarify any order if the dose requires more than 3 dosing units.
- If dose ordered requires use of multiple dosage units or very small fractions of a dose unit, review the dose, have another health care provider check the original order and recalculate formulas, and confirm the dose with the prescriber.
- If taking a verbal order, ask prescriber to spell out the drug name and dosage to avoid sound-alike confusion (e.g., hearing Cerebyx for Celebrex, or fifty for fifteen). Read back the order to the prescriber after you have written it in the chart. Confirm and document the indication to further enhance accurate communication.
- Clarify any order that does not include metric weight, dosing frequency, or route of administration.
- Check the nurse's/clerk's transcription against the original order. Make sure stray marks or initials do not obscure the original order.
- Do not start a patient on new medication by borrowing medications from another patient. This action bypasses the double check provided by the pharmacist's review of the order.
- Always check the patient's name band before administering medications. Verbally addressing a patient by name does not provide sufficient identification.
- Use the facility's standard drug administration times to reduce the chance of an omission error.
- Be sure to fully understand any drug administration device before using it. This includes infusion pumps, inhalers, and transdermal patches.

- Have a second practitioner independently check original order, dosage calculations, and infusion pump settings for high alert medications.
- Realize that the printing on packaging boxes, vials, ampoules, prefilled syringes, or any container in which a medication is stored can be misleading. Be sure to differentiate clearly the medication and the number of milligrams per milliliter versus the total number of milligrams contained within. Massive overdoses have been administered by assuming that the number of milligrams per ml is all that is contained within the vial or ampule. Read the label when obtaining the medication, before preparing or pouring the medication, and after preparing or pouring the medication.
- Educate patients about the medications they take. Provide verbal and written instructions and ask the patient to restate important points. Refer to Educating Patients about Safe Medication Use on page 29 for recommendations on what patients should understand about their medications.

As stated previously, errors are a result of problems within the medication use system and cannot be eliminated by the vigilance of any one group of health care providers. System redesign involves strong leadership from administration and all involved departments. Health care facilities should consider the following when addressing the issue of medication errors:

- Do not provide unit stock of critical, high alert medications. If eliminating these medications from floor stock is not feasible, consider reducing the number available and standardizing the concentrations or forms in which the medication is available.
- Create committees that address safety issues.
- Install a computer physician order entry (CPOE) system to help reduce prescribing orders. Link order entry to pertinent lab, allergy, and medication data.
- Implement bar code technology to ensure the right drug reaches the right patient.
- Develop policies that discourage error-prone prescribing practices such as inappropriate use of verbal orders, use of confusing dosing symbols, and use of abbreviations.
- Develop policies that encourage better communication of medication information such as requiring block-style printing of medications, including indication in prescription, and using both the trade and generic name in prescriptions.
- Ensure a reasonable workload for pharmacists and nurses, and provide a well-designed work area.
- Limit the availability of varying concentrations of high alert medications.
- Provide standard concentrations and infusion rate tables.
- Supply pharmacy and patient care areas with current reference material.
- Cultivate a culture that does not assign blame when medication errors occur but looks for root causes instead.
- Encourage staff to participate in the USP-ISMP-MERP error reporting program.

Table 1: High Alert Medications in Davis's Drug Guide for Nurses

aldesleukin	erlotinib	mitoxantrone
alemtuzumab	esmolol	morphine
alitretinoin	etoposides	nalbuphine
amiodarone	fentanyl (buccal, transmucosal)	nateglinide
amphotericin B cholesteryl sulfate/ lipid complex/liposome	fentanyl (parenteral)	nesiritide
argatroban	fentanyl (transdermal)	nilotinib
arsenic trioxide	fludarabine	nitroprusside
asparaginase	flurouracil	norepinephrine
azacitidine	fondaparinux	oxaliplatin
bendamustine	gefitinib	oxycodone compound
bevacizumab	gemcitabine	oxymorphone
bivalirudin	gemtuzumab ozogamicin	oxytocin
bleomycin	heparin	paclitaxel
bortezomib	heparins (low molecular weight)	pancuronium
buprenorphine	hydrocodone	panitumumab
busulfan	hydromorphone	pazopanib
butorphanol	hydroxyurea	pegaspargase
capecitabine	hypoglycemic agents, oral	pemetrexed
carboplatin	idarubicin	pentazocine
carmustine	ifosfamide	potassium phosphates
cetuximab	imatinib	potassium supplements
chloralhydrate	insulin mixtures	pramlintide
chlorambucil	insulins (intermediate-acting)	procarbazine
cisplatin	insulins (long-acting)	promethazine (IV)
cladribine	insulins (rapid-acting)	propofol
clofarabine	insulins (short-acting)	propranolol
codeine	irinotecan	repaglinide
colchicine (IV)	ixabepilone	rituximab
cyclophosphamide	labetalol	sodium chloride (hypertonic)
cytarabine	lapatinib	sunitinib
dacarbazine	lepirudin	temsirolimus
DAUNOrubicin hydrochloride	lidocaine	thalidomide
decitabine	magnesium sulfate (IV, parenteral)	thioguanine
digoxin	mechlorethamine	thrombolytic agents
DOBUTamine	melphalan	tirofiban
docetaxel	mepredine	topotecan
DOPamine	methadone	trastuzumab
DOXOrubicin hydrochloride	methotrexate	vinBLASTine
DOXOrubicin hydrochloride lipo- some	metoprolol	vinCRISTine
epinephrine	midazolam	vinorelbine
epirubicin	milrinone	warfarin
eptifibatide	mitomycin	

Table 2: Abbreviations and Symbols Associated with Medication Errors

Abbreviation/Symbol	Intended Meaning	Mistaken For	Recommendation
APAP	Acetaminophen	Not recognized as acetaminophen	Use full drug name
AZT	Zidovudine	Azathioprine	Use full drug name
CPZ	Compazine (prochlorperazine)	Thorazine (chlorpromazine)	Use full drug name
HCl	Hydrochloric acid	KCl (potassium chloride)	Use full drug name
HCT	Hydrocortisone	Hydrochlorothiazide	Use full drug name
HCTZ	Hydrochlorothiazide	Hydrocortisone	Use full drug name
IV Vanc	Intravenous vancomycin	Invanz (ertapenem)	Use full drug name
MgSO ₄ *	Magnesium sulfate	Morphine sulfate	Use full drug name
MS, MSO ₄ *	Morphine sulfate	Magnesium sulfate	Use full drug name
MTX	Methotrexate	Mitoxantrone	Use full drug name
"Nitro" drip	Nitroglycerin infusion	Nitroprusside infusion	Use full drug name

NoAC	Novel/new oral anticoagulant	No anticoagulant	Use full drug name
PCA	Procainamide	Patient controlled analgesia	Use full drug name
PTU	Propylthiouracil	Mercaptopurine	Use full drug name
T3	Tylenol with codeine no. 3	Liothyronine	Use full drug name
TAC	Triamcinolone	Tetracaine, Adrenalin, or Cocaine	Use full drug name
TNK	TNKase	tPA	Use full drug name
TPA or tPA	Tissue plasminogen activator (alteplase)	TNKase (tenecteplase)	Use full drug name
ZnSO ₄	Zinc sulfate	Morphine sulfate	Use full drug name
μg	Microgram	Mg (milligram)	Use "mcg"
AD, AS, AU	Right ear, left ear, both ears	Right eye, left eye, both eyes	Spell out "right ear," "left ear," or "both ears"
BT	Bedtime	BID (twice daily)	Spell out "bedtime"
cc	cubic centimeters	u (units)	Use "ml"
D/C	Discharge or discontinue	One mistaken for the other	Spell out "discharge" or "discontinue"
HS or hs	Half strength or hour of sleep (at bedtime)	One mistaken for the other	Spell out "half strength" or "at bedtime"
IN	Intranasal	IM or IV	Spell out "intranasal" or use "NAS"
I.U.*	International Units	IV or 10	Spell out "units"
"Nitro" drip	Nitroglycerin infusion	Nitroprusside infusion	
OD, OS, OU	Right eye, left eye, both eyes	Right ear, left ear, both ears	Spell out "right eye," "left eye," or "both eyes"
o.d. or OD	Every day	Right eye	Spell out "daily"
q.d. or QD*	Every day	q.i.d. (4 times per day)	Spell out "daily"
qhs	Nightly at bedtime	qhr (every hour)	Spell out "at bedtime"
q.o.d. or QOD*	Every other day	q.i.d. (4 times per day) or qd (daily)	Spell out "every other day"
SC, SQ, sub q	Subcutaneously	SC mistaken as SL (sublingual); SQ as "5 every"; q in sub q as "every"	Use subcut or write out "subcutaneously"
SSRI	Sliding scale regular insulin	Selective serotonin reuptake inhibitor	Spell out "sliding scale insulin"
TIW	3 times a week	3 times a day or twice a week	Spell out "3 times weekly"
u or U*	units	0 (zero), 4 (four) or cc	Spell out "units"
/ (slash mark)	Per	1 (numeral one)	Spell out "per"
+	Plus sign	"4" (numeral four)	Spell out "and"
Zero after a decimal point (e.g., 1.0 mg)*	1 mg	10 mg	DO NOT USE zero after a decimal point
No zero before a decimal point (e.g., .1 mg)*	.1 mg	1 mg	ALWAYS USE zero before a decimal point
@	At	2	Use "at"
>	Greater than	7 or <	Spell out "greater than"
<	Less than	L or >	Spell out "less than"
&	And	2	Use "and"
°	Hour	Zero (q 1° seen as q 10)	Use "hr," "h," or "hour"
Drug name and dose run together. Example: Inderal 40 mg	Inderal 40 mg	Inderal 140 mg	Leave space between drug name, dose, and unit of measure
Numerical dose and unit of measure run together. Example: 10 mg	10 mg	100 mg	Leave space between drug dose and unit of measure

*Appears on The Joint Commission's "Do Not Use" list of abbreviations.

Modified from ISMP's List of Error-Prone Abbreviations, Symbols, and Dose Designations, 2015.

DETECTING AND MANAGING ADVERSE DRUG REACTIONS

An *adverse drug reaction* (ADR) is any unexpected, undesired, or excessive response to a medication that results in:

- temporary or permanent serious harm or disability
- admission to a hospital, transfer to a higher level of care, or prolonged stay
- death.

Adverse drug reactions are distinguished from adverse drug events, in which causality is uncertain, and side effects, which may be bothersome to the patient and necessitate a change in therapy but are not considered serious. Although some ADRs are the result of medication errors, many are not.

Types of ADRs

The Food and Drug Administration (FDA) classifies ADRs into 2 broad categories: Type A and Type B. Type A reactions are predictable reactions based on the primary or secondary pharmacologic effect of the drug. Dose-related reactions and drug-drug interactions are examples of Type A reactions. Type B reactions are unpredictable, are not related to dose, and are not the result of the drug's primary or secondary pharmacologic effect. Idiosyncratic and hypersensitivity reactions are examples of Type B reactions.

Dose-Related Reactions (Toxic Reactions): In dose related reactions, the dose prescribed for the patient is excessive. Although a variety of mechanisms may interact, reasons for this type of reaction include:

- renal or hepatic impairment
- extremes in age (neonates and frail elderly)
- drug-drug or drug-food interactions
- underlying illness.

Dose-related reactions are often the result of preventable errors in prescribing in which physiologic factors such as age, renal impairment, and weight were not considered sufficiently, or in inadequate therapeutic monitoring. Medications with narrow therapeutic ranges (digoxin, aminoglycosides, antiepileptic drugs) and those that require careful monitoring or laboratory testing (anticoagulants, nephrotoxic drugs) are most frequently implicated in dose-related reactions. Dose-related reactions usually are managed successfully by temporarily discontinuing the drug and then reducing the dose or increasing the dosing interval. In some instances, the toxic effects need to be treated with another agent (e.g., Digibind for digoxin toxicity or Kayexalate for drug-induced hyperkalemia). Appropriately timed therapeutic drug level monitoring, review of new drugs added to an existing regimen that may affect the drug level, and frequent assessment of relevant laboratory values are critical to safe medical management and prevention of dose-related reactions.

Drug-Drug Interactions: Drug-drug interactions occur when the pharmacokinetic or pharmacodynamic properties of an individual drug affect another drug. Pharmacokinetics refers to the way the body processes a medication (absorption, distribution, metabolism, and elimination). In a drug-drug interaction, the pharmacokinetic properties of one drug can cause a change in drug concentration of another drug and an altered response. For example, one drug may block enzymes that metabolize a second drug. The concentration of the second drug is then increased and may become toxic or cause adverse reactions. Pharmacodynamic drug-drug interactions involve the known effects and side-effects of the drugs. For example, two drugs with similar therapeutic effects may act together in a synergistic way. The increased anticoagulant effects that occur when warfarin and aspirin are taken together, or the increased central nervous system (CNS) depression that results when two drugs with CNS depressant effects potentiate each other, are examples of pharmacodynamic

drug-drug interactions. Certain classes of drugs are more likely to result in serious drug-drug interactions, and patients receiving these agents should be monitored carefully. The medication classes include anticoagulants, oral hypoglycemic agents, nonsteroidal anti-inflammatory agents, monoamine oxidase inhibitors, antihypertensives, antiepileptics, and antiretrovirals. In addition, specific drugs such as theophylline, cimetidine, lithium, and digoxin may result in serious ADRs.

Idiosyncratic Reactions: Idiosyncratic reactions occur without relation to dose and are unpredictable and sporadic. Reactions of this type may manifest in many different ways, including fever, blood dyscrasias, cardiovascular effects, or mental status changes. The time frame between the occurrence of a problem and initiation of therapy is sometimes the only clue linking drug to symptom. Some idiosyncratic reactions may be explained by genetic differences in drug-metabolizing enzymes.

Hypersensitivity Reactions: Hypersensitivity reactions are usually allergic responses. Manifestations of hypersensitivity reactions range from mild rashes, to nephritis, pneumonitis, hemolytic anemia, and anaphylaxis. Protein drugs (vaccines, enzymes) are frequently associated with hypersensitivity reactions. In most instances, antibody formation is involved in the process and therefore cross-sensitivity may occur. An example of this is hypersensitivity to penicillin and cross-sensitivity with other penicillins and/or cephalosporins. Documenting drugs to which the patient is allergic and the specific hypersensitivity reaction is very important. If the reaction to an agent is anaphylaxis the nurse should monitor the patient during administration of a cross-hypersensitive agent, especially during the initial dose, and ensure ready access to emergency resuscitative equipment.

Recognizing an ADR

Adverse drug reactions should be suspected whenever there is a negative change in a patient's condition, particularly when a new drug has been introduced. Strategies that can enhance recognition include knowing the side effect/adverse reaction profile of medications. Nurses should be familiar with a drug's most commonly encountered side effects and adverse reactions before administering it. (In *Davis's Drug Guide for Nurses*, most frequent adverse drug reactions are underlined, and life-threatening adverse reactions are **CAPITALIZED and appear in second color** in the **Adverse Reactions and Side Effects** section.) As always, monitoring the patient's response to a medication and ongoing assessment are key nursing actions. Learn to recognize patient findings that suggest an ADR has occurred. These include:

- rash
- change in respiratory rate, heart rate, blood pressure, or mental state
- seizure
- anaphylaxis
- diarrhea
- fever.

Any of these findings can suggest an ADR and should be reported and documented promptly so that appropriate interventions, including discontinuation of suspect medications, can occur. Prompt intervention can prevent a mild adverse reaction from escalating into a serious health problem. Other steps taken by the health care team when identifying and treating an ADR include:

1. Determining that the drug ordered was the drug given and intended.
2. Determining that the drug was given in the correct dosage by the correct route.
3. Establishing the chronology of events: time drug was taken and onset of symptoms.
4. Stopping the drug and monitoring patient status for improvement (dechallenge).
5. Restarting the drug, if appropriate, and monitoring closely for adverse reactions (rechallenge).

Prevention

Health care organizations have responded to consumer, regulator, and insurer pressures by developing programs that aim to eliminate preventable ADRs. In the inpatient setting, computer

systems can display the patient's age, height, weight, and creatinine clearance or serum creatinine concentration and send an alert to the clinician if a prescribed dose is out of range for any of the displayed parameters. Allergy alerts and drug-drug interactions can be presented to the clinician at the time an order is entered.

In the outpatient setting, strategies that increase the patient's knowledge base and access to pharmacists and nurses may help prevent adverse reactions. Outpatient pharmacy computer systems that are linked within a chain of pharmacies may allow the pharmacist to view the patient's profile if the patient is filling a prescription in a pharmacy other than the usual one. Many pharmacy computers have dose limits and drug-drug reaction verification to assist pharmacists filling orders.

Such strategies are a valuable auxiliary to, but cannot replace, conscientious history taking, careful patient assessment, and ongoing monitoring. A thorough medication history including all prescription and nonprescription drugs, all side effects and adverse reactions encountered, allergies, and all pertinent physical data should be available to the prescriber. The prescriber is responsible for reviewing this data, along with current medications, laboratory values, and any other variable that affects drug response.

It is not expected that practitioners will remember all relevant information when prescribing. In fact, reliance on memory is error-fraught, and clinicians need to use available resources to verify drug interactions whenever adding a new drug to the regimen. Setting expectations that clinicians use evidence-based information rather than their memories when prescribing, dispensing, administering, or monitoring patients has the potential to reduce the incidence of preventable ADRs.

Reporting Adverse Drug Reactions in the U.S.:

Food and Drug Administration MedWatch Program: To monitor and assess the incidence of adverse reactions, the FDA sponsors MedWatch, a program that allows health care practitioners and consumers the opportunity to report serious adverse reactions or product defects encountered from medications, medical devices, special nutritional products, or other FDA-regulated items. The FDA considers serious those reactions that result in death, life-threatening illness or injury, hospitalization, disability, congenital anomaly, or those that require medical/surgical intervention.

In addition to reporting serious adverse reactions, health care providers should also report problems related to suspected contamination, questionable stability, defective components, or poor packaging/labeling. Reports should be submitted even if there is some uncertainty about the cause/effect relationship or if some details are missing. This reporting form may be accessed at www.fda.gov/medwatch/report/hcp.htm. Reports also may be faxed to the FDA (1-800-FDA-0178). Reactions to vaccines should be reported to the Vaccine Adverse Event Reporting System (VAERS; 1-800-822-7967). Nurses share with other health care providers an obligation to report adverse reactions to the MedWatch program so that all significant data can be analyzed for opportunities to improve patient care.

Reporting Adverse Drug Reactions in Canada:

The Marketed Health Products Directorate of Health Canada coordinates adverse reaction reporting activities, and analyzes reports submitted from regional centers in each province. MedEffect Canada encourages health professionals, patients and regulatory authorities to report adverse reactions as they occur, either by email, mail, or the Health Canada website. Health care professionals reporting adverse reactions are required to supply information regarding patient characteristics, details about the reaction(s), current treatment, and outcomes. Information identifying the patient or health care provider remains confidential.

Adverse reaction reports are analyzed to investigate any associations with the health product. Based on the outcome, regulatory bodies decide on a course of action, which may include performing additional post-marketing studies, re-assessment of the risk versus benefit of the product, packaging modification, addition of warnings in patient information leaflets, or issuing public alerts or market

withdrawals. Updates regarding adverse reactions are published in the Health Product InfoWatch every month.

Access the following link for the Side Effect Reporting Form for consumers and health professionals: http://www.hc-sc.gc.ca/dhp-mpps/alt_formats/pdf/medeff/report-declaration/ar-ei_cons_form-eng.pdf

OVERVIEW OF RISK EVALUATION AND MITIGATION SYSTEMS (REMS)

Over the past several decades, the Food and Drug Administration (FDA) has employed a number of “risk management” programs designed to detect, evaluate, prevent, and mitigate drug adverse events for drugs with the potential for serious adverse drug reactions. Some of the risk management plans used by the FDA over the years have included the use of patient package inserts, medication guides, restricted access programs, and classification of drugs as controlled substances. These programs were acknowledged by the FDA as Risk Minimization Action Plans (RiskMAPS) in 2005. With these programs, the FDA only had the authority to mandate postmarketing commitments from drug manufacturers before the drug was approved; however, these requirements could not be enforced after the drug was approved.

The Food and Drug Administration Amendments Act of 2007 has given the FDA the authority to subject drugs to new risk identification and communication strategies in the postmarketing period. These new strategies, called Risk Evaluation and Mitigation Strategies (REMS), can be required for any drug or drug class that is associated with serious risks. The FDA can require a REMS if it believes that this program is necessary to ensure that the benefits outweigh the potential risks of the drug. The FDA can require a REMS either as part of the drug approval process or during the postmarketing period if new information becomes available regarding potentially harmful effects that are associated with the use of the drug.

Components of the REMS may include a medication guide, a patient package insert, and/or a communication plan. A REMS for New Drug Applications or Biologics License Applications requires a timetable for submission of assessment of the REMS. A variety of elements to ensure safe use of drugs can be required as part of the REMS if it is believed that a medication guide, patient package insert, or communication plan are not adequate to mitigate the serious risks associated with a particular drug. These elements may include the following:

- Health care providers who prescribe the drug are specifically trained and/or certified.
- Pharmacies, practitioners, or health care settings that dispense the drug are specifically trained and/or certified.
- The drug is dispensed to patients only in certain health care settings, such as hospitals.
- The drug is dispensed only to patients with evidence or other documentation of safe-use conditions, such as laboratory test results.
- Patients using the drug are subject to certain monitoring.
- Patients using the drug are enrolled in a registry.

The FDA maintains an updated list of these REMS programs at <https://www.accessdata.fda.gov/scripts/cder/remis/index.cfm>. A REMS tag has been added at the top of the monographs of drugs associated with these programs.

SPECIAL DOSING CONSIDERATIONS

For many patients the average dose range for a given drug can be toxic. The purpose of this section is to describe vulnerable patient populations for which special dosing considerations must be made to protect the patient and improve clinical outcomes.

The Pediatric Patient

Most drugs prescribed to children are not approved by the Food and Drug Administration (FDA) for use in pediatric populations. This does not mean it's wrong to prescribe these drugs to children, rather it means that the medications were not tested in children. The lack of pediatric drug information can result in patient harm or death, such as what occurred with the drug chloramphenicol. When given to very young children, chloramphenicol caused toxicity and multiple deaths. Referred to as "gray baby syndrome," this toxic reaction was eventually found to be dose dependent. The FDA now requires that new drugs that may be used in children include information for safe pediatric use.

The main reason for adjusting dosages in pediatric patients is body size, which is measured by body weight or body surface area (BSA). Weight-based pediatric drug dosages are expressed in number of milligrams per kilogram of body weight (mg/kg) while dosages calculated on BSA are expressed in number of milligrams per meter squared (mg/m²). BSA is determined using a BSA nomogram or calculated by using formulas (Appendix F).

The neonate and the premature infant require additional adjustments secondary to immature function of body systems. For example, absorption may be incomplete or altered secondary to differences in gastric pH or motility. Distribution may be altered because of varying amounts of total body water, and metabolism and excretion can be delayed due to immature liver and kidney function. Furthermore, rapid weight changes and progressive maturation of hepatic and renal function require frequent monitoring and careful dosage adjustments. Gestational age, as well as weight, may be needed to properly dose some drugs in the neonate.

The Older Adult Patient

Absorption, distribution, metabolism, and excretion are altered in adults over 65 years of age, putting the older patient at risk for toxic reactions. Pharmacokinetic properties in older adults are affected by

- diminished gastrointestinal (GI) motility and blood flow, which delays absorption
- percentage of body fat, lean muscle mass, and total body water, which alters distribution
- decreased plasma proteins, especially in the malnourished patient, which alters distribution by allowing a larger proportion of free or unbound drug to circulate and exert effects
- diminished hepatic function, which slows metabolism
- diminished renal function, which delays excretion.

Older adults should be prescribed the lowest possible effective dose at the initiation of therapy followed by careful titration of doses as needed. Just as importantly, they should be monitored very carefully for signs and symptoms of adverse drug reactions.

Another concern is that many older adult patients are prescribed multiple drugs and are at risk for polypharmacy. As the number of medications a patient takes increases, so does the risk for an adverse drug reaction. One drug may negate or potentiate the effects of another drug (drug-drug interaction). This situation is compounded by concurrent use of nonprescription drugs and natural products. In general, doses of most medications (especially digoxin, sedative/hypnotics, anticoagulants, nonsteroidal anti-inflammatory agents, antibiotics, and antihypertensives) should be decreased in the older adult population. The Beers List/Criteria, which appears in the *Medication Safety Tools* section, is a list of drugs to be used with caution in older adults, and is based on these concerns.

The Patient of Reproductive Age

Generally, pregnant women should avoid medications, except when absolutely necessary. Both the mother and the fetus must be considered. The placenta protects the fetus only from extremely large molecules. The fetus is particularly vulnerable during the first and the last trimesters of pregnancy. During the first trimester, vital organs are forming and ingestion of teratogenic drugs may lead to fetal malformation or miscarriage. Unfortunately, this is the time when a woman is least likely to know that she is pregnant. In the third trimester, drugs administered to the mother and transferred to the fetus may not be safely metabolized and excreted by the fetus. This is especially true of drugs administered near term. After the infant is delivered, he or she no longer has the placenta to help with drug excretion, and drugs administered before delivery may result in toxicity.

Of course, many conditions, such as asthma, diabetes, gastrointestinal disorders, and mental illness affect pregnant women and require long-term medication use. When the medications are used, whether over-the-counter or prescription, prescribing the lowest effective dose for the shortest period of time necessary is the rule.

The possibility of a medication altering sperm quality and quantity in a potential father also is an area of concern. Male patients should be informed of this risk when taking any medications known to have this potential.

Renal Impairment

The kidneys are the major organ of drug elimination. Failure to account for decreased renal function is a preventable source of adverse drug reactions. Renal function is measured by the creatinine clearance (CCr), which can be approximated in the absence of a 24-hour urine collection (Appendix F). In addition, dosages in the patients with renal impairment can be optimized by measuring blood levels of certain drugs (e.g., digoxin, aminoglycosides).

Patients with underlying renal impairment, premature infants with immature renal function, and older adults with an age-related decrease in renal function require careful dose adjustments. Renal function may fluctuate over time and should be re-assessed periodically.

Hepatic Impairment

The liver is the major organ of drug metabolism. It changes a drug from a relatively fat-soluble compound to a more water-soluble substance, which means that the drug can then be excreted by the kidneys. Liver function is not as easily quantified as renal function, and it therefore is difficult to predict the correct dosage for a patient with hepatic impairment based on laboratory tests.

A patient who is severely jaundiced or who has very low serum proteins (particularly albumin) can be expected to have some problems metabolizing drugs. In advanced liver disease, portal vascular congestion also impairs drug absorption. Examples of drugs that should be carefully dosed in patients with hepatic impairment include theophylline, diuretics, phenytoin, and sedatives. Some drugs (e.g., enalapril, carisoprodol) must be activated in the liver to exert their effect and are known as prodrugs. In patients with hepatic impairment, these drugs may not be converted to the active component, thereby resulting in decreased efficacy.

Heart Failure

Heart failure results in passive congestion of blood vessels in the gastrointestinal tract, which impairs drug absorption. Heart failure also slows drug delivery to the liver, delaying metabolism. Renal function is frequently compromised as well, adding to delayed elimination and prolonged drug action. Dosages of drugs metabolized mainly by the liver or excreted mainly by the kidneys should be decreased in patients with chronic heart failure.

Body Size

Drug dosing is often based on total body weight. However, some drugs selectively penetrate fatty tissues. If the drug does not penetrate fatty tissues (e.g., digoxin, gentamicin), dosages for the obese patient should be determined by ideal body weight or estimated lean body mass. Ideal body weight

may be determined from tables of desirable weights or may be estimated using formulas for lean body mass when the patient's height and weight are known (Appendix F). If such adjustments are not made, considerable toxicity can result.

Body size is also a factor in patients who are grossly underweight. Older adults, chronic alcoholics, patients with acquired immune deficiency, and patients who are terminally ill from cancer or other debilitating illnesses need careful attention to dosing. Patients who have had a limb amputated also need to have this change in body size taken into account.

Drug Interactions

Use of multiple drugs, especially those known to interact with other drugs, may necessitate dosage adjustments. Drugs highly bound to plasma proteins, such as warfarin and phenytoin, may be displaced by other highly protein-bound drugs. When this phenomenon occurs, the drug that has been displaced exhibits an increase in its activity because the free or unbound drug is active.

Some drugs decrease the liver's ability to metabolize other drugs. Drugs capable of doing this include cimetidine and ketoconazole. Concurrently administered drugs that are also highly metabolized by the liver may need to be administered in decreased dosages. Other agents such as phenobarbital, other barbiturates, and rifampin are capable of stimulating the liver to metabolize drugs more rapidly, requiring larger doses to be administered. Concurrently administered drugs that are also highly metabolized by the liver may need to be administered in higher dosages.

Drugs that significantly alter urine pH can affect excretion of drugs for which the excretory process is pH dependent. Alkalinizing the urine will hasten the excretion of acidic drugs. An example of this is administering sodium bicarbonate in cases of aspirin overdose to promote the renal excretion of aspirin. Alkalinizing the urine will increase reabsorption of alkaline drugs, which prolongs and enhances drug action. Acidification of the urine will hasten the excretion of alkaline drugs. Acidification of the urine will also enhance reabsorption of acidic drugs, prolonging and enhancing drug action.

Some drugs compete for enzyme systems with other drugs. Allopurinol inhibits the enzyme involved in uric acid production, but it also inhibits metabolism (inactivation) of 6-mercaptopurine, greatly increasing its toxicity. The dosage of mercaptopurine needs to be significantly reduced when coadministered with allopurinol.

The same potential for interactions exists for some foods. Dietary calcium, found in high concentrations in dairy products, combines with tetracycline or fluoroquinolones and prevents their absorption. Foods high in pyridoxine (vitamin B₆) can negate the anti-Parkinsonian effect of levodopa. Grapefruit juice inhibits the enzyme that breaks down some drugs, and concurrent ingestion may significantly increase drug levels and the risk for toxicity.

Many commonly taken natural products interact with pharmaceutical drugs. St. John's wort, garlic, ephedra, and other natural products can interact with medications and cause known or unpredictable reactions.

Nurses and prescribers should consult drug references and remember that the average dosing range for drugs is intended for an average patient. However, every patient is an individual with specific drug-handling capabilities. Taking these special dosing considerations into account allows for an individualized drug regimen that promotes the desired therapeutic outcome and minimizes the risk of toxicity.

The Cytochrome P450 System: What Is It and Why Should I Care?¹⁰⁰

Looking beyond the obvious takes time, energy, insight, and fortitude; yet this is what we are called to do. We are nurses—tireless care providers. Yet, when the subject of the liver's enzyme system, also called the cytochrome P450 system, is discussed, we feel the urge to run the other way . . . or better yet, to just ignore the conversation. Yet, can we do this as the tireless care provider? The answer to this question is clear and simple: no, we cannot. This is because numerous medications, nutrients, and herbal therapies are metabolized through the cytochrome P450 (CYP450) enzyme system. This system can be inhibited or induced by drugs, and once altered can be clinically significant in the development of drug-drug interactions that may cause unanticipated adverse reactions or therapeutic failures. This article will review the basic concepts of the CYP450 system and relate these concepts to clinically significant altered responses.

The CYP450 enzymes are essential for the production of numerous agents including cholesterol and steroids. Additionally, these enzymes are necessary for the detoxification of foreign chemicals and the metabolism of drugs. CYP450 enzymes are so named because they are bound to membranes within a cell (cyto) and contain a heme pigment (chrome and P) that absorbs light at a wavelength of 450 nm when exposed to carbon monoxide. There are more than 50 CYP450 enzymes, but the CYP1A2, CYP2C19, CYP2D6, CYP1A2, CYP3A4, and CYP3A5 enzymes are responsible for metabolizing 45% of drug metabolism. The CYP2D6 (20–30%), the CYP2C9 (10%), and the CYP2E1 and CYP1A2 (5%) complete this enzyme system.

Drugs that cause CYP450 drug interactions are referred to as either inhibitors or inducers. An inducing agent can increase the rate of another drug's metabolism by as much as two- to threefold that develops over a period of a week. When an inducing agent is prescribed with another medication, the dosage of the other medication may need to be adjusted since the rate of metabolism is increased and the effect of the medication reduced. This can lead to a therapeutic failure of the medication. Conversely, if a medication is taken with an agent that inhibits its metabolism, then the drug level can rise and possibly result in a harmful or adverse effect. Information regarding a drug's CYP450 metabolism and its potential for inhibition or induction can be found on the drug label and accessed through the U.S. Food and Drug Administration (FDA) or manufacturer's websites.

When we assess our patients and provide management modalities, these are implemented within a framework of the patient's heritage, race, and culture. This is also true in pharmacology as well (i.e., "pharmacogenetics"). This concept is important to examine since we know that there exists genetic variability, which may influence a patient's response to commonly prescribed drug classes. This genetic variability can be defined as polymorphism. Seven percent of Caucasians and 2–7% of African Americans are poor metabolizers of drugs dependent on CYP2D6, which metabolizes many beta blockers, antidepressants, and opioids. This is because the drug's metabolism via CYP450 enzymes exhibits genetic variability.

Recently, researchers have studied the genetic variability in metabolism among women who were prescribed tamoxifen and medications that inhibit the CYP2D6 enzyme. To review, tamoxifen is biotransformed to the potent antiestrogen, endoxifen, by this enzyme. CYP2D6 genetic variation (individuals considered extensive metabolizers versus poor metabolizers) and inhibitors of the enzyme markedly reduce endoxifen plasma concentrations in tamoxifen-treated patients.

The researchers concluded that CYP2D6 metabolism is an "independent predictor of breast cancer outcome in post-menopausal women receiving tamoxifen for early breast cancer. Determination of CYP2D6 genotype may be of value in selecting adjuvant hormonal therapy and it appears CYP2D6 inhibitors should be avoided in tamoxifen-treated women." Do oncology patients come to us with only their cancer and its treatment? No, they come with multifaceted dimensions and co-morbid conditions such as hypertension, dyslipidemia, depression, seizure disorders, etc. For

example, several antidepressants (paroxetine [Paxil] and fluoxetine [Prozac]) are inhibitors of metabolism when given with drugs metabolized through the CYP2D6 enzyme, such as haloperidol (Haldol), metoprolol (Lopressor), and hydrocodone. Thus, the therapeutic response can be accentuated. Medications that inhibit the CYP3A4 enzyme, such as amiodarone and antifungals, can affect the therapeutic response of fentanyl, alprazolam (Xanax), and numerous statins; as a result, the effect of these drugs can be enhanced leading to potential toxic levels.

At times, these CYP450 inducers and inhibitors are commonly ingested items such as grapefruit juice and tobacco. In the case of grapefruit juice, there are numerous medications known to interact with grapefruit juice including statins, antiarrhythmic agents, immunosuppressive agents, and calcium channel blockers. Furthermore, the inhibition of the enzyme system seems to be dose dependent; thus, the more a patient drinks, the more the inhibition that occurs. Additionally, the effects can last for several days if grapefruit juice is consumed on a regular basis. Luckily, the effect of this is not seen with other citrus juices.

Hopefully, this brief review has opened the door to your inquisitive nature on how the liver's enzyme system is affected by numerous medications and why some patients experience clinically significant unanticipated adverse reactions or therapeutic failures.

CYP1A2		
Substrates	Inhibitors	Inducers
alosepron, amitriptyline, clozapine, cyclobenzaprine, desipramine, diazepam, duloxetine, fluvoxamine, imipramine, mexiletine, mirtazapine, olanzapine, propranolol, ropinirole, theophylline, (R)-warfarin	cimetidine, ciprofloxacin, fluvoxamine, ketoconazole, lidocaine, mexiletine	carbamazepine, cigarette smoke, phenobarbital, rifampin

CYP2C9		
Substrates	Inhibitors	Inducers
celecoxib, glimepiride, glipizide, losartan, montelukast, nateglinide, phenytoin, sulfamethoxazole, voriconazole, (S)-warfarin	amiodarone, efavirenz, fluconazole, fluvastatin, ketoconazole, sulfamethoxazole, zafirlukast	carbamazepine, phenobarbital, phenytoin, rifampin

CYP2C19		
Substrates	Inhibitors	Inducers
citalopram, diazepam, escitalopram, esomeprazole, imipramine, lansoprazole, nelfinavir, omeprazole, pantoprazole, phenytoin, rabeprazole, voriconazole	efavirenz, esomeprazole, fluoxetine, fluvoxamine, lansoprazole, omeprazole, rabeprazole, sertraline, ticlopidine	carbamazepine, phenytoin, rifampin

CYP2D6		
Substrates	Inhibitors	Inducers
amitriptyline, aripiprazole, atomoxetine, codeine, desipramine, dextromethorphan, duloxetine, flecainide, fluoxetine, haloperidol, imipramine, lidocaine, metoprolol, mexiletine, mirtazapine, nefazodone, nortriptyline, oxycodone, paroxetine, propafenone, propranolol, risperidone, ritonavir, tramadol, venlafaxine	amiodarone, cimetidine, clozapine, desipramine, duloxetine, fluoxetine, haloperidol, lidocaine, methadone, paroxetine, pimozone, quinidine, ritonavir, sertraline, ticlopidine	None

CYP3A

Substrates	Inhibitors	Inducers
alprazolam, amiodarone, aprepitant, aripiprazole, atorvastatin, boceprevir, buspirone, calcium channel blockers, carbamazepine, cilostazol, citalopram, clarithromycin, clonazepam, cyclosporine, dapsone, diazepam, disopyramide, efavirenz, ergot derivatives, erlotinib, erythromycin, escitalopram, estrogens, fentanyl, gefitinib, glucocorticoids, imatinib, indinavir, irinotecan, itraconazole, ketoconazole, lansoprazole, lidocaine, losartan, lovastatin, methadone, midazolam, mirtazapine, montelukast, nateglinide, nefazodone, nelfinavir, nevirapine, ondansetronoxycodone, paclitaxel, pimozone, protease inhibitors, quetiapine, quinidine, repaglinide, rifabutin, sildenafil, simvastatin, sirolimus, sorafenib, sunitinib, tacrolimus, tadalafil, tamoxifen, telaprevir, theophylline, tiagabine, ticlopidine, vardenafil, (R)-warfarin, zolpidem, zonisamide	amiodarone, aprepitant, cimetidine, clarithromycin, cyclosporine, diltiazem, efavirenz, erythromycin, fluconazole, grapefruit juice, imatinib, indinavir, itraconazole, ketoconazole, metronidazole, nefazodone, nelfinavir, quinidine, ritonavir, saquinavir, sertraline, verapamil, voriconazole	carbamazepine, efavirenz, nevirapine, phenobarbital, phenytoin, rifabutin, rifampin, St. John's wort

EDUCATING PATIENTS ABOUT SAFE MEDICATION USE

Research has shown that patients need information about several medication-related topics, no matter what the medication. A well-informed patient and/or family can help prevent medication errors by hospital staff and is less likely to make medication errors at home. Adherence to the medication regimen is another goal achieved through patient education.

Before beginning any teaching, however, always assess the patient's current knowledge by asking if he or she is familiar with the medication, how it is taken at home, what precautions or follow-up care is required, and other questions specific to each drug. Based on the patient's current knowledge level and taking into consideration factors such as readiness to learn, environmental and social barriers to learning or adherence, and cultural factors, discuss the following:

- 1. Generic and brand names of the medication.** Patients should know both the brand and generic names of each medication for two reasons. It helps them identify their medications when a generic equivalent is substituted for a brand name version, and it prevents patients or health care providers from making sound-alike confusion errors when giving or documenting a medication history. An example of this is saying Celebrex but meaning or hearing Cerebyx.
- 2. Purpose of the medication.** Patients have a right to know what the therapeutic benefit of the medication will be but also should be told the consequences of not taking the prescribed medication. This may enhance adherence. For example, a patient may be more likely to take blood pressure medication if told lowering high blood pressure will prevent heart attack, kidney disease, or stroke, rather than saying only that it will lower blood pressure.
- 3. Dosage and how to take the medication.** To derive benefit and avoid adverse reactions or other poor outcomes, the patient must know how much of the medication to take and when to take it. Refer to dosages in metric weight (i.e., milligram, gram) rather than dosage unit (tablet) or volume (1 teaspoon). The patient must also be informed of the best time to take the medication, for example, on an empty or a full stomach, before bedtime, or with or without other medications. If possible, help the patient fit the medication schedule into his or her own schedule, so that taking the medication is not difficult or forgotten.
- 4. What to do if a dose is missed.** Always explain to patients what to do if a dose is missed. Patients have been reported to take a double dose of medications when a missed dose occurs, putting themselves at risk for side effects and adverse reactions.
- 5. Duration of therapy.** It is not uncommon for patients to stop taking a medication when they feel better or to discontinue a medication when they cannot perceive a benefit. For very long term, even lifelong therapy, the patient may need to be reminded that the medication helps maintain the current level of wellness. Patients may need to be reminded to finish short-term courses of medications even though they frequently will feel much better before the prescription runs out. Some medications cannot be discontinued abruptly and patients should be warned to consult a health care professional before discontinuing such agents. Patients will need to know to refill prescriptions several days before running out or to take extra medication if traveling.
- 6. Minor side effects and what to do if they occur.** Inform the patient that all medications have potential side effects. Explain the most common side effects associated with the medication and how to avoid or manage them if they occur. An informed patient is less likely to stop taking a medication because of a minor and potentially avoidable side effect.
- 7. Serious side effects and what to do if they occur.** Inform the patient of the possibility of serious side effects. Describe signs and symptoms associated with serious side effects, and tell the

patient to immediately inform a physician or nurse should they occur. Tell the patient to call before the next dose of the medication is scheduled and to not assume that the medication is the source of the symptom and prematurely discontinue it.

8. Medications to avoid. Drug-drug interactions can dampen drug effects, enhance drug effects, or cause life-threatening adverse events such as cardiac dysrhythmias, hepatitis, renal failure, or internal bleeding. The patient and family need to know which other medications, including which over-the-counter medications, to avoid.

9. Foods to avoid and other precautions. Food-drug interactions are not uncommon and can have effects similar to drug-drug interactions. Excessive sun exposure resulting in severe dermal reactions is not uncommon and represents an environmental-drug interaction. Likewise, the patient should be informed of what activities to avoid, in case the medication affects alertness or coordination, for example.

10. How to store the medication: Medications must be stored properly to maintain potency. Most medications should not be stored in the bathroom medicine cabinet because of excess heat and humidity. In addition, thoughtful storage practices, such as separating two family members' medications, can prevent mix-ups and inadvertent accessibility by children (or pets). Review storage with patients and ask about current methods for storing medications.

11. Follow-up care. Anyone taking medication requires ongoing care to assess effectiveness and appropriateness of medications. Many medications require invasive and noninvasive testing to monitor blood levels; hematopoietic, hepatic, or renal function; or other effects on other body systems. Ongoing medical evaluation may result in dosage adjustments, change in medication, or discontinuation of medication.

12. What not to take. Inform patients not to take expired medications or someone else's medication. Warn them not to self-medicate with older, no-longer-used prescriptions even if the remaining supply is not expired. Tell patients to keep a current record of all medications taken and to ask health care providers if new medications are meant to replace a current medication.

As you teach, encourage the patient and the family to ask questions. Providing feedback about medication questions will increase their understanding and help you identify areas that need reinforcement. Also, ask patients to repeat what you have said and return to demonstrate application or administration techniques.

Stress the importance of concurrent therapies. Medications often are only a part of a recommended therapy. Review with the patient and family other measures that will enhance or maintain health. Always consider the cultural context in which health information is provided and plan accordingly. This might include obtaining a same-gender translator or adjusting dosing times to avoid conflict with traditional rituals.

Finally, provide written instructions in a simple and easy-to-read format. Keep in mind that most health care information is written at a 10th grade reading level, while many patients read at a 5th grade level. Tell patients to keep the written instructions, so that they can be reviewed at home, when stress levels are lower and practical difficulties in maintaining the medication plan are known.

CLASSIFICATIONS

● ANTI-ALZHEIMER'S AGENTS

PHARMACOLOGIC PROFILE

General Use

Management of Alzheimer's dementia.

General Action and Information

All agents act by ↑ the amount of acetylcholine in the CNS by inhibiting cholinesterase. No agents to date can slow the progression of Alzheimer's dementia. Current agents may temporarily improve cognitive function and therefore improve quality of life.

Contraindications

Hypersensitivity.

Precautions

Use cautiously in patients with a history of "sick sinus syndrome" or other supraventricular cardiac conduction abnormalities (may cause bradycardia). Cholinergic effects may result in adverse GI effects (nausea, vomiting, diarrhea, weight loss) and may also ↑ gastric acid secretion resulting in GI bleeding, especially during concurrent NSAID therapy. Other cholinergic effects may include urinary tract obstruction, seizures, or bronchospasm.

Interactions

Additive effects with other drugs having cholinergic properties. May exaggerate the effects of succinylcholine-type muscle relaxation during anesthesia. May ↓ therapeutic effects of anticholinergics.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) throughout therapy.
- Monitor nausea, vomiting, anorexia, and weight loss. Notify health care professional if these side effects occur.

Potential Nursing Diagnoses

- Disturbed thought process (Indications).
- Imbalanced nutrition: less than body requirements.
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

Patient/Family Teaching

- Instruct patient and caregiver that medication should be taken as directed.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, anorexia, and weight loss occur.

Evaluation/Desired Outcomes

- Temporary improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

● ANTIANEMICS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of anemias.

General Action and Information

Iron (ferric carboxymaltose, ferric pyrophosphate citrate, ferrous fumarate, ferrous gluconate, ferrous sulfate, ferumoxytol, iron dextran, iron sucrose, polysaccharide-iron complex, sodium ferric gluconate complex) is required for production of hemoglobin, which is necessary for oxygen transport to cells. Cyanocobalamin and hydroxocobalamin (vitamin B₁₂) and folic acid are water-soluble vitamins that are required for red blood cell production. Darbepoetin, epoetin, and methoxy polyethylene glycol-epoetin beta stimulate production of red blood cells.

Contraindications

Undiagnosed anemias. Hemochromatosis, hemosiderosis, hemolytic anemia (Iron). Uncontrolled hypertension (darbepoetin, epoetin, and peginesatide).

Precautions

Use parenteral iron (ferric carboxymaltose, ferric pyrophosphate citrate, ferumoxytol, iron dextran, iron sucrose, sodium ferric gluconate complex) cautiously in patients with a history of allergy or hypersensitivity reactions.

Interactions

Oral iron can ↓ the absorption of tetracyclines, fluoroquinolones, or penicillamine. Vitamin E may impair the therapeutic response to iron. Phenytoin and other anticonvulsants may ↓ the absorption of folic acid. Darbepoetin and epoetin may ↑ the requirement for heparin during hemodialysis.

NURSING IMPLICATIONS

Assessment

- Assess patient's nutritional status and dietary history to determine possible causes for anemia and need for patient teaching.

Potential Nursing Diagnoses

- Activity intolerance (Indications).
- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Iron salts are available in combination with many vitamins and minerals (see Appendix B).

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of health care professional. Explain that the best source of vitamins and minerals is a well-balanced diet with foods from the four basic food groups.
- Patients self-medicating with vitamin and mineral supplements should be cautioned not to exceed RDA. The effectiveness of mega doses for treatment of various medical conditions is unproven and may cause side effects.

Evaluation/Desired Outcomes

- Resolution of anemia.

● ANTIANGINALS

PHARMACOLOGIC PROFILE

General Use

Nitrates are used to treat and prevent attacks of angina. Only nitrates (sublingual, lingual spray, or intravenous) may be used in the acute treatment of attacks of angina pectoris. Calcium channel blockers, beta blockers, and ranolazine are used prophylactically in long-term management of angina.

General Action and Information

Several different groups of medications are used in the treatment of angina pectoris. The nitrates (isosorbide dinitrate, isosorbide mononitrate, and nitroglycerin) are available as a translingual spray, sublingual tablets, sublingual powder, intravenous solution, transdermal patch, topical ointment, and sustained-release oral dosage forms. Nitrates dilate coronary arteries and cause systemic vasodilation (↓ preload). Calcium channel blockers dilate coronary arteries (some also slow heart rate). Beta blockers ↓ myocardial oxygen consumption via a ↓ in heart rate. Ranolazine ↓ myocardial oxygen consumption. Therapy may be combined if selection is designed to minimize side effects or adverse reactions.

Contraindications

Hypersensitivity. Avoid use of beta blockers or calcium channel blockers in advanced heart block, cardiogenic shock, or untreated HF.

Precautions

Beta blockers should be used cautiously in patients with diabetes mellitus, pulmonary disease, or hypothyroidism.

Interactions

Nitrates, calcium channel blockers, and beta blockers may cause hypotension with other anti-hypertensives or acute ingestion of alcohol. Verapamil, diltiazem, and beta blockers may have additive myocardial depressant effects when used with other agents that affect cardiac function. Verapamil and ranolazine have a number of other significant drug-drug interactions.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- Monitor BP and pulse periodically throughout therapy.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Ineffective tissue perfusion (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Available in various dose forms. See specific drugs for information on administration.

Patient/Family Teaching

- Instruct patient on concurrent nitrate therapy and prophylactic antianginals to continue taking both medications as ordered and to use sublingual/translingual nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional immediately if chest pain does not improve; worsens after therapy; is accompanied by diaphoresis or shortness of breath; or if severe, persistent headache occurs.

34 ANTIANXIETY AGENTS

- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol with these medications.

Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance.

● ANTIANXIETY AGENTS

PHARMACOLOGIC PROFILE

General Use

Antianxiety agents are used in the management of various forms of anxiety, including generalized anxiety disorder (GAD). Some agents are more suitable for intermittent or short-term use (benzodiazepines) while others are more useful long-term (buspirone, doxepin, fluoxetine, paroxetine, sertraline, venlafaxine).

General Action and Information

Most agents cause generalized CNS depression. Benzodiazepines may produce tolerance with long-term use and have potential for psychological or physical dependence. These agents have NO analgesic properties.

Contraindications

Hypersensitivity. Should not be used in comatose patients or in those with pre-existing CNS depression. Should not be used in patients with uncontrolled severe pain. Avoid use during pregnancy or lactation.

Precautions

Use cautiously in patients with hepatic dysfunction, severe renal impairment, or severe underlying pulmonary disease (benzodiazepines only). Use with caution in patients who may be suicidal or who may have had previous drug addictions. Patients may be more sensitive to CNS depressant effects; dosage ↓ may be required.

Interactions

Mainly for benzodiazepines; additive CNS depression with alcohol, antihistamines, some antidepressants, opioid analgesics, or phenothiazines may occur. Most agents should not be used with MAO inhibitors.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory status frequently throughout IV administration.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- **Anxiety:** Assess degree of anxiety and level of sedation (ataxia, dizziness, slurred speech) before and periodically throughout therapy.

Potential Nursing Diagnoses

- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Patients changing to buspirone from other antianxiety agents should receive gradually ↓ doses. Buspirone will not prevent withdrawal symptoms.

Patient/Family Teaching

- May cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with these medications.
- Advise patient to inform health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decrease in anxiety level.

• ANTIARRHYTHMICS

PHARMACOLOGIC PROFILE

General Use

Suppression of cardiac arrhythmias.

General Action and Information

Correct cardiac arrhythmias by a variety of mechanisms, depending on the group used. The therapeutic goal is ↓ symptomatology and ↑ hemodynamic performance. Choice of agent depends on etiology of arrhythmia and individual patient characteristics. Treatable causes of arrhythmias should be corrected before therapy is initiated (e.g., electrolyte disturbances, other drugs). Antiarrhythmics are generally classified by their effects on cardiac conduction tissue (see the following table). Adenosine, atropine, and digoxin are also used as antiarrhythmics.

MECHANISM OF ACTION OF MAJOR ANTIARRHYTHMIC DRUGS

CLASS	DRUGS	MECHANISM
IA	quinidine, procainamide, disopyramide	Na channel blockers, ↑ APD and ERP, ↓ membrane responsiveness
IB	lidocaine, phenytoin, mexiletine	Na channel blockers, ↓ APD and ERP
IC	flecainide, propafenone	Profound slowing of conduction by blocking Na channels, markedly depress phase 0; propafenone also has beta-blocking properties
II	esmolol, propranolol, metoprolol	Beta-blockers; ↓ AV nodal conduction, ↓ automaticity
III	amiodarone, dofetilide, dronedarone, ibutilide, sotalol	K channel blockers; amiodarone and dronedarone also have Na channel, beta-receptor, and Ca-channel blocking properties; sotalol also has beta-blocking properties
IV	diltiazem, verapamil	Non-dihydropyridine Ca channel blockers; ↓ AV nodal conduction

APD = action-potential duration; AV = atrioventricular; Ca = calcium; ERP = effective refractory period; K = potassium; Na = sodium.

Contraindications

Differ greatly among various agents. See individual drugs.

Precautions

Differ greatly among agents used. Appropriate dosage adjustments should be made in elderly patients and those with renal or hepatic impairment, depending on agent chosen. Correctable causes (electrolyte abnormalities, drug toxicity) should be evaluated. See individual drugs.

Interactions

Differ greatly among agents used. See individual drugs.

NURSING IMPLICATIONS

Assessment

- Monitor ECG, pulse, and BP continuously throughout IV administration and periodically throughout oral administration.

Potential Nursing Diagnoses

- Decreased cardiac output (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Take apical pulse before administration of oral doses. Withhold dose and notify physician or other health care professional if heart rate is < 50 bpm.

Patient/Family Teaching

- Instruct patient to take oral doses around the clock, as directed, even if feeling better.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- Caution patient to avoid taking OTC medications without consulting health care professional.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Resolution of cardiac arrhythmias without detrimental side effects.

● ANTI-ASTHMATICS

PHARMACOLOGIC PROFILE

General Use

Management of acute and chronic episodes of reversible bronchoconstriction. Goal of therapy is to treat acute attacks (short-term control) and to ↓ incidence and intensity of future attacks (long-term control). The choice of modalities depends on the continued requirement for short term control agents.

General Action and Information

Adrenergic bronchodilators and phosphodiesterase inhibitors both work by ↑ intracellular levels of cyclic-3', 5'-adenosine monophosphate (cAMP); adrenergics by ↑ production and phosphodiesterase inhibitors by ↓ breakdown. ↑ levels of cAMP produce bronchodilation. Corticosteroids act by ↓ airway inflammation. Anticholinergics (ipratropium) produce bronchodilation by ↓ intracellular levels of cyclic guanosine monophosphate (cGMP). Leukotriene receptor antagonists and mast cell stabilizers ↓ the release of substances that can contribute to bronchospasm.

Contraindications

Inhaled corticosteroids, long-acting adrenergic agents, and mast cell stabilizers should not be used during acute attacks of asthma.

Precautions

Adrenergic bronchodilators and anticholinergics should be used cautiously in patients with cardiovascular disease. Chronic use of systemic corticosteroids should be avoided in children or during pregnancy or lactation. Patients with diabetes may experience loss of glycemic control during corticosteroid therapy. Corticosteroids should never be abruptly discontinued.

Interactions

Adrenergic bronchodilators and phosphodiesterase inhibitors may have additive CNS and cardiovascular effects with other adrenergic agents. Cimetidine ↑ theophylline levels and the risk of toxicity. Corticosteroids may ↓ the effectiveness of antidiabetics. Corticosteroids may cause hypokalemia which may be additive with potassium-losing diuretics and may also ↑ the risk of digoxin toxicity.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds and respiratory function prior to and periodically throughout therapy.
- Assess cardiovascular status of patients taking adrenergic bronchodilators or anticholinergics. Monitor for ECG changes and chest pain.

Potential Nursing Diagnoses

- Ineffective airway clearance (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- **PO:** Administer oral doses of glycopyrrolate, propantheline, or scopolamine 30 min before meals.
- Scopolamine transdermal patch should be applied at least 4 hr before travel.

Patient/Family Teaching

- Instruct patient to take antiasthmatics as directed. Do not take more than prescribed or discontinue without discussing with health care professional.
- Advise patient to avoid smoking and other respiratory irritants.
- Instruct patient in correct use of metered-dose inhaler or other administration devices (see Appendix D).
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, if symptoms worsen after treatment, or if toxic effects occur.
- Patients using inhalation medications and bronchodilators should be advised to use the bronchodilator first and allow 5 minutes to elapse before administering other medications, unless otherwise directed by health care professional.

Evaluation/Desired Outcomes

- Prevention of and reduction in symptoms of asthma.

● ANTICHOLINERGICS

PHARMACOLOGIC PROFILE

General Use

Atropine—Bradycardias. **Ipratropium**—bronchospasm (inhalation) and rhinorrhea (intranasal). **Scopolamine**—Nausea and vomiting related to motion sickness and vertigo.

Propantheline and glycopyrrolate—↓ gastric secretory activity and ↑ esophageal sphincter tone. Atropine and scopolamine are also used as ophthalmic mydriatics. Benztropine and trihexyphenidyl are used in the management of Parkinson's disease. Oxybutynin and tolterodine are used as urinary tract antispasmodics.

General Action and Information

Competitively inhibit the action of acetylcholine. In addition, atropine, glycopyrrolate, propantheline, and scopolamine are antimuscarinic in that they inhibit the action of acetylcholine at sites innervated by postganglionic cholinergic nerves.

Contraindications

Hypersensitivity, narrow-angle glaucoma, severe hemorrhage, tachycardia (due to thyrotoxicosis or cardiac insufficiency), or myasthenia gravis.

Precautions

Geriatric and pediatric patients are more susceptible to adverse effects. Use cautiously in patients with urinary tract pathology; those at risk for GI obstruction; and those with chronic renal, hepatic, pulmonary, or cardiac disease.

Interactions

Additive anticholinergic effects (dry mouth, dry eyes, blurred vision, constipation) with other agents possessing anticholinergic activity, including antihistamines, antidepressants, quinidine, and disopyramide. May alter GI absorption of other drugs by inhibiting GI motility and ↑ transit time. Antacids may ↓ absorption of orally administered anticholinergics.

NURSING IMPLICATIONS

Assessment

- Assess vital signs and ECG frequently during IV drug therapy. Report any significant changes in heart rate or BP or increase in ventricular ectopy or angina promptly.
- Monitor intake and output ratios in elderly or surgical patients; may cause urinary retention.
- Assess patient regularly for abdominal distention and auscultate for bowel sounds. Constipation may become a problem. Increasing fluids and adding bulk to the diet may help alleviate constipation.

Potential Nursing Diagnoses

- Decreased cardiac output (Indications).
- Impaired oral mucous membrane (Side Effects).
- Constipation (Side Effects).

Implementation

- **PO:** Administer oral doses of glycopyrrolate, propantheline, or scopolamine 30 min before meals.
- Scopolamine transdermal patch should be applied at least 4 hr before travel.

Patient/Family Teaching

- Instruct patient that frequent rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Ophth:** Advise patients that ophthalmic preparations may temporarily blur vision and impair ability to judge distances. Dark glasses may be needed to protect eyes from bright light.

Evaluation/Desired Outcomes

- Increase in heart rate.
- Decrease in nausea and vomiting related to motion sickness or vertigo.
- Dryness of mouth.
- Dilation of pupils.
- Decrease in GI motility.
- Resolution of signs and symptoms of Parkinson's disease.

● ANTICOAGULANTS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of thromboembolic disorders including deep vein thrombosis, pulmonary embolism, and atrial fibrillation. Also used in the management of myocardial infarction (MI) sequentially or in combination with thrombolytics and/or antiplatelet agents.

General Action and Information

Anticoagulants are used to prevent clot extension and formation. They do not dissolve clots. The main types of anticoagulants in common use are parenteral heparins, oral warfarin, oral direct thrombin inhibitors, and oral factor Xa inhibitors. When initiating warfarin, unfractionated heparin or a low-molecular weight heparin is usually administered concomitantly initially since warfarin takes several days to produce therapeutic anticoagulation. Once a therapeutic anticoagulant effect is achieved with warfarin, the unfractionated heparin or low-molecular weight heparin will be discontinued. Unfractionated heparin (at lower doses), a low-molecular weight heparin (at lower doses), or fondaparinux are mostly used to prevent deep vein thrombosis after certain surgical procedures or situations in which prolonged bedrest increases the risk of thromboembolism. Argatroban is used as anticoagulation in patients who have developed thrombocytopenia during heparin therapy.

Contraindications

Underlying coagulation disorders, ulcer disease, malignancy, recent surgery, or active bleeding.

Precautions

Anticoagulation should be undertaken cautiously in any patient with a potential site for bleeding. Pregnant or lactating patients should not receive warfarin. Heparin does not cross the placenta. All anticoagulants should be used cautiously in patients receiving epidural analgesia.

Interactions

Warfarin is highly protein bound and may displace or be displaced by other highly protein-bound drugs. The resultant interactions depend on which drug is displaced. Bleeding may be potentiated by aspirin or large doses of penicillins or penicillin-like drugs, cefotetan, cefoperazone, valproic acid, or NSAIDs.

NURSING IMPLICATIONS

Assessment

- Assess patient taking anticoagulants for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or BP; guaiac-positive stools; urine; or NG aspirate).
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- **Lab Test Considerations:** Monitor prothrombin time (PT) or international normalized ratio (INR) with warfarin therapy, activated partial thromboplastin time (aPTT) with full-dose heparin therapy and hematocrit, and other clotting factors frequently during therapy.
- **Toxicity and Overdose:** If overdose occurs or anticoagulation needs to be immediately reversed, the antidote for heparins is protamine sulfate; for warfarin, the antidote is vitamin K (phytonadione); for dabigatran, the antidote is idarucizumab. Administration of fresh frozen plasma or prothrombin complex concentrate may also be required in severe bleeding due to warfarin, the oral direct thrombin inhibitors, or the oral factor Xa inhibitors.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).

40 ANTICONVULSANTS

- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Inform all health care professionals caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation.
- Use an infusion pump with continuous infusions to ensure accurate dosage.

Patient/Family Teaching

- Caution patient to avoid activities leading to injury, to use a soft toothbrush and electric razor, and to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take OTC medications, especially those containing aspirin, NSAIDs, or alcohol, without advice of health care professional.
- Review foods high in vitamin K (see Appendix K) with patients on warfarin. Patient should have consistent limited intake of these foods, as vitamin K is the antidote for warfarin and greatly alternating intake of these foods will cause the INR to fluctuate.
- Emphasize the importance of frequent lab tests to monitor the degree of anticoagulation with unfractionated heparin or warfarin.
- Instruct patient to carry identification describing medication regimen at all times and to inform all health care professionals caring for patient of anticoagulant therapy before laboratory tests, treatment, or surgery.

Evaluation/Desired Outcomes

- Prevention of undesired clotting and its sequelae without signs of hemorrhage. Prevention of stroke, MI, and death in patients at risk.

● ANTICONVULSANTS

PHARMACOLOGIC PROFILE

General Use

Anticonvulsants are used to ↓ the incidence and severity of seizures due to various etiologies. Some anticonvulsants are used parenterally in the immediate treatment of seizures. It is not uncommon for patients to require more than one anticonvulsant to control seizures on a long-term basis. Many regimens are evaluated with serum level monitoring. Several anticonvulsants also are used to treat neuropathic pain.

General Action and Information

Anticonvulsants include a variety of agents, all capable of depressing abnormal neuronal discharges in the CNS that may result in seizures. They may work by preventing the spread of seizure activity, depressing the motor cortex, raising seizure threshold, or altering levels of neurotransmitters, depending on the group. See individual drugs.

Contraindications

Previous hypersensitivity.

Precautions

Use cautiously in patients with severe hepatic or renal impairment; dose adjustment may be required. Choose agents carefully in pregnant and lactating women. Fetal hydantoin syndrome may occur in offspring of patients who receive phenytoin during pregnancy.

Interactions

Barbiturates stimulate the metabolism of other drugs that are metabolized by the liver, ↓ their effectiveness. Phenytoin is highly protein-bound and may displace or be displaced by other

highly protein-bound drugs. Lamotrigine, tiagabine, and topiramate are capable of interacting with several other anticonvulsants. Many drugs are capable of lowering seizure threshold and may ↓ the effectiveness of anticonvulsants, including tricyclic antidepressants and phenothiazines. For more specific interactions, see individual drugs.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity.
- **Toxicity and Overdose:** Monitor serum drug levels routinely throughout anticonvulsant therapy, especially when adding or discontinuing other agents.

Potential Nursing Diagnoses

- Risk for injury (Indications) (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Administer anticonvulsants around the clock. Abrupt discontinuation may precipitate status epilepticus.
- Implement seizure precautions.

Patient/Family Teaching

- Instruct patient to take medication every day, exactly as directed.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizures.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with these medications.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.

● ANTIDEPRESSANTS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of various forms of endogenous depression, often in conjunction with psychotherapy. Other uses include: Treatment of anxiety (doxepin, duloxetine, fluoxetine, paroxetine, sertraline, venlafaxine); Enuresis (imipramine); Chronic pain syndromes (amitriptyline, doxepin, duloxetine, imipramine, nortriptyline); Smoking cessation (bupropion); Bulimia (fluoxetine); Obsessive-compulsive disorder (fluoxetine, fluvoxamine, paroxetine, sertraline); Social anxiety disorder (paroxetine, sertraline, venlafaxine).

General Action and Information

Antidepressant activity is most likely due to preventing the reuptake of dopamine, norepinephrine, and serotonin by presynaptic neurons, resulting in accumulation of these neurotransmitters. The major classes of antidepressants are the tricyclic antidepressants, the selective serotonin reuptake inhibitors (SSRIs), and the serotonin/norepinephrine reuptake inhibitors (SNRIs). Most tricyclic agents possess significant anticholinergic and sedative properties, which explains many of their side effects (amitriptyline, amoxapine, desipramine, doxepin, imipramine, nortriptyline, trimipramine). The SSRIs are more likely to cause insomnia (citalopram,

escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline, vortioxetine, vilazodone). The SNRIs include desvenlafaxine, duloxetine, levomilnacipran, milnacipran, and venlafaxine.

Contraindications

Hypersensitivity. Should not be used in narrow-angle glaucoma. Should not be used in pregnancy or lactation or immediately after MI.

Precautions

Use cautiously in older patients and those with pre-existing cardiovascular disease. Elderly men with prostatic enlargement may be more susceptible to urinary retention. Anticholinergic side effects of tricyclic antidepressants (dry eyes, dry mouth, blurred vision, and constipation) may require dosage modification or drug discontinuation. Dosage requires slow titration; onset of therapeutic response may be 2–4 wk. May ↓ seizure threshold, especially bupropion.

Interactions

Tricyclic antidepressants—May cause hypertension, tachycardia, and convulsions when used with MAO inhibitors. May prevent therapeutic response to some antihypertensives. Additive CNS depression with other CNS depressants. Sympathomimetic activity may be enhanced when used with other sympathomimetics. Additive anticholinergic effects with other drugs possessing anticholinergic properties. **MAO inhibitors**—Hypertensive crisis may occur with concurrent use of MAO inhibitors and amphetamines, methyl dopa, levodopa, dopamine, epinephrine, norepinephrine, desipramine, imipramine, reserpine, vasoconstrictors, or ingestion of tyramine-containing foods. Hypertension or hypotension, coma, convulsions, and death may occur with meperidine or other opioid analgesics and MAO inhibitors. Additive hypotension with antihypertensives or spinal anesthesia and MAO inhibitors. Additive hypoglycemia with insulin or oral hypoglycemic agents and MAO inhibitors. SSRIs, bupropion, or venlafaxine should not be used in combination with or within weeks of MAO inhibitors (see individual monographs). Risk of adverse reactions with MAO inhibitors may be ↑ by almotriptan, frovatriptan, rizatriptan, naratriptan, sumatriptan, or zolmitriptan.

NURSING IMPLICATIONS

Assessment

- Monitor mental status and affect. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Toxicity and Overdose:** Concurrent ingestion of MAO inhibitors and tyramine-containing foods may lead to hypertensive crisis. Symptoms include chest pain, severe headache, nuchal rigidity, nausea and vomiting, photosensitivity, and enlarged pupils. Treatment includes IV phentolamine.

Potential Nursing Diagnoses

- Ineffective coping (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Administer drugs that are sedating at bedtime to avoid excessive drowsiness during waking hours, and administer drugs that cause insomnia in the morning.

Patient/Family Teaching

- Caution patient to avoid alcohol and other CNS depressants. Patients receiving MAO inhibitors should also avoid OTC drugs and foods or beverages containing tyramine (see Appendix K) during and for at least 2 wk after therapy has been discontinued, as they may precipitate a hypertensive crisis. Health care professional should be contacted immediately if symptoms of hypertensive crisis develop.

- Inform patient that dizziness or drowsiness may occur. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Advise patient to notify health care professional of medication regimen and any herbal alternative therapies before treatment or surgery. MAO inhibitor therapy usually needs to be withdrawn at least 2 wk before use of anesthetic agents.
- Emphasize the importance of participation in psychotherapy and follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Resolution of depression.
- Decrease in anxiety.
- Control of bedwetting in children over 6 yr of age.
- Management of chronic neurogenic pain.

● ANTIDIABETICS

PHARMACOLOGIC PROFILE

General Use

Insulin is used in the management of type 1 diabetes mellitus. It may also be used in type 2 diabetes mellitus when diet and/or oral medications fail to adequately control blood sugar. The choice of insulin preparation (rapid-acting, intermediate-acting, long-acting) depends on the degree of control desired, daily blood glucose fluctuations, and history of previous reactions. Oral agents are used primarily in type 2 diabetes mellitus. Oral agents are used when diet therapy alone fails to control blood glucose or symptoms or when patients are not amenable to using insulin. Some oral agents may be used with insulin.

General Action and Information

Insulin, a hormone produced by the pancreas, lowers blood glucose by ↑ transport of glucose into cells and promotes the conversion of glucose to glycogen. It also promotes the conversion of amino acids to proteins in muscle, stimulates triglyceride formation, and inhibits the release of free fatty acids. Sulfonylureas, nateglinide, repaglinide, the dipeptidyl peptidase IV inhibitors (e.g. sitagliptin), and the glucagon-like peptide-1 receptor agonists (e.g. exenatide) ↓ blood glucose by stimulating endogenous insulin secretion by beta cells of the pancreas and by ↑ sensitivity to insulin at intracellular receptor sites. Intact pancreatic function is required. Acarbose and miglitol delay digestion of ingested carbohydrates, thus ↓ blood glucose, especially after meals. The thiazolidinediones (e.g. pioglitazone) and metformin ↑ insulin sensitivity. The sodium-glucose transporter 2 (SGLT2) inhibitors (e.g. empagliflozin) inhibit the reabsorption of glucose in the proximal renal tubule, thereby ↑ the excretion of glucose in the urine.

Contraindications

Insulin—Hypoglycemia. **Oral hypoglycemic agents**—Hypersensitivity (cross-sensitivity with other sulfonylureas and sulfonamides may exist). Hypoglycemia. Type 1 diabetes. Avoid use in patients with severe kidney, liver, thyroid, and other endocrine dysfunction. Should not be used in pregnancy or lactation.

Precautions

Insulin—Infection, stress, or changes in diet may alter requirements. **Oral hypoglycemic agents**—Use cautiously in geriatric patients. Dose ↓ may be necessary. Infection, stress, or

changes in diet may alter requirements. Use sulfonylureas with caution in patients with a history of cardiovascular disease. Metformin may cause lactic acidosis.

Interactions

Insulin—Additive hypoglycemic effects with oral hypoglycemic agents. **Oral hypoglycemic agents**—Ingestion of alcohol may result in disulfiram-like reaction with some agents. Alcohol, corticosteroids, rifampin, glucagon, and thiazide and loop diuretics may ↓ effectiveness. Anabolic steroids, chloramphenicol, MAO inhibitors, most NSAIDs, salicylates, sulfonamides, and warfarin may ↑ hypoglycemic effect. Beta blockers may produce hypoglycemia and mask signs and symptoms of hypoglycemia.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions.
- Metformin, acarbose, miglitol, and the thiazolidinediones do not cause hypoglycemia when taken alone but may ↑ the hypoglycemic effect of other hypoglycemic agents.
- Patients who have been well controlled on metformin but develop illness or laboratory abnormalities should be assessed for ketoacidosis or lactic acidosis. Assess serum electrolytes, renal function, ketones, glucose, and, if indicated, blood pH and lactate and pyruvate levels. If either form of acidosis is present, discontinue metformin immediately and treat acidosis.
- **Lab Test Considerations:** Serum glucose and glycosylated hemoglobin should be monitored periodically throughout therapy to evaluate effectiveness of treatment.

Potential Nursing Diagnoses

- Imbalanced nutrition: more than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require sliding scale insulin. Withhold oral hypoglycemic agents and reinstitute after resolution of acute illness..
- **Insulin:** Available in different types and strengths and from different species. Check type, species, source, dose, and expiration date with another licensed nurse. Do not interchange insulins without physician's order. Use only insulin syringes to draw up dose. Use only U100 syringes to draw up insulin lispro dose.

Patient/Family Teaching

- Explain to patient that medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water (glucose, not table sugar, if taking miglitol), and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops; if unable to eat usual diet; or if blood glucose levels are not controlled.
- Advise patient to carry sugar or a form of glucose and identification describing medication regimen at all times.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.

- **Insulin:** Instruct patient on proper technique for administration; include type of insulin, equipment (syringe and cartridge pens), storage, and syringe disposal. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.
- **Sulfonylureas:** Advise patient that concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headache, and hypoglycemia).
- **Metformin:** Explain to patient the risk of lactic acidosis and the potential need for discontinuation of metformin therapy if a severe infection, dehydration, or severe or continuing diarrhea occurs or if medical tests or surgery is required.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

● ANTIDIARRHEALS

PHARMACOLOGIC PROFILE

General Use

For the control and symptomatic relief of acute and chronic nonspecific diarrhea.

General Action and Information

Diphenoxylate/atropine, difenoxin/atropine, and loperamide slow intestinal motility and propulsion. Bismuth subsalicylate affects fluid content of the stool. Bismuth subsalicylate is also used as part of the management of peptic ulcer disease due to *Helicobacter pylori*. Polycarbophil acts as an antidiarrheal by taking on water within the bowel lumen to create a formed stool. Polycarbophil may also be used to treat constipation. Octreotide is used specifically for diarrhea associated with GI endocrine tumors.

Contraindications

Previous hypersensitivity. Severe abdominal pain of unknown cause, especially when associated with fever.

Precautions

Use cautiously in patients with severe liver disease or inflammatory bowel disease. Safety in pregnancy and lactation not established (diphenoxylate/atropine and loperamide). Octreotide may aggravate gallbladder disease.

Interactions

Polycarbophil ↓ the absorption of tetracycline. Octreotide may alter the response to insulin or oral hypoglycemic agents.

NURSING IMPLICATIONS

Assessment

- Assess the frequency and consistency of stools and bowel sounds before and throughout therapy.
- Assess patient's fluid and electrolyte status and skin turgor for dehydration.

Potential Nursing Diagnoses

- Diarrhea (Indications).
- Constipation (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Shake liquid preparations before administration.

Patient/Family Teaching

- Instruct patient to notify health care professional if diarrhea persists; or if fever, abdominal pain, or palpitations occur.

Evaluation/Desired Outcomes

- Decrease in diarrhea.

● **ANTIEMETICS****PHARMACOLOGIC PROFILE****General Use**

Phenothiazines, dolasetron, granisetron, metoclopramide, ondansetron, and palonosetron are used to manage nausea and vomiting of many causes, including surgery, anesthesia, and anti-neoplastic and radiation therapy. Aprepitant, fosaprepitant, netupitant, and rolapitant are used specifically with emetogenic chemotherapy. Dimenhydrinate, scopolamine, and meclizine are used almost exclusively to prevent motion sickness.

General Action and Information

Phenothiazines act on the chemoreceptor trigger zone to inhibit nausea and vomiting. Dimenhydrinate, scopolamine, and meclizine act as antiemetics mainly by diminishing motion sickness. Metoclopramide ↓ nausea and vomiting by its effects on gastric emptying. Dolasetron, granisetron, palonosetron, and ondansetron block the effects of serotonin at 5-HT₃ receptor sites. Aprepitant, fosaprepitant, netupitant, and rolapitant act as selective antagonists at substance P/neurokinin 1 receptors in the brain.

Contraindications

Previous hypersensitivity.

Precautions

Use phenothiazines cautiously in children who may have viral illnesses. Choose agents carefully in pregnant patients (no agents are approved for safe use).

Interactions

Additive CNS depression with other CNS depressants including antidepressants, antihistamines, opioid analgesics, and sedative/hypnotics. Phenothiazines may produce hypotension when used with antihypertensives, nitrates, or acute ingestion of alcohol.

NURSING IMPLICATIONS**Assessment**

- Assess nausea, vomiting, bowel sounds, and abdominal pain before and following administration.
- Monitor hydration status and intake and output. Patients with severe nausea and vomiting may require IV fluids in addition to antiemetics.

Potential Nursing Diagnoses

- Deficient fluid volume (Indications).
- Imbalanced nutrition: less than body requirements (Indications).
- Risk for injury (Side Effects).

Implementation

- For prophylactic administration, follow directions for specific drugs so that peak effect corresponds to time of anticipated nausea.

Patient/Family Teaching

- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, nongreasy meals; provide oral hygiene; and remove noxious stimuli from environment).
- May cause drowsiness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.

Evaluation/Desired Outcomes

- Prevention of, or decrease in, nausea and vomiting.

● ANTIFUNGALS**PHARMACOLOGIC PROFILE****General Use**

Treatment of fungal infections. Infections of skin or mucous membranes may be treated with topical or vaginal preparations. Deep-seated or systemic infections require oral or parenteral therapy. Lipid-based formulations of amphotericin employ lipid encapsulation technology designed to ↓ nephrotoxicity.

General Action and Information

Kill (fungicidal) or stop growth of (fungistatic) susceptible fungi by affecting the permeability of the fungal cell membrane or protein synthesis within the fungal cell itself.

Contraindications

Previous hypersensitivity.

Precautions

Because most systemic antifungals may have adverse effects on bone marrow function, use cautiously in patients with depressed bone marrow reserve. Amphotericin B commonly causes renal impairment. Fluconazole requires dosage adjustment in the presence of renal impairment. Adverse reactions to fluconazole may be more severe in HIV-positive patients. The IV formulation of voriconazole should be avoided in patients with renal impairment.

Interactions

Differ greatly among various agents. See individual drugs.

NURSING IMPLICATIONS**Assessment**

- Assess patient for signs of infection and assess involved areas of skin and mucous membranes before and throughout therapy. Increased skin irritation may indicate need to discontinue medication.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Impaired skin integrity (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Available in various dosage forms. Refer to specific drugs for directions for administration.
- **Topical:** Consult physician or other health care professional for cleansing technique before applying medication. Wear gloves during application. Do not use occlusive dressings unless specified by physician or other health care professional.

Patient/Family Teaching

- Instruct patient on proper use of medication form.
- Instruct patient to continue medication as directed for full course of therapy, even if feeling better.
- Advise patient to report increased skin irritation or lack of therapeutic response to health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection. Deep-seated fungal infections may require prolonged therapy (weeks–months). Recurrent fungal infections may be a sign of serious systemic illness.

● ANTIHISTAMINES

PHARMACOLOGIC PROFILE

General Use

Relief of symptoms associated with allergies, including rhinitis, urticaria, and angioedema, and as adjunctive therapy in anaphylactic reactions. Some antihistamines are used to treat motion sickness (dimenhydrinate and meclizine), insomnia (diphenhydramine), Parkinson-like reactions (diphenhydramine), and other nonallergic conditions.

General Action and Information

Antihistamines block the effects of histamine at the H_1 receptor. They do not block histamine release, antibody production, or antigen-antibody reactions. Most antihistamines have anticholinergic properties and may cause constipation, dry eyes, dry mouth, and blurred vision. In addition, many antihistamines cause sedation. Some phenothiazines have strong antihistaminic properties (hydroxyzine and promethazine).

Contraindications

Hypersensitivity and angle-closure glaucoma. Should not be used in premature or newborn infants.

Precautions

Elderly patients may be more susceptible to adverse anticholinergic effects of antihistamines. Use cautiously in patients with pyloric obstruction, prostatic hypertrophy, hyperthyroidism, cardiovascular disease, or severe liver disease. Use cautiously in pregnancy and lactation.

Interactions

Additive sedation when used with other CNS depressants, including alcohol, antidepressants, opioid analgesics, and sedative/hypnotics. MAO inhibitors prolong and intensify the anticholinergic properties of antihistamines.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout therapy.
- Monitor pulse and BP before initiating and throughout IV therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- **Nausea and Vomiting:** Assess degree of nausea and frequency and amount of emesis when administering for nausea and vomiting.
- **Anxiety:** Assess mental status, mood, and behavior when administering for anxiety.

- **Pruritus:** Observe the character, location, and size of affected area when administering for pruritic skin conditions.

Potential Nursing Diagnoses

- Ineffective airway clearance (Indications).
- Risk for injury (Adverse Reactions).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr before exposure to conditions that may precipitate motion sickness.
- When administering concurrently with opioid analgesics (hydroxyzine, promethazine), supervise ambulation closely to prevent injury secondary to increased sedation.

Patient/Family Teaching

- Inform patient that drowsiness may occur. Avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid using concurrent alcohol or CNS depressants.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may help relieve dryness of mouth.
- Instruct patient to contact health care professional if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Prevention or decreased severity of nausea and vomiting.
- Decrease in anxiety.
- Relief of pruritus.
- Sedation when used as a hypnotic.

● ANTIHYPERTENSIVES

PHARMACOLOGIC PROFILE

General Use

Treatment of hypertension of many causes, most commonly essential hypertension. Parenteral products are used in the treatment of hypertensive emergencies. Oral treatment should be initiated as soon as possible and individualized to ensure adherence and compliance for long-term therapy. Therapy is initiated with agents having minimal side effects. When such therapy fails, more potent drugs with different side effects are added in an effort to control BP while causing minimal patient discomfort.

General Action and Information

As a group, the antihypertensives are used to lower BP to a normal level (<130–140 systolic and <80–90 mm Hg diastolic) or to the lowest level tolerated. The goal of antihypertensive therapy is prevention of end-organ damage. Antihypertensives are classified into groups according to their site of action. These include alpha-1 receptor antagonists, centrally-acting alpha-adrenergic agonists; beta blockers; vasodilators; ACE inhibitors; angiotensin II receptor antagonists; calcium channel blockers; renin inhibitors; and diuretics. Hypertensive emergencies may be managed with parenteral agents, such as nitroprusside, nicardipine, or beta blockers (e.g. esmolol, labetalol).

Contraindications

Hypersensitivity to individual agents.

Precautions

Choose agents carefully in pregnancy and during lactation. ACE inhibitors, angiotensin II receptor antagonists, and aliskiren should be avoided during pregnancy. Centrally acting alpha-adrenergic agonists and beta blockers should be used only in patients who are compliant with their medications because abrupt discontinuation of these agents may result in rapid and excessive ↑ in BP (rebound phenomenon). Thiazide and loop diuretics may ↑ the risk of hyperglycemia. Vasodilators may cause tachycardia if used alone and are commonly used in combination with beta blockers. Some antihypertensives (e.g. hydralazine, minoxidil) cause sodium and water retention and are usually combined with a diuretic.

Interactions

Many drugs can negate the therapeutic effectiveness of antihypertensives, including NSAIDs, sympathomimetics, decongestants, appetite suppressants, SNRIs, and MAO inhibitors. Hypokalemia from diuretics may ↑ the risk of digoxin toxicity. Potassium supplements and potassium-sparing diuretics may cause hyperkalemia when used with ACE inhibitors, angiotensin II receptor antagonists, or aliskiren.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight with use of diuretics.
- Monitor frequency of prescription refills to determine compliance.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Many antihypertensives are available as combination products to enhance compliance (see Appendix B).

Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well. Abrupt withdrawal may cause rebound hypertension. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, discontinuation of smoking, moderation of alcohol consumption, and stress management).
- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP weekly and report significant changes.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercise or hot weather may enhance hypotensive effects.
- Advise patient to consult health care professional before taking any OTC medications, especially cold remedies.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Patients taking ACE inhibitors, angiotensin II antagonists, or aliskiren should notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decrease in BP.

● ANTI-INFECTIVES

PHARMACOLOGIC PROFILE

General Use

Treatment and prophylaxis of various bacterial infections. See specific drugs for spectrum and indications. Some infections may require additional surgical intervention and supportive therapy.

General Action and Information

Kill (bactericidal) or inhibit the growth of (bacteriostatic) susceptible pathogenic bacteria. Not active against viruses or fungi. Anti-infectives are subdivided into categories depending on chemical similarities and antimicrobial spectrum.

Contraindications

Known hypersensitivity to individual agents. Cross-sensitivity among related agents may occur.

Precautions

Culture and susceptibility testing are desirable to optimize therapy. Dosage modification may be required in patients with hepatic or renal insufficiency. Use cautiously in pregnant and lactating women. Prolonged inappropriate use of broad spectrum anti-infective agents may lead to superinfection with fungi or resistant bacteria.

Interactions

Penicillins and aminoglycosides chemically inactivate each other and should not be physically admixed. Erythromycin and clarithromycin may ↓ hepatic metabolism of other drugs. Probenecid ↑ serum levels of penicillins and related compounds. Highly protein-bound anti-infectives such as sulfonamides may displace or be displaced by other highly bound drugs. See individual drugs. Extended-spectrum penicillins (piperacillin/tazobactam) and some cephalosporins (cefoperazone, cefotetan) may ↑ the risk of bleeding with anticoagulants, thrombolytic agents, antiplatelet agents, or NSAIDs. Fluoroquinolone absorption may be ↓ by antacids, bismuth subsalicylate, calcium, iron salts, sucralfate, and zinc salts.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of infection prior to and throughout therapy.
- Determine previous hypersensitivities in patients receiving penicillins or cephalosporins.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD).

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Most anti-infectives should be administered around the clock to maintain therapeutic serum drug levels.

Patient/Family Teaching

- Instruct patient to continue taking medication around the clock until finished completely, even if feeling better.

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy to health care professional.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains pus, blood, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

● ANTINEOPLASTICS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of various solid tumors, lymphomas, and leukemias. Also used in some autoimmune disorders such as rheumatoid arthritis (cyclophosphamide, methotrexate). Often used in combinations to minimize individual toxicities and ↑ response. Chemotherapy may be combined with other treatment modalities such as surgery and radiation therapy. Dosages vary greatly, depending on extent of disease, other agents used, and patient's condition. Some agents (doxorubicin, irinotecan) are available in lipid-based formulations that have less toxicity with greater efficacy.

General Action and Information

Act by many different mechanisms (see the following table). Many affect DNA synthesis or function; others alter immune function or affect hormonal status of sensitive tumors. Action may not be limited to neoplastic cells.

MECHANISM OF ACTION OF VARIOUS ANTINEOPLASTICS

MECHANISM OF ACTION	AGENT	EFFECTS ON CELL CYCLE
ALKYLATING AGENTS Cause cross-linking of DNA	busulfan carboplatin chlorambucil cisplatin cyclophosphamide ifosfamide mechlorethamine melphalan procarbazine temozolamide	Cell cycle—nonspecific
ANTHRACYCLINES Interfere with DNA and RNA synthesis	daunorubicin doxorubicin epirubicin idarubicin	Cell cycle—nonspecific
ANTITUMOR ANTIBIOTIC Interfere with DNA and RNA synthesis	bleomycin mitomycin mitoxantrone	Cell cycle—nonspecific (except bleomycin)
ANTIMETABOLITES Take the place of normal proteins	cytarabine fluorouracil hydroxyurea methotrexate	Cell cycle—specific, work mostly in S phase (DNA synthesis)
ENZYMES Deplete asparagine	asparaginase pegaspargase	Cell-cycle phase—specific

(continued) MECHANISM OF ACTION OF VARIOUS ANTINEOPLASTICS

MECHANISM OF ACTION	AGENT	EFFECTS ON CELL CYCLE
ENZYME INHIBITORS	irinotecan	Cell-cycle phase—specific
Inhibits topoisomerase	topotecan	
Inhibits kinase	imatinib	Unknown
HORMONAL AGENTS	bicalutamide	Unknown
Alter hormonal status in tumors that are sensitive	estramustine	
	flutamide	
	leuprolide	
	megestrol	
	nilutamide	
	tamoxifen	
	testosterone (androgens)	
	triptorelin	
HORMONAL AGENTS—AROMATASE INHIBITORS	anastrozole	Unknown
Inhibit enzyme responsible for activating estrogen	letrozole	
IMMUNE MODULATORS	aldesleukin	Unknown
	alemtuzumab	
	gemtuzumab	
	toremifene	
	trastuzumab	
	etoposide	Cell-cycle phase—specific
PODOPHYLLOTOXIN DERIVATIVES		
Damages DNA before mitosis		
TAXOIDS	docetaxel	Cell-cycle phase—specific
Interrupt interphase and mitosis	paclitaxel	
VINCA ALKALOIDS	vinblastine	Cell cycle—specific, work during M phase (mitosis)
Interfere with mitosis	vincristine	
	vinorelbine	

Contraindications

Previous bone marrow depression or hypersensitivity. Contraindicated in pregnancy and lactation.

Precautions

Use cautiously in patients with active infections, ↓ bone marrow reserve, radiation therapy, or other debilitating illnesses. Use cautiously in patients with childbearing potential.

Interactions

Allopurinol ↓ metabolism of mercaptopurine. Toxicity from methotrexate may be ↑ by other nephrotoxic drugs or larger doses of aspirin or NSAIDs. Bone marrow depression is additive. See individual drugs.

NURSING IMPLICATIONS

Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for ↑ fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor IV site carefully and ensure patency. Discontinue infusion immediately if discomfort, erythema along vein, or infiltration occurs. Tissue ulceration and necrosis may result from infiltration.

54 ANTIPARKINSON AGENTS

- Monitor for symptoms of gout (↑ uric acid, joint pain, and edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may be given to ↓ uric acid levels. Alkalinization of urine may be ordered to ↑ excretion of uric acid.

Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Imbalanced nutrition: less than body requirements (Adverse Reactions).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Solutions for injection should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Check dose carefully. Fatalities have resulted from dosing errors.

Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection occur.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions.
- These drugs may cause gonadal suppression; however, patient should still use birth control, as most antineoplastics are teratogenic. Advise patient to inform health care professional immediately if pregnancy is suspected.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Topical agents may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient not to receive any vaccinations without advice of health care professional. Antineoplastics may ↓ antibody response and ↑ risk of adverse reactions.
- Advise patient of need for medical follow-up and frequent lab tests.

Evaluation/Desired Outcomes

- Decrease in size and spread of tumor.
- Improvement in hematologic status in patients with leukemia.

● ANTIPARKINSON AGENTS**PHARMACOLOGIC PROFILE****General Use**

Used in the treatment of Parkinson's disease.

General Action and Information

Drugs used in the treatment of Parkinson's disease and other dyskinesias are aimed at restoring the natural balance of two major neurotransmitters in the CNS: acetylcholine and dopamine. The imbalance is a deficiency in dopamine that results in excessive cholinergic activity. Drugs used are either anticholinergics (benztropine and trihexyphenidyl) or dopaminergic agonists (apomorphine, bromocriptine, levodopa/carbidopa, pramipexole, ropinirole, rotigotine). Entacapone and tolcapone inhibit the enzyme that breaks down levodopa, thereby enhancing its effects. Rasagiline and selegiline are MAO-B inhibitors that lead to ↑ concentrations of dopamine in the CNS.

Contraindications

Anticholinergics should be avoided in patients with angle-closure glaucoma.

Precautions

Use cautiously in patients with severe cardiac disease, pyloric obstruction, or prostatic enlargement.

Interactions

Pyridoxine, MAO inhibitors, benzodiazepines, phenytoin, phenothiazines, and haloperidol may antagonize the effects of levodopa. Agents that antagonize dopamine (phenothiazines, metoclopramide) may ↓ effectiveness of dopamine agonists.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian and extrapyramidal symptoms (akinesia, rigidity, tremors, pill rolling, mask facies, shuffling gait, muscle spasms, twisting motions, and drooling) before and throughout course of therapy. On-off phenomenon may cause symptoms to appear or improve suddenly.
- Monitor BP frequently during therapy. Instruct patient to remain supine during and for several hours after first dose of bromocriptine, as severe hypotension may occur.

Potential Nursing Diagnoses

- Impaired physical mobility (Indications).
- Risk for injury (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- In the carbidopa/levodopa combination, the number following the drug name represents the milligram of each respective drug.

Patient/Family Teaching

- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities that require alertness until response to medication is known.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify health care professional if dryness persists (saliva substitutes may be used). Also notify the dentist if dryness interferes with use of dentures.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages. Patients receiving levodopa should avoid multivitamins. Vitamin B₆ (pyridoxine) may interfere with levodopa's action.
- Caution patient that decreased perspiration may occur. Overheating may occur during hot weather. Patients should remain indoors in an air-conditioned environment during hot weather.
- Advise patient to increase activity, bulk, and fluid in diet to minimize constipating effects of medication.
- Advise patient to notify health care professional if confusion, rash, urinary retention, severe constipation, visual changes, or worsening of parkinsonian symptoms occur.

Evaluation/Desired Outcomes

- Resolution of parkinsonian signs and symptoms
- Resolution of drug-induced extrapyramidal symptoms.

● ANTIPLATELET AGENTS

PHARMACOLOGIC PROFILE

General Use

Antiplatelet agents are used to treat and prevent thromboembolic events such as stroke and MI.

General Action and Information

Inhibit platelet aggregation, prolong bleeding time, and are used to prevent MI or stroke (aspirin, clopidogrel, dipyridamol, ticlopidine, prasugrel, ticagrelor). Eptifibatide, abciximab, and tirofiban are used in the management of acute coronary syndromes. These agents are often used concurrently/sequentially with anticoagulants and thrombolytics.

Contraindications

Hypersensitivity, ulcer disease, active bleeding, and recent surgery.

Precautions

Use cautiously in patients at risk for bleeding (trauma, surgery). History of GI bleeding or ulcer disease. Safety not established in pregnancy, lactation, or children.

Interactions

Concurrent use with NSAIDs, heparin, thrombolytics, or warfarin may ↑ the risk of bleeding.

NURSING IMPLICATIONS

Assessment

- Assess patient for evidence of additional or ↑ thrombosis. Symptoms will depend on area of involvement.
- Assess patient taking antiplatelet agents for symptoms of stroke, peripheral arterial disease, or MI periodically throughout therapy.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Use an infusion pump with continuous infusions to ensure accurate dosage.

Patient/Family Teaching

- Instruct patient to notify health care professional immediately if any bleeding is noted.

Evaluation/Desired Outcomes

- Prevention of stroke, MI, and vascular death in patients at risk.

● ANTIPSYCHOTICS

PHARMACOLOGIC PROFILE

General Use

Treatment of acute and chronic psychoses, particularly when accompanied by ↑ psychomotor activity. Use of clozapine is limited to schizophrenia unresponsive to conventional therapy. Selected agents are also used as antihistamines or antiemetics. Chlorpromazine is also used in the treatment of intractable hiccups.

General Action and Information

Block dopamine receptors in the brain; also alter dopamine release and turnover. Peripheral effects include anticholinergic properties and alpha-adrenergic blockade. Typical antipsychotics include the phenothiazines and haloperidol. Atypical antipsychotics may have fewer adverse reactions compared to the typical antipsychotics and include aripiprazole, asenapine, brexpiprazole, cariprazine, clozapine, lurasidone, paliperidone, olanzapine, quetiapine, risperidone, and ziprasidone. Phenothiazines differ in their ability to produce sedation (greatest with chlorpromazine and thioridazine), extrapyramidal reactions (greatest with prochlorperazine and trifluoperazine), and anticholinergic effects (greatest with chlorpromazine).

Contraindications

Hypersensitivity. Cross-sensitivity may exist among phenothiazines. Should not be used in angle-closure glaucoma. Should not be used in patients who have CNS depression.

Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with symptomatic cardiac disease. Avoid exposure to extremes in temperature. Use cautiously in severely ill or debilitated patients and patients with respiratory insufficiency, diabetes, prostatic hypertrophy, or intestinal obstruction. May ↓ seizure threshold. Clozapine may cause agranulocytosis. Most agents are capable of causing neuroleptic malignant syndrome. Should not be used routinely for anxiety or agitation not related to psychoses.

Interactions

Additive hypotension with acute ingestion of alcohol, antihypertensives, or nitrates. Antacids may ↓ absorption. Phenobarbital may ↑ metabolism and ↓ effectiveness. Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, or sedative/hypnotics. Lithium may ↓ blood levels and effectiveness of phenothiazines. May ↓ the therapeutic response to levodopa. May ↑ the risk of agranulocytosis with antithyroid agents.

NURSING IMPLICATIONS

Assessment

- Assess patient's mental status (orientation, mood, behavior) before and periodically throughout therapy.
- Monitor BP (sitting, standing, lying), pulse, and respiratory rate before and frequently during the period of dosage adjustment.
- Observe patient carefully when administering medication to ensure medication is actually taken and not hoarded.
- Monitor patient for onset of *akathisia*—restlessness or desire to keep moving—and extrapyramidal side effects; *parkinsonian effects*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonia*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs—every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Parkinsonian effects are more common in geriatric patients and dystonias are more common in younger patients. Notify health care professional if these symptoms occur, as ↓ in dosage or discontinuation of medication may be necessary. Trihexyphenidyl, benztropine, or diphenhydramine may be used to control these symptoms.
- Monitor for *tardive dyskinesia*—uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue. Notify health care professional immediately if these symptoms occur; these side effects may be irreversible.
- Monitor for development of *neuroleptic malignant syndrome*—fever, respiratory distress, tachycardia, convulsions, diaphoresis, hypertension or hypotension, pallor, tiredness, severe

58 ANTIPYRETICS

muscle stiffness, loss of bladder control. Notify health care professional immediately if these symptoms occur.

Potential Nursing Diagnoses

- Disturbed thought process (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Keep patient recumbent for at least 30 min following parenteral administration to minimize hypotensive effects..
- **PO:** Administer with **food, milk**, or a full glass of **water** to minimize gastric irritation.
- Dilute most concentrates in 120 mL of distilled or acidified tap water or **fruit juice** just before administration.

Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to skip doses or double up on missed doses. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes of temperature should also be avoided, as these drugs impair body temperature regulation.
- Advise patient that ↑ activity, bulk, and fluids in the diet helps minimize the constipating effects of this medication.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoid, or withdrawn behavior. Relief of nausea and vomiting. Relief of intractable hiccups.

● ANTIPYRETICS

PHARMACOLOGIC PROFILE

General Use

Used to lower fever of many causes (infection and inflammation).

General Action and Information

Antipyretics lower fever by affecting thermoregulation in the CNS and by inhibiting the action of prostaglandins peripherally. Many antipyretics affect platelet function; of these, aspirin has the most profound effect as compared with other salicylates or NSAIDs.

Contraindications

Avoid aspirin or NSAIDs in patients with bleeding disorders (risk of bleeding is less with other salicylates). Aspirin and other salicylates should be avoided in children and adolescents.

Precautions

Use aspirin or NSAIDs cautiously in patients with peptic ulcer disease. Avoid chronic use of large doses of acetaminophen.

Interactions

Large doses of aspirin may displace other highly protein-bound drugs. Additive GI irritation with aspirin and other NSAIDs or corticosteroids. Aspirin or NSAIDs may ↑ the risk of bleeding with other agents affecting hemostasis (anticoagulants, thrombolytic agents, antiplatelets, and anti-neoplastics).

NURSING IMPLICATIONS

Assessment

- Assess fever; note presence of associated symptoms (diaphoresis, tachycardia, and malaise).

Potential Nursing Diagnoses

- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Administration with food or antacids may minimize GI irritation.
- Available in oral and rectal dosage forms and in combination with other drugs.

Patient/Family Teaching

- Advise patient to consult health care professional if fever is not relieved by routine doses or if greater than 39.5°C (103°F) or lasts longer than 3 days.
- Centers for Disease Control and Prevention warns against giving aspirin to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.

Evaluation/Desired Outcomes

- Reduction of fever.

● ANTIRETROVIRALS

PHARMACOLOGIC PROFILE

General Use

The goal of antiretroviral therapy in the management of HIV infection is to improve CD4 cell counts and ↓ viral load. If accomplished, this generally results in slowed progression of the disease, improved quality of life, and ↓ opportunistic infections. Perinatal use of agents also prevents transmission of the virus to the fetus. Post-exposure and pre-exposure prophylaxis with certain antiretrovirals is also recommended.

General Action and Information

Because of the rapid emergence of resistance and toxicities of individual agents, HIV infection is almost always managed by a combination of agents. Selections and doses are based on individual toxicities, underlying organ system disease, concurrent drug therapy, and severity of illness.

Contraindications

Hypersensitivity. Because of highly varying toxicities among agents, see individual monographs for more specific information.

Precautions

Many agents require modification for renal impairment. Protease inhibitors may cause hyperglycemia and should be used cautiously in patients with diabetes. Hemophiliacs may also be at risk of bleeding when taking protease inhibitors. See individual monographs for specific information.

Interactions

There are many significant and potentially serious drug-drug interactions among the antiretrovirals. They are affected by drugs that alter metabolism; some agents themselves affect metabolism. See individual agents.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of symptoms of HIV and for symptoms of opportunistic infections throughout therapy.
- **Lab Test Considerations:** Monitor viral load and CD4 counts prior to and periodically during therapy.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Administer doses around the clock.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, around the clock, even if sleep is interrupted. Emphasize the importance of complying with therapy, not taking more than prescribed amount, and not discontinuing without consulting health care professional. Missed doses should be taken as soon as remembered unless almost time for next dose; patient should not double doses. Inform patient that long-term effects are unknown at this time.
- Instruct patient that antiretrovirals should not be shared with others.
- Inform patient that antiretroviral therapy does not cure HIV and does not ↓ the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Advise patient to avoid taking any Rx, OTC, or herbal products without consulting health care professional.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in viral load and increase in CD4 counts in patients with HIV.

● ANTIRHEUMATICS

PHARMACOLOGIC PROFILE

General Use

Antirheumatics are used to manage symptoms of rheumatoid arthritis (pain, swelling) and in more severe cases to slow down joint destruction and preserve joint function. NSAIDs, aspirin, and other salicylates are used to manage symptoms such as pain and swelling, allowing contin-

ued motility and improved quality of life. Corticosteroids are reserved for more advanced swelling and discomfort, primarily because of their ↑ side effects, especially with chronic use. They can be used to control acute flares of disease. Neither NSAIDs nor corticosteroids prevent disease progression or joint destruction. Disease-modifying antirheumatics drugs (DMARDs) slow the progression of rheumatoid arthritis and delay joint destruction. DMARDs are reserved for severe cases because of their toxicity. Several months of therapy may be required before benefit is noted and maintained. Serious and frequent adverse reactions may require discontinuation of therapy, despite initial benefit.

General Action and Information

Both NSAIDs and corticosteroids have potent anti-inflammatory properties. DMARDs work by a variety of mechanisms. See individual agents, but most work by suppressing the autoimmune response thought to be responsible for joint destruction.

Contraindications

Hypersensitivity. Patients who are allergic to aspirin should not receive other NSAIDs. Corticosteroids should not be used in patients with active untreated infections.

Precautions

NSAIDs and corticosteroids should be used cautiously in patients with a history of GI bleeding. Corticosteroids should be used with caution in patients with diabetes. Many DMARDs have immunosuppressive properties and should be avoided in patients for whom immunosuppression poses a serious risk, including patients with active infections, underlying malignancy, and transplant recipients.

Interactions

NSAIDs may diminish the response to diuretics and other antihypertensives. Corticosteroids may augment hypokalemia from other medications and ↑ the risk of digoxin toxicity. DMARDs ↑ the risk of serious immunosuppression with other immunosuppressants. Live vaccines should not be given concurrently with DMARDs.

NURSING IMPLICATIONS

Assessment

- Assess patient monthly for pain, swelling, and range of motion.

Potential Nursing Diagnoses

- Chronic pain (Indications).
- Deficient knowledge, related to disease process and medication regimen.

Implementation

- Most agents require regular administration to obtain maximum effects.

Patient/Family Teaching

- Instruct patient to contact health care professional if no improvement is noticed within a few days.

Evaluation/Desired Outcomes

- Improvement in signs and symptoms of rheumatoid arthritis.

● ANTITUBERCULARS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment and prevention of tuberculosis. Combinations are used in the treatment of active tuberculosis to rapidly ↓ the infectious state and delay or prevent the emergence of resis-

tant strains. In selected situations, intermittent (twice weekly) regimens may be employed. Streptomycin is also used as an antitubercular. Rifampin is also used in the prevention of meningococcal meningitis and *Haemophilus influenzae* type B.

General Action and Information

Kill (tuberculocidal) or inhibit the growth of (tuberculostatic) mycobacteria responsible for causing tuberculosis. Combination therapy with two or more agents is required, unless used as prophylaxis (isoniazid alone).

Contraindications

Hypersensitivity. Severe liver disease.

Precautions

Use cautiously in patients with a history of liver disease or in elderly or debilitated patients. Ethambutol requires ophthalmologic follow-up. Safety in pregnancy and lactation not established, although selected agents have been used without adverse effects on the fetus. Compliance is required for optimal response.

Interactions

Isoniazid inhibits the metabolism of phenytoin. Rifampin significantly ↓ levels of many drugs.

NURSING IMPLICATIONS

Assessment

- Mycobacterial studies and susceptibility tests should be performed prior to and periodically throughout therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically throughout therapy.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Most medications can be administered with food if GI irritation occurs.

Patient/Family Teaching

- Advise patient of the importance of continuing therapy even after symptoms have subsided.
- Emphasize the importance of regular follow-up exams to monitor progress and check for side effects.
- Inform patients taking rifampin that saliva, sputum, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of tuberculosis. Negative sputum cultures.

● ANTIULCER AGENTS

PHARMACOLOGIC PROFILE

General Use

Treatment and prophylaxis of peptic ulcer and gastric hypersecretory conditions such as Zollinger-Ellison syndrome. Histamine H₂-receptor antagonists (blockers) and proton pump inhibitors are also used in the management of gastroesophageal reflux disease (GERD).

General Action and Information

Because a great majority of peptic ulcer disease may be traced to GI infection with the organism *Helicobacter pylori*, eradication of the organism ↓ symptomatology and recurrence. Anti-infectives with significant activity against the organism include amoxicillin, clarithromycin, metronidazole, and tetracycline. Bismuth also has anti-infective activity against *H. pylori*. *H. pylori* treatment regimens usually include: a proton pump inhibitor, and 2 anti-infectives with or without bismuth subsalicylate for 10–14 days. Other medications used in the management of gastric/duodenal ulcer disease are aimed at neutralizing gastric acid (antacids), ↓ acid secretion (histamine H₂ antagonists, proton pump inhibitors, misoprostol), or protecting the ulcer surface from further damage (misoprostol, sucralfate). Histamine H₂-receptor antagonists competitively inhibit the action of histamine at the H₂ receptor, located primarily in gastric parietal cells, resulting in inhibition of gastric acid secretion. Misoprostol ↓ gastric acid secretion and ↑ production of protective mucus. Proton pump inhibitors prevent the transport of hydrogen ions into the gastric lumen.

Contraindications

Hypersensitivity. Pregnancy.

Precautions

Most histamine H₂ antagonists require dose reduction in renal impairment and in elderly patients. Magnesium-containing antacids should be used cautiously in patients with renal impairment. Misoprostol should be used cautiously in women of reproductive potential.

Interactions

Calcium- and magnesium-containing antacids ↓ the absorption of tetracycline and fluoroquinolones. Cimetidine inhibits the ability of the liver to metabolize several drugs, ↑ the risk of toxicity from warfarin, tricyclic antidepressants, theophylline, metoprolol, phenytoin, propranolol, and lidocaine. Omeprazole ↓ metabolism of phenytoin, diazepam, and warfarin. All agents that ↑ gastric pH will ↓ the absorption of itraconazole, ketoconazole, iron salts, erlotinib, nilotinib, atazanavir, nelfinavir, rilpivirine, and mycophenolate mofetil.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Antacids:** Assess for heartburn and indigestion as well as the location, duration, character, and precipitating factors of gastric pain.
- **Histamine H₂ Antagonists:** Assess elderly and severely ill patients for confusion routinely. Notify health care professional promptly should this occur.
- **Misoprostol:** Assess women of reproductive potential for pregnancy. Medication is usually begun on 2nd or 3rd day of menstrual period following a negative serum pregnancy test within 2 wk of beginning therapy.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- **Antacids:** Antacids cause premature dissolution and absorption of enteric-coated tablets and may interfere with absorption of other oral medications. Separate administration of antacids and other oral medications by at least 1 hr.
- Shake liquid preparations well before pouring. Follow administration with water to ensure passage to stomach. Liquid and powder dosage forms are considered to be more effective than chewable tablets.

- Chewable tablets must be chewed thoroughly before swallowing. Follow with half a glass of water.
- Administer 1 and 3 hr after meals and at bedtime for maximum antacid effect.
- **Misoprostol:** Administer with meals and at bedtime to reduce the severity of diarrhea.
- **Proton Pump Inhibitors:** Administer before meals, preferably in the morning. Capsules should be swallowed whole; do not open, crush, or chew.
- May be administered concurrently with antacids.
- **Sucralfate:** Administer on an empty stomach 1 hr before meals and at bedtime. **Do not crush or chew tablets.** Shake suspension well prior to administration. If nasogastric administration is required, consult pharmacist, as protein-binding properties of sucralfate have resulted in formation of a bezoar when administered with enteral feedings and other medications.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. If a dose is missed, it should be taken as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patient to avoid alcohol, products containing aspirin, NSAIDs, and foods that may cause an ↑ in GI irritation.
- Advise patient to report onset of black, tarry stools to health care professional promptly.
- Inform patient that cessation of smoking may help prevent the recurrence of duodenal ulcers.
- **Antacids:** Caution patient to consult health care professional before taking antacids for more than 2 wk or if problem is recurring. Advise patient to consult health care professional if relief is not obtained or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- **Misoprostol:** Emphasize that sharing of this medication may be dangerous.
- Inform patient that misoprostol may cause spontaneous abortion. Women of reproductive potential must be informed of this effect through verbal and written information and must use contraception throughout therapy. If pregnancy is suspected, the woman should stop taking misoprostol and immediately notify her health care professional.
- **Sucralfate:** Advise patient to continue with course of therapy for 4–8 wk, even if feeling better, to ensure ulcer healing.
- Advise patient that an ↑ in fluid intake, dietary bulk, and exercise may prevent drug-induced constipation.

Evaluation/Desired Outcomes

- Decrease in GI pain and irritation. Prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen by x-rays or endoscopy. Therapy with histamine H₂ antagonists is continued for at least 6 wk after initial episode. Decreased symptoms of GERD. Increase in the pH of gastric secretions (antacids). Prevention of gastric ulcers in patients receiving chronic NSAID therapy (misoprostol only).

● ANTIVIRALS

PHARMACOLOGIC PROFILE

General Use

Acyclovir, famciclovir, and valacyclovir are used in the management of herpes virus infections. Acyclovir and valacyclovir are also used in the management of chickenpox. Oseltamivir, peramivir, and zanamivir are used primarily in the prevention of influenza infections. Cidofovir, ganciclovir, valganciclovir, and foscarnet are used in the treatment of cytomegalovirus (CMV) retinitis. Vidarabine is used only to treat ophthalmic viral infections. Penciclovir, famciclovir, valacyclovir, and docosanol are used in the treatment and prevention of oral-facial herpes simplex.

General Action and Information

Most agents inhibit viral replication.

Contraindications

Previous hypersensitivity.

Precautions

All except zanamivir require dose adjustment in renal impairment. Acyclovir may cause renal impairment. Acyclovir may cause CNS toxicity. Foscarnet ↑ risk of seizures.

Interactions

Acyclovir may have additive CNS and nephrotoxicity with drugs causing similar adverse reactions.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of infection before and throughout therapy.
- **Ophth:** Assess eye lesions before and daily during therapy.
- **Topical:** Assess lesions before and daily during therapy.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Impaired skin integrity (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Most systemic antiviral agents should be administered around the clock to maintain therapeutic serum drug levels.

Patient/Family Teaching

- Instruct patient to continue taking medication around the clock for full course of therapy, even if feeling better.
- Advise patient that antivirals do not prevent transmission to others. Precautions should be taken to prevent spread of virus.
- Instruct patient in correct technique for topical or ophthalmic preparations.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Prevention or resolution of the signs and symptoms of viral infection. Length of time for complete resolution depends on organism and site of infection.

● BETA BLOCKERS

PHARMACOLOGIC PROFILE

General Use

Management of hypertension, angina pectoris, tachyarrhythmias, migraine headache (prophylaxis), MI, glaucoma (ophthalmic use), heart failure (HF) (bisoprolol, carvedilol, and sustained-release metoprolol only) and hyperthyroidism (management of symptoms only).

General Action and Information

Beta blockers compete with adrenergic (sympathetic) neurotransmitters (epinephrine and norepinephrine) for adrenergic receptor sites. Beta₁-adrenergic receptor sites are located chiefly in the heart where stimulation results in increased heart rate and myocardial contractility. Beta₂-

adrenergic receptors are found mainly in bronchial and vascular smooth muscle and the uterus. Stimulation of beta₂-adrenergic receptors produces vasodilation, bronchodilation, and uterine relaxation. Beta blockers may be relatively selective for beta₁-adrenergic receptors (acebutolol, atenolol, betaxolol, bisoprolol, esmolol, and metoprolol) or nonselective (carvedilol, labetalol, nadolol, pindolol, propranolol, and timolol) blocking both beta₁- and beta₂-adrenergic receptors. Carvedilol and labetalol have additional alpha-adrenergic blocking properties. Ophthalmic beta blockers ↓ production of aqueous humor.

Contraindications

Decompensated HF, acute bronchospasm, some forms of valvular heart disease, bradyarrhythmias, and heart block.

Precautions

Use cautiously in pregnant and lactating women (may cause fetal bradycardia and hypoglycemia). Use cautiously in any form of lung disease. Use with caution in patients with diabetes or severe liver disease. Beta blockers should not be abruptly discontinued in patients with cardiovascular disease.

Interactions

May cause additive myocardial depression and bradycardia when used with other agents having these effects (digoxin, diltiazem, verapamil, clonidine, and ivabradine). May antagonize the therapeutic effects of bronchodilators. May alter the requirements for insulin or hypoglycemic agents in patients with diabetes. Cimetidine may ↓ the metabolism and ↑ the effects of some beta blockers.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight. Assess patient routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and severity of episodes of chest pain periodically throughout therapy.
- **Migraine Prophylaxis:** Assess frequency and severity of migraine headaches periodically throughout therapy.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Take apical pulse prior to administering. If heart rate is <50 bpm or if arrhythmias occur, hold medication and notify health care professional.
- Many beta blockers are available in combination products to enhance compliance (see Appendix B).

Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well. Abrupt withdrawal may cause life-threatening arrhythmias, hypertension, or myocardial ischemia. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).

- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP weekly and report significant changes to health care professional.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercising or hot weather may enhance hypotensive effects.
- Advise patient to consult health care professional before taking any OTC medications or herbal/alternative therapies, especially cold remedies.
- Patients with diabetes should monitor blood glucose closely, especially if weakness, malaise, irritability, or fatigue occurs.
- Advise patient to advise health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.
- **Ophthalm:** Instruct patient in correct technique for administration of ophthalmic preparations.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Control of arrhythmias.
- Prevention of myocardial reinfarction.
- Prevention of migraine headaches.
- Decrease in tremors.
- Lowering of intraocular pressure.

● BONE RESORPTION INHIBITORS

PHARMACOLOGIC PROFILE

General Use

Bone resorption inhibitors are primarily used to treat and prevent osteoporosis in postmenopausal women. Other uses include treatment of osteoporosis due to other causes, including corticosteroid therapy, treatment of Paget's disease of the bone, and management of hypercalcemia.

General Action and Information

Biphosphonates (alendronate, etidronate, ibandronate, pamidronate, risedronate, and zoledronic acid) inhibit resorption of bone by inhibiting hydroxyapatite crystal dissolution and osteoclast activity. Raloxifene binds to estrogen receptors, producing estrogen-like effects on bone including ↓ bone resorption and ↓ bone turnover.

Contraindications

Hypersensitivity. Biphosphonates should not be used in patients with hypocalcemia. Raloxifene should not be used in women of reproductive potential or a history of thromboembolic disease.

Precautions

Use cautiously in patients with renal impairment; some agents should be avoided in moderate to severe renal impairment.

Interactions

Calcium supplements ↓ absorption of biphosphonates. Aspirin may ↑ GI adverse reactions with biphosphonates. Cholestyramine ↓ absorption of raloxifene (concurrent use is contraindicated).

NURSING IMPLICATIONS

Assessment

- Assess patients for low bone density before and periodically during therapy.
- Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, ↑ skull size).
- **Lab Test Considerations:** Monitor serum calcium in patients with osteoporosis. Monitor alkaline phosphatase in patients with Paget's disease.

Potential Nursing Diagnoses

- Risk for injury (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

Patient/Family Teaching

- Instruct patient to take medication exactly as directed.
- Encourage patient to participate in regular exercise and to modify behaviors that ↑ the risk of osteoporosis.

Evaluation/Desired Outcomes

- Prevention of, or decrease in, the progression of osteoporosis in postmenopausal women.
Decrease in the progression of Paget's disease.

● BRONCHODILATORS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of reversible airway obstruction due to asthma or chronic obstructive pulmonary disease (COPD). Recommendations for management of asthma recommend that rapid-acting inhaled beta-agonist bronchodilators (not salmeterol, formoterol, arformoterol, indacaterol, olodaterol, or vilanterol) be reserved as acute relievers of bronchospasm; repeated or chronic use indicates the need for additional long-term control agents, including inhaled corticosteroids, mast cell stabilizers, long-acting bronchodilators (oral theophylline, beta₂-agonists, or anticholinergics), and leukotriene modifiers (montelukast, zafirlukast).

General Action and Information

Beta₂-adrenergic agonists (albuterol, arformoterol, epinephrine, formoterol, indacaterol, levalbuterol, metaproterenol, olodaterol, pirbuterol, salmeterol, terbutaline, and vilanterol) produce bronchodilation by stimulating the production of cyclic adenosine monophosphate (cAMP). Onset of action allows use in management of acute attacks except for arformoterol, formoterol, indacaterol, olodaterol, salmeterol, and vilanterol, which have delayed onset. Phosphodiesterase inhibitors (aminophylline and theophylline) inhibit the breakdown of cAMP. Ipratropium and tiotropium are anticholinergic compounds that produce bronchodilation by blocking the action of acetylcholine in the respiratory tract.

Contraindications

Hypersensitivity to agents or preservatives (bisulfites) used in their formulation. Avoid use in uncontrolled cardiac arrhythmias.

Precautions

Use cautiously in patients with diabetes, cardiovascular disease, or hyperthyroidism.

Interactions

Therapeutic effectiveness may be antagonized by concurrent use of beta blockers. Additive sympathomimetic effects with other adrenergic (sympathetic) drugs, including vasopressors and decongestants. Cardiovascular effects may be potentiated by antidepressants and MAO inhibitors.

NURSING IMPLICATIONS

Assessment

- Assess BP, pulse, respiration, lung sounds, and character of secretions before and throughout therapy.
- Patients with a history of cardiovascular problems should be monitored for ECG changes and chest pain.

Potential Nursing Diagnoses

- Ineffective airway clearance (Indications).
- Activity intolerance (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Administer around the clock to maintain therapeutic plasma levels.

Patient/Family Teaching

- Emphasize the importance of taking only the prescribed dose at the prescribed time intervals.
- Encourage the patient to drink adequate liquids (2000 mL/day minimum) to ↓ the viscosity of the airway secretions.
- Advise patient to avoid OTC cough, cold, or breathing preparations without consulting health care professional and to minimize intake of xanthine-containing foods or beverages (colas, coffee, and chocolate), as these may ↑ side effects of theophylline.
- Caution patient to avoid smoking and other respiratory irritants.
- Instruct patient on proper use of metered-dose inhaler (see Appendix D).
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, symptoms worsen after treatment, or toxic effects occur.
- Patients using other inhalation medications and bronchodilators should be advised to use bronchodilator first and allow 5 min to elapse before administering the other medication, unless otherwise directed by health care professional.

Evaluation/Desired Outcomes

- Decreased bronchospasm. Increased ease of breathing.

● CALCIUM CHANNEL BLOCKERS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of hypertension (amlodipine, diltiazem, felodipine, isradipine, nifedipine, nisoldipine, verapamil) or in the treatment and prophylaxis of angina pectoris or coronary artery spasm (amlodipine, diltiazem, felodipine, nifedipine, verapamil). Verapamil and diltiazem are also used as antiarrhythmics. Nimodipine is used to prevent neurologic damage due to certain types of cerebral vasospasm.

General Action and Information

Block calcium entry into cells of vascular smooth muscle and myocardium. Dilate coronary arteries in both normal and ischemic myocardium and inhibit coronary artery spasm. Diltiazem

70 CALCIUM CHANNEL BLOCKERS

and verapamil also ↓ AV nodal conduction. Nimodipine has a relatively selective effect on cerebral blood vessels.

Contraindications

Hypersensitivity. Contraindicated in bradycardia, 2nd- or 3rd-degree heart block, or decompensated HF (all except for amlodipine and felodipine).

Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with liver disease or uncontrolled arrhythmias.

Interactions

May cause additive bradycardia when used with other agents having these effects (beta blockers, digoxin, clonidine, and ivabradine). Effectiveness may be ↓ by phenobarbital or phenytoin and ↑ by propranolol or cimetidine. Verapamil and diltiazem may ↑ serum digoxin levels and cause toxicity.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight. Assess patient routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and severity of episodes of chest pain periodically throughout therapy.
- **Arrhythmias:** ECG should be monitored continuously during IV therapy and periodically during long-term therapy with verapamil or diltiazem.
- **Cerebral Vasospasm:** Assess patient's neurological status (level of consciousness, movement) before and periodically during therapy with nimodipine.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Acute pain (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- May be administered without regard to meals.
- **Do not open, crush, or chew sustained-release capsules.**

Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercising or hot weather may enhance hypotensive effects.
- Instruct patient on the importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Advise patient to consult health care professional before taking any OTC medications or herbal/alternative therapies, especially cold remedies.
- Advise patient to advise health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

- **Angina:** Instruct patients on concurrent nitrate therapy to continue taking both medications as directed and using SL nitroglycerin as needed for anginal attacks. Advise patient to contact health care professional if chest pain worsens or does not improve after therapy, or is accompanied by diaphoresis or shortness of breath, or if severe, persistent headache occurs. Caution patient to discuss exercise precautions with health care professional prior to exertion.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management). Medication controls, but does not cure, hypertension.
- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP weekly and report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of supraventricular tachyarrhythmias.
- Improvement in neurological deficits due to vasospasm following subarachnoid hemorrhage.

● CENTRAL NERVOUS SYSTEM STIMULANTS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of narcolepsy and as adjunctive treatment in the management of attention deficit hyperactivity disorder (ADHD).

General Action and Information

Produce CNS stimulation by ↑ levels of neurotransmitters in the CNS. Produce CNS and respiratory stimulation, dilated pupils, ↑ motor activity and mental alertness, and a diminished sense of fatigue. In children with ADHD, these agents ↓ restlessness and ↑ attention span.

Contraindications

Hypersensitivity. Should not be used in pregnant or lactating women. Should not be used in hyperexcitable states. Avoid using in patients with psychotic personalities or suicidal/homicidal tendencies. Contraindicated in glaucoma and severe cardiovascular disease.

Precautions

Use cautiously in patients with a history of cardiovascular disease, hypertension, diabetes mellitus, or in elderly or debilitated patients. Continual use may result in psychological dependence or addiction.

Interactions

Additive sympathomimetic (adrenergic) effects. Use with MAO inhibitors can result in hypertensive crises. Alkalinizing the urine (sodium bicarbonate, acetazolamide) ↓ excretion and enhances effects of amphetamines. Acidification of the urine (ammonium chloride, large doses of ascorbic acid) ↓ effect of amphetamines. Phenothiazines may also ↓ effects. Methylphenidate may ↓ the metabolism and ↑ effects of other drugs (warfarin, anticonvulsants, tricyclic antidepressants).

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiration before administering and periodically during therapy.
- Monitor weight biweekly and inform health care professional of significant weight loss.

- Monitor height periodically in children; inform health care professional if growth inhibition occurs.
- May produce false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- **ADHD:** Assess attention span, impulse control, and interactions with others in children. Therapy may be interrupted at intervals to determine if symptoms are sufficient to warrant continued therapy.
- **Narcolepsy:** Observe and document frequency of episodes.

Potential Nursing Diagnoses

- Disturbed thought process (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

Patient/Family Teaching

- Instruct patient not to alter dose without consulting health care professional. These medications have high dependence and abuse potential. Abrupt cessation with high doses may cause extreme fatigue and mental depression.
- Advise patient to avoid intake of large amounts of caffeine.
- Medication may impair judgment. Caution patient to avoid driving or other activities requiring judgment until response to medication is known.
- Inform patient that periodic holidays from the drug may be used to assess progress and decrease dependence.

Evaluation/Desired Outcomes

- Decreased frequency of narcoleptic episodes.
- Improved attention span and social interactions.

● CORTICOSTEROIDS

PHARMACOLOGIC PROFILE

General Use

Used in replacement doses (20 mg of hydrocortisone or equivalent) systemically to treat adrenocortical insufficiency. Larger doses are usually used for their anti-inflammatory, immunosuppressive, or antineoplastic activity. Used adjunctively in many other situations, including hypercalcemia and autoimmune diseases. Topical corticosteroids are used in a variety of inflammatory and allergic conditions. Inhalant corticosteroids are used in the chronic management of reversible airway disease (asthma); intranasal and ophthalmic corticosteroids are used in the management of chronic allergic and inflammatory conditions.

General Action and Information

Produce profound and varied metabolic effects, in addition to modifying the normal immune response and suppressing inflammation. Available in a variety of dosage forms, including oral, injectable, topical, and inhalation. Prolonged use of large amounts of topical or inhaled agent may result in systemic absorption and/or adrenal suppression.

Contraindications

Serious infections (except for certain forms of meningitis). Do not administer live vaccines to patients on larger doses.

Precautions

Prolonged treatment will result in adrenal suppression. Do not discontinue abruptly. Additional doses may be needed during stress (surgery and infection). Safety in pregnancy and lactation

not established. Long-term use in children will result in ↓ growth. May mask signs of infection. Use lowest dose possible for shortest time possible. Alternate-day therapy is preferable during long-term treatment.

Interactions

Additive hypokalemia with amphotericin B and potassium-losing diuretics. Hypokalemia may ↑ the risk of digoxin toxicity. May ↑ requirements for insulin or oral hypoglycemic agents. Phenytoin, phenobarbital, and rifampin stimulate metabolism and may ↓ effectiveness. Oral contraceptives may block metabolism. Cholestyramine and colestipol may ↓ absorption.

NURSING IMPLICATIONS

Assessment

- These drugs are indicated for many conditions. Assess involved systems prior to and periodically throughout course of therapy.
- Assess patient for signs of adrenal insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness) prior to and periodically throughout course of therapy.
- Children should have periodic evaluations of growth.

Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Disturbed body image (Side Effects).

Implementation

- If dose is ordered daily or every other day, administer in the morning to coincide with the body's normal secretion of cortisol.
- **PO:** Administer with meals to minimize gastric irritation.

Patient/Family Teaching

- Emphasize need to take medication exactly as directed. Review symptoms of adrenal insufficiency that may occur when stopping the medication and that may be life-threatening.
- Encourage patients on long-term therapy to eat a diet high in protein, calcium, and potassium and low in sodium and carbohydrates.
- These drugs cause immunosuppression and may mask symptoms of infection. Instruct patient to avoid people with known contagious illnesses and to report possible infections. Advise patient to consult health care professional before receiving any vaccinations.
- Discuss possible effects on body image. Explore coping mechanisms.
- Advise patient to carry identification in the event of an emergency in which patient cannot relate medical history.

Evaluation/Desired Outcomes

- Suppression of the inflammatory and immune responses in autoimmune disorders, allergic reactions, and organ transplants.
- Replacement therapy in adrenal insufficiency.
- Resolution of skin inflammation, pruritus, or other dermatologic conditions.

● DIURETICS

PHARMACOLOGIC PROFILE

General Use

Thiazide diuretics and loop diuretics are used alone or in combination in the treatment of hypertension or edema due to HF or other causes. Potassium-sparing diuretics have weak diuretic

and antihypertensive properties and are used mainly to conserve potassium in patients receiving thiazide or loop diuretics. Osmotic diuretics are often used in the management of cerebral edema.

General Action and Information

Enhance the selective excretion of various electrolytes and water by affecting renal mechanisms for tubular secretion and reabsorption. Groups commonly used are thiazide diuretics and thiazide-like diuretics (chlorothiazide, chlorthalidone, hydrochlorothiazide, indapamide, and metolazone), loop diuretics (bumetanide, furosemide, and torsemide), potassium-sparing diuretics (amiloride, spironolactone, and triamterene), and osmotic diuretics (mannitol). Mechanisms vary, depending on agent.

Contraindications

Hypersensitivity. Thiazide and loop diuretics may exhibit cross-sensitivity with other sulfonamides.

Precautions

Use with caution in patients with renal or hepatic disease. Safety in pregnancy and lactation not established.

Interactions

Additive hypokalemia with corticosteroids and amphotericin B, piperacillin. Hypokalemia may ↑ the risk of digoxin toxicity. Potassium-losing diuretics ↓ lithium excretion and may cause toxicity. Additive hypotension with other antihypertensives or nitrates. Potassium-sparing diuretics may cause hyperkalemia when used with potassium supplements, ACE inhibitors, angiotensin II receptor antagonists, and aliskiren.

NURSING IMPLICATIONS

Assessment

- Assess fluid status throughout therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes.
- Assess patient for anorexia, muscle weakness, numbness, tingling, paresthesia, confusion, and excessive thirst. Notify health care professional promptly if these signs of electrolyte imbalance occur.
- **Hypertension:** Monitor BP and pulse before and during administration. Monitor frequency of prescription refills to determine compliance in patients treated for hypertension.
- **Increased Intracranial Pressure:** Monitor neurologic status and intracranial pressure readings in patients receiving osmotic diuretics to decrease cerebral edema.
- **Increased Intraocular Pressure:** Monitor for persistent or increased eye pain or decreased visual acuity.
- **Lab Test Considerations:** Monitor electrolytes (especially potassium), blood glucose, BUN, and serum uric acid levels before and periodically throughout course of therapy.
- Thiazide and loop diuretics may cause ↑ serum cholesterol, low-density lipoprotein (LDL) cholesterol, and triglyceride concentrations.

Potential Nursing Diagnoses

- Excess fluid volume (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Administer oral diuretics in the morning to prevent disruption of sleep cycle.
- Many diuretics are available in combination with other antihypertensives or potassium-sparing diuretics.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Advise patients on antihypertensive regimen to continue taking medication, even if feeling better. Medication controls, but does not cure, hypertension.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding dietary potassium guidelines.
- Instruct patient to monitor weight weekly and report significant changes.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional before taking OTC medication concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to contact health care professional immediately if muscle weakness, cramps, nausea, dizziness, or numbness or tingling of extremities occurs.
- Emphasize the importance of routine follow-up.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, regular exercise, restricted sodium intake, stress reduction, moderation of alcohol consumption, and cessation of smoking).
- Instruct patients with hypertension in the correct technique for monitoring weekly BP.

Evaluation/Desired Outcomes

- Decreased BP.
- Increased urine output.
- Decreased edema.
- Reduced intracranial pressure.
- Prevention of hypokalemia in patients taking diuretics.
- Treatment of hyperaldosteronism.

● HORMONES

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of deficiency states including diabetes mellitus (insulin), diabetes insipidus (desmopressin), hypothyroidism (thyroid hormones), and menopause (estrogens or estrogens/progestins). Estrogenic and progestational hormones are used as contraceptive agents in various combinations and sequences. Hormones may be used to treat hormonally sensitive tumors (androgens, estrogens) and in other selected situations. See individual drugs.

General Action and Information

Natural or synthetic substances that have a specific effect on target tissue. Differ greatly in their effects, depending on individual agent and function of target tissue.

Contraindications

Differ greatly among individual agents; see individual entries.

Precautions

Differ greatly among individual agents; see individual entries.

Interactions

Differ greatly among individual agents; see individual entries.

NURSING IMPLICATIONS

Assessment

- Monitor patient for symptoms of hormonal excess or insufficiency.
- **Sex Hormones:** BP and hepatic function tests should be monitored periodically throughout therapy.

Potential Nursing Diagnoses

- Sexual dysfunction (Indications).
- Disturbed body image (Indications) (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- **Sex Hormones:** During hospitalization, continue to administer according to schedule followed prior to hospitalization.

Patient/Family Teaching

- Explain dose schedule (and withdrawal bleeding with female sex hormones).
- Emphasize the importance of follow-up exams to monitor effectiveness of therapy and to ensure proper development of children and early detection of possible side effects.
- **Female Sex Hormones:** Advise patient to report signs and symptoms of fluid retention, thromboembolic disorders, mental depression, or hepatic dysfunction to health care professional.

Evaluation/Desired Outcomes

- Resolution of clinical symptoms of hormone imbalance including menopause symptoms and contraception.
- Correction of fluid and electrolyte imbalances.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Slowed progression of postmenopausal osteoporosis.

● IMMUNOSUPPRESSANTS

PHARMACOLOGIC PROFILE

General Use

Azathioprine, basiliximab, cyclosporine, everolimus, mycophenolate, sirolimus, and tacrolimus are used with corticosteroids in the prevention of transplantation rejection reactions. Muromonab-CD3 is used to manage rejection reactions not controlled by other agents. Azathioprine, cyclophosphamide, and methotrexate are used in the management of selected autoimmune diseases (nephrotic syndrome of childhood and severe rheumatoid arthritis).

General Action and Information

Inhibit cell-mediated immune responses by different mechanisms. In addition to azathioprine and cyclosporine, which are used primarily for their immunomodulating properties, cyclophosphamide and methotrexate are used to suppress the immune responses in certain disease states (nephrotic syndrome of childhood and severe rheumatoid arthritis). Muromonab-CD3 is a recombinant immunoglobulin antibody that alters T-cell function. Basiliximab is a monoclonal antibody.

Contraindications

Hypersensitivity to drug or vehicle.

Precautions

Use cautiously in patients with infections. Safety in pregnancy and lactation not established.

Interactions

Allopurinol inhibits the metabolism of azathioprine. Drugs that alter liver-metabolizing processes may change the effect of cyclosporine, tacrolimus, or sirolimus. The risk to toxicity of methotrexate may be ↑ by other nephrotoxic drugs, large doses of aspirin, or NSAIDs. Muro-monab-CD3 has additive immunosuppressive properties; concurrent immunosuppressive doses should be ↓ or eliminated.

NURSING IMPLICATIONS

Assessment

- Monitor for infection (vital signs, sputum, urine, stool, WBC). Notify physician or other health care professional immediately if symptoms occur.
- **Organ Transplant:** Assess for symptoms of organ rejection throughout therapy.
- **Lab Test Consideration:** Monitor CBC and differential throughout therapy.

Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Protect transplant patients from staff and visitors who may carry infection.
- Maintain protective isolation as indicated.

Patient/Family Teaching

- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ and stress the need for patient to notify health care professional immediately if they occur.
- Advise patient to avoid contact with contagious persons. Patients should not receive vaccinations without first consulting with health care professional.
- Emphasize the importance of follow-up exams and lab tests.

Evaluation/Desired Outcomes

- Prevention or reversal of rejection of organ transplants or decrease in symptoms of autoimmune disorders.

● LAXATIVES

PHARMACOLOGIC PROFILE

General Use

Used to treat or prevent constipation or to prepare the bowel for radiologic or endoscopic procedures.

General Action and Information

Induce one or more bowel movements per day. Groups include stimulants (bisacodyl, sennosides), saline laxatives (magnesium salts and phosphates), stool softeners (docusate), bulk-forming agents (polycarbophil and psyllium), and osmotic cathartics (lactulose, polyethylene glycol/electrolyte). ↑ fluid intake, exercising, and adding more dietary fiber are also useful in the management of chronic constipation.

Contraindications

Hypersensitivity. Contraindicated in persistent abdominal pain, nausea, or vomiting of unknown cause, especially if accompanied by fever or other signs of an acute abdomen.

Precautions

Excessive or prolonged use may lead to dependence. Should not be used in children unless advised by a physician or other health care professional.

Interactions

Theoretically may ↓ the absorption of other orally administered drugs by ↓ transit time.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses

- Constipation (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- May be administered at bedtime for morning results.
- Taking oral doses on an empty stomach will usually produce more rapid results.
- **Do not crush or chew enteric-coated tablets.** Take with a full glass of water or juice.
- Stool softeners and bulk laxatives may take several days for results.

Patient/Family Teaching

- Advise patients, other than those with spinal cord injuries, that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Advise patient to ↑ fluid intake to a minimum of 1500–2000 mL/day during therapy to prevent dehydration.
- Encourage patients to use other forms of bowel regulation: ↑ bulk in the diet, ↑ fluid intake, and ↑ mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient that laxatives should not be used when constipation is accompanied by abdominal pain, fever, nausea, or vomiting.

Evaluation/Desired Outcomes

- A soft, formed bowel movement.
- Evacuation of the colon.

● LIPID-LOWERING AGENTS

PHARMACOLOGIC PROFILE

General Use

Used as a part of a total plan including diet and exercise to ↓ blood lipids in an effort to ↓ the morbidity and mortality of atherosclerotic cardiovascular disease and its sequelae.

General Action and Information

HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pitavastatin, pravastatin, rosuvastatin, simvastatin) inhibit an enzyme involved in cholesterol synthesis. Bile acid sequestrants (cholestyramine, colestipol, colestevlam) bind cholesterol in the GI tract. Ezetimibe inhibits the

absorption of cholesterol in the small intestine. Fenofibrate, gemfibrozil, and niacin act by other mechanisms (see individual monographs).

Contraindications

Hypersensitivity. HMG-CoA reductase inhibitors are contraindicated in pregnancy.

Precautions

Safety of other drugs in pregnancy, lactation, and children not established. See individual drugs. Dietary therapy should be given a 2–3 mo trial before drug therapy is initiated.

Interactions

Bile acid sequestrants (cholestyramine and colestipol) may bind lipid-soluble vitamins (A, D, E, and K) and other concurrently administered drugs in the GI tract. The risk of myopathy from HMG-CoA reductase inhibitors is ↑ by niacin, erythromycin, gemfibrozil, and cyclosporine.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially in regard to **fat** and alcohol consumption.
- **Lab Test Considerations:** Serum cholesterol and triglyceride levels should be evaluated before initiating and periodically throughout therapy. Medication should be discontinued if paradoxical increase in cholesterol level occurs.
- Liver function tests should be assessed before and periodically throughout therapy. May cause an ↑ in levels.

Potential Nursing Diagnoses

- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- See specific medications to determine timing of doses in relation to meals.

Patient/Family Teaching

- Advise patient that these medications should be used in conjunction with diet restrictions (**fat**, **cholesterol**, **carbohydrates**, and alcohol), exercise, and cessation of smoking.

Evaluation/Desired Outcomes

- Decreased serum triglyceride and LDL **cholesterol** levels and improved HDL cholesterol ratios. Therapy is usually discontinued if the clinical response is not evident after 3 mo of therapy.

● MINERALS/ELECTROLYTES/pH MODIFIERS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of deficiencies or excesses of electrolytes and maintenance of optimal acid/base balance for homeostasis. Acidifiers and alkalinizers are also used to promote urinary excretion of substances that accumulate in certain disease states (kidney stones, uric acid).

General Action and Information

Electrolytes and minerals are necessary for many body processes. Maintenance of electrolyte levels within normal limits is required for many physiological processes such as cardiac, nerve, and muscle function; bone growth and stability; and a number of other activities. Minerals and

electrolytes may also serve as catalysts in many enzymatic reactions. Acid/base balance allows for normal transfer of substances at the cellular and intracellular level.

Contraindications

Contraindicated in situations in which replacement would cause excess or when risk factors for retention are present.

Precautions

Use cautiously in disease states in which electrolyte imbalances are common such as significant hepatic or renal disease, adrenal or pituitary disorders.

Interactions

Depend on individual agents. Alkalinizers and acidifiers can alter the excretion of drugs for which elimination is pH dependent. See specific entries.

NURSING IMPLICATIONS

Assessment

- Observe patient carefully for evidence of electrolyte excess or insufficiency. Monitor lab values before and periodically throughout therapy.

Potential Nursing Diagnoses

- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).

Implementation

- **Potassium Chloride:** Do not administer potassium chloride undiluted.

Patient/Family Teaching

- Review diet modifications with patients with chronic electrolyte disturbances.

Evaluation/Desired Outcomes

- Return to normal serum electrolyte concentrations and resolution of clinical symptoms of electrolyte imbalance.
- Changes in pH or composition of urine, which prevent formation of renal calculi.

● NATURAL/HERBAL PRODUCTS

PHARMACOLOGIC PROFILE

General Use

These remedies are used for a wide variety of conditions. Prescriptions are not required and consumers have the choice of many products.

General Action and Information

Use of these agents is based on historical and sometimes anecdotal evidence. The FDA has little control over these agents, so currently there is little standardization among products.

Contraindications

Hypersensitivity. Most products are plant extracts that may contain a variety of impurities.

Precautions

Elderly, pediatric, and pregnant or lactating patients should be aware that these agents carry many of the same risks as prescription medications. Patients with serious chronic medical conditions should consult their health care professional before use.

Interactions

These agents have the ability to interact with prescription medications and may prevent or augment a desired therapeutic outcome. St. John's wort and kava-kava have the greatest risk for serious interactions.

NURSING IMPLICATIONS

Assessment

- Assess the condition for which the patient is taking the product.

Potential Nursing Diagnoses

- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- **PO:** Administer salicylates and NSAIDs after meals or with food to minimize gastric irritation.

Patient/Family Teaching

- Discuss with patient the reason for using the product. Encourage patient to choose products with USP label, if possible, to guarantee content and purity of medication.
- Inform patient of known side effects and interactions with other medications.

Evaluation/Desired Outcomes

- Improvement in condition for which medication was taken.

● NONOPIOID ANALGESICS

PHARMACOLOGIC PROFILE

General Use

Used to control mild to moderate pain and/or fever. Phenazopyridine is used only to treat urinary tract pain, and capsaicin is used topically for a variety of painful syndromes.

General Action and Information

Most nonopioid analgesics inhibit prostaglandin synthesis peripherally for analgesic effect and centrally for antipyretic effect. Tramadol is a centrally acting agent.

Contraindications

Hypersensitivity and cross-sensitivity among NSAIDs may occur.

Precautions

Use cautiously in patients with severe hepatic or renal disease, chronic alcohol use/abuse, or malnutrition. Tramadol has CNS depressant properties.

Interactions

Long-term use of acetaminophen with NSAIDs may ↑ the risk of adverse renal effects. Prolonged high-dose acetaminophen may ↑ the risk of bleeding with warfarin. Hepatotoxicity may be additive with other hepatotoxic agents, including alcohol. NSAIDs ↑ the risk of bleeding with warfarin, thrombolytic agents, antiplatelet agents, some cephalosporins, and valproates (effect is greatest with aspirin). NSAIDs may also ↓ the effectiveness of diuretics and antihypertensives. The risk of CNS depression with tramadol is ↑ by concurrent use of other CNS depressants, including alcohol, antihistamines, sedative/hypnotics, and some antidepressants.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an ↑ risk for developing hypersensitivity reactions.

- **Pain:** Assess pain and limitation of movement; note type, location, and intensity prior to and at the peak (see Time/Action Profile) following administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Hepatic, hematologic, and renal function should be evaluated periodically throughout prolonged high-dose therapy. Aspirin and most NSAIDs prolong bleeding time due to suppressed platelet aggregation and, in large doses, may cause prolonged prothrombin time. Monitor hematocrit periodically in prolonged high-dose therapy to assess for GI blood loss.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- **PO:** Administer salicylates and NSAIDs after meals or with food to minimize gastric irritation.

Patient/Family Teaching

- Instruct patient to take salicylates and NSAIDs with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Adults should not take acetaminophen longer than 10 days and children not longer than 5 days unless directed by health care professional. Short-term doses of acetaminophen with salicylates or NSAIDs should not exceed the recommended daily dose of either drug alone.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may ↑ the risk of GI bleeding with salicylates or NSAIDs. Caution patient to avoid taking acetaminophen, salicylates, or NSAIDs concurrently for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Advise patients on long-term therapy to inform health care professional of medication regimen prior to surgery. Aspirin, salicylates, and NSAIDs may need to be withheld prior to surgery.

Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort.
- Reduction of fever.

● NONSTEROIDAL ANTI-INFLAMMATORY AGENTS

PHARMACOLOGIC PROFILE

General Use

NSAIDs are used to control mild to moderate pain, fever, and various inflammatory conditions, such as rheumatoid arthritis and osteoarthritis. Ophthalmic NSAIDs are used to ↓ postoperative ocular inflammation, to inhibit perioperative miosis, and to ↓ inflammation due to allergies.

General Action and Information

NSAIDs have analgesic, antipyretic, and anti-inflammatory properties. Analgesic and anti-inflammatory effects are due to inhibition of prostaglandin synthesis. Antipyretic action is due to vasodilation and inhibition of prostaglandin synthesis in the CNS. COX-2 inhibitors (celecoxib) may cause less GI bleeding.

Contraindications

Hypersensitivity to aspirin is a contraindication for the whole group of NSAIDs. Cross-sensitivity may occur.

Precautions

Use cautiously in patients with a history of bleeding disorders, GI bleeding, and severe hepatic, renal, or cardiovascular disease. Safe use in pregnancy is not established and, in general, should be avoided during the second half of pregnancy.

Interactions

NSAIDs prolong bleeding time and potentiate the effect of warfarin, thrombolytic agents, some cephalosporins, antiplatelet agents, and valproates. Prolonged use with aspirin may result in ↑ GI side effects and ↓ effectiveness. NSAIDs may also ↓ response to diuretics or anti-hypertensive therapy. COX-2 inhibitors do not negate the cardioprotective effect of low-dose aspirin.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an ↑ risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity prior to and at the peak (see Time/Action Profile) following administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Most NSAIDs prolong bleeding time due to suppressed platelet aggregation and, in large doses, may cause prolonged PT. Monitor periodically in prolonged high-dose therapy to assess for GI blood loss.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- **PO:** Administer NSAIDs after meals or with food to minimize gastric irritation.

Patient/Family Teaching

- Instruct patient to take NSAIDs with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may ↑ the risk of GI bleeding with salicylates or NSAIDs. Caution patient to avoid taking acetaminophen, salicylates, or NSAIDs concurrently for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Advise patient on long-term therapy to inform health care professional of medication regimen prior to surgery. NSAIDs may need to be withheld prior to surgery.

Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort
- Reduction of fever.

● OPIOID ANALGESICS

PHARMACOLOGIC PROFILE

General Use

Management of moderate to severe pain. Fentanyl is also used as a general anesthetic adjunct.

General Action and Information

Opioids bind to opiate receptors in the CNS, where they act as agonists of endogenously occurring opioid peptides (eukephalins and endorphins). The result is alteration to the perception of and response to pain.

Contraindications

Hypersensitivity to individual agents.

Precautions

Use cautiously in patients with undiagnosed abdominal pain, head trauma or pathology, liver disease, or history of addiction to opioids. Use smaller doses initially in the elderly and those with respiratory diseases. Prolonged use may result in tolerance and the need for larger doses to relieve pain. Psychological or physical dependence may occur.

Interactions

↑ the CNS depressant properties of other drugs, including alcohol, antihistamines, antidepressants, sedative/hypnotics, phenothiazines, and MAO inhibitors. Use of partial-antagonist opioid analgesics (buprenorphine, butorphanol, nalbuphine, and pentazocine) may precipitate opioid withdrawal in physically dependent patients. Use with MAO inhibitors or procarbazine may result in severe paradoxical reactions (especially with meperidine). Nalbuphine or pentazocine may ↓ the analgesic effects of other concurrently administered opioid analgesics.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and at peak following administration. When titrating opioid doses, ↑ of 25–50% should be administered until there is either a 50% ↓ in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring higher doses of opioid agonist-antagonists should be converted to an opioid agonist.
- Opioid agonist-antagonists are not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is < 10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be ↓ by 25–50%. Initial drowsiness will diminish with continued use.
- Assess prior analgesic history. Antagonistic properties of agonist-antagonists may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and ↑ BP and temperature) in patients physically dependent on opioids.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioid analgesics for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with chronic therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with ↑ intake of fluids and bulk, stool softeners, and laxatives to minimize constipating effects. Stimu-

lant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.

- Monitor intake and output ratios. If significant discrepancies occur, assess for urinary retention and inform physician or other health care professional.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Disturbed sensory perception (auditory, visual) (Side Effects).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Do not confuse morphine with hydromorphone or meperidine; errors have resulted in fatalities.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Medication may cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

Evaluation/Desired Outcomes

- Decreased severity of pain without a significant alteration in level of consciousness or respiratory status.

● SEDATIVE/HYPNOTICS

PHARMACOLOGIC PROFILE

General Use

Sedatives are used to provide sedation, usually prior to procedures. Hypnotics are used to manage insomnia. Selected agents are useful as anticonvulsants (clorazepate, diazepam, phenobarbital), skeletal muscle relaxants (diazepam), adjuncts in the management of alcohol withdrawal syndrome (chloridiazepoxide, diazepam, oxazepam), adjuncts in general anesthesia (droperidol), or as amnestics (midazolam, diazepam).

General Action and Information

Cause generalized CNS depression. May produce tolerance with chronic use and have potential for psychological or physical dependence. These agents have NO analgesic properties.

Contraindications

Hypersensitivity. Should not be used in comatose patients or in those with pre-existing CNS depression. Should not be used in patients with uncontrolled severe pain. Avoid use during pregnancy or lactation.

Precautions

Use cautiously in patients with hepatic dysfunction, severe renal impairment, or severe underlying pulmonary disease. Use with caution in patients who may be suicidal or who may have had previous drug addictions. Hypnotic use should be short-term. Geriatric patients may be more sensitive to CNS depressant effects; dosage ↓ may be required.

Interactions

Additive CNS depression with alcohol, antihistamines, some antidepressants, opioid analgesics, or phenothiazines. Barbiturates induce hepatic drug-metabolizing enzymes and can ↓ the effectiveness of drugs metabolized by the liver, including oral contraceptives. Should not be used with MAO inhibitors.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory status frequently throughout IV administration. Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- **Insomnia:** Assess sleep patterns before and periodically throughout course of therapy.
- **Seizures:** Observe and record intensity, duration, and characteristics of seizure activity. Institute seizure precautions.
- **Muscle Spasms:** Assess muscle spasms, associated pain, and limitation of movement before and throughout therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect patient from injury.

Potential Nursing Diagnoses

- Insomnia (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Supervise ambulation and transfer of patients following administration of hypnotic doses. Remove cigarettes. Side rails should be raised and call bell within reach at all times. Keep bed in low position.

Patient/Family Teaching

- Discuss the importance of preparing the environment for sleep (dark room, quiet, avoidance of nicotine and caffeine). If less effective after a few weeks, consult health care professional; do not ↑ dose. Gradual withdrawal may be required to prevent reactions following prolonged therapy.
- May cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.

- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with these medications.
- Advise patient to inform health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Improvement in sleep patterns.
- Control of seizures.
- Decrease in muscle spasms.
- Decreased tremulousness.
- More rational ideation when used for alcohol withdrawal.

● SKELETAL MUSCLE RELAXANTS

PHARMACOLOGIC PROFILE

General Use

Two major uses are spasticity associated with spinal cord diseases or lesions (baclofen and dantrolene) or adjunctive therapy in the symptomatic relief of acute painful musculoskeletal conditions (cyclobenzaprine, diazepam, and methocarbamol). IV dantrolene is also used to treat and prevent malignant hyperthermia.

General Action and Information

Act either centrally (baclofen, carisoprodol, cyclobenzaprine, diazepam, and methocarbamol) or directly (dantrolene).

Contraindications

Baclofen and oral dantrolene should not be used in patients in whom spasticity is used to maintain posture and balance.

Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with a history of previous liver disease.

Interactions

Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, and sedative/hypnotics.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Impaired physical mobility (Indications).
- Risk for injury (Side Effects).

Implementation

- Provide safety measures as indicated. Supervise ambulation and transfer of patients.

Patient/Family Teaching

- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.

- Advise patient to avoid concurrent use of alcohol or other CNS depressants with these medications.

Evaluation/Desired Outcomes

- Decreased musculoskeletal pain
- Decreased muscle spasticity
- Increased range of motion
- Prevention or decrease in temperature and skeletal rigidity in malignant hyperthermia.

● THROMBOLYTICS

PHARMACOLOGIC PROFILE

General Use

Acute management of ST-segment-elevation MI. Alteplase is also used in the management of acute pulmonary embolism and acute ischemic stroke.

General Action and Information

Converts plasminogen to plasmin, which then degrades fibrin in clots. Alteplase, reteplase, and tenecteplase directly activate plasminogen. Results in lysis of blood clots.

Contraindications

Hypersensitivity. Active internal bleeding, history of cerebrovascular accident, recent CNS trauma or surgery, neoplasm, or arteriovenous malformation, severe uncontrolled hypertension, and known bleeding tendencies.

Precautions

Recent (within 10 days) major surgery, trauma, GI or GU bleeding. Severe hepatic or renal disease. Subacute bacterial endocarditis or acute pericarditis. Use cautiously in geriatric patients. Safety not established in pregnancy, lactation, or children.

Interactions

Concurrent use with antiplatelet agents, NSAIDs, warfarin, or heparins may ↑ the risk of bleeding, although these agents are frequently used together or in sequence. Risk of bleeding may also be ↑ by concurrent use with cefotetan, cefoperazone, and valproic acid.

NURSING IMPLICATIONS

Assessment

- Begin therapy as soon as possible after the onset of symptoms.
- Monitor vital signs, including temperature, continuously for coronary thrombosis and at least every 4 hr during therapy for other indications. Do not use lower extremities to monitor BP.
- Assess patient carefully for bleeding every 15 min during the 1st hr of therapy, every 15–30 min during the next 8 hr, and at least every 4 hr for the duration of therapy. Frank bleeding may occur from sites of invasive procedures or from body orifices. Internal bleeding may also occur (↓ neurologic status; abdominal pain with coffee-ground emesis or black, tarry stools; hematuria; joint pain). If uncontrolled bleeding occurs, stop medication and notify physician immediately.
- Assess neurologic status throughout therapy.
- Altered sensorium or neurologic changes may be indicative of intracranial bleeding.
- **Coronary Thrombosis:** Monitor ECG continuously. Notify physician if significant arrhythmias occur. IV lidocaine or procainamide may be ordered prophylactically. Cardiac enzymes should be monitored. Coronary angiography may be ordered following therapy to monitor effectiveness of therapy.

- Monitor heart sounds and breath sounds frequently. Inform physician if signs of HF occur (rales/crackles, dyspnea, S3 heart sound, jugular venous distention).
- **Pulmonary Embolism:** Monitor pulse, BP, hemodynamics, and respiratory status (rate, degree of dyspnea, arterial blood gases).
- **Cannula/Catheter Occlusion:** Monitor ability to aspirate blood as indicator of patency. Ensure that patient exhales and holds breath when connecting and disconnecting IV syringe to prevent air embolism.
- **Acute Ischemic Stroke:** Assess neurologic status. Determine time of onset of stroke symptoms. Alteplase must be administered within 3–4.5 hr of onset (within 3 hr in patients >80 years, those taking oral anticoagulants, those with a baseline National Institutes of Health Stroke Scale score >25, or those with both a history of stroke and diabetes).
- **Lab Test Considerations:** Hematocrit, hemoglobin, platelet count, fibrin/fibrin degradation product (FDP/fdp) titer, fibrinogen concentration, prothrombin time, thrombin time, and activated partial thromboplastin time may be evaluated prior to and frequently throughout therapy. Bleeding time may be assessed prior to therapy if patient has received platelet aggregation inhibitors. Obtain type and cross match and have blood available at all times in case of hemorrhage. Stools should be tested for occult blood loss and urine for hematuria periodically during therapy.
- **Toxicity and Overdose:** If local bleeding occurs, apply pressure to site. If severe or internal bleeding occurs, discontinue infusion. Clotting factors and/or blood volume may be restored through infusions of whole blood, packed RBCs, fresh frozen plasma, or cryoprecipitate. Do not administer dextran, as it has antiplatelet activity. Aminocaproic acid may be used as an antidote.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- This medication should be used only in settings in which hematologic function and clinical response can be adequately monitored.
- Starting two IV lines prior to therapy is recommended: one for the thrombolytic agent, the other for any additional infusions.
- Avoid invasive procedures, such as IM injections or arterial punctures, with this therapy. If such procedures must be performed, apply pressure to all arterial and venous puncture sites for at least 30 min. Avoid venipunctures at noncompressible sites (jugular vein, subclavian site).
- Systemic anticoagulation with heparin is usually begun several hours after the completion of thrombolytic therapy.
- Acetaminophen may be ordered to control fever.

Patient/Family Teaching

- Explain purpose of medication and the need for close monitoring to patient and family. Instruct patient to report hypersensitivity reactions (rash, dyspnea) and bleeding or bruising.
- Explain need for bedrest and minimal handling during therapy to avoid injury. Avoid all unnecessary procedures such as shaving and vigorous tooth brushing.

Evaluation/Desired Outcomes

- Lysis of thrombi and restoration of blood flow
- Prevention of neurologic sequelae in acute ischemic stroke
- Cannula or catheter patency.

● VACCINES/IMMUNIZING AGENTS

PHARMACOLOGIC PROFILE

General Use

Immune globulins provide passive immunization to infectious diseases by providing antibodies. Immunization with vaccines and toxoids containing bacterial or viral antigenic material results in endogenous production of antibodies.

General Action and Information

Immunity from immune globulins is rapid, but short-lived (up to 3 months). Active immunization with vaccine or toxoids produces prolonged immunity (years).

Contraindications

Hypersensitivity to product, preservatives, or other additives. Some products contain thimerisol, neomycin, and/or **egg protein**.

Precautions

Severe bleeding problems (IM injections).

Interactions

↓ antibody response to vaccine/toxoids and ↑ risk of adverse reactions in patients receiving concurrent antineoplastic, immunosuppressive, or radiation therapy.

NURSING IMPLICATIONS

Assessment

- Assess previous immunization history and history of hypersensitivity.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Measles, mumps, and rubella vaccine, trivalent oral polio virus vaccine, and diphtheria toxoid, tetanus toxoid, and pertussis vaccine may be given concurrently.
- Administer each immunization by appropriate route.

Patient/Family Teaching

- Inform patient/parent of potential and reportable side effects of immunization. Health care professional should be notified if patient develops fever over 39.4°C (103°F); difficulty breathing; hives; itching; swelling of the eyes, face, or inside of nose; sudden severe tiredness or weakness; or convulsions occur.
- Review next scheduled immunization with parent. Emphasize the importance of keeping a record of immunizations and dates given.

Evaluation/Desired Outcomes

- Prevention of diseases through active immunity.

● VASCULAR HEADACHE SUPPRESSANTS

PHARMACOLOGIC PROFILE

General Use

Used for acute treatment of vascular headaches (migraine, cluster headaches, migraine variants). Other agents such as some beta blockers and some calcium channel blockers are used for suppression of frequently occurring vascular headaches.

General Action and Information

Ergot derivatives (ergotamine, dihydroergotamine) directly stimulate alpha-adrenergic and serotonergic receptors, producing vascular smooth muscle vasoconstriction. Almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan produce vasoconstriction by acting as serotonin (5-HT₁) agonists.

Contraindications

Avoid using these agents in patients with ischemic cardiovascular disease.

Precautions

Use cautiously in patients who have a history of, or at risk for, cardiovascular disease.

Interactions

Avoid concurrent use of ergot derivative agents with serotonin agonist agents; see also individual agents.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack and frequency of attacks.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Medication should be administered at the first sign of a headache.

Patient/Family Teaching

- Inform patient that medication should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Advise patient that lying down in a darkened room following medication administration may further help relieve headache.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches.

Evaluation/Desired Outcomes

- Relief of migraine attack.

● VITAMINS

PHARMACOLOGIC PROFILE

General Use

Used in the prevention and treatment of vitamin deficiencies and as supplements in various metabolic disorders.

General Action and Information

Serve as components of enzyme systems that catalyze numerous varied metabolic reactions. Necessary for homeostasis. Water-soluble vitamins (B-vitamins and vitamin C) rarely cause toxicity. Fat-soluble vitamins (vitamins D and E) may accumulate and cause toxicity.

Contraindications

Hypersensitivity to additives, preservatives, or colorants.

Precautions

Dose should be adjusted to avoid toxicity, especially for fat-soluble vitamins.

Interactions

Pyridoxine in large amounts may interfere with the effectiveness of levodopa. Cholestyramine, colestipol, and mineral oil ↓ absorption of fat-soluble vitamins.

NURSING IMPLICATIONS**Assessment**

- Assess patient for signs of vitamin deficiency before and periodically throughout therapy.
- Assess nutritional status through 24-hr diet recall. Determine frequency of consumption of vitamin-rich foods.

Potential Nursing Diagnoses

- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

Implementation

- Because of infrequency of single vitamin deficiencies, combinations are commonly administered.

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of physician or other health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDAs. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects and toxicity.

Evaluation/Desired Outcomes

- Prevention of, or decrease in, the symptoms of vitamin deficiencies.

● WEIGHT CONTROL AGENTS**PHARMACOLOGIC PROFILE****General Use**

These agents are used in the management of exogenous obesity as part of a regimen including a reduced-calorie diet. They are especially useful in the presence of other risk factors including hypertension, diabetes, or dyslipidemias.

General Action and Information

Phentermine is an anorexiant designed to ↓ appetite via its action in the CNS. Orlistat is a lipase inhibitor that ↓ absorption of dietary fat.

Contraindications

None of these agents should be used during pregnancy or lactation. Phentermine should not be used in patients with severe hepatic or renal disease, uncontrolled hypertension, known HF, or cardiovascular disease. Orlistat should not be used in patients with chronic malabsorption.

Precautions

Phentermine should be used cautiously in patients with a history of seizures, or angle-closure glaucoma and in geriatric patients.

Interactions

Phentermine may have additive, adverse effects with CNS stimulants, some vascular headache suppressants, MAO inhibitors, and some opioids (concurrent use should be avoided). Orlistat ↓ absorption of some fat-soluble vitamins and beta-carotene.

NURSING IMPLICATIONS

Assessment

- Monitor weight and dietary intake prior to and periodically during therapy. Adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.

Potential Nursing Diagnoses

- Disturbed body image (Indications).
- Imbalanced nutrition: more than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).

Implementation

Patient/Family Teaching

- Advise patient that regular physical activity, approved by healthcare professional, should be used in conjunction with medication and diet.

Evaluation/Desired Outcomes

- Slow, consistent weight loss when combined with a reduced-calorie diet.

abacavir (ah-back-ah-veer)
Ziagen

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

Indications

Treatment of HIV-1 infection.

Action

Converted inside cells to carbovir triphosphate, its active metabolite. Carbovir triphosphate inhibits the activity of HIV-1 reverse transcriptase, which in turn terminates viral DNA growth. **Therapeutic Effects:** Slows the progression of HIV infection and decreases the occurrence of its sequelae. Increases CD4 cell counts and decreases viral load.

Pharmacokinetics

Absorption: Rapidly and extensively (83%) absorbed.

Distribution: Distributes into extravascular space and readily distributes into erythrocytes.

Metabolism and Excretion: Mostly metabolized by the liver; 1.2% excreted unchanged in urine.

Half-life: 1.5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity (rechallenge may be fatal); \mathbb{H} Presence of HLA-B*5701 allele; Moderate to severe hepatic impairment; Concurrent use of antiretroviral combination products containing abacavir; **Lactation:** Breast feeding not recommended for HIV-infected patients.

Use Cautiously in: Coronary heart disease; **OB:** Safety not established; **Pedi:** Children <3 mo (safety not established).

Adverse Reactions/Side Effects

CNS: headache, insomnia. **CV:** MYOCARDIAL INFARCTION. **GI:** HEPATOMEGALY (WITH STEATOSIS), diarrhea, nausea, vomiting, anorexia. **Derm:** rashes. **F and E:** LACTIC ACIDOSIS. **Misc:** HYPERSENSITIVITY REACTIONS, fat redistribution, immune reconstitution syndrome.

Interactions

Drug-Drug: Alcohol \uparrow blood levels. May \uparrow methadone metabolism in some patients; slight \uparrow in methadone dosing may be needed.

Route/Dosage

PO (Adults): 300 mg twice daily.

PO (Children ≥ 3 mo): *Oral solution*—8 mg/kg twice daily or 16 mg/kg once daily (not to exceed 600 mg/day); *Tablets*—14–19 kg: 150 mg twice daily or 300 mg once daily; 20–24 kg: 150 mg in AM and 300 mg in PM or 450 mg once daily; ≥ 25 kg: 300 mg twice daily or 600 mg once daily.

Availability (generic available)

Tablets: 300 mg. **Oral solution (strawberry/banana flavor):** 20 mg/mL. **In combination with:** lamivudine (Epzicom); lamivudine and zidovudine (Trizivir); lamivudine and dolutegravir (Triumeq). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for signs of hypersensitivity reactions (fever; rash; gastrointestinal—nausea, vomiting, diarrhea, abdominal pain; constitutional—malaise, fatigue, achiness; respiratory—dyspnea, cough, pharyngitis). May also cause elevated liver function tests, increased creatine phosphokinase or creatinine, and lymphopenia. \mathbb{H} Patients who carry the HLA-B*5701 allele are at high risk for hypersensitivity reaction. Discontinue promptly if hypersensitivity reaction is suspected. Regardless of HLA-B*5701 status, permanently discontinue abacavir if hypersensitivity cannot be ruled out, even when other diagnoses are possible. Following a hypersensitivity reaction, never restart abacavir or abacavir-containing products. More severe symptoms may occur within hours and may include life-threatening hypotension and death. Symptoms usually resolve upon discontinuation.
- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (\uparrow serum lactate levels, \uparrow liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- **Lab Test Considerations:** Monitor viral load and CD4 cell count regularly during therapy.
- \mathbb{H} Screen for HLA-B*5701 allele prior to initiation of therapy to decrease risk of hypersensitivity reaction. Screening is also recommended prior to reinitiation of abacavir in patients of unknown HLA-B*5701 status who have previously tolerated abacavir.
- Monitor liver function. May cause \uparrow AST, ALT, and alkaline phosphatase levels, which usually resolve after interruption of therapy. Lactic acidosis may occur with hepatic toxicity, causing hepatic steatosis; may be fatal, especially in women.
- May cause \uparrow serum glucose and triglyceride levels.

* = Canadian drug name. \mathbb{H} = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be administered with or without food. Oral solution is clear to opalescent and yellow, may be stored at room temperature or refrigerated; do not freeze. Tablet may be used with children if able to swallow and dose is correctly calculated.

Patient/Family Teaching

- Emphasize the importance of taking abacavir as directed. Must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount, and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Instruct patient not to share abacavir with others.
- Inform patient that abacavir does not cure AIDS or prevent associated or opportunistic infections. Abacavir does not reduce risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom, and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that long-term effects of abacavir are unknown.
- Advise patient of potential for hypersensitivity reactions that may result in death. Instruct patient to discontinue abacavir and notify health care professional immediately if symptoms of hypersensitivity or signs of Immune Reconstitution Syndrome (signs and symptoms of an infection) occur. A warning card summarizing symptoms of abacavir hypersensitivity is provided with each prescription; instruct patient to carry card at all times.
- Instruct patient to notify health care professional immediately if symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light-colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur. These symptoms may occur more frequently in patients that are female, obese, or have been taking medications like abacavir for a long time.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care profes-

sional before taking other medications, especially methadone and other antiretrovirals.

- Advise female patients to avoid breast feeding and to notify health care professional if pregnancy is planned or suspected. Encourage women who become pregnant while taking abacavir to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS, and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

abacavir/dolutegravir/lamivudine

(ah-back-ah-veer/doe-loo-teg-ravir/la-mi-vyoo-deen)

Triumeq

Classification

Therapeutic: antiretrovirals (combination)
Pharmacologic: integrase strand transfer inhibitors (INSTI) (dolutegravir), nucleoside reverse transcriptase inhibitors (abacavir, lamivudine)

Indications

Treatment of HIV-1 infection.

Action

Abacavir—Converted inside cells to carbovir triphosphate, its active metabolite. Carbovir triphosphate inhibits the activity of HIV-1 reverse transcriptase, which in turn terminates viral DNA growth. **Dolutegravir**—Inhibits HIV-1 integrase, which is required for viral replication. **Lamivudine**—After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme reverse transcriptase. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics

Abacavir

Absorption: Rapidly and extensively (83%) absorbed.

Distribution: Distributes into extravascular space and readily distributes into erythrocytes.

Metabolism and Excretion: Mostly metabolized by the liver; 1.2% excreted unchanged in urine.

Half-life: 1.5 hr.

Dolutegravir

Absorption: Absorption follows oral administration; bioavailability is unknown.

Distribution: Enters CSF.

Protein Binding: >98.9%.

Metabolism and Excretion: Metabolized primarily by the UGT1A1 enzyme system with some metabolism by CYP3A4. 53% excreted unchanged in feces. Metabolites are renally excreted, minimal renal elimination of unchanged drug. H Poor metabolizers of dolutegravir have \uparrow levels and \downarrow clearance.

Half-life: 14 hr.

Lamivudine

Absorption: Well absorbed after oral administration (86% in adults, 66% in infants and children).

Distribution: Distributes into the extravascular space. Some penetration into CSF; remainder of distribution unknown.

Metabolism and Excretion: Mostly excreted unchanged in urine; <5% metabolized by the liver.

Half-life: *Adults*—3.7 hr; *children*—2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to any component (especially abacavir, rechallenge may be fatal); Resistance to any component; Presence of HLA-B*5701 allele; Concurrent use of dofetilide; Concurrent administration of lamivudine or abacavir alone or in other combination antiretroviral dose forms; **Lactation:**

Breast feeding not recommended for HIV-infected patients; Moderate to severe liver impairment; CCr <50 mL/min.

Use Cautiously in: Underlying hepatitis B or C (may worsen liver function); Patients with HIV-1/HCV coinfection receiving interferon alfa with/without ribavirin (may be at risk for hepatic decompensation, dose alteration or discontinuation of interferon and/or ribavirin may be necessary); Mild hepatic impairment (if dose \downarrow of abacavir is necessary, combination should be given as individual components); Underlying cardiovascular disease, including history of hypertension, hyperlipidemia, smoking history, or diabetes mellitus; **OB:** Use only if potential benefit justifies potential risk to the fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

Abacavir/dolutegravir/lamivudine.

CNS: fatigue, headache, insomnia. **CV:** MYOCARDIAL INFARCTION. **GI:** HEPATOMEGALY (WITH STEATOSIS), HEPATOTOXICITY (\uparrow WITH HEPATITIS B OR C), exacerbation of Hepatitis B. **F and E:** LACTIC ACIDOSIS. **Misc:** HYPER-

SENSITIVITY REACTIONS, immune reconstitution syndrome, redistribution/accumulation of body fat.

Interactions

Drug-Drug: **Abacavir:** Alcohol \uparrow blood levels. May \uparrow methadone metabolism in some patients; slight \uparrow in methadone dosing may be needed. **Dolutegravir:** May \uparrow blood levels and toxicity from dofetilide; concurrent use contraindicated. Blood levels and effectiveness are \downarrow by etravirine (should not be used concurrently without atazanavir/ritonavir, darunavir/ritonavir or lopinavir/ritonavir). Blood levels and effectiveness are \downarrow by efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir, carbamazepine, and rifampin; \uparrow dosage of dolutegravir recommended. Blood levels and effectiveness may be \downarrow by nevirapine; avoid concurrent use. May \uparrow blood levels and toxicity from metformin; do not exceed metformin dose of 1000 mg/day. Blood levels and effectiveness may be \downarrow by other metabolic inducers including oxcarbazepine, phenobarbital, and phenytoin; avoid concurrent use. Absorption and effectiveness may be \downarrow by cation-containing antacids, buffered medications, oral calcium supplements, oral iron supplements, laxatives, or sucralfate; dolutegravir should be taken 2 hr before or 6 hr after; may also take dolutegravir and calcium or iron supplements with food. **Lamivudine:**

Trimethoprim/sulfamethoxazole \uparrow levels (dose alteration may be necessary in renal impairment). \uparrow risk of pancreatitis with concurrent use of other drugs causing pancreatitis. \uparrow risk of neuropathy with concurrent use of other drugs causing neuropathy. Combination therapy with tenofovir and abacavir may lead to virologic nonresponse; avoid use.

Drug-Natural Products: Blood levels and effectiveness may be \downarrow St. John's wort; avoid concurrent use.

Route/Dosage

PO (Adults): One tablet (abacavir 600 mg/dolutegravir 50 mg/lamivudine 300 mg) daily; Concurrent efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir, carbamazepine, or rifampin—additional 50-mg dose of dolutegravir is required separated by 12 hr.

Availability

Tablets: abacavir 600 mg/dolutegravir 50 mg/lamivudine 300 mg per tablet.

NURSING IMPLICATIONS**Assessment**

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for signs of hypersensitivity reactions (fever; rash; gastrointestinal—nausea, vomiting, diarrhea, abdominal pain; constitutional—malaise, fatigue,

* = Canadian drug name. H = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

achiness; respiratory—dyspnea, cough, pharyngitis). May also cause elevated liver function tests, increased creatine phosphokinase or creatinine, and lymphopenia. ❗ Patients who carry the HLA-B*5701 allele are at high risk for hypersensitivity reaction. Discontinue promptly if hypersensitivity reaction is suspected. Regardless of HLA-B*5701 status, permanently discontinue if hypersensitivity cannot be ruled out, even when other diagnoses are possible. Following a hypersensitivity reaction, never restart abacavir-containing products. More severe symptoms may occur within hr and may include life-threatening hypotension and death. Symptoms usually resolve upon discontinuation.

- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (↑ serum lactate levels, ↑ liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Assess patient, especially pediatric patients, for signs of pancreatitis (nausea, vomiting, abdominal pain) periodically during therapy. May require discontinuation of therapy.
- Monitor patient for signs and symptoms of peripheral neuropathy (tingling, burning, numbness, or pain in hands or feet); may be difficult to differentiate from peripheral neuropathy of severe HIV disease. May require discontinuation of therapy.
- **Lab Test Considerations:** Monitor viral load and CD4 cell count regularly during therapy.
- ❗ Screen for HLA-B*5701 allele prior to initiation of therapy to decrease risk of hypersensitivity reaction. Screening is also recommended prior to reinitiation of abacavir in patients of unknown HLA-B*5701 status who have previously tolerated abacavir.
- Monitor liver function periodically. May cause ↑ levels of AST, ALT, and alkaline phosphatase, which usually resolve after interruption of therapy. Patients with concurrent Hepatitis B or C should be followed for at least several mo after stopping therapy. Lactic acidosis may occur with hepatic toxicity, causing hepatic steatosis; may be fatal, especially in women.
- May cause ↑ serum glucose, lipase, and triglyceride levels.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer without regard to food.
- Take *Triumeq* 2 hr before or 6 hr after antacids, laxatives, other medications containing aluminum, magnesium, sucralfate, or buffering agents, calcium, or iron. Supplements containing calcium or iron can be taken with *Triumeq* if taken with food.

Patient/Family Teaching

- Emphasize the importance of taking abacavir as directed. Must always be used in combination with

other antiretroviral drugs. Do not take more than prescribed amount, and do not stop taking without consulting health care professional. Take missed doses as soon as remembered until 4 hr of time of next dose; do not double doses. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.

- Instruct patient not to share medication with others.
- Inform patient that medication does not cure AIDS or prevent associated or opportunistic infections. Medication does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom, and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of medication are unknown at this time.
- Advise patient of potential for hypersensitivity reactions that may result in death. Instruct patient to discontinue medication and notify health care professional immediately if symptoms of hypersensitivity or signs of Immune Reconstitution Syndrome (signs and symptoms of inflammation from previous infections) occur. A warning card summarizing symptoms of hypersensitivity is provided with each prescription; instruct patient to carry card at all times.
- Instruct patient to notify health care professional immediately if symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light-colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur. These symptoms may occur more frequently in patients that are female, obese, or have been taking medications for a long time.
- Instruct patient to notify health care professional promptly if signs of peripheral neuropathy or pancreatitis occur.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially methadone, St. John's Wort, and other antiretrovirals.
- Advise female patients to avoid breast feeding and to notify health care professional if pregnancy is planned or suspected. Breast feeding should be avoided during therapy. Pregnant patients should be encouraged to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.

- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS, and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

abemaciclib (a-bem-a-sye-klib) Verzenio

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

☞ In combination with fulvestrant for the treatment of advanced or metastatic hormone receptor (HR)-positive, human epidermal growth factor 2 (HER2)-negative breast cancer in women with disease progression following endocrine therapy. ☞ Treatment of advanced or metastatic HR-positive, HER2-negative breast cancer in women with disease progression following endocrine therapy and prior chemotherapy in the metastatic setting (as monotherapy).

Action

Inhibits kinases (cyclin-dependent kinases 4 and 6) that are part of the signaling pathway for cell proliferation. **Therapeutic Effects:** Improved survival and decreased spread of breast cancer.

Pharmacokinetics

Absorption: 45% absorbed following oral administration.

Distribution: Extensively distributed to tissues.

Protein Binding: 96%.

Metabolism and Excretion: Primarily metabolized in the liver by CYP3A4 to several active metabolites; 81% excreted in feces, 3% in urine.

Half-life: 18.3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	8 hr	24 hr

Contraindications/Precautions

Contraindicated in: **OB:** May cause fetal harm;

Lactation: Avoid breast feeding.

Use Cautiously in: Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment (↓ dose);

Rep: Women of reproductive potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **CV:** **VENOUS THROMBOEMBOLISM**, peripheral edema. **Derm:** alopecia, pruritus, rash. **GI:** **HEPATOTOXICITY**, abdominal pain, ↓ appetite, constipation, diarrhea, dry mouth, dysgeusia, ↑ liver enzymes, nausea, stomatitis, vomiting. **GU:** ↑ serum creatinine, ↓ fertility (males). **Hemat:** **ANEMIA**, **LEUKOPENIA**, **NEUTROPENIA**, **THROMBOCYTOPENIA**. **Metab:** ↓ weight. **MS:** arthralgia. **Resp:** cough. **Misc:** **INFECTION**, fever.

Interactions

Drug-Drug: **Strong CYP3A inhibitors**, including itraconazole or ketoconazole may ↑ abemaciclib levels and risk of toxicity; avoid concurrent use with ketoconazole; ↓ abemaciclib dose when using other strong CYP3A4 inhibitors (resume original dose after 3–5 half-lives of offending drug have passed following discontinuation). **Strong CYP3A inducers**, including rifampin may ↓ abemaciclib levels and its effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults): With fulvestrant—150 mg twice daily; continue until disease progression or unacceptable toxicity. As monotherapy—200 mg twice daily; continue until disease progression or unacceptable toxicity. **Concurrent use of strong CYP3A inhibitor (other than ketoconazole)**—100 mg twice daily (with fulvestrant or as monotherapy); if dose already at 100 mg twice daily due to adverse reactions, ↓ dose to 50 mg twice daily; continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): **Severe hepatic impairment (Child-Pugh C)**—With fulvestrant: 150 mg once daily; continue until disease progression or unacceptable toxicity. **As monotherapy**—200 mg once daily; continue until disease progression or unacceptable toxicity. **Concurrent use of strong CYP3A inhibitor (other than ketoconazole)**—100 mg once daily (with fulvestrant or as monotherapy); if dose already at 100 mg once daily due to adverse reactions, ↓ dose to 50 mg once daily; continue until disease progression or unacceptable toxicity.

Availability

Tablets: 50 mg, 100 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for diarrhea, result in dehydration and infection. **Grade 1:** no dose modification required. **Grade 2:** If resolves in 24 hrs to ≤Grade 1, suspend therapy until resolution. No dose reduction required. **Grade 2 that persists or recurs after resuming same dose despite maximal supportive**

* = Canadian drug name. ☞ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

measures: Hold dose until diarrhea resolves to \leq Grade 1. Resume at next lower dose. **Grade 3 or 4 diarrhea or diarrhea that requires hospitalization,** withhold abemaciclib until resolves to \leq Grade 1, then resume at next lower dose.

- Monitor for signs and symptoms of venous thrombosis and pulmonary embolism and treat as medically appropriate.
- **Lab Test Considerations:** Verify negative pregnancy test before starting therapy.
- Monitor CBC before starting, every 2 wks for first 2 mo, monthly for next 2 mo, and as clinically indicated. **Grade 1 or 2 neutropenia:** No dose reduction required. **Grade 3:** Hold dose until resolves to \leq Grade 2. **Grade 3 recurrent or Grade 4:** Hold therapy until resolved to \leq Grade 2. Resume at next lower dose.
- Monitor ALT, AST, and serum bilirubin prior to starting therapy, every 2 wks for first 2 mo, monthly for next 2 mo, and as clinically indicated. **If Grade 1 (>upper limit of normal [ULN] to 3 times ULN), Grade 2 (>3.0 to 5.0 times ULN, without \uparrow in total bilirubin >2 times ULN):** no dose reduction required. **If persistent or recurrent Grade 2, or Grade 3 (>5.0–20.0 x ULN), without \uparrow in total bilirubin above 2 x ULN:** Withhold therapy until toxicity resolves to baseline or Grade 1. Resume at next lower dose. **If elevation in AST and/or ALT >3 x ULN with total bilirubin >2 x ULN, in the absence of cholestasis or Grade 4 (>20.0 x ULN):** discontinue therapy.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- **PO:** Administer twice daily, at the same times each day, without regard to food. Swallow tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take abemaciclib at the same times each day as directed. If patient vomits or misses a dose, omit dose and take next dose as scheduled. Do not ingest tablets that are broken, cracked, or not intact. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient that at first sign of diarrhea, start anti-diarrheal therapy (loperamide), increase oral fluids, and notify health care professional for further instructions.
- Advise patient to notify health care professional if signs and symptoms of infection (fever, chills), liver problems (feeling very tired, pain on upper right side of abdomen, loss of appetite, unusual bleeding or bruising, or venous thromboembolism (pain or swelling in arms or legs, shortness of breath, chest pain, rapid breathing, rapid heart rate) occurs.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-

ucts being taken and to consult with health care professional before taking other medications.

- **Rep:** May be teratogenic. Advise female patient to use effective contraception and avoid breast feeding during and for at least 3 wk after last dose of therapy. Inform male patient may impair fertility.

Evaluation/Desired Outcomes

- Decrease in the spread of breast cancer.

abiraterone (a-bi-ra-te-rone)

Zytiga

Classification

Therapeutic: antineoplastics

Pharmacologic: enzyme inhibitors

Indications

With prednisone in the treatment of metastatic castration-resistant prostate cancer.

Action

Inhibits the enzyme 17 α -hydroxylase/C17,20-lyase, which is required for androgen production. May also result in increased mineralocorticoid production.

Therapeutic Effects: Decreased androgen production with decreased spread of androgen-sensitive prostate cancer.

Pharmacokinetics

Absorption: Hydrolyzed to its active compound following oral administration.

Distribution: Unknown.

Protein Binding: >99%.

Metabolism and Excretion: Metabolized by esterases to inactive compounds; eliminated primarily in feces as unchanged drug and metabolites; 5% excreted in urine.

Half-life: 12 hr.

TIME/ACTION PROFILE (blood level)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	12 hr

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment (Child-Pugh Class C); **OB:** Pregnancy or potential to become pregnant (may cause fetal harm); **Lactation:** Lactation.

Use Cautiously in: Cardiovascular disease (safety not established if LVEF <50% or NYHA Class III or IV heart failure; Recent myocardial infarction; Ventricular arrhythmias; Electrolyte abnormalities or hypertension (correct/treat prior to initiation); Pre-existing liver disease (dose modification required for Child-Pugh Class B); Stress, infection, trauma, acute disease process (may result in adrenocortical insufficiency requiring additional corticosteroids).

Adverse Reactions/Side Effects

Noted for combination treatment with prednisone.

Resp: cough. **CV:** arrhythmia, edema, hypertension.

GI: HEPATOTOXICITY, diarrhea, dyspepsia. **Derm:** hot flush. **Endo:** adrenocortical insufficiency (due to concurrent prednisone). **F and E:** hypokalemia. **GU:** nocturia, urinary frequency. **MS:** fracture, joint pain/discomfort.

Interactions

Drug-Drug: Acts as an inhibitor of the CYP2D6 and CYP2C8 enzyme system; avoid concurrent use with agents that are substrates of CYP2D6, especially those with narrow therapeutic indices, including **thioridazine** and **dextromethorphan** (CYP2D6 substrates) as well as **pioglitazone** (CYP2C8 substrate); if concurrent use is necessary, dose ↓ of substrate may be required. Abiraterone is a substrate of the CYP3A4 enzyme system. Concurrent use of strong CYP3A4 inducers including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampentine**, or **rifampin** should be avoided or undertaken with caution.

Route/Dosage

PO (Adults): 1000 mg once daily used in combination with 5 mg prednisone twice daily; *Concurrent use of strong CYP3A4 inducer*—1000 mg twice daily.

Hepatic Impairment

PO (Adults): *Child-Pugh Class B*—250 mg once daily with 5 mg prednisone twice daily.

Availability

Tablets: 250 mg, 500 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and assess for fluid retention at least monthly. Control hypertension during therapy.
- Monitor for signs and symptoms of adrenocortical insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness), especially in patients under stress or who are withdrawn from or have decreased prednisone dose. Symptoms may be masked by abiraterone.
- **Lab Test Considerations:** Monitor AST, ALT, and bilirubin prior to, every 2 wks for 3 mo, and monthly thereafter. If AST and/or ALT ↑ >5 times upper limit of normal or bilirubin ↑ >3 times upper limit of normal in patients with baseline moderate hepatic impairment, interrupt abiraterone. Following return of liver function to baseline or AST and ALT ↑ >2.5 times upper limit of normal or bilirubin ↑ >1.5 times upper limit of normal may restart at a reduced dose of 750 mg once daily. Monitor serum transaminases and bilirubin every 2 wks for 3 mo and

monthly thereafter. If hepatotoxicity recurs, may restart at 500 mg once daily following return to baseline or AST and ALT ↑ >2.5 times upper limit of normal or bilirubin ↑ >1.5 times upper limit of normal. If hepatotoxicity recurs at 500 mg dose, discontinue therapy. If concurrent ↑ ALT >3 times upper limit of normal and total bilirubin ↑ >2 times upper limit of normal without biliary obstruction or other causes, permanently discontinue therapy.

- Monitor serum potassium and sodium at least monthly during therapy. May cause hypokalemia; control during therapy.
- May cause ↑ triglycerides and ↓ phosphorous.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Control hypertension and correct hypokalemia prior to starting therapy.
- **PO:** Administer once daily with twice daily prednisone on an empty stomach at least 1 hr before or 2 hrs after meals; food increases absorption. Swallow tablets whole with water; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to stop abiraterone or prednisone without consulting health care professional. If a dose is missed, take the following day. If more than 1 dose is missed, consult health care professional. Do not share medication with others, even if they have the same symptoms; may be dangerous.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional of side effects that are bothersome or persistent.
- **Rep:** Advise female patient to use effective contraception during therapy and for 1 wk after therapy and to notify health care professional immediately if pregnancy is suspected or if breast feeding. Male patients should use a condom and another form of contraception during sex with a women of reproductive potential during and for 1 wk after therapy. Pregnant women should not touch tablets without wearing gloves.
- Explain need for continued follow-up exams and lab tests to assess possible side effects.

Evaluation/Desired Outcomes

- Decreased spread of androgen-sensitive prostate cancer.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

acetaminophen (oral, rectal)

(a-seet-a-min-oh-fen)

✳️ Abenol, Acephen, ✳️ Acet,
 ✳️ Children Feverhalt, ✳️ Fortolin, In-
 fant's Feverall, ✳️ Peditaphen,
 ✳️ Peditrix, ✳️ Taminol, ✳️ Tempra, Ty-
 lenol

acetaminophen (intravenous)

Ofirmev

Classification

Therapeutic: antipyretics, nonopioid analgesics

Indications

PO, Rect: Treatment of: Mild pain, Fever. **IV:** Treatment of: Mild to moderate pain, Moderate to severe pain with opioid analgesics, Fever.

Action

Inhibits synthesis of prostaglandins that may serve as mediators of pain and fever, primarily in the CNS. Has no significant anti-inflammatory properties or GI toxicity. **Therapeutic Effects:** Analgesia. Antipyresis.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Rectal absorption is variable. Intravenous administration results in complete bioavailability.

Distribution: Widely distributed. Crosses the placenta; enters breast milk in low concentrations.

Metabolism and Excretion: 85–95% metabolized by the liver (CYP2E1 enzyme system). Metabolites may be toxic in overdose situation. Metabolites excreted by the kidneys.

Half-life: Neonates: 7 hr; Infants and Children: 3–4 hr; Adults: 1–3 hr.

TIME/ACTION PROFILE (analgesia and antipyresis)

ROUTE	ONSET	PEAK	DURATION
PO	0.5–1 hr	1–3 hr	3–8 hr†
Rect	0.5–1 hr	1–3 hr	3–4 hr
IV‡	within 30 min	30 min	4–6 hr

†Depends on dose.

‡Antipyretic effects.

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity; Products containing alcohol, aspartame, saccharin, sugar, or tartrazine (FDC yellow dye #5) should be avoided in patients who have hypersensitivity or intolerance to these compounds; Severe hepatic impairment/active liver disease.

Use Cautiously in: Hepatic disease/renal disease (lower chronic doses recommended); Alcoholism, chronic malnutrition, severe hypovolemia or severe re-

nal impairment (CCr < 30 mL/min, ↑ dosing interval and ↓ daily dose may be necessary); Chronic alcohol use/abuse; Malnutrition; **OB:** Use in pregnancy only if clearly needed (for IV); **Lactation:** Use cautiously (for IV).

Adverse Reactions/Side Effects

CNS: agitation (↑ in children) (IV), anxiety (IV), headache (IV), fatigue (IV), insomnia (IV). **Resp:** atelectasis (↑ in children) (IV), dyspnea (IV). **CV:** hypertension (IV), hypotension (IV). **GI:** **HEPATOTOXICITY** (↑ **DOSES**), constipation (↑ in children) (IV), ↑ liver enzymes, nausea (IV), vomiting (IV). **F and E:** hypokalemia (IV). **GU:** renal failure (high doses/chronic use). **Hemat:** neutropenia, pancytopenia. **MS:** muscle spasms (IV), trismus (IV). **Derm:** **ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS**, rash, urticaria.

Interactions

Drug-Drug: Chronic high-dose acetaminophen (>2 g/day) may ↑ risk of bleeding with **warfarin** (INR should not exceed 4). Hepatotoxicity is additive with other **hepatotoxic substances**, including **alcohol**. Concurrent use of **isoniazid**, **rifampin**, **rifabutin**, **phenytoin**, **barbiturates**, and **carbamazepine** may ↑ the risk of acetaminophen-induced liver damage (limit self-medication); these agents will also ↓ therapeutic effects of acetaminophen. Concurrent use of **NSAIDs** may ↑ the risk of adverse renal effects (avoid chronic concurrent use). **Propranolol** ↓ metabolism and may ↑ effects. May ↓ effects of **lamotrigine** and **zidovudine**.

Route/Dosage

Children ≤ 12 yr should not receive >5 PO or rectal doses/24 hr without notifying physician or other health care professional. No dose adjustment needed when converting between IV and PO acetaminophen in adults and children ≥ 50 kg.

PO (Adults and Children >12 yr): 325–650 mg every 6 hr or 1 g 3–4 times daily or 1300 mg every 8 hr (not to exceed 3 g or 2 g/24 hr in patients with hepatic/renal impairment).

PO (Children 1–12 yr): 10–15 mg/kg/dose every 6 hr as needed (not to exceed 5 doses/24 hr).

PO (Infants): 10–15 mg/kg/dose every 6 hr as needed (not to exceed 5 doses/24 hr).

PO (Neonates): 10–15 mg/kg/dose every 6–8 hr as needed.

IV (Adults and Children ≥13 yr and ≥50 kg):

1000 mg every 6 hr or 650 mg every 4 hr (not to exceed 1000 mg/dose, 4 g/day [by all routes], and less than 4 hr dosing interval).

IV (Adults and Children ≥13 yr and <50 kg): 15 mg/kg every 6 hr or 12.5 mg/kg every 4 hr (not to exceed 15 mg/kg/dose [up to 750 mg/dose], 75 mg/kg/day [up to 3750 mg/day] [by all routes], and less than 4 hr dosing interval).

IV (Children 2–12 yr): 15 mg/kg every 6 hr or 12.5 mg/kg every 4 hr (not to exceed 15 mg/kg/dose [up to

750 mg/dose], 75 mg/kg/day [up to 3750 mg/day] [by all routes], and less than 4 hr dosing interval).

IV (Infants 29 days-2 yr): 15 mg/kg every 6 hr (not to exceed 60 mg/kg/day [by all routes]).

IV (Neonates Birth-28 days): 12.5 mg/kg every 6 hr (not to exceed 50 mg/kg [by all routes]).

Rect (Adults and Children >12 yr): 325-650 mg every 4-6 hr as needed or 1 g 3-4 times/day (not to exceed 4 g/24 hr).

Rect (Children 1-12 yr): 10-20 mg/kg/dose every 4-6 hr as needed.

Rect (Infants): 10-20 mg/kg/dose every 4-6 hr as needed.

Rect (Neonates): 10-15 mg/kg/dose every 6-8 hr as needed.

Availability (generic available)

Chewable tablets (fruit, bubblegum, or grape flavor): 80 mg^{OTC}, 160 mg^{OTC}. **Tablets:** 160 mg^{OTC}, 325 mg^{OTC}. **Caplets:** 325 mg^{OTC}. **Solution (berry, fruit, and grape flavor):** 100 mg/mL^{OTC}. **Liquid (mint):** 160 mg/5 mL^{OTC}. **Elixir (grape and cherry flavor):** 160 mg/5 mL^{OTC}. **Drops:** 160 mg/5 mL^{OTC}. **Suspension:** * 100 mg/mL^{OTC}, * 160 mg/5 mL^{OTC}. **Syrup:** 160 mg/5 mL^{OTC}. **Suppositories:** 80 mg^{OTC}, 120 mg^{OTC}, 325 mg^{OTC}. **Solution for intravenous infusion:** 1000 mg/100 mL in 100-mL vials. **In combination with:** many other medications. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess overall health status and alcohol usage before administering acetaminophen. Patients who are malnourished or chronically abuse alcohol are at higher risk of developing hepatotoxicity with chronic use of usual doses of this drug.
- Assess amount, frequency, and type of drugs taken in patients self-medicating, especially with OTC drugs. Prolonged use of acetaminophen increases risk of adverse hepatic and renal effects. For short-term use, combined doses of acetaminophen and salicylates should not exceed the recommended dose of either drug given alone. Do not exceed maximum daily dose of acetaminophen when considering all routes of administration and all combination products containing acetaminophen.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if rash (reddening of skin, blisters, and detachment of upper surface of skin peeling) or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Pain:** Assess type, location, and intensity prior to and 30-60 min following administration.
- **Fever:** Assess fever; note presence of associated signs (diaphoresis, tachycardia, and malaise).

- **Lab Test Considerations:** Evaluate hepatic, hematologic, and renal function periodically during prolonged, high-dose therapy.
- May alter results of blood glucose monitoring. May cause falsely ↓ values when measured with glucose oxidase/peroxidase method, but probably not with hexokinase/G6PD method. May also cause falsely ↑ values with certain instruments; see manufacturer's instruction manual.
- **Increased serum bilirubin, LDH, AST, ALT, and prothrombin time may indicate hepatotoxicity.**
- **Toxicity and Overdose:** If overdose occurs, **acetylcysteine** (Acetadote) is the antidote.

Potential Nursing Diagnoses

Acute pain (Indications)

Risk for imbalanced body temperature (Indications)

Implementation

- **Do not confuse Tylenol with Tylenol PM.**
- To prevent fatal medication errors ensure dose in milligrams (mg) and milliliters (mL) is not confused; dosing is based on weight for patients under 50 kg; programming of infusion pump is accurate; and total daily dose of acetaminophen from all sources does not exceed maximum daily limits.
- When combined with opioids do not exceed the maximum recommended daily dose of acetaminophen.
- **PO:** Administer with a full glass of water.
- May be taken with food or on an empty stomach.

IV Administration

- **Intermittent Infusion:** For 1000 mg dose, insert vented IV set through septum of 100 mL vial; may be administered without further dilution. For doses <1000 mg, withdraw appropriate dose from vial place in a separate empty, sterile container for IV infusion. Place small volume pediatric doses up to 60 mL in a syringe and administer via syringe pump. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Administer within 6 hrs of breaking vial seal. **Rate:** Infuse over 15 min. Monitor end of infusion in order to prevent air embolism, especially if acetaminophen is primary infusion.
- **Y-Site Compatibility:** buprenorphine, butorphanol, cefoxitin, ceftriaxone, clindamycin, D5W, dexamethasone, dexmedetomidine, D10W, D5/1R, D5/0.9% NaCl, diphenhydramine, dolasetron, droperidol, esmolol, fentanyl, gentamicin, grisetron, heparin, hydromorphone, hydromorphone, ketorolac, LR, lidocaine, lorazepam, mannitol, meperidine, methylprednisolone, metoclopramide, midazolam, morphine, nalbuphine, 0.9% NaCl, ondansetron, oxycodone, piperacillin/tazobactam, potassium chloride, prochlorperazine, ranitidine, sufentanil, vancomycin.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Y-Site Incompatibility:** acyclovir, chlorpromazine, diazepam, metronidazole.
- **Additive Incompatibility:** Do not mix with other medications.

Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to take more than the recommended amount. **Chronic excessive use of >4 g/day (2 g in chronic alcoholics) may lead to hepatotoxicity, renal, or cardiac damage.** Adults should not take acetaminophen longer than 10 days and children not longer than 5 days unless directed by health care professional. Short-term doses of acetaminophen with salicylates or NSAIDs should not exceed recommended daily dose of either drug alone.
- Advise patient to avoid alcohol (3 or more glasses per day increase the risk of liver damage) if taking more than an occasional 1–2 doses and to avoid taking concurrently with salicylates or NSAIDs for more than a few days, unless directed by health care professional.
- Advise patient to discontinue acetaminophen and notify health care professional if rash occurs.
- Inform patients with diabetes that acetaminophen may alter results of blood glucose monitoring. Advise patient to notify health care professional if changes are noted.
- Caution patient to check labels on all OTC products. Advise patients to avoid taking more than one product containing acetaminophen at a time to prevent toxicity.
- Advise patient to consult health care professional if discomfort or fever is not relieved by routine doses of this drug or if fever is greater than 39.5°C (103°F) or lasts longer than 3 days.
- **Pedi:** Advise parents or caregivers to check concentrations of liquid preparations. All OTC single ingredient acetaminophen liquid products now come in a single concentration of 160 mg/5 mL. Errors have resulted in serious liver damage. Have parents or caregivers determine the correct formulation and dose for their child (based on the child's age/weight), and demonstrate how to measure it using an appropriate measuring device.

Evaluation/Desired Outcomes

- Relief of mild to moderate pain.
- Reduction of fever.

acetylcysteine
(a-se-teel-sis-teen)
Acetadote, Cetylev

Classification

Therapeutic: antidotes (for acetaminophen toxicity), mucolytic

Indications

PO, IV: Antidote for the management of potentially hepatotoxic overdose of acetaminophen. **Inhaln:** Mucolytic in the management of conditions associated with thick viscid mucous secretions. **Unlabeled Use: PO:** Prevention of radiocontrast-induced renal dysfunction.

Action

PO, IV: Decreases the buildup of a hepatotoxic metabolite in acetaminophen overdosage. **Inhaln:** Degrades mucus, allowing easier mobilization and expectoration. **Therapeutic Effects: PO:** Prevention or lessening of liver damage following acetaminophen overdose. **Inhaln:** Lowers the viscosity of mucus.

Pharmacokinetics

Absorption: Absorbed from the GI tract following oral administration. Action is local following inhalation; remainder may be absorbed from pulmonary epithelium. IV administration results in complete bioavailability.

Distribution: Crosses the placenta; 0.47 L/kg.

Protein Binding: 83% bound to plasma proteins.

Metabolism and Excretion: Partially metabolized by the liver, 22% excreted renally.

Half-life: Adults—5.6 hr (↑ in hepatic impairment) **newborns**—11 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (antidote)	unknown	30–60 min	4 hr
IV (antidote)	unknown	unknown	unknown
Inhaln (mucolytic)	1 min	5–10 min	short

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Severe respiratory insufficiency, asthma, or history of bronchospasm; History of GI bleeding (oral only); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: drowsiness. **CV:** vasodilation, tachycardia, hypotension. **EENT:** rhinorrhea. **Resp:** bronchospasm, bronchial/tracheal irritation, chest tightness, ↑ secretions. **GI:** nausea, vomiting, stomatitis. **Derm:** rash, clamminess, pruritus, urticaria. **Misc:** allergic reactions (primarily with IV), including **ANAPHYLAXIS, ANGIOEDEMA**, chills, fever.

Interactions

Drug-Drug: Activated charcoal may adsorb orally administered acetylcysteine and ↓ its effectiveness as an antidote.

Route/Dosage

Acetaminophen Overdose

PO (Adults and Children): 140 mg/kg initially, followed by 70 mg/kg every 4 hr for 17 additional doses.

IV (Adults and Children): Loading dose—150 mg/kg (maximum: 15 g) over 60 min initially followed by **First maintenance dose**—50 mg/kg (maximum: 5 g) over 4 hr, then **second maintenance dose**—100 mg/kg (maximum: 10 g) over 16 hr.

Mucolytic

Inhaln (Adults and Children 1–12 yrs): Nebulization via face mask—3–5 mL of 20% solution or 6–10 mL of the 10% solution 3–4 times daily; **nebulization via tent or croupette**—volume of 10–20% solution required to maintain heavy mist; **direct instillation**—1–2 mL of 10–20% solution every 1–4 hr; **intratracheal instillation via tracheostomy**—1–2 mL of 10–20% solution every 1–4 hr (up to 2–5 mL of 20% solution via tracheal catheter into particular segments of the bronchopulmonary tree).

Inhaln (Infants): Nebulization—1–2 mL of 20% solution or 2–4 mL of 10% solution 3–4 times daily.

Prevention of Radiocontrast-Induced Renal Dysfunction

PO (Adults): 600 mg twice daily for 2 days, beginning the day before the procedure.

Availability (generic available)

Effervescent tablets (lemon-mint flavor): 500 mg, 2.5 g. **Solution for inhalation:** 10% (100 mg/mL), 20% (200 mg/mL). **Solution for injection:** 20% (200 mg/mL).

NURSING IMPLICATIONS

Assessment

- **Antidote in Acetaminophen Overdose:** Assess type, amount, and time of acetaminophen ingestion. Assess plasma acetaminophen levels. Initial levels are drawn at least 4 hr after ingestion of acetaminophen. Plasma level determinations may be difficult to interpret following ingestion of extended-release preparations. Do not wait for results to administer dose.
- **IV: Assess for anaphylaxis.** Erythema and flushing are common, usually occurring 30–60 min after initiating infusion, and may resolve with continued administration. If rash, hypotension, wheezing, or dyspnea occur, initiate treatment for anaphylaxis (antihistamine and epinephrine). Interrupt acetylcysteine infusion until symptoms resolve and restart carefully. If anaphylaxis recurs, discontinue acetylcysteine and use alternative form of treatment.
- Assess patient for nausea, vomiting, and urticaria. Notify health care professional if these occur.
- **Mucolytic:** Assess respiratory function (lung sounds, dyspnea) and color, amount, and consistency of secretions before and immediately following treatment to determine effectiveness of therapy.

- **Lab Test Considerations:** Monitor AST, ALT, and bilirubin levels along with prothrombin time every 24 hr for 96 hr in patients with plasma acetaminophen levels indicating potential hepatotoxicity.
- Monitor cardiac and renal function (creatinine, BUN), serum glucose, and electrolytes. Maintain fluid and electrolyte balance; correct hypoglycemia.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications)

Ineffective airway clearance (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- After opening, solution for inhalation may turn light purple; does not alter potency. Refrigerate open vials and discard after 96 hr.
- Drug reacts with rubber and metals (iron, nickel, copper); avoid contact.
- **PO:** Dissolve effervescent tablets in 100 mL of water for a 50 mg/mL solution for patient weighing 1–19 kg, in 150 mL for patients weighing 20–59 kg, and in 300 mL for patients weighing 60 kg or more within 2 hrs of administration. May be administered by duodenal tube if patient is unable to swallow. If patient vomits loading dose or maintenance doses within 1 hr of administration, readminister dose.
- **Acetaminophen Overdose**—Empty stomach contents by inducing emesis or lavage prior to administration.

IV Administration

- **Intermittent Infusion:** Most effective if administered within 8 hr of acetaminophen ingestion. **Diluent:** Dilute in D5W. **Concentration: For loading dose:** For patients 5–20 kg: Dilute 150 mg in 3 mL/kg of diluent. For patients 21–40 kg: Dilute 150 mg/kg in 100 mL. For patients 41–100 kg: Dilute 150 mg/kg in 200 mL. **For Second Dose:** For patients 5–20 kg: Dilute 50 mg/kg in 7 mL/kg of diluent. For patients 21–40 kg: Dilute 50 mg/kg in 250 mL of diluent. For patients 41–100 kg: Dilute 50 mg/kg in 500 mL. **For Third Dose:** For patients 5–20 kg: Dilute 100 mg/kg in 14 mL/kg of diluent. For patients 21–40 kg: 100 mg/kg diluted in 500 mL of diluent. For patients 41–100 kg: Dilute 100 mg/kg in 1000 mL. Adjust fluid volume for patients requiring fluid restriction. Vials are single-use. Discard after using. Reconstituted solution is stable for 24 hr at room temperature. **Rate:** Administer **Loading Dose** over 1 hr.
- Administer **For Second Dose:** over 4 hr.
- Administer **For Third Dose:** over 16 hr.
- **Y-Site Compatibility:** heparin, naloxone, tigecycline, vancomycin.
- **Y-Site Incompatibility:** cefepime, ceftazidime.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Inhaln: Mucolytic**—Encourage adequate fluid intake (2000–3000 mL/day) to decrease viscosity of secretions.
- For nebulization, the 20% solution may be diluted with 0.9% NaCl for injection or inhalation or sterile water for injection or inhalation. May use 10% solution undiluted. May be administered by nebulization, or 1–2 mL may be instilled directly into airway. During administration, when 25% of medication remains in nebulizer, dilute with equal amount of 0.9% NaCl or sterile water.
- An increased volume of liquefied bronchial secretions may occur following administration. Have suction equipment available for patients unable to effectively clear airways.
- If bronchospasm occurs during treatment, discontinue and consult health care professional regarding possible addition of bronchodilator to therapy. Patients with asthma or hyperactive airway disease should be given a bronchodilator prior to acetylcysteine to prevent bronchospasm.
- Rinse patient's mouth and wash face following treatment, as drug leaves a sticky residue.

Patient/Family Teaching

- **Acetaminophen Overdose:** Explain purpose of medication to patient.
- **Inhaln:** Instruct patient to clear airway by coughing deeply before taking aerosol treatment.
- Inform patient that unpleasant odor of this drug becomes less noticeable as treatment progresses and medicine dissipates.

Evaluation/Desired Outcomes

- Decreased acetaminophen levels.
- No further increase in hepatic damage during acetaminophen overdose therapy.
- Decreased dyspnea and clearing of lung sounds when used as a mucolytic.
- Prevention of radiocontrast-induced renal dysfunction.

acclidinium (a-kli-din-ee-um)

★ Tudorza Genuair, Tudorza Pressair

Classification

Therapeutic: COPD agents

Pharmacologic: anticholinergics

Indications

Long-term maintenance treatment of bronchospasm associated with COPD, including chronic bronchitis and emphysema. Not for acute (rescue) use.

Action

Acts as an anticholinergic by inhibiting the M₃ receptor in bronchial smooth muscle. **Therapeutic Effects:** Bronchodilation with lessened symptoms of COPD.

Pharmacokinetics

Absorption: 6% systemically absorbed following inhalation.

Distribution: Unknown.

Metabolism and Excretion: Rapidly hydrolyzed; metabolites are not pharmacologically active. Metabolites are eliminated in urine (54–65%) and feces (20–33%). 1% excreted unchanged in urine.

Half-life: 5–8 hr.

TIME/ACTION PROFILE (improvement in FEV₁)

ROUTE	ONSET	PEAK	DURATION
Inhaln	within 1 hr	2–4 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to acclidinium or any of the excipients; Severe hypersensitivity to milk proteins.

Use Cautiously in: Narrow-angle glaucoma; Prostatic hyperplasia or bladder neck obstruction; Severe hypersensitivity to milk proteins; History of hypersensitivity to atropine (cross-sensitivity may occur); **OB:** Use only if potential benefit justifies potential risk to the fetus; **Lactation:** Use cautiously; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache. **EENT:** worsening of narrow-angle glaucoma. **Resp:** paradoxical bronchospasm. **GU:** urinary retention. **Misc:** **HYPERSENSITIVITY REACTIONS** (including anaphylaxis, angioedema, urticaria, rash, bronchospasm, or itching).

Interactions

Drug-Drug: ↑ risk of anticholinergic effects with other anticholinergics.

Route/Dosage

Inhaln (Adults): One inhalation (400 mcg) twice daily.

Availability

Dry powder metered-dose inhaler: 400 mcg/actuation.

NURSING IMPLICATIONS

Assessment

- **Inhaln:** Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify health care professional immediately.
- **Monitor for signs and symptoms of hypersensitivity reactions** (angioedema [swelling of the lips, tongue, or throat], bronchospasm, urticaria, rash, itching,

anaphylaxis) during therapy, especially in patients with a history of hypersensitivity reactions to atropine or milk products. Discontinue aciclinium if symptoms occur.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Activity intolerance (Indications)

Implementation

- **Inhaln:** Administer every 12 hr. See Appendix D for administration of inhalation medications.
- When aciclinium is administered concurrently with other inhalation medications, administer adrenergic bronchodilators first, followed by aciclinium, then corticosteroids. Wait 5 min between medications.

Patient/Family Teaching

- Instruct patient in proper use of inhaler and to take medication as directed. Omit missed doses and take next dose at the usual time; do not double doses. Advise patient to read *Medication Guide* before beginning therapy and with each Rx refill in case of changes.
- Advise patient to have a rapid-acting bronchodilator available for use at all times to treat sudden symptoms. Notify health care professional immediately if sudden shortness of breath occurs immediately after using aciclinium inhaler, if breathing becomes worse, if rescue inhaler is needed more often than usual, or if rescue inhaler does not work as well at relieving symptoms.
- Caution patient to avoid getting powder into eyes.
- Advise patient to inform health care professional if symptoms of new or worsened increased eye pressure (eye pain or discomfort, nausea or vomiting, blurred visions, seeing halos or bright colors around lights, red eyes), new or worsened urinary retention (difficulty urinating, painful urination, urinating frequently, urination in a weak stream or drips), or allergic reactions (rash, hives, swelling of the face, mouth, and tongue, breathing problems) occur.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Explain need for pulmonary function tests prior to and periodically during therapy to determine effectiveness of medication.

Evaluation/Desired Outcomes

- Decreased dyspnea.
- Improved breath sounds.

acyclovir (ay-sye-kloe-veer)

Sitavig,  Xerese, Zovirax

Classification

Therapeutic: antivirals

Pharmacologic: purine analogues

Indications

PO: Recurrent genital herpes infections. Localized cutaneous herpes zoster infections (shingles) and chickenpox (varicella). **Buccal:** Recurrent herpes labialis (cold sores) in nonimmunosuppressed patients. **IV:** Severe initial episodes of genital herpes in nonimmunosuppressed patients. Mucosal or cutaneous herpes simplex infections or herpes zoster infections (shingles) in immunosuppressed patients. Herpes simplex encephalitis. **Topical: Cream**—Recurrent herpes labialis (cold sores). **Ointment**—Treatment of limited non-life-threatening herpes simplex infections in immunocompromised patients (systemic treatment is preferred).

Action

Interferes with viral DNA synthesis. **Therapeutic Effects:** Inhibition of viral replication, decreased viral shedding, and reduced time for healing of lesions.

Pharmacokinetics

Absorption: Despite poor absorption (15–30%), therapeutic blood levels are achieved.

Distribution: Widely distributed. CSF concentrations are 50% of plasma. Crosses placenta; enters breast milk.

Protein Binding: <30%.

Metabolism and Excretion: >90% eliminated unchanged by kidneys; remainder metabolized by liver.

Half-life: Neonates: 4 hr; Children 1–12 yr: 2–3 hr; Adults: 2–3.5 hr (↑ in renal failure).

TIME/ACTION PROFILE (antiviral blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5–2.5 hr	4 hr
IV	prompt	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to acyclovir or valacyclovir; Hypersensitivity to milk protein concentrate (buccal only).

Use Cautiously in: Pre-existing serious neurologic, hepatic, pulmonary, or fluid and electrolyte abnormalities; Renal impairment (dose alteration recommended if CrCl <50 mL/min); **Geriatric:** Due to age related ↓ in renal function; Obese patients (dose should be based on

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ideal body weight); Patients with hypoxia; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache, hallucinations, trembling. **GI:** diarrhea, nausea, vomiting, ↑ liver enzymes, hyperbilirubinemia, abdominal pain, anorexia. **GU:** RENAL FAILURE, crystalluria, hematuria, renal pain. **Derm:** STEVENS-JOHNSON SYNDROME, acne, hives, rash, unusual sweating. **Endo:** changes in menstrual cycle. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA/HEMOLYTIC UREMIC SYNDROME (high doses in immunosuppressed patients). **Local:** pain, phlebitis, local irritation. **MS:** joint pain. **Misc:** polydipsia.

Interactions

Drug-Drug: Probenecid ↑ blood levels of acyclovir. ↑ blood levels and risk of toxicity from theophylline; dose adjustment may be necessary. ↓ blood levels and may ↓ effectiveness of valproic acid or phenytoin. Concurrent use of other nephrotoxic drugs ↑ risk of adverse renal effects. Zidovudine and IT methotrexate may ↑ risk of CNS side effects.

Route/Dosage

Initial Genital Herpes

PO (Adults and Children): 200 mg q 4 hr while awake (5 times/day) for 7–10 days or 400 mg q 8 hr for 7–10 days; maximum dose in children: 80 mg/kg/day in 3–5 divided doses.

IV (Adults and Children): 5 mg/kg q 8 hr or 750 mg/m²/day divided q 8 hr for 5–7 days.

Chronic Suppressive Therapy for Recurrent Genital Herpes

PO (Adults and Children): 400 mg twice daily or 200 mg 3–5 times/day for up to 12 mo. Maximum dose in children: 80 mg/kg/day in 2–5 divided doses.

Intermittent Therapy for Recurrent Genital Herpes

PO (Adults and Children): 200 mg q 4 hr while awake (5 times/day) or 400 mg q 8hr or 800 mg q 12 hr for 5 days, start at first sign of symptoms. Maximum dose in children: 80 mg/kg/day in 2–5 divided doses.

Acute Treatment of Herpes Zoster in Immunosuppressed Patients

PO (Adults): 800 mg q 4 hr while awake (5 times/day) for 7–10 days. *Prophylaxis*—400 mg 5 times/day.

PO (Children): 250–600 mg/m²/dose 4–5 times/day.

Herpes Zoster in Immunocompetent Patients

PO (Adults and Children): 4000 mg/day in 5 divided doses for 5–7 days, maximum dose in children: 80 mg/kg/day in 5 divided doses.

Chickenpox

PO (Adults and Children): 20 mg/kg (not to exceed 800 mg/dose) qid for 5 days. Start within 24 hr of rash onset.

Mucosal and Cutaneous Herpes Simplex Infections in Immunosuppressed Patients

IV (Adults and Children >12 yr): 5 mg/kg q 8 hr for 7 days.

IV (Children <12 yr): 10 mg/kg q 8 hr for 7 days.

Topical (Adults): 0.5 in. ribbon of 5% ointment for every 4-square-in. area q 3 hr (6 times/day) for 7 days.

Herpes Simplex Encephalitis

IV (Adults): 10 mg/kg q 8 hr for 14–21 days.

IV (Children 3 mo–12 yr): 10 mg/kg q 8 hr for 14–21 days.

IV (Children birth–3 mo): 20 mg/kg q 8 hr for 14–21 days.

IV (Neonates, premature): 10 mg/kg q 12 hr for 14–21 days.

Varicella Zoster Infections in Immunosuppressed Patients

IV (Adults): 10 mg/kg q 8 hr for 7–10 days.

IV (Children <12 yr): 10 mg/kg q 8 hr for 7–10 days.

Renal Impairment

PO, IV (Adults and Children): *CCr* >50 mL/min/1.73 m²—no dosage adjustment needed; *CCr* 25–50 mL/min/1.73 m²—administer normal dose q 12 hr; *CCr* 10–25 mL/min/1.73 m²—administer normal dose q 24 hr; *CCr* 0–10 mL/min/1.73 m²—50% of dose q 24 hr.

IV (Neonates): *SCr* 0.8–1.1 mg/dL: Administer 20 mg/kg/dose q 12 hr; *SCr* 1.2–1.5 mg/dL: Administer 20 mg/kg/dose q 24 hr; *SCr* >1.5 mg/dL: Administer 10 mg/kg/dose q 24 hr.

Herpes labialis

Topical (Adults and Children >12 yr): Apply 5 times/day for 4 days; start at first symptoms.

Buccal (Adults): Apply one 50–mg buccal tablet to the upper gum region within 1 hr of onset of prodromal symptoms (but before appearance of any lesions).

Availability (generic available)

Capsules: 200 mg. **Cost:** *Generic*—\$97.70/100.

Tablets: 400 mg, 800 mg. **Cost:** *Generic*—400 mg

\$6.99/30, 800 mg \$17.91/30. **Buccal tablets:** 50 mg.

Suspension (banana flavor): 200 mg/5 mL. **Cost:**

Generic—\$137.70/473 mL. **Powder for injection:**

500 mg/vial, 1000 mg/vial. **Solution for injection:** 25

mg/mL, 50 mg/mL. **Cream:** 5%. **Cost:** \$565.24/5 g.

Ointment: 5%. **Cost:** *Generic*—\$797.59/30 g. **In**

combination with: hydrocortisone (Xerese). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess lesions before and daily during therapy.
- Assess frequency of recurrences.
- Monitor neurologic status in patients with herpes encephalitis.
- **Lab Test Considerations:** Monitor BUN, serum creatinine, and CCr before and during therapy. ↑ BUN and serum creatinine levels or ↓ CCr may indicate renal failure.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

Risk for infection (Patient/Family Teaching)

Implementation

- **Do not confuse Zovirax with Doribax, Zyvox, or Zos-trix.**
- Start acyclovir treatment as soon as possible after herpes simplex symptoms appear and within 24 hr of a herpes zoster outbreak.
- **PO:** Acyclovir may be administered with food or on an empty stomach, with a full glass of water.
- Shake oral suspension well before administration.
- **Buccal:** Apply tablet with a dry finger immediately after taking out of blister to upper gum just above canine. Hold in place with pressure on lip for 30 seconds to ensure adhesion. May be more comfortable to apply rounded side of tablet to gum surface. Apply on same side as herpes labialis symptoms within 1 hr of onset of symptoms, before appearance of herpes labialis lesions. Once applied, stays in position and dissolves slowly during day; do not crush, suck, chew, or swallow. May eat and drink while tablet is in place; avoid interfering with adhesion of tablet (chewing gum, touching, or pressing tablet after placement, wearing upper denture, brushing teeth). If the teeth need to be cleaned while tablet is in place, rinse mouth gently. Drink plenty of liquids to prevent dry mouth.

IV Administration

- **IV:** Maintain adequate hydration (2000–3000 mL/day), especially during first 2 hr after IV infusion, to prevent crystalluria.
- Observe infusion site for phlebitis. Rotate infusion site to prevent phlebitis.
- Do not administer acyclovir injectable topically, IM, subcut, PO, or in the eye.
- **Intermittent Infusion:** Reconstitute 500-mg or 1-g vial with 10 mL or 20 mL, respectively, of sterile water for injection. Do not reconstitute with bacteriostatic water with benzyl alcohol or parabens. Shake well to dissolve completely. **Diluent:** Dilute in at least 100 mL of D5W, 0.9% NaCl, dextrose/saline combinations or LR. **Concentration:** 7 mg/mL. Patients requiring fluid restriction: 10 mg/mL. **Rate:**

Administer via infusion pump over 1 hr to minimize renal tubular damage.

- Use reconstituted solution within 12 hr. Once diluted for infusion, the solution should be used within 24 hr. Refrigeration results in precipitation, which dissolves at room temperature.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amikacin, aminophylline, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, ampicillin, anidulafungin, argatroban, atracurium, azithromycin, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, ceftioxin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, dantrolene, dexamethasone, dexmedetomidine, digoxin, dimenhydrinate, diphenhydramine, docetaxel, doxacurium, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, ertapenem, erythromycin lactobionate, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fluorouracil, furosemide, glycopyrrolate, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, leucovorin calcium, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, methohexital, methotrexate, methylprednisolone, metoprolol, metronidazole, milrinone, mitoxantrone, multivitamin infusion, nafcillin, naloxone, nesiritide, nitroglycerin, octreotide, oxacillin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentobarbital, perphenazine, phenobarbital, potassium acetate, potassium chloride, propofol, propranolol, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amfostine, amphotericin B colloidal, ampicillin/sulbactam, amsacrine, aztreonam, cefepime, chlorpromazine, ciprofloxacin, daptomycin, dexrazoxane, diazepam, dobutamine, dolasetron, dopamine, doxorubicin hydrochloride, epinephrine, epirubicin, epifibatide, esmolol, fenoldopam, fludarabine, foscaert, gemcitabine, haloperidol, hydralazine, hydroxyzine, idarubicin, irinotecan, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, methylglucoside, midazolam, mycophenolate, nicardipine, nitroprusside, ondansetron, palonosetron, pentamidine, phenylephrine, phenytoin, piperacillin/tazobactam, potassium phosphates,

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

procainamide, prochlorperazine, promethazine, quinupristin/dalfopristin, sargramostim, sodium phosphates, streptozocin, tacrolimus, vecuronium, verapamil, vinorelbine.

- **Topical:** Apply to skin lesions only; do not use in the eye.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy. Take missed doses as soon as possible but not just before next dose is due; do not double doses. Acyclovir should not be used more frequently or longer than prescribed.
- Advise patients that the additional use of OTC creams, lotions, and ointments may delay healing and may cause spreading of lesions.
- Inform patient that acyclovir is not a cure. The virus lies dormant in the ganglia, and acyclovir will not prevent the spread of infection to others.
- Advise patient that condoms should be used during sexual contact and that no sexual contact should be made while lesions are present.
- Patient should consult health care professional if symptoms are not relieved after 7 days of topical therapy or if oral acyclovir does not decrease the frequency and severity of recurrences. Immunocompromised patients may require a longer time, usually 2 weeks, for crusting over of lesions.
- Instruct women with genital herpes to have yearly Papanicolaou smears because they may be more likely to develop cervical cancer.
- **Topical:** Instruct patient to apply ointment in sufficient quantity to cover all lesions every 3 hr, 6 times/day for 7 days. 0.5-in. ribbon of ointment covers approximately 4 square in. Use a finger cot or glove when applying to prevent inoculation of other areas or spread to other people. Keep affected areas clean and dry. Loose-fitting clothing should be worn to prevent irritation.
- Avoid drug contact in or around eyes. Report any unexplained eye symptoms to health care professional immediately; ocular herpetic infection can lead to blindness.
- **Buccal:** Instruct patient on correct application and use of buccal tablet. If buccal tablet does not adhere or falls off within first 6 hours, reposition immediately with same tablet. If tablet cannot be repositioned, apply new tablet. If swallowed within first 6 hours, advise patient to drink a glass of water and apply a new tablet. Do not reapply if tablet falls out after 6 hrs.

Evaluation/Desired Outcomes

- Crusting over and healing of skin lesions.
- Decrease in frequency and severity of recurrences.
- Acceleration of complete healing and cessation of pain in herpes zoster.
- Decrease in intensity of chickenpox.

adalimumab (a-da-li-mu-mab)

Amjevita, Humira

Classification

Therapeutic: antirheumatics

Pharmacologic: DMARDs, monoclonal antibodies

Indications

Amjevita and Humira: Treatment of the following conditions: Moderately to severely active rheumatoid arthritis (may be used alone or with methotrexate or other DMARDs), Psoriatic arthritis (may be used alone or with other DMARDs), Active ankylosing spondylitis, Moderately to severely active Crohn's disease in patients who have responded inadequately to conventional therapy, Moderately to severely active ulcerative colitis in patients who have responded inadequately to immunosuppressants such as corticosteroids, azathioprine, or 6-mercaptopurine, Moderate to severely active polyarticular juvenile idiopathic arthritis (to be used as monotherapy or with methotrexate), Moderate to severe chronic plaque psoriasis in patients who are candidates for systemic therapy or phototherapy and when other systemic therapies are deemed inappropriate. **Humira only:** Treatment of the following conditions: Moderate to severe hidradenitis suppurativa, Non-infectious inter-mediate, posterior and panuveitis.

Action

Neutralizes and prevents the action of tumor necrosis factor (TNF), resulting in anti-inflammatory and anti-proliferative activity. **Therapeutic Effects:** Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, juvenile idiopathic arthritis, and ankylosing spondylitis. Reduced signs and symptoms and maintenance of clinical remission of Crohn's disease. Induction and maintenance of clinical remission of ulcerative colitis. Reduced severity of plaques. Reduced number of abscesses and inflammatory nodules. Decreased progression of uveitis.

Pharmacokinetics

Absorption: 64% absorbed after subcut administration.

Distribution: Synovial fluid concentrations are 31–96% of serum.

Metabolism and Excretion: Unknown.

Half-life: 14 days (range 10–20 days).

TIME/ACTION PROFILE (improvement)

ROUTE	ONSET	PEAK	DURATION
Subcut	8–26 wk	131 hr*	2 wk†

*Blood level.

†Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of anakinra or abatacept; Active infection (including localized); **Lactation:** Potential for serious side effects in the infant; discontinue drug or provide formula.

Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection; History of exposure to tuberculosis; History of opportunistic infection; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycoses, or blastomycosis is endemic; Pre-existing or recent-onset CNS demyelinating disorders; History of lymphoma; **Geri:** ↑ risk of infection/malignancy; **OB:** Use only if clearly needed; **Pedi:** Children <2 yr (safety not established); ↑ risk of lymphoma (including hepatosplenic T-cell lymphoma [HSTCL] in patients with Crohn's disease or ulcerative colitis), leukemia, and other malignancies.

Adverse Reactions/Side Effects

CNS: headache, Guillain-Barre syndrome, multiple sclerosis. **CV:** hypertension. **EENT:** optic neuritis. **GI:** abdominal pain, nausea. **GU:** hematuria. **Derm:** rash, psoriasis. **Hemat:** neutropenia, thrombocytopenia.

Local: injection site reactions. **Metab:** hyperlipidemia. **MS:** back pain. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIOEDEMA, INFECTIONS (including reactivation tuberculosis and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), MALIGNANCY (including lymphoma, HSTCL, leukemia, and skin cancer), fever.

Interactions

Drug-Drug: Concurrent use with anakinra, abatacept, or other TNF blocking agents ↑ risk of serious infections and is contraindicated. Concurrent use with azathioprine and/or methotrexate may ↑ risk of HSTCL. **Live vaccinations** should not be given concurrently. Risks and benefits should be considered before using live vaccinations in an infant exposed to adalimumab therapy *in utero*.

Route/Dosage

Rheumatoid Arthritis, Ankylosing Spondylitis, and Psoriatic Arthritis

Subcut (Adults): 40 mg every other week; patients not receiving concurrent methotrexate may receive additional benefit by ↑ dose to 40 mg once weekly.

Crohn's Disease

Subcut (Adults): 160 mg initially on Day 1 (given as four 40-mg injections in one day or as two 40-mg injections given in two consecutive days), followed by 80 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 40 mg every other wk. Aminos-

licylates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6-mercaptopurine, methotrexate) may be continued during therapy.

Subcut (Children ≥6 yr and ≥40 kg): Humira only—160 mg initially on Day 1 (given as four 40-mg injections in one day or as two 40-mg injections given in two consecutive days), followed by 80 mg 2 wk later on Day 15 (given as two 40-mg injections in one day). Two wk later (Day 29), begin maintenance dose of 40 mg every other wk. Aminosaliclates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6-mercaptopurine, methotrexate) may be continued during therapy.

Subcut (Children ≥6 yr and 17–<40 kg): Humira only—80 mg initially on Day 1 (given as two 40-mg injections in one day), followed by 40 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 20 mg every other wk. Aminosaliclates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6-mercaptopurine, methotrexate) may be continued during therapy.

Ulcerative Colitis

Subcut (Adults): 160 mg initially on Day 1 (given as four 40-mg injections in one day or as two 40-mg injections given in two consecutive days), followed by 80 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 40 mg every other wk. Aminosaliclates, corticosteroids, and/or immunomodulatory agents (e.g. azathioprine, 6-mercaptopurine, methotrexate) may be continued during therapy. Should be continued only if patients have evidence of clinical remission by wk 8 of therapy.

Juvenile Idiopathic Arthritis

Subcut (Children 2–17 yr (Humira); 4–17 yr (Amjevita)): 10–<15 kg (Humira only)—10 mg every other wk; 15–<30 kg—20 mg every other wk; ≥30 kg—40 mg every other wk.

Plaque Psoriasis or Uveitis

Subcut (Adults): 80 mg initially, then in 1 wk, begin regimen of 40 mg every other wk.

Hidradenitis Suppurativa

Subcut (Adults): 160 mg initially (given as four 40-mg injections on Day 1 or as two 40-mg injections per day on Days 1 and 2), followed by 80 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 40 mg every wk.

Availability

Solution for subcutaneous injection (prefilled syringes): 10 mg/0.1 mL, 10 mg/0.2 mL, 20 mg/0.2 mL, 20 mg/0.4 mL, 40 mg/0.4 mL, 40 mg/0.8 mL, 80 mg/0.8 mL. **Solution for subcutaneous injection (vials):** 40 mg/0.8 mL. **Prefilled pen:** 40 mg/0.4 mL, 40 mg/0.8 mL, 80 mg/0.8 mL.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis and Hepatitis B virus (HBV), prior to and periodically during therapy. Adalimumab is contraindicated in patients with active infection. New infections should be monitored closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Infections may be fatal, especially in patients taking immunosuppressive therapy.
- Monitor for injection site reactions (redness and/or itching, rash, hemorrhage, bruising, pain, or swelling). Rash will usually disappear within a few days. Application of a towel soaked in cold water may relieve pain or swelling.
- Assess patient for latex allergy. Needle cover of syringe contains latex and should not be handled by persons sensitive to latex.
- Monitor patient for signs of anaphylaxis (urticaria, dyspnea, facial edema) following injection. Medications (antihistamines, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction. Discontinue adalimumab immediately if anaphylaxis or other severe allergic reaction occurs.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with adalimumab.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until pathogens are identified. Consult with an infectious diseases specialist. Consider stopping adalimumab until infection has been diagnosed and adequately treated.
- **Arthritis:** Assess pain and range of motion before and periodically during therapy.
- **Crohn's Disease or Ulcerative Colitis:** Monitor frequency and consistency of bowel movements periodically during therapy.
- **Plaque Psoriasis:** Assess skin lesions periodically during therapy.
- **Hidradenitis Suppurativa:** Monitor skin lesions (abscesses, inflammatory nodules, draining fistulas) during therapy.
- **Uveitis:** Monitor signs and symptoms of uveitis (red eye with or without pain, photosensitivity, blurry vision, seeing "floaters" all of a sudden) during therapy.
- **Lab Test Considerations:** May cause agranulocytosis, granulocytopenia, leukopenia, pancytopenia, and polycythemia.

- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue adalimumab if symptoms of blood dyscrasias (persistent fever) occur.
- Monitor for HBV blood tests before starting during, and for several mo after therapy is completed.

Potential Nursing Diagnoses

Acute pain (Indications)

Risk for infection (Side Effects)

Implementation

- Administer a tuberculin skin test prior to administration of adalimumab. Patients with active latent TB should be treated for TB prior to therapy.
- Immunizations should be current prior to initiating therapy. Patients on adalimumab may receive concurrent vaccinations, except for live vaccines.
- Administer initial injection under supervision of a health care professional.
- Vial is for institutional use only. With training, patient may use pen and prefilled syringes at home.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused solution.
- Other DMARDs should be continued during adalimumab therapy.
- **Subcut:** Solution may be left at room temperature for 15–30 min before injecting. Administer at a 45° angle in upper thighs or abdomen, avoiding the 2 inches around the navel. Put pressure on injection site for 10 sec, do not rub. Rotate injection sites; avoid areas that are tender, bruised, hard, or red. If multiple injections required per dose, administer in separate sites. Refrigerate prefilled syringes and pens.

Patient/Family Teaching

- Instruct patient on the correct technique for administering adalimumab. Review *Medication Guide*, preparation of dose, administration sites and technique, and disposal of equipment into a puncture-resistant container.
- Advise patient to use calendar stickers provided by manufacturer to assist in remembering when dose is due. If a dose is missed, instruct patient to administer as soon as possible, then take next dose according to regular schedule. If more than prescribed dose is taken, caution patient to consult health care professional or the HUMIRA Patient Resource Center at 1-800-4HUMIRA (448-6472).
- Caution patient to notify health care professional immediately if signs of infection, HBV (muscle aches, clay-colored bowel movements, feeling very tired, fever, dark urine, chills, skin or eyes look yellow, stomach discomfort, little or no appetite, skin rash, vomiting), severe rash, swollen face, or difficulty breathing occurs or if nervous system problems (numbness or tingling, problems vision, weakness in arms or legs, dizziness) occur while taking adalimumab.

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to avoid live vaccines during therapy.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patient to contact the pregnancy registry by calling 1-877-311-8972 if pregnant.
- **Pen:** Clean area for injection with alcohol swab. Hold pen with gray cap pointing up. Check solution through window; if discolored, cloudy, or contains flakes, discard solution. Turn pen over and point cap down to make sure solution reaches fill line; if not, do not use and contact pharmacist. Remove gray cap exposing the needle and the plum cap exposing the button; removing the plum cap activates the pen. Pinch skin and place pen, with window visible, against skin at a 90° angle and press button until a click is heard. Hold pen in place until all solution is injected (10 seconds) and yellow marker is visible in window and has stopped moving. Continue to pinch skin throughout injection. Remove needle and press with a gauze pad or cotton ball for 10 seconds. Do not rub injection site. Dispose of pen into a puncture-resistant container.

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased signs and symptoms, slowed progression of joint destruction, and improved physical function in patients with psoriatic arthritis.
- Reduced signs and symptoms of ankylosing spondylitis.
- Decreased signs and symptoms, and maintenance of remission, in patients with Crohn's disease or ulcerative colitis.
- Reduced pain and swelling in patients moderate to severe polyarticular juvenile idiopathic arthritis in children 2 yr of age and older.
- Reduced severity of plaques in patients with severe chronic plaque psoriasis.
- Improvement in skin lesions in patients with hidradenitis suppurativa.
- Decreased progression of uveitis.

adenosine (a-den-oh-seen)

Adenocard, Adenoscan

Classification

Therapeutic: antiarrhythmics

Indications

Conversion of paroxysmal supraventricular tachycardia (PSVT) to normal sinus rhythm when vagal maneuvers are unsuccessful. As a diagnostic agent (with noninvasive techniques) to assess myocardial perfusion defects occurring as a consequence of coronary artery disease.

Action

Restores normal sinus rhythm by interrupting re-entrant pathways in the AV node. Slows conduction time through the AV node. Also produces coronary artery vasodilation. **Therapeutic Effects:** Restoration of normal sinus rhythm.

Pharmacokinetics

Absorption: Following IV administration, absorption is complete.

Distribution: Taken up by erythrocytes and vascular endothelium.

Metabolism and Excretion: Rapidly converted to inosine and adenosine monophosphate.

Half-life: < 10 sec.

TIME/ACTION PROFILE (antiarrhythmic effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1–2 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; 2nd- or 3rd-degree AV block or sick sinus syndrome, unless a functional artificial pacemaker is present; Myocardial ischemia/infarction (only Adenoscan).

Use Cautiously in: Patients with a history of asthma (may induce bronchospasm); Unstable angina; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: **SEIZURES** (only with Adenoscan), **STROKE** (only with Adenoscan), apprehension, dizziness, headache, head pressure, lightheadedness. **EENT:** blurred vision, throat tightness. **Resp:** shortness of breath, chest pressure, hyperventilation. **CV:** **MI, VENTRICULAR TACHYCARDIA**, facial flushing, transient arrhythmias, chest pain, hypotension, palpitations. **GI:** metallic taste, nausea.

Derm: burning sensation, facial flushing, sweating.

MS: neck and back pain. **Neuro:** numbness, tingling.

Misc: **HYPERSENSITIVITY REACTIONS**, heaviness in arms, pressure sensation in groin.

Interactions

Drug-Drug: Carbamazepine may ↑ risk of progressive heart block. Dipyridamole ↑ effects of adenosine (dose ↓ of adenosine recommended). Effects of adenosine ↓ by theophylline or caffeine (↑ doses of adenosine may be required). Concurrent use with digoxin may ↑ risk of ventricular fibrillation.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

IV (Adults and Children >50 kg): *Antiarrhythmic (Adenocard)* — 6 mg by rapid IV bolus; if no results, repeat 1–2 min later as 12-mg rapid bolus. This dose may be repeated (single dose not to exceed 12 mg). *Diagnostic use (Adenoscan)* — 140 mcg/kg/min for 6 min (0.84 mg/kg total).

IV (Children <50 kg): *Antiarrhythmic* — 0.05–0.1 mg/kg as a rapid bolus, may repeat in 1–2 min; if response is inadequate, may increase by 0.05–0.1 mg/kg until sinus rhythm is established or maximum dose of 0.3 mg/kg is used.

Availability (generic available)

Injection: 3 mg/mL in 2–mL vial (Adenocard), 3 mg/mL in 20–mL and 30-mL vials (Adenoscan).

NURSING IMPLICATIONS

Assessment

- Monitor heart rate frequently (every 15–30 sec) and ECG continuously during therapy. A short, transient period of 1st-, 2nd-, or 3rd-degree heart block or asystole may occur following injection; usually resolves quickly due to short duration of adenosine. Once conversion to normal sinus rhythm is achieved, transient arrhythmias (premature ventricular contractions, atrial premature contractions, sinus tachycardia, sinus bradycardia, skipped beats, AV nodal block) may occur, but generally last a few seconds.
- Monitor BP during therapy.
- Assess respiratory status (breath sounds, rate) following administration. Patients with history of asthma may experience bronchospasm.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

IV Administration

- **IV:** Crystals may occur if adenosine is refrigerated. Warm to room temperature to dissolve crystals. Solution must be clear before use. Do not administer solutions that are discolored or contain particulate matter. Discard unused portions.
- **IV Push:** *Diluent:* Administer undiluted. *Concentration:* 3 mg/mL. *Rate:* Administer over 1–2 seconds via peripheral IV as proximal as possible to trunk. Slow administration may cause increased heart rate in response to vasodilation. Follow each dose with 20 mL rapid saline flush to ensure injection reaches systemic circulation.
- **Intermittent Infusion (for use in diagnostic testing):** *Diluent:* Administer 30-mL vial undiluted. *Concentration:* 3 mg/mL. *Rate:* Administer at a rate of 140 mcg/kg/min over 6 min for a total dose of 0.84 mg/kg. Thallium-201 should be injected as close to the venous access as possible at the midpoint (after 3 min) of the infusion.

Patient/Family Teaching

- Caution patient to change positions slowly to minimize orthostatic hypotension. Doses >12 mg decrease BP by decreasing peripheral vascular resistance.
- Instruct patient to report facial flushing, shortness of breath, or dizziness.
- Advise patient to avoid products containing methylxanthines (caffeinated coffee, tea, carbonated drinks or drugs such as aminophylline or theophylline) prior to myocardial perfusion imaging study.

Evaluation/Desired Outcomes

- Conversion of supraventricular tachycardia to normal sinus rhythm.
- Diagnosis of myocardial perfusion defects.

ado-trastuzumab (ado tras-too-zoo-mab) Kadcyla

Classification

Therapeutic: antineoplastics
Pharmacologic: drug-antibody conjugates

Indications

HER2-positive metastatic breast cancer previously treated with trastuzumab and a taxane.

Action

A HER2-targeted antibody and microtubule inhibitor conjugate. Trastuzumab, the antibody, attaches to receptors and is taken into the cell, where the microtubule inhibitor, DM1, causes cell cycle arrest and death.

Therapeutic Effects: Decreased spread of metastatic breast cancer, with improved progression-free survival.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: DM1 is metabolized by CYP3A4/5.

Half-life: 4 days.

TIME/ACTION PROFILE (comparative improvement in progression-free survival)

ROUTE	ONSET	PEAK	DURATION
IV	4–6 mos	10–12 mos	2 yr

Contraindications/Precautions

Contraindicated in: Interstitial lung disease or pneumonitis; Concurrent use of strong CYP3A4 inhibitors; **OB:** May cause fetal harm; **Lactation:** Breast feeding should be avoided.

Use Cautiously in: Underlying cardiovascular or pulmonary disease, including dyspnea at rest; **Rep:** Women of reproductive potential and men with female

partners of reproductive potential should use effective contraception; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue, headache, dizziness, insomnia, weakness. **Resp:** PULMONARY TOXICITY, cough. **EENT:** blurred vision, conjunctivitis, dry eyes, ↑ lacrimation. **CV:** LEFT VENTRICULAR DYSFUNCTION, hypertension, peripheral edema. **GI:** HEPATOTOXICITY, constipation, ↑ liver enzymes, nausea, altered taste, diarrhea, dry mouth, dyspepsia, stomatitis, vomiting. **Derm:** pruritus, rash. **F and E:** hypokalemia. **GU:** ↓ fertility. **Hemat:** HEMORRHAGE, THROMBOCYTOPENIA, anemia, neutropenia. **MS:** musculoskeletal pain, arthralgia, myalgia. **Neuro:** peripheral neuropathy. **Misc:** HYPERSENSITIVITY REACTIONS, chills, infusion-related reactions, fever.

Interactions

Drug-Drug: Blood levels and risk of toxicity may be ↑ by concurrent use of **strong inhibitors of CYP3A4** including atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, and voriconazole, and should be avoided, waiting 3 half-lives of inhibitor to start treatment. Concurrent use of **anticoagulants**, or **antiplatelet agents**, especially during the first cycle, may ↑ risk of bleeding.

Route/Dosage

IV (Adults): 3.6 mg/kg every 3 wk continued until disease progresses or unacceptable toxicity occurs.

Availability

Lyophilized powder for intravenous injection (requires reconstitution): 100 mg/vial, 160 mg/vial.

NURSING IMPLICATIONS

Assessment

- Evaluate left ventricular function in all patients prior to and every 3 mo during therapy. *If symptomatic HF:* discontinue ado-trastuzumab. *If left ventricular ejection fraction (LVEF) <40%:* Hold dose. Repeat LVSF assessment within 3 wks. *If LVEF <40% is confirmed, discontinue therapy. If LVEF 40% to ≤45% and decrease is ≥10% points from baseline:* Hold dose. Repeat LVEF within 3 wks. *If LVEF has not recovered to within 10% points from baseline, discontinue therapy. If LVEF 40% to ≤45% and decrease is <10% points from baseline:* Continue therapy with ado-trastuzumab. Repeat LVEF within 3 wks. *If LVEF >45%:* Continue therapy.
- Monitor infusion site closely for infiltration and extravasation closely. Within 24 hrs erythema, tenderness, skin irritation, pain, or swelling at infusion site is seen if extravasation occurs.

- Assess for signs and symptoms of infusion reactions (fever, chills, flushing, dyspnea, hypotension, wheezing, bronchospasm, tachycardia). Interrupt therapy if symptoms are severe. Observe closely during first infusion. Permanently discontinue for life-threatening reactions.
- Monitor neurologic status before and during treatment. Assess for paresthesia (numbness, tingling, pain, burning sensation), loss of deep tendon reflexes (Achilles reflex is usually first involved), weakness (wrist drop or footdrop, gait disturbances), cranial nerve palsies (jaw pain, hoarseness, ptosis, visual changes), arthralgia, myalgia, muscle spasm, autonomic dysfunction (ileus, difficulty voiding, orthostatic hypotension, impaired sweating), and CNS dysfunction (decreased level of consciousness, agitation, hallucinations). Temporarily discontinue therapy in patients with Grade 3 or 4 peripheral neuropathy (severe symptoms; limiting self-care activities of daily living (ADL) until resolution to ≤ Grade 2 (moderate symptoms; limiting instrumental ADL) neuropathy.
- Monitor for signs and symptoms of pulmonary toxicity (dyspnea, cough, fatigue, pulmonary infiltrates). Permanently discontinue therapy if interstitial lung disease or pneumonitis develops.
- Monitor for hemorrhage (central nervous system, respiratory, gastrointestinal hemorrhage) during therapy, especially in patients receiving anticoagulants, antiplatelet therapy, or who have thrombocytopenia.
- **Lab Test Considerations:** Ξ HER2 protein overexpression is used to determine whether treatment with ado-trastuzumab is indicated. HER2 protein overexpression should be determined by labs with proficiency in specific technology used.
- Monitor serum transaminases and bilirubin prior to starting therapy and before each dose. *If AST/ALT is Grade 2 (>2.5 to ≤5 × upper limit of normal):* Treat at same dose. *If AST/ALT is Grade 3 (>5 to ≤20 × upper limit of normal):* Do not administer ado-trastuzumab until AST/ALT recovers to Grade ≤2, and then reduce 1 dose level. *If AST/ALT is Grade 4 (>20 × upper limit of normal):* Permanently discontinue ado-trastuzumab. *If serum bilirubin is Grade 2 (>1.5 to ≤3 × upper limit of normal):* Hold dose until bilirubin recovers to Grade ≤1, then treat at same dose level. *If bilirubin is Grade 3 (>3 to ≤10 × upper limit of normal):* Hold dose until bilirubin recovers to Grade ≤1, then reduce 1 dose level. *If bilirubin is Grade 4 (>10 × upper limit of normal):* Permanently discontinue ado-trastuzumab. Permanently discontinue ado-trastuzumab in patients with AST/ALT >3 × upper limit of normal and concomitant total bilirubin >2 × upper limit of normal.

★ = Canadian drug name. Ξ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor platelet count prior to starting therapy and before each dose. Nadir of thrombocytopenia occurs by Day 8 and generally improves to Grade 0 or 1 by next scheduled dose. *If thrombocytopenia is Grade 3 (PLT 25,000/mm³ to <50,000/mm³):* Hold dose until platelet count recovers to \leq Grade 1 (\geq 75,000/mm³), then treat at same dose level. *If thrombocytopenia is Grade 4 (PLT <25,000/mm³):* Hold dose until platelet count recovers to \leq Grade 1, then reduce 1 dose level.
- May cause \downarrow hemoglobin, neutrophils, and serum potassium.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **High Alert:** Do not confuse ado-trastuzumab (Kadcyla) with trastuzumab (Herceptin). Double check names. Trade name of administered product should be clearly recorded in patient file to improve traceability.
- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations and infusion pump settings.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** Reconstitute by slowly inject 5 or 8 mL of Sterile Water for Injection into 100 or 160 mg vial of ado-trastuzumab respectively, for a solution of 20 mg/mL. Swirl gently until dissolved; do not shake. Solution is clear, colorless to pale brown, and slightly opalescent; do not administer solutions that are discolored or contain particulate matter. Use reconstituted vials immediately or store in refrigerator up to 4 hr; then discard. Do not freeze. Calculate amount of solution needed. **Diluent:** Withdraw from vial and add to infusion bag containing 250 mL of 0.9% NaCl; do not use dextrose solutions. Gently invert bag to mix without foaming. Use diluted solution immediately; may be stored in refrigerator up to 24 hrs prior to use, then discard; do not freeze or shake. Administer every 3 wks (21-day cycle); if cycle is delayed, administer as soon as possible. Do not wait until next planned cycle; maintain 3-wk interval between doses. **Rate:** Infuse through a 0.2 or 0.22 micron in-line non-protein adsorptive polyethersulfone (PES) filter. Do not administer as IV push or bolus. **First infusion:** Infuse over 90 min; observe for infusion related reaction. **Subsequent infusions:** Infuse over 30 min if prior infusions were well tolerated. Observe patient

during infusion and for at least 90 min after infusion.

- Management of increased serum transaminases, hyperbilirubinemia, left ventricular dysfunction, thrombocytopenia, pulmonary toxicity, or peripheral neuropathy may require temporary interruption, dose reduction, or discontinuation.
- Dose reduction schedule is: *Starting dose*—3.6 mg/kg; *First dose reduction*—3 mg/kg; *Second dose reduction*—2.4 mg/kg; *Requirement for further dose reduction*—discontinue therapy.
- **Y-Site Incompatibility:** Do not mix or administer with other medications.

Patient/Family Teaching

- Explain purpose of medication to patient.
- **Inform patient of potential liver injury and HF.** Advise patient to notify health care professional immediately if signs and symptoms of liver injury (nausea, vomiting, abdominal pain, jaundice, dark urine, pruritus, anorexia) or HF (new onset or worsening shortness of breath, cough, swelling of ankles/legs, palpitations, weight gain of $>$ 5 lbs in 24 hrs, dizziness, loss of consciousness) occur.
- Advise patient to notify health care professional if signs of peripheral neuropathy (burning, numbness, pain in hands and feet/legs) occur.
- **Rep:** Ado-trastuzumab can cause fetal harm. Advise male and female patients to use a highly effective method (IUD, hormonal contraceptive, tubal ligation, partner's vasectomy) of contraception during and for at least 4 mo after last dose. Instruct patient to notify health care professional promptly if pregnancy is suspected and to avoid breast feeding for at least 7 mo after last dose. Encourage women who have been exposed to ado-trastuzumab either directly or through seminal fluid, to enroll in the MoTHER Pregnancy Registry by contacting 1-800-690-6720 and to immediately report exposure to Genentech Adverse Event Line at 1-888-835-2555.

Evaluation/Desired Outcomes

- Decreased spread of metastatic breast cancer.

 **afatinib** (a-fa-ti-nib)
Gilotrif,  Giotrif

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

First-line treatment of metastatic non-small cell lung cancer (NSCLC) where the tumor has a specific epidermal growth factor receptor (EGFR) deletion or substitution mutation detectable by an FDA-approved test. Treatment of metastatic squamous NSCLC progressing after platinum chemotherapy.

Action

Inhibits tyrosine kinases which results in slowed proliferation of specific tumor cell lines. **Therapeutic Effects:** Decreased spread of NSCLC.

Pharmacokinetics

Absorption: Well absorbed (92%) following oral administration; absorption is decreased by high fat meal.

Distribution: Unknown.

Metabolism and Excretion: Metabolites occur partly as protein-bound products. Excretion is primarily fecal (85%) as parent drug; 4% excreted in urine.

Half-life: 37 hr.

TIME/ACTION PROFILE (improved progression-free survival)

ROUTE	ONSET	PEAK	DURATION
PO	3 mo	12 mo	20 mo

Contraindications/Precautions

Contraindicated in: **Lactation:** Discontinue drug or discontinue breast feeding; **OB:** May cause fetal harm.

Use Cautiously in: Severe renal impairment (↓ dose); Severe hepatic impairment (dose adjustment may be necessary); **⊠** Asian ethnicity (may be ↑ susceptible to interstitial lung disease); **Rep:** Women of reproductive potential (use effective contraception); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

Derm: **STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, cutaneous reactions** (including bullous/blistering/exfoliating reactions, acneiform eruptions and palmar-plantar erythrodysesthesia), **dry skin, paronychia, pruritus, rash. EENT:** **conjunctivitis, epistaxis, keratitis, rhinorrhea. GI:** **HEPATOTOXICITY, PANCREATITIS, diarrhea, ↓ appetite, ↓ weight, nausea, stomatitis, vomiting. F and E:** **hypokalemia. Resp:** **INTERSTITIAL LUNG DISEASE. Misc:** **fever.**

Interactions

Drug-Drug: Concurrent use of **P-gp inhibitors** including **amiodarone, cyclosporine, erythromycin, itraconazole, ketoconazole, quinidine, ritonavir, saquinavir, tacrolimus, or verapamil** ↑ blood levels and the risk of toxicity; dosage adjustment may be necessary (ritonavir may be given concurrently or 6 hr after). Concurrent use of **P-gp inducers** including **carbamazepine, phenobarbital, phenytoin, or rifampin** ↓ blood levels and may ↓ effectiveness; dosage adjustment may be necessary.

Route/Dosage

PO (Adults): 40 mg once daily; **concurrent use of P-gp inhibitors**—↓ dose by 10 mg/day if necessary; **concurrent use of P-gp inducers**—↑ dose by 10 mg/

day if necessary. Continue until disease progression or occurrence of unacceptable toxicity.

Renal Impairment

PO (Adults): *eGFR 15–29 mL/min*—30 mg once daily.

Availability

Tablets: 20 mg, 30 mg, 40 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for diarrhea; occurs frequently. Provide patient with an antidiarrheal agent (loperamide) at the onset of diarrhea and until diarrhea ceases for 12 hrs. If diarrhea is severe and lasts more than 48 hr despite use of antidiarrheal agent (Grade 2 or higher), withhold afatinib until diarrhea resolves to Grade 1 or less, then resume with reduced dose of 10 mg/day.
- Assess for cutaneous reactions (bullous, blistering, exfoliative lesions; rash, erythema, acneiform rash) periodically during therapy. Discontinue afatinib if life-threatening lesions or prolonged Grade 2 cutaneous lesions lasting ≥ 7 days, intolerable Grade 2, or Grade 3 cutaneous reactions occur. Withhold afatinib until reaction resolves to Grade 1 or less and resume at 10 mg/day.
- Monitor for signs and symptoms of interstitial lung disease (lung infiltration, pneumonitis, acute respiratory distress syndrome, allergic alveolitis); **⊠** may occur more commonly in patients of Asian ethnicity. Withhold afatinib if symptoms occur; discontinue if interstitial lung disease is confirmed.
- **Lab Test Considerations:** Monitor liver function tests periodically during therapy. If severe decline in liver function occurs, discontinue afatinib. May cause ↑ AST and ALT.
- May cause hypokalemia.

Potential Nursing Diagnoses

Diarrhea (Side Effects)

Implementation

- **PO:** Administer once daily on an empty stomach, at least 1 hr before or 2 hrs after meals.

Patient/Family Teaching

- Instruct patient to take afatinib as directed. Take missed dose as soon as remembered unless within 12 hrs of next dose, then omit and take next dose at scheduled time; do not double doses.
- Caution patient to notify health care professional if signs and symptoms of keratitis (acute or worsening eye inflammation, lacrimation, light sensitivity, blurred vision, eye pain, and/or red eye) occur. Withhold if symptoms occur; if ulcerative keratitis is confirmed, discontinue afatinib. Advise patient that use of contact lenses is also a risk factor.

* = Canadian drug name. **⊠** = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to wear sunscreen and protective clothing during therapy to minimize risk of skin disorders.
- Inform patient that diarrhea occurs in most patients and may cause dehydration and renal impairment. Notify health care professional if diarrhea is severe or persistent, if **new or worsening lung symptoms** (difficulty breathing, shortness of breath, cough, fever), **symptoms of liver problems** (yellow skin or whites of eyes, dark brown urine, pain on right side of abdomen, unusual bleeding or bruising, lethargy) or if symptoms of left ventricular dysfunction (shortness of breath, exercise intolerance, cough, fatigue, swelling of ankles or feet, palpitations, sudden weight gain) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Advise female patients to use highly effective contraception during and for at least 2 wks after last dose and to avoid breast feeding. If pregnancy occurs, instruct patient to notify health care professional immediately.

Evaluation/Desired Outcomes

- Decreased spread of non-small cell lung cancer.

albuterol (al-byoo-ter-ole)

Accuneb, ❄️ Airomir, Proair HFA, Proair Respiclick, Proventil HFA,
❄️ Salbutamol, Ventolin HFA,
❄️ Ventolin Diskus, ❄️ Ventolin Nebules,
VoSpire ER

Classification

Therapeutic: bronchodilators
Pharmacologic: adrenergics

Indications

Treatment or prevention of bronchospasm in asthma or chronic obstructive pulmonary disease (COPD). **In-hal:** Prevention of exercise-induced bronchospasm. **PO:** Used as a long-term control agent in patients with chronic/persistent bronchospasm.

Action

Binds to beta₂-adrenergic receptors in airway smooth muscle, leading to activation of adenylyl cyclase and increased levels of cyclic-3', 5'-adenosine monophosphate (cAMP). Increases in cAMP activate kinases, which inhibit the phosphorylation of myosin and decrease intracellular calcium. Decreased intracellular calcium relaxes smooth muscle airways. Relaxation of airway smooth muscle with subsequent bronchodilation. Relatively selective for beta₂ (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: Well absorbed after oral administration but rapidly undergoes extensive metabolism.

Distribution: Small amounts appear in breast milk.

Metabolism and Excretion: Extensively metabolized by the liver and other tissues.

Half-life: Oral 2.7–5 hr; Inhalation: 3.8 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	2–3 hr	4–6 hr or more
PO–ER	30 min	2–3 hr	12 hr
Inhaln	5–15 min	60–90 min	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to adrenergic amines.

Use Cautiously in: Cardiac disease; Hypertension; Hyperthyroidism; Diabetes; Glaucoma; Seizure disorders; Excess inhaler use may lead to tolerance and paradoxical bronchospasm; **OB, Lactation, Pedi:** Safety not established for pregnant women near term, breast-feeding women, and children <2 yr; **Geri:** ↑ risk of adverse reactions; may require dose ↓.

Adverse Reactions/Side Effects

CNS: nervousness, restlessness, tremor, headache, insomnia (**Pedi:** occurs more frequently in young children than adults), hyperactivity in children. **Resp:** PARADOXICAL BRONCHOSPASM (excessive use of inhalers). **CV:** chest pain, palpitations, angina, arrhythmias, hypertension. **GI:** nausea, vomiting. **Endo:** hyperglycemia. **F and E:** hypokalemia. **Neuro:** tremor.

Interactions

Drug-Drug: Concurrent use with other adrenergic agents will have ↑ adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers** may negate therapeutic effect. May ↓ serum **digoxin** levels. Cardiovascular effects are potentiated in patients receiving **tricyclic antidepressants**. Risk of hypokalemia ↑ concurrent use of **potassium-losing diuretics**. Hypokalemia ↑ the risk of **digoxin** toxicity.

Drug-Natural Products: Use with caffeine-containing herbs (**cola nut, guarana, tea, coffee**) ↑ stimulant effect.

Route/Dosage

PO (Adults and Children ≥12 yr): 2–4 mg 3–4 times daily (not to exceed 32 mg/day) or 4–8 mg of extended-release tablets twice daily.

PO (Geriatric Patients): Initial dose should not exceed 2 mg 3–4 times daily, may be ↑ carefully (up to 32 mg/day).

PO (Children 6–12 yr): 2 mg 3–4 times daily or 0.3–0.6 mg/kg/day as extended-release tablets divided twice daily; may be carefully ↑ as needed (not to exceed 8 mg/day).

PO (Children 2–6 yr): 0.1 mg/kg 3 times daily (not to exceed 2 mg 3 times daily initially); may be carefully ↑ to 0.2 mg/kg 3 times daily (not to exceed 4 mg 3 times daily).

Inhaln (Adults and Children ≥4 yr): *Via metered-dose inhaler or dry powder inhaler*—2 inhalations every 4–6 hr (some patients may respond to 1 inhalation) or 2 inhalations 15 min before exercise; *NIH Guidelines for acute asthma exacerbation: Children*—4–8 puffs every 20 min for 3 doses then every 1–4 hr; *Adults*—4–8 puffs every 20 min for up to 4 hr then every 1–4 hr as needed.

Inhaln (Adults and Children >12 yr): *NIH Guidelines for acute asthma exacerbation via nebulization or IPPB*—2.5–5 mg every 20 min for 3 doses then 2.5–10 mg every 1–4 hr as needed; *Continuous nebulization*—10–15 mg/hr.

Inhaln (Children 2–12 yr): *NIH Guidelines for acute asthma exacerbation via nebulization or IPPB*—0.15 mg/kg/dose (minimum dose 2.5 mg) every 20 min for 3 doses then 0.15–0.3 mg/kg (not to exceed 10 mg) every 1–4 hr as needed or 1.25 mg 3–4 times daily for children 10–15 kg or 2.5 mg 3–4 times daily for children >15 kg; *Continuous nebulization*—0.5–3 mg/kg/hr.

Inhaln (Neonates): 1.25 mg/dose every 8 hr via nebulization or 1–2 puffs via MDI into the ventilator circuit every 6 hrs.

Availability (generic available)

Tablets: 2 mg, 4 mg. **Cost:** *Generic*—4 mg \$565.87/100. **Extended-release tablets:** 4 mg, 8 mg. **Oral syrup (strawberry-flavored):** 2 mg/5 mL. **Metered-dose aerosol:** 90 mcg/inhalation in 6.7-g, 8-g, 8.5-g, and 18-g canisters (200 metered inhalations). * 100 mcg/spray. **Cost:** *Proair HFA*—\$52.53/8.5-g canister; *Proventil HFA*—\$62.62/6.7-g canister; *Ventolin HFA*—\$19.08/8-g canister. **Inhalation solution:** 0.63 mg/3 mL (0.021%), 1.25 mg/3 mL (0.042%), 2.5 mg/3 mL (0.083%), * 1 mg/mL, * 2 mg/mL, 5 mg/mL (0.5%). **Cost:** *Generic*—2.5 mg/3 mL \$40.82/90 mL, 5 mg/mL \$51.02/60 mL. **Powder for inhalation (Proair Respiclick):** 90 mcg/inhalation (200 metered inhalations). **Powder for inhalation (Ventolin Diskus):** * 200 mcg. **In combination with:** ipratropium (Combivent). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced.
- Monitor pulmonary function tests before initiating therapy and periodically during therapy.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify health care professional immediately.

- **Lab Test Considerations:** May cause transient ↓ in serum potassium concentrations with nebulization or higher-than-recommended doses.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- **PO:** Administer oral medication with meals to minimize gastric irritation.
- Extended-release tablets should be swallowed whole; do not break, crush, or chew.
- **Inhaln:** Shake inhaler well, and allow at least 1 min between inhalations of aerosol medication. Prime the inhaler before first use by releasing 4 test sprays into the air away from the face. *Proair Respiclick* does not require priming. **Pedi:** Use spacer for children <8 yr of age.
- For nebulization or IPPB, the 0.5-, 0.83-, 1-, and 2-mg/mL solutions do not require dilution before administration. The 5 mg/mL (0.5%) solution must be diluted with 1–2.5 mL of 0.9% NaCl for inhalation. Diluted solutions are stable for 24 hr at room temperature or 48 hr if refrigerated.
- For nebulizer, compressed air or oxygen flow should be 6–10 L/min; a single treatment of 3 mL lasts about 10 min.
- IPPB usually lasts 5–20 min.

Patient/Family Teaching

- Instruct patient to take albuterol as directed. If on a scheduled dosing regimen, take missed dose as soon as remembered, spacing remaining doses at regular intervals. Do not double doses or increase the dose or frequency of doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm (more likely with first dose from new canister), or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Instruct patient to prime unit with 4 sprays before using and to discard canister after 200 sprays. Actuators should not be changed among products.
- Inform patient that these products contain hydrofluoroalkane (HFA) and the propellant and are described as non-CFC or CFC-free (contain no chlorofluorocarbons).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Inform patient that albuterol may cause an unusual or bad taste.
- **Inhaln:** Instruct patient in the proper use of the metered-dose inhaler or nebulizer (see Appendix D).
- Advise patients to use albuterol first if using other inhalation medications and allow 5 min to elapse before administering other inhalant medications unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth and clean the mouthpiece with water at least once a week.
- **Instruct patient to notify health care professional if there is no response to the usual dose or if contents of one canister are used in less than 2 wk.** Asthma and treatment regimen should be re-evaluated and corticosteroids should be considered. Need for increased use to treat symptoms indicates decrease in asthma control and need to re-evaluate patient's therapy.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.

alclometasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

alectinib (al-ekti-nib)

Alecensa,  Alecensaro

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Indications

 Patients with metastatic non-small cell lung cancer (NSCLC) that is positive for anaplastic lymphoma kinase (ALK) who have progressed on or are intolerant to crizotinib.

Action

Inhibits tyrosine kinase receptors targeting anaplastic lymphoma kinase (ALK) and RET. **Therapeutic Effects:** Decreased spread of lung cancer.

Pharmacokinetics

Absorption: 37% absorbed following oral administration; high-fat, high-calorie meals ↑ absorption.

Distribution: Extensively distributed to tissues.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system) to its active metabolite, M4 (also metabolized by CYP3A4). 84% excreted in feces unchanged; minimal excretion in urine.

Half-life: 33 hr (alectinib); 31 hr (M4 active metabolite).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 hr	unknown

Contraindications/Precautions

Contraindicated in: **OB:** May cause fetal harm;

Lactation: Breast feeding should be avoided during treatment and for 1 wk after therapy.

Use Cautiously in: Severe renal impairment (CCr <30 mL/min); Moderate or severe hepatic impairment;

Rep: Patients with childbearing potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue, headache. **CV:** bradycardia, edema.

Derm: photosensitivity, rash. **EENT:** blurred vision, diplopia. **Endo:** hyperglycemia. **F and E:** hypocalcemia, hypokalemia, hyponatremia, hypophosphatemia. **GI:** HEPATOTOXICITY, constipation, diarrhea, hyperbilirubinemia, nausea, vomiting. **GU:** ↑ serum creatinine. **Hemat:** HEMORRHAGE, anemia, lymphopenia. **Metab:** ↑ weight. **MS:** ↑ creatine kinase, back pain, myalgia. **Resp:** INTERSTITIAL LUNG DISEASE, PULMONARY EMBOLISM, cough, dyspnea.

Interactions

Drug-Drug: None known.

Route/Dosage

PO (Adults): 600 mg twice daily with food.

Availability

Capsules: 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of interstitial lung disease/pneumonitis (worsening of respiratory symptoms, dyspnea, cough, fever). Withhold therapy if symptoms occur and permanently discontinue if no other potential causes are identified.
- Monitor heart rate and BP regularly during therapy. *If symptomatic bradycardia occurs*, withhold therapy until asymptomatic or heart rate ≥ 60 bpm. If concomitant medication identified as contributing and is discontinued, or its dose adjusted, resume alectinib at previous dose upon recovery to asymptomatic bradycardia or to heart rate ≥ 60 bpm. If no contributing medication identified, or if contributing medications are not discontinued or dose modified, resume alectinib at reduced dose upon recovery to asymptomatic bradycardia or to heart rate of ≥ 60 bpm. *If life-threatening bradycardia occurs*, permanently discontinue alectinib if no contributing medication is identified. If contributing medication is identified and discontinued, or its dose is adjusted, resume alectinib at reduced dose upon recovery to asymptomatic bradycardia or to heart rate of ≥ 60 bpm, with frequent monitoring as clinically

indicated. Permanently discontinue alectinib in case of recurrence.

- Assess for myalgia periodically during therapy.
- **Lab Test Considerations:** Dose reduction schedule: 1st dose reduction—450 mg twice daily, 2nd dose reduction 300 mg twice daily. Discontinue if unable to tolerate 300 mg twice daily.
- Monitor liver function tests every 2 wks during first 3 mo of therapy, and then monthly and as clinically indicated during treatment. *If ALT or AST \uparrow >5 times upper limit of normal (ULN) with total bilirubin ≤ 2 times ULN, temporarily withhold until recovery to baseline or ≤ 3 times ULN, then resume at reduced dose. If ALT or AST \uparrow >3 times ULN with total bilirubin \uparrow >2 times ULN in absence of cholestasis or hemolysis, permanently discontinue alectinib. If total bilirubin \uparrow >3 times ULN, temporarily withhold until recovery to baseline or to ≤ 1.5 times ULN, then resume at reduced dose.*
- Assess CPK every 2 wks during 1st mo of therapy and in patients reporting unexplained muscle pain, tenderness, or weakness. *If \uparrow CPK >5 times ULN, temporarily withhold until recovery to baseline or ≤ 2.5 times ULN, then resume at same dose. If \uparrow CPK >10 times ULN or 2nd occurrence of \uparrow CPK >5 times ULN, temporarily withhold until recovery to baseline or ≤ 2.5 times ULN, then resume at reduced dose.*
- May cause hyperglycemia, hypocalcemia, hypokalemia, hypophosphatemia, and hyponatremia.
- May cause anemia and lymphopenia.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer twice daily with food. Swallow capsules whole, do not open or dissolve capsule contents.

Patient/Family Teaching

- Instruct patient to take alectinib as directed. If a dose is missed or vomiting occurs after taking, omit dose and take next dose at scheduled time.
- Advise patient to use sunscreen and lip balm (SPF ≥ 50) and to wear protective clothing to prevent photosensitivity reaction.
- Advise patient to notify health care professional if signs and symptoms of liver problems (feeling tired, itchy skin, feeling less hungry than usual, nausea or vomiting, yellowing of skin or whites of eyes, pain on right side of stomach, dark urine, bleeding or bruising more easily than normal), respiratory problems (trouble breathing, shortness of breath, cough, fever), bradycardia (dizziness, lightheadedness, syncope), or myalgia (unexplained muscle pain, tenderness, or weakness) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-

ucts being taken and consult health care professional before taking any new medications.

- **Rep:** May cause teratogenic effects. Advise both male and female patients to use effective contraception during and for at least 1 wk following therapy. Advise female patients to avoid breast feeding during and for at least 1 wk following therapy.

Evaluation/Desired Outcomes

- Decreased spread of lung cancer.

alendronate (a-len-drone-ate) Binosto, Fosamax

Classification

Therapeutic: bone resorption inhibitors

Pharmacologic: biphosphonates

Indications

Treatment and prevention of postmenopausal osteoporosis. Treatment of osteoporosis in men. Treatment of Paget's disease of the bone. Treatment of corticosteroid-induced osteoporosis in patients (men and women) who are receiving ≥ 7.5 mg of prednisone/day (or equivalent) with evidence of decreased bone mineral density.

Action

Inhibits resorption of bone by inhibiting osteoclast activity. **Therapeutic Effects:** Reversal of the progression of osteoporosis with decreased fractures. Decreased progression of Paget's disease.

Pharmacokinetics

Absorption: Poorly absorbed (0.6–0.8%) after oral administration.

Distribution: Transiently distributes to soft tissue, then distributes to bone.

Metabolism and Excretion: Excreted in urine.

Half-life: 10 yr (reflects release of drug from skeleton).

TIME/ACTION PROFILE (inhibition of bone resorption)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	3–6 mo	3 wk–7 mo†

†After discontinuation of alendronate.

Contraindications/Precautions

Contraindicated in: Abnormalities of the esophagus which delay esophageal emptying (i.e. strictures, achalasia); Inability to stand/sit upright for at least 30 min; Renal insufficiency (CCr <35 mL/min); **OB, Lactation:** Safety not established.

Use Cautiously in: History of upper GI disorders; Pre-existing hypocalcemia or vitamin D deficiency; Invasive dental procedures, cancer, receiving chemother-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

apy, corticosteroids, or angiogenesis inhibitors, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis).

Adverse Reactions/Side Effects

CNS: headache. **EENT:** blurred vision, conjunctivitis, eye pain/inflammation. **CV:** atrial fibrillation. **GI:** abdominal distention, abdominal pain, acid regurgitation, constipation, diarrhea, dyspepsia, dysphagia, esophageal cancer, esophageal ulcer, esophagitis, flatulence, gastritis, nausea, taste perversion, vomiting. **Derm:** erythema, photosensitivity, rash. **MS:** musculoskeletal pain, femur fractures, osteonecrosis (primarily of jaw). **Resp:** asthma exacerbation.

Interactions

Drug-Drug: Calcium supplements, antacids, and levothyroxine may ↓ the absorption of alendronate. Doses > 10 mg/day ↑ risk of adverse GI events when used with NSAIDs. IV ranitidine ↑ blood levels.

Drug-Food: Food significantly ↓ absorption. Caffeine (coffee, tea, cola), mineral water, and orange juice also ↓ absorption.

Route/Dosage

PO (Adults): *Treatment of osteoporosis*—10 mg once daily or 70 mg once weekly. *Prevention of osteoporosis*—5 mg once daily or 35 mg once weekly.

Paget's disease—40 mg once daily for 6 mo. Retreatment may be considered for patients who relapse.

Treatment of corticosteroid-induced osteoporosis in men and premenopausal women—5 mg once daily.

Treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving estrogen—10 mg once daily.

Availability (generic available)

Tablets: 5 mg, 10 mg, 35 mg, 40 mg, 70 mg. **Cost:** Generic—10 mg \$20.94/100, 35 mg \$6.99/4, 70 mg \$8.22/4. **Oral solution (raspberry flavor):** 70 mg/75 mL. **Cost:** Generic—\$23.44/75 mL. **Effervescent tablets (strawberry flavor):** 70 mg. **Cost:** \$168.00/4. **In combination with:** Cholecalciferol (Fosamax plus D) See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Osteoporosis:** Assess patients for low bone mass before and periodically during therapy.
- **Paget's Disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- **Lab Test Considerations:** *Osteoporosis:* Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating alendronate therapy. May cause mild, transient ↑ of calcium and phosphate.
- **Paget's Disease:** Monitor alkaline phosphatase before and periodically during therapy. Alendronate is

indicated for patients with alkaline phosphatase twice the upper limit of normal.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- **PO:** Administer first thing in the morning with 6–8 oz plain water 30 min before other medications, beverages, or food. Oral solution should be followed by at least 2 ounces of water. Swallow tablets whole; do not crush, break, or chew.
- For *effervescent tablets* dissolve 1 tablet in half a glass (4 oz) of plain room temperature water (not mineral water or flavored water). Wait at least 5 minutes after the effervescence stops, stir the solution for approximately 10 seconds and drink contents.

Patient/Family Teaching

- Instruct patient on the importance of taking exactly as directed, first thing in the morning, 30 min before other medications, beverages, or food. Waiting longer than 30 min will improve absorption. Alendronate should be taken with 6–8 oz plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. If a weekly dose is missed, take the morning after remembered and resume the following wk on the chosen day. Do not take 2 tablets on the same day. Do not discontinue without consulting health care professional.
- Caution patient to remain upright for 30 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation. Advise patient to discontinue alendronate and notify health care provider if pain or difficulty swallowing, retrosternal pain, or new/worsening heartburn occur.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise patient to inform health care professional of alendronate therapy prior to dental surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if blurred vision, eye pain, or inflammation occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Prevention of or decrease in the progression of osteoporosis in postmenopausal women. Reassess need for medication periodically. Consider discontinuation of alendronate after 3–5 years in patients with

low-risk of fractures. If discontinued, reassess fracture risk periodically.

- Treatment of osteoporosis in men.
- Decrease in the progression of Paget's disease.
- Treatment of corticosteroid-induced osteoporosis.

alfuzosin (al-fyoo-zo-sin)

Uroxatral,  Xatral

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: peripherally acting antiadrenergics

Indications

Management of symptomatic benign prostatic hyperplasia (BPH).

Action

Selectively blocks alpha₁-adrenergic receptors in the lower urinary tract to relax smooth muscle in the bladder neck and prostate. **Therapeutic Effects:** Increased urine flow and decreased symptoms of BPH.

Pharmacokinetics

Absorption: 49% absorbed following oral administration; food enhances absorption.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); 11% excreted unchanged in urine.

Half-life: 10 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO-ER	within hr	8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Moderate to severe hepatic impairment; Potent inhibitors of the CYP3A4 enzyme system; Concurrent use of other alpha-adrenergic blocking agents; Severe renal impairment; **Pedi:** Children.

Use Cautiously in: Congenital or acquired QTc prolongation or concurrent use of other drugs known to prolong QTc; Mild hepatic impairment; Symptomatic hypotension; Concurrent use of antihypertensive agents, phosphodiesterase type 5 inhibitors, or nitrates (↑ risk of postural hypotension); Previous hypotensive episode with other medications; **Geri:** Consider age-related changes in body mass and cardiac, renal, and hepatic function when prescribing.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **EENT:** intraoperative floppy iris syndrome. **Derm:** TOXIC EPIDERMAL NE-

CROLYSIS. **Resp:** bronchitis, sinusitis, pharyngitis. **CV:** postural hypotension. **GI:** abdominal pain, constipation, dyspepsia, nausea. **GU:** erectile dysfunction, priapism. **Hemat:** thrombocytopenia.

Interactions

Drug-Drug: Ketoconazole, itraconazole, and ritonavir ↓ metabolism and significantly ↑ levels and effects (concurrent use contraindicated). Levels are ↑ by cimetidine, atenolol, and diltiazem. May ↑ levels and effects of atenolol and diltiazem (monitor BP and heart rate). ↑ risk of hypotension with anti-hypertensives, nitrates, phosphodiesterase type 5 inhibitors (including sildenafil, tadalafil, and vardenafil) and acute ingestion of alcohol.

Route/Dosage

PO (Adults): 10 mg once daily.

Availability (generic available)

Extended-release tablets: 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of benign prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Assess for orthostatic reaction and syncope. Monitor BP (lying and standing) and pulse frequently during initial dose adjustment and periodically thereafter. May occur within a few hr after initial doses and occasionally thereafter.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer with food at the same meal each day. Tablets must be swallowed whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication with the same meal each day. Take missed doses as soon as remembered. If not remembered until next day, omit; do not double doses.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension.
- Advise patient to consult health care professional before taking any cough, cold, or allergy remedies.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Instruct patient to notify health care professional of medication regimen before any surgery, especially cataract surgery.
- Advise patient to notify health care professional if priapism, angina, frequent dizziness, rash, or fainting occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Geriatric:** Assess risk for falls; implement fall prevention program and instruct patient and family in preventing falls at home.

Evaluation/Desired Outcomes

- Decreased symptoms of benign prostatic hyperplasia.

alirocumab (a-li-roe-kyoo-mab) Praluent

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitor antibodies

Indications

Lowering of low density lipoprotein cholesterol (LDL-C) as an adjunct to diet and maximally tolerated statin (HMG CoA reductase inhibitor) therapy in patients with heterozygous familial hypercholesterolemia (HeFH) or cardiovascular disease who require supplemental agents.

Action

A human monoclonal immunoglobulin (IgG1) produced in genetically engineered Chinese hamster ovary cells that binds to PCSK9 inhibiting its binding to the low density lipoprotein receptor (LDLR) resulting in ↑ number of LDLRs available to clear LDL from blood.

Therapeutic Effects: ↓ LDL-C.

Pharmacokinetics

Absorption: Well absorbed (85%) following subcut administration.

Distribution: Mostly distributed in the circulatory system; crosses the placenta.

Metabolism and Excretion: Eliminated by binding to PCSK9 and by proteolytic degradation.

Half-life: 17–20 days.

TIME/ACTION PROFILE (effect circulating unbound PCSK9)

ROUTE	ONSET	PEAK	DURATION
subcut	rapid	4–8 hr	2 wk

Contraindications/Precautions

Contraindicated in: History of serious hypersensitivity to alirocumab.

Use Cautiously in: Severe renal/hepatic impairment; **Geriatric:** Elderly patients may be more sensitive to

drug effects; **OB:** Crosses the placenta, consider fetal risks; **Lactation:** Consider benefits of breast feeding against possible risk to infant; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: confusion. **Local:** injection site reactions.

Misc: serious allergic reactions including **VASCULITIS**.

Interactions

Drug-Drug: None noted.

Route/Dosage

Subcut (Adults): 75 mg every 2 wk; if desired LDL-C has not been achieved, dose may be ↑ to 150 mg every 2 wk. If less frequent dosing desired, may initiate therapy with 300 mg every 4 wk; if desired LDL-C has not been achieved, may adjust dose to 150 mg every 2 wk.

Availability

Solution for subcutaneous injection: 75 mg/mL (in prefilled pen or prefilled syringe), 150 mg/mL (in prefilled pen or prefilled syringe).

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption.
- Monitor for signs and symptoms of hypersensitivity reactions (pruritus, rash, urticaria, hypersensitivity vasculitis and hypersensitivity reactions requiring hospitalization) during therapy. If severe symptoms occur, discontinue alirocumab.
- **Lab Test Considerations:** Assess LDL-C levels within 4 to 8 wk of initiating or titrating alirocumab, to assess response and adjust dose, if needed.

Potential Nursing Diagnoses

Noncompliance, related to diet and medication regimen (Patient/Family Teaching)

Implementation

- **Subcut:** Administer every 2 wks. Allow solution to warm to room temperature for 30–40 min before injecting. May be kept at room temperature for up to 30 days. Solution is clear and colorless to pale yellow; do not administer solutions that are cloudy or contain particulate matter. Do not shake. Inject into thigh, abdomen, or upper arm. Rotate sites with each injection. Do not inject into areas with skin disease or injury (sunburns, rashes, inflammation, skin infections). Do not re-use pre-filled pen or syringe. Do not administer other injectable drugs at same site. Store in refrigerator; do not freeze.

Patient/Family Teaching

- Instruct patient in correct technique for self-injection, care and disposal of equipment. Administer missed doses within 7 days, then resume original schedule. If not administered within 7 days, wait until next dose on original schedule. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.

- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- ↓ LDL-C levels.

allopurinol (al-oh-pure-i-nole)

Aloprim, Lopurin, Zyloprim

Classification

Therapeutic: antigout agents, antihyperuricemics

Pharmacologic: xanthine oxidase inhibitors

Indications

PO: Prevention of attack of gouty arthritis and nephropathy. **PO, IV:** Treatment of secondary hyperuricemia, which may occur during treatment of tumors or leukemias.

Action

Inhibits the production of uric acid by inhibiting the action of xanthine oxidase. **Therapeutic Effects:** Lowering of serum uric acid levels.

Pharmacokinetics

Absorption: Well absorbed (80%) following oral administration.

Distribution: Widely distributed in tissue and breast milk.

Protein Binding: <1%.

Metabolism and Excretion: Metabolized to oxypurinol, an active compound with a long half-life. 12% excreted unchanged, 76% excreted as oxypurinol.

Half-life: 1–3 hr (oxypurinol 18–30 hr).

TIME/ACTION PROFILE (hypouricemic effect)

ROUTE	ONSET	PEAK	DURATION
PO, IV	1–2 days	1–2 wk	1–3 wk†

†Duration after discontinuation of allopurinol.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Acute attacks of gout; Renal insufficiency (dose ↓ required if CCR <20 mL/min); De-

hydration (adequate hydration necessary); **OB, Lactation:** Rarely used; **Geri:** Begin at lower end of dosage range.

Adverse Reactions/Side Effects

CV: hypotension, flushing, hypertension, bradycardia, and heart failure (reported with IV administration).

CNS: drowsiness. **GI:** diarrhea, hepatitis, nausea, vomiting. **GU:** renal failure, hematuria. **Derm:** rash (discontinue drug at first sign of rash), urticaria. **Hemat:** bone marrow depression. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Use with mercaptopurine and azathioprine ↑ bone marrow depressant properties—doses of these drugs should be ↓. Use with ampicillin or amoxicillin ↑ risk of rash. Use with oral hypoglycemic agents and warfarin ↑ effects of these drugs. Use with thiazide diuretics or ACE inhibitors ↑ risk of hypersensitivity reactions. Large doses of allopurinol may ↑ risk of theophylline toxicity. May ↑ cyclosporine levels.

Route/Dosage

Management of Gout

PO (Adults and Children >10 yr): *Initially*—100 mg/day; ↑ at weekly intervals based on serum uric acid (not to exceed 800 mg/day). Doses >300 mg/day should be given in divided doses; *Maintenance dose*—100–200 mg 2–3 times daily. Doses of ≤300 mg may be given as a single daily dose.

Management of Secondary Hyperuricemia

PO (Adults and Children >10 yr): 600–800 mg/day in 2–3 divided doses starting 1–2 days before chemotherapy or radiation.

PO (Children 6–10 yr): 10 mg/kg/day in 2–3 divided doses (maximum 800 mg/day) or 300 mg daily in 2–3 divided doses.

PO (Children <6 yr): 10 mg/kg/day in 2–3 divided doses (maximum 800 mg/day) or 150 mg daily in 3 divided doses.

IV (Adults and Children >10 yr): 200–400 mg/m²/day (up to 600 mg/day) as a single daily dose or in divided doses q 8–24 hr.

IV (Children <10 yr): 200 mg/m²/day initially as a single daily dose or in divided doses q 8–24 hr (maximum dose 600 mg/day).

Renal Impairment

(Adults and Children): CCR 10–50 mL/min—↓ dose to 50% of recommended; CCR <10 mL/min—↓ dosage to 30% of recommended.

★ = Canadian drug name. † = Genetic implication. ~~through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Availability (generic available)

Tablets: 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—100 mg \$10.83/100, 300 mg \$10.83/100.

Powder for injection: 500 mg/vial.

NURSING IMPLICATIONS**Assessment**

- Monitor intake and output ratios. Decreased kidney function can cause drug accumulation and toxic effects. Ensure that patient maintains adequate fluid intake (minimum 2500–3000 mL/day) to minimize risk of kidney stone formation.
- Assess patient for rash or more severe hypersensitivity reactions. Discontinue allopurinol immediately if rash occurs. Therapy should be discontinued permanently if reaction is severe. Therapy may be reinstated after a mild reaction has subsided, at a lower dose (50 mg/day with very gradual titration). If skin rash recurs, discontinue permanently.
- **Gout:** Monitor for joint pain and swelling. Addition of colchicine or NSAIDs may be necessary for acute attacks. Prophylactic doses of colchicine or an NSAID should be administered concurrently during first 3–6 mo of therapy because of an increased frequency of acute attacks of gouty arthritis during early therapy.
- **Lab Test Considerations:** Serum and urine uric acid levels usually begin to ↓ 2–3 days after initiation of oral therapy.
- Monitor blood glucose in patients receiving oral hypoglycemic agents. May cause hypoglycemia.
- Monitor hematologic, renal, and liver function tests before and periodically during therapy, especially during the first few mo. May cause ↑ serum alkaline phosphatase, bilirubin, AST, and ALT levels. ↓ CBC and platelets may indicate bone marrow depression. ↑ BUN, serum creatinine, and CCr may indicate nephrotoxicity. These are usually reversed with discontinuation of therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **Do not confuse Zyluprim with zolpidem.**
- **PO:** May be administered after milk or meals to minimize gastric irritation; give with plenty of fluid. May be crushed and given with fluid or mixed with food for patients who have difficulty swallowing.

IV Administration

- **Intermittent Infusion:** Reconstitute each 500 mg vial with 25 mL of sterile water for injection. Solution should be clear and almost colorless with only slight opalescence. **Diluent:** Dilute to desired concentration with 0.9% NaCl or D5W. Administer within 10 hr of reconstitution; do not refrigerate. Do not administer solutions that are discolored or contain particulate matter. **Concentration:** Not >6 mg/mL. **Rate:** Infusion should be initiated 24–48 hr before start of

chemotherapy known to cause tumor cell lysis. Rate of infusion depends on volume of infusate (100–300 mg doses may be infused over 30 minutes). May be administered as a single infusion or equally divided infusions at 6-, 8-, or 12-hr intervals.

- **Y-Site Compatibility:** acyclovir, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, caspofungin, ceftazidime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, cisplatin, cyclophosphamide, dactinomycin, dexamethasone sodium phosphate, dexmedetomidine, docetaxel, doxorubicin liposome, enalaprilat, etoposide, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, fosphenytoin, furosemide, ganciclovir, gemcitabine, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, leucovorin calcium, linezolid, lorazepam, mannitol, mesna, methotrexate, metronidazole, milrinone, mitoxantrone, morphine, nesiritide, octreotide, oxytocin, palitaxel, pamidronate, pantoprazole, pemetrexed, piperacillin/tazobactam, potassium chloride, ranitidine, sodium acetate, teniposide, thiotepa, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vinblastine, vincristine, voriconazole, zidovudine, zoletronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amikacin, amiodarone, carmustine, cefotaxime, chlorpromazine, clindamycin, cytarabine, dacarbazine, daptomycin, daunorubicin, dexrazoxane, diltiazem, diphenhydramine, doxorubicin, doxycycline, droperidol, epirubicin, etarapenem, etoposide phosphate, floxuridine, foscarnet, gentamicin, haloperidol, hydroxyzine, idarubicin, imipenem/cilastatin, irinotecan, methchlorothamine, meperidine, methylprednisolone sodium succinate, metoprolol, moxifloxacin, mycophenolate, nalbuphine, ondansetron, palonosetron, pancuronium, potassium acetate, prochlorperazine, promethazine, sodium bicarbonate, streptozocin, tacrolimus, tobramycin, topotecan, vecuronium, vinorelbine.

Patient/Family Teaching

- Instruct patient to take allopurinol as directed. Take missed doses as soon as remembered. If dosing schedule is once daily, do not take if remembered the next day. If dosing schedule is more than once a day, take up to 300 mg for next dose.
- Instruct patient to continue taking allopurinol along with an NSAID or colchicine during an acute attack of gout. Allopurinol helps prevent, but does not relieve, acute gout attacks.
- Alkaline diet may be ordered. Urinary acidification with large doses of vitamin C or other acids may increase kidney stone formation (see Appendix K). Advise patient of need for increased fluid intake.

- May occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to report skin rash, blood in urine, or influenza symptoms (chills, fever, muscle aches and pains, nausea, or vomiting) to health care professional immediately; skin rash may indicate hypersensitivity.
- Advise patient that large amounts of alcohol increase uric acid concentrations and may decrease the effectiveness of allopurinol.
- Emphasize the importance of follow-up exams to monitor effectiveness and side effects.

Evaluation/Desired Outcomes

- Decreased serum and urinary uric acid levels. May take 2–6 wk to observe clinical improvement in patients treated for gout.

almotriptan (al-moe-trip-tan)

Axert

Classification

Therapeutic: vascular headache suppressants

Pharmacologic: 5-HT₁ agonists

Indications

Acute treatment of migraine headache (for adolescents, migraines should be ≥ 4 hr in duration).

Action

Acts as an agonist at specific 5-HT₁ receptor sites in intracranial blood vessels and sensory trigeminal nerves.

Therapeutic Effects: Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.

Pharmacokinetics

Absorption: Well absorbed following oral administration (70%).

Distribution: Unknown.

Metabolism and Excretion: 40% excreted unchanged in urine; 27% metabolized by monoamine oxidase-A (MAO-A); 12% metabolized by CYP3A4 and CYP2D6; 13% excreted in feces as unchanged and metabolized drug.

Half-life: 3–4 hr.

TIME/ACTION PROFILE (Blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Ischemic cardiovascular, cerebrovascular, or peripheral vascular syndromes (including ischemic bowel disease); History of significant cardiovascular disease; Uncontrolled hypertension; Should not be used within 24 hr of other 5-HT₁ agonists or ergot-type compounds (dihydroergotamine); Basilar or hemiplegic migraine; Concurrent MAO-A inhibitor therapy or within 2 wk of discontinuing MAO-A inhibitor therapy.

Use Cautiously in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men > 40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision; Impaired hepatic or renal function; Hypersensitivity to sulfonamides (cross-sensitivity may occur); **OB, Lactation:** Safety not established; **Pedi:** Children < 12 yr (safety not established).

Adverse Reactions/Side Effects

CNS: drowsiness, headache. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR ARRHYTHMIAS, myocardial ischemia. **GI:** dry mouth, nausea. **Neuro:** paresthesia.

Interactions

Drug-Drug: Concurrent use with MAO-A inhibitors \uparrow blood levels and the risk of adverse reactions (concurrent use or use within 2 wk or MAO inhibitor is contraindicated). Concurrent use with other 5-HT₁ agonists or ergot-type compounds (dihydroergotamine) may result in additive vasoactive properties (avoid use within 24 hr of each other). \uparrow serotonin levels and serotonin syndrome may occur when used concurrently with SSRI and SNRI antidepressants. Blood levels and effects may be \uparrow by ketoconazole, itraconazole, ritonavir, and erythromycin (inhibitors of CYP3A4 enzymes).

Route/Dosage

PO (Adults and Children ≥ 12 yr): 6.25–12.5 mg initially, may repeat in 2 hr; not to exceed 2 doses per 24-hr period.

Hepatic/Renal Impairment

PO (Adults): 6.25 mg initially, may repeat in 2 hr; not to exceed 2 doses per 24-hr period.

Availability (generic available)

Tablets: 6.25 mg, 12.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

* = Canadian drug name. \boxtimes = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs).

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Tablets should be swallowed whole with liquid.

Patient/Family Teaching

- Inform patient that almotriptan should only be used during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer almotriptan as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 2 doses in any 24-hr period.
- If first dose does not relieve headache, additional almotriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take almotriptan within 24 hr of another vascular headache suppressant.
- Advise patient that lying down in a darkened room following almotriptan administration may further help relieve headache.
- Advise patient that overuse (use more than 10 days/month) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of almotriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional prior to next dose of almotriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop discuss with health care professional at next visit.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during almotriptan use.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional immediately if signs or symptoms of serotonin syndrome occur.
- Caution patient not to use almotriptan if pregnant, suspects pregnancy, plans to become pregnant, or is

breast feeding. Adequate contraception should be used during therapy.

Evaluation/Desired Outcomes

- Relief of migraine attack.

alogliptin (al-oh-glip-tin)

Nesina

Classification

Therapeutic: antidiabetics

Pharmacologic: dipeptidyl peptidase-4 (DPP-4) inhibitors

Indications

Adjunct to diet and exercise to improve glycemic control in type 2 diabetes mellitus.

Action

Acts as a competitive inhibitor of dipeptidyl peptidase-4 (DPP-4) which slows the inactivation of incretin hormones, thereby increasing their concentrations and reducing fasting and postprandial glucose concentrations. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics

Absorption: Completely absorbed following oral administration (100%).

Distribution: Well distributed into tissues.

Metabolism and Excretion: Not extensively metabolized, 76% excreted unchanged in urine.

Half-life: 21 hr.

TIME/ACTION PROFILE (inhibition of DPP-4)

ROUTE	ONSET	PEAK†	DURATION
PO	unknown	1–2 hr	24 hr

†Multiple dosing.

Contraindications/Precautions

Contraindicated in: Type 1 diabetes; Diabetic ketoacidosis; Previous severe hypersensitivity reactions.

Use Cautiously in: Hepatic impairment; Renal impairment (dose ↓ required if CCr <60 mL/min); HF or renal impairment (↑ risk for worsening HF); **Geri:** May have ↑ sensitivity to effects; **Lactation:** Use cautiously; **OB:** Use during pregnancy only if clearly needed; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache. **CV:** HF. **Derm:** STEVENS-JOHNSON SYNDROME, bullous pemphigoid. **GI:** HEPATOTOXICITY, PANCREATITIS, ↑ liver enzymes. **MS:** arthralgia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis or angioedema).

Interactions

Drug-Drug: ↑ risk of hypoglycemia with sulfonylureas and insulin; dose adjustments may be necessary.

Route/Dosage

PO (Adults): 25 mg once daily.

Renal Impairment

PO (Adults): *CCr* 30–59 mL/min—12.5 mg once daily; *CCr* 15–29 mL/min—6.25 mg once daily; *CCr* <15 mL/min or requiring hemodialysis—6.25 mg once daily.

Availability

Tablets: 6.25 mg, 12.5 mg, 25 mg. **In combination with:** metformin (Kazano), pioglitazone (Oseni).

NURSING IMPLICATIONS**Assessment**

- Observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Monitor for signs of pancreatitis (nausea, vomiting, anorexia, persistent severe abdominal pain, sometimes radiating to the back) during therapy. If pancreatitis occurs, discontinue alogliptin and monitor serum and urine amylase, amylase/creatinine clearance ratio, electrolytes, serum calcium, glucose, and lipase.
- Assess for signs and symptoms of HF (increasing shortness of breath, rapid increase in weight, swelling of feet) periodically during therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Lab Test Considerations:** Monitor hemoglobin A1C prior to and periodically during therapy.
- Monitor liver function tests prior to starting and periodically during therapy. Interrupt therapy and determine cause if significant ↑ in enzymes or abnormal tests persist or worsen. Do not restart therapy without explanation for abnormalities.
- Monitor renal function prior to and periodically during therapy.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take alogliptin as directed. Take missed doses as soon as remembered, unless it is al-

most time for next dose; do not double doses. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.

- Explain to patient that alogliptin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to stop taking alogliptin and notify health care professional promptly if symptoms of hypersensitivity reactions (rash; hives; swelling of face, lips, tongue, and throat; difficulty in breathing or swallowing), liver dysfunction (fatigue, nausea, vomiting, anorexia, right upper abdominal discomfort, dark urine, yellowing of skin or whites of eyes), HF, or pancreatitis occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C, fasting plasma glucose and 2-hr post-prandial glucose levels.

ALPRAZolam (al-pray-zoe-lam)

Xanax, Xanax XR

Classification

Therapeutic: antianxiety agents
Pharmacologic: benzodiazepines

Schedule IV**Indications**

Generalized anxiety disorder (GAD). Panic disorder. Anxiety associated with depression. **Unlabeled Use:** Management of symptoms of premenstrual syndrome (PMS) and premenstrual dysphoric disorder. Insom-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

nia, irritable bowel syndrome (IBS), and other somatic symptoms associated with anxiety. Used as an adjunct with acute mania, acute psychosis.

Action

Acts at many levels in the CNS to produce anxiolytic effect. May produce CNS depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Relief of anxiety.

Pharmacokinetics

Absorption: Well absorbed (90%) from the GI tract; absorption is slower with extended-release tablets.

Distribution: Widely distributed, crosses blood-brain barrier. Probably crosses the placenta and enters breast milk. Accumulation is minimal.

Metabolism and Excretion: Metabolized by the liver (CYP3A4 enzyme system) to an active compound that is subsequently rapidly metabolized.

Half-life: 12–15 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	1–2 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma; Obstructive sleep apnea or pulmonary disease; Concurrent use with itraconazole or ketoconazole; **OB, Lactation:** Use in pregnancy or lactation may cause CNS depression, flaccidity, feeding difficulties, and seizures in infant.

Use Cautiously in: Renal impairment (↓ dose required); Hepatic impairment (↓ dose required); Concurrent use with nefazodone, fluvoxamine, cimetidine, fluoxetine, hormonal contraceptives, diltiazem, isoniazid, erythromycin, clarithromycin, or grapefruit juice (↓ dose may be necessary); History of suicide attempt or alcohol/drug dependence, debilitated patients (↓ dose required); **Geri:** Appears on Beers list. Elderly patients have ↑ sensitivity to benzodiazepines; associated with ↑ risk of falls and excessive CNS effects (↓ dose required); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy, confusion, depression, hangover, headache, paradoxical excitation.

EENT: blurred vision. **GI:** constipation, diarrhea, nausea, vomiting, weight gain. **Derm:** rash. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **opioids** or other **CNS depressants**, including other **benzodiazepines**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation,

respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **metoprolol**, **propranolol**, **valproic acid**, **CYP3A4 inhibitors** (erythromycin, ketoconazole, itraconazole, fluvoxamine, cimetidine, nefazodone) ↑ levels and effects; dose adjustments may be ↓ by **theophylline**. **Cigarette smoking** ↓ levels and effects.

Drug-Natural Products: Kava-kava, valerian, or chamomile can ↑ CNS depression.

Drug-Food: Concurrent ingestion of **grapefruit juice** ↑ levels and effects.

Route/Dosage

Anxiety

PO (Adults): 0.25–0.5 mg 2–3 times daily (not to exceed 4 mg/day).

PO (Geriatric Patients): Begin with 0.25 mg 2–3 times daily.

Panic Attacks

PO (Adults): 0.5 mg 3 times daily; may be ↑ by 1 mg or less every 3–4 days as needed (not to exceed 10 mg/day). **Extended-release tablets**—0.5–1 mg once daily in the morning, may be ↑ every 3–4 days by not more than 1 mg/day; up to 10 mg/day (usual range 3–6 mg/day).

Availability (generic available)

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.25 mg \$10.59/100, 0.5 mg \$5.25/100, 1 mg \$10.41/100, 2 mg \$15.13/100. **Extended-release tablets:** 0.5 mg, 1 mg, 2 mg, 3 mg. **Cost:** *Generic*—1 mg \$54.05/180, 2 mg \$86.76/180, 3 mg \$319.38/60.

Orally disintegrating tablets (orange-flavor): 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.25 mg \$151.73/100, 0.5 mg \$189.04/100, 1 mg \$252.22/100, 2 mg \$428.86/100. **Oral solution (concentrate):** 1 mg/mL. **Cost:** *Generic*—\$81.10/30 mL.

NURSING IMPLICATIONS

Assessment

- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess patient for drowsiness, light-headedness, and dizziness. These symptoms usually disappear as therapy progresses. Dose should be reduced if these symptoms persist.
- **Geri:** Assess CNS effects and risk of falls. Institute falls prevention strategies.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Risk is greater in patients taking >4 mg/day. Restrict the amount of drug

available to patient. Assess regularly for continued need for treatment.

- **Lab Test Considerations:** Monitor CBC and liver and renal function periodically during long-term therapy. May cause ↓ hematocrit and neutropenia.
- **Toxicity and Overdose:** Flumazenil is the antidote for alprazolam toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizures disorder or who are taking tricyclic antidepressants).

Potential Nursing Diagnoses

Anxiety (Indications)

Risk for injury (Side Effects)

Risk for falls (Side Effects)

Implementation

- Do not confuse Xanax (alprazolam) with Zantac (ranitidine), Fanapt (iloperidone), or Tenex (guanfacine).
- Do not confuse alprazolam with clonazepam or lorazepam.
- If early morning anxiety or anxiety between doses occurs, same total daily dose should be divided into more frequent intervals.
- **PO:** May be administered with food if GI upset occurs. Administer greatest dose at bedtime to avoid daytime sedation.
- Tablets may be crushed and taken with food or fluids if patient has difficulty swallowing. Do not crush, break, or chew extended-release tablets.
- Taper by 0.5 mg every 3 days to prevent withdrawal. Some patients may require longer tapering period (months).
- For orally disintegrating tablets: Remove tablet from bottle with dry hands just prior to taking medication. Place tablet on tongue. Tablet will dissolve with saliva; may also be taken with water. Remove cotton from bottle and reseal tightly to prevent moisture from entering bottle. If only ½ tablet taken, discard unused portion immediately; may not remain stable.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not skip or double up on missed doses. If a dose is missed, take within 1 hr; otherwise, skip the dose and return to regular schedule. If medication is less effective after a few weeks, check with health care professional; do not increase dose. Abrupt withdrawal may cause sweating, vomiting, muscle cramps, tremors, and seizures.
- Advise patient to not take more than prescribed or share medication with anyone.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the medication is known.

Ger: Instruct patient and family how to reduce falls risk at home.

- Advise patient to avoid drinking grapefruit juice during therapy.
- Advise patient to avoid the use of alcohol or other CNS depressants concurrently with alprazolam. Instruct patient to consult health care professional before taking Rx, OTC, or herbal products concurrently with this medication.
- Inform patient that benzodiazepines are usually prescribed for short-term use and do not cure underlying problems.

Evaluation/Desired Outcomes

- Decreased sense of anxiety without CNS side effects.
- Decreased frequency and severity of panic attacks.
- Decreased symptoms of premenstrual syndrome.

alteplase, See THROMBOLYTIC AGENTS.

aluminum hydroxide

AlternaGEL, Alu-Cap, Alugel, Aluminet, Alu-Tab, Amphojel, Basalgel, Dialume

Classification

Therapeutic: antiulcer agents, hypophosphatemics

Pharmacologic: antacids, phosphate binders

Indications

Lowering of phosphate levels in patients with chronic renal failure. Adjunctive therapy in the treatment of peptic, duodenal, and gastric ulcers. Hyperacidity, indigestion, reflux esophagitis.

Action

Binds phosphate in the GI tract. Neutralizes gastric acid and inactivates pepsin. **Therapeutic Effects:** Lowering of serum phosphate levels. Healing of ulcers and decreased pain associated with ulcers or gastric hyperacidity. Constipation limits use alone in the treatment of ulcer disease. Frequently found in combination with magnesium-containing compounds.

Pharmacokinetics

Absorption: With chronic use, small amounts of aluminum are systemically absorbed.

Distribution: If absorbed, aluminum distributes widely, crosses the placenta, and enters breast milk. Concentrates in the CNS with chronic use.

Metabolism and Excretion: Mostly excreted in feces. Small amounts absorbed are excreted by the kidneys.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO†	hr–days	days–wk	days
PO‡	15–30 min	30 min	30 min–3 hr

†Hypophosphatemic effect.

‡Antacid effect.

Contraindications/Precautions

Contraindicated in: Severe abdominal pain of unknown cause.

Use Cautiously in: Hypercalcemia; Hypophosphatemia; **OB:** Generally considered safe; chronic high-dose therapy should be avoided.

Adverse Reactions/Side Effects

GI: constipation. **F and E:** hypophosphatemia.

Interactions

Drug-Drug: Absorption of tetracyclines, chlorpromazine, iron salts, isoniazid, digoxin, or fluoroquinolones may be decreased. Salicylate blood levels may be decreased. Quinidine, mexiletine, and amphetamine levels may be increased if enough antacid is ingested such that urine pH is increased.

Route/Dosage

Hypophosphatemia

PO (Adults): 1.9–4.8 g (30–40 mL of regular suspension or 15–20 mL of concentrated suspension) 3–4 times daily.

PO (Children): 50–150 mg/kg/24 hr in 4–6 divided doses; titrate to normal serum phosphate levels.

Antacid

PO (Adults): 500–1500 mg (5–30 mL) 3–6 times daily.

Availability (generic available)

Capsules: 475 mg^{OTC}, 500 mg^{OTC}. **Tablets:** 300 mg^{OTC}, 500 mg^{OTC}, 600 mg^{OTC}. **Suspension:** 320 mg/5 mL^{OTC}, 450 mg/5 mL^{OTC}, 600 mg/5 mL^{OTC}, 675 mg/5 mL^{OTC}. **In combination with:** magnesium carbonate, calcium carbonate, simethicone, and mineral oil. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, character, and precipitating factors of gastric pain.
- **Lab Test Considerations:** Monitor serum phosphate and calcium levels periodically during chronic use of aluminum hydroxide.
- May cause increased serum gastrin and decreased serum phosphate concentrations.
- In treatment of severe ulcer disease, guaiac stools, and emesis, monitor pH of gastric secretions.

Potential Nursing Diagnoses

Acute pain (Indications)

Constipation (Side Effects)

Implementation

- Antacids cause premature dissolution and absorption of enteric-coated tablets and may interfere with absorption of other oral medications. Separate administration of aluminum hydroxide and oral medications by at least 1–2 hr.
- Tablets must be chewed thoroughly before swallowing to prevent their entering small intestine in undissolved form. Follow with a glass of water.
- Shake liquid preparations well before pouring. Follow administration with water to ensure passage into stomach.
- Liquid dosage forms are considered more effective than tablets.
- **Hypophosphatemic:** For phosphate lowering, follow dose with full glass of water or fruit juice.
- **Antacid:** May be given in conjunction with magnesium-containing antacids to minimize constipation, except in patients with renal failure. Administer 1 and 3 hr after meals and at bedtime for maximum antacid effect.
- For treatment of peptic ulcer, aluminum hydroxide may be administered every 1–2 hr while the patient is awake or diluted with 2–3 parts water and administered intragastrically every 30 min for 12 or more hr per day. Physician may order NG tube clamped after administration.
- For reflux esophagitis, administer 15 mL 20–40 min after meals and at bedtime.

Patient/Family Teaching

- Instruct patient to take aluminum hydroxide exactly as directed. If on a regular dosing schedule and a dose is missed, take as soon as remembered if not almost time for next dose; do not double doses.
- Advise patient not to take aluminum hydroxide within 1–2 hr of other medications without consulting health care professional.
- Advise patients to check label for sodium content. Patients with HF or hypertension, or those on sodium restriction, should use low-sodium preparations.
- Inform patients of potential for constipation from aluminum hydroxide.
- **Hypophosphatemia:** Patients taking aluminum hydroxide for hyperphosphatemia should be taught the importance of a low-phosphate diet.
- **Antacid:** Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if taking other medications, if relief is not obtained, or if symptoms of gastric bleeding (black tarry stools, coffee-ground emesis) occur.

Evaluation/Desired Outcomes

- Decrease in serum phosphate levels.
- Decrease in GI pain and irritation.

- Increase in the pH of gastric secretions. In treatment of peptic ulcer, antacid therapy should be continued for at least 4–6 wk after symptoms have disappeared because there is no correlation between disappearance of symptoms and healing of ulcers.

amcinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

amifostine (a-mi-fos-teen)

Ethylol

Classification

Therapeutic: cytoprotective agents

Indications

Reduces renal toxicity from cisplatin. Reduces the incidence of moderate to severe xerostomia from postoperative radiation for head and neck cancer in which the radiation port includes a large portion of the parotid glands.

Action

Converted by alkaline phosphatase in tissue to a free thiol compound that binds and detoxifies damaging metabolites of cisplatin and reactive oxygen species generated by radiation. **Therapeutic Effects:** Decreased renal damage from cisplatin. Decreased severity of xerostomia following radiation for head and neck cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Rapidly cleared from plasma; converted to cytoprotective compounds by alkaline phosphatase in tissues.

Half-life: 8 min.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aminothiols compounds; Hypotension or dehydration; **Lactation:** Avoid breast feeding; Concurrent antineoplastic therapy for other tumors (especially malignancies of germ cell origin).

Use Cautiously in: Cardiovascular disease (↑ risk of adverse reactions); **OB:** Use only if potential benefit outweighs potential risk; **Pedi:** Safety and effectiveness not established; **Geri:** ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CNS: dizziness, somnolence. **EENT:** blurred vision, diplopia, sneezing. **CV:** hypotension. **GI:** hiccups, nausea, vomiting. **Derm:** **ERYTHEMA MULTIFORME, EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, TOXODERMA,** flushing. **F and E:** hypocalcemia. **Misc:** **ANAPHYLAXIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS),** chills, injection site reactions.

Interactions

Drug-Drug: Concurrent use of antihypertensives ↑ risk of hypotension.

Route/Dosage

Reduction of Renal Damage with Cisplatin

IV (Adults): 910 mg/m² once daily, within 30 min before chemotherapy; if full dose is poorly tolerated, subsequent doses should be ↓ to 740 mg/m².

Reduction of Xerostomia from Radiation

IV (Adults): 200 mg/m² once daily, as a 3-min infusion starting 15–30 min before standard fraction radiation therapy.

Availability (generic available)

Powder for injection: 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor BP before and every 5 min during infusion. Discontinue antihypertensives 24 hr prior to treatment. If significant hypotension requiring interruption of therapy occurs, place patient in Trendelenburg position and administer an infusion of 0.9% NaCl using a separate IV line. If BP returns to normal in 5 min and patient is asymptomatic, infusion may be resumed so that full dose may be given.
- Assess fluid status before administration. Correct dehydration before instituting therapy. Nausea and vomiting are frequent and may be severe. Administer prophylactic antiemetics including dexamethasone 20 mg IV and a serotonin-antagonist antiemetic (dolasetron, granisetron, ondansetron, palonosetron) before and during infusion. Monitor fluid status closely.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor patient for skin reactions before, during, and after amifostine administration; reactions may

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

be delayed by several wk after initiation of therapy. Permanently discontinue amifostine in patients who experience serious or severe cutaneous reactions or cutaneous reactions associated with fever or other symptoms of unknown cause. Withhold therapy and obtain dermatologic consultation and biopsy for cutaneous reactions or mucosal lesions of unknown cause appearing outside of injection site or radiation port, and for erythematous, edematous, or bullous lesions on the palms of the hand or soles of the feet.

- **Monitor for signs and symptoms of DRESS** (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **Xerostomia:** Assess patient for dry mouth and mouth sores periodically during therapy.
- **Lab Test Considerations:** Monitor serum calcium concentrations before and periodically during therapy. May cause hypocalcemia. Calcium supplements may be necessary.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

IV Administration

- **Intermittent Infusion: Diluent:** Reconstitute with 9.7 mL of sterile 0.9% NaCl. Dilute further with 0.9% NaCl. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 5 hr at room temperature or 24 hr if refrigerated. **Concentration:** Adults: dilute dose to a final volume of 50 mL; Children: 5–40 mg/mL. **Rate:** For renal toxicity: Administer over 15 min within 30 min before chemotherapy administration. Longer infusion times are not as well tolerated. For xerostomia: Administer over 3 min starting 15–30 min prior to radiation therapy.
- **Y-Site Compatibility:** alemtuzumab, amikacin, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, docetaxel, dolasetron, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, epirubicin, ertapenem, etoposide, etoposide phosphate, famotidine, fenoldopam, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, haloperidol,

heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, leucovorin, levofloxacin, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, nesiritide, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, piperacillin/tazobactam, potassium acetate, potassium chloride, promethazine, ranitidine, rituximab, sodium acetate, sodium bicarbonate, streptozocin, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, chlorpromazine, cisplatin, ganciclovir, hydroxyzine, minocycline, mycophenolate, prochlorperazine, quinupristin/dalfopristin, topotecan.

Patient/Family Teaching

- Explain the purpose of amifostine infusion to patient.
- Inform patient that amifostine may cause hypotension, nausea, vomiting, flushing, chills, dizziness, somnolence, hiccups, and sneezing.
- Advise patient to notify health care professional if skin reactions, or signs and symptoms of anaphylaxis or DRESS occur.

Evaluation/Desired Outcomes

- Prevention of renal toxicity associated with repeated administration of cisplatin in patients with ovarian cancer.
- Decreased severity of xerostomia from radiation treatment of head and neck cancer.

amikacin, See AMINOGLYCOSIDES.

aMILoride, See DIURETICS (POTASSIUM-SPARING).

aminocaproic acid (a-mee-noe-ka-pro-ik a-sid) Amicar

Classification

Therapeutic: hemostatic agents
Pharmacologic: fibrinolysis inhibitors

Indications

Management of acute, life-threatening hemorrhage due to systemic hyperfibrinolysis or urinary fibrinolysis.

Unlabeled Use: Prevention of recurrent subarach-

noid hemorrhage. Prevention of bleeding following oral surgery in hemophiliacs. Management of severe hemorrhage caused by thrombolytic agents.

Action

Inhibits activation of plasminogen. **Therapeutic Effects:** Inhibition of fibrinolysis. Stabilization of clot formation.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: Mostly eliminated unchanged by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (peak blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	N/A
IV	unknown	2 hr	N/A

Contraindications/Precautions

Contraindicated in: Active intravascular clotting.

Use Cautiously in: Upper urinary tract bleeding; Cardiac, renal, or liver disease (dosage reduction may be required); Disseminated intravascular coagulation (should be used concurrently with heparin); **OB, Lactation:** Safety not established; **Pedi:** Do not use products containing benzyl alcohol with neonates.

Adverse Reactions/Side Effects

CNS: dizziness, malaise. **EENT:** nasal stuffiness, tinnitus. **CV:** arrhythmias, hypotension (IV only). **GI:** anorexia, bloating, cramping, diarrhea, nausea. **GU:** diuresis, renal failure. **MS:** myopathy.

Interactions

Drug-Drug: Concurrent use with **estrogens, conjugated** may result in a hypercoagulable state. Concurrent use with **clotting factors** may ↑ risk of thromboses.

Route/Dosage

Acute Bleeding Syndromes due to Elevated Fibrinolytic Activity

PO (Adults): 5 g 1st hr, followed by 1–1.25 g q hr for 8 hr or until hemorrhage is controlled; or 6 g over 24 hr after prostate surgery (not >30 g/day).

IV (Adults): 4–5 g over 1st hr, followed by 1 g/hr for 8 hr or until hemorrhage is controlled; or 6 g over 24 hr after prostate surgery (not >30 g/day).

PO, IV (Children): 100 mg/kg or 3 g/m² over 1st hr, followed by continuous infusion of 33.3 mg/kg/hr; or 1 g/m²/hr (total dose not >18 g/m²/24 hr).

Subarachnoid Hemorrhage

PO (Adults): To follow IV—3 g q 2 hr (36 g/day). If no surgery is performed, continue for 21 days after bleeding stops, then decrease to 2 g q 2 hr (24 g/day) for 3 days, then 1 g q 2 hr (12 g/day) for 3 days.

IV (Adults): 36 g/day for 10 days followed by PO.

Prevention of Bleeding Following Oral Surgery in Hemophiliacs

PO (Adults): 75 mg/kg (up to 6 g) immediately after procedure, then q 6 hr for 7–10 days; syrup may also be used as an oral rinse of 1.25 g (5 mL) 4 times a day for 7–10 days.

IV, PO (Children): Also for epistaxis—50–100 mg/kg/dose administered IV every 6 hr for 2–3 days starting 4 hr before the procedure. After completion of IV therapy, aminocaproic acid should be given as 50–100 mg/kg/dose orally every 6 hr for 5–7 days.

Availability

Tablets: 500 mg, 1000 mg. **Syrup (raspberry flavor):** 1.25 g/5 mL. **Injection:** 250 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory status as indicated by severity of bleeding.
- Monitor for overt bleeding every 15–30 min.
- Monitor neurologic status (pupils, level of consciousness, motor activity) in patients with subarachnoid hemorrhage.
- Monitor intake and output ratios frequently; notify physician if significant discrepancies occur.
- Assess for thromboembolic complications (especially in patients with history). Notify health care professional of positive Homans' sign, leg pain and edema, hemoptysis, dyspnea, or chest pain.
- **Lab Test Considerations:** Monitor platelet count and clotting factors prior to and periodically throughout therapy in patients with systemic fibrinolysis.
- ↑ CPK, AST, and serum aldolase may indicate myopathy.
- May ↑ serum potassium.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- **PO:** Syrup may be used as an oral rinse, swished for 30 sec 4 times/day for 7–10 days for the control of bleeding during dental and oral surgery in hemophilic patients. Small amounts may be swallowed, except during 1st and 2nd trimesters of pregnancy.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Syrup may be applied with an applicator in children or unconscious patients.

IV Administration

- **IV:** Stabilize IV catheter to minimize thrombophlebitis. Monitor site closely.
- **Intermittent Infusion: Diluent:** Do not administer undiluted. Dilute initial 4–5 g dose in 250 mL of sterile water for injection, 0.9% NaCl, D5W, or LR. Do not dilute with sterile water in patients with subarachnoid hemorrhage. **Concentration:** 20 mg/mL. **Rate:** Single doses: Administer over 1 hr. Rapid infusion rate may cause hypotension, bradycardia, or other arrhythmias.
- **Continuous Infusion:** Administer IV solution using infusion pump to ensure accurate dose. Administer via slow IV infusion.
- **Rate:** Initial dose may be followed by a continuous infusion of 1–1.25 g/hr in adults or 33.3 mg/kg/hr in children.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, cisatracurium, clindamycin, cyclophosphamide, cyclosporine, cytarabine, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, methohexital, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, ondansetron, oxaliplatin, oxytocin, palonosetron, pamidronate, pantoprazole, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, promethazine, propranolol, ranitidine, remifentanyl, rocuronium, sargramostim, sodium bicarbonate, sodium phosphates, succinylcho-

line, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amiodarone, caspofungin, chlorpromazine, ciprofloxacin, diazepam, dolasetron, doxycycline, filgrastim, ganciclovir, midazolam, mycophenolate, nicardipine, phenytoin, prochlorperazine, quinupristin/dalfopristin, thiopental.
- **Additive Incompatibility:** Do not admix with other medications.

Patient/Family Teaching

- Instruct patient to notify the nurse immediately if bleeding recurs or if thromboembolic symptoms develop.
- **IV:** Caution patient to make position changes slowly to avoid orthostatic hypotension.

Evaluation/Desired Outcomes

- Cessation of bleeding.
- Prevention of rebleeding in subarachnoid hemorrhage without occurrence of undesired clotting.

AMINOGLYCOSIDES

amikacin (am-i-kay-sin)

Amikacin

gentamicin† (jen-ta-mye-sin)

Garamycin

neomycin (neo-oh-mye-sin)

streptomycin (strep-toe-mye-sin)

tobramycin† (toe-bra-mye-sin)

Bethkis, Kitabis Pak, TOBI, TOBI Podhaler

Classification

Therapeutic: anti-infectives

Pharmacologic: aminoglycosides

†See Appendix C for ophthalmic use

Indications

Amikacin, gentamicin, and tobramycin: Treatment of serious gram-negative bacterial infections and infections caused by staphylococci when penicillins or other less toxic drugs are contraindicated. **Streptomycin:** In combination with other agents in the management of active tuberculosis. **Neomycin:** Used orally to prepare the GI tract for surgery, to decrease the number of ammonia-producing bacteria in the gut as part of the management of hepatic encephalopathy, and to treat diarrhea caused by *Escherichia coli*. **Tobramycin by**

inhalation: Management of *Pseudomonas aeruginosa* in cystic fibrosis patients. **Gentamicin, streptomycin:** In combination with other agents in the management of serious enterococcal infections.

Gentamicin IV: Prevention of infective endocarditis.

Gentamicin (topical): Treatment of localized infections caused by susceptible organisms. **Unlabeled**

Use: Amikacin: In combination with other agents in the management of *Mycobacterium avium* complex infections.

Action

Inhibits protein synthesis in bacteria at level of 30S ribosome. **Therapeutic Effects:** Bactericidal action.

Spectrum: Most aminoglycosides notable for activity against: *P. aeruginosa*, *Klebsiella pneumoniae*, *E. coli*, *Proteus*, *Serratia*, *Acinetobacter*, *Staphylococcus aureus*. In treatment of enterococcal infections, synergy with a penicillin is required. Streptomycin and amikacin also active against *Mycobacterium*.

Pharmacokinetics

Absorption: Well absorbed after IM administration. IV administration results in complete bioavailability.

Some absorption follows administration by other routes. Minimal systemic absorption with neomycin (may accumulate in patients with renal failure).

Distribution: Widely distributed throughout extracellular fluid; cross the placenta; small amounts enter breast milk. Poor penetration into CSF (\uparrow when meninges are inflamed).

Metabolism and Excretion: Excretion is $>90\%$ renal.

Half-life: 2–4 hr (\uparrow in renal impairment).

TIME/ACTION PROFILE (blood levels*)

ROUTE	ONSET	PEAK	DURATION
PO (neomycin)	rapid	1–4 hr	N/A
IM	rapid	30–90 min	6–24 hr
IV	rapid	15–30 min†	6–24 hr

*All parenterally administered aminoglycosides.

†Postdistribution peak occurs 30 min after the end of a 30-min infusion and 15 min after the end of a 1-hr infusion.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aminoglycosides; Most parenteral products contain bisulfites and should be avoided in patients with known intolerance; **Pedi:** Products containing benzyl alcohol should be avoided in neonates; Intestinal obstruction (neomycin only).

Use Cautiously in: Renal impairment (dose adjustments necessary; blood level monitoring useful in preventing ototoxicity and nephrotoxicity); Hearing impairment; Neuromuscular diseases such as myasthenia

gravis; Obese patients (dose should be based on ideal body weight); **OB:** Tobramycin and streptomycin may cause congenital deafness; **Lactation:** Safety not established; **Pedi:** Neonates have \uparrow risk of neuromuscular blockade; difficulty in assessing auditory and vestibular function and immature renal function; **Geri:** Difficulty in assessing auditory and vestibular function and age-related renal impairment.

Adverse Reactions/Side Effects

CNS: ataxia, vertigo. **EENT:** ototoxicity (vestibular and cochlear). **GU:** nephrotoxicity. **GI:** Neomycin—diarrhea, nausea, vomiting. **F and E:** hypomagnesemia. **MS:** muscle paralysis (high parenteral doses).

Neuro: \uparrow neuromuscular blockade. **Resp:** apnea; Tobramycin, *Inhaln only*, bronchospasm, wheezing.

Misc: hypersensitivity reactions.

Interactions

Drug-Drug: Inactivated by penicillins and cephalosporins when coadministered to patients with renal insufficiency. Possible respiratory paralysis after **inhalation anesthetics** or **neuromuscular blocking agents**. \uparrow incidence of ototoxicity with **loop diuretics** or **mannitol (IV)**. \uparrow incidence of nephrotoxicity with other **nephrotoxic drugs**. Neomycin may \uparrow anticoagulant effects of **warfarin**. Neomycin may \downarrow absorption of **digoxin** and **methotrexate**.

Route/Dosage

Amikacin

IM, IV (Adults and Children): 5 mg/kg every 8 hr or 7.5 mg/kg every 12 hr (not to exceed 1.5 g/day). *Mycobacterium avium complex*—7.5–15 mg/kg/day divided every 12–24 hr.

IM, IV (Neonates): *Loading dose*—10 mg/kg; *Maintenance dose*—7.5 mg/kg every 12 hr.

Renal Impairment

IM, IV (Adults): *Loading dose*—7.5 mg/kg, further dosing based on blood level monitoring and renal function assessment.

Gentamicin

Many regimens are used; most involve dosing adjusted on the basis of blood level monitoring and assessment of renal function.

IM, IV (Adults): 1–2 mg/kg every 8 hr (up to 6 mg/kg/day in 3 divided doses); *Once-daily dosing (unlabeled)*—4–7 mg/kg every 24 hr.

IM, IV (Children >5 yr): 2–2.5 mg/kg/dose every 8 hr; *Once daily*—5–7.5 mg/kg/dose every 24 hr; *Cystic fibrosis*—2.5–3.3 mg/kg/dose every 6–8 hr; *Hemodialysis*—1.25–1.75 mg/kg/dose postdialysis.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

IM, IV (Children 1 mo–5 yr): 2.5 mg/kg/dose every 8 hr; *Once daily*—5–7.5 mg/kg/dose every 24 hr; *Cystic fibrosis*—2.5–3.3 mg/kg/dose every 6–8 hr; *Hemodialysis*—1.25–1.75 mg/kg/dose postdialysis.

IM, IV (Neonates full term and/or >1 wk): *Weight <1200 g*—2.5 mg/kg/dose every 18–24 hr; *Weight 1200–2000 g*—2.5 mg/kg/dose every 8–12 hr; *Weight >2000 g*—2.5 mg/kg/dose every 8 hr; *ECMO*—2.5 mg/kg/dose every 18 hr, subsequent doses based on serum concentrations; *Once daily*—3.5–5 mg/kg/dose every 24 hr.

IM, IV (Neonates premature and/or ≤1 wk): *Weight <1000 g*—3.5 mg/kg/dose every 24 hr; *Weight 1000–1200 g*—2.5 mg/kg/dose every 18–24 hr; *Weight >1200 g*—2.5 mg/kg/dose every 12 hr; *Once daily*—3.5–4 mg/kg/dose every 24 hr.

IT (Adults): 4–8 mg/day.

IT (Infants >3 mo and Children): 1–2 mg/day.

IT (Neonates): 1 mg/day.

Topical (Adults and Children >1 mo): Apply cream or ointment 3–4 times daily.

Renal Impairment

IM, IV (Adults): Initial dose of 2 mg/kg. Subsequent doses/intervals based on blood level monitoring and renal function assessment.

Neomycin

PO (Adults): *Preoperative intestinal antiseptics*—1 g every hr for 4 doses, then 1 g every 4 hr for 5 doses or 1 g at 1 PM, 2 PM, and 11 PM on day before surgery; *Hepatic encephalopathy*—1–3 g every 6 hr for 5–6 days; may be followed by 4 g/day chronically.

PO (Children): *Preoperative intestinal antiseptics*—15 mg/kg every 4 hr for 2 days or 25 mg/kg at 1 PM, 2 PM, and 11 PM on day before surgery; *Hepatic encephalopathy*—12.5–25 mg/kg every 6 hr for 5–6 days (maximum dose = 12 g/day).

Streptomycin

IM (Adults): *Tuberculosis*—1 g/day initially, ↓ to 1 g 2–3 times weekly; *Other infections*—250 mg–1 g every 6 hr or 500 mg–2 g every 12 hr.

IM (Children): *Tuberculosis*—20 mg/kg/day (not to exceed 1 g/day); *Other infections*—5–10 mg/kg every 6 hr or 10–20 mg/kg every 12 hr.

Renal Impairment

IM (Adults): 1 g initially, further dosing determined by blood level monitoring and assessment of renal function.

Tobramycin

IM, IV (Adults): 1–2 mg/kg every 8 hr or 4–6.6 mg/kg/day every 24 hr.

IM, IV (Adults): 3–6 mg/kg/day in 3 divided doses, or 4–6.6 mg/kg once daily.

IM, IV (Children >5 yr): 6–7.5 mg/kg/day divided every 8 hr, up to 13 mg/kg/day divided every 6–8 hr in cystic fibrosis patients (dosing interval may vary from

every 6 hr—every 24 hr, depending on clinical situation).

IM, IV (Children 1 mo–5 yr): 7.5 mg/kg/day divided every 8 hr, up to 13 mg/kg/day divided every 6–8 hr in cystic fibrosis.

IM, IV (Neonates): *Preterm <1000 g*—3.5 mg/kg/dose every 24 hr; *0–4 weeks, <1200 g*—2.5 mg/kg/dose every 18 hr; *Postnatal age <7 days*—2.5 mg/kg/dose every 12 hr; *Postnatal age ≥8 days, 1200–2000 g*—2.5 mg/kg/dose every 8–12 hr; *Postnatal age ≥8 days, >2000 g*—2.5 mg/kg/dose every 8 hr.

Inhaln (Adults and Children ≥6 yr): *Nebulizer solution*—300 mg twice daily for 28 days, then off for 28 days, then repeat cycle; *Powder for inhalation*—Inhale contents of four 28-mg capsules twice daily for 28 days, then off for 28 days, then repeat cycle.

Renal Impairment

IM, IV (Adults): 1 mg/kg initially, further dosing determined by blood level monitoring and assessment of renal function.

Availability

Amikacin (generic available)

Injection: 250 mg/mL.

Gentamicin (generic available)

Injection: 10 mg/mL, 40 mg/mL. **Premixed injection:** 60 mg/50 mL, 80 mg/50 mL, 80 mg/100 mL, 100 mg/50 mL, 100 mg/100 mL, 120 mg/100 mL. **Topical cream:** 0.1%. **Topical ointment:** 0.1%.

Neomycin (generic available)

Tablets: 500 mg. **In combination with:** other topical antibiotics or anti-inflammatory agents for skin, ear, and eye infections. See Appendix B.

Streptomycin (generic available)

Lyophilized powder for injection: 1 g/vial.

Tobramycin (generic available)

Injection: 10 mg/mL, 40 mg/mL. **Nebulizer solution (TOBI, Kitabis Pak):** 300 mg/5 mL. **Nebulizer solution (Bethkis):** 300 mg/4 mL. **Powder for inhalation (TOBI Podhaler):** 28 mg/capsule. **Powder for injection:** 1200 mg/vial. **Premixed injection:** 80 mg/100 mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs, wound appearance, sputum, urine, stool, WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Evaluate eighth cranial nerve function by audiometry before and throughout therapy. Hearing loss is usually in high-frequency range. Prompt recognition and intervention are essential in preventing perma-

nent damage. Monitor for vestibular dysfunction (vertigo, ataxia, nausea, vomiting). Eighth cranial nerve dysfunction is associated with persistently elevated peak aminoglycoside levels. Discontinue aminoglycosides if tinnitus or subjective hearing loss occurs.

- Monitor intake and output and daily weight to assess hydration status and renal function.
- Assess for signs of superinfection (fever, upper respiratory infection, vaginal itching or discharge, increasing malaise, diarrhea).
- **Hepatic Encephalopathy:** Monitor neurologic status. Before administering oral medication, assess patient's ability to swallow.
- **Lab Test Considerations:** Monitor renal function by urinalysis, specific gravity, BUN, creatinine, and CCr before and during therapy.
- May cause ↑ BUN, AST, ALT, serum alkaline phosphatase, bilirubin, creatinine, and LDH concentrations.
- May cause ↓ serum calcium, magnesium, potassium, and sodium concentrations (streptomycin and tobramycin).
- **Toxicity and Overdose:** Monitor blood levels periodically during oral, IM, and IV therapy; not needed for inhalation therapy. Timing of blood levels is important in interpreting results. Draw blood for peak levels 1 hr after IM injection and 30 min after a 30-min IV infusion is completed. Draw trough levels just before next dose. Peak level for **amikacin** is 20–30 mcg/mL; trough level should be <10 mcg/mL. Peak level for **gentamicin** and **tobramycin** should not exceed 10 mcg/mL; trough level should not exceed 2 mcg/mL. Peak level for **streptomycin** should not exceed 25 mcg/mL.

Potential Nursing Diagnoses

Risk for infection (Indications)

Disturbed sensory perception (auditory) (Side Effects)

Implantation

- Keep patient well hydrated (1500–2000 mL/day) during therapy.
- **Preoperative Bowel Prep:** Neomycin is usually used in conjunction with erythromycin, a low-residue diet, and a cathartic or enema.
- **PO:** Neomycin may be administered without regard to meals.
- **IM:** IM administration should be deep into a well-developed muscle. Alternate injection sites.
- **IV:** If aminoglycosides and penicillins or cephalosporins must be administered concurrently, administer in separate sites, at least 1 hr apart.

Amikacin

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute with D5W, D10W, 0.9% NaCl, dextrose/saline combinations, or LR. Solution may be pale yellow without decreased potency. Stable for 24 hr at room temperature. **Concentration:** 10 mg/mL. **Rate:** Infuse over 30–60 min for adults and children and over 1–2 hr in infants.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, amifostine, aminophylline, amiodarone, amsacrine, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, hydro-morphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin, levofoxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, pentazocine, phenobarbital, phen-tolamine, phenylephrine, phytonadione, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, dacarbazine, dantrolene, diazepam, diazoxide, folic acid, ganciclovir, ibuprofen lysine, indomethacin, mitomycin, pentamidine, pentobarbital, phenytoin, propofol, trastuzumab, trimethoprim/sulfamethoxazole.

Gentamicin

IV Administration

- **Intermittent Infusion:** *Diluent:* Dilute each dose with D5W, 0.9% NaCl, or LR. Do not use solutions that are discolored or that contain a precipitate.

Concentration: 10 mg/mL. *Rate:* Infuse slowly over 30 min–2 hr.

- **Y-Site Compatibility:** aldesleukin, alemtuzumab, alfentanil, alprostadil, amifostine, amikacin, aminophylline, amiodarone, amsacrine, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxapram, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, glycopyrrolate, granisetron, hydromorphone, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlor-ethamine, melphalan, meperidine, meropenem, mesna, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentazocine, phenobarbital, phentolamine, phenylephrine, phytonadione, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, ranitidine, rinfentitanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorel-

bine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cangrelor, cefotetan, dacarbazine, dantrolene, diazepam, diazoxide, folic acid, ganciclovir, idarubicin, indomethacin, methotrexate, pemetrexed, pentamidine, pentobarbital, phenytoin, propofol, trimethoprim/sulfamethoxazole, warfarin.

Tobramycin

IV Administration

- **Intermittent Infusion:** *Diluent:* Dilute each dose of tobramycin in 50–100 mL of D5W, D10W, D5/0.9% NaCl, 0.9% NaCl, Ringer's or lactated Ringer's solution. *Concentration:* not >10 mg/mL. Pediatric doses may be diluted in proportionately smaller amounts. Stable for 24 hr at room temperature, 96 hr if refrigerated. *Rate:* Infuse slowly over 30–60 min in both adult and pediatric patients.

- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, alprostadil, alteplase, amifostine, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlor-ethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentazocine, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine,

pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, succinylcholine, sufentanil, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, toptecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cangrelor, cefazolin, cefotetan, ceftriaxone, dacarbazine, dantrolene, dexamethasone, diazepam, diazoxide, folic acid, ganciclovir, hetastarch, indomethacin, oxacillin, pemetrexed, pentamidine, pentobarbital, phenytoin, piperacillin/tazobactam, propofol, sargamostim, trimethoprim/sulfamethoxazole.
- **Topical:** Cleanse skin before application. Wear gloves during application.
- **Inhaln:** Do not mix *TOBI* with dornase alpha in nebulizer.
- ***TOBI Podhaler* capsules** are not for oral use. Store capsules in blister until immediately before use. Use new Podhaler device provided with each weekly packet. Check to see capsule is empty after inhaling. If powder remains in capsule, repeat inhalation until capsule is empty.

Patient/Family Teaching

- Instruct patient to report signs of hypersensitivity, tinnitus, vertigo, hearing loss, rash, dizziness, or difficulty urinating.
- Advise patient of the importance of drinking plenty of liquids.
- Teach patients with a history of rheumatic heart disease or valve replacement the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **PO:** Instruct patient to take neomycin as directed for full course of therapy. Take missed doses as soon as possible if not almost time for next dose; do not take double doses.
- Caution patient that neomycin may cause nausea, vomiting, or diarrhea.
- **Topical:** Instruct patient to wash affected skin gently and pat dry. Apply a thin film of ointment. Apply occlusive dressing only if directed by health care professional. Patient should assess skin and inform health care professional if skin irritation develops or infection worsens.
- **Inhaln:** Instruct patient to take inhalation twice daily as close to 12 hr apart as possible; not <6 hr

apart. Solution is colorless to pale yellow and may darken with age without effecting quality. Administer over 15 min period using a hand-held PARI LC PLUS reusable nebulizer with a *PARI VIOS (for Bethkis) or DeVibiss Pulmo Aide (for TOBI)* compressor. Instruct patient on multiple therapies to take others first and use *tobramycin* last. Tobramycin-induced bronchospasm may be reduced if tobramycin is administered after bronchodilators. Instruct patient to sit or stand upright during inhalation and breathe normally through mouthpiece of nebulizer. Nose clips may help patient breath through mouth. Store at room temperature for up to 28 days. Advise patient to disinfect the nebulizer parts (except tubing) by boiling them in water for a full 10 minutes every other treatment day.

- Instruct patient in correct technique for use of *TOBI Podhaler*. Wipe mouthpiece with clean, dry cloth after use; do not wash with water.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. If no response is seen within 3–5 days, new cultures should be taken.
- Prevention of infection in intestinal surgery (neomycin).
- Improved neurologic status in hepatic encephalopathy (neomycin).
- Endocarditis prophylaxis (gentamicin).

HIGH ALERT

amiodarone
(am-ee-oh-da-rone)
Nexterone, Pacerone

Classification

Therapeutic: antiarrhythmics (class III)

Indications

Life-threatening ventricular arrhythmias unresponsive to less toxic agents. **Unlabeled Use: PO:** Management of supraventricular tachyarrhythmias. **IV:** As part of the Advanced Cardiac Life Support (ACLS) and Pediatric Advanced Life Support (PALS) guidelines for the management of ventricular fibrillation (VF)/pulseless ventricular tachycardia (VT) after cardiopulmonary resuscitation and defibrillation have failed; also for other life-threatening tachyarrhythmias.

Action

Prolongs action potential and refractory period. Inhibits adrenergic stimulation. Slows the sinus rate, increases PR and QT intervals, and decreases peripheral vascular resistance (vasodilation). **Therapeutic Effects:** Suppression of arrhythmias.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: Slowly and variably absorbed from the GI tract (35–65%). IV administration results in complete bioavailability.

Distribution: Distributed to and accumulates slowly in body tissues. Reaches high levels in fat, muscle, liver, lungs, and spleen. Crosses the placenta and enters breast milk.

Protein Binding: 96% bound to plasma proteins.

Metabolism and Excretion: Metabolized by the liver, excreted into bile. Minimal renal excretion. One metabolite has antiarrhythmic activity.

Half-life: 13–107 days.

TIME/ACTION PROFILE (suppression of ventricular arrhythmias)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 days (up to 2–3 mo)	3–7 hr	wk–mos
IV	2 hr	3–7 hr	unknown

Contraindications/Precautions

Contraindicated in: Patients with cardiogenic shock; Severe sinus node dysfunction; 2nd- and 3rd-degree AV block; Bradycardia (has caused syncope unless a pacemaker is in place); Hypersensitivity to amiodarone or iodine; **OB:** May cause fetal harm (cardiac, thyroid, neurodevelopmental, neurological, and growth adverse effects); **Lactation:** Enters breast milk and can cause harm to the neonate; avoid breast feeding; **Pedi:** Safety not established; products containing benzyl alcohol should not be used in neonates.

Use Cautiously in: History of HF; Thyroid disorders; Corneal refractive laser surgery; Severe pulmonary or liver disease; **Geri:** Initiate therapy at the low end of the dosing range due to ↓ hepatic, renal, or cardiac function; comorbid disease; or other drug therapy.

Adverse Reactions/Side Effects

CNS: confusional states, disorientation, hallucinations, dizziness, fatigue, malaise, headache, insomnia. **EENT:** corneal microdeposits, abnormal sense of smell, dry eyes, optic neuritis, optic neuropathy, photophobia.

Resp: ADULT RESPIRATORY DISTRESS SYNDROME (ARDS), PULMONARY FIBROSIS, PULMONARY TOXICITY. **CV:** HF, WORSENING OF ARRHYTHMIAS, QT INTERVAL PROLONGATION, bradycardia, hypotension. **GI:** anorexia, constipation, nausea, vomiting, abdominal pain, abnormal sense of taste, ↑ liver enzymes. **GU:** ↓ libido, epididymitis. **Derm:** TOXIC EPIDERMAL NECROLYSIS (rare), photosensitivity, blue discoloration. **Endo:** hypothyroidism, hyperthyroidism. **Neuro:** ataxia, involuntary movement, paresthesia, peripheral neuropathy, poor coordination, tremor.

Interactions

Drug-Drug: ↑ risk of QT prolongation with fluoroquinolones, macrolides, and azole antifungals (undertake concurrent use with caution). ↑ levels of

digoxin (↓ dose of digoxin by 50%). ↑ levels of class I antiarrhythmics (quinidine, mexiletine, lidocaine, or flecainide)—↓ doses of other drugs by 30–50%. ↑ levels of cyclosporine, dextromethorphan, methotrexate, phenytoin, carvedilol, and theophylline. Phenytoin ↓ amiodarone levels. ↑ activity of warfarin (↓ dose of warfarin by 33–50%). ↑ risk of bradyarrhythmias, sinus arrest, or AV heart block with beta blockers, verapamil, diltiazem, digoxin, ivabradine, or clonidine. ↑ risk of bradycardia when used with ledipasvir/sofosbuvir or with sofosbuvir with simeprevir. Cholestyramine may ↓ amiodarone levels. Cimetidine and ritonavir ↑ amiodarone levels. Risk of myocardial depression is ↑ by volatile anesthetics. ↑ risk of myopathy with lovastatin and simvastatin (do not exceed 40 mg/day of lovastatin or 20 mg/day of simvastatin).

Drug-Natural Products: St. John's wort induces enzymes that metabolize amiodarone; may ↓ levels and effectiveness. Avoid concurrent use.

Drug-Food: Grapefruit juice inhibits enzymes in the GI tract that metabolize amiodarone resulting in ↑ levels and risk of toxicity; avoid concurrent use.

Route/Dosage

Ventricular Arrhythmias

PO (Adults): 800–1600 mg/day in 1–2 doses for 1–3 wk, then 600–800 mg/day in 1–2 doses for 1 mo, then 400 mg/day maintenance dose.

PO (Children): 10 mg/kg/day (800 mg/1.72 m²/day) for 10 days or until response or adverse reaction occurs, then 5 mg/kg/day (400 mg/1.72 m²/day) for several weeks, then ↓ to 2.5 mg/kg/day (200 mg/1.72 m²/day) or lowest effective maintenance dose.

IV (Adults): 150 mg over 10 min, followed by 360 mg over the next 6 hr and then 540 mg over the next 18 hr. Continue infusion at 0.5 mg/min until oral therapy is initiated. If arrhythmia recurs, a small loading infusion of 150 mg over 10 min should be given; in addition, the rate of the maintenance infusion may be ↑. *Conversion to initial oral therapy*—If duration of IV infusion was <1 wk, oral dose should be 800–1600 mg/day; if IV infusion was 1–3 wk, oral dose should be 600–800 mg/day; if IV infusion was >3 wk, oral dose should be 400 mg/day. *ACLS guidelines for pulseless VF/VT*—300 mg IV push, may repeat once after 3–5 min with 150 mg IV push (maximum cumulative dose 2.2 g/24 hr; unlabeled).

IV: Intraosseous (Children and infants): *PALS guidelines for pulseless VF/VT*—5 mg/kg as a bolus; *Perfusion tachycardia*—5 mg/kg loading dose over 20–60 min (maximum of 15 mg/kg/day; unlabeled).

Supraventricular Tachycardia

PO (Adults): 600–800 mg/day for 1 wk or until desired response occurs or side effects develop, then ↓ to 400 mg/day for 3 wk, then maintenance dose of 200–400 mg/day.

PO (Children): 10 mg/kg/day (800 mg/1.72 m²/day) for 10 days or until response or side effects occur, then 5 mg/kg/day (400 mg/1.72 m²/day) for several weeks, then ↓ to 2.5 mg/kg/day (200 mg/1.72 m²/day) or lowest effective maintenance dose.

Availability (generic available)

Tablets: 100 mg, 200 mg, 400 mg. **Injection:** 50 mg/mL. **Premixed infusion (Nexterone):** 150 mg/100 mL D5W (does not contain polysorbate 80 or benzyl alcohol), 360 mg/200 mL D5W (does not contain polysorbate 80 or benzyl alcohol).

NURSING IMPLICATIONS

Assessment

- **Monitor ECG continuously during IV therapy or initiation of oral therapy.** Monitor heart rate and rhythm throughout therapy; PR prolongation, slight QRS widening, T-wave amplitude reduction with T-wave widening and bifurcation, and U waves may occur. QT prolongation may be associated with worsening of arrhythmias; monitor closely during IV therapy. Report bradycardia or increase in arrhythmias promptly; patients receiving IV therapy may require slowing rate, discontinuing infusion, or inserting a temporary pacemaker.
- Assess pacing and defibrillation threshold in patients with pacemakers and implanted defibrillators at beginning and periodically during therapy.
- **Assess for signs of pulmonary toxicity (rales/crackles, decreased breath sounds, pleuritic friction rub, fatigue, dyspnea, cough, wheezing, pleuritic pain, fever, hemoptysis, hypoxia).** Chest x-ray and pulmonary function tests are recommended before therapy. Monitor chest x-ray every 3–6 mo during therapy to detect diffuse interstitial changes or alveolar infiltrates. Bronchoscopy or gallium radionuclide scan may also be used for diagnosis. Usually reversible after withdrawal, but fatalities have occurred.
- **IV:** Assess for signs and symptoms of ARDS throughout therapy. Report dyspnea, tachypnea, or rales/crackles promptly. Bilateral, diffuse pulmonary infiltrates are seen on chest x-ray.
- Monitor BP frequently. Hypotension usually occurs during first several hours of therapy and is related to rate of infusion. If hypotension occurs, slow rate.
- **PO:** Assess for neurotoxicity (ataxia, proximal muscle weakness, tingling or numbness in fingers or toes, uncontrolled movements, tremors); common during initial therapy, but may occur within 1 wk to several mo of initiation of therapy and may persist for more than 1 yr after withdrawal. Dose reduction is recommended. Assist patient during ambulation to prevent falls.
- Ophthalmic exams should be performed before and regularly during therapy and whenever visual changes

(photophobia, halos around lights, decreased acuity) occur. May cause permanent loss of vision.

- Assess for signs of thyroid dysfunction, especially during initial therapy. Lethargy; weight gain; edema of the hands, feet, and periorbital region; and cool, pale skin suggest hypothyroidism and may require decrease in dose or discontinuation of therapy and thyroid supplementation. Tachycardia; weight loss; nervousness; sensitivity to heat; insomnia; and warm, flushed, moist skin suggest hyperthyroidism and may require discontinuation of therapy and treatment with antithyroid agents.
- **Lab Test Considerations:** Monitor liver and thyroid functions before and every 6 mo during therapy. Drug effects persist long after discontinuation. Thyroid function abnormalities are common, but clinical thyroid dysfunction is uncommon.
- Monitor AST, ALT, and alkaline phosphatase at regular intervals during therapy, especially in patients receiving high maintenance dose. If liver function studies are 3 times normal or double in patients with elevated baseline levels or if hepatomegaly occurs, dose should be reduced.
- May cause asymptomatic ↑ in ANA titer concentrations.
- Monitor serum potassium, calcium, and magnesium prior to starting and periodically during therapy. Hypokalemia, hypocalcemia, and/or hypomagnesemia may ↓ effectiveness or cause additional arrhythmias; correct levels before beginning therapy. Monitor closely when converting from IV to oral therapy, especially in geriatric patients.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Impaired gas exchange (Side Effects)

Implementation

- **High Alert:** IV vasoactive medications are inherently dangerous; fatalities have occurred from medication errors involving amiodarone. Before administering, have second practitioner check original order, dose calculations, and infusion pump settings. Patients should be hospitalized and monitored closely during IV therapy and initiation of oral therapy. IV therapy should be administered only by clinicians experienced in treating life-threatening arrhythmias.
- Do not confuse amiodarone with amantadine.
- **PO:** May be administered with meals and in divided doses if GI intolerance occurs or if daily dose exceeds 1000 mg.

IV Administration

- **IV:** Administer via volumetric pump; drop size may be reduced, causing altered dosing with drop counter infusion sets.
- Administer through an in-line filter.
- Infusions exceeding 2 hr must be administered in glass or polyolefin bottles to prevent adsorption.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

However, polyvinyl chloride (PVC) tubing must be used during administration because concentrations and infusion rate recommendations have been based on PVC tubing.

- **IV Push: Diluent:** Administer undiluted. May also be diluted in 20–30 mL of D5W or 0.9% NaCl. **Concentration:** 50 mg/mL. **Rate:** Administer IV push.
- **Intermittent Infusion: Diluent:** Dilute 150 mg of amiodarone in 100 mL of D5W. Infusion stable for 2 hr in PVC bag, or use pre-mixed bags. **Concentration:** 1.5 mg/mL. **Rate:** Infuse over 10 min. Do not administer IV push.
- **Continuous Infusion: Diluent:** Dilute 900 mg (18 mL) of amiodarone in 500 mL of D5W. Infusion stable for 24 hr in glass or polyolefin bottle. **Concentration:** 1.8 mg/mL. Concentration may range from 1–6 mg/mL (concentrations > 2 mg/mL must be administered via central venous catheter). **Rate:** Infuse at a rate of 1 mg/min for the first 6 hr, then decrease infusion rate to 0.5 mg/min and continue until oral therapy initiated.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, amphotericin B lipid complex, anidulafungin, atracurium, atropine, bleomycin, buprenorphine, busulfan, butorphanol, calcium chloride, cangrelor, carboplatin, carmustine, caspofungin, cefepime, ceftaroline, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, docetaxel, dolasetron, dopamine, doxacurium, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, fentanyl, fenoldopam, fluconazole, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydralazine, hydromorphone, idarubicin, ifosfamide, irinotecan, isoproterenol, ketamine, labetalol, lidocaine, linezolid, lorazepam, mannitol, meperidine, mesna, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, octreotide, ondansetron, oxaliplatin, palonosetron, pancuronium, pemetrexed, penicillin G potassium, pentamidine, pentazocine, phentolamine, phenylephrine, procainamide, prochlorperazine, promethazine, propranolol, quinuapristin/dalfopristin, remifentanyl, rifampin, rocuronium, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, amifostine, aminocaproic acid, aminophylline, ampicillin, ampicillin/sulbactam, azithromycin, bivalirudin, cefotaxime, cefotetan, ceftazidime, chloramphenicol, cytarabine, dantrolene, dexamethasone,

diazepam, digoxin, doxorubicin, ertapenem, fludarabine, fluorouracil, fosfarnet, fosphenytoin, ganciclovir, heparin, hydrocortisone, imipenem-cilastatin, ketorolac, leucovorin, levofloxacin, mechlorethamine, melphalan, meropenem, methotrexate, micafungin, mitomycin, paclitaxel, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, potassium phosphates, ranitidine, sodium acetate, sodium bicarbonate, sodium phosphates, thiopental, thiotepa, tigecycline, trimethoprim/sulfamethoxazole, verapamil.

Patient/Family Teaching

- Instruct patient to take amiodarone as directed. If a dose is missed, do not take at all. Consult health care professional if more than two doses are missed. Advise patient to read the *Medication Guide* prior to first dose and with each Rx refill in case of changes.
- Advise patient to avoid drinking grapefruit juice during therapy.
- Inform patient that side effects may not appear until several days, weeks, or yr after initiation of therapy and may persist for several mo after withdrawal.
- **Teach patients to monitor pulse daily and report abnormalities.**
- Advise patients that photosensitivity reactions may occur through window glass, thin clothing, and sunscreens. Protective clothing and sunblock are recommended during and for 4 mo after therapy. If photosensitivity occurs, dose reduction may be useful.
- Inform patients that bluish discoloration of the face, neck, and arms is a possible side effect of this drug after prolonged use. This is usually reversible and will fade over several mo. Notify health care professional if this occurs.
- Instruct male patients to notify health care professional if signs of epididymitis (pain and swelling in scrotum) occur. May require reduction in dose.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if signs and symptoms of thyroid dysfunction occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Emphasize the importance of follow-up exams, including chest x-ray and pulmonary function tests every 3–6 mo and ophthalmic exams after 6 mo of therapy, and then annually.

Evaluation/Desired Outcomes

- Cessation of life-threatening ventricular arrhythmias. Adverse effects may take up to 4 mo to resolve.

amitriptyline (a-mee-trip-ti-leen)

★ Elavil, ★ Levate

Classification

Therapeutic: antidepressants

Pharmacologic: tricyclic antidepressants

Indications

Depression. **Unlabeled Use:** Anxiety, insomnia, treatment-resistant depression. Chronic pain syndromes (i.e., fibromyalgia, neuropathic pain/chronic pain, headache, low back pain).

Action

Potentiates the effect of serotonin and norepinephrine in the CNS. Has significant anticholinergic properties.

Therapeutic Effects: Antidepressant action.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Widely distributed.

Protein Binding: 95% bound to plasma proteins.

Metabolism and Excretion: Extensively metabolized by the liver. Some metabolites have antidepressant activity. Undergoes enterohepatic recirculation and secretion into gastric juices. Probably crosses the placenta and enters breast milk.

Half-life: 10–50 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk (up to 30 days)	2–6 wk	days–wk

Contraindications/Precautions

Contraindicated in: Angle-closure glaucoma; Known history of QTc interval prolongation, recent MI, or heart failure.

Use Cautiously in: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Patients with pre-existing cardiovascular disease; Prostatic hyperplasia (↑ risk of urinary retention); History of seizures (threshold may be ↓); **OB:** Use only if clearly needed and maternal benefits outweigh risk to fetus; **Lactation:** May cause sedation in infant; **Pedi:** Children <12 yr (safety not established); **Geri:** Appears on Beers list. ↑ risk of adverse reactions including falls secondary to sedative and anticholinergic effects.

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS**, lethargy, sedation. **EENT:** blurred vision, dry eyes, dry mouth. **CV:** **ARRHYTHMIAS**, **TORSADE DE POINTES**, hypotension, ECG changes, QT interval prolongation. **GI:** constipation, hepatitis, para-

lytic ileus, ↑ appetite, weight gain. **GU:** urinary retention, ↓ libido. **Derm:** photosensitivity. **Endo:** changes in blood glucose, gynecomastia. **Hemat:** blood dyscrasias.

Interactions

Drug-Drug: Amitriptyline is metabolized in the liver by the cytochrome P450 2D6 enzyme, and its action may be affected by drugs that compete for metabolism by this enzyme, including other antidepressants, phenothiazines, carbamazepine, class 1C antiarrhythmics including propafenone, and flecainide; when these drugs are used concurrently with amitriptyline, dosage ↓ of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including cimetidine, quinidine, amiodarone, and ritonavir, may result in ↑ effects of amitriptyline. May cause hypotension, tachycardia, and potentially fatal reactions when used with MAO inhibitors (avoid concurrent use—discontinue 2 wk before starting amitriptyline). Concurrent use with SSRI antidepressants may result in ↑ toxicity and should be avoided (fluoxetine should be stopped 5 wk before starting amitriptyline). Concurrent use with clonidine may result in hypertensive crisis and should be avoided. Concurrent use with levodopa may result in delayed or ↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by rifampin, rifapentine, and rifabutin. Concurrent use with moxifloxacin ↑ risk of adverse cardiovascular reactions. ↑ CNS depression with other CNS depressants including alcohol, antihistamines, clonidine, opioids, and sedative/hypnotics. Barbiturates may alter blood levels and effects. Adrenergic and anticholinergic side effects may be ↑ with other agents having anticholinergic properties. Phenothiazines or oral contraceptives ↑ levels and may cause toxicity. Nicotine may ↑ metabolism and alter effects.

Drug-Natural Products: St. John's wort may ↓ serum concentrations and efficacy. Concomitant use of kava-kava, valerian, or chamomile can ↑ CNS depression. ↑ anticholinergic effects with jimson weed and scopolia.

Route/Dosage

PO (Adults): 75 mg/day in divided doses; may be ↑ up to 150 mg/day or 50–100 mg at bedtime, may ↑ by 25–50 mg up to 150 mg (in hospitalized patients, may initiate with 100 mg/day, and ↑ total daily dose up to 300 mg).

PO (Geriatric Patients): 10–25 mg at bedtime; may ↑ by 10–25 mg weekly if tolerated (usual dose range = 25–150 mg/day).

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Cost:** *Generic*—25 mg \$9.33/100, 75 mg \$9.83/100.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Obtain weight and BMI initially and periodically during treatment.
- Assess fasting glucose and cholesterol levels in overweight/obese individuals.
- Monitor BP and pulse before and during initial therapy. Notify health care professional of decreases in BP (10–20 mm Hg) or sudden increase in pulse rate. **Patients taking high doses or with a history of cardiovascular disease should have ECG monitored before and periodically during therapy.**
- **Depression:** Monitor mental status (orientation, mood behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Assess for suicidal tendencies, especially during early therapy.** Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤ 24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- **Pain:** Assess intensity, quality, and location of pain periodically during therapy. May require several wk for effects to be seen. Use pain scale to monitor effectiveness of medication. Assess for sexual dysfunction (decreased libido; erectile dysfunction). **Geri:** Geriatric patients started on amitriptyline may be at an increased risk for falls; start with low dose and monitor closely. Assess for anticholinergic effects (weakness and sedation).
- **Lab Test Considerations:** Assess leukocyte and differential blood counts, liver function, and serum glucose before and periodically during therapy. May cause an \uparrow serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be \uparrow or \downarrow .

Potential Nursing Diagnoses

Ineffective coping (Indications)

Chronic pain (Indications)

Risk for injury (Side Effects)

Implementation

- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take wk to mo. May give entire dose at bedtime. Sedative effect may be apparent before antidepressant effect is noted. May require tapering to avoid withdrawal effects.
- **PO:** Administer medication with or immediately after a meal to minimize gastric upset. Tablet may be crushed and given with food or fluids.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, take as soon as possible unless almost time for next dose; if regimen is a single dose

at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.

- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in geriatric patients. Protect patient from falls and advise patient to make position changes slowly. Institute fall precautions. Advise patient to make position changes slowly. Refer as appropriate for nutrition/weight management and medical management.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for 3–7 days after therapy has been discontinued.
- Advise patient, family and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for >2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions. Alert patient that medication may turn urine blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Advise patient to notify health care professional of medication regimen before treatment or surgery. Medication should be discontinued as long as possible before surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Therapy for depression is usually prolonged and should be continued for at least 3 mo to prevent relapse. Emphasize the importance of follow-up exams to monitor effectiveness, side effects, and improved coping skills. Advise patient and family that treatment is not a cure and symptoms can recur after discontinuation of medication.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.

- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in chronic pain symptoms.
- Full therapeutic effects may be seen 2–6 wk after initiating therapy.

amLODIPine (am-loe-di-peen)

Norvasc

Classification

Therapeutic: antihypertensives

Pharmacologic: calcium channel blockers

Indications

Alone or with other agents in the management of hypertension, angina pectoris, and vasospastic (Prinzmetal's) angina.

Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased BP. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

Pharmacokinetics

Absorption: Well absorbed after oral administration (64–90%).

Distribution: Probably crosses the placenta.

Protein Binding: 95–98%.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 30–50 hr (↑ in geriatric patients and patients with hepatic impairment).

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–9	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Systolic BP <90 mm Hg.

Use Cautiously in: Severe hepatic impairment (dose reduction recommended); Aortic stenosis; History of HF; **OB, Lactation, Pedi:** Children <6 yr (safety not established); **Geri:** Dose reduction recommended; ↑ risk of hypotension.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue. **CV:** peripheral edema, angina, bradycardia, hypotension, palpitations. **GI:** gingival hyperplasia, nausea. **Derm:** flushing.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including ketoconazole, itraconazole, clarithromycin, and ritonavir may ↑ levels. Additive hypotension may occur when used concurrently with fentanyl, other antihypertensives, nitrates, acute ingestion of alcohol, or quinidine. Antihypertensive effects may be ↓ by concurrent use of nonsteroidal anti-inflammatory agents. May ↑ risk of neurotoxicity with lithium. ↑ risk of myopathy with simvastatin (do not exceed 20 mg/day of simvastatin). May ↑ cyclosporine and tacrolimus levels.

Route/Dosage

PO (Adults): 5–10 mg once daily; *antihypertensive in fragile or small patients or patients already receiving other antihypertensives*—initiate at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day) as an antihypertensive therapy with 2.5 mg/day in patients with hepatic insufficiency.

PO (Geriatric Patients): *Antihypertensive*—Initiate therapy at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day); *antianginal*—initiate therapy at 5 mg/day, ↑ as required/tolerated (up to 10 mg/day).

PO (Children 6–17 yr): 2.5–5 mg once daily.

Hepatic Impairment

PO (Adults): *Antihypertensive*—Initiate therapy at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day); *antianginal*—initiate therapy at 5 mg/day, ↑ as required/tolerated (up to 10 mg/day).

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg. **Cost: Generic**—2.5 mg \$11.35/100, 5 mg \$12.86/100, 10 mg \$8.42/100.

In combination with: aliskiren/hydrochlorothiazide (Amturndie), atorvastatin (Caduet), benazepril (Lotrel), olmesartan (Azor), perindopril (Prexalta), telmisartan (Twynsta), valsartan (Exforge), olmesartan/hydrochlorothiazide (Tribenzor), and valsartan/hydrochlorothiazide (Exforge HCT). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse before therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Lab Test Considerations:** Total serum calcium concentrations are not affected by calcium channel blockers.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Acute pain (Indications)

Implementation

- **Do not confuse amlodipine with amiloride.**
- **PO:** May be administered without regard to meals.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible within 12 hrs of missed dose. If >12 hrs since missed dose, skip dose and take next dose at scheduled time; do not double doses. May need to be discontinued gradually.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to avoid alcohol, and to consult health care professional before taking any new medications, especially cold preparations.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Instruct female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve or worsens after therapy, if it occurs with diaphoresis, if shortness of breath occurs, or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and

stress management). Medication controls but does not cure hypertension.

- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

amoxicillin (a-mox-i-sill-in)

Amoxil, Moxatag, Novamoxin, Tri-mox

Classification

Therapeutic: anti-infectives, antiulcer agents

Pharmacologic: aminopenicillins

Indications

Treatment of: Skin and skin structure infections, Otitis media, Sinusitis, Respiratory infections, Genitourinary infections. Endocarditis prophylaxis. Postexposure inhalational anthrax prophylaxis. Management of ulcer disease due to *Helicobacter pylori*. **Unlabeled Use:** Lyme disease in children <8 yr.

Action

Binds to bacterial cell wall, causing cell death. **Therapeutic Effects:** Bactericidal action; spectrum is broader than penicillins. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Shigella*, *Chlamydia trachomatis*, *Salmonella*, *Borrelia burgdorferi*, *H. pylori*.

Pharmacokinetics

Absorption: Well absorbed from duodenum (75–90%). More resistant to acid inactivation than other penicillins.

Distribution: Diffuses readily into most body tissues and fluids. CSF penetration increased when meninges are inflamed. Crosses placenta; enters breast milk in small amounts.

Metabolism and Excretion: 70% excreted unchanged in the urine; 30% metabolized by the liver.

Half-life: Neonates: 3.7 hr; Infants and Children: 1–2 hr; Adults: 0.7–1.4 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–2 hr	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins (cross-sensitivity exists to cephalosporins and other beta-lactams).

Use Cautiously in: Severe renal insufficiency (\downarrow dose if $\text{CCr} < 30 \text{ mL/min}$); Infectious mononucleosis, acute lymphocytic leukemia, or cytomegalovirus infection (\uparrow risk of rash); **OB, Lactation:** Has been used safely.

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting, \uparrow liver enzymes. **Derm:** rash, urticaria. **Hemat:** blood dyscrasias. **Misc:** allergic reactions including ANAPHYLAXIS, SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid \downarrow renal excretion and \uparrow blood levels of amoxicillin—therapy may be combined for this purpose. May \uparrow effect of warfarin. May \downarrow effectiveness of oral contraceptives. Allopurinol may \uparrow frequency of rash.

Route/Dosage

Most Infections

PO (Adults): 250–500 mg q 8 hr or 500–875 mg q 12 hr (not to exceed 2–3 g/day).

PO (Adults and Children ≥ 12 yr): *Extended-release tablets (for Strep throat)*—775 mg once daily for 10 days.

PO (Children > 3 mo): 25–50 mg/kg/day in divided doses q 8 hr or 25–50 mg/kg/day individual doses q 12 hr; *Acute otitis media due to highly resistant strains of S. pneumoniae*—80–90 mg/kg/day divided q 12 hr; *Postexposure inhaled anthrax prophylaxis*— < 40 kg: 45 mg/kg/day in divided doses q 8 hr; > 40 kg: 500 mg q 8 hr.

PO (Infants ≤ 3 mo and neonates): 20–30 mg/kg/day in divided doses q 12 hr.

H. Pylori

PO (Adults): *Triple therapy*—1000 mg amoxicillin twice daily with lansoprazole 30 mg twice daily and clarithromycin 500 mg twice daily for 14 days or 1000 mg amoxicillin twice daily with omeprazole 20 mg twice daily and clarithromycin 500 mg twice daily for 14 days or amoxicillin 1000 mg twice daily with esomeprazole 40 mg daily and clarithromycin 500 mg twice daily for 10 days. *Dual therapy*—1000 mg amoxicillin three times daily with lansoprazole 30 mg three times daily for 14 days.

Endocarditis Prophylaxis

PO (Adults): 2 g 1 hr prior to procedure.

PO (Children): 50 mg/kg 1 hr prior to procedure (not to exceed adult dose).

Gonorrhea

PO (Adults and Children ≥ 40 kg): single 3 g dose.

PO (Children > 2 yr and < 40 kg): 50 mg/kg with probenecid 25 mg/kg as a single dose.

Renal Impairment

PO (Adults $\text{CCr} 10$ – 30 mL/min): 250–500 mg q 12 hr.

Renal Impairment

PO (Adults $\text{CCr} < 10 \text{ mL/min}$): 250–500 mg q 24 hr.

Availability (generic available)

Chewable tablets (cherry, banana, peppermint flavors): 125 mg, 200 mg, 250 mg, 400 mg. **Cost:** *Generic*—250 mg \$15.89/30. **Tablets:** 500 mg, 875 mg. **Cost:** *Generic*—875 mg \$9.53/30. **Extended-release tablets:** 775 mg. **Cost:** \$524.90/30. **Capsules:** 250 mg, 500 mg. **Cost:** *Generic*—250 mg \$5.90/30, 500 mg \$5.90/30. **Suspension (pediatric drops) (bubblegum flavor):** 50 mg/mL. **Powder for oral suspension (strawberry [125 mg/5 mL] and bubblegum [200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL] flavors):** 125 mg/5 mL, 200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL \$4.11/150 mL, 200 mg/5 mL \$6.84/75 mL, 250 mg/5 mL \$6.09/100 mL, 400 mg/5 mL \$7.33/75 mL. **In combination with:** clarithromycin and lansoprazole in a compliance package (Prevpac). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Lab Test Considerations:** May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- May cause false-positive direct Coombs' test result.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock. May be given without regard to meals or with meals to decrease GI side effects. Capsule contents may be emptied and swallowed with liquids. Extended-release tablets should be swallowed whole; do not crush, break, or chew. Chewable tablets should be crushed or chewed before swallowing with liquids.
- Shake oral suspension before administering. Suspension may be given straight or mixed in formula, milk, fruit juice, water, or ginger ale. Administer immediately after mixing. Discard refrigerated reconstituted suspension after 10 days.

Patient/Family Teaching

- Instruct patients to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication may be dangerous.
- **Pedi:** Teach parents or caregivers to calculate and measure doses accurately. Reinforce importance of using measuring device supplied by pharmacy or with product, not household items.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- **Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with anti-diarrheals without consulting health care professional.**
- Instruct the patient to notify health care professional if symptoms do not improve.
- Teach patients with a history of rheumatic heart disease or valve replacement the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Instruct female patients taking oral contraceptives to use an alternate or additional nonhormonal method of contraception during therapy with amoxicillin and until next menstrual period.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.
- Eradication of *H. pylori* with resolution of ulcer symptoms.
- Prevention of inhalational anthrax (postexposure).

amoxicillin/clavulanate

(a-mox-i-sill-in/klav-yoo-lan -ate)
Augmentin, Augmentin ES, Augmentin XR, ♣ Clavulin

Classification

Therapeutic: anti-infectives

Pharmacologic: aminopenicillins/beta lactamase inhibitors

Indications

Treatment of a variety of infections including: Skin and skin structure infections, Otitis media, Sinusitis, Respiratory tract infections, Genitourinary tract infections.

Action

Binds to bacterial cell wall, causing cell death; spectrum of amoxicillin is broader than penicillin. Clavulanate resists action of beta-lactamase, an enzyme produced by bacteria that is capable of inactivating some penicillins. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Staphylococcus aureus*, *Klebsiella pneumoniae*, *Shigella*, *Salmonella*, *Moraxella catarrhalis*.

Pharmacokinetics

Absorption: Well absorbed from the duodenum (75–90%). More resistant to acid inactivation than other penicillins.

Distribution: Diffuses readily into most body tissues and fluids. Does not readily enter brain/CSF; CSF penetration is ↑ in the presence of inflamed meninges. Crosses the placenta and enters breast milk in small amounts.

Metabolism and Excretion: 70% excreted unchanged in the urine; 30% metabolized by the liver.

Half-life: 1–1.3 hr.

TIME/ACTION PROFILE (peak blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–2 hr	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins or clavulanate; Suspension and chewable tablets contain aspartame and should be avoided in phenylketonurics; History of amoxicillin/clavulanate-associated cholestatic jaundice.

Use Cautiously in: Severe renal insufficiency (dose ↓ necessary); Infectious mononucleosis (↑ risk of rash); Hepatic impairment (dose cautiously, monitor liver function).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, hepatic

dysfunction, nausea, vomiting. **GU:** vaginal candidiasis.

Derm: rash, urticaria. **Hemat:** blood dyscrasias.

Misc: allergic reactions including **ANAPHYLAXIS** and **SEVERUM SICKNESS**, superinfection.

Interactions

Drug-Drug: **Probenecid** ↓ renal excretion and ↑ blood levels of amoxicillin—therapy may be combined for this purpose. May ↑ the effect of **warfarin**. Concurrent **allopurinol** therapy ↑ risk of rash. May ↓ the effectiveness of **hormonal contraceptives**.

Drug-Food: Clavulanate absorption is ↓ by a **high fat meal**.

Route/Dosage

Most Infections (Dosing based on amoxicillin component)

PO (Adults and Children >40 kg): 250 mg q 8 hr or 500 mg q 12 hr.

Serious Infections and Respiratory Tract Infections

PO (Adults and Children >40 kg): 875 mg q 12 hr or 500 mg q 8 hr; *Acute bacterial sinusitis*—2000 mg q 12 hr for 10 days as extended release (XR) product; *Community-acquired pneumonia*—2000 mg every 12 hr for 7–10 days as extended release (XR) product.

Recurrent/persistent acute otitis media due to Multidrug-resistant *Streptococcus pneumoniae*, *H. influenzae*, or *M. catarrhalis*

PO (Children <40 kg): 80–90 mg/kg/day in divided doses q 12 hr for 10 days (as ES formulation only).

Renal Impairment

PO (Adults): *CCr 10–30 mL/min*—250–500 mg q 12 hr (do not use 875 mg tablet); *CCr <10 mL/min*—250–500 mg q 24 hr.

Otitis Media, Sinusitis, Lower Respiratory Tract Infections, Serious Infections

PO (Children ≥3 mo): 200 mg/5 mL or 400 mg/5 mL suspension—45 mg/kg/day divided q 12 hr; 125 mg/5 mL or 250 mg/5 mL suspension—40 mg/kg/day divided q 8 hr.

Less Serious Infections

PO (Children ≥3 mo): 200 mg/5 mL or 400 mg/5 mL suspension—25 mg/kg/day divided q 12 hr or 20 mg/kg/day divided q 8 hr (as 125 mg/5 mL or 250 mg/5 mL suspension).

PO (Children <3 mo): 15 mg/kg q 12 hr (125 mg/mL suspension recommended).

Availability (generic available)

Tablets: 250 mg amoxicillin with 125 mg clavulanate, 500 mg amoxicillin with 125 mg clavulanate, 875 mg amoxicillin with 125 mg clavulanate. **Cost:** *Generic*—500 mg \$18.98/20, 875 mg \$23.46/30. **Chewable tablets (cherry-banana flavor):** 200 mg amoxicillin with 28.5 mg clavulanate, 400 mg amoxicillin with 57 mg clavulanate. **Cost:** *Generic*—200 mg \$36.17/20, 400 mg \$68.93/20. **Extended-release tablets (scored):** 1000 mg amoxicillin with 62.5 mg clavulanate. **Cost:** *Generic*—\$108.62/28. **Powder for oral suspension (125 mg/5 mL is banana flavor; 200 mg/5 mL is fruit flavor; 250 mg/5 mL is orange flavor; 400 mg/5 mL is fruit flavor; 600 mg/5 mL is orange or strawberry-creme flavor):** 125 mg amoxicillin with 31.25 mg clavulanate/5 mL, 200 mg amoxicillin with 28.5 mg clavulanate/5 mL, 250 mg amoxicillin with 62.5 mg clavulanate/5 mL, 400 mg amoxicillin with 57 mg clavulanate/5 mL, 600 mg amoxicillin with 42.9 mg clavulanate/5 mL (ES formulation). **Cost:** *Generic*—200 mg \$36.17/100 mL, 250 mg \$86.43/100 mL, 400 mg \$68.93/100 mL, 600 mg \$83.03/125 mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- **Observe for signs and symptoms of anaphylaxis** (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- **Lab Test Considerations:** May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations. Elderly men and patients receiving prolonged treatment are at ↑ risk for hepatic dysfunction.
- May cause false-positive direct Coombs' test result.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Implementation

- **PO:** Administer around the clock. Administer at the start of a meal to enhance absorption and to decrease GI side effects. Do not administer with high fat meals; clavulanate absorption is decreased. XR tablet is scored and can be broken for ease of administration. Capsule contents may be emptied and swallowed with liquids. Chewable tablets should be crushed or chewed before swallowing with liquids. Shake oral suspension before administering. Refrigerated reconstituted suspension should be discarded after 10 days.
- Two 250-mg tablets are not bioequivalent to one 500-mg tablet; 250-mg tablets and 250-mg chewable tablets are also not interchangeable. Two 500-mg tablets are not interchangeable with one 1000-mg XR tablet; amounts of clavulanic acid and durations of action are different. Augmentin ES 600 (600 mg/5 mL) does not contain the same amount of clavulanic acid as any of the other Augmentin suspensions. Suspensions are not interchangeable.
- **Pedi:** Do not administer 250-mg chewable tablets to children <40 kg due to clavulanate content. Children <3 mo should receive the 125-mg/5 mL oral solution.

Patient/Family Teaching

- Instruct patients to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication may be dangerous.
- **Pedi:** Teach parents or caregivers to calculate and measure doses accurately. Reinforce importance of using measuring device supplied by pharmacy or with product, not household items.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- **Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with anti-diarrheals without consulting health care professionals.**
- Instruct the patient to notify health care professional if symptoms do not improve or if nausea or diarrhea persists when drug is administered with food.
- Instruct female patients taking oral contraceptives to use an alternate or additional method of contraception during therapy and until next menstrual period; may decrease effectiveness of hormonal contraceptives.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

amphetamine mixtures

(am-fet-a-meen)

Amphetamine Salt, Adderall, Adderall XR

Classification

Therapeutic: central nervous system stimulants

Schedule II

Indications

ADHD. Narcolepsy.

Action

Causes release of norepinephrine from nerve endings. Pharmacologic effects are: CNS and respiratory stimulation, Vasoconstriction, Mydriasis (pupillary dilation).

Therapeutic Effects: Increased motor activity, mental alertness, and decreased fatigue in narcoleptic patients. Increased attention span in ADHD.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed in body tissues, with high concentrations in the brain and CSF. Crosses placenta and enters breast milk.

Metabolism and Excretion: Some metabolism by the liver. Urinary excretion is pH-dependent. Alkaline urine promotes reabsorption and prolongs action.

Half-life: Children 6–12 yrs: 9–11 hr; Adults: 10–13 hr (depends on urine pH).

TIME/ACTION PROFILE (CNS stimulation)

ROUTE	ONSET	PEAK	DURATION
PO	tablet: 0.5–1 hr	tablet: 3 hr capsule: 7 hr	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hyperexcitable states including hyperthyroidism; Psychotic personalities; Concurrent use or use within 14 days of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Suicidal or homicidal tendencies; Chemical dependence; Glaucoma; Structural cardiac abnormalities (may ↑ the risk of sudden death); **OB:** Potentially embryotoxic.

Use Cautiously in: Cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); History of substance use disorder (misuse may result in serious cardiovascular events/sudden death); Hypertension; Diabetes mellitus; Tourette's syndrome (may exacerbate tics); **Geri:** Geriatric or debilitated patients may be more susceptible to side effects.

Adverse Reactions/Side Effects

CNS: hyperactivity, insomnia, restlessness, tremor, aggression, anger, behavioral disturbances, dizziness,

hallucinations, headache, mania, irritability, skin picking, talkativeness, thought disorder, tics. **EENT:** blurred vision, mydriasis. **CV:** **SUDDEN DEATH**, palpitations, tachycardia, cardiomyopathy (increased with prolonged use, high doses), hypertension, hypotension, peripheral vasculopathy. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **GU:** erectile dysfunction, libido changes, priapism. **Derm:** alopecia, urticaria. **Endo:** growth inhibition (with long term use in children). **MS:** **RHABDOMYOLYSIS**. **Neuro:** paresthesia. **Misc:** **HYPERSENSITIVITY REACTIONS** (including anaphylaxis and angioedema), psychological dependence.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** or **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of amphetamine mixtures. Drugs that affect serotonergic neurotransmitter systems, including **MAO inhibitors**, **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **fenfluramine**, **buspirone**, **tramadol**, **lithium**, and **triptans** ↑ risk of serotonin syndrome. ↑ adrenergic effects with other **adrenergics** or **thyroid preparations**. **Drugs that alkalinize urine** (sodium bicarbonate, acetazolamide) ↓ excretion, ↑ effects. **Drugs that acidify urine** (large doses of **ascorbic acid**) ↑ excretion, ↓ effects. ↑ risk of hypertension and bradycardia with **beta blockers**. ↑ risk of arrhythmias with **digoxin**. **Tricyclic antidepressants** may ↑ effect of amphetamine but may ↑ risk of arrhythmias, hypertension, or hyperpyrexia. **Proton pump inhibitors** may ↑ effects.

Drug-Natural Products: Use with **St. John's wort** may ↑ risk of serotonin syndrome.

Drug-Food: **Foods that alkalinize the urine** (fruit juices) can ↑ effect of amphetamine.

Route/Dosage

Dose is expressed in total amphetamine content (amphetamine + dextroamphetamine).

ADHD

PO (Children ≥6 yr): 5 mg/day 1–2 times daily; ↑ daily dose by 5 mg at weekly intervals. Sustained-release capsules can be given once daily, tablets every 8–12 hr. If starting therapy with extended-release capsules, start with 10 mg once daily and ↑ by 10 mg/day at weekly intervals (up to 40 mg/day).

PO (Adults): 20 mg/day initially (as extended-release product).

PO (Children 3–5 yr): 2.5 mg/day in the morning; ↑ daily dose by 2.5 mg at weekly intervals not to exceed 40 mg/day.

Narcolepsy

PO (Adults and Children ≥12 yr): 10–60 mg/day in divided doses; start with 10 mg/day, ↑ by 10 mg/day at weekly intervals. Sustained-release capsules can be given once daily, tablets every 8–12 hr.

PO (Children 6–12 yr): 5 mg once daily; may ↑ by 5 mg/day at weekly intervals to a maximum of 60 mg/day.

Availability (generic available)

Amount is expressed in total amphetamine content (amphetamine + dextroamphetamine).

Tablets: 5 mg, 7.5 mg, 10 mg, 12.5 mg, 15 mg, 20 mg, 30 mg. **Cost: Generic**—All strengths \$171.40/100.

Extended-release capsules: 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg. **Cost: Generic**—All strengths \$613.15/100.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiration before and periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- Monitor closely for behavior change.
- Assess for risk of abuse prior to starting therapy. Monitor during therapy. Has high dependence and abuse potential. Tolerance to medication occurs rapidly; do not increase dose.
- **ADHD:** Monitor weight biweekly and height periodically and inform health care professional of significant loss.
- Assess child's attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Narcolepsy:** Observe and document frequency of narcoleptic episodes.
- **Lab Test Considerations:** May interfere with urinary steroid determinations.
- May cause ↑ plasma corticosteroid concentrations; greatest in evening.

Potential Nursing Diagnoses

Disturbed thought process (Side Effects)
 Impaired social interaction (Indications)
 Deficient knowledge, related to medication regimen (Patient/Family Teaching)

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Implementation

- **PO:** Administer in the morning. May be taken without regard to food. Individualize dose to therapeutic needs and response of patient. Use the lowest effective dose.
- May be taken without regard to food. Administer short acting doses 4–6 hrs apart.
- Extended-release capsules may be swallowed whole or opened and sprinkled on applesauce; swallow contents without chewing. Applesauce should be swallowed immediately; do not store. Do not divide contents of capsule; entire contents of capsule should be taken.
- **ADHD:** **Pedi:** When symptoms are controlled, dose reduction or interruption of therapy may be possible during summer mo or may be given on each of the 5 school days, with medication-free weekends and holidays.

Patient/Family Teaching

- Instruct patient to take medication once in the morning as directed. With extended release capsule, avoid afternoon doses to prevent insomnia. Do not double doses. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation of high doses may cause extreme fatigue and mental depression.
- Inform patient that sharing this medication may be dangerous.
- Inform patient that the effects of drug-induced dry mouth can be minimized by rinsing frequently with water or chewing sugarless gum or candies.
- Advise patient to limit caffeine intake.
- May impair judgment. Advise patient to use caution when driving or during other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Inform patient that periodic holidays from the drug may be used to assess progress and decrease dependence. **Pedi:** Children should be given a drug-free holiday each year to reassess symptoms and treatment. Doses will change as children age due to pharmacokinetic changes such as slower hepatic metabolism.
- Advise patient and/or parents to notify health care professional of behavioral changes (new or worse behavior and thought problems, bipolar illness, or aggressive behavior or hostility; new psychotic symptoms such as hearing voices, believing things that are not true, are suspicious, or new manic symptoms).
- Advise patient to notify health care professional if symptoms of heart problems (chest pain, shortness of breath, fainting), nervousness, restlessness, in-

somnia, dizziness, anorexia, or dry mouth becomes severe. **Pedi:** If reduced appetite and weight loss occur, advise parents to provide high calorie meals when drug levels are low (at breakfast and or bedtime).

- Inform patients of risk of peripheral vasculopathy. Instruct patients to notify health care professional of any new numbness; pain; skin color change from pale, to blue, to red; or coolness or sensitivity to temperature in fingers or toes, and call if unexplained wounds appear on fingers or toes.
- Caution patients to inform health care professional if they have ever abused or been dependent on alcohol or drugs, or if they are now abusing or dependent on alcohol or drugs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Home Care Issues:** Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Improved attention span.
- Decrease in narcoleptic symptoms.

HIGH ALERT

amphotericin B deoxycholate

(am-foe-ter-i-sin)

★ Fungizone

amphotericin B lipid complex

Abelcet

amphotericin B liposome

AmBisome

Classification

Therapeutic: antifungals

Indications

IV: Treatment of progressive, potentially fatal fungal infections. The lipid complex, and liposome formulations should be considered for patients who are intolerant (e.g., renal dysfunction) or refractory to amphotericin B deoxycholate. **Amphotericin B liposome:** Management of suspected fungal infections in febrile neutropenic patients; Treatment of visceral leishmaniasis, Treatment of cryptococcal meningitis in HIV patients.

Action

Binds to fungal cell membrane, allowing leakage of cellular contents. Toxicity (especially acute infusion reac-

tions and nephrotoxicity) is less with lipid formulations. **Therapeutic Effects:** Can be fungistatic or fungicidal (depends on concentration achieved and susceptibility of organism). **Spectrum:** Active against: Aspergillosis, Blastomycosis, Candidiasis, Coccidioidomycosis, Cryptococcosis, Histoplasmosis, Leishmaniasis (liposomal formulation only), Mucormycosis.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Extensively distributed to body tissues and fluids. Poor penetration into CSF.

Metabolism and Excretion: Elimination is very prolonged. Detectable in urine up to 7 wk after discontinuation.

Half-life: Biphasic—initial phase, 24–48 hr; terminal phase, 15 days. *Cholesteryl sulfate*—28 hr. *Lipid complex*—174 hr. *Liposomal*—100–153 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Potential for distribution into breast milk and toxicity in infant; discontinue nursing.

Use Cautiously in: Renal impairment or electrolyte abnormalities; Patients receiving concurrent leukocyte transfusions (↑ risk of pulmonary toxicity); **OB:** Has been used safely.

Adverse Reactions/Side Effects

CNS: anxiety, confusion, headache, insomnia. **Resp:** dyspnea, hypoxia, wheezing. **CV:** chest pain, hypotension, tachycardia, edema, hypertension. **GI:** diarrhea, hyperbilirubinemia, ↑ liver enzymes, nausea, vomiting, abdominal pain. **GU:** nephrotoxicity, hematuria. **F and E:** hyperglycemia, hypocalcemia, hypokalemia, hypomagnesemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Derm:** pruritus, rashes. **Local:** phlebitis. **MS:** arthralgia, myalgia. **Misc:** **HYPERSENSITIVITY REACTIONS**, chills, fever, acute infusion reactions.

Interactions

Drug-Drug: ↑ risk of nephrotoxicity, bronchospasm, and hypotension with **antineoplastics**. Concurrent use with **corticosteroids** ↑ risk of hypokalemia. Concurrent use with **zidovudine** may ↑ the risk of myelotoxicity and nephrotoxicity. Concurrent use with **flucytosine** ↑ antifungal activity but may ↑ the risk of toxicity from flucytosine. Combined use with **azole antifungals** may induce fungal resistance. ↑ risk of nephrotoxicity with other **nephrotoxic agents** such as **aminoglycosides, cyclosporine, or tacrolimus**.

Hypokalemia from amphotericin ↑ the risk of **digoxin** toxicity. Hypokalemia may enhance the curariform effects of **neuromuscular blocking agents**.

Route/Dosage

Specific dosage and duration of therapy depend on nature of infection being treated.

Amphotericin Deoxycholate

IV (Adults): Give test dose of 1 mg. If test dose tolerated, initiate therapy with 0.25 mg/kg/day (doses up to 1.5 mg/kg/day may be used, depending on type of infection) (alternate-day dosing may also be used); *Bladder irrigation*—Instill 50 mcg/mL solution into bladder daily for 5–10 days.

IV (Infants and Children): Give test dose of 0.1 mg/kg (maximum dose 1 mg) or may administer initial dose of 0.25–1 mg/kg/day over 6 hr (without test dose) (some infections may require 1.5 mg/kg/day; alternate-day dosing may be used).

IT (Adults): 25–300 mcg q 48–72 hr, ↑ to 500 mcg–1 mg as tolerated (maximum total dose = 15 mg).

IT (Children): 25–100 mcg q 48–72 hr; ↑ to 500 mcg as tolerated.

Amphotericin B Lipid Complex (Abelcet)

IV (Adults and Children): 2.5–5 mg/kg q 24 hr (no test dose needed).

Amphotericin B Liposome (AmBisome)

IV (Adults and Children): *Empiric therapy*—3 mg/kg q 24 hr; *Documented infections*—3–5 mg/kg q 24 hr; *Visceral leishmaniasis (immunocompetent patients)*—3 mg/kg q 24 hr on days 1–5, then 3 mg/kg q 24 hr on days 14 and 21; *Visceral leishmaniasis (immunosuppressed patients)*—4 mg/kg q 24 hr on days 1–5, then 4 mg/kg q 24 hr on days 10, 17, 24, 31, and 38; *Cryptococcal meningitis in HIV patients*—6 mg/kg q 24 hr.

Availability (generic available)

Amphotericin Deoxycholate

Powder for injection: 50 mg/vial.

Amphotericin B Lipid Complex

Suspension for injection: 5 mg/mL.

Amphotericin B Liposome

Powder for injection: 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor patient closely during test dose and the first 1–2 hr of each dose for fever, chills, headache, anorexia, nausea, or vomiting. Premedicating with antipyretics, corticosteroids, antihistamines, meperidine, and antiemetics may decrease these reactions.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Febrile reaction usually subsides within 4 hr after the infusion is completed.

- Assess injection site frequently for thrombophlebitis or leakage. Drug is very irritating to tissues.
- **Monitor vital signs every 15 min during test dose and every 30 min for 2–4 hr after administration.** Meperidine and dantrolene have been used to prevent and treat rigors. Assess respiratory status (lung sounds, dyspnea) daily. If respiratory distress occurs, discontinue infusion immediately; anaphylaxis may occur. Equipment for cardiopulmonary resuscitation should be readily available.
- Monitor intake and output and weigh daily. Adequate hydration (2000–3000 mL/day) and maintaining sodium balance may minimize nephrotoxicity.
- **Lab Test Considerations:** Monitor CBC, BUN and serum creatinine, and potassium and magnesium levels daily. If BUN and serum creatinine ↑ significantly, may need to discontinue or consider switching to lipid complex, or liposomal formulation.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse amphotericin deoxycholate with amphotericin B lipid complex (Abelcet), or amphotericin B liposome (AmBisome); they are not interchangeable.
- This drug should be administered IV only to hospitalized patients or those under close supervision. Diagnosis should be confirmed before administration.

Amphotericin B Deoxycholate

IV Administration

- **Test dose:** Reconstitute 50-mg vial with 10 mL of sterile water for injection to achieve a concentration of 5 mg/mL. Reconstituted vial stable for 24 hr at room temperature or 1 wk if refrigerated. **Diluent:** Further dilute with 500 mL of D5W. May be diluted in 250 mL of D5W if being administered via a central venous catheter. Protect infusion from light. Infusion stable for 24 hr at room temperature or 2 days if refrigerated. To obtain test dose, withdraw 1 mg (10 mL) from 500 mL infusion and further dilute with D5W to a total volume of 20 mL. **Concentration:** 0.05 mg/mL. **Rate:** Infuse over 10–30 min to determine patient tolerance. **Pedi:** Infuse over 30–60 min.
- **Intermittent Infusion:** **Diluent:** Reconstitute and dilute 50-mg vial as per the directions above. **Concentration:** Final concentration of infusion should not exceed 0.1 mg/mL for peripheral infusion or 0.25 mg/mL for central line administration. **Rate:** Infuse slowly over 4–6 hr.
- **Y-Site Compatibility:** aldesleukin, aminocaproic acid, argatroban, carmustine, dactinomycin, diltiazem, etoposide, hydromorphone, ifosfamide, lorazepam, nesiritide, octreotide, oxaliplatin, tacrolimus,

teniposide, thiotepa, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, ampicillin, ampicillin/sulbactam, anidulafungin, atropine, azithromycin, aztreonam, benztrapine, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, caspofungin, cefepime, cefotetan, ceftaroline, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dacarbazine, dantrolene, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposome, doxycycline, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatide, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hetastarch, hydralazine, hydrocortisone, hydroxyzine, idarubicin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, melphalan, meperidine, mechlorethamine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, nifedipine, nitroprusside, norepinephrine, ondansetron, oxacillin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phenylephrine, phenytoin, piperacillin/tazobactam, potassium acetate, potassium chloride, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, telavancin, thiamine, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole.
- **Solution Incompatibility:** LR injection, saline solutions.

Amphotericin B Lipid Complex

IV Administration

- **Intermittent Infusion:** **Diluent:** Shake vial gently until yellow sediment at bottom has dissolved. Withdraw dose from required number of vials with 18-gauge needle. Replace needle from syringe filled with amphotericin B lipid complex with 5-micron filter needle. Each filter needle may be used to filter the contents of no more than 4 vials. Insert filter needle of syringe into IV bag of D5W and empty contents of syringe into bag. Protect from light. Infusion

is stable for 6 hr at room temperature or 48 hr if refrigerated. **Concentration:** Final concentration of infusion should be 1 mg/mL; a concentration of 2 mg/mL can be used for pediatric patients or patients who cannot tolerate large volumes of fluid. **Rate:**

Do not use an in-line filter. Infuse at a rate of 2.5 mg/kg/hr via infusion pump. If infusion exceeds 2 hr, mix contents by shaking infusion bag every 2 hr. If administering through an existing line, flush line with D5W before infusion or use a separate line.

- **Y-Site Compatibility:** acyclovir, allopurinol, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, azithromycin, aztreonam, bumetanide, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dexamethasone, digoxin, diphenhydramine, docetaxel, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, eptifibatid, ertapenem, etoposide, famotidine, fentanyl, fludarabine, fluorouracil, fosphenytoin, furosemide, ganciclovir, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, insulin, ketorolac, lidocaine, linezolid, lorazepam, mannitol, melphalan, meperidine, methotrexate, methylprednisolone, metoclopramide, mitomycin, nafcillin, nesiritide, nitroglycerin, nitroprusside, octreotide, oxaliplatin, paclitaxel, pamidronate, pantoprazole, pemetrexed, pentazocine, pentobarbital, phenobarbital, piperacillin/tazobactam, procainamide, ranitidine, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiopental, thiotopa, verapamil, vinblastine, vincristine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, alfentanil, amifostine, amikacin, ampicillin, ampicillin/sulbactam, bivalirudin, bleomycin, calcium chloride, calcium gluconate, caspofungin, ciprofloxacin, cisplatin, dacarbazine, dantrolene, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, diazepam, diltiazem, dobutamine, dolasetron, dopamine, doxorubicin, doxycycline, droperidol, epirubicin, erythromycin, esmolol, etoposide phosphate, fenoldopam, fluconazole, foscarnet, gemcitabine, gentamicin, glycopyrrolate, haloperidol, hydralazine, hydroxyzine, idarubicin, imipenem/cilastatin, irinotecan, isoproterenol, labetalol, leucovorin, levofloxacin, magnesium sulfate, mechlorethamine, meropenem, mesna, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nalbuphine, naloxone, nifedipine, norepinephrine, ondansetron, pancuronium, pentamidine, phenylephrine, phenytoin, potassium acetate, potassium phosphates, prochlorperazine, promethazine, propranolol, quinu-

pristin/dalfopristin, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinorelbine, voriconazole.

- **Solution Incompatibility:** saline solutions.

Amphotericin B Liposome

IV Administration

- **Intermittent Infusion:** **Diluent:** Reconstitute each 50-mg vial with 12 mL of sterile water for injection to achieve concentration of 4 mg/mL. Immediately shake vial vigorously for at least 30 seconds until all particulate matter is completely dispersed. Reconstituted vials are stable for 24 hr if refrigerated. Withdraw appropriate volume for dilution into a syringe. Attach the 5-micron filter to the syringe and inject syringe contents into an appropriate volume of D5W. Infusion should be administered within 6 hr of dilution. **Concentration:** Final concentration of infusion should be 1–2 mg/mL; a lower concentration (0.2–0.5 mg/mL) may be used for infants and small children. **Rate:** Infuse over 2 hr. Infusion time may be shortened to 1 hr if patient tolerates infusion without any adverse reactions. If discomfort occurs during infusion, duration of infusion may be increased. May be administered through an in-line filter with pore diameter of at least 1 micron. If administering through an existing line, flush line with D5W before infusion or use a separate line.
- **Y-Site Compatibility:** acyclovir, amifostine, aminocaproic acid, aminophylline, anidulafungin, argatroban, atropine, azithromycin, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, cefazolin, cefoxitin, ceftriaxone, cefuroxime, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, diphenhydramine, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, eptifibatid, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, isoproterenol, ketorolac, lidocaine, linezolid, mesna, methotrexate, methylprednisolone, metoprolol, milrinone, mitomycin, nesiritide, nitroglycerin, nitroprusside, octreotide, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, ranitidine, sufentanil, tacrolimus, theophylline, thiopental, thiotopa, tigecycline, trimethoprim/sulfamethoxazole, vasopressin, vincristine, voriconazole, zidovudine, zoledronic acid.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Y-Site Incompatibility:** alemtuzumab, alfentanil, amikacin, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, calcium chloride, calcium gluconate, caspofungin, cefepime, cefotaxime, cefotetan, ceftazidime, chlorpromazine, ciprofloxacin, cisplatin, cyclosporine, dacarbazine, daunorubicin, dexrazoxane, diazepam, digoxin, diltiazem, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxycycline, droperidol, epirubicin, erythromycin, etoposide phosphate, gemcitabine, gentamicin, hetastarch, hydroxyzine, idarubicin, imipenem/cilastatin, irinotecan, labetalol, leucovorin, levofloxacin, lorazepam, magnesium sulfate, mannitol, mechlor-ethamine, meperidine, meropenem, metoclopramide, metronidazole, midazolam, mitoxantrone, morphine, mycophenolate, nalbuphine, naloxone, nicardipine, ondansetron, paclitaxel, pentamidine, phenytoin, potassium phosphates, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, sodium bicarbonate, sodium phosphates, telavancin, teniposide, tobramycin, vancomycin, vecuronium, verapamil, vinblastine, vinorelbine.
- **Solution Incompatibility:** Do not dilute or admix with saline solutions, other medications, or solutions containing a bacteriostatic agent.

Patient/Family Teaching

- Explain need for long duration of IV therapy.
- **IV:** Inform patient of potential side effects and discomfort at IV site. Advise patient to notify health care professional if side effects occur.
- **Home Care Issue:** Instruct family or caregiver on dilution, rate, and administration of drug and proper care of IV equipment.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Several wk to mo of therapy may be required to prevent relapse.

ampicillin (am-pi-sil-in)

Classification

Therapeutic: anti-infectives

Pharmacologic: aminopenicillins

Indications

Treatment of the following infections: Skin and skin structure infections, Soft-tissue infections, Otitis media, Sinusitis, Respiratory infections, Genitourinary infections, Meningitis, Septicemia. Endocarditis prophylaxis.

Unlabeled Use: Prevention of infection in certain high-risk patients undergoing cesarean section.

Action

Binds to bacterial cell wall, resulting in cell death.

Therapeutic Effects: Bactericidal action; spectrum is broader than penicillin. **Spectrum:** Active against: Streptococci, nonpenicillinase-producing staphylococci, *Listeria*, Pneumococci, Enterococci, *Haemophi-*

lus influenzae, *Escherichia coli*, *Enterobacter*, *Klebsiella*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Sbigella*, *Salmonella*.

Pharmacokinetics

Absorption: Moderately absorbed from the duodenum (30–50%).

Distribution: Diffuses readily into body tissues and fluids. CSF penetration is ↑ in the presence of inflamed meninges. Crosses the placenta; enters breast milk in small amounts.

Metabolism and Excretion: Variably metabolized by the liver (12–50%). Renal excretion is variable (25–60% after oral dosing; 50–85% after IM administration).

Half-life: Neonates: 1.7–4 hr; Children and Adults: 1–1.5 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.5–2 hr	4–6 hr
IM	rapid	1 hr	4–6 hr
IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins.

Use Cautiously in: Severe renal insufficiency (dose ↓ required if CCr <10 mL/min); Infectious mononucleosis, acute lymphocytic leukemia or cytomegalovirus infection (↑ incidence of rash); Patients allergic to cephalosporins; **OB:** Has been used during pregnancy; **Lactation:** Distributed into breast milk. Can cause rash, diarrhea, and sensitization in the infant.

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **Derm:** rash, urticaria. **Hemat:** blood dyscrasias. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels of ampicillin—therapy may be combined for this purpose. Large doses may ↑ the risk of bleeding with warfarin. ↑ risk of with concurrent allopurinol therapy. May ↓ the effectiveness of oral hormonal contraceptives.

Route/Dosage

Respiratory and Soft-Tissue Infections

PO (Adults and Children ≥20 kg): 250–500 mg q 6 hr.

PO (Children <20 kg): 50–100 mg/kg/day in divided doses q 6–8 hr (not to exceed 2–3 g/day).

IM, IV (Adults and Children ≥40 kg): 500 mg to 3 g q 6 hr (not to exceed 14 g/day).

IM, IV (Children <40 kg): 100–200 mg/kg/day in divided doses q 6–8 hr (not to exceed 12 g/day).

Bacterial Meningitis Caused by *H. influenzae*, *Streptococcus pneumoniae*, Group B streptococcus or *N. meningitidis* or Septicemia

IM, IV (Adults): 500 mg to 3 g q 6 hr (not to exceed 14 g/day).

IM, IV (Children >1 mo): 200–400 mg/kg/day in divided doses q 6 hr (not to exceed 12 g/day).

IM, IV (Neonates ≤7 days): 200 mg/kg/day divided q 8 hr.

IM, IV (Neonates >7 days): 300 mg/kg/day divided q 6 hr.

GI/GU Infections other than *N. gonorrhoeae*

PO (Adults and Children >20 kg): 250–500 mg q 6 hr (larger doses for more serious/chronic infections).

PO (Children ≤20 kg): 50–100 mg/kg/day in divided doses q 6 hr.

N. gonorrhoeae

PO (Adults): 3 g with 1 g probenecid.

IM, IV (Adults and Children ≥40 kg): 500 mg q 6 hr.

IM, IV (Children <40 kg): 100–200 mg/kg/day in divided doses q 6–8 hr.

Urethritis Caused by *N. gonorrhoeae* in Men

IM, IV (Adults and Children ≥40 kg): 500 mg, repeated 8–12 hr later; additional doses may be necessary for more complicated infections (prostatitis, epididymitis).

Prevention of Bacterial Endocarditis

IM, IV (Adults): 2 g 30 min before procedure (gentamicin may be added for high-risk patients); additional 1 g may be given 6 hr later for high-risk patients.

IM, IV (Children): 50 mg/kg (not to exceed 2 g) 30 min before procedure (gentamicin may be added for high-risk patients); additional 25 mg/kg may be given 6 hr later for high-risk patients.

Renal Impairment

(Adults and Children): *CCr* ≤10 mL/min—↑ dosing interval to q 12 hr.

Availability (generic available)

Capsules: 250 mg, 500 mg. **Suspension (wild cherry flavor):** 125 mg/5 mL, 250 mg/5 mL. **Powder for injection:** 125 mg/vial, 250 mg/vial, 500 mg/vial, 1 g/vial, 2 g/vial, 10 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs, wound appearance, sputum, urine, stool, and WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess skin for “ampicillin rash,” a nonallergic, dull red, macular or maculopapular, mildly pruritic rash.
- **Lab Test Considerations:** May cause ↑ AST and ALT. May cause transient ↓ estradiol, total conjugated estradiol, estradiol-glucuronide, or conjugated estrone in pregnant women. May cause a false-positive direct Coombs’ test result. May cause a false-positive urinary glucose.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Reserve IM or IV route for moderately severe or severe infections or patients unable to take oral medication. Change to PO as soon as possible.
- **PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals with a full glass of water. Capsules may be opened and mixed with water. Reconstituted oral suspensions retain potency for 7 days at room temperature and 14 days if refrigerated. Combination with probenecid should be used immediately after reconstitution.
- **IM:** Reconstitute for IM or IV use by adding sterile water for injection 0.9–1.2 mL to the 125-mg vial, 0.9–1.9 mL to the 250-mg vial, 1.2–1.8 mL to the

★ = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underline indicate most frequent.

500-mg vial, 2.4–7.4 mL to the 1-g vial, and 6.8 mL to the 2-g vial.

IV Administration

- **IV Push:** Add 5 mL of sterile water for injection to each 125-, 250-, or 500-mg vial or at least 7.4–10 mL of diluent to each 1- or 2-g vial. Solution should be used within 1 hr of reconstitution. **Rate:** Doses of 125–500 mg may be given over 3–5 min (not to exceed 100 mg/min). Rapid administration may cause seizures.
- **Intermittent Infusion: Diluent:** Reconstitute vials as per the directions above. Further dilute in 50 mL or more of 0.9% NaCl, D5W, D5/0.45% NaCl, or LR. Administer within 4 hr (more stable in NaCl). **Concentration:** Not to exceed 30 mg/mL. **Rate:** Infuse over 10–15 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alprostadil, amifostine, anidulafungin, argatroban, bivalirudin, bleomycin, carboplatin, carmustine, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, docetaxel, doxacurium, doxapram, doxorubicin liposome, eptifibatid, etoposide, etoposide phosphate, filgrastim, fludarabine, fluorouracil, foscarnet, gemcitabine, granisetron, hetastarch, ifosfamide, irinotecan, levofloxacin, linezolid, mechlorethamine, melphalan, methotrexate, metronidazole, milrinone, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, perphenazine, potassium acetate, propofol, remifentanyl, rituximab, rocuronium, sodium acetate, teniposide, thiopeta, tigecycline, tirofiban, trastuzumab, vecuronium, vincristine, vitamin B complex with C, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart, aminophylline, amphotericin B cholesterol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, buprenorphine, caspofungin, chlorpromazine, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, doxycycline, epirubicin, fenoldopam, fluconazole, ganciclovir, haloperidol, hydroxyzine, idarubicin, ketamine, lorazepam, midazolam, mitoxantrone, mycophenolate, nafcillin, nesiritide, nicardipine, nitroprusside, ondansetron, papaverine, penicillin G potassium, pentamidine, pentazocine, pentobarbital, phenobarbital, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sargramostim, sodium bicarbonate, tranexamic acid, trimethoprim/sulfamethoxazole, verapamil, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication can be dangerous.

- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.**
- Instruct the patient to notify health care professional if symptoms do not improve.
- Patients with a history of rheumatic heart disease or valve replacement need to be taught the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Advise patients taking oral contraceptives to use an alternate or additional nonhormonal method of contraception while taking ampicillin and until next menstrual period.
- Advise female patient to notify health care professional if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.

ampicillin/sulbactam (am-pi-sil-in/sul-bak-tam) Unasyn

Classification

Therapeutic: anti-infectives

Pharmacologic: aminopenicillins/beta lactamase inhibitors

Indications

Treatment of the following infections: Skin and skin structure infections, soft-tissue infections, Otitis media, Intra-abdominal infections, Sinusitis, Respiratory infections, Genitourinary infections, Meningitis, Septicemia.

Action

Binds to bacterial cell wall, resulting in cell death; spectrum is broader than that of penicillin. Addition of sulbactam increases resistance to beta-lactamases, enzymes produced by bacteria that may inactivate ampicillin. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *S. shigella*, *Salmonella*, *Bacteroides fragilis*, *Moraxella catarrhalis*. Use should be reserved for infections caused by beta-lactamase-producing strains.

Pharmacokinetics

Absorption: Well absorbed from IM sites.

Distribution: Ampicillin diffuses readily into bile, blister and tissue fluids. Poor CSF penetration unless meninges are inflamed. Crosses the placenta; enters breast milk in small amounts.

Metabolism and Excretion: Ampicillin is variably metabolized by the liver (12–50%). Renal excretion is also variable. Sulbactam is eliminated unchanged in urine.

Protein Binding: *Ampicillin*—28%; *sulbactam*—38%.

Half-life: *Ampicillin*—1–1.8 hr; *sulbactam*—1–1.3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	1 hr	6–8 hr
IV	immediate	end of infusion	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins or sulbactam; History of cholestatic jaundice or hepatic dysfunction with ampicillin/sulbactam.

Use Cautiously in: Severe renal insufficiency (dosage ↓ required if CCr <30 mL/min); Epstein-Barr virus infection, acute lymphocytic leukemia, or cytomegalovirus infection (↑ risk of rash).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** HEPATOTOXICITY, CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, cholestasis, nausea, vomiting. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, acute generalized exanthematous pustulosis, rash, urticaria. **Hemat:** blood dyscrasias. **Local:** pain at IM site, pain at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, phlebitis, superinfection, ↑ liver enzymes.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ levels of ampicillin—therapy may be combined for this purpose. May potentiate the effect of warfarin. Concurrent allopurinol therapy (↑ risk of rash). May ↓ levels and effectiveness of hormonal contraceptives.

Route/Dosage

Dosage based on ampicillin component.

IM, IV (Adults and Children ≥40 kg): 1–2 g ampicillin every 6–8 hr (not to exceed 12 g ampicillin/day).

IM, IV (Children ≥1 yr): 100–200 mg ampicillin/kg/day divided every 6 hr; Meningitis—200–400 mg ampicillin/kg/day divided every 6 hr; maximum dose: 8 g ampicillin/day.

IM, IV (Infants >1 mo): 100–150 mg ampicillin/kg/day divided every 6 hr.

Renal Impairment

IM, IV (Adults, Children, and Infants): CCr 15–29 mL/min—Administer every 12 hr; CCr 5–14—Administer every 24 hr.

Availability (generic available)

Powder for injection: 1.5 g/vial (1 g ampicillin with 500 mg sulbactam), 3 g/vial (2 g ampicillin with 1 g sulbactam), 15 g/vial (10 g ampicillin with 5 g sulbactam).

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs, wound appearance, sputum, urine, stool, and WBCs) at beginning and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of, and reactions to, penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician or other health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several mo following cessation of therapy.
- Monitor for rash, may lead to severe skin reactions.
- **Lab Test Considerations:** Monitor hepatic function periodically during therapy. May cause ↑ AST, ALT, LDH, bilirubin, alkaline phosphatase, BUN, and creatinine.
- May cause ↓ hemoglobin, hematocrit, RBC, WBC, neutrophils, and lymphocytes.
- May cause transient ↓ estradiol, total conjugated estrone, estrone-glucuronide, or conjugated estrone in pregnant women.
- May cause a false-positive Coombs' test result.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

★ = Canadian drug name. ☒ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

Implementation

- **IM:** Reconstitute for IM use by adding 3.2 mL of sterile water or 0.5% or 2% lidocaine HCl to the 1.5-g vial or 6.4 mL to the 3-g vial. Administer within 1 hr of preparation, deep IM into well-developed muscle.

IV Administration

- **IV Push:** **Diluent:** Reconstitute 1.5-g vial with 3.2 mL of sterile water for injection and the 3-g vial with 6.4 mL. **Concentration:** 375 mg ampicillin/sulbactam per mL. **Rate:** Administer over at least 10–15 min within 1 hr of reconstitution. More rapid administration may cause seizures.
- **Intermittent Infusion:** Reconstitute vials as per directions above. **Diluent:** Further dilute in 50–100 mL of 0.9% NaCl, D5W, D5/0.45% NaCl, or LR. Stability of solution varies from 2–8 hr at room temperature or 3–72 hr if refrigerated, depending on concentration and diluent. **Concentration:** Final concentration of infusion should be 3–45 mg of ampicillin/sulbactam per mL. **Rate:** Infuse over 15–30 min.
- **Y-Site Compatibility:** alemtuzumab, amifostine, aminocaproic acid, anidulafungin, argatroban, azithromycin, bivalirudin, bleomycin, cangrelor, carboplatin, carmustine, cefepime, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, docetaxel, doxorubicin liposomal, eptifibatide, etoposide, etoposide phosphate, fenoldopam, filgrastim, fludauridine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, granisetron, hydromorphone, ifosfamide, irinotecan, leucovorin, levofloxacin, linezolid, mesna, methotrexate, metronidazole, milrinone, mitomycin, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, potassium acetate, remifentanyl, rituximab, rocuronium, sodium acetate, televancin, teniposide, thiotepa, tigecycline, tirofiban, trastuzumab, vecuronium, vinblastine, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, caspofungin, chlorpromazine, ciprofloxacin, dacarbazine, dantrolene, daunorubicin, diazepam, diazoxide, dobutamine, dolasetron, doxorubicin, doxycycline, epirubicin, ganciclovir, haloperidol, hydralazine, hydrocortisone, hydroxyzine, idarubicin, lansoprazole, lorazepam, mechlorethamine, methylprednisolone, midazolam, mitoxantrone, mycophenolate, nesiritide, nifedipine, ondansetron, papaverine, pentamidine, pentazocine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sargramostim, topotecan, tranexamic acid, trimethoprim/sulfamethoxazole, verapamil, vinorelbine. If aminoglycosides and penicillins must be given concurrently, administer in separate sites at least 1 hr apart.

Patient/Family Teaching

- Advise patient to report rash, signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and **allergy**.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.**
- **Rep:** Advise patients taking oral contraceptives to use an alternative or additional nonhormonal method of contraception while taking ampicillin/sulbactam and until next menstrual period.
- Instruct the patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

anastrozole (a-nass-troe-zole) Arimidex

Classification

Therapeutic: antineoplastics

Pharmacologic: aromatase inhibitors

Indications

Adjuvant treatment of postmenopausal hormone receptor-positive early breast cancer. Initial therapy in women with postmenopausal hormone receptor-positive or hormone receptor unknown, locally advanced, or metastatic breast cancer. Advanced postmenopausal breast cancer in women with disease progression despite tamoxifen therapy.

Action

Inhibits the enzyme aromatase, which is partially responsible for conversion of precursors to estrogen.

Therapeutic Effects: Lowers levels of circulating estrogen, which may halt progression of estrogen-sensitive breast cancer.

Pharmacokinetics

Absorption: 83–85% absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: 85% metabolized by the liver; 11% excreted renally.

Half-life: 50 hr.

TIME/ACTION PROFILE (lowering of serum estradiol)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	14 days	6 days†

†Following cessation of therapy.

Contraindications/Precautions

Contraindicated in: **OB:** Potential harm to fetus or spontaneous abortion.

Use Cautiously in: Women with childbearing potential; Ischemic heart disease; **Lactation, PEDI:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, weakness, dizziness. **EENT:** pharyngitis. **Resp:** cough, dyspnea. **CV:** MYOCARDIAL INFARCTION, angina, peripheral edema. **F and E:** hypercalcemia. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea, dry mouth, vomiting. **GU:** pelvic pain, vaginal bleeding, vaginal dryness. **Derm:** rash, sweating. **Metab:** hypercholesterolemia, weight gain. **MS:** back pain, arthritis, bone pain, carpal tunnel syndrome, fracture, myalgia. **Neuro:** paresthesia. **Misc:** allergic reactions including ANGIOEDEMA, URTICARIA, ANAPHYLAXIS, hot flashes, pain.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 1 mg daily.

Availability (generic available)

Tablets: 1 mg.

NURSING IMPLICATIONS**Assessment**

- Assess patient for pain and other side effects periodically during therapy.
- **Lab Test Considerations:** May cause ↑ GGT, AST, ALT, alkaline phosphatase, total cholesterol, and LDL cholesterol levels.

Potential Nursing Diagnoses

Acute pain (Side Effects)

Implementation

- **PO:** Take medication consistently with regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless it is almost time for next dose. Do not double doses. Advise patient to read the *Patient Information* leaflet before starting and with each Rx refill; changes may occur.
- Inform patient of potential for adverse reactions, and advise patient to notify health care professional immediately if allergic reactions (swelling of the face, lips, tongue, and/or throat, difficulty in swallowing and/or breathing), liver problems (general feeling of not being well, yellowing of skin or whites of eyes, pain on the right side of abdomen), skin reactions (lesions, ulcers, or blisters), or chest pain occurs.

- Advise patient that vaginal bleeding may occur during first few wk after changing over from other hormonal therapy. Continued bleeding should be evaluated.
- Teach patient to report increase in pain so treatment can be initiated.
- Advise patient to notify health care professional immediately if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Slowing of disease progression in women with advanced breast cancer.

ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS

benazepril (ben-aye-ze-pril)

trandolapril (tran-doe-la-pril)
Mavik

Classification

Therapeutic: antihypertensives
Pharmacologic: ACE inhibitors

Indications

Alone or with other agents in the management of hypertension. **Captopril, enalapril, fosinopril, lisinopril, quinapril, ramipril, trandolapril:** Management of HF. **Captopril, lisinopril, ramipril, trandolapril:** Reduction of risk of death or development of HF following MI. **Enalapril:** Slowed progres-

✱ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

sion of left ventricular dysfunction into overt heart failure. **Ramipril:** Reduction of the risk of MI, stroke, and death from cardiovascular disease in patients at risk (>55 yr old with a history of CAD, stroke, peripheral vascular disease, or diabetes with another cardiovascular risk factor). **Captopril:** ↓ progression of diabetic nephropathy. **Perindopril:** Reduction of risk of death from cardiovascular causes or nonfatal MI in patients with stable CAD.

Action

ACE inhibitors block the conversion of angiotensin I to the vasoconstrictor angiotensin II. ACE inhibitors also prevent the degradation of bradykinin and other vasodilatory prostaglandins. ACE inhibitors also ↑ plasma renin levels and ↓ aldosterone levels. Net result is systemic vasodilation. **Therapeutic Effects:** Lowering of BP in hypertensive patients. Improved symptoms in patients with HF (selected agents only). ↓ development of overt heart failure (enalapril only). Improved survival and ↓ development of overt HF after MI (selected agents only). ↓ risk of death from cardiovascular causes or MI in patients with stable CAD (perindopril only). ↓ risk of MI, stroke or death from cardiovascular causes in high-risk patients (ramipril only). ↓ progression of diabetic nephropathy (captopril only).

Pharmacokinetics

Absorption: *Benazepril*—37% absorbed after oral administration. *Captopril*—60–75% absorbed after oral administration (↓ by food). *Enalapril*—55–75% absorbed after oral administration. *Enalaprilat*—IV administration results in complete bioavailability. *Fosinopril*—36% absorbed after oral administration. *Lisinopril*—25% absorbed after oral administration (much variability). *Moexipril*—13% bioavailability as moexiprilat after oral administration (↓ by food). *Perindopril*—25% bioavailability as perindoprilat after oral administration. *Quinapril*—60% absorbed after oral administration (high-fat meal may ↓ absorption). *Ramipril*—50–60% absorbed after oral administration. *Trandolapril*—70% bioavailability as trandolapril at after oral administration.

Distribution: All ACE inhibitors cross the placenta. *Benazepril*, *captopril*, *enalapril*, *fosinopril*, *quinapril*, and *trandolapril*—Enter breast milk. *Lisinopril*—Minimal penetration of CNS. *Ramipril*—Probably does not enter breast milk. *Trandolapril*—Enters breast milk.

Protein Binding: *Benazepril*—95%, *Fosinopril*—99.4%, *Moexipril*—90%, *Quinapril*—97%.

Metabolism and Excretion: *Benazepril*—Converted by the liver to benazeprilat, the active metabolite. 20% excreted by kidneys; 11–12% nonrenal (biliary elimination). *Captopril*—50% metabolized by the liver to inactive compounds, 50% excreted unchanged by the kidneys. *Enalapril*, *enalaprilat*—Enalapril is converted by the liver to enalaprilat, the active metabolite; primarily eliminated by the kidneys. *Fosinopril*—

Converted by the liver and GI mucosa to fosinoprilat, the active metabolite—50% excreted in urine, 50% in feces. *Lisinopril*—100% eliminated by the kidneys.

Moexipril—Converted by liver and GI mucosa to moexiprilat, the active metabolite; 13% excreted in urine, 53% in feces. *Perindopril*—Converted by the liver to perindoprilat, the active metabolite; primarily excreted in urine. *Quinapril*—Converted by the liver, GI mucosa, and tissue to quinaprilat, the active metabolite; 96% eliminated by the kidneys. *Ramipril*—Converted by the liver to ramiprilat, the active metabolite; 60% excreted in urine, 40% in feces. *Trandolapril*—Converted by the liver to trandolaprilat, the active metabolite; 33% excreted in urine, 66% in feces.

Half-life: *Benazeprilat*—10–11 hr. *Captopril*—2 hr (↑ in renal impairment). *Enalapril*—2 hr (↑ in renal impairment). *Enalaprilat*—35–38 hr (↑ in renal impairment). *Fosinoprilat*—12 hr. *Lisinopril*—12 hr (↑ in renal impairment). *Moexiprilat*—2–9 hr (↑ in renal impairment). *Perindoprilat*—3–10 hr (↑ in renal impairment). *Quinaprilat*—3 hr (↑ in renal impairment). *Ramiprilat*—13–17 hr (↑ in renal impairment). *Trandolaprilat*—22.5 hr (↑ in renal impairment).

TIME/ACTION PROFILE (effect on BP—single dose†)

ROUTE	ONSET	PEAK	DURATION
Benazepril	within 1 hr	2–4 hr	24 hr
Captopril	15–60 min	60–90 min	6–12 hr
Enalapril PO	1 hr	4–8 hr	12–24 hr
Enalapril IV	15 min	1–4 hr	4–6 hr
Fosinopril	within 1 hr	2–6 hr	24 hr
Lisinopril	1 hr	6 hr	24 hr
Moexipril	within 1 hr	3–6 hr	up to 24 hr
Perindoprilat	within 1–2 hr	3–7 hr	up to 24 hr
Quinapril	within 1 hr	2–4 hr	up to 24 hr
Ramipril	within 1–2 hr	3–6 hr	24 hr
Trandolapril	within 1–2 hr	4–10 hr	up to 24 hr

†Full effects may not be noted for several wks.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of angioedema with previous use of ACE inhibitors (also in absence of previous use of ACE inhibitors for benazepril); Concurrent use with aliskiren in patients with diabetes or moderate-to-severe renal impairment (CCr <60 mL/min); Concurrent use with sacubitril; **OB:** Can cause injury or death of fetus—if pregnancy occurs, discontinue immediately; **Lactation:** Certain ACE inhibitors appear in breast milk; discontinue drug or use formula.

Use Cautiously in: Renal impairment, hepatic impairment, hypovolemia, hyponatremia, concurrent diuretic therapy; ⚠ Black patients with hypertension (monotherapy less effective, may require additional therapy; ↑ risk of angioedema); Women of childbearing potential; Surgery/anesthesia (hypotension may be exaggerated); **Pedi:** Safety not established for most agents;

benazepril, fosinopril, and lisinopril may be used in children ≥ 6 yr (captopril and enalapril may be used in children of all ages); **Geri**: Initial dose \downarrow recommended for most agents due to age-related \downarrow in renal function. **Exercise Extreme Caution in**: Family history of angioedema.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache, insomnia, vertigo, weakness. **Resp**: cough, dyspnea. **CV**: hypotension, chest pain, edema, tachycardia. **Endo**: hyperuricemia. **GI**: taste disturbances, abdominal pain, anorexia, constipation, diarrhea, nausea, vomiting. **GU**: erectile dysfunction, proteinuria, renal dysfunction, renal failure. **Derm**: flushing, pruritis, rashes. **F and E**: hyperkalemia. **Hemat**: **AGRANULOCYTOSIS**, neutropenia (captopril only). **MS**: back pain, muscle cramps, myalgia. **Misc**: **ANGIOEDEMA**, fever.

Interactions

Drug-Drug: Concurrent use with **sacubitril** may \uparrow risk of angioedema and is contraindicated; do not administer within 36 hr of switching to/from sacubitril/valsartan. Excessive hypotension may occur with concurrent use of **diuretics** and other **anti-hypertensives**. \uparrow risk of hyperkalemia with concurrent use of **potassium supplements**, **potassium-sparing diuretics**, or **potassium-containing salt substitutes**. \uparrow risk of hyperkalemia, renal dysfunction, hypotension, and syncope with concurrent use of **angiotensin II receptor blockers** or **aliskiren**; avoid concurrent use with aliskiren in patients with diabetes or $CCr < 60$ mL/min; avoid concurrent use with angiotensin II receptor blockers. **NSAIDs** and selective **COX-2 inhibitors** may blunt the anti-hypertensive effect and \uparrow the risk of renal dysfunction. Absorption of fosinopril may be \downarrow by **antacids** (separate administration by 1–2 hr). \uparrow levels and may \uparrow risk of **lithium** toxicity. Quinapril may \downarrow absorption of **tetracycline**, **doxycycline**, and **fluoroquinolones** (because of magnesium in tablets). \uparrow risk of angioedema with **temsirolimus**, **sirolimus**, or **everolimus**. **Drug-Food**: Food significantly \downarrow absorption of captopril and moexipril (administer drugs 1 hr before meals).

Route/Dosage

Benazepril

PO (Adults): 10 mg once daily, \uparrow gradually to maintenance dose of 20–40 mg/day in 1–2 divided doses (begin with 5 mg/day in patients receiving diuretics). **PO (Children ≥ 6 yr)**: 0.2 mg/kg once daily; may be titrated up to 0.6 mg/kg/day (or 40 mg/day).

Renal Impairment

PO (Adults): $CCr < 30$ mL/min—Initiate therapy with 5 mg once daily.

Renal Impairment

PO (Children ≥ 6 yr): $CCr < 30$ mL/min—Contraindicated.

Captopril

PO (Adults): **Hypertension**—12.5–25 mg 2–3 times daily, may be \uparrow at 1–2 wk intervals up to 150 mg 3 times daily (begin with 6.25–12.5 mg 2–3 times daily in patients receiving diuretics) (maximum dose = 450 mg/day); **HF**—25 mg 3 times daily (6.25–12.5 mg 3 times daily in patients who have been vigorously diuresed); titrated up to target dose of 50 mg 3 times daily; **Post-MI**—6.25-mg test dose, followed by 12.5 mg 3 times daily, may be \uparrow up to 50 mg 3 times daily; **Diabetic nephropathy**—25 mg 3 times daily.

PO (Children): **HF**—0.3 mg/kg–0.5 mg/kg/dose 3 times daily, titrate up to a maximum of 6 mg/kg/day in 2–4 divided doses; **Older Children**—6.25–12.5 mg/dose every 12–24 hr, titrate up to a maximum of 6 mg/kg/day in 2–4 divided doses.

PO (Infants): **HF**—0.15–0.3 mg/kg/dose, titrate up to a maximum of 6 mg/kg/day in 1–4 divided doses.

PO (Neonates): **HF**—0.05–0.1 mg/kg/dose every 8–24 hr, may \uparrow as needed up to 0.5 mg/kg every 6–24 hr; **Premature neonates**—0.01 mg/kg/dose every 8–12 hr.

Renal Impairment

PO (Adults): $CCr 10$ –50 mL/min—Administer 75% of dose; $CCr < 10$ mL/min—Administer 50% of dose.

Enalapril/Enalaprilat

PO (Adults): **Hypertension**—2.5–5 mg once daily, \uparrow as required up to 40 mg/day in 1–2 divided doses (initiate therapy at 2.5 mg once daily in patients receiving diuretics); **HF**—2.5 mg 1–2 times daily, titrated up to target dose of 10 mg twice daily; begin with 2.5 mg once daily in patients with hyponatremia (serum sodium < 130 mEq/L); **Asymptomatic left ventricular dysfunction**—2.5 mg twice daily, titrated up to a target dose of 10 mg twice daily.

PO (Children > 1 mo): **Hypertension**—0.08 mg/kg once daily; may be slowly titrated up to a maximum of 0.58 mg/kg/day.

IV (Adults): **Hypertension**—0.625–1.25 mg (0.625 mg if receiving diuretics) every 6 hr; can be titrated up to 5 mg every 6 hr.

IV (Children > 1 mo): **Hypertension**—5–10 mcg/kg/dose given every 8–24 hr.

Renal Impairment

PO, IV (Adults): **Hypertension** $CCr 10$ –50 mL/min—Administer 75% of dose; $CCr < 10$ mL/min—Administer 50% of dose.

Renal Impairment

PO, IV (Children > 1 mo): $CCr < 30$ mL/min—Contraindicated.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Fosinopril

PO (Adults): *Hypertension*—10 mg once daily, may be ↑ as required up to 80 mg/day. *HF*—10 mg once daily (5 mg once daily in patients who have been vigorously diuresed), may be ↑ over several wk up to 40 mg/day.

PO (Children ≥6 yr and >50 kg): *Hypertension*—5–10 mg once daily.

Lisinopril

PO (Adults): *Hypertension*—10 mg once daily, can be ↑ up to 20–40 mg/day (initiate therapy at 5 mg/day in patients receiving diuretics); *HF*—5 mg once daily; may be titrated every 2 wk up to 40 mg/day; begin with 2.5 mg once daily in patients with hyponatremia (serum sodium <130 mEq/L); *Post-MI*—5 mg once daily for 2 days, then 10 mg daily.

PO (Children ≥6 yr): *Hypertension*—0.07 mg/kg once daily (up to 5 mg/day), may be titrated every 1–2 wk up to 0.6 mg/kg/day (or 40 mg/day).

Renal Impairment

PO (Adults): *CCr 10–30 mL/min*—Begin with 5 mg once daily; may be slowly titrated up to 40 mg/day; *CCr <10 mL/min*—Begin with 2.5 mg once daily; may be slowly titrated up to 40 mg/day.

Renal Impairment

(Children ≥6 yr): *CCr <30 mL/min*—Contraindicated.

Moexipril

PO (Adults): 7.5 mg once daily, may be ↑ up to 30 mg/day in 1–2 divided doses (begin with 3.75 mg/day in patients receiving diuretics).

Renal Impairment

PO (Adults): *CCr ≤40 mL/min*—Initiate therapy at 3.75 mg once daily, may be titrated upward carefully to 15 mg/day.

Perindopril

PO (Adults): *Hypertension*—4 mg once daily, may be slowly titrated up to 16 mg/day in 1–2 divided doses (should not exceed 8 mg/day in elderly patients) (begin with 2–4 mg/day in 1–2 divided doses in patients receiving diuretics); *Stable CAD*—4 mg once daily for 2 weeks, may be ↑, if tolerated, to 8 mg once daily; for elderly patients, begin with 2 mg once daily for 1 wk (may be ↑, if tolerated, to 4 mg once daily for 1 week, then, ↑ as tolerated to 8 mg once daily).

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—2 mg/day initially, may be slowly titrated up to 8 mg/day in 1–2 divided doses.

Quinapril

PO (Adults): *Hypertension*—10–20 mg once daily initially, may be titrated q 2 wk up to 80 mg/day in 1–2 divided doses (initiate therapy at 5 mg/day in patients

receiving diuretics); *HF*—5 mg twice daily initially, may be titrated at weekly intervals up to 20 mg twice daily.

Renal Impairment

PO (Adults): *CCr >60 mL/min*—Initiate therapy at 10 mg/day; *CCr 30–60 mL/min*—Initiate therapy at 5 mg/day; *CCr 10–30 mL/min*—Initiate therapy at 2.5 mg/day.

Ramipril

PO (Adults): *Hypertension*—2.5 mg once daily, may be ↑ slowly up to 20 mg/day in 1–2 divided doses (initiate therapy at 1.25 mg/day in patients receiving diuretics). *HF post-MI*—1.25–2.5 mg twice daily initially, may be ↑ slowly up to 5 mg twice daily. *Reduction in risk of MI, stroke, and death from cardiovascular causes*—2.5 mg once daily for 1 wk, then 5 mg once daily for 3 wk, then ↑ as tolerated to 10 mg once daily (can also be given in 2 divided doses).

Renal Impairment

PO (Adults): *CCr <40 mL/min*—Initiate therapy at 1.25 mg once daily, may be slowly titrated up to 5 mg/day in 1–2 divided doses.

Trandolapril

PO (Adults): *Hypertension*—1 mg once daily (2 mg once daily in black patients); *HF post-MI*—Initiate therapy at 1 mg once daily, titrate up to 4 mg once daily if possible.

Renal Impairment

PO (Adults): *CCr <30 mL/min*—Initiate therapy at 0.5 mg once daily, may be slowly titrated upward (maximum dose = 4 mg/day).

Hepatic Impairment

PO (Adults): Initiate therapy at 0.5 mg once daily, may be slowly titrated upward (maximum dose = 4 mg/day).

Availability**Benazepril (generic available)**

Tablets: 5 mg, 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—All strengths \$10.83/100. **In combination with:** amlodipine (Lotrel) and hydrochlorothiazide (Lotensin HCT). See Appendix B.

Captopril (generic available)

Tablets: 12.5 mg, 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—12.5 mg \$77.18/100, 25 mg \$83.44/100, 50 mg \$143.08/100, 100 mg \$190.54/100. **In combination with:** hydrochlorothiazide (Capozide). See Appendix B.

Enalapril (generic available)

Oral solution (mixed berry flavor): 1 mg/mL. **Powder for oral solution (requires reconstitution):** 1 mg/mL. **Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—2.5 mg \$88.33/100, 5 mg \$106.37/100, 10 mg \$117.81/100, 20 mg \$167.64/

100. **In combination with:** hydrochlorothiazide (Vaseretic). See Appendix B.

Enalaprilat (generic available)

Injection: 1.25 mg/mL.

Fosinopril (generic available)

Tablets: 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—All strengths \$107.08/90. **In combination with:** hydrochlorothiazide. See Appendix B.

Lisinopril (generic available)

Oral solution: 1 mg/mL. **Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Generic*—2.5 mg \$9.63/100, 5 mg \$10.83/100, 10 mg \$6.99/100, 20 mg \$9.14/100, 30 mg \$10.83/100, 40 mg \$7.41/100. **In combination with:** hydrochlorothiazide (Prinzide, Zestoretic). See Appendix B.

Moexipril (generic available)

Tablets: 7.5 mg, 15 mg. **Cost:** *Generic*—7.5 mg \$138.92/100, 15 mg \$145.54/100. **In combination with:** hydrochlorothiazide (Uniretic).

Perindopril (generic available)

Tablets: 2 mg, 4 mg, 8 mg. **Cost:** *Generic*—2 mg \$189.77/100, 4 mg \$221.27/100, 8 mg \$268.76/100. **In combination with:** amlodipine (Prestalia). See Appendix B.

Quinapril (generic available)

Tablets: 5 mg, 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—5 mg \$27.20/100, 10 mg \$39.19/100, 20 mg \$21.04/100, 40 mg \$27.50/100. **In combination with:** hydrochlorothiazide (Accuretic, Quinaretic). See Appendix B.

Ramipril (generic available)

Capsules: 1.25 mg, 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—1.25 mg \$153.01/100, 2.5 mg \$180.61/100, 5 mg \$189.49/100, 10 mg \$221.72/100.

Trandolapril (generic available)

Tablets: 1 mg, 2 mg, 4 mg. **Cost:** *Generic*—All strengths \$123.93/100. **In combination with:** verapamil (Tarka). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Hypertension:** Monitor BP and pulse frequently during initial dose adjustment and periodically during therapy. Notify health care professional of significant changes.
- Monitor frequency of prescription refills to determine adherence.
- Assess patient for signs of angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing); may occur at any time during therapy. Discontinue medication and provide supportive care.

- **HF:** Monitor weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Lab Test Considerations:** Monitor BUN, creatinine, and electrolyte levels periodically. Serum potassium and creatinine may be ↑, whereas sodium levels may be ↓. If ↑ BUN or serum creatinine concentrations occur, dose reduction or withdrawal may be required.
- Monitor CBC periodically during therapy. Certain drugs may rarely cause slight ↓ in hemoglobin and hematocrit, leukopenia, and eosinophilia.
- May cause ↑ AST, ALT, alkaline phosphatase, serum bilirubin, uric acid, and glucose.
- Assess urine protein prior to and periodically during therapy for up to 1 yr in patients with renal impairment or those receiving >150 mg/day of captopril. If excessive or ↑ proteinuria occurs, re-evaluate ACE inhibitor therapy.
- **Captopril:** May cause positive ANA titer.
- **Captopril:** May cause false-positive test results for urine acetone.
- **Captopril:** Monitor CBC with differential prior to initiation of therapy, every 2 wk for first 3 mo, and periodically for up to 1 yr in patients at risk for neutropenia (patients with renal impairment or collagen-vascular disease) or at first sign of infection. Discontinue therapy if neutrophil count is <1000/mm³.

Potential Nursing Diagnoses

Decreased cardiac output (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse Accupril with Aciphex. Do not confuse benazepril with Benadryl. Do not confuse captopril with carvedilol. Do not confuse Zestril with Zegerid, Zetia, or Zyprexa.
- Correct volume depletion, if possible, before initiation of therapy.
- **PO:** Precipitous drop in BP during first 1–3 hr after first dose may require volume expansion with normal saline but is not normally considered an indication for stopping therapy. Discontinuing diuretic therapy or cautiously increasing salt intake 2–3 days before initiation may ↓ risk of hypotension. Monitor closely for at least 1 hr after BP has stabilized. Resume diuretics if BP is not controlled.

Benazepril

- **PO:** For patients with difficulty swallowing tablets, pharmacist may compound oral suspension; stable for 30 days if refrigerated. Shake suspension before each use.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Captopril

- **PO:** Administer 1 hr before or 2 hr after meals. May be crushed if patient has difficulty swallowing. Tablets may have a sulfurous odor.
- An oral solution may be prepared by crushing a 25-mg tablet and dissolving it in 25–100 mL of water. Shake for at least 5 min and administer within 30 min.

Enalapril

- **PO:** For patients with difficulty swallowing tablets, oral solution is available ready to use or as a kit containing enalapril powder and Ora-Sweet SF diluent to be mixed prior to dispensing to patient. Shake solution before each use. Solution is stable at controlled room temperature for 60 days.

Enalaprilat

IV Administration

- **IV Push:** **Diluent:** May be administered undiluted. **Concentration:** 1.25 mg/mL. **Rate:** Administer over at least 5 min.
- **Intermittent Infusion:** **Diluent:** Dilute in up to 50 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, or D5/LR. Diluted solution is stable for 24 hr. **Rate:** Administer as a slow infusion over at least 5 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, ephedrine, epinephrine, epirubicin, epoetin, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide,

metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancaronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanyl, tacrolimus, teniposide, tetracycline, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, caspofungin, cefepime, dantrolene, diazepam, diazoxide, phenytoin.

Lisinopril

- **PO:** Oral solution is clear to slightly opalescent. Administer without dilution.

Moexipril

- **PO:** Administer moexipril on an empty stomach, 1 hr before a meal.

Ramipril

- **PO:** Capsules may be opened and sprinkled on applesauce, or dissolved in 4 oz water or apple juice for patients with difficulty swallowing. Effectiveness is same as capsule. Prepared mixtures can be stored for up to 24 hr at room temperature or up to 48 hr if refrigerated.

Trandolapril

- **PO:** May be taken with or without food.

Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day, even if feeling well. Take missed doses as soon as possible but not if almost time for next dose. Do not double doses. Warn patient not to discontinue ACE inhibitor therapy unless directed by health care professional.
- Caution patient to avoid salt substitutes or foods containing high levels of potassium or sodium unless directed by health care professional (see Appendix K).
- Caution patient to change positions slowly to minimize hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may ↑ orthostatic hypotension. Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult

health care professional before taking any new medications, especially cough, cold, or allergy remedies.

- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient that medication may cause impairment of taste that generally resolves within 8–12 wk, even with continued therapy.
- **Instruct patient to notify health care professional immediately if rash; mouth sores; sore throat; fever; swelling of hands or feet; irregular heart beat; chest pain; dry cough; hoarseness; swelling of face, eyes, lips, or tongue; difficulty swallowing or breathing occur;** or if taste impairment or skin rash persists. Persistent dry cough may occur and may not subside until medication is discontinued. Consult health care professional if cough becomes bothersome. Also notify health care professional if nausea, vomiting, or diarrhea occurs and continues.
- Advise diabetic patients to monitor blood glucose closely, especially during first mo of therapy; may cause hypoglycemia.
- Advise women of childbearing age to use contraception and notify health care professional if pregnancy is planned or suspected. If pregnancy is detected, discontinue medication as soon as possible. May be teratogenic.
- Emphasize the importance of follow-up examinations to monitor progress.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family on correct technique for monitoring BP. Advise them to check BP at least weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of excessive side effects.
- Decrease in signs and symptoms of HF (some drugs may also improve survival).
- Decrease in development of overt HF (enalapril).
- Reduction of risk of death or development of HF following MI.
- Reduction of risk of death from cardiovascular causes and MI in patients with stable CAD (perindopril).
- Reduction of risk of MI, stroke, or death from cardiovascular causes in patients at high-risk for these events (ramipril).
- Decrease in progression of diabetic nephropathy (captopril).

olmesartan (ole-me-sar-tan)
Benicar,  Olmetec

telmisartan (tel-mi-sar-tan)
Micardis

valsartan (val-sar-tan)
Diovan

Classification

Therapeutic: antihypertensives

Pharmacologic: angiotensin II receptor antagonists

Indications

Along with other agents in the management of hypertension. Treatment of diabetic nephropathy in patients with type 2 diabetes and hypertension (irbesartan and losartan only). Management of HF (New York Heart Association class II-IV) in patients who cannot tolerate ACE inhibitors (candesartan and valsartan only) or in combination with an ACE inhibitor and beta-blocker (candesartan only). Prevention of stroke in patients with hypertension and left ventricular hypertrophy (losartan only). Reduction of risk of death from cardiovascular causes in patients with left ventricular systolic dysfunction after MI (valsartan only). Reduction of risk of myocardial infarction, stroke, or cardiovascular death in patients ≥ 55 yr who are at high risk for cardiovascular events and are unable to take ACE inhibitors (telmisartan only).

Action

Blocks vasoconstrictor and aldosterone-producing effects of angiotensin II at receptor sites, including vascular smooth muscle and the adrenal glands. **Therapeutic Effects:** Lowering of BP. Slowed progression of diabetic nephropathy (irbesartan and losartan only). Reduced cardiovascular death and hospitalizations due to HF in patients with HF (candesartan and valsartan only). De-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

creased risk of cardiovascular death in patients with left ventricular systolic dysfunction who are post-MI (valsartan only). Decreased risk of stroke in patients with hypertension and left ventricular hypertrophy (effect may be less in black patients) (losartan only).

Pharmacokinetics

Absorption: *Azilsartan*—Azilsartan medoxomil is converted to azilsartan, the active component. 60% absorbed; *Candesartan*—Candesartan cilexetil is converted to candesartan, the active component; 15% bioavailability of candesartan; *Eprosartan*—13% absorbed after oral administration; *Irbesartan*—60–80% absorbed after oral administration; *Losartan*—well absorbed, with extensive first-pass hepatic metabolism, resulting in 33% bioavailability; *Olmesartan*—Olmesartan medoxomil is converted to olmesartan, the active component; 26% bioavailability of olmesartan; *Telmisartan*—42–58% absorbed following oral administration (bioavailability ↑ in patients with hepatic impairment); *Valsartan*—10–35% absorbed following oral administration.

Distribution: All angiotensin receptor blockers (ARBs) cross the placenta; *Candesartan*—enters breast milk.

Protein Binding: All ARBs are >90% protein-bound.

Metabolism and Excretion: *Azilsartan*—50% metabolized by the liver, primarily by the CYP2C9 enzyme system. 55% eliminated in feces, 42% in urine (15% as unchanged drug); *Candesartan*—Minor metabolism by the liver; 33% excreted in urine, 67% in feces (via bile); *Eprosartan*—Excreted primarily unchanged in feces via biliary excretion; *Irbesartan*—Some hepatic metabolism; 20% excreted in urine, 80% in feces; *Losartan*—Undergoes extensive first-pass hepatic metabolism; 14% is converted to an active metabolite. 4% excreted unchanged in urine; 6% excreted in urine as active metabolite; some biliary elimination; *Olmesartan*—30–50% excreted unchanged in urine, remainder eliminated in feces via bile; *Telmisartan*—Excreted mostly unchanged in feces via biliary excretion; *Valsartan*—Minor metabolism by the liver; 13% excreted in urine, 83% in feces.

Half-life: *Azilsartan*—11 hr; *Candesartan*—9 hr; *Eprosartan*—20 hr; *Irbesartan*—11–15 hr; *Losartan*—2 hr (6–9 hr for metabolite); *Olmesartan*—13 hr; *Telmisartan*—24 hr; *Valsartan*—6 hr.

TIME/ACTION PROFILE (antihypertensive effect with chronic dosing)

DRUG	ONSET	PEAK	DURATION
Azilsartan	within 2 hr	18 hr	24 hr
Candesartan	2–4 hr	4 wk	24 hr
Eprosartan	1–2 hr	2–3 wk	12–24 hr
Irbesartan	within 2 hr	2 wk	24 hr
Losartan	6 hr	3–6 wk	24 hr
Olmesartan	within 1 wk	2 wk	24 hr
Telmisartan	within 3 hr	4 wk	24 hr
Valsartan	within 2 hr	4 wk	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use with aliskiren in patients with diabetes or moderate-to-severe renal impairment (CCr <60 mL/min); Severe hepatic impairment (candesartan); **OB:** Can cause injury or death of fetus—if pregnancy occurs, discontinue immediately; **Lactation:** Discontinue drug or use formula.

Use Cautiously in: HF (may result in azotemia, oliguria, acute renal failure and/or death); Volume- or salt-depleted patients or patients receiving high doses of diuretics (correct deficits before initiating therapy or initiate at lower doses); ⚠ Black patients (may not be effective); Impaired renal function due to primary renal disease or HF (may worsen renal function); Obstructive biliary disorders (telmisartan) or hepatic impairment (losartan, or telmisartan); Women of childbearing potential; **Pedi:** Safety not established in children <18 yr (<6 yr for losartan, olmesartan, and valsartan).

Adverse Reactions/Side Effects

CNS: dizziness, anxiety, depression, fatigue, headache, insomnia, weakness. **CV:** hypotension, chest pain, edema, tachycardia. **Derm:** rashes. **EENT:** nasal congestion, pharyngitis, rhinitis, sinusitis. **GI:** abdominal pain, diarrhea, drug-induced hepatitis, dyspepsia, nausea, vomiting. **GU:** impaired renal function. **F and E:** hyperkalemia. **MS:** arthralgia, back pain, myalgia.

Misc: ANGIOEDEMA.

Interactions

Drug-Drug: NSAIDs and selective COX-2 inhibitors may blunt the antihypertensive effect and ↑ the risk of renal dysfunction. ↑ antihypertensive effects with other antihypertensives and diuretics. Telmisartan may ↑ serum digoxin levels. Concurrent use of potassium-sparing diuretics, potassium-containing salt substitutes, or potassium supplements may ↑ risk of hyperkalemia. ↑ risk of hyperkalemia, renal dysfunction, hypotension, and syncope with concurrent use of ACE inhibitors or aliskiren; avoid concurrent use with aliskiren in patients with diabetes or CCr <60 mL/min; avoid concurrent use with ACE inhibitors. Candesartan, valsartan, and irbesartan may ↑ lithium levels. Irbesartan and losartan may ↑ effects of amiodarone, fluoxetine, glimepiride, glipizide, phenytoin, rosiglitazone, and warfarin. Rifampin may ↓ effects of losartan. ↑ risk of renal dysfunction when telmisartan used with ramipril (concurrent use not recommended). Colesevelam may ↓ olmesartan levels; administer olmesartan ≥4 hr before colesevelam.

Route/Dosage

Azilsartan

PO (Adults): 80 mg once daily, initial dose may be ↓ to 40 mg once daily if high doses of diuretics are used concurrently.

Candesartan

PO (Adults): *Hypertension*—16 mg once daily; may be ↑ up to 32 mg/day in 1–2 divided doses (begin therapy at a lower dose in patients who are receiving diuretics or are volume depleted). *HF*—4 mg once daily initially, dose may be doubled at 2 wk intervals up to target dose of 32 mg once daily.

PO (Children 6–16 yr and >50 kg): 8–16 mg/day (in 1–2 divided doses); may be ↑ up to 32 mg/day (in 1–2 divided doses).

PO (Children 6–16 yr and <50 kg): 4–8 mg/day (in 1–2 divided doses); may be ↑ up to 16 mg/day (in 1–2 divided doses).

PO (Children 1–5 yr): 0.20 mg/kg/day (in 1–2 divided doses); may be ↑ up to 0.4 mg/kg/day (in 1–2 divided doses).

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—Initiate at 8 mg once daily.

Eprosartan

PO (Adults): 600 mg once daily; may be ↑ to 800 mg/day (in 1–2 divided doses) (usual range 400–800 mg/day).

Renal Impairment

PO (Adults): *CCr <60 mL/min*—Do not exceed 600 mg/day.

Irbesartan

PO (Adults): *Hypertension*—150 mg once daily; may be ↑ to 300 mg once daily. Initiate therapy at 75 mg once daily in patients who are receiving diuretics or are volume depleted. *Type 2 diabetic nephropathy*—300 mg once daily.

Losartan

PO (Adults): *Hypertension*—50 mg once daily initially (range 25–100 mg/day as a single daily dose or 2 divided doses) (initiate therapy at 25 mg once daily in patients who are receiving diuretics or are volume depleted). *Prevention of stroke in patients with hypertension and left ventricular hypertrophy*—50 mg once daily initially; hydrochlorothiazide 12.5 mg once daily should be added and/or dose of losartan ↑ to 100 mg once daily followed by an ↑ in hydrochlorothiazide to 25 mg once daily based on BP response. *Type 2 diabetic nephropathy*—50 mg once daily, may ↑ to 100 mg once daily depending on BP response.

Hepatic Impairment

PO (Adults): 25 mg once daily initially; may be ↑ as tolerated.

PO (Children >6 yr): *Hypertension*—0.7 mg/kg once daily (up to 50 mg/day), may be titrated up to 1.4 mg/kg/day (or 100 mg/day).

Renal Impairment

PO (Children >6 yr): *CCr <30 mL/min*—Contraindicated.

Olmesartan

PO (Adults): 20 mg once daily; may be ↑ up to 40 mg once daily (patients who are receiving diuretics or are volume-depleted should be started on lower doses).

PO (Children 6–16 yr): ≈35 kg—20 mg once daily; may be ↑ after 2 wk up to 40 mg once daily; 20–34.9 kg—10 mg once daily; may be ↑ after 2 wk up to 20 mg once daily.

Telmisartan

PO (Adults): *Hypertension*—40 mg once daily (volume-depleted patients should start with 20 mg once daily); may be titrated up to 80 mg/day; *Cardiovascular risk reduction*—80 mg once daily.

Valsartan

PO (Adults): *Hypertension*—80 mg or 160 mg once daily initially in patients who are not volume-depleted; may be ↑ to 320 mg once daily; *HF*—40 mg twice daily, may be titrated up to target dose of 160 mg twice daily as tolerated; *Post-MI*—20 mg twice daily (may be initiated ≥ 12 hr after MI); dose may be titrated up to target dose of 160 mg twice daily, as tolerated.

PO (Children 6–16 yr): *Hypertension*—1.3 mg/kg once daily (maximum dose = 40 mg/day); may be ↑ up to 2.7 mg/kg once daily (maximum dose = 160 mg/day).

Availability**Azilsartan**

Tablets: 40 mg, 80 mg. **Cost:** All strengths \$113.23/30. **In combination with:** chlorthalidone (Edarbyclor); see Appendix B.

Candesartan (generic available)

Tablets: 4 mg, 8 mg, 16 mg, 32 mg. **Cost:** *Generic*—4 mg \$99.16/30, 8 mg \$99.16/30, 16 mg \$285.56/30, 32 mg \$386.60/30. **In combination with:** hydrochlorothiazide (Atacand HCT); see Appendix B.

Eprosartan (generic available)

Tablets: 400 mg, 600 mg. **Cost:** *Generic*—600 mg \$102.78/30. **In combination with:** hydrochlorothiazide (Teveten HCT); see Appendix B.

Irbesartan (generic available)

Tablets: 75 mg, 150 mg, 300 mg. **Cost:** *Generic*—75 mg \$10.44/90, 150 mg \$279.97/90, 300 mg \$31.13/90. **In combination with:** hydrochlorothiazide (Avalide); see Appendix B.

Losartan (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg \$151.43/90, 50 mg \$67.88/30, 100 mg \$277.36/

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

90. **In combination with:** hydrochlorothiazide (Hyzaar); see Appendix B.

Olmesartan (generic available)

Tablets: 5 mg, 20 mg, 40 mg. **Cost:** 5 mg \$288.15/90, 20 mg \$358.41/90, 40 mg \$543.45/100. **In combination with:** hydrochlorothiazide (Benicar HCT); amlodipine (Azor); see Appendix B.

Telmisartan (generic available)

Tablets: 20 mg, 40 mg, 80 mg. **Cost:** 20 mg \$445.33/90, 40 mg \$441.19/90, 80 mg \$441.19/90. **In combination with:** hydrochlorothiazide (Micardis HCT); amlodipine (Twynsta); see Appendix B.

Valsartan (generic available)

Tablets: 40 mg, 80 mg, 160 mg, 320 mg. **Cost:** 40 mg \$330.05/90, 80 mg \$428.25/90, 160 mg \$469.86/90, 320 mg \$581.92/90. **In combination with:** amlodipine (Exforge); hydrochlorothiazide (Diovan HCT); amlodipine and hydrochlorothiazide (Exforge HCT); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess BP (lying, sitting, standing) and pulse periodically during therapy. Notify health care professional of significant changes.
- Monitor frequency of prescription refills to determine adherence.
- **Assess patient for signs of angioedema (dyspnea, facial swelling). May rarely cause angioedema.**
- **HF:** Monitor daily weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Lab Test Considerations:** Monitor renal function and electrolyte levels periodically. Serum potassium, BUN, and serum creatinine may be ↑.
- May cause ↑ AST, ALT, and serum bilirubin (candesartan and olmesartan only).
- May cause ↑ uric acid, slight ↓ in hemoglobin and hematocrit, neutropenia, and thrombocytopenia.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse Benicar with Mevacor. Do not confuse Diovan with Zyban.**
- Correct volume depletion, if possible, prior to initiation of therapy.
- **PO:** May be administered without regard to meals.

Losartan

- **PO:** For patients with difficulty swallowing tablets, pharmacist can compound oral suspension; stable for 4 wk if refrigerated. Shake suspension before each use.

Patient/Family Teaching

- Emphasize the importance of continuing to take as directed, even if feeling well. Take missed doses as soon as remembered if not almost time for next dose; do not double doses. Instruct patient to take medication at the same time each day. Warn patient not to discontinue therapy unless directed by health care professional.
- Caution patient to avoid salt substitutes containing potassium or food containing high levels of potassium or sodium unless directed by health care professional. See Appendix K.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may increase orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially NSAIDs and cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- **Instruct patient to notify health care professional immediately if swelling of face, eyes, lips, or tongue occurs, or if difficulty swallowing or breathing occurs.**
- Advise women with reproductive potential to use contraception and notify health care professional if pregnancy is suspected or planned, or if breast feeding. If pregnancy is detected, discontinue medication as soon as possible.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, stress management). Medication controls but dose not cure hypertension.
- Instruct patient and family on proper technique for monitoring BP. Advise them to check BP at least weekly and to report significant changes.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of excessive side effects.
- Slowed progression of diabetic nephropathy (irbesartan, losartan).
- Decreased cardiovascular death and HF-related hospitalizations in patients with HF (candesartan).
- Decreased hospitalizations in patients with HF (valsartan).
- Decreased risk of cardiovascular death in patients with left ventricular systolic dysfunction after MI (valsartan).

- Reduced risk of stroke in patients with hypertension and left ventricular hypertrophy (losartan).
- Reduction of risk of myocardial infarction, stroke, or cardiovascular death (telmisartan).

anidulafungin (a-ni-du-la-fun-gin)

Eraxis

Classification

Therapeutic: antifungals

Pharmacologic: echinocandins

Indications

Candidemia and other serious candidal infections including intra-abdominal abscess, peritonitis. Esophageal candidiasis.

Action

Inhibits the synthesis of fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi. **Spectrum:** Active against *Candida albicans*, *C. glabrata*, *C. parapsilosis*, and *C. tropicalis*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Crosses the placenta.

Metabolism and Excretion: Undergoes chemical degradation without hepatic metabolism; <1% excreted in urine.

Half-life: 40–50 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Underlying liver disease (may worsen); **OB, Lactation:** Pregnancy or lactation; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

Resp: bronchospasm, dyspnea. **CV:** hypotension. **GI:** diarrhea, ↑ liver enzymes. **Derm:** flushing, rash, urticaria. **F and E:** hypokalemia. **Misc:** ANAPHYLAXIS, infusion reaction.

Interactions

Drug-Drug: None noted.

Route/Dosage

IV (Adults): *Esophageal candidiasis*—100 mg loading dose on day 1, then 50 mg daily. *Candidemia and other candidal infections*—200 mg loading dose on day 1, then 100 mg daily.

Availability

Lyophilized powder for IV use (requires reconstitution): 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess infected area and monitor cultures before and periodically during therapy.
- Specimens for culture should be taken before instituting therapy. Therapy may be started before results are obtained.
- **Monitor for signs and symptoms of anaphylaxis** (rash, urticaria, flushing, pruritus, bronchospasm, dyspnea, hypotension); usually related to histamine release. To decrease risk, do not exceed a rate of infusion of 1.1 mg/minute.
- **Lab Test Considerations:** May cause ↑ ALT, AST, alkaline phosphatase, and hepatic enzymes.
- May cause hypokalemia.
- May cause neutropenia and leukopenia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

IV Administration

- **Intermittent Infusion:** Reconstitute each 50 mg vial with 15 mL or the 100 mg vial with 30 mL of Sterile Water for Injection for a concentration of 3.33 mg/mL. May be stored in refrigerator for up to 1 hr. **Diluent:** Further dilute within 24 hr by transferring contents of reconstituted vial into IV bag of D5W or 0.9% NaCl. For the 50 mg dose, dilute with 85 mL for an infusion volume of 100 mL. For the 100 mg dose, dilute with 170 mL for an infusion volume of 200 mL. For the 200 mg dose, dilute with 340 mL for a total infusion volume of 400 mL. **Concentration:** Final concentration should not exceed 0.5 mg/mL. Do not administer solutions that are discolored or contain particulate matter. Store reconstituted solution in refrigerator; do not freeze. Administer within 24 hr. **Rate:** Administer at a rate not to exceed 1.1 mg/min (1.4 mL/min or 84 mL/hr).
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarba-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

zine, dactinomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nafcillin, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, dantrolene, diazepam, ertapenem, magnesium sulfate, nalbuphine, pemetrexed, phenytoin, potassium phosphates, sodium bicarbonate, sodium phosphates.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Instruct patient to notify health care professional if signs and symptoms of anaphylaxis occur or if diarrhea becomes pronounced.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Duration of therapy should be based on the patient's clinical response. Therapy should be continued for at least 14 days after the last positive culture. For esophageal candidiasis, treatment should continue for at least 7 days following resolution of symptoms.

Lamisil AT

tolnaftate (tol-naff-tate)

✳Absorbine Jr, ✳Flexitol, ✳Fungicure, Lamisil AF, ✳Pitrex, Podactin, ✳Proclearz, Tinactin

Classification

Therapeutic: antifungals (topical)

Indications

Treatment of a variety of cutaneous fungal infections, including cutaneous candidiasis, tinea pedis (athlete's foot), tinea cruris (jock itch), tinea corporis (ringworm), tinea versicolor, seborrheic dermatitis, dandruff, and onychomycosis of fingernails and toes.

Action

Butenafine, nystatin, clotrimazole, econazole, ketoconazole, luliconazole, miconazole, naftifine, oxiconazole, sulconazole, and terbinafine affect the synthesis of the fungal cell wall, allowing leakage of cellular contents.

Tolnaftate distorts the hyphae and stunts mycelial growth in fungi. Ciclopirox inhibits the transport of essential elements in the fungal cell, disrupting the synthesis of DNA, RNA, and protein. **Therapeutic Effects:** Decrease in symptoms of fungal infection.

Pharmacokinetics

Absorption: Absorption through intact skin is minimal.

Distribution: Distribution after topical administration is primarily local.

Metabolism and Excretion: Metabolism and excretion not known following local application.

Half-life: *Butenafine*—35 hr; *Ciclopirox*—5.5 hr (gel); *Terbinafine*—21 hr.

TIME/ACTION PROFILE (resolution of symptoms/lesions†)

ROUTE	ONSET	PEAK	DURATION
Butenafine	unknown	up to 4 wk	unknown
Luliconazole	unknown	3–4 wk	unknown
Tolnaftate	24–72 hr	unknown	unknown

† Only the drugs with known information included in this table.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to active ingredients, additives, preservatives, or bases; Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance.

Use Cautiously in: Nail and scalp infections (may require additional systemic therapy); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

Local: burning, itching, local hypersensitivity reactions, redness, stinging.

Interactions

Drug-Drug: Econazole may ↑ levels of and risk of bleeding from **warfarin**.

Route/Dosage

Butenafine

Topical (Adults and Children >12 yr): Apply once daily for 2 wk for tinea corporis, tinea cruris, or tinea versicolor. Apply once daily for 4 wk or once daily for 7 days for tinea pedis.

Ciclopirox

Topical (Adults and Children >10 yr): *Cream/Lotion*—Apply twice daily for 2–4 wk; *Topical solution (nail lacquer)*—Apply to nails at bedtime or 8 hr prior to bathing for up to 48 wk. Each daily application should be made over the previous coat and then removed with alcohol every 7 days; *Gel*—Apply twice daily for 4 wk; *Shampoo*—5–10 mL applied to scalp,

lather and leave on for 3 min, rinse; repeat twice weekly for 4 wk (at least 3 days between applications).

Clotrimazole

Topical (Adults and Children >3 yr): Apply twice daily for 1–4 wk.

Econazole

Topical (Adults and Children): Apply once daily for tinea pedis (for 4 wk), tinea cruris (for 2 wk), tinea corporis (for 2 wk), or tinea versicolor (for 2 wk). Apply twice daily for cutaneous candidiasis (for 2 wk).

Ketoconazole

Topical (Adults): Apply cream once daily for cutaneous candidiasis (for 2 wk), tinea corporis (for 2 wk), tinea cruris (for 2 wk), tinea pedis (for 6 wk), or tinea versicolor (for 2 wk). Apply cream twice daily for seborrheic dermatitis (for 4 wk). For dandruff, use shampoo twice weekly (wait 3–4 days between treatments) for 4 wk, then intermittently.

Luliconazole

Topical (Adults): *Interdigital tinea pedis*—Apply to affected and surrounding areas once daily for 2 wk; *Tinea cruris and tinea corporis*—Apply to affected and surrounding areas once daily for 1 wk.

Miconazole

Topical (Adults and Children >2 yr): Apply twice daily. Treat tinea cruris for 2 wk and tinea pedis or tinea corporis for 4 wk.

Naftifine

Topical (Adults): *Interdigital tinea pedis*—Apply cream or gel once daily for 2 wk; *Tinea cruris or tinea corporis*—apply cream once daily for 2 wk.

Topical (Children ≥12 yr): *Interdigital tinea pedis*—Apply cream or gel once daily for 2 wk.

Topical (Children ≥2 yr): *Tinea corporis*—Apply cream once daily for 2 wk.

Nystatin

Topical (Adults and Children): Apply 2–3 times daily until healing is complete.

Oxiconazole

Topical (Adults and Children): Apply cream or lotion 1–2 times daily for tinea pedis (for 4 wk), tinea corporis (for 2 wk), or tinea cruris (for 2 wk). Apply cream once daily for tinea versicolor (for 2 wk).

Sulconazole

Topical (Adults): Apply 1–2 times daily (twice daily for tinea pedis). Treat tinea corporis, tinea cruris, or tinea versicolor for 3 wk, and tinea pedis for 4 wk.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicates most frequent.

Terbinafine

Topical (Adults): Apply twice daily for tinea pedis (for 1 wk) or daily for tinea cruris or tinea corporis for 1 wk.

Tolnaftate

Topical (Adults): Apply twice daily for tinea cruris (for 2 wk), tinea pedis (for 4 wk), or tinea corporis (for 4 wk).

NURSING IMPLICATIONS**Assessment**

- Inspect involved areas of skin and mucous membranes before and frequently during therapy. In-

creased skin irritation may indicate need to discontinue medication.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

Risk for infection (Indications)

Implementation

- Consult health care professional for proper cleansing technique before applying medication.
- Choice of vehicle is based on use. Ointments, creams, and liquids are used as primary therapy. Lotion is usually preferred in intertriginous areas; if cream is used, apply sparingly to avoid maceration. Powders are usually used as adjunctive therapy but may be used as primary therapy for mild conditions (especially for moist lesions).
- Topical:** Apply small amount to cover affected area completely. Avoid use of occlusive wrappings or dressings unless directed by health care professional.
- Nail lacquer:** Avoid contact with skin other than skin immediately surrounding treated nail. Avoid contact with eyes or mucous membranes. Removal of unattached, infected nail, as frequently as monthly, by health care professional is needed with use of this medication. Up to 48 wk of daily application and professional removal may be required to achieve clear or almost clear nail. 6 mo of treatment may be required before results are noticed.
- Ciclopirox or Ketoconazole shampoo:** Moisten hair and scalp thoroughly with water. Apply sufficient shampoo to produce enough lather to wash scalp and hair and gently massage it over the entire scalp area for approximately 1 min. Rinse hair thoroughly with warm water. Repeat process, leaving shampoo on hair for an additional 3 min. After the 2nd shampoo, rinse and dry hair with towel or warm air flow. Shampoo twice a wk for 4 wk with at least 3 days between each shampooing and then intermittently as needed to maintain control.
- Ketoconazole foam:** Hold container upright and dispense foam into cap of can or other smooth surface; dispensing directly on to hand is not recommended as the foam begins to melt immediately on contact with warm skin. Pick up small amounts with fingertips and gently massage into affected areas until absorbed. Move hair to allow direct application to skin.

Patient/Family Teaching

- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Emphasize the importance of avoiding the eyes.
- Caution patient that some products may stain fabric, skin, or hair. Check label information. Fabrics stained from cream or lotion can usually be cleaned by hand washing with soap and warm water; stains from ointments can usually be removed with standard cleaning fluids.

- Patients with athlete's foot should be taught to wear well-fitting, ventilated shoes, to wash affected areas thoroughly, and to change shoes and socks at least once a day.
- Advise patient to report increased skin irritation or lack of response to therapy to health care professional.
- **Nail lacquer:** File away loose nail and trim nails every 7 days after solution is removed with alcohol. Do not use nail polish on treated nails. Inform health care professional if patient has diabetes mellitus before using.

Evaluation/Desired Outcomes

- Decrease in skin irritation and resolution of infection. Early relief of symptoms may be seen in 2–3 days. For *Candida*, tinea cruris, and tinea corporis, 2 wk are needed, and for tinea pedis, therapeutic response may take 3–4 wk. Recurrent fungal infections may be a sign of systemic illness.

ANTIFUNGALS (VAGINAL)

butoconazole

(byoo-toe-kon-a-zole)
Gynezone-1, Mycelex-3

clotrimazole (kloe-trye-ma-zole)

★ Canesten, ★ Clotrimaderm, Gyne-Lotrimin-3, Mycelex-7

miconazole (mye-kon-a-zole)

Monistat-1, Monistat-3, Monistat-7, Vagistat-3

terconazole (ter-kon-a-zole)

Terazol-3, Terazol-7

tioconazole (tye-oh-kon-a-zole)

1-Day, Monistat-1Day, Vagistat-1

Classification

Therapeutic: antifungals (vaginal)

Indications

Treatment of vulvovaginal candidiasis.

Action

Affects the permeability of the fungal cell wall, allowing leakage of cellular contents. Not active against bacteria.

Therapeutic Effects: Inhibited growth and death of susceptible *Candida*, with decrease in accompanying symptoms of vulvovaginitis (vaginal burning, itching, discharge).

Pharmacokinetics

Absorption: Absorption through intact skin is minimal.

Distribution: Unknown. Action is primarily local.

Metabolism and Excretion: Negligible with local application.

Half-life: Not applicable.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
All agents	rapid	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to active ingredients, additives, or preservatives; **OB:** Safety not established; **Lactation:** Safety not established.

Use Cautiously in: None noted.

Adverse Reactions/Side Effects

Derm: *terconazole*—**TOXIC EPIDERMAL NECROLYSIS.**

GU: itching, pelvic pain, vulvovaginal burning. **Misc:** *terconazole*—**ANAPHYLAXIS.**

Interactions

Drug-Drug: Concurrent use of vaginal miconazole with **warfarin** ↑ risk of bleeding/bruising (appropriate monitoring recommended).

Route/Dosage

Butoconazole

Vag (Adults and Children ≥12 yr): 1 applicatorful (5 g) at bedtime for 3 days (Mycelex-3) *or* one applicatorful single dose (Gynezone-1).

Clotrimazole

Vag (Adults and Children >12 yr): *Vaginal tablets*—100 mg at bedtime for 7 nights (preferred regimen for pregnancy) *or* 200 mg at bedtime for 3 nights. *Vaginal cream*—1 applicatorful (5 g) of 1% cream at bedtime for 7 days *or* 1 applicatorful (5 g) of 2% cream at bedtime for 3 days.

Miconazole

Vag (Adults and Children ≥12 yr): *Vaginal suppositories*—one 100-mg suppository at bedtime for 7 days *or* one 200-mg suppository at bedtime for 3 days *or* one 1200-mg suppository as a single dose. *Vaginal cream*—1 applicatorful of 2% cream at bedtime for 7 days *or* 1 applicatorful of 4% cream at bedtime for 3 days. *Combination packages*—contain a cream *or* suppositories as well as an external vaginal cream (may be used twice daily for up to 7 days, as needed, for symptomatic management of itching).

Terconazole

Vag (Adults): *Vaginal cream*—1 applicatorful (5 g) of 0.4% cream at bedtime for 7 days *or* 1 applicatorful (5 g) of 0.8% cream at bedtime for 3 days. *Vaginal suppositories*—1 suppository (80 mg) at bedtime for 3 days.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Tioconazole

Vag (Adults and Children ≥ 12 yr): 1 applicatorful (4.6 g) at bedtime as a single dose.

Availability**Butoconazole**

Vaginal cream: 2%^{Rx, OTC}.

Clotrimazole (generic available)

Vaginal tablets: 100 mg^{OTC}, 200 mg^{OTC}. **Vaginal cream:** 1%^{OTC}, 2%^{OTC}.

Miconazole (generic available)

Vaginal cream: 2%^{OTC}, 4%^{OTC}. **Vaginal suppositories:** 100 mg^{OTC}, 200 mg^{Rx, OTC}. **In combination with:** combination package of three 200-mg suppositories and 2% external cream^{OTC}; one 1200-mg suppository and 2% external cream^{OTC}; 4% vaginal cream and 2% external cream^{OTC}; seven 100-mg suppositories and 2% external cream^{OTC}; 2% vaginal cream and 2% external cream^{OTC}.

Terconazole (generic available)

Vaginal cream: 0.4%, 0.8%. **Vaginal suppositories:** 80 mg.

Tioconazole

Vaginal ointment: 6.5%^{OTC}.

NURSING IMPLICATIONS**Assessment**

- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

Potential Nursing Diagnoses

Risk for infection (Indications)

Risk for impaired skin integrity (Indications)

Implementation

- Consult health care professional for proper cleansing technique before applying medication.
- Vag:** Applicators are supplied for vaginal administration.

Patient/Family Teaching

- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Therapy should be continued during menstrual period.
- Instruct patient on proper use of vaginal applicator. Medication should be inserted high into the vagina at bedtime. Instruct patient to remain recumbent for at least 30 min after insertion. Advise use of sanitary napkins to prevent staining of clothing or bedding.
- Advise patient to avoid using tampons while using this product.
- Advise patient to consult health care professional regarding intercourse during therapy. Vaginal medication may cause minor skin irritation in sexual partner. Advise patient to refrain from sexual contact during therapy or have male partner wear a con-

dom. Some products may weaken latex contraceptive devices. Another method of contraception should be used during treatment.

- Advise patient to report to health care professional increased skin irritation or lack of response to therapy. A second course may be necessary if symptoms persist.
- Instruct patient to stop using medication and notify health care professional if rash or signs and symptoms of anaphylaxis (wheezing, rash, hives, shortness of breath) occur.**
- Advise patient to dispose of applicator after each use (except for terconazole).

Evaluation/Desired Outcomes

- Decrease in skin irritation and vaginal discomfort. Therapeutic response is usually seen after 1 wk. Diagnosis should be reconfirmed with smears or cultures before a second course of therapy to rule out other pathogens associated with vulvovaginitis. Recurrent vaginal infections may be a sign of systemic illness.

apixaban (a-pix-a-ban)

Eliquis

Classification

Therapeutic: anticoagulants

Pharmacologic: factor Xa inhibitors

Indications

Decreases risk of stroke/systemic embolism associated with nonvalvular atrial fibrillation. Prevention of deep vein thrombosis that may lead to pulmonary embolism following knee or hip replacement surgery. Treatment of and reduction in risk of recurrence of deep vein thrombosis (DVT) or pulmonary embolism (PE).

Action

Acts as a selective, reversible site inhibitor of factor Xa, inhibiting both free and bound factor. Does not affect platelet aggregation directly, but does inhibit thrombin-induced platelet aggregation. Decreases thrombin generation and thrombus development. **Therapeutic Effects:** Treatment and prevention of thromboembolic events.

Pharmacokinetics

Absorption: 50% absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: 25% metabolized (mostly by CYP3A4) and excreted in urine and feces. Biliary and direct intestinal excretion account for fecal elimination.

Half-life: 6 hr (12 hr after repeated dosing due to prolonged absorption).

TIME/ACTION PROFILE (effect on hemostasis)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr†	24 hr

†Blood levels.

Contraindications/Precautions

Contraindicated in: Previous severe hypersensitivity reactions; Active pathological bleeding; Severe hepatic impairment; Not recommended for use in patients with prosthetic heart valves; Concurrent use of strong dual inducers of CYP3A4 and P-gp; PE with hemodynamic instability or requiring thrombolysis or pulmonary embolectomy; **Lactation:** Should not be used.

Use Cautiously in: Neuroaxial spinal anesthesia or spinal puncture, especially if concurrent with an indwelling epidural catheter, drugs affecting hemostasis, history of traumatic/repeated spinal puncture or spinal deformity (↑ risk of spinal hematoma); Discontinuation ↑ risk of thromboses; Surgery; Renal impairment (dose ↓ may be required); Moderate hepatic impairment (↑ risk of bleeding); Concurrent use of strong dual inhibitors of CYP3A4 and P-gp systems (dose ↓ required); **OB:** Use during pregnancy only if potential benefit outweighs possible risks to mother and fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

Hemat: **BLEEDING.** **Misc:** hypersensitivity reactions including **ANAPHYLAXIS.**

Interactions

Drug-Drug: ↑ risk of bleeding with other **anticoagulants, aspirin, clopidogrel, ticagrelor, prasugrel, fibrinolytics, NSAIDs, SNRIs, or SSRIs.** Concurrent use of strong inhibitors of both the CYP3A4 and P-gp enzyme systems (including **clarithromycin, itraconazole, ketoconazole, and ritonavir**) ↑ levels and bleeding risk; dosage of apixaban should be ↓ to 2.5 mg twice daily. If other reasons for ↓ dose exist, apixaban should be avoided. Inducers of the CYP3A4 enzyme system and the P-gp system including **carbamazepine, phenytoin, rifampin** will ↓ levels and may ↑ risk of thromboses; avoid concomitant use.

Drug-Natural Products: Concurrent use **St. John's wort**, a strong dual inducer of the CYP3A4 and P-gp enzyme systems can ↓ levels and ↑ risk of thromboses and should be avoided.

Route/Dosage

Reduction in Risk of Stroke/Systemic Embolism in Nonvalvular Atrial Fibrillation

PO (Adults): 5 mg twice daily; *Any 2 of the following: age ≥80 yr, weight ≤60 kg, serum creatinine ≥1.5 mg/dL.*—2.5 mg twice daily; *Concurrent use of strong*

inhibitors of both CYP3A4 and P-gp—2.5 mg twice daily; if patient already taking 2.5 mg twice daily, avoid concomitant use.

Renal Impairment

PO (Adults): *HD—5 mg twice daily; HD and either age ≥80 yr or weight ≤60 kg—2.5 mg twice daily.*

Prevention of Deep Vein Thrombosis Following Knee or Hip Replacement Surgery

PO (Adults): 2.5 mg twice daily, initiated 12–24 hr post-operatively (when hemostasis is achieved) continued for 35 days after hip replacement or 12 days after knee replacement.

Treatment of DVT or PE

PO (Adults): 10 mg twice daily for 7 days, then 5 mg twice daily.

Reduction in Risk of Recurrence of DVT or PE

PO (Adults): 2.5 mg twice daily after ≥6 mo of treatment of DVT or PE.

Availability

Tablets: 2.5 mg, 5 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of stroke, DVT, PE, or peripheral vascular disease periodically during therapy.
- **Toxicity and Overdose:** An antidote or reversal agent is not available. Effects persist for at least 24 hrs after last dose. Oral activated charcoal decreases apixaban absorption, lowering plasma concentrations. Other agents and hemodialysis do not have a significant effect.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Adverse Reactions)

Implementation

- When *converting from warfarin*, discontinue warfarin and start apixaban when INR is <2.0.
- When *converting from apixaban to warfarin*, apixaban affects INR, so INR measurements may not be useful for determining appropriate dose of warfarin. If continuous anticoagulation is necessary, discontinue apixaban and begin both a parenteral anticoagulant and warfarin at time of next dose of apixaban, discontinue parenteral anticoagulant when INR reaches acceptable range.
- When *switching between apixaban and anticoagulants other than warfarin*, discontinue one being taken and begin the other at the next scheduled dose.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- *For surgery*, discontinue apixaban at least 48 hrs before invasive or surgical procedures with a moderate or high risk of unacceptable or clinically significant bleeding or at least 24 hrs prior to procedures with a low risk of bleeding or where the bleeding would be non-critical in location and easily controlled.
- **PO:** Administer twice daily without regard to food.
- For patients who cannot swallow tablet, 5 mg and 2.5 mg tablets can be crushed, suspended in water, D5W, or apple juice, or mixed with applesauce and administered immediately orally. May also be suspended in 60 mL of water or D5W and promptly administered through a nasogastric tube.

Patient/Family Teaching

- Instruct patient to take apixaban as directed. Take missed doses as soon as remembered on the same day and resume twice daily administration; do not double doses. Do not discontinue without consulting health care professional; may increase risk of having a stroke, DVT, or PE. If temporarily discontinued, restart as soon as possible. Store apixaban at room temperature. Advise patient to read *Medication Guide* before beginning therapy and with each Rx refill in case of changes.
- Inform patient that they may bruise and bleed more easily or longer than usual. Advise patient to notify health care professional immediately if signs of bleeding (unusual bruising, pink or brown urine, red or black, tarry stools, coughing up blood, vomiting blood, pain or swelling in a joint, headache, dizziness, weakness, recurring nose bleeds, unusual bleeding from gums, heavier than normal menstrual bleeding, dyspepsia, abdominal pain, epigastric pain) occurs or if injury occurs, especially head injury.
- Caution patient to notify health care professional if skin rash or signs of severe allergic reaction (chest pain or tightness, swelling of face or tongue, trouble breathing or wheezing, feeling dizzy or faint) occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's Wort. Risk of bleeding is increased with aspirin, NSAIDs, warfarin, heparin, SSRIs or SNRIs.
- Inform patient having had neuraxial anesthesia or spinal puncture to watch for signs and symptoms of spinal or epidural hematomas (numbness or weakness of legs, bowel or bladder dysfunction). Notify health care professional immediately if symptoms occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Reduction in the risk and treatment of stroke and systemic embolism.

aprepitant (oral)

(a-prep-i-tant)

Emend

fosaprepitant (injection)

(fos-a-prep-i-tant)

Emend

Classification

Therapeutic: antiemetics

Pharmacologic: neurokinin antagonists

Indications

PO, IV: Prevention of: Acute and delayed nausea and vomiting associated with initial and repeat courses of highly emetogenic chemotherapy, Nausea and vomiting associated with initial and repeat courses of moderately emetogenic chemotherapy. **PO:** Prevention of postoperative nausea and vomiting.

Action

Acts as a selective antagonist at substance P/neurokinin 1 (NK₁) receptors in the brain. **Therapeutic Effects:** Decreased nausea and vomiting associated with chemotherapy. Augments the antiemetic effects of dexamethasone and 5-HT₃ antagonists (ondansetron).

Pharmacokinetics

Absorption: 60–65% absorbed following oral administration. Following IV administration, fosaprepitant is rapidly converted to aprepitant, the active component.

Distribution: Crosses the blood brain barrier; remainder of distribution unknown.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); not renally excreted.

Half-life: *Aprepitant*—9–13 hr.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	4 hr*	24 hr
IV	rapid	end of infusion*	24 hr

*Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use with pimoizide (risk of life-threatening adverse cardiovascular reactions); **Lactation:** May cause unwanted effects in nursing infants.

Use Cautiously in: Concurrent use with any agents metabolized by CYP3A4; **OB:** Use only if clearly needed; Children <18 yr (IV) and <6 mo (PO) (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: dizziness, fatigue, weakness. **Derm:** STEVENS-JOHNSON SYNDROME. **GI:** diarrhea. **Misc:** hiccups, hypersensitivity reaction (flushing, erythema, dyspnea) (IV).

Interactions

Drug-Drug: Aprepitant inhibits, induces, and is metabolized by the CYP3A4 enzyme system; it also induces the CYP2C9 system. Concurrent use with other medications that are metabolized by CYP3A4 may result in ↑ toxicity from these agents including docetaxel, paclitaxel, etoposide, irinotecan, ifosfamide, imatinib, vinorelbine, vinblastine, vincristine, midazolam, triazolam, and alprazolam; concurrent use should be undertaken with caution. Concurrent use with **drugs that significantly inhibit the CYP3A4 enzyme system** (including ketoconazole, itraconazole, nefazodone, clarithromycin, ritonavir, nelfinavir, and diltiazem) may ↑ blood levels and effects of aprepitant. Concurrent use with **drugs that induce the CYP3A4 enzyme system** including rifampin, carbamazepine, and phenytoin may ↓ blood levels and effects of aprepitant. ↑ blood levels and effects of dexamethasone (regimen reflects a 50% dose ↓); a similar effect occurs with methylprednisolone (↓ IV dose by 25%, ↓ PO dose by 50% when used concurrently). May ↓ the effects of warfarin (careful monitoring for 2 wk recommended), oral contraceptives (use alternate method), and phenytoin.

Route/Dosage

Prevention of Nausea and Vomiting Associated with Highly Emetogenic Chemotherapy

PO (Adults): Capsules or suspension—125 mg given 1 hr prior to chemotherapy (Day 1) (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT₃ antagonist given prior to chemotherapy), then 80 mg once daily for 2 days (Days 2 and 3) (with dexamethasone 8 mg once daily for 3 days [Days 2–4]).

IV (Adults): 150 mg given 30 min prior to chemotherapy on Day 1 (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT₃ antagonist given prior to chemotherapy). Continue dexamethasone on Days 2–4 (8 mg PO on Day 2, 8 mg twice daily on Days 3 and 4).

PO (Children ≥12 yr): Capsules—125 mg given 1 hr prior to chemotherapy (Day 1) (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT₃ antagonist given prior to chemotherapy), then 80 mg once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 3 days [Days 2–4]).

PO (Children 6 mo–<12 yr and >6 kg): Suspension—3 mg/kg (max dose = 125 mg) given 1 hr prior to chemotherapy (Day 1) (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT₃ antagonist given prior to chemotherapy), then 2 mg/kg (max dose = 80 mg) once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 3 days [Days 2–4]).

Prevention of Nausea and Vomiting Associated with Moderately Emetogenic Chemotherapy

PO (Adults): Capsules or suspension—125 mg given 1 hr prior to chemotherapy (Day 1) (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT₃ antagonist), then 80 mg once daily for 2 days (Days 2 and 3).

IV (Adults): 150 mg given 30 min prior to chemotherapy on Day 1 (with dexamethasone 12 mg PO given 30 min prior to chemotherapy and a 5-HT₃ antagonist).

PO (Children ≥12 yr): Capsules—125 mg given 1 hr prior to chemotherapy (Day 1) (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT₃ antagonist), then 80 mg once daily for 2 days (Days 2 and 3).

PO (Children 6 mo–<12 yr and >6 kg): Suspension—3 mg/kg (max dose = 125 mg) given 1 hr prior to chemotherapy (Day 1) (with PO dexamethasone at 50% of recommended dose given 30 min prior to chemotherapy and a 5-HT₃ antagonist given prior to chemotherapy), then 2 mg/kg (max dose = 80 mg) once daily for 2 days (Days 2 and 3) (with PO dexamethasone at 50% of recommended dose once daily for 3 days [Days 2–4]).

Prevention of Postoperative Nausea and Vomiting

PO (Adults): 40 mg given within 3 hr prior to induction of anesthesia.

Availability (generic available)

Capsules: 40 mg, 80 mg, 125 mg. **Lyophilized powder:** 150 mg/vial. **Powder for oral suspension (requires reconstitution):** 125 mg/pouch.

NURSING IMPLICATIONS

Assessment

- Assess nausea, vomiting, appetite, bowel sounds, and abdominal pain prior to and following administration.
- Monitor hydration, nutritional status, and intake and output. Patients with severe nausea and vomiting may require IV fluids in addition to antiemetics.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

apy if severe rash or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, skin peeling, sores, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.

- Monitor for signs and symptoms of infusion site reaction (erythema, edema, pain, thrombophlebitis). Treat symptomatically.
- Monitor for signs and symptoms of hypersensitivity reactions (flushing, erythema, dyspnea, hypotension, syncope) periodically during therapy. If symptoms occur, discontinue therapy and treat symptoms; do not reinstitute therapy if symptoms occur with first use.
- **Lab Test Considerations:** Monitor clotting status closely during the 2 wk period, especially at 7–10 days, following aprepitant therapy in patients on chronic warfarin therapy.
- May cause mild, transient ↑ in alkaline phosphatase, AST, ALT, and BUN.
- May cause proteinuria, erythrocyturia, leukocyturia, hyperglycemia, hyponatremia, and ↑ leukocytes.
- May cause ↓ hemoglobin and WBC.

Potential Nursing Diagnoses

Risk for deficient fluid volume (Indications)

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- For chemotherapy, aprepitant is given as part of a regimen that includes a corticosteroid and a 5-HT₃ antagonist (see Route/Dosage).
- **PO:** Administer daily for 3 days. *Day 1*—administer 1 hr prior to chemotherapy. *Days 2 and 3*—administer once in the morning. May be administered without regard to food. Swallow capsules whole; do not open, crush, or chew.
- Oral suspension may be used for pediatric patients or those with difficulty swallowing. Refrigerate suspension; may be stored at room temperature for up to 3 hrs before use. To administer, take cap off, place dispenser in patient's mouth along inner cheek. Dispense slowly. Discard after 72 hrs.

IV Administration

- **Single-Dose Regimen: Intermittent Infusion:** Inject 5 mL of 0.9% NaCl for Injection into vial. Swirl gently; avoid shaking or jetting saline into vial. **Diluent:** Prepare an infusion bag of 145 mL 0.9% NaCl. Withdraw entire volume from vial, and transfer to infusion bag for a total volume of 150 mL. **Concentration:** 1 mg/mL. Gently invert bag 2–3 times. Solution is stable for 24 hr at room temperature. Inspect solution for particulate matter. Do not administer solutions that are discolored or contain particulate matter. **Rate:** Infuse over 20–30 min, 30 min prior to chemotherapy.
- **Y-Site Compatibility:** dexamethasone, granisetron, methylprednisolone, ondansetron, palonosetron.

- **Solution Incompatibility:** Incompatible with solutions containing divalent cations (calcium, magnesium) including LR and Hartmann's solution.

Patient/Family Teaching

- Instruct patient to take aprepitant as directed. Direct patient to read the *Patient Package Insert* before starting therapy and each time Rx renewed in case of changes.
- Instruct patient to notify health care professional if nausea and vomiting occur prior to administration.
- Advise patient to notify health care professional immediately if symptoms of hypersensitivity reaction (hives, rash, itching, redness of the face/skin, difficulty in breathing or swallowing) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, non-greasy meals; provide oral hygiene; remove noxious stimuli from environment).
- **Rep:** Caution patient that aprepitant and fosaprepitant may decrease effectiveness of oral contraceptives. Advise patient to use alternate nonhormonal methods of contraception during and for 1 mo following treatment. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased nausea and vomiting associated with chemotherapy.
- Prevention of postoperative nausea and vomiting.

HIGH ALERT

argatroban (ar-gat-tro-ban)

Classification

Therapeutic: anticoagulants

Pharmacologic: thrombin inhibitors

Indications

Prophylaxis or treatment of thrombosis in patients with heparin-induced thrombocytopenia. As an anticoagulant in patients with or at risk for heparin-induced thrombocytopenia who are undergoing percutaneous coronary intervention (PCI).

Action

Inhibits thrombin by binding to its receptor sites. Inhibition of thrombin prevents activation of factors V, VIII, and XII; the conversion of fibrinogen to fibrin; platelet adhesion and aggregation. **Therapeutic Effects:** Decreased thrombus formation and extension with decreased sequelae of thrombosis (emboli, postphlebotic syndromes).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver; excreted primarily in feces via biliary excretion. 16% excreted unchanged in urine, 14% excreted unchanged in feces.

Half-life: 39–51 min (↑ in hepatic impairment).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	1–3 hr	2–4 hr

Contraindications/Precautions

Contraindicated in: Major bleeding; Hypersensitivity; **Lactation:** Lactation.

Use Cautiously in: Hepatic impairment (↓ initial infusion rate recommended); **OB:** Use only if clearly needed; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CV: hypotension. **GI:** diarrhea, nausea, vomiting. **Hemat:** BLEEDING. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of antiplatelet agents, thrombolytic agents, or other anticoagulants.

Drug-Natural Products: ↑ bleeding risk with anise, arnica, chamomile, clove, feverfew, garlic, ginger, ginkgo, Panax ginseng, and others.

Route/Dosage

IV (Adults): 2 mcg/kg/min as a continuous infusion; adjust infusion rate on the basis of activated partial thromboplastin time (aPTT). *Patients undergoing PCI*—350 mcg/kg bolus followed by infusion at 25 mcg/kg/min, activated clotting time (ACT) should be assessed 5–10 min later. If ACT is 300–450 sec, procedure may be started. If ACT <300 sec, give additional bolus of 150 mcg/kg and ↑ infusion rate to 30 mcg/kg/min. If ACT is >450 sec infusion rate should be ↓ to 15 mcg/kg/min and ACT rechecked after 5–10 min. If thrombotic complications occur or ACT drops to <300 sec, an additional bolus of 150 mcg/kg may be given and the infusion rate ↑ to 40 mcg/kg/min followed by ACT monitoring. If anticoagulation is required after surgery, lower infusion rates should be used.

Hepatic Impairment

IV (Adults): 0.5 mcg/kg/min as a continuous infusion; adjust infusion rate on the basis of aPTT.

Availability (generic available)

Solution for injection: 100 mg/mL. **Premixed infusion:** 50 mg/50 mL, 125 mg/125 mL, 250 mg/250 mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs periodically during therapy. Unexplained decreases in BP may indicate hemorrhage. Assess patient for bleeding. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes should be minimized. Noncompressible sites for IV access should be avoided. Monitor for blood in urine, lower back pain, pain or burning on urination. If bleeding cannot be controlled with pressure, decrease dose or discontinue argatroban immediately.
- Monitor for signs of anaphylaxis (rash, coughing, dyspnea) throughout therapy.
- **Lab Test Considerations:** Monitor aPTT prior to initiation of continuous infusion, 2 hours after initiation of therapy, and periodically during therapy to confirm aPTT is within desired therapeutic range.
- For patients undergoing PCI, monitor ACT as described in Route and Dose section.
- Assess hemoglobin, hematocrit, and platelet count prior to, and periodically during, argatroban therapy. May cause ↓ hemoglobin and hematocrit. Unexplained ↓ hematocrit may indicate hemorrhage.
- Use of argatroban concurrently with multiple doses of warfarin will result in more prolonged prothrombin time and international normalized ratio (INR) (although there is not an ↑ in vitamin K-dependent factor X_a activity) than when warfarin is used alone. Monitor INR daily during concomitant therapy. Repeat INR 4–6 hr after argatroban is discontinued. If repeat value is below desired therapeutic value for warfarin alone, restart argatroban therapy and continue until desired therapeutic range for warfarin alone is reached. To obtain the INR for warfarin alone when dose of argatroban is >2 mcg/kg/min, temporarily reduce argatroban dose to 2 mcg/kg/min; INR for combined therapy may then be obtained 4–6 hr after argatroban dose was reduced.
- **Toxicity and Overdose:** There is no specific antidote for argatroban. If overdose occurs, discontinue argatroban. Anticoagulation parameters usually return to baseline within 2–4 hr after discontinuation.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- Do not confuse argatroban with Aggrastat (tirofiban).
- All parenteral anticoagulants should be discontinued before argatroban therapy is initiated. Oral anticoagulation may be initiated with maintenance dose of warfarin; do not administer loading dose. Discon-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tinue argatroban therapy when INR for combined therapy is >4 .

IV Administration

- **IV:** Do not administer solutions that are cloudy or contain particulate matter. Discard unused portion.
- **IV Push:** *Diluent:* Bolus dose of 350 mcg/kg should be given prior to continuous infusion in patients undergoing PCI. For Diluent information, see Continuous Infusion section below. *Rate:* Administer bolus over 3–5 min.
- **Continuous Infusion:** *Diluent:* Dilute each 100 mg/mL in 0.9% NaCl, D5W, or LR. *Concentration:* 1 mg/mL. Mix by repeated inversion for 1 min. Diluted solution is slightly viscous, clear, and colorless to pale yellow and may show a slight haziness that disappears upon mixing; solution must be clear before use. Solution is stable at controlled room temperature and ambient light for 24 hrs, or for 96 hrs at controlled room temperature or refrigerated and protected from light; do not expose to direct sunlight. Pre-mixed solutions are clear and colorless. Store at room temperature, do not refrigerate or freeze. *Rate:* Based on patient's weight (See Route/Dosage section). Dose adjustment may be made 2 hr after starting infusion or changing dose until steady-state aPTT is 1.5–3 times the initial baseline value (not to exceed 100 sec).
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, ceftiofloxacin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eftifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, ibutilide, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperi-

dine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nocardipine, nitroglycerin, nitropruside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** cefepime, dantrolene, diazepam, phenytoin.

Patient/Family Teaching

- Inform patient of the purpose of argatroban.
- Advise patient to avoid other products known to affect bleeding.
- **Instruct patient to notify health care professional immediately if any bleeding or signs and symptoms of allergic reaction is noted.**

Evaluation/Desired Outcomes

- Decreased thrombus formation and extension.
- Decreased sequelae of thrombosis (emboli, postphlebotic syndromes).

ARIPiprazole (a-ri-pip-ra-zole) Abilify, Abilify Maintena, Aristada

Classification

Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: serotonin-dopamine activity modulators (SDAM)

Indications

Schizophrenia (Abilify, Abilify Maintena, and Aristada). Acute and maintenance therapy of manic and mixed episodes associated with bipolar disorder (as monotherapy or with lithium or valproate) (Abilify only). Adjunctive treatment of depression in adults (Abilify only). Agitation associated with schizophrenia or bipolar disorder (Abilify only). Irritability associated with autism spectrum disorder in children (Abilify only). Tourette's disorder.

Action

Psychotropic activity may be due to agonist activity at dopamine D₂ and serotonin 5-HT_{1A} receptors and an-

tagonist activity at the 5-HT_{2A} receptor. Also has alpha₁ adrenergic blocking activity. **Therapeutic Effects:** Decreased manifestations of schizophrenia. Decreased mania in bipolar patients. Decreased symptoms of depression. Decreased agitation associated with schizophrenia or bipolar disorder. Decreased emotional and behavioral symptoms of irritability. Decreased incidence of tics.

Pharmacokinetics

Absorption: Well absorbed (87%) following oral administration; 100% following IM injection.

Distribution: Extensive extravascular distribution.

Protein Binding: >99%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 and CYP2D6 isoenzymes); H the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly \uparrow aripiprazole concentrations and an \uparrow risk of adverse effects (\downarrow dose by 50% in PMs); one metabolite (dehydro-aripiprazole) has anti-psychotic activity. 18% excreted unchanged in feces; <1% excreted unchanged in urine.

Half-life: *Aripiprazole*—75 hr; *dehydro-aripiprazole*—94 hr; ER injectable suspension: 30–46 days (*Abilify Maintena*); 29–35 days (*Aristada*).

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	unknown
ER-IM	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Excreted in breast milk; discontinue drug or bottle feed.

Use Cautiously in: Known cardiovascular or cerebrovascular disease; Conditions which cause hypotension (dehydration, treatment with antihypertensives or diuretics); Diabetes (may \uparrow risk of hyperglycemia); Seizure disorders; Patients at risk for aspiration pneumonia; Concurrent ketoconazole or other potential CYP3A4 inhibitors (\downarrow aripiprazole dose by 50%); Concurrent quinidine, fluoxetine, paroxetine, or other potential CYP2D6 inhibitors; Concurrent carbamazepine or other potential CYP3A4 inducers; **OB:** Neonates at \uparrow risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if maternal benefit outweighs risk to fetus; **Pedi:** May \uparrow risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children, adolescents, and young adults taking antidepressants (safe use in children/adolescents not established); **Geri:** \uparrow risk of mortality in elderly patients treated for psychosis related to dementia/neurocognitive disorders.

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS**, drowsiness, extrapyramidal reactions, akathisia, confusion, depression, fatigue, hostility, impaired cognitive function, impulse control disorders (eating/binge eating, gambling, sexual, shopping), insomnia, lightheadedness, manic reactions, nervousness, restlessness, seizures, tardive dyskinesia.

Resp: dyspnea. **CV:** bradycardia, chest pain, edema, hypertension, orthostatic hypotension, tachycardia.

EENT: blurred vision, conjunctivitis, ear pain. **GI:** constipation, anorexia, \uparrow salivation, nausea, vomiting, weight gain, weight loss. **GU:** urinary incontinence.

Hemat: **AGRANULOCYTOSIS**, anemia, leukopenia, neutropenia. **Derm:** dry skin, ecchymosis, skin ulcer, sweating. **MS:** muscle cramps, neck pain. **Metab:** dyslipidemia, hyperglycemia. **Neuro:** tremor, abnormal gait. **Misc:** **HYPERSENSITIVITY REACTIONS**, **NEUROLEPTIC MALIGNANT SYNDROME**, \downarrow heat regulation, injection site reactions.

Interactions

Drug-Drug: Ketoconazole, clarithromycin, or other strong CYP3A4 inhibitors \downarrow metabolism and \uparrow effects (\downarrow aripiprazole dose by 50%). Quinidine, fluoxetine, paroxetine, or other strong CYP2D6 inhibitors \downarrow metabolism and \uparrow effects (\downarrow aripiprazole dose by at least 50%). Concurrent carbamazepine or other potential CYP3A4 inducers \uparrow metabolism and \downarrow effects (double aripiprazole dose).

Route/Dosage

If used concurrently with combination of strong, moderate, or weak CYP3A4 and CYP2D6 inhibitors, \downarrow oral aripiprazole dose by 75%. Aripiprazole dose should be \downarrow by 75% in CYP2D6 PMs who are concomitantly receiving a strong CYP3A4 inhibitor.

Schizophrenia

PO (Adults): 10 or 15 mg once daily; doses up to 30 mg/day have been used; increments in dosing should not be made before 2 wk at a given dose.

PO (Children 13–17 yr): 2 mg once daily; \uparrow to 5 mg once daily after 2 days, and then to target dose of 10 mg once daily after another 2 days; may further \uparrow dose in 5-mg increments if needed (max: 30 mg/day).

IM (Adults): *Abilify Maintena*—400 mg every month; after 1st injection, continue treatment with oral aripiprazole (10–20 mg/day) for 14 days; if no adverse reactions to 400 mg/month dose, may \downarrow dose to 300 mg every mo. *CYP2D6 PMs*— \downarrow dose to 300 mg monthly; *CYP2D6 PMs concomitantly receiving strong CYP3A4 inhibitor*— \downarrow dose to 200 mg monthly; *Concomitant therapy with strong CYP2D6 or CYP3A4 inhibitor*— \downarrow dose to 300 mg monthly (if originally receiving 400 mg monthly) or 200 mg monthly (if originally receiving 300 mg monthly); *Concomitant therapy with strong CYP2D6 and CYP3A4 inhibitor*— \downarrow

* = Canadian drug name. H = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dose to 200 mg monthly (if originally receiving 400 mg monthly) or 160 mg monthly (if originally receiving 300 mg monthly); *Concomitant therapy with CYP3A4 inducer*—Avoid use.

IM (Adults): *Aristada*—Dose is based on total daily dose of oral aripiprazole; if patient receiving 10 mg/day of oral aripiprazole, administer 441 mg every month; if patient receiving 15 mg/day of oral aripiprazole, administer 662 mg every month; if patient receiving ≥ 20 mg/day of oral aripiprazole, administer 882 mg every month; after 1st injection, continue treatment with oral aripiprazole for 21 days; *Concomitant therapy with strong CYP2D6 or CYP3A4 inhibitor for >2 wk*—↓ dose to 441 mg monthly (if originally receiving 662 mg monthly) or 662 mg monthly (if originally receiving 882 mg monthly); no dose adjustment necessary if originally receiving 441 mg monthly; *CYP2D6 PMs concomitantly receiving strong CYP3A4 inhibitor for >2 wk*—↓ dose to 441 mg monthly (if originally receiving 662 mg or 882 mg monthly); no dose adjustment necessary if originally receiving 441 mg monthly; *Concomitant therapy with strong CYP2D6 and CYP3A4 inhibitor*—avoid use in patients requiring 662 mg or 882 mg monthly dose; no dose adjustment necessary if originally receiving 441 mg monthly; *Concomitant therapy with CYP3A4 inducer*—↑ dose to 662 mg monthly (if originally receiving 441 mg monthly); no dose adjustment necessary if originally receiving 662 mg or 882 mg monthly.

Acute Manic or Mixed Episodes Associated with Bipolar I Disorder

PO (Adults): 15 mg once daily as monotherapy or 10–15 mg once daily with lithium or valproate; target dose is 15 mg once daily; may ↑ to 30 mg once daily, if needed.

PO (Children 10–17 yr): 2 mg once daily; ↑ to 5 mg once daily after 2 days, and then to target dose of 10 mg once daily after another 2 days; may further ↑ dose in 5-mg increments if needed (max: 30 mg/day).

Maintenance Treatment of Bipolar I Disorder

PO (Adults): Continue same dose needed to stabilize patient during acute treatment.

PO (Children 10–17 yr): Continue same dose needed to stabilize patient during acute treatment.

Depression

PO (Adults): 2–5 mg once daily, may titrate upward at 1-wk intervals to 5–10 mg once daily (max: 15 mg/day).

Irritability Associated with Autistic Disorder

PO (Children 6–17 yr): 2 mg once daily; ↑ to 5 mg once daily after at least 1 wk; may further ↑ dose in 5-mg increments if needed at ≥ 1 -wk intervals (max: 15 mg/day).

Tourette's Disorder

PO (Children 6–18 yr and ≥ 50 kg): 2 mg once daily; ↑ to target dose of 5 mg once daily after 2 days; may further ↑ dose if needed at ≥ 1 -wk intervals (max: 10 mg/day).

PO (Children 6–18 yr and < 50 kg): 2 mg once daily; ↑ to 5 mg once daily after 2 days, and then to target dose of 10 mg once daily after 5 days; may further ↑ dose in 5-mg increments if needed at ≥ 1 -wk intervals (max: 20 mg/day).

Availability (generic available)

Tablets: 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg.

Cost: 2 mg \$2,208.52/90, 5 mg \$2,208.52/90, 10 mg \$2,208.52/90, 15 mg \$2,208.52/90, 20 mg \$3,107.38/90, 30 mg \$3,107.38/90.

Orally disintegrating tablets (vanilla flavor): 10 mg, 15 mg. **Cost:** All strengths \$955.82/30. **Extended-release injectable suspension (Abilify Maintena):** 300 mg/vial or pre-filled syringe, 400 mg/vial or pre-filled syringe. **Extended-release injectable suspension (Aristada):** 441 mg/pre-filled syringe, 662 mg/pre-filled syringe, 882 mg/pre-filled syringe, 1064 mg/pre-filled syringe. **Oral solution (orange cream):** 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies, especially during early therapy for depression. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤ 24 yrs.
- Assess weight and BMI initially and throughout therapy. Compare weight of children and adolescents with that expected during normal growth.
- Monitor BP (sitting, standing, lying), pulse, and respiratory rate before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental

status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Notify health care professional immediately if these symptoms occur.

- **Lab Test Considerations:** May cause ↑ creatinine phosphokinase.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.
- Monitor blood glucose and cholesterol levels initially and periodically during therapy.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- **Do not confuse aripiprazole with rabeprazole.**
- **PO:** Administer once daily without regard to meals.
- **Orally disintegrating tablets:** Do not open blister until ready to administer. For single tablet removal, open package and peel back foil on blister to expose tablet. Do not push tablet through foil; may damage tablet. Immediately upon opening blister, using dry hands, remove tablet and place entire orally disintegrating tablet on tongue. Tablet disintegration occurs rapidly in saliva. Take tablet without liquid; but if needed, it can be taken with liquid. Do not attempt to split tablet.
- **Extended-Release IM:** *Abilify Maintena* is available in vials or dual chamber prefilled syringes. For vials, reconstitute 300 mg dose with 1.5 mL and 400 mg dose with 1.9 mL of Sterile Water for Injection; discard extra sterile water. Withdraw air to equalize pressure in vial. Shake vial vigorously for 30 seconds until suspension is uniform; suspension is opaque and milky white. If injection is not given immediately, shake vial vigorously to re-suspend prior to injection. Do not store suspension in syringe. Determine volume needed for dose: from 400 mg vial: 400 mg = 2 mL, 300 mg = 1.5 mL, 200 mg = 1.0, and 160 mg = 0.8 mL. From 300 mg vial: 300 mg = 1.5 mL, 200 mg = 1 mL, and 160 mg = 0.8 mL. For prefilled syringes, push plunger rod slightly to engage threads. Rotate plunger rod until rod stops rotating to release diluent; middle stopper will be at indicator line. Vertically shake syringe vigorously for 20 seconds until drug is uniformly milky-white. For deltoid site, use 23 gauge needle, 1 inch in length for non-obese patients and 22 gauge 1.5 inch for obese patients. For gluteal site, use 22 gauge needle, 1.5 inches in length for non-obese patients and 22 gauge, 2 inch for obese patients. Inject deep into deltoid or gluteal site; do not massage. Continue oral

dosing of aripiprazole for 2 wks after first dose of *Abilify Maintena*.

- If second or third doses of *Abilify Maintena* are missed and >4 wk and <5 wk since last injection, administer injection as soon as possible. If >5 wk since last injection, restart concomitant oral aripiprazole for 14 days with next administered injection. If fourth or subsequent doses are missed and >4 wk and <6 wk since last injection, administer injection as soon as possible. If >6 wk since last injection, restart concomitant oral aripiprazole for 14 days with next administered injection.
- *Aristada* comes in a kit with several needle sizes. Tap syringe at least 10 times to dislodge settled material and shake syringe vigorously for at least 30 seconds to ensure suspension is uniform. Shake again if syringe not used within 15 min. Select needle and injection site. Deltoid may be used for 441 mg dose only. May use gluteal site for all doses. Remove air from syringe. Inject entire contents rapidly and continuously over <10 seconds.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose. Emphasize importance of maintaining regular scheduled injections when taking *Abilify Maintena* or *Aristada*.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness and lightheadedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Inform patient that aripiprazole may cause weight gain. Advise patient to monitor weight periodically. Notify health care professional of significant weight gain.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications. Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional if new or increased eating/binge eating, gambling, sexual, shopping, or other impulse control disorders occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Encourage pregnant patients to enroll in registry by contacting National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit <http://womensmental-health.org/clinical-and-research-programs/pregnancyregistry/>.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoid, or withdrawn behavior.
- Decrease incidence of mood swings in patients with bipolar disorders.
- Increased sense of well-being in patients with depression.
- Decreased agitation associated with schizophrenia or bipolar disorder.
- Decreased emotional and behavioral symptoms of irritability.
- Decrease in tics.

asenapine (a-sen-a-peen)

Saphris

Classification

Therapeutic: antipsychotics, mood stabilizers

Pharmacologic: dibenzo-oxepino pyrroles

Indications

Schizophrenia. Acute treatment of manic/mixed episodes associated with bipolar I disorder (as monotherapy or with lithium or valproate). Maintenance treatment of manic/mixed episodes associated with bipolar I disorder (as monotherapy).

Action

May act through combined antagonism of dopaminergic (D₂) and 5-HT_{2A} receptors. **Therapeutic Effects:** Decreased symptoms of acute schizophrenia and mania/mixed episodes of bipolar I disorder.

Pharmacokinetics

Absorption: 35% absorbed following SL administration.

Distribution: Rapidly distributed throughout the body. Vd is approximately 20–25 L/kg; 95% bound to plasma proteins.

Metabolism and Excretion: Highly metabolized; primarily by CYP1A2 and UGT1A4 enzyme systems 50% excreted in urine, 40% in feces, primarily as metabolites.

Half-life: 24 hr.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
SL	unknown	0.5–1.5 hr†	12–24 hr

†Blood levels.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Dementia-related psychoses; Severe hepatic impairment; **Lactation:** Avoid use.

Use Cautiously in: History of cardiac arrhythmias, congenital QT prolongation, electrolyte abnormalities (especially hypomagnesemia or hypokalemia; correct prior to use) or concurrent use of medications known to prolong the QTc interval (may ↑ risk of life-threatening arrhythmias); History of seizures or conditions/medications known to ↓ seizure threshold; History of leukopenia/neutropenia; Strenuous exercise, exposure to extreme heat, concurrent medications with anticholinergic activity, or risk of dehydration; History of suicide attempt; Dehydration, hypovolemia, concurrent use of antihypertensive medications, history of myocardial infarction/ischemic heart disease/HF/conduction abnormalities/cerebrovascular disease (↑ risk of hypotension); Patients at risk for falls; **Geri:** ↑ risk of adverse reactions; consider age-related ↓ in hepatic function, cardiovascular status, and concurrent medications; ↑ risk of mortality and stroke/TIA in elderly patients treated for dementia-related psychosis; **OB:** Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if benefit outweighs risk to fetus; **Pedi:** Children <10 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, akathisia, dizziness, drowsiness, extrapyramidal symptoms, anxiety, fatigue, syncope, tardive dyskinesia. **CV:** QT INTERVAL PROLONGATION, bradycardia, orthostatic hypotension, tachycardia. **GI:** oral hypoesthesia, dry mouth, dyspepsia, dysphagia, oral blisters, oral inflammation, oral peeling/sloughing, oral ulcers. **Endo:** dyslipidemia, hyperglycemia, hyperprolactinemia. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Metab:** weight gain, ↑ appetite. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, hypotension, tachycardia, swollen tongue, dyspnea, wheezing, and rash).

Interactions

Drug-Drug: Concurrent use of **QTc interval prolonging drugs** including **Class 1A antiarrhythmics** such as **quinidine** and **procainamide** or **Class 3 antiarrhythmics** including **amiodarone** and **sotalol** or other **antipsychotics** including **ziprasidone**, **chlorpromazine** or **thioridazine** or certain **antibiotics** such as **moxifloxacin**; may ↑ risk of torsade de pointes and/or sudden death; avoid concurrent use. **Fluvoxamine**, a strong inhibitor of CYP1A2, ↑ levels and risk of toxicity; use cautiously. Similar effects may occur with **paroxetine**, a CYP2D6 substrate and inhibitor. Drugs having similar properties (**substrates/inhibitors of CYP2D6**) should also be used cautiously with asenapine. ↑ risk of CNS depression with other **CNS depressants** including **antihistamines**, some **anti-depressants**, **sedative/hypnotics**, and **alcohol**.

Route/Dosage

Schizophrenia

SL (Adults): 5 mg twice daily; may ↑ to 10 mg twice daily after 1 wk.

Acute Manic/Mixed Episodes Associated with Bipolar I Disorder

SL (Adults): *Monotherapy*—10 mg twice daily; may ↓ to 5 mg twice daily if tolerated poorly; continue on the dose that caused stabilization as maintenance therapy; *Adjunctive therapy with lithium or valproate*—5 mg twice daily; may ↑ to 10 mg twice daily.

SL (Children 10–17 yr): *Monotherapy*—2.5 mg twice daily; may ↑ to 5 mg twice daily after 3 days; may ↑ to 10 mg twice daily after another 3 days.

Availability

Sublingual tablets (black cherry flavor): 2.5 mg, 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs.
- Assess weight and BMI initially and throughout therapy.
- Monitor BP (sitting, standing, lying) and pulse before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands,

masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.

- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Discontinue asenapine and notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- Assess patient for signs and symptoms of hypersensitivity reactions, including anaphylaxis, angioedema, hypotension, tachycardia, swollen tongue, dyspnea, wheezing, and rash.
- **Lab Test Considerations:** Obtain fasting blood glucose, lipid profile, and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Monitor patients with neutropenia for fever or other symptoms of infection and treat promptly. Discontinue therapy if ANC <1000/mm³ occurs.
- May cause transient ↑ in serum ALT.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Implementation

- **SL:** Open packet immediately before use by firmly pressing thumb button and pulling out tablet pack. Do not push tablet through or cut or tear tablet pack. Peel back colored tab and gently remove tablet. Place tablet under tongue and allow to dissolve completely; dissolves in saliva within seconds. Do not split, crush, chew, or swallow tablets. Avoid eating or drinking for 10 min after administration. Slide tablet pack back into case until it clicks.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

missed doses as soon as remembered unless almost time for the next dose.

- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension. Protect from falls.
- Medication may cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; feeling angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood or if signs and symptoms of hypersensitivity reactions (difficulty breathing, itching, swelling of the face, tongue or throat, feeling lightheaded) occur.
- Inform patient that oral ulcers, blisters, peeling/sloughing, and inflammation may occur at application site. Advise patient to notify health care professional if these occur, may require discontinuation. Inform patient that numbness or tingling of mouth or throat may occur shortly after administration of asenapine; usually resolves within 1 hr.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to avoid alcohol, and to consult health care professional before taking any new medications and to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Encourage pregnant patients to enroll in registry by contacting National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit <http://womensmental-health.org/clinical-and-research-programs/pregnancyregistry/>.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoid, or withdrawn behavior.
- Decrease incidence of mood swings in patients with bipolar disorders.
- Decreased agitation associated with schizophrenia or bipolar disorder.

asparaginase *Erwinia chrysanthemi* (a-spare-a-ji-nase)

★ Erwinase, Erwinaze

Classification

Therapeutic: antineoplastics

Pharmacologic: enzymes

Indications

Part of combination chemotherapy in the treatment of acute lymphocytic leukemia (ALL) in patients who developed hypersensitivity to *E. coli*-derived asparaginase.

Action

Catalyst in the conversion of asparagine (an amino acid) to aspartic acid and ammonia. Depletes asparagine in leukemic cells. **Therapeutic Effects:** Death of leukemic cells.

Pharmacokinetics

Absorption: Bioavailability after IM administration unknown; IV administration results in complete bioavailability.

Distribution: Remains in the intravascular space. Poor penetration into the CSF.

Metabolism and Excretion: Slowly sequestered in the reticuloendothelial system.

Half-life: IV: 8–30 hr; IM: 39–49 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM	unknown	unknown	unknown
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity; History of pancreatitis with prior L-asparaginase; History of serious thrombosis or hemorrhagic events with prior L-asparaginase; **Lactation:** Lactation.

Use Cautiously in: OB: Use only if the potential benefit justifies the potential risk to the fetus.

Adverse Reactions/Side Effects

GI: PANCREATITIS, ↑ liver function tests, nausea, vomiting. **Endo:** hyperglycemia. **Hemat:** hemorrhage, thromboembolic events. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: None known.

Route/Dosage

IM, IV (Adults and Children): *Substitution for E. coli*-derived asparaginase—25,000 International Units/m² substituted for each dose of *E. coli*-derived asparaginase; *Substitution for pegasparaginase*—25,000 International Units/m² 3 times a wk (Mon/Wed/Fri) for 6 doses substituted for each dose of pegasparaginase.

Availability

Powder for injection: 10,000 International Units/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and periodically during therapy; may cause fever.
- Monitor for signs and symptoms of pancreatitis (abdominal pain, nausea, vomiting, ↑ serum amylase) during therapy. If abdominal pain >72 hrs and serum amylase ↑ ≥2.0 x upper limit of normal occur, discontinue therapy. If mild pancreatitis occurs, withhold asparaginase *Erwinia chrysanthemi* until symptoms and serum amylase return to normal; then restart.
- Monitor for hypersensitivity reaction (urticaria, diaphoresis, facial swelling, joint pain, hypotension, bronchospasm). Epinephrine and resuscitation equipment should be readily available.
- **Lab Test Considerations:** Monitor CBC and coagulation studies before and periodically throughout therapy. May ↓ fibrinogen, protein C activity, protein S activity, and anti-thrombin III. If thrombotic or hemorrhagic event occurs, withhold asparaginase *Erwinia chrysanthemi* until symptoms resolve; then resume therapy.
- Hepatotoxicity may be manifested by ↑ AST, ALT, bilirubin, or cholesterol. Liver function test results usually return to normal after therapy. May cause pancreatitis; monitor frequently for ↑ amylase or glucose.
- Monitor blood glucose prior to and periodically during therapy. May cause hyperglycemia treatable with fluids and insulin.
- For IV doses, monitoring pre-dose nadir serum asparaginase activity (NSAA) levels and switch to IM administration if desired NSAA levels are not achieved.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order and dose calculations.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Reconstitute by adding 1 or 2 mL of 0.9% NaCl for injection (without preservatives) against inner wall of the 10,000-IU vial. Swirl vial gently; do not shake

or invert. Administer no more than 2 mL per injection site. **Concentration:** Reconstitution with 1 mL = 10,000 IU/mL; with 2 mL = 5,000 IU/mL. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. Withdraw dose needed into a polypropylene syringe and administer within 15 min of reconstitution. Do not refrigerate or freeze; administer within 4 hrs or discard. Inject IM with no >2 mL/site. Do not save unused portions; discard.

- **IM:** Limit volume to 2 mL at each injection site. If volume >2 mL, use multiple injection sites.

IV Administration

- **Intermittent Infusion:** For IV use, slowly inject reconstituted solution into 100 mL 0.9% NaCl at room temperature; do not shake or squeeze IV bag. **Rate:** Infuse over 1–2 hr.
- **Y-Site Incompatibility:** Do not infuse other IV drugs through same IV line.

Patient/Family Teaching

- Instruct patient to notify health care professional if signs and symptoms of hypersensitivity reaction, pancreatitis, thrombosis or hemorrhage (headache, arm or leg swelling, shortness of breath, chest pain) or hyperglycemia (excess thirst or increase in frequency or volume of urination), occur.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

aspirin (as-pir-in)

acetylsalicylic acid, Acuprin, ASA, ✳Asaphen, Aspergum, Aspir-Low, Aspirtab, Bayer Aspirin, Bayer Timed-Release Arthritic Pain Formula, Easprin, Ecotrin, 8-Hour Bayer Timed-Release, Empirin, ✳Entrophen, Halfprin, Healthprin, ✳Lowprin, Norwich Aspirin, ✳Novasen, ✳Rivasa, Sloprin, St. Joseph Adult Chewable Aspirin, Therapy Bayer, ZORprin

Classification

Therapeutic: antipyretics, nonopioid analgesics
Pharmacologic: salicylates

✳ = Canadian drug name. ~~Ⓜ~~ = Genetic implication. ~~Ⓜ~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Inflammatory disorders including: Rheumatoid arthritis, Osteoarthritis. Mild to moderate pain. Fever. Prophylaxis of transient ischemic attacks and MI. **Unlabeled Use:** Adjunctive treatment of Kawasaki disease.

Action

Produce analgesia and reduce inflammation and fever by inhibiting the production of prostaglandins. Decreases platelet aggregation. **Therapeutic Effects:** Analgesia. Reduction of inflammation. Reduction of fever. Decreased incidence of transient ischemic attacks and MI.

Pharmacokinetics

Absorption: Well absorbed from the upper small intestine; absorption from enteric-coated preparations may be unreliable; rectal absorption is slow and variable.

Distribution: Rapidly and widely distributed; crosses the placenta and enters breast milk.

Metabolism and Excretion: Extensively metabolized by the liver; inactive metabolites excreted by the kidneys. Amount excreted unchanged by the kidneys depends on urine pH; as pH increases, amount excreted unchanged increases from 2–3% up to 80%.

Half-life: 2–3 hr for low doses; up to 15–30 hr with larger doses because of saturation of liver metabolism.

TIME/ACTION PROFILE (analgesia/fever reduction)

ROUTE	ONSET	PEAK	DURATION
PO	5–30 min	1–3 hr	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aspirin or other salicylates; Cross-sensitivity with other NSAIDs may exist (less with nonaspirin salicylates); Bleeding disorders or thrombocytopenia; **Pedi:** May increase risk of Reye's syndrome in children or adolescents with viral infections.

Use Cautiously in: History of GI bleeding or ulcer disease; Chronic alcohol use/abuse; Severe hepatic or renal disease; **OB:** Salicylates may have adverse effects on fetus and mother and should be avoided during pregnancy, especially during the 3rd trimester; **Lactation:** Safety not established; **Geriatric:** ↑ risk of adverse reactions especially GI bleeding; more sensitive to toxic levels.

Adverse Reactions/Side Effects

EENT: tinnitus. **GI:** GI BLEEDING, dyspepsia, epigastric distress, nausea, abdominal pain, anorexia, hepatotoxicity, vomiting. **Hemat:** anemia, hemolysis. **Derm:** rash, urticaria. **Misc:** allergic reactions including ANAPHYLAXIS and LARYNGEAL EDEMA.

Interactions

Drug-Drug: May ↑ the risk of bleeding with warfarin, heparin, heparin-like agents, thrombolytic agents, dipyridamole, clopidogrel, tirofiban, or eptifibatid, although these agents are frequently used safely in combination and in sequence. **Ibuprofen:** may negate the cardioprotective antiplatelet effects of low-dose aspirin. May ↑ risk of bleeding with cefotetan and valproic acid. May ↑ activity of penicillins, phenytoin, methotrexate, valproic acid, oral hypoglycemic agents, and sulfonamides. **Urinary acidification** ↑ reabsorption and may ↑ serum salicylate levels. **Alkalinization of the urine** or the ingestion of large amounts of antacids ↑ excretion and ↓ serum salicylate levels. May blunt the therapeutic response to diuretics and ACE inhibitors. ↑ risk of GI irritation with NSAIDs.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with arnica, chamomile, clove, feverfew, garlic, ginger, ginkgo, Panax ginseng, and others.

Drug-Food: Foods capable of acidifying the urine (see Appendix K) may ↑ serum salicylate levels.

Route/Dosage

Pain/Fever

PO, Rect (Adults): 325–1000 mg every 4–6 hr (not to exceed 4 g/day). *Extended-release tablets*—650 mg every 8 hr or 800 mg every 12 hr.

PO, Rect (Children 2–11 yr): 10–15 mg/kg/dose every 4–6 hr; maximum dose: 4 g/day.

Inflammation

PO (Adults): 2.4 g/day initially; ↑ to maintenance dose of 3.6–5.4 g/day in divided doses (up to 7.8 g/day for acute rheumatic fever).

PO (Children): 60–100 mg/kg/day in divided doses (up to 130 mg/kg/day for acute rheumatic fever).

Prevention of Transient Ischemic Attacks

PO (Adults): 50–325 mg once daily.

Prevention of Myocardial Infarction/Antiplatelet Effects

PO (Adults): 80–325 mg once daily. *Suspected acute MI*—160 mg as soon as MI is suspected.

PO (Children): 3–10 mg/kg/day given once daily (round dose to a convenient amount).

Kawasaki Disease

PO (Children): 80–100 mg/kg/day in 4 divided doses until fever resolves; may be followed by maintenance dose of 3–5 mg/kg/day as a single dose for up to 8 wk.

Availability (generic available)

Tablets: 81 mg^{OTC}, 162.5 mg^{OTC}, 325 mg^{OTC}, 500 mg^{OTC}, 650 mg^{OTC}, *975 mg^{OTC}. **Chewable tablets:** *80 mg^{OTC}, 81 mg^{OTC}. **Chewing gum:** 227 mg^{OTC}. **Dispersible tablets:** 325 mg^{OTC}, 500 mg^{OTC}. **Enteric-coated (delayed-release) tablets:** 80 mg^{OTC}, 165 mg^{OTC}, *300 mg^{OTC}, 325 mg^{OTC}, 500 mg^{OTC}, *600 mg^{OTC}, 650 mg^{OTC}, 975 mg^{OTC}. **Extended-release tablets:** *325 mg^{OTC}, 650 mg^{OTC}, 800 mg. **Delayed-release capsules:** *325 mg^{OTC}, *500 mg^{OTC}. **Suppositories:** 60 mg^{OTC}, 120 mg^{OTC}, 125 mg^{OTC}, 130 mg^{OTC}, *150 mg^{OTC}, *160 mg^{OTC}, 195 mg^{OTC}, 200 mg^{OTC}, 300 mg^{OTC}, *320 mg^{OTC}, 325 mg^{OTC}, 600 mg^{OTC}, *640 mg^{OTC}, 650 mg^{OTC}, 1.2 g^{OTC}. **In combination with:** antihistamines, decongestants, cough suppressants^{OTC}, opioids, and omeprazole (Yosprala). See Appendix B.

NURSING IMPLICATIONS**Assessment**

- **Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an increased risk for developing hypersensitivity reactions.**
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity before and at the peak (see Time/Action Profile) after administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Monitor hepatic function before antirheumatic therapy and if symptoms of hepatotoxicity occur; more likely in patients, especially children, with rheumatic fever, systemic lupus erythematosus, juvenile arthritis, or pre-existing hepatic disease. May cause ↑ serum AST, ALT, and alkaline phosphatase, especially when plasma concentrations exceed 25 mg/100 mL. May return to normal despite continued use or dose reduction. If severe abnormalities or active liver disease occurs, discontinue and use with caution in future.
- Monitor serum salicylate levels periodically with prolonged high-dose therapy to determine dose, safety, and efficacy, especially in children with Kawasaki disease.
- May alter results of serum uric acid, urine vanillyl-mandelic acid (VMA), protirelin-induced thyroid-stimulating hormone (TSH), urine hydroxyindoleacetic acid (5-HIAA) determinations, and radionuclide thyroid imaging.
- Prolongs bleeding time for 4–7 days and, in large doses, may cause prolonged prothrombin time.

Monitor hematocrit periodically in prolonged high-dose therapy to assess for GI blood loss.

- **Toxicity and Overdose:** Monitor for the onset of tinnitus, headache, hyperventilation, agitation, mental confusion, lethargy, diarrhea, and sweating. If these symptoms appear, withhold medication and notify health care professional immediately.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Implementation

- Use lowest effective dose for shortest period of time.
- **PO:** Administer after meals or with food or an antacid to minimize gastric irritation. Food slows but does not alter the total amount absorbed.
- Do not crush or chew enteric-coated tablets. Do not take antacids within 1–2 hr of enteric-coated tablets. Chewable tablets may be chewed, dissolved in liquid, or swallowed whole. Some extended-release tablets may be broken or crumbled but must not be ground up before swallowing. See manufacturer's prescribing information for individual products.

Patient/Family Teaching

- Instruct patient to take salicylates with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Advise patient to report tinnitus; unusual bleeding of gums; bruising; black, tarry stools; or fever lasting longer than 3 days.
- **Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may increase risk of GI bleeding. Caution patient to avoid taking concurrently with acetaminophen or NSAIDs for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.**
- Teach patients on a sodium-restricted diet to avoid effervescent tablets or buffered-aspirin preparations.
- Tablets with an acetic (vinegar-like) odor should be discarded.
- Advise patients on long-term therapy to inform health care professional of medication regimen before surgery. Aspirin may need to be withheld for 1 wk before surgery.
- **Pedi:** Centers for Disease Control and Prevention warns against giving aspirin to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Transient Ischemic Attacks or MI:** Advise patients receiving aspirin prophylactically to take only prescribed dose. Increasing dose has not been found to provide additional benefits.

Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort.
- Increased ease of joint movement. May take 2–3 wk for maximum effectiveness.
- Reduction of fever.
- Prevention of transient ischemic attacks.
- Prevention of MI.

aspirin, See SALICYLATES.

atazanavir (a-ta-zan-a-veer)

Reyataz

Classification

Therapeutic: antiretrovirals

Pharmacologic: protease inhibitors

Indications

HIV infection (with other antiretrovirals).

Action

Inhibits the action of HIV protease, preventing maturation of virions. **Therapeutic Effects:** ↑ CD4 cell counts and ↓ viral load with subsequent slowed progression of HIV and its sequelae.

Pharmacokinetics

Absorption: Rapidly absorbed (↑ by food).

Distribution: Enters cerebrospinal fluid and semen.

Metabolism and Excretion: 80% metabolized (CYP3A); 13% excreted unchanged in urine.

Half-life: 7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2.5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic impairment; Concurrent use of ergot derivatives, midazolam (PO), lurasidone, pimozone, triazolam, alfuzosin, sildenafil (Revatio), rifampin, irinotecan, lovastatin, simvastatin, indinavir, nevirapine, or St. John's wort; **Pedi:** ↑ risk of kernicterus in infants <3 mo.

Use Cautiously in: Mild to moderate hepatic impairment; Pre-existing conduction system disease (marked first-degree AV block or second- or third-degree AV block) or concurrent use of other drugs that increase the PR interval (especially those metabolized

by CYP3A4, including verapamil or diltiazem); Diabetes mellitus; Hemophilia (↑ risk of bleeding); Phenylketonuria (oral powder contains aspartame); **OB:** Use only if clearly needed; Breast feeding is not recommended if HIV-infected.

Adverse Reactions/Side Effects

When used in combination with other antiretrovirals.

CNS: headache, depression, dizziness, insomnia.

CV: ↑ PR interval, heart block. **GI:** HEPATOTOXICITY, nausea, abdominal pain, ↑ bilirubin, cholelithiasis, diarrhea, jaundice, ↑ liver enzymes, vomiting. **Derm:** DRESS SYNDROME, ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, rash. **Endo:** hyperglycemia.

GU: nephrolithiasis. **Metab:** fat redistribution. **MS:** myalgia. **Misc:** ANGIOEDEMA, fever, immune reconstitution syndrome.

Interactions

Drug-Drug: Atazanavir is an inhibitor of CYP3A and UGT1A1 enzyme systems. It is also a substrate of CYP3A. ↑ blood levels and risk of toxicity from **ergot derivatives** (ergotamine, dihydroergotamine, methylergonovine), midazolam (PO), lurasidone, pimozone, triazolam, lovastatin, simvastatin, sildenafil (Revatio), alfuzosin, and irinotecan; concurrent use is contraindicated. Concurrent use with **indinavir** may ↑ risk of hyperbilirubinemia; concurrent use is contraindicated. Levels are significantly ↓ by **rifampin** and **nevirapine**; may promote viral resistance; concurrent use is contraindicated. Combination therapy with **tenofovir** may lead to ↓ virologic response and possible resistance (100 mg **ritonavir** should be added to boost blood levels and dose of atazanavir ↓ to 300 mg/day). Levels are significantly ↓ by **omeprazole**; do not exceed omeprazole dose of 20 mg/day when used with atazanavir and ritonavir in treatment-naïve patients (should be taken at least 12 hr before atazanavir and ritonavir); should not be used in treatment-experienced patients. Concurrent use with **didanosine** buffered tablets will ↓ absorption and levels; give atazanavir with food 2 hr before or 1 hr after **didanosine**. **Efavirenz** ↓ levels and may promote viral resistance; 600 mg efavirenz should be given with atazanavir 400 mg/day and ritonavir 100 mg/day to counteract this effect in treatment-naïve patients (should not be used with atazanavir in treatment-experienced patients). ↑ **saquinavir** levels. Levels are ↑ by **ritonavir**; ↓ atazanavir dose to 300 mg/day. **Nevirapine** may ↓ levels and atazanavir may ↑ **nevirapine** levels; avoid concurrent use. **Antacids** or **buffered medications** will ↓ absorption; atazanavir should be given 2 hr before or 1 hr after. ↑ levels of **lidocaine**, **amiodarone**, or **quinidine**; blood level monitoring is recommended. ↑ risk of bleeding with **warfarin**. ↑ of **tricyclic antidepressants**; blood level monitoring is recommended. ↑ levels of **rifabutin**; ↓ rifabutin dose

by 75% (150 mg every other day or 3 times weekly). ↑ levels of **diltiazem** and its active metabolite; ↓ diltiazem dose by 50% and ECG monitoring recommended. Similar precautions may be needed with **felodipine**, **nifedipine**, **nicardipine**, and **verapamil**. ↑ levels of **fluticasone**; consider alternative therapy; should not be used when atazanavir used with ritonavir. ↓ levels of **voriconazole** when atazanavir is used with ritonavir; avoid concurrent use. **Voriconazole** may also ↑ levels of atazanavir (when used without ritonavir). ↑ levels of **ketoconazole** or **itraconazole** when atazanavir is used with ritonavir. ↑ levels of **trazodone**; ↓ dose of trazodone. ↑ levels of **sildenafil**, **vardenafil**, and **tadalafil**; ↓ **sildenafil** dose to 25 mg every 48 hr; ↓ **vardenafil** dose to 2.5 mg every 72 hr (when atazanavir used with ritonavir) or 2.5 mg every 24 hr (when atazanavir used alone); ↓ **tadalafil** dose to 10 mg every 72 hr. Exercise caution and monitor for hypertension, visual changes, and priapism. ↑ levels and risk of myopathy from **atorvastatin** or **rosuvastatin**; use lowest possible dose of statin; do not exceed rosuvastatin dose of 10 mg/day. Levels may be ↓ by **histamine H₂ antagonists**, promoting viral resistance; separate doses by at least 10 hr. ↑ levels of **cyclosporine**, **sirolimus**, and **tacrolimus**; monitor immunosuppressant blood levels. ↑ levels of **clarithromycin**; ↓ clarithromycin dose by 50% or consider alternative therapy. May ↓ levels of some **estrogens** found in **hormonal contraceptives**; use alternative nonhormonal method of contraception. May ↑ levels of **buprenorphine**; consider ↓ dose of buprenorphine. Concurrent use of other **drugs known to ↑ PR interval** may ↑ risk of heart block. May ↑ risk of adverse effects with **salmeterol**; concurrent use not recommended. May ↑ **bosentan** levels; initiate bosentan at 62.5 mg once daily or every other day; if patient already receiving bosentan, discontinue bosentan at least 36 hr before initiation of atazanavir and then restart bosentan at least 10 days later at 62.5 mg once daily or every other day; do not use with atazanavir alone (should be used with atazanavir and ritonavir). May ↑ **tadalafil (Adcirca)** levels; initiate tadalafil (Adcirca) at 20 mg once daily; if patient already receiving tadalafil (Adcirca), discontinue tadalafil (Adcirca) at least 24 hr before initiation of atazanavir and then restart tadalafil (Adcirca) at least 7 days later at 20 mg once daily. May ↑ **colchicine** levels; ↓ dose of colchicine; do not administer colchicine if patients have renal or hepatic impairment. **Carbamazepine**, **phenytoin**, and **phenobarbital** may ↓ levels; do not give concurrently with atazanavir without using ritonavir. Concurrent use of **lamotrigine** with atazanavir and ritonavir results in ↓ lamotrigine levels; concurrent use not recommended. Concurrent use of **voriconazole** with atazanavir and ritonavir may result in either ↓ or ↑ voriconazole levels; concurrent use not recommended.

May ↑ **quetiapine** levels; ↓ quetiapine dose to 1/2 of current dose.

Drug-Natural Products: **St. John's wort** significantly ↓ blood levels; concurrent use is contraindicated.

Route/Dosage

PO (Adults): *Therapy-naïve*—400 mg once daily or 300 mg once daily with ritonavir 100 mg once daily (must be used with ritonavir in pregnancy); should be used at a dose of 300 mg once daily with ritonavir 100 mg once daily if used concomitantly with tenofovir, H₂ receptor antagonist, or proton pump inhibitor; should be used at a dose of 400 mg once daily with ritonavir 100 mg once daily if used concomitantly with efavirenz. *Therapy-experienced*—300 mg once daily with ritonavir 100 mg once daily; should be used at dose of 400 mg once daily with ritonavir 100 mg once daily if used with tenofovir and a H₂ receptor antagonist; in pregnant patients in 2nd or 3rd trimester, should be used at a dose of 400 mg once daily with ritonavir 100 mg once daily if used with tenofovir or a H₂ receptor antagonist.

PO (Capsules) (Children ≥6 yr): *Therapy-naïve or therapy-experienced (15–34.9 kg)*—200 mg once daily with ritonavir 100 mg once daily; *Therapy-naïve or therapy-experienced (≥35 kg)*—300 mg once daily with ritonavir 100 mg once daily; *Therapy-naïve, ≥13 yr, ≥40 kg and unable to tolerate ritonavir*—400 mg once daily.

PO (Oral Powder) (Children ≥3 mo and ≥5 kg): *Therapy-naïve or therapy-experienced (5–14.9 kg)*—200 mg once daily with ritonavir 80 mg once daily; *Therapy-naïve or therapy-experienced (15–24.9 kg)*—250 mg once daily with ritonavir 80 mg once daily.

Renal Impairment

PO (Adults): *Therapy-naïve and HD*—300 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced and HD*—contraindicated.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—300 mg once daily (do not use with ritonavir).

Availability (generic available)

Capsules: 150 mg, 200 mg, 300 mg. **Oral powder:** 50 mg/packet. **In combination with:** cobicistat (Evotaz). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for rash which can occur within initial 8 wk of therapy. Usually resolves within 2 wk without al-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tering therapy. Discontinue therapy if rash becomes severe.

- **Lab Test Considerations:** Monitor viral load and CD4 cell count regularly during therapy.
- May cause ↑ serum amylase, lipase, and hyperglycemia.
- May ↑ liver enzymes.
- May ↑ creatine kinase.
- May cause ↓ hemoglobin, neutrophils, and platelets.
- May cause ↑ in unconjugated bilirubin; reversible on discontinuation.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer daily with food to enhance absorption. Capsules should be swallowed whole; do not open.
- For oral powder, mix oral powder with applesauce or yogurt or a beverage (milk, infant formula, or water) for infants who can drink from a cup. For infants (less than 6 months) who cannot eat solid food or drink from a cup, mix oral powder with infant formula and administer using an oral dosing syringe. Administration in infant formula using an infant bottle is not recommended because full dose may not be delivered. Administer entire dose within 1 hr. *If mixed with food*, add an additional spoonful of food to container, mix, and administer residual mixture. *If mixed with liquid*, mix packet contents into 30 mL of liquid and give to child to drink. Add an additional 15 mL more of beverage to drinking cup, mix, and have the child drink the residual mixture. If water is used, food should also be taken at the same time. *If mixing with infant formula*, mix in 10 mL of formula, draw up and administer in left or right cheek of infant. Pour another 10 mL of formula into medicine cup to rinse off remaining oral powder in cup. Draw up residual mixture into syringe and administer into either right or left inner cheek of infant. Additional food may be given after consumption of the entire mixture. Administer ritonavir immediately following oral powder administration.

Patient/Family Teaching

- Emphasize the importance of taking atazanavir with food as directed. Advise patient to read the *Patient Information* before taking and with each Rx refill; may be updated. Atazanavir must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, then return to regular dose schedule. If within 6 hr of next

dose, omit dose and take next dose at regular time. Do not double doses.

- Instruct patient that atazanavir should not be shared with others.
- Inform patient that atazanavir does not cure HIV or prevent associated or opportunistic infections. Atazanavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the HIV virus to others.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort; interactions may be fatal.
- May cause dizziness. Caution patient to notify health care professional if this occurs and to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional immediately if signs and symptoms of hepatitis (flu-like symptoms, tiredness, nausea, lack of appetite, yellow skin or eyes, dark urine, pale stools, pain or sensitivity to touch on right side below ribs), skin reactions with symptoms (flu-like symptoms, fever, muscle aches, conjunctivitis, blisters, mouth sores, swelling of face, tiredness), gallbladder disorder (right or middle upper stomach pain, fever, nausea, vomiting, or yellowing of skin and whites of eyes), kidney stones (side pain, blood in urine, pain upon urination), change in heart rhythm, high blood sugar, or signs of immune reconstitution syndrome (signs and symptoms of an infection) occur.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Instruct females using hormonal contraceptives to use an alternative nonhormonal method of contraception. Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding. If pregnant patient is exposed to atazanavir, register patient in *Antiretroviral Pregnancy Registry* by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of HIV and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

atenolol (a-ten-oh-lole)

Tenormin

Classification

Therapeutic: antianginals, antihypertensives

Pharmacologic: beta blockers

Indications

Management of hypertension. Management of angina pectoris. Prevention of MI.

ActionBlocks stimulation of beta₁ (myocardial)-adrenergic receptors. Does not usually affect beta₂ (pulmonary, vascular, uterine)-receptor sites. **Therapeutic Effects:** Decreased BP and heart rate. Decreased frequency of attacks of angina pectoris. Prevention of MI.**Pharmacokinetics****Absorption:** 50–60% absorbed after oral administration.**Distribution:** Minimal penetration of CNS. Crosses the placenta and enters breast milk.**Metabolism and Excretion:** 40–50% excreted unchanged by the kidneys; remainder excreted in feces as unabsorbed drug.**Half-life:** 6–9 hr.**TIME/ACTION PROFILE** (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2–4 hr	24 hr

Contraindications/Precautions**Contraindicated in:** Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.**Use Cautiously in:** Renal impairment (dosage ↓ recommended if CCr ≤35 mL/min); Hepatic impairment; **Geri:** ↑ sensitivity to beta blockers; initial dose ↓ recommended; Pulmonary disease (including asthma; beta selectivity may be lost at higher doses); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); **OB:** Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; **Lactation, Pedi:** Safety not established.**Adverse Reactions/Side Effects****CNS:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental statuschanges, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** **BRADYCARDIA**, **HF**, **PULMONARY EDEMA**, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, ↑ liver enzymes, nausea, vomiting. **GU:** erectile dysfunction, ↓ libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.**Interactions****Drug-Drug:** **General anesthesia**, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **anti-hypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the beneficial beta₁-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).**Route/Dosage****PO (Adults):** *Antianginal*—50 mg once daily; may be ↑ after 1 wk to 100 mg/day (up to 200 mg/day).*Antihypertensive*—25–50 mg once daily; may be ↑ after 2 wk to 50–100 mg once daily. **MI**—50 mg, then 50 mg 12 hr later, then 100 mg/day as a single dose or in 2 divided doses for 6–9 days or until hospital discharge.**Renal Impairment****PO (Adults):** *CCr 15–35 mL/min*—dosage should not exceed 50 mg/day; *CCr <15 mL/min*—dosage should not exceed 50 mg every other day.**Availability (generic available)****Tablets:** 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—All strengths \$10.83/100. **In combination with:** chlor-thalidone (Tenoretic). See Appendix B.**NURSING IMPLICATIONS****Assessment**

- Monitor BP, ECG, and pulse frequently during dose adjustment period and periodically throughout therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for HF (dyspnea, rales/crackles,

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.*CAPITALS indicates life-threatening; _____ indicate most frequent.

weight gain, peripheral edema, jugular venous distention).

- Monitor frequency of prescription refills to determine adherence.
- **Angina:** Assess frequency and characteristics of angina periodically during therapy.
- **Lab Test Considerations:** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- **Toxicity and Overdose:** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Take apical pulse before administering drug. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.

Patient/Family Teaching

- Instruct patient to take atenolol as directed at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may cause life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly and to report significant changes.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that atenolol may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to avoid alcohol, and to consult health care professional before taking any new medications, especially cold preparations.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block sweating as a sign of hypoglycemia.

- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in BP.
- Reduction in frequency of angina.
- Increase in activity tolerance.
- Prevention of MI.

atezolizumab

(a-te-zoe-liz-ue-mab)

Tecentriq

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies; programmed death ligand 1 (PD-L1) inhibitors

Indications

Locally advanced or metastatic urothelial carcinoma in patients who are not eligible for cisplatin-containing chemotherapy or have disease progression during or following platinum-containing chemotherapy or have disease progression within 12 mo of neoadjuvant or adjuvant chemotherapy. Metastatic non-small cell lung cancer (NSCLC) in patients who have disease progression during or following platinum-containing chemotherapy. Patients with epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving atezolizumab.

Action

Binds to programmed death ligand 1 (PD-L1) to prevent its interaction with the programmed cell death-1 (PD-1) and B7.1 (or CD80) receptors, which activates the anti-tumor immune response. **Therapeutic Effects:** Decreased spread of urothelial carcinoma; decreased spread of NSCLC with increased survival.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Minimally distributed to tissues.

Metabolism and Excretion: Unknown.

Half-life: 27 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: **OB:** May cause fetal harm;

Lactation: Breast feeding should be avoided during treatment and for ≥ 5 mo after therapy.

Use Cautiously in: **Rep:** Patients with childbearing potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: peripheral edema. **CNS:** ENCEPHALITIS, MENINGITIS.

Derm: pruritus, rash. **Endo:** adrenal insufficiency, hyperglycemia, hyperthyroidism, hypophysitis, hypothyroidism, type 1 diabetes mellitus. **F and E:** hyponatremia, dehydration. **GI:** COLITIS/DIARRHEA, HEPATOTOXICITY, PANGREATITIS, constipation, ↓ appetite, nausea, vomiting, abdominal pain, ↑ liver enzymes. **GU:** hematuria, acute kidney injury, ↓ fertility, ↑ serum creatinine, urinary obstruction. **Hemat:** lymphopenia, anemia. **Metab:** hypoalbuminemia. **MS:** arthralgias, ↑ alkaline phosphatase. **Neuro:** GUILLAIN-BARRE SYNDROME, MYASTHENIA GRAVIS. **Resp:** INTERSTITIAL LUNG DISEASE, cough, dyspnea. **Misc:** INFECTIONS (including herpes encephalitis and tuberculosis), fatigue, fever, infusion-related reactions.

Interactions

Drug-Drug: None known.

Route/Dosage

IV (Adults): 1200 mg every 3 wk until disease progression or unacceptable toxicity.

Availability

Solution for injection (requires dilution): 60 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of pneumonitis (new or worsening cough, dyspnea, chest pain) during therapy. Monitor with x-rays as needed. For \geq Grade 2 pneumonitis, administer corticoste-

roids at a dose of 1–2 mg/kg/day prednisolone equivalents followed by a taper. For Grade 3 or 4 pneumonitis, permanently discontinue atezolizumab.

- Monitor for signs and symptoms of hepatitis (jaundice, severe nausea or vomiting, pain on right side of abdomen, lethargy, dark urine, unusual bleeding or bruising, anorexia) periodically during therapy.
- Monitor for signs and symptoms of diarrhea or colitis (blood in stools, dark tarry stools, abdominal pain or tenderness) periodically during therapy. For Grade 2, withhold atezolizumab. If symptoms persist for >5 days or recur, administer 1–2 mg/kg prednisolone or equivalent/day. For Grade 3, withhold atezolizumab and treat with methylprednisolone IV 1–2 mg/kg/day; convert to oral steroids once improved. For Grade 2 and 3, when symptoms improve to Grade 0 or 1, taper steroids over ≥ 1 mo. Resume atezolizumab if diarrhea or colitis improves to Grade 0 or 1 within 12 wks and corticosteroids reduced to equivalent of ≤ 10 mg oral prednisolone/day. For Grade 4, permanently discontinue atezolizumab.
- Monitor for signs and symptoms of hypophysitis (unusual headaches, persistent headaches, vision problems) periodically during therapy. Administer corticosteroids and hormone replacement as needed. For Grade 2 or 3, withhold therapy. For Grade 4, permanently discontinue atezolizumab.
- Monitor for signs and symptoms of adrenal insufficiency (extreme tiredness, dizziness or fainting, frequent urination, nausea or vomiting, changes in mood or behavior, ↓ sex drive, irritability, forgetfulness) periodically during therapy. For symptomatic adrenal insufficiency, withhold atezolizumab and administer methylprednisolone 1–2 mg/kg/day IV followed by 1–2 mg/kg/day oral prednisolone or equivalent once symptoms improve. If symptoms improve to \leq Grade 1, taper steroids over ≥ 1 mo. Resume atezolizumab if adrenal insufficiency improves to Grade 0 or 1 within 12 wks and corticosteroids reduced to equivalent of ≤ 10 mg oral prednisolone/day and patient is stable on replacement therapy.
- Monitor for signs and symptoms of meningitis or encephalitis (fever, confusion, changes in mood or behavior, extreme sensitivity to light, neck stiffness) during therapy. If symptoms occur, permanently discontinue atezolizumab. Administer 1–2 mg/kg/day methylprednisolone or equivalent. Convert to oral prednisone 60 mg/day or equivalent once improved. When symptoms improve to \leq Grade 1, taper steroids over ≥ 1 mo.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor for signs and symptoms of motor or sensory neuropathy (severe muscle weakness, numbness or tingling in hands or feet) periodically during therapy. For any grade of myasthenic syndrome/myasthenia gravis or Guillaine-Barre syndrome, permanently discontinue atezolizumab. Institute treatment as needed. Consider systemic corticosteroids at a dose of 1–2 mg/kg/day prednisone.
- Monitor for signs and symptoms of pancreatitis (abdominal pain) during therapy. *If Grade 2 or 3 pancreatitis*, withhold atezolizumab. Treat with methylprednisolone IV 1–2 mg/kg/day or equivalent. Once symptoms improve, follow with 1–2 mg/kg/day of oral prednisone or equivalent. Resume atezolizumab if symptoms of pancreatitis resolved and corticosteroid reduced to ≤ 10 mg/day oral prednisone or equivalent. *For Grade 4 or recurrent pancreatitis*, permanently discontinue atezolizumab.
- Monitor for signs and symptoms of infection (fever, cough, frequent urination, flu-like symptoms, painful urination) periodically during therapy. Treat suspected or confirmed infections with antibiotics. For \geq Grade 3 infections, withhold atezolizumab.
- Monitor for signs and symptoms of infusion-related reactions (chills or shaking, itching or rash, flushing, dyspnea, wheezing, dizziness, fever, feeling faint, back or neck pain, facial swelling) during therapy. For mild or moderate reactions, interrupt or slow infusion. For Grade 3 or 4 infusion reactions, permanently discontinue atezolizumab.
- **Lab Test Considerations:** Monitor AST, ALT, and serum bilirubin prior to and periodically during therapy. *If \geq Grade 2 \uparrow AST or ALT, with or without \uparrow total bilirubin*, administer 1–2 mg/kg/day of prednisolone equivalent corticosteroids followed by corticosteroid taper. Withhold atezolizumab. *If Grade 3 or 4*, permanently discontinue atezolizumab.
- Monitor thyroid function prior to and periodically during therapy. *If asymptomatic*, continue therapy. *For symptomatic hypothyroidism (extreme tiredness, weight gain, constipation, feeling cold, hair loss, deepening voice)*, withhold atezolizumab and begin thyroid replacement therapy as needed without corticosteroids. *For symptomatic hyperthyroidism (hunger, irritability, mood swings, weight loss)*, withhold atezolizumab and begin antithyroid agents as needed. Resume therapy when symptoms of hyper— or hypothyroidism are controlled and thyroid function is improving.
- Monitor blood glucose periodically during therapy. For type 1 diabetes, begin treatment with insulin. For \geq Grade 3 hyperglycemia (fasting glucose >250 –500 mg/dL), withhold atezolizumab. Resume

atezolizumab when metabolic control is achieved on insulin replacement therapy.

- Monitor serum amylase or lipase in patients with symptoms of pancreatitis. If serum amylase or lipase levels \geq Grade 3 ($>2\times$ upper limit of normal), withhold atezolizumab. Treat with methylprednisolone IV 1–2 mg/kg/day or equivalent. Once symptoms improve, follow with 1–2 mg/kg/day of oral prednisone or equivalent. Resume atezolizumab if symptoms of pancreatitis resolved and corticosteroid \downarrow to ≤ 10 mg/day oral prednisone or equivalent.
- May cause lymphopenia, hyponatremia, anemia, \uparrow alkaline phosphatase, \uparrow creatinine, and hypoalbuminemia.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

Risk for infection (Adverse Reactions)

Implementation

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute 20 mL of atezolizumab in 250 mL of 0.9% NaCl in a polyvinyl chloride, polyethylene, or polyolefin infusion bag. Gently invert to dilute; do not shake. Solution is clear and colorless to slightly yellow. Do not administer solutions that are discolored or contain particulate matter. Administer immediately once prepared or store for ≤ 6 hrs at room temperature (including infusion time) or ≤ 24 hrs if refrigerated. Do not freeze. **Rate:** Administer over 60 min with or without a sterile, non-pyrogenic, low-protein binding in-line filter (0.2–0.22 micron); do not administer via IV push or bolus. If first infusion is tolerated, subsequent infusions may be infused over 30 min.
- **Y-Site Incompatibility:** Do not administer other drugs through same IV line.

Patient/Family Teaching

- Advise patient to notify health care professional immediately if symptoms of pneumonitis, hepatitis, colitis, endocrine problems, meningitis, nervous system problems, ocular inflammatory toxicity (blurry or double vision, eye pain or redness), pancreatitis, infection, infusion-related reactions, or rash occur.
- **Rep:** May be teratogenic. Advise females to use effective contraception during and for ≥ 5 mo after last dose. Inform females atezolizumab may impair fertility. Advise patient to avoid breast feeding during and for ≥ 5 mo after last dose.

Evaluation/Desired Outcomes

- Decrease spread of urothelial carcinoma.
- Decreased spread of NSCLC with increased survival.

atomoxetine (a-to-mox-e-teen) Strattera

Classification

Therapeutic: agents for attention deficit disorder

Pharmacologic: selective norepinephrine reuptake inhibitors

Indications

Attention-Deficit/Hyperactivity Disorder (ADHD).

Action

Selectively inhibits the presynaptic transporter of norepinephrine. **Therapeutic Effects:** Increased attention span.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 enzyme pathway). H A small percentage of the population are poor metabolizers and will have higher blood levels with \uparrow effects.

Half-life: 5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent or within 2 wk therapy with MAO inhibitors; Angle-closure glaucoma; Pheochromocytoma; Hypertension, tachycardia, cardiovascular, or cerebrovascular disease.

Use Cautiously in: Pre-existing psychiatric illness; **Pedi:** May \uparrow risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Concurrent albuterol or vasopressors (\uparrow risk of adverse cardiovascular reactions); **OB:** Use only if benefits outweigh risks to fetus; **Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: SUICIDAL THOUGHTS, dizziness, fatigue, mood swings, behavioral disturbances, hallucinations, hostility, mania, thought disorder; **Adults, insomnia.** **CV:** hypertension, orthostatic hypotension, QT interval prolongation, syncope, tachycardia. **GI:** HEPATOTOXICITY, dyspepsia, nausea, vomiting; **Adults**, dry mouth, constipation. **Derm:** \uparrow sweating, rash, urticaria. **GU:** **Adults**—dysmenorrhea, ejaculatory problems, erectile dysfunction, libido changes, priapism, urinary hesita-

tion, urinary retention. **Metab:** \downarrow appetite, weight/growth loss. **MS:** RHABDOMYOLYSIS. **Neuro:** **Adults**—paresthesia. **Misc:** allergic reactions including ANGIO-NEUROTIC EDEMA and ANAPHYLAXIS.

Interactions

Drug-Drug: Concurrent use with MAO inhibitors may result in serious, potentially fatal reactions (do not use within 2 wk of each other). \uparrow risk of cardiovascular effects with albuterol or vasopressors (use cautiously). **Drugs which inhibit the CYP2D6 enzyme pathway (quinidine, fluoxetine, paroxetine)** will \uparrow blood levels and effects, dose \downarrow recommended.

Route/Dosage

PO (Children and adolescents <70 kg): 0.5 mg/kg/day initially, may be \uparrow every 3 days to a daily target dose of 1.2 mg/kg, given as a single dose in the morning or evenly divided doses in the morning and late afternoon/early evening (not to exceed 1.4 mg/kg/day or 100 mg/day whichever is less). *If taking concurrent CYP2D6 inhibitor (quinidine, fluoxetine, paroxetine)*—0.5 mg/kg/day initially, may \uparrow if needed to 1.2 mg/kg/day after 4 wk.

PO (Adults, adolescents, and children >70 kg): 40 mg/day initially, may be \uparrow every 3 days to a daily target dose of 80 mg/day given as a single dose in the morning or evenly divided doses in the morning and late afternoon/early evening; may be further \uparrow after 2–4 wk up to 100 mg/day. *If taking concurrent CYP2D6 inhibitor (quinidine, fluoxetine, paroxetine)*—40 mg/day initially, may \uparrow if needed to 80 mg/day after 4 wk.

Hepatic Impairment

PO (Adults and Children): *Moderate hepatic impairment (Child-Pugh Class B)*— \downarrow initial and target dose by 50%; *Severe hepatic impairment (Child-Pugh Class C)*— \downarrow initial and target dose to 25% of normal.

Availability (generic available)

Capsules: 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess attention span, impulse control, and interactions with others.
- Monitor BP and pulse periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Monitor growth, body height, and weight in children.

* = Canadian drug name. H = Genetic implication. ~~Strattera~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Assess for signs of liver injury (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained “flu-like” symptoms) during therapy. Monitor liver function tests at first sign of liver injury. Discontinue and do not restart atoxometine in patients with jaundice or laboratory evidence of liver injury.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Impaired social interaction (Indications)

Implementation

- Do not confuse atoxometine with atorvastatin.
- **PO:** Administer without regard to food. Capsules should be swallowed whole; do not open, crush, or chew. Doses may be discontinued without tapering.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible, but should not take more than the total daily amount in any 24-hr period. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill.
- Inform patient that sharing this medication may be dangerous.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive or hostile; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur or if signs and symptoms of severe liver injury (pruritus, dark urine, jaundice, right upper quadrant tenderness, or unexplained “flu-like” symptoms) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if they are breast feeding.

Evaluation/Desired Outcomes

- Improved attention span and social interactions in ADHD.

**atorvastatin, See HMG-CoA
REDUCTASE INHIBITORS (statins).**

atovaquone (a-toe-va-kwone)

Mepron

Classification

Therapeutic: anti-infectives

Indications

Treatment of mild to moderate *Pneumocystis jirovecii* pneumonia (PJP) in patients who are unable to tolerate trimethoprim/sulfamethoxazole. Prophylaxis of PJP.

Action

Inhibits the action of enzymes necessary to nucleic acid and ATP synthesis. **Therapeutic Effects:** Active against *P. jirovecii*.

Pharmacokinetics

Absorption: Absorption is poor but is increased by food, particularly fat.

Distribution: Enters CSF in very low concentrations (<1% of plasma levels).

Protein Binding: >99.9%.

Metabolism and Excretion: Undergoes enterohepatic recycling; elimination occurs in feces.

Half-life: 2.2–2.9 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–8 hr; 24–96 hr†	12 hr

†Two peaks are due to enterohepatic recycling.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** May appear in breast milk.

Use Cautiously in: ↓ hepatic, renal, or cardiac function (dose modification may be necessary); GI disorders (absorption may be limited); **OB:** Safety not established; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, insomnia. **Resp:** cough. **GI:** diarrhea, nausea, vomiting. **Derm:** rash. **Misc:** fever.

Interactions

Drug-Drug: May interact with drugs that are highly bound to plasma proteins (does not appear to interact with phenytoin).

Drug-Food: Food ↑ absorption.

Route/Dosage

Treatment

PO (Adults): 750 mg twice daily for 21 days.

PO (Children): 40 mg/kg/day (unlabeled).

Prevention

PO (Adults and Adolescents 13–16 yr): 1500 mg once daily.

Availability (generic available)

Suspension: 750 mg/5 mL. **In combination with:** proguanil (Malarone). See Appendix B.

NURSING IMPLICATIONS**Assessment**

- Assess patient for signs of infection (vital signs, lung sounds, sputum, WBCs) at beginning of and throughout therapy.
- Obtain specimens prior to initiating therapy. First dose may be given before receiving results.
- **Lab Test Considerations:** Monitor hematologic and hepatic functions. May cause mild, transient anemia and neutropenia. May also cause ↑ serum amylase, AST, ALT, and alkaline phosphatase.
- Monitor electrolytes. May cause hyponatremia.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer with food twice daily for 21 days for treatment and once daily for prevention.
- Shake suspension gently prior to administration.

Patient/Family Teaching

- Instruct patient to take atovaquone as directed around the clock for full course of therapy, even if feeling better. Emphasize the importance of taking atovaquone with food, especially foods high in fat; taking without food may decrease plasma concentrations and effectiveness.
- Advise patient to notify health care professional if rash occurs.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection.

atropine† (at-ro-peen)

Atro-Pen

Classification

Therapeutic: antiarrhythmics
Pharmacologic: anticholinergics, antimuscarinics

†See Appendix C for ophthalmic use

Indications

IM: Given preoperatively to decrease oral and respiratory secretions. **IV:** Treatment of sinus bradycardia and heart block. **IV:** Reversal of adverse muscarinic effects of anticholinesterase agents (neostigmine, physostig-

mine, or pyridostigmine). **IM, IV:** Treatment of anticholinesterase (organophosphate pesticide) poisoning. **Inhaln:** Treatment of exercise-induced bronchospasm.

Action

Inhibits the action of acetylcholine at postganglionic sites located in: Smooth muscle, Secretory glands, CNS (antimuscarinic activity). Low doses decrease: Sweating, Salivation, Respiratory secretions. Intermediate doses result in: Mydriasis (pupillary dilation), Cycloplegia (loss of visual accommodation), Increased heart rate. GI and GU tract motility are decreased at larger doses. **Therapeutic Effects:** Increased heart rate. Decreased GI and respiratory secretions. Reversal of muscarinic effects. May have a spasmolytic action on the biliary and genitourinary tracts.

Pharmacokinetics

Absorption: Well absorbed following subcut or IM administration.

Distribution: Readily crosses the blood-brain barrier. Crosses the placenta and enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver; 30–50% excreted unchanged by the kidneys.

Half-life: Children <2 yr: 4–10 hr; Children >2 yr: 1.5–3.5 hr; Adults: 4–5 hr.

TIME/ACTION PROFILE (inhibition of salivation)

ROUTE	ONSET	PEAK	DURATION
IM, subcut	rapid	15–50 min	4–6 hr
IV	immediate	2–4 min	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis; Obstructive disease of the GI tract.

Use Cautiously in: Intra-abdominal infections; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; **OB, Lactation:** Safety not established; IV administration may produce fetal tachycardia; **Pedi:** Infants with Down syndrome have increased sensitivity to cardiac effects and mydriasis. Children may have increased susceptibility to adverse reactions. Exercise care when prescribing to children with spastic paralysis or brain damage; **Geri:** Increased susceptibility to adverse reactions.

Adverse Reactions/Side Effects

CNS: drowsiness, confusion, hyperpyrexia. **EENT:** blurred vision, cycloplegia, photophobia, dry eyes, mydriasis. **CV:** tachycardia, palpitations, arrhythmias. **GI:** dry mouth, constipation, impaired GI motility. **GU:** urinary hesitancy, retention, impotency. **Resp:** tachy-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

pnea, pulmonary edema. **Misc:** flushing, decreased sweating.

Interactions

Drug-Drug: ↑ anticholinergic effects with other anticholinergics, including antihistamines, tricyclic antidepressants, quinidine, and disopyramide. Anticholinergics may alter the absorption of other orally administered drugs by slowing motility of the GI tract. **Antacids** ↓ absorption of anticholinergics. May ↑ GI mucosal lesions in patients taking oral potassium chloride tablets. May alter response to beta-blockers.

Route/Dosage

Preanesthesia (To Decrease Salivation/Secretions)

IM, IV, Subcut (Adults): 0.4–0.6 mg 30–60 min pre-op.

IM, IV, Subcut (Children >5 kg): 0.01–0.02 mg/kg/dose 30–60 min preop to a maximum of 0.4 mg/dose; minimum: 0.1 mg/dose.

IM, IV, Subcut (Children <5 kg): 0.02 mg/kg/dose 30–60 min preop then q 4–6 hr as needed.

Bradycardia

IV (Adults): 0.5–1 mg; may repeat as needed q 5 min, not to exceed a total of 2 mg (q 3–5 min in Advanced Cardiac Life Support guidelines) or 0.04 mg/kg (total vagolytic dose).

IV (Children): 0.02 mg/kg (maximum single dose is 0.5 mg in children and 1 mg in adolescents); may repeat q 5 min up to a total dose of 1 mg in children (2 mg in adolescents).

Endotracheal (Children): use the IV dose and dilute before administration.

Reversal of Adverse Muscarinic Effects of Anticholinesterases

IV (Adults): 0.6–12 mg for each 0.5–2.5 mg of neostigmine methylsulfate or 10–20 mg of pyridostigmine bromide concurrently with anticholinesterase.

Organophosphate Poisoning

IM (Adults): 2 mg initially, then 2 mg q 10 min as needed up to 3 times total.

IV (Adults): 1–2 mg/dose q 10–20 min until atropinic effects observed then q 1–4 hr for 24 hr; up to 50 mg in first 24 hr and 2 g over several days may be given in severe intoxication.

IM (Children >10 yr >90 lbs): 2 mg.

IM (Children 4–10 yr 40–90 lbs): 1 mg.

IM (Children 6 mo–4 yr 15–40 lbs): 0.5 mg.

IV (Children): 0.02–0.05 mg/kg q 10–20 min until atropinic effects observed then q 1–4 hr for 24 hr.

Bronchospasm

Inhaln (Adults): 0.025–0.05 mg/kg/dose q 4–6 hr as needed; maximum 2.5 mg/dose.

Inhaln (Children): 0.03–0.05 mg/kg/dose 3–4 times/day; maximum 2.5 mg/dose.

Availability (generic available)

Injection: 0.05 mg/mL, 0.1 mg/mL, 0.4 mg/mL, 1 mg/mL, 0.5 mg/0.7 mL Auto-injector, 1 mg/0.7 mL Auto-injector, 2 mg/0.7 mL Auto-injector.

NURSING IMPLICATIONS

Assessment

- Assess vital signs and ECG tracings frequently during IV drug therapy. Report any significant changes in heart rate or BP, or increased ventricular ectopy or angina to health care professional promptly.
- Monitor intake and output ratios in elderly or surgical patients because atropine may cause urinary retention.
- Assess patients routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate constipation.
- **Toxicity and Overdose:** If overdose occurs, physostigmine is the antidote.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Impaired oral mucous membrane (Side Effects)

Constipation (Side Effects)

Implementation

- **IM:** Intense flushing of the face and trunk may occur 15–20 min following IM administration. In children, this response is called “atropine flush” and is not harmful.

IV Administration

- **IV Push: Diluent:** Administer undiluted. **Rate:** Administer over 1 min; more rapid administration may be used during cardiac resuscitation (follow with 20 mL saline flush). Slow administration (over >1 min) may cause a paradoxical bradycardia (usually resolved in approximately 2 min).
- **Y-Site Compatibility:** abiximab, alfentanil, amikacin, aminophylline, amiodarone, argatroban, ascorbic acid, azathioprine, aztreonam, benzotropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, dexmedetomidine, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatid, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketamine, ketorolac, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, meropenem, methadone, methylodopate, methylprednisolone, metoclopramide, metoprolol, midazolam, morphine, multivita-

mins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, palonosetron, papaverine, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, theophylline, thiamine, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, verapamil, vitamin B complex with C.

- **Y-Site Incompatibility:** amphotericin B colloidal, dantrolene, diazepam, diazoxide, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole, thiopental.
- **Endotracheal:** Dilute with 5–10 mL of 0.9% NaCl.
- **Rate:** Inject directly into the endotracheal tube followed by several positive pressure ventilations.

Patient/Family Teaching

- May cause drowsiness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient that oral rinses, sugarless gum or candy, and frequent oral hygiene may help relieve dry mouth.
- Caution patients that atropine impairs heat regulation. Strenuous activity in a hot environment may cause heat stroke. Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Pedi:** Instruct parents or caregivers that medication may cause fever and to notify health care professional before administering to a febrile child.
- **Geri:** Inform male patients with benign prostatic hyperplasia that atropine may cause urinary hesitancy and retention. Changes in urinary stream should be reported to health care professional.

Evaluation/Desired Outcomes

- Increase in heart rate.
- Dryness of mouth.
- Reversal of muscarinic effects.

avanafil (av-an-a-fil)

Stendra

Classification

Therapeutic: erectile dysfunction agents
Pharmacologic: phosphodiesterase type 5 inhibitors

Indications

Treatment of erectile dysfunction.

Action

Enhances effects of nitric oxide released during sexual stimulation. Nitric oxide activates guanylate cyclase, which produces ↑ levels of cyclic guanosine monophosphate (cGMP). cGMP produces smooth muscle relaxation of the corpus cavernosum, which promotes ↑ blood flow and subsequent erection. Inhibits the enzyme phosphodiesterase type 5 (PDE5), PDE5 inactivates cGMP. **Therapeutic Effects:** Enhanced blood flow to the corpus cavernosum and erection sufficient to allow sexual intercourse. Requires sexual stimulation.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.

Distribution: Minimal amounts enter semen.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by the CYP3A4 enzyme system), metabolites excreted in feces (62%) and urine (21%). One metabolite had inhibitory activity on PDE5.

Half-life: 5 hr.

TIME/ACTION PROFILE (effect on BP)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	1–2 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of nitrates or riociguat; Severe renal or hepatic impairment; Concurrent use of strong CYP3A4 inhibitors; Serious underlying cardiovascular disease (including history of MI, stroke, or serious arrhythmia within 6 mo), cardiac failure, or coronary artery disease with unstable angina, angina with sexual intercourse; History of HF, coronary artery disease, uncontrolled hypertension (BP >170/110 mm Hg) or hypotension (BP <90/50 mm Hg), dehydration, autonomic dysfunction, or severe left ventricular outflow obstruction; Hereditary degenerative retinal disorders; Women.

Use Cautiously in: Serious underlying cardiovascular disease or conditions in which sexual activity is not advised; History of sudden severe vision loss or non-arteritic ischemic optic neuropathy (NAION); may ↑ risk of recurrence; Low cup to disk ratio, age >50 yr, diabetes, hypertension, coronary artery disease, hyperlipidemia, or smoking (↑ risk of NAION); Alpha adrenergic blockers (patients should be on stable dose of alpha blockers before treatment, initiate with 50 mg dose); Anatomic penile deformity (angulation, cavernosal fibrosis, Peyronie disease); Conditions associated with priapism (sickle cell anemia, multiple myeloma, leuke-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

mia); Concurrent use of moderate CYP3A4 inhibitors (initiate with 50 mg dose); History of hearing loss; Bleeding disorders or peptic ulceration; **Ger:** Elderly may be more sensitive to drug effects; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, dizziness. **EENT:** nasal congestion, nasopharyngitis, sudden hearing/vision loss. **GU:** priapism. **Derm:** flushing. **MS:** back pain.

Interactions

Drug-Drug: Concurrent use of nitrates may cause serious, life-threatening hypotension and is contraindicated. Concurrent use of riociguat may result in severe hypotension; concurrent use contraindicated. Blood levels and effects may be ↑ by CYP3A4 inhibitors, concurrent use of strong CYP3A4 inhibitors including atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, and saquinavir is contraindicated. A similar but lesser effect is expected with moderate CYP3A4 inhibitors including erythromycin, aprepitant, diltiazem, fluconazole, fosamprenavir, ritonavir, and verapamil; initial dose should not exceed 50 mg/24 hr. ↑ risk of hypotension with alpha-adrenergic blockers, antihypertensives, and alcohol (more than 3 units); dosage adjustments may be necessary.

Route/Dosage

PO (Adults): 100 mg 15 min prior to sexual activity, not to exceed once daily (range 50–200 mg, use lowest effective dose); Concurrent alpha-blockers or moderate CYP3A4 inhibitors—50 mg, not to exceed once daily.

Availability

Tablets: 50 mg, 100 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Determine erectile dysfunction before administration. Avanafil has no effect in the absence of sexual stimulation.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Ineffective tissue perfusion (Adverse Reactions)

Implementation

- **PO:** Administer dose as needed for erectile dysfunction at least 15 min prior to sexual activity.
- May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take avanafil as needed for ED at least 15 min before sexual activity and not more than once per day. Inform patient that sexual stimulation is required for an erection to occur after taking avanafil.
- Advise patient that avanafil is not indicated for use in women.

- Caution patient not to take avanafil concurrently with alpha adrenergic blockers (unless on a stable dose) or nitrates. If chest pain occurs after taking avanafil, instruct patient to seek immediate medical attention.
- Advise patient to avoid excess alcohol intake (≥ 3 units) in combination with avanafil; may increase risk of orthostatic hypotension, increased heart rate, decreased standing BP, dizziness, headache.
- Instruct patient to notify health care professional promptly if erection lasts longer than 4 hr, if they are not satisfied with their sexual performance, develop unwanted side effects or if they experience sudden or decreased vision loss in one or both eyes or loss or decrease in hearing, ringing in the ears, or dizziness.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications that may interact with avanafil.
- Inform patient that avanafil offers no protection against sexually transmitted diseases. Counsel patient that protection against sexually transmitted diseases and HIV infection should be considered.

Evaluation/Desired Outcomes

- Male erection sufficient to allow intercourse.

azaTHIOprine (ay-za-thye-oh-preen) Azasan, Imuran

Classification

Therapeutic: immunosuppressants
Pharmacologic: purine antagonists

Indications

Prevention of renal transplant rejection (with corticosteroids, local radiation, or other cytotoxic agents). Treatment of severe, active, erosive rheumatoid arthritis unresponsive to more conventional therapy. **Unlabeled Use:** Management of Crohn's disease or ulcerative colitis.

Action

Antagonizes purine metabolism with subsequent inhibition of DNA and RNA synthesis. **Therapeutic Effects:** Suppression of cell-mediated immunity and altered antibody formation.

Pharmacokinetics

Absorption: Readily absorbed after oral administration.

Distribution: Crosses the placenta. Enters breast milk in low concentrations.

Metabolism and Excretion: Metabolized to mercaptopurine, which is further metabolized \rightarrow (one route is by thiopurine methyltransferase [TPMT] to form an inactive metabolite). Minimal renal excretion of unchanged drug.

Half-life: 3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (anti-inflammatory)	6–8 wk	12 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of mycophenolate; **OB:** Has been shown to cause fetal harm; **Lactation:** Appears in breast milk.

Use Cautiously in: Infection; Malignancies; ↓ bone marrow reserve; Previous or concurrent radiation therapy; Other chronic debilitating illnesses; Severe renal impairment/oliguria (↑ sensitivity); **⚠** Patients with TPMT enzyme deficiency (substantial dose ↓ are required to avoid hematologic adverse events); **Rep:** Women of reproductive potential; **Pedi:** ↑ risk of hepatosplenic T-cell lymphoma [HSTCL] in patients with inflammatory bowel disease.

Adverse Reactions/Side Effects

CNS: PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY.

EENT: retinopathy. **Resp:** pulmonary edema. **GI:** anorexia, hepatotoxicity, nausea, vomiting, diarrhea, mucositis, pancreatitis. **Derm:** alopecia, rash. **Hemat:** anemia, leukopenia, pancytopenia, thrombocytopenia. **MS:** arthralgia. **Misc:** MALIGNANCY (including post-transplant lymphoma, HSTCL, and skin cancer), SERUM SICKNESS, chills, fever, Raynaud's phenomenon, retinopathy.

Interactions

Drug-Drug: Additive myelosuppression with anti-neoplastics, cyclosporine, and myelosuppressive agents. Allopurinol inhibits the metabolism of azathioprine, increasing toxicity. Dose of azathioprine should be ↓ to 25–33% of the usual dose when used with allopurinol. May ↓ antibody response to live-virus vaccines and ↑ the risk of adverse reactions.

Drug-Natural Products: Concomitant use with echinacea and melatonin may interfere with immunosuppression.

Route/Dosage

Renal Allograft Rejection Prevention

PO (Adults and Children): 3–5 mg/kg/day initially; maintenance dose 1–3 mg/kg/day.

Rheumatoid Arthritis

PO (Adults and Children): 1 mg/kg/day for 6–8 wk, ↑ by 0.5 mg/kg/day every 4 wk until response or up to 2.5 mg/kg/day, then ↓ by 0.5 mg/kg/day every 4–8 wk to minimal effective dose.

Inflammatory Bowel Disease (Crohn's Disease or Ulcerative Colitis) (unlabeled use)

PO (Adults and Children): 50 mg once daily; may ↑ by 25 mg/day every 1–2 wk as tolerated to target dose of 2–3 mg/kg/day.

Availability (generic available)

Tablets: 50 mg, 75 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs, sputum, urine, stool, WBC) during therapy.
- Monitor intake and output and daily weight. Decreased urine output may lead to toxicity with this medication.
- **Rheumatoid Arthritis:** Assess range of motion; degree of swelling, pain, and strength in affected joints; and ability to perform activities of daily living before and periodically during therapy.
- **Lab Test Considerations:** Monitor renal, hepatic, and hematologic functions before beginning therapy, weekly during the 1st mo, bimonthly for the next 2–3 mo, and monthly thereafter.
- Leukocyte count of <3000 or platelet count of <100,000/mm³ may necessitate a reduction in dose or temporary discontinuation.
- ↓ in hemoglobin may indicate bone marrow suppression.
- Hepatotoxicity may be manifested by ↑ alkaline phosphatase, bilirubin, AST, ALT, and amylase concentrations. Usually occurs within 6 mo of transplant, rarely with rheumatoid arthritis, and is reversible on discontinuation of azathioprine.
- May ↓ serum and urine uric acid and plasma albumin.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse azathioprine with azacitidine.
- Protect transplant patients from staff members and visitors who may carry infection. Maintain protective isolation as indicated.
- **PO:** May be administered with or after meals or in divided doses to minimize nausea.

Patient/Family Teaching

- Instruct patient to take azathioprine as directed. If a dose is missed on a once-daily regimen, omit dose; if on several-times-a-day dosing, take as soon as possible or double next dose. Consult health care professional if more than 1 dose is missed or if vomiting occurs shortly after dose is taken. Do not discontinue without consulting health care professional.

* = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to report unusual tiredness or weakness; cough or hoarseness; fever or chills; lower back or side pain; painful or difficult urination; severe diarrhea; black, tarry stools; blood in urine; or transplant rejection to health care professional immediately.
- Reinforce the need for lifelong therapy to prevent transplant rejection.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications or receiving any vaccinations while taking this medication.
- Advise patient to avoid contact with persons with contagious diseases and persons who have recently taken oral poliovirus vaccine or other live viruses.
- **Rep:** This drug may have teratogenic properties. Advise patient to use contraception during and for at least 4 mo after therapy is completed.
- Emphasize the importance of follow-up exams and lab tests.
- **Rheumatoid Arthritis:** Concurrent therapy with salicylates, NSAIDs, or corticosteroids may be necessary. Patient should continue physical therapy and adequate rest. Explain that joint damage will not be reversed; goal is to slow or stop disease process.

Evaluation/Desired Outcomes

- Prevention of transplant rejection.
- Decreased stiffness, pain, and swelling in affected joints in 6–8 wk in rheumatoid arthritis. Therapy is discontinued if no improvement in 12 wk.

azilsartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

azithromycin

(aye-zith-roe-mye-sin)

Zithromax, Zmax

Classification

Therapeutic: agents for atypical mycobacterium, anti-infectives

Pharmacologic: macrolides

Indications

Treatment of the following infections due to susceptible organisms: Upper respiratory tract infections, including streptococcal pharyngitis, acute bacterial exacerbations of chronic bronchitis and tonsillitis, Lower respiratory tract infections, including bronchitis and pneumonia, Acute otitis media, Skin and skin structure infections, Nongonococcal urethritis, cervicitis, gonorrhea, and chancroid. Prevention of disseminated *Mycobacterium avium* complex (MAC) infection in patients with advanced HIV infection. *Extended-release suspension (ZMax)* Acute bacterial sinusitis and community-ac-

quired pneumonia in adults. **Unlabeled Use:** Prevention of bacterial endocarditis. Treatment of cystic fibrosis lung disease. Treatment and post-exposure prophylaxis of pertussis in infants.

Action

Inhibits protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Active against the following gram-positive aerobic bacteria: *Staphylococcus aureus*, *Streptococcus pneumoniae*, *S. pyogenes* (group A strep). Active against these gram-negative aerobic bacteria: *Haemophilus influenzae*, *Moraxella catarrhalis*, *Neisseria gonorrhoeae*. Also active against: *Bordetella pertussis*, *Mycoplasma, Legionella, Chlamydia pneumoniae, Ureaplasma urealyticum, Borrelia burgdorferi, M. avium*. Not active against methicillin-resistant *S. aureus*.

Pharmacokinetics

Absorption: Rapidly absorbed (40%) after oral administration. IV administration results in complete bioavailability.

Distribution: Widely distributed to body tissues and fluids. Intracellular and tissue levels exceed those in serum; low CSF levels.

Protein Binding: 7–51%.

Metabolism and Excretion: Mostly excreted unchanged in bile; 4.5% excreted unchanged in urine.

Half-life: 11–14 hr after single dose; 2–4 days after several doses; 59 hr after extended release suspension.

TIME/ACTION PROFILE (serum)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2.5–3.2 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to azithromycin, erythromycin, or other macrolide anti-infectives; History of cholestatic jaundice or hepatic dysfunction with prior use of azithromycin; QT interval prolongation, hypokalemia, hypomagnesemia, or bradycardia; Concurrent use of quinidine, procainamide, dofetilide, amiodarone, or sotalol.

Use Cautiously in: Severe liver impairment (dose adjustment may be required); Severe renal impairment (CCr <10 mL/min); Myasthenia gravis (may worsen symptoms); **Geri:** May have ↑ risk of QT interval prolongation; **OB, Lactation:** Safety not established; **Pedi:** Neonates (↑ risk of infantile hypertrophic pyloric stenosis at up to 42 days of life).

Adverse Reactions/Side Effects

CNS: dizziness, seizures, drowsiness, fatigue, headache. **CV:** **TORSADES DE POINTES**, chest pain, hypotension, palpitations, QT interval prolongation. **GI:** **HEPATOTOXICITY, CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD)**, abdominal pain, diarrhea, nausea, cholestatic

jaundice, ↑ liver enzymes, dyspepsia, flatulence, melena, oral candidiasis, pyloric stenosis. **GU:** nephritis, vaginitis. **Hemat:** anemia, leukopenia, thrombocytopenia. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rash. **EENT:** ototoxicity. **F and E:** hyperkalemia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Quinidine, procainamide, dofetilide, sotalol, and amiodarone may ↑ risk of QT interval prolongation; concurrent use should be avoided.

Aluminum- and **magnesium-containing antacids** ↓ peak levels. **Nelfinavir** ↑ levels (monitor carefully); azithromycin also ↓ nelfinavir levels. **Efavirenz** ↑ levels. May ↑ the effects and risk of toxicity of **warfarin** and **zidovudine**. Other macrolide anti-infectives have been known to ↑ levels and effects of **digoxin**, **theophylline**, **ergotamine**, **dihydroergotamine**, **triazolam**, **carbamazepine**, **cyclosporine**, **tacrolimus**, and **phenytoin**; careful monitoring of concurrent use is recommended.

Route/Dosage

Most Respiratory and Skin Infections

PO (Adults): 500 mg on 1st day, then 250 mg/day for 4 more days (total dose of 1.5 g); *Acute bacterial sinusitis*—500 mg once daily for 3 days or single 2-g dose of extended-release suspension (Zmax).

PO (Children ≥ 6 mo): *Pneumonia/Pertussis*—10 mg/kg (not >500 mg/dose) on 1st day, then 5 mg/kg once daily (not >250 mg/dose) for 4 more days. *Pharyngitis/tonsillitis*—12 mg/kg once daily for 5 days (not >500 mg/dose); *Acute bacterial sinusitis*—10 mg/kg once daily for 3 days.

PO (Neonates): *Pertussis, treatment and post-exposure prophylaxis*—10 mg/kg once daily for 5 days.

Otitis Media

PO (Children ≥ 6 mo): 30 mg/kg single dose (not >1500 mg/dose) or 10 mg/kg once daily (not >500 mg/dose) for 3 days or 10 mg/kg (not >500 mg/dose) on 1st day, then 5 mg/kg once daily (not >250 mg/dose) for 4 more days.

Acute Bacterial Exacerbations of Chronic Bronchitis

PO (Adults): 500 mg on 1st day, then 250 mg once daily for 4 more days (total dose of 1.5 g) or 500 mg once daily for 3 days.

Community-Acquired Pneumonia

IV, PO (Adults): *More severe*—500 mg IV every 24 hr for at least 2 doses, then 500 mg PO every 24 hr for a

total of 7–10 days; *Less severe*—500 mg PO, then 250 mg/day PO for 4 more days or 2 g single dose as extended-release suspension (Zmax).

PO (Children >6 mo): 10 mg/kg on 1st day, then 5 mg/kg once daily for 4 more days.

Pelvic Inflammatory Disease

IV, PO (Adults): 500 mg IV every 24 hr for 1–2 days, then 250 mg PO every 24 hr for a total of 7 days.

Endocarditis Prophylaxis

PO (Adults): 500 mg 1 hr before procedure.

PO (Children): 15 mg/kg 1 hr before procedure.

Nongonococcal Urethritis, Cervicitis, Chancroid, Chlamydia

PO (Adults): Single 1-g dose.

PO (Children): *Chancroid:* Single 20-mg/kg dose (not >1000 mg/dose). *Urethritis or cervicitis:* Single 10-mg/kg dose (not >1000 mg/dose).

Gonorrhea

PO (Adults): Single 2-g dose.

Prevention of Disseminated MAC Infection

PO (Adults): 1.2 g once weekly (alone or with rifabutin).

PO (Children): 5 mg/kg once daily (not >250 mg/dose) or 20 mg/kg (not >1200 mg/dose) once weekly (alone or with rifabutin).

Cystic Fibrosis

PO (Children ≥ 6 yrs, ≥ 40 kg): 500 mg every Monday, Wednesday, and Friday.

PO (Children ≥ 6 yrs, 25 kg to <40 kg): 250 mg every Monday, Wednesday, and Friday.

Availability (generic available)

Tablets: 250 mg, 500 mg, 600 mg. **Cost:** *Generic*—250 mg \$8.82/6, 500 mg \$10.03/3, 600 mg \$104.62/30. **Powder for oral suspension (cherry, creme de vanilla, and banana flavor):** 1 g/pkt. **Cost:** *Generic*—\$72.45/3 pkts. **Powder for oral suspension (cherry, creme de vanilla, and banana flavor):** 100 mg/5 mL, 200 mg/5 mL. **Cost:** *Generic*—100 mg/5 mL \$34.88/15 mL, 200 mg/5 mL \$34.88/22.5 mL. **Extended-release oral suspension (ZMax) (cherry-banana):** 2-g single-dose bottle. **Cost:** \$128.36/1 bottle. **Powder for injection:** 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Assess patient for skin rash frequently during therapy. Discontinue azithromycin at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- **Lab Test Considerations:** May cause ↑ serum bilirubin, AST, ALT, LDH, and alkaline phosphatase concentrations.
- May cause ↑ creatine phosphokinase, potassium, prothrombin time, BUN, serum creatinine, and blood glucose concentrations.
- May occasionally cause ↓ WBC and platelet count.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **Zmax extended release oral suspension** is not bioequivalent or interchangeable with azithromycin oral suspension.
- **PO:** Administer 1 hr before or 2 hr after meals.
- For administration of single 1-g packet, thoroughly mix entire contents of packet with 2 oz (60 mL) of water. Drink entire contents immediately; add an additional 2 oz of water, mix and drink to assure complete consumption of dose. Do not use the single packet to administer doses other than 1000 mg of azithromycin. **Pedi:** 1-g packet is not for pediatric use.
- For **Zmax**, shake suspension well and drink entire contents of bottle. Use within 12 hr of reconstitution. If patient vomits within 1 hr of administration, contact prescriber for instructions. **Zmax** may be taken without regard to antacids containing magnesium or aluminum hydroxide.

IV Administration

- **Intermittent Infusion:** **Diluent:** Reconstitute each 500-mg vial with 4.8 mL of sterile water for injection to achieve a concentration of 100 mg/mL. Reconstituted solution is stable for 24 hr at room temperature. Further dilute the 500-mg dose in 250 mL or 500 mL of 0.9% NaCl, 0.45% NaCl, D5W, LR, D5/0.45% NaCl, or D5/LR. Infusion is stable for 24 hr at room temperature or for 7 days if refrigerated. **Concentration:** Final concentration of infusion is 1–2 mg/mL. **Rate:** Administer the 1-mg/mL solution over 3 hr or the 2-mg/mL solution over 1 hr. Do not administer as a bolus.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate,

cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotetan, cefoxitin, ceftriaxone, ceftazidime, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, eftifibatid, eripenem, esmolol, etoposide, etoposide phosphate, fenoldopam, fluconazole, fluorouracil, foscarnet, fosphenytoin, ganciclovir, gemcitabine, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, irinotecan, isoproterenol, labetalol, leucovorin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meprenone, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, metronidazole, milrinone, nalbuphine, naloxone, nesiritide, nitroglycerin, nitropruside, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenylephrine, potassium acetate, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, thiopepa, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, voriconazole, zidovudine, zoletronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, chlorpromazine, diazepam, doxorubicin, epirubicin, midazolam, mitoxantrone, mycophenolate, nicardipine, pentamidine, phenytoin, quinupristin/dalfopristin, thiopental.

Patient/Family Teaching

- Instruct patients to take medication as directed and to finish the drug completely, even if they are feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patients that sharing of this medication may be dangerous.
- Instruct patient not to take azithromycin with food or antacids.
- May cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report symptoms of chest pain, palpitations, yellowing of skin or eyes, or signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) or rash.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool con-

tains blood, pus, or mucus. Advise patient not to treat diarrhea without advice of health care professional.

- Advise patients being treated for nongonococcal urethritis or cervicitis that sexual partners should also be treated.
- Instruct parents, caregivers, or patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

aztreonam (az-tree-oh-nam)

Azactam, Cayston

Classification

Therapeutic: anti-infectives

Pharmacologic: monobactams

Indications

Treatment of serious gram-negative infections including: Septicemia, Skin and skin structure infections, Intra-abdominal infections, Gynecologic infections, Respiratory tract infections, Urinary tract infections. Useful for treatment of multi-resistant strains of some bacteria including aerobic gram-negative pathogens. **Inhaln:** To improve respiratory symptoms in cystic fibrosis (CF) patients with *Pseudomonas aeruginosa*.

Action

Binds to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Displays significant activity against gram-negative aerobic organisms only: *Escherichia coli*, *Serratia*, *Klebsiella oxytoca* or *pneumoniae*, *Citrobacter*, *Proteus mirabilis*, *Pseudomonas aeruginosa*, *Enterobacter*, *Haemophilus influenzae*. Not active against: *Staphylococcus aureus*, *Enterococcus*, *Bacteroides fragilis*, *Streptococci*.

Pharmacokinetics

Absorption: Well absorbed following IM administration. Low absorption follows administration by inhalation.

Distribution: Widely distributed. Crosses the placenta and enters breast milk in low concentrations. High concentrations achieved in sputum with inhalation.

Protein Binding: 56%.

Metabolism and Excretion: 60–70% excreted unchanged by the kidneys. 10% of inhaled dose excreted unchanged in urine. Small amounts metabolized by the liver.

Half-life: Adults: 1.5–2 hr; Children: 1.7 hr; Neonates: 2.4–9 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	60 min	6–8 hr
IV	rapid	end of infusion	6–8 hr
Inhaln	rapid	unknown	Several hours

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal impairment (dosage ↓ required if CCr 30 mL/min or less); Cross-sensitivity with penicillins or cephalosporins may occur rarely. Has been used safely in patients with a history of penicillin or cephalosporin allergy; Patients with FEV₁ <25% or >75% predicted, or patients colonized with *Burkholderia cepacia* (safety and effectiveness not established); **OB, Lactation:** Safety not established; **Pedi:** Children <7 yr (inhalation) (safety and effectiveness not established); **Geri:** Consider age-related ↓ in renal function.

Adverse Reactions/Side Effects

CNS: SEIZURES. **EENT:** nasal congestion (inhalation), nasopharyngeal pain (inhalation). **CV:** chest discomfort (inhalation). **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain (inhalation), altered taste, diarrhea, nausea, vomiting. **Resp:** cough (inhalation), wheezing (inhalation), bronchospasm (inhalation). **Derm:** rash. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS, fever (inhalation), superinfection.

Interactions

Drug-Drug: Serum levels may be ↑ by furosemide or probenecid.

Route/Dosage

IM, IV (Adults): Moderately severe infections—1–2 g q 8–12 hr; severe or life-threatening infections (including those due to *Pseudomonas aeruginosa*)—2 g q 6–8 hr; urinary tract infections—0.5–1 g q 8–12 hr.

IV (Children 1 mo–16 yr): Mild to moderate infections—30 mg/kg q 8 hr; moderate to severe infections—30 mg/kg q 6–8 hr; cystic fibrosis—50 mg/kg q 6–8 hr.

IV (Neonates >2 kg): 30 mg/kg q 6–8 hr.

IV (Neonates ≤2 kg): 30 mg/kg q 8–12 hr.

Inhaln (Adults and Children >7 yr): 75 mg three times daily for 28 days.

Renal Impairment

IV (Adults): CCr 10–30 mL/min—1–2 g initially, then 50% of usual dosage at usual interval; CCr <10 mL/min—500 mg–2 g initially, then 25% of usual

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dosage at usual interval (1/3 of initial dose should also be given after each hemodialysis session).

Availability (generic available)

Injection: 500 mg/vial, 1 g/vial, 2 g vial. **Premixed containers:** 1 g/50 mL, 2 g/50 mL. **Lyophilized powder for use with diluent provided in Altera Nebulizer System only (Cayston):** 75 mg/vial with 1 mL ampule of diluent (0.17% sodium chloride).

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; wound appearance, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins and cephalosporins. Patients allergic to these drugs may exhibit hypersensitivity reactions to aztreonam. However, aztreonam can often be used in these patients.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Assess respiratory status prior to and following inhalation therapy.
- **Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing).** Notify the health care professional immediately if these occur.
- **Monitor bowel function. Report diarrhea, abdominal cramping, fever, and bloody stools to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD).** May begin up to several wk following cessation of therapy.
- **Lab Test Considerations:** May cause ↑ in AST, ALT, alkaline phosphatase, LDH, and serum creatinine. May cause ↑ prothrombin and partial thromboplastin times, and positive Coombs' test.

Potential Nursing Diagnoses

Risk for infection (Indications)

Ineffective airway clearance (Indications)

Implementation

- After adding diluent to vial, shake immediately and vigorously. Not for multidose use; discard unused solution. IV route is recommended if single dose > 1 g or for severe or life-threatening infection.
- **IM:** Use 15-mL vial and dilute each gram of aztreonam with at least 3 mL of 0.9% NaCl, or sterile or bacteriostatic water for injection. Stable at room temperature for 48 hr or 7 days if refrigerated.
- Administer into large, well-developed muscle.

IV Administration

- **IV Push:** Reconstitute 15 mL vial with 6–10 mL of sterile water for injection. **Rate:** Administer slowly over 3–5 min by direct injection or into tubing of a compatible solution.
- **Intermittent Infusion:** Reconstitute 15 mL vial with 3 mL of Sterile Water for Injection. **Diluent:**

Dilute further with 0.9% NaCl, Ringer's or LR, D5W, D10W, D5/0.9% NaCl, D5/0.45% NaCl, D5/0.2% NaCl, D5/LR, or sodium lactate. **Concentration:** Do not exceed 50 mg/mL. Solution is stable for 48 hr at room temperature and 7 days if refrigerated. Solutions range from colorless to light, straw yellow or may develop a pink tint upon standing; this does not affect potency. **Rate:** Infuse over 20–60 min.

- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, amifalungin, argatroban, ascorbic acid, atracurium, atropine, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftazidime, cefepime, cefotaxime, cefotetan, ceftiofur, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, dobutamine, docetaxel, dopamine, doxycycline, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatid, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, flouxuridine, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methoxamine, methylodopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propofol, propranolol, protamine, pyridoxime, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, amsacrine, azathioprine, azithromycin,

chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, diazoxide, erythromycin, ganciclovir, indomethacin, lorazepam, metronidazole, mitomycin, mitoxantrone, mycophenolate, pantoprazole, papaverine, pentamidine, pentazocine, pentobarbital, phenytoin, prochlorperazine, streptozocin, trastuzumab.

- **Inhaln:** Open glass aztreonam vial by removing metal ring and pulling tab, and removing gray rubber stopper. Twist tip of diluent ampule and squeeze contents into glass aztreonam vial. Replace rubber stopper and swirl gently until contents are completely dissolved. Administer immediately after reconstitution using *Altera Nebulizer System*. Pour reconstituted solution into handset of nebulizer. Turn unit on. Place mouthpiece into mouth and breathe normally only through mouth. Administration takes 2–3 min. Do not use other nebulizers or mix with other medications. Do not administer IV or IM. Refrigerate aztreonam and diluent; may be stored at room temperature for up to 28 days. Protect from light.
- Administer short-acting bronchodilator between 15 min and 4 hr or long-acting bronchodilator between 30 min and 12 hr prior to treatment. If taking multiple inhaled therapies, administer in the following order: bronchodilator, mucolytic, and lastly, aztreonam.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- **Advise patient to notify health care professional if new or worsening symptoms or signs of anaphylaxis occur.**
- **Inhaln:** Instruct patient to use aztreonam as directed for the full 28-day course, even if feeling better. If a dose is missed, take all 3 daily doses, as long as doses are at least 4 hrs apart. Skipping doses or not completing full course of therapy may decrease effectiveness and increase likelihood of bacterial resistance not treatable in the future. Inform patient of the importance of using a bronchodilator prior to treatment and in use and cleaning of nebulizer.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Improvement in respiratory symptoms in patients with cystic fibrosis.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

baclofen (bak-loe-fen)

Gablofen, Lioresal

Classification

Therapeutic: antispasticity agents, skeletal muscle relaxants (centrally acting)

Indications

PO: Treatment of reversible spasticity due to multiple sclerosis or spinal cord lesions. **IT:** Treatment of severe spasticity of cerebral or spinal origin (should be reserved for patients who do not respond or are intolerant to oral baclofen) (should wait at least one year in patients with traumatic brain injury before considering therapy). **Unlabeled Use:** Management of pain in trigeminal neuralgia.

Action

Inhibits reflexes at the spinal level. **Therapeutic Effects:** Decreased muscle spasticity; bowel and bladder function may also be improved.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed; crosses the placenta.

Protein Binding: 30%.

Metabolism and Excretion: 70–80% eliminated unchanged by the kidneys.

Half-life: 2.5–4 hr.

TIME/ACTION PROFILE (effects on spasticity)

ROUTE	ONSET	PEAK	DURATION
PO	hr–wk	unknown	unknown
IT	0.5–1 hr	4 hr	4–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Patients in whom spasticity maintains posture and balance; Patients with epilepsy (may ↓ seizure threshold); Renal impairment (↓ dose may be required); **OB, Lactation:** Safety not established; **Pedi:** Children <4 yr (intrathecal) (safety not established); **Geri:** ↑ risk of CNS side effects.

Adverse Reactions/Side Effects

CNS: SEIZURES (IT), dizziness, drowsiness, fatigue, weakness, confusion, depression, headache, insomnia.

EENT: nasal congestion, tinnitus. **CV:** edema, hypotension. **GI:** nausea, constipation. **GU:** frequency.

Derm: pruritus, rash. **Metab:** hyperglycemia, weight gain. **Neuro:** ataxia. **Misc:** hypersensitivity reactions, sweating.

Interactions

Drug-Drug: ↑ CNS depression with other CNS depressants including alcohol, antihistamines,

opioid analgesics, and sedative/hypnotics. Use with MAO inhibitors may lead to ↑ CNS depression or hypotension.

Drug-Natural Products: Concomitant use of kava-kava, valerian, or chamomile can ↑ CNS depression.

Route/Dosage

PO (Adults): 5 mg 3 times daily. May increase q 3 days by 5 mg/dose up to 80 mg/day (some patients may have a better response to 4 divided doses).

PO (Children ≥8 yr): 30–40 mg daily divided q 8 hr; titrate to a maximum of 120 mg/day.

PO (Children 2–7 yr): 20–30 mg daily divided q 8 hr; titrate to a maximum of 60 mg/day.

PO (Children <2 yr): 10–20 mg daily divided q 8 hr; titrate to a maximum of 40 mg/day.

IT (Adults): 100–800 mcg/day infusion; dose is determined by response during screening phase.

IT (Children ≥4 yr): 25–1200 mcg/day infusion (average 275 mcg/day); dose is determined by response during screening phase.

Availability (generic available)

Tablets: 10 mg, 20 mg. **Cost:** Generic—10 mg \$10.83/100, 20 mg \$11.04/100. **Intrathecal injection:** 50 mcg/mL, 500 mcg/mL, 1000 mcg/mL, 2000 mcg/mL.

NURSING IMPLICATIONS**Assessment**

- Assess muscle spasticity before and periodically during therapy.
- Observe patient for drowsiness, dizziness, or ataxia. May be alleviated by a change in dose.
- **IT:** Monitor patient closely during test dose and titration. Resuscitative equipment should be immediately available for life-threatening or intolerable side effects.
- **Lab Test Considerations:** May cause ↑ in serum glucose, alkaline phosphatase, AST, and ALT levels.

Potential Nursing Diagnoses

Impaired wheelchair mobility (Indications)

Risk for injury (Adverse Reactions)

Implementation

- **PO:** Administer with milk or food to minimize gastric irritation.
- **IT:** For screening phase, dilute for a concentration of 50 mcg/mL with sterile preservative-free NaCl for injection. Test dose should be administered over at least 1 min. Observe patient for a significant decrease in muscle tone or frequency or severity of spasm. If response is inadequate, 2 additional test doses, each 24 hr apart, 75 mcg/1.5 mL and 100 mcg/2 mL respectively, may be administered. Patients with an inadequate response should not re-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ceive chronic IT therapy. Avoid use of prefilled syringes for filling reservoir of pump; prefilled syringes are not sterile.

- Dose titration for implantable IT pumps is based on patient response. If no substantive response after dose increase, check pump function and catheter patency.

Patient/Family Teaching

- Instruct patient to take baclofen as directed. Take a missed dose within 1 hr; do not double doses. Caution patient to avoid abrupt withdrawal of this medication because it may precipitate an acute withdrawal reaction (hallucinations, increased spasticity, seizures, mental changes, restlessness). Discontinue baclofen gradually over 2 wk or more.
- May cause dizziness and drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants while taking this medication.
- Instruct patient to notify health care professional if frequent urge to urinate or painful urination, constipation, nausea, headache, insomnia, tinnitus, depression, or confusion persists.
- Advise patient to report signs and symptoms of hypersensitivity (rash, itching) promptly.
- **IT:** Caution patient and caregiver not to discontinue IT therapy abruptly. May result in fever, mental status changes, exaggerated rebound spasticity, and muscle rigidity. Advise patient not to miss scheduled refill appointments and to notify health care professional promptly if signs of withdrawal occur.

Evaluation/Desired Outcomes

- Decrease in muscle spasticity and associated musculoskeletal pain with an increased ability to perform activities of daily living.
- Decreased pain in patients with trigeminal neuralgia. May take wk to obtain optimal effect.

basiliximab (ba-sil-ix-i-mab)

Simulect

Classification

Therapeutic: immunosuppressants

Pharmacologic: monoclonal antibodies

Indications

Prevention of acute organ rejection in patients undergoing renal transplantation; used with corticosteroids and cyclosporine.

Action

Binds to and blocks specific interleukin-2 (IL-2) receptor sites on activated T lymphocytes. **Therapeutic**

Effects: Prevention of acute organ rejection following renal transplantation.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 7.2 days.

TIME/ACTION PROFILE (effect on immune function)

ROUTE	ONSET	PEAK	DURATION
IV	2 hr	unknown	36 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** May affect fetal developing immune system; **Lactation:** May enter breast milk.

Use Cautiously in: Women with childbearing potential; **Geri:** Due to greater incidence of infection.

Adverse Reactions/Side Effects

Noted for patients receiving corticosteroids and cyclosporine in addition to basiliximab.

CNS: dizziness, headache, insomnia, weakness.

EENT: abnormal vision, cataracts. **Resp:** coughing.

CV: HEART FAILURE, edema, hypertension, angina, arrhythmias, hypotension. **GI:** abdominal pain, constipation, diarrhea, dyspepsia, moniliasis, nausea, vomiting, GI bleeding, gingival hyperplasia, stomatitis. **Derm:** acne, wound complications, hypertrichosis, pruritus.

Endo: hyperglycemia, hypoglycemia. **F and E:** acidosis, hypercholesterolemia, hyperkalemia, hyperuricemia, hypocalcemia, hypokalemia, hypophosphatemia. **Hemat:** bleeding, coagulation abnormalities.

MS: back pain, leg pain. **Neuro:** tremor, neuropathy, paresthesia. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, infection, weight gain, chills.

Interactions

Drug-Drug: Immunosuppression may be ↑ with other immunosuppressants.

Drug-Natural Products: Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression.

Route/Dosage

IV (Adults and Children ≥35 kg): 20 mg given 2 hr before transplantation; repeated 4 days after transplantation. Second dose should be withheld if complications or graft loss occurs.

IV (Children <35 kg): 10 mg given 2 hr before transplantation; repeated 4 days after transplantation. Second dose should be withheld if complication or graft loss occurs.

Availability

Powder for reconstitution: 20 mg/vial, 10 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for signs of anaphylactic or hypersensitivity reactions (hypotension, tachycardia, cardiac failure, dyspnea, wheezing, bronchospasm, pulmonary edema, respiratory failure, urticaria, rash, pruritus, sneezing) at each dose. Onset of symptoms is usually within 24 hr. Resuscitation equipment and medications for treatment of severe hypersensitivity should be readily available. If a severe hypersensitivity reaction occurs, basiliximab therapy should be permanently discontinued. Patients who have previously received basiliximab should only receive subsequent therapy with extreme caution.
- Monitor for infection (fever, chills, rash, sore throat, purulent discharge, dysuria). Notify physician immediately if these symptoms occur; may necessitate discontinuation of therapy.
- **Lab Test Considerations:** May cause ↑ or ↓ hemoglobin, hematocrit, serum glucose, potassium, and calcium concentrations.
- May cause ↑ serum cholesterol levels.
- May cause ↑ BUN, serum creatinine, and uric acid concentrations.
- May cause ↓ serum magnesium, phosphate, and platelet levels.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Implementation

IV Administration

- Basiliximab is usually administered concurrently with cyclosporine and corticosteroids.
- Reconstitute with 2.5 mL or 5 mL of sterile water for injection for the 10 mg or 20 mg vial, respectively. Shake gently to dissolve powder.
- **IV Push:** *Diluent:* May be administered undiluted. Bolus administration may be associated with nausea, vomiting, and local reactions (pain). *Concentration:* 4 mg/mL. *Rate:* Administer over 20–30 min via peripheral or central line.
- **Intermittent Infusion:** *Diluent:* Dilute further with 25–50 mL of 0.9% NaCl or D5W. Gently invert bag to mix; do not shake, to avoid foaming. Solution is clear to opalescent and colorless; do not administer solutions that are discolored or contain particulate matter. Discard unused portion. Administer within 4 hr or may be refrigerated for up to 24 hr. Discard after 24 hr. *Concentration:* 0.08–0.16 mg/mL. *Rate:* Administer over 20–30 min via peripheral or central line.
- **Additive Incompatibility:** Do not admix; do not administer in IV line containing other medications.

Patient/Family Teaching

- Explain purpose of medication to patient. Explain that patient will need to resume lifelong therapy with other immunosuppressive drugs after completion of basiliximab course.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response is known.
- Instruct patient to continue to avoid crowds and persons with known infections, because basiliximab also suppresses the immune system.

Evaluation/Desired Outcomes

- Prevention of acute organ rejection in patients receiving renal transplantation.

becaplermin (be-kap-lerm-in) Regranex

Classification

Therapeutic: wound/ulcer/decubiti healing agent

Pharmacologic: platelet-derived growth factors

Indications

Treatment of lower extremity diabetic neuropathic ulcers extending to subcut tissue or beyond and having adequate blood supply.

Action

Promotes chemotaxis of cells involved in wound repair and enhances formation of granulation tissue. **Therapeutic Effects:** Improved healing.

Pharmacokinetics

Absorption: Minimal absorption (<3%).

Distribution: Action is primarily local.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (improvement in ulcer healing)

ROUTE	ONSET	PEAK	DURATION
Topical	within 10 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Known hypersensitivity to becaplermin or parabens; Known neoplasm at site of application; Wounds that close by primary intention.

Use Cautiously in: Known malignancy; **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

Derm: erythematous rash at application site. **Misc:** MALIGNANCY (MAY LEAD TO ↑ MORTALITY, ESPECIALLY WITH USE OF ≥3 TUBES).

★ = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

Interactions

Drug-Drug: None known.

Route/Dosage

Topical (Adults): Length of gel *in inches* from 15- or 7.5-g tube = length \times width of ulcer area \times 0.6; from the 2-g tube = length \times width of ulcer area \times 1.3.

Length of gel *in centimeters* from 15- or 7.5-g tube = length \times width of ulcer area \div 4; from the 2-g tube = length \times width of ulcer area \div 2; for 12 hr each day.

Availability

Gel: 100 mcg/g (0.01%) in 2-, 7.5-, and 15-g tubes.

NURSING IMPLICATIONS

Assessment

- Assess size, color, drainage, and skin surrounding wound at weekly or biweekly intervals. Amount of gel to be applied is recalculated based on wound size.

Potential Nursing Diagnoses

Impaired tissue integrity (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Topical:** Calculated amount is applied as a thin layer (1/16-in. thick) and covered with a moist saline dressing for 12 hr; dressing is removed, ulcer rinsed and redressed with moist dressing without becaplermin for rest of day. Process is repeated daily.
- Store gel in refrigerator; do not freeze. Do not use beyond expiration date on crimped end of tube.

Patient/Family Teaching

- Instruct patient on proper technique for application. Wash hands before applying gel and use cotton swab or tongue depressor to aid in application. Tip of tube should not come in contact with ulcer or any other surface; recap tightly after each use. Squeeze calculated amount of gel onto a clean, firm, nonabsorbable surface (wax paper). Spread gel with swab or tongue depressor over the ulcer surface in an even layer to the thickness of a dime. Cover with a saline-moistened gauze dressing.
- Do not apply more than calculated amount; has not been shown to be beneficial. If a dose is missed, apply as soon as remembered. If not remembered until next day, skip dose and return to regular dosing schedule. Do not double doses.
- After 12 hr, rinse ulcer gently with saline or water to remove residual gel and cover with saline-moistened gauze.
- Emphasize the importance of strict wound care and non-weight-bearing program.

Evaluation/Desired Outcomes

- Improved healing of ulcers. If the ulcer does not decrease in size by 30% within 10 wk or if complete healing has not occurred within 20 wk, continuation of therapy should be reassessed.

beclomethasone, See CORTICOSTEROIDS (INHALATION) and CORTICOSTEROIDS (NASAL).

belatacept (be-lat-a-sept)

Nulojix

Classification

Therapeutic: immunosuppressants

Pharmacologic: fusion proteins

Indications

Prevention of organ rejection following kidney transplant in adult patients; in combination with basiliximab induction, mycophenolate, and corticosteroids.

Action

Binds to CD80 and CD86 sites, thereby blocking T-cell costimulation; result is inhibition of T-lymphocyte proliferation and cytokine production. **Therapeutic Effects:** Prolonged graft survival with decreased production of anti-donor antibodies following kidney transplantation.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 9.8 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	up to 4 wk

Contraindications/Precautions

Contraindicated in: Epstein-Barr virus (EBV) seronegativity or unknown EBV serostatus; Liver transplantation; **Lactation:** Avoid breast feeding.

Use Cautiously in: Cytomegalovirus (CMV) infection/T-cell depleting therapy (\uparrow risk of post-transplant lymphoproliferative disorder [PTLD]), CMV prophylaxis recommended for 3 mo following transplant; Change in body weight $>$ 10% (dose adjustment recommended); Unknown tuberculosis status (latent infection should be treated prior to use); Evidence of polyoma virus-associated nephropathy (PVAN), \downarrow immunosuppression may be necessary; **OB:** Use only if potential benefit to mother outweighs potential risk to fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), headache. **Resp:** cough. **CV:** hypertension, peripheral edema. **GI:** constipation, diarrhea, nausea, vomiting. **GU:** proteinuria. **Endo:** new-onset diabetes

mellitus. **F and E:** hyperkalemia, hypokalemia. **Hemat:** anemia, leukopenia. **Misc:** **POST-TRANSPLANT LYMPHOPROLIFERATIVE DISORDER (PTLD)**, **↑ RISK OF MALIGNANCY, SERIOUS INFECTIONS, fever, graft dysfunction, infusion reactions.**

Interactions

Drug-Drug: May ↓ antibody response to and ↑ risk of adverse reactions from live virus vaccines; avoid use during treatment. May ↑ blood levels, effects and toxicity of **mycophenolic acid**.

Route/Dosage

Prescribed dose must be evenly divisible by 12.5 to ensure accurate preparation.

IV (Adults): Initial phase—10 mg/kg on day of transplant/prior to implantation, day 5 (96 hr after day 1 dose), end of wk 2, 4, 8, and 12 post transplantation; **Maintenance phase**—10 mg/kg end of wk 16 and every four wk (± 3 days) thereafter.

Availability

Lyophilized powder for injection (requires reconstitution): 250 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of organ rejection throughout therapy.
- **Assess for signs of progressive multifocal leukoencephalopathy (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.**
- Monitor for signs and symptoms of infection (fever, dyspnea) periodically during therapy.
- **Assess for signs and symptoms of post-transplant lymphoproliferative disorder (changes in mood or usual behavior, confusion, problems thinking, loss of memory, changes in walking or talking, decreased strength or weakness on one side of the body, changes in vision) during and for at least 36 mo post-transplant.**
- Monitor for infusion reactions (hypotension, hypertension) during therapy.
- **Lab Test Considerations:** May cause hyperkalemia, hypokalemia, hypophosphatemia, hyperglycemia, hypocalcemia, hypercholesterolemia, hypomagnesemia, and hyperuricemia.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- Pre-medication is not required.
- Cortisone doses should be consistent with clinical trials experience. Cortisone doses were tapered to between 10–20 mg/day by first 6 wks after transplant, then remained at 10 mg (5–10 mg) per day for first 6 mo after transplant.

- Treat patient for latent tuberculosis prior to therapy.
- Prophylaxis for *Pneumocystis jiroveci* is recommended after transplant.

IV Administration

- **Intermittent Infusion:** Calculate number of vials required for total infusion dose. Reconstitute contents of each vial with 10.5 mL of 0.9% NaCl or D5W using the silicone-free disposable syringe provided and an 18–21 gauge needle for a concentration of 25 mg/mL. Direct stream of diluent to wall of vial. Rotate and invert vial gently; do not shake to avoid foaming. Solution is clear to slightly opalescent and colorless to pale yellow; do not use if opaque particles, discoloration, or other particles are present. Calculate total volume needed for infusion dose. **Diluent:** Dilute further with 0.9% NaCl or D5W if reconstituted with sterile water for injection, 0.9% NaCl if reconstituted with 0.9% NaCl, or with D5W if reconstituted with D5W. **Concentration:** 2 mg/mL. Withdraw amount of diluent from infusion container equal to volume of infusion dose. Using same silicone-free disposable syringe used for reconstitution, withdraw required amount of belatacept solution from vial, inject into infusion container, and rotate gently to mix. Typical infusion volume is 100 mL, but may range from 50–250 mL. Transfer from vial to infusion container immediately; infusion must be completed within 24 hr of reconstitution. May be refrigerated and protected from light for 24 hr. Do not administer solutions that are discolored or contain particulate matter. Discard unused solution in vials. **Rate:** Infuse over 30 min using a non-pyrogenic, low-protein-binding filter with 0.2–1.2 micron pore size.
- **Y-Site Incompatibility:** Do not mix or infuse in same line with other agents.

Patient/Family Teaching

- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for the transplanted organ, and stress need to notify health care professional immediately if signs of rejection or infection occur.
- Advise patient to avoid contact with persons with contagious diseases.
- Inform patient of the increased risk of skin cancer and other malignancies. Advise patient to use sunscreen with a high protection factor and wear protective clothing to decrease risk of skin cancer.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Advise patient to notify health care professional immediately if signs or symptoms of infection, post-**

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

transplant lymphoproliferative disorder or progressive multifocal leukoencephalopathy occur.

- Advise patients to avoid live vaccines during therapy.
- **Rep:** Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant or whose partners have received belatacept to register with the National Transplant Pregnancy Registry (NTPR) by calling 1-877-955-6877.
- Emphasize the importance of routine follow-up laboratory tests.

Evaluation/Desired Outcomes

- Prevention of rejection of transplanted kidneys.

belimumab (be-li-moo-mab)

Benlysta

Classification

Therapeutic: immunosuppressants

Pharmacologic: monoclonal antibodies

Indications

Treatment of active autoantibody-positive systemic lupus erythematosus (SLE) in patients currently receiving standard therapy.

Action

A monoclonal antibody produced by recombinant DNA technique that specifically binds to B-lymphocyte stimulator protein (BlyS), thereby inactivating it. **Therapeutic Effects:** ↓ survival of B cells, including auto-reactive ones and ↓ differentiation into immunoglobulin-producing plasma cells. Result is ↓ disease activity with lessened damage/improvement in mucocutaneous, musculoskeletal, and immunologic manifestations of SLE.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 19.4 days.

TIME/ACTION PROFILE (reduction in activated B cells)

ROUTE	ONSET	PEAK	DURATION
IV	8 wk	unknown	52 wk†

†With continuous treatment.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of other biologicals or cyclophosphamide; Concurrent use of live vaccines; Receiving therapy for chronic infection.

Use Cautiously in: Infections (consider temporary withdrawal for acute infections, treat aggressively); Previous history of depression or suicidal ideation (may

worsen); **Geri:** May be more sensitive to drug effects, consider age-related changes in renal, hepatic and cardiac function, concurrent drug therapy, and chronic disease states; **OB, Lactation:** Use only if potential maternal benefit outweighs potential fetal risk; **Rep:** Women of reproductive potential (use effective contraception).

Adverse Reactions/Side Effects

CNS: PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), depression, insomnia, migraine, fatigue. **GI:** nausea, diarrhea. **GU:** cystitis. **Hemat:** leukopenia. **MS:** extremity pain, myalgia. **Derm:** rash. **Misc:** allergic reactions including ANAPHYLAXIS, INFECTION, infusion reactions, fever, facial edema.

Interactions

Drug-Drug: ↑ risk of adverse reactions and ↓ immune response to live vaccines; should not be given concurrently.

Route/Dosage

IV (Adults): 10 mg/kg every 2 wk for 3 doses, then every 4 wk.

Availability

Lyophilized powder for IV administration (requires reconstitution and dilution): 120 mg/vial, 400 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor patient for signs of anaphylaxis (hypotension, angioedema, urticaria, rash, pruritus, wheezing, dyspnea, facial edema) during and following injection. Medications (antihistamines, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction. Discontinue belimumab immediately if anaphylaxis or other severe allergic reaction occurs.
- Monitor for infusion reactions (headache, nausea, skin reactions, bradycardia, myalgia, headache, rash, urticaria, hypotension). There is insufficient evidence to determine whether premedication diminishes frequency or severity. Infusion rate may be slowed or interrupted if an infusion reaction occurs.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Belimumab is contraindicated in patients with active infection. New infections should be monitored closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Signs and symptoms of inflammation may be lessened due to suppression from belimumab. Infections may be fatal, especially in patients taking immunosuppressive therapy. If patient develops a serious infection, consider discontinuing belimumab until infection is controlled.
- Assess mental status and mood changes. Inform health care professional if patient demonstrates sig-

nificant ↑ in depressed mood, anxiety, nervousness, or insomnia.

- Assess for signs of progressive multifocal leukoencephalopathy (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- Consider premedication for prophylaxis against infusion reactions and hypersensitivity reactions.
- **Subcut:** Allow autoinjector or prefilled syringe to sit at room temperature for 30 min prior to injection; do not use other methods of warming. Solution is clear to opalescent and colorless to pale yellow. Do not inject solutions that are discolored or contain particulate matter. Administer first injection under supervision of health care professional into abdomen or thigh. Rotate injection sites each week. Avoid areas of tenderness, bruising, redness, or hardness.

IV Administration

- **Intermittent Infusion:** Remove belimumab from refrigerator and allow to stand 10–15 min to reach room temperature. Using a 21–25 gauge needle, reconstitute 120 mg vial with 1.5 mL and 400 mg vial with 4.8 mL of Sterile Water for Injection by directing stream toward side of vial to minimize foaming. Swirl gently for 60 seconds. Allow vial to sit at room temperature during reconstitution, swirling gently for 60 seconds every 5 min until powder is dissolved. Do not shake. Reconstitution usually takes 10–15 min, but may take up to 30 min. Protect from sunlight. Solution is opalescent and colorless to pale yellow and without particles. Small bubbles are expected and acceptable. **Concentration:** 80 mg/mL. **Diluent:** 0.9% NaCl, 0.45% NaCl or LR. Remove volume of patient's dose from a 250 mL infusion bag and discard. Replace with required amount of reconstituted solution. Gently invert bag to mix. Do not administer solutions that are discolored or contain particulate matter. Discard unused solution in vial. If not used immediately, refrigerate and protect from light. Solution is stable for 8 hrs. **Rate:** Infuse over 1 hr; may slow or interrupt rate if patient develops an infusion reaction.
- **Y-Site Incompatibility:** Do not administer with dextrose solutions or other solutions or medications.

Patient/Family Teaching

- Instruct patient in correct technique for subcut injection. Inject on the same day each week. Inject missed doses as soon as remembered, then resume on usual day or start a new weekly schedule from the day missed dose was administered. Do not inject 2

doses on same day. Advise patient to read *Medication Guide* prior to each treatment session in case of changes.

- Caution patient to notify health care professional immediately if signs of infection (fever, sweating, chills, muscle aches, cough, shortness of breath, blood in phlegm, weight loss, warm, red or painful skin or sores, diarrhea or stomach pain, burning on urination, urinary frequency, feeling tired), progressive multifocal leukoencephalopathy, severe rash, swollen face, or difficulty breathing occurs while taking.
- Advise patient, family, and caregivers to look for depression and suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior, or if symptoms of serotonin syndrome occur.
- Caution patient to avoid receiving live vaccines for 30 days before and during belimumab therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- **Rep:** Advise women of childbearing potential to use adequate contraception during and for at least 4 mo after final treatment and to notify health care professional if breast feeding. Encourage pregnant patients to enroll in registry by calling 1-877-681-6296.

Evaluation/Desired Outcomes

- Improvement in mucocutaneous, musculoskeletal, and immunologic disease activity in patients with SLE.

benazepril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

benzathine penicillin G, See PENICILLINS.

benztropine (benz-troe-peen) Cogentin

Classification

Therapeutic: antiparkinson agents
Pharmacologic: anticholinergics

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Adjunctive treatment of all forms of Parkinson's disease, including drug-induced extrapyramidal effects and acute dystonic reactions.

Action

Blocks cholinergic activity in the CNS, which is partially responsible for the symptoms of Parkinson's disease. Restores the natural balance of neurotransmitters in the CNS. **Therapeutic Effects:** Reduction of rigidity and tremors.

Pharmacokinetics

Absorption: Well absorbed following PO and IM administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (antidyskinetic activity)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	several days	24 hr
IM, IV	within min	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Children <3 yr; Angle-closure glaucoma; Tardive dyskinesia.

Use Cautiously in: Prostatic hyperplasia; Seizure disorders; Cardiac arrhythmias; **OB, Lactation:** Safety not established; **Geri:** ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CNS: confusion, depression, dizziness, hallucinations, headache, sedation, weakness. **EENT:** blurred vision, dry eyes, mydriasis. **CV:** arrhythmias, hypotension, palpitations, tachycardia. **GI:** constipation, dry mouth, ileus, nausea. **GU:** hesitancy, urinary retention. **Misc:** decreased sweating.

Interactions

Drug-Drug: Additive anticholinergic effects with drugs sharing anticholinergic properties, such as antihistamines, phenothiazines, quinidine, disopyramide, and tricyclic antidepressants. Counteracts the cholinergic effects of bethanechol. Antacids and antidiarrheals may ↓ absorption.

Drug-Natural Products: ↑ anticholinergic effect with angel's trumpet, jimson weed, and scopolia.

Route/Dosage

Parkinsonism

PO (Adults): 1–2 mg/day in 1–2 divided doses (range 0.5–6 mg/day).

Acute Dystonic Reactions

IM, IV (Adults): 1–2 mg, then 1–2 mg PO twice daily.

Drug-Induced Extrapyramidal Reactions

PO, IM, IV (Adults): 1–4 mg given once or twice daily (1–2 mg 2–3 times daily may also be used PO).

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg \$26.07/100, 1 mg \$25.74/100, 2 mg \$51.86/100. **Injection:** 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, masklike face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) before and throughout therapy.
- Assess bowel function daily. Monitor for constipation, abdominal pain, distention, or absence of bowel sounds.
- Monitor intake and output ratios and assess patient for urinary retention (dysuria, distended abdomen, infrequent voiding of small amounts, overflow incontinence).
- Patients with mental illness are at risk of developing exaggerated symptoms of their disorder during early therapy with benzotropine. Withhold drug and notify physician or other health care professional if significant behavioral changes occur.
- **IM/IV:** Monitor pulse and BP closely and maintain bedrest for 1 hr after administration. Advise patients to change positions slowly to minimize orthostatic hypotension.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Risk for injury (Indications)

Implementation

- **PO:** Administer with food or immediately after meals to minimize gastric irritation. May be crushed and administered with food if patient has difficulty swallowing.
- **IM:** Parenteral route is used only for dystonic reactions.

IV Administration

- **IV Push:** IV route is rarely used because onset is same as with IM route. **Rate:** Administer at a rate of 1 mg over 1 min.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, famotidine, fentanyl, fluconazole, folic acid, gentamicin, glycopyrrolate, heparin, hydrocortisone, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, magnesium sulfate, mannitol, meper-

dine, metaraminol, methylodopate, methylprednisolone, metoclopramide, metoprolol, midazolam, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, pentazocine, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, tobramycin, tolazoline, vancomycin, vasopressin, verapamil.

- **Y-Site Incompatibility:** amphotericin B colloidal, chloramphenicol, dantrolene, diazepam, diazoxide, furosemide, ganciclovir, indomethacin, pentobarbital, phenytoin, sulfamethoxazole/trimethoprim.

Patient/Family Teaching

- Encourage patient to take betrixaban as directed. Take missed doses as soon as possible, up to 2 hr before the next dose. Taper gradually when discontinuing or a withdrawal reaction may occur (anxiety, tachycardia, insomnia, return of parkinsonian or extrapyramidal symptoms).
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify health care professional if dryness persists (saliva substitutes may be used). Also, notify the dentist if dryness interferes with use of dentures.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional if difficulty with urination, constipation, abdominal discomfort, rapid or pounding heartbeat, confusion, eye pain, or rash occurs.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages.
- Caution patient that this medication decreases perspiration. Overheating may occur during hot weather. Patient should notify health care professional if unable to remain indoors in an air-conditioned environment during hot weather.
- Advise patient to avoid taking antacids or antiarrhythmals within 1–2 hr of this medication.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Decrease in tremors and rigidity and an improvement in gait and balance. Therapeutic effects are usually seen 2–3 days after the initiation of therapy.

betamethasone, See CORTICOSTEROIDS (SYSTEMIC) and CORTICOSTEROIDS (TOPICAL/LOCAL).

betrixaban (be-trix-a-ban)

Bevyxxa

Classification

Therapeutic: anticoagulants
Pharmacologic: factor Xa inhibitors

Indications

Prevention of venous thromboembolism in patients hospitalized for an acute medical illness who are at increased risk for thromboembolic events.

Action

Selective inhibitor of factor Xa. Decreases thrombin generation and thrombus development. Does not inhibit platelet aggregation. **Therapeutic Effects:** Prevention of deep vein thrombosis and pulmonary embolism.

Pharmacokinetics

Absorption: 34% absorbed following oral administration. Bioavailability ↓ by food.

Distribution: Widely distributed.

Metabolism and Excretion: Undergoes minimal metabolism. Primarily excreted unchanged in the feces; 18% excreted unchanged in urine.

Half-life: 19–27 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active bleeding; Concurrent use of P-gp inhibitors in patients with severe renal impairment; Prosthetic heart valve; Hepatic impairment.

Use Cautiously in: Neuroaxial anesthesia/spinal puncture (↑ risk of spinal/epidural hematoma and potential paralysis); Severe renal impairment (dose ↓ required for CrCl 15–29 mL/min); **OB:** Use during pregnancy only if potential benefit outweighs potential risk to fetus; **Lactation:** Safety not established; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

F and E: hypokalemia. **GI:** constipation. **Hemat:** BLEEDING.

Interactions

Drug-Drug: ↑ risk of bleeding with other anticoagulants, aspirin, clopidogrel, ticagrelor, prasugrel.

★ = Canadian drug name. ☒ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

grel, fibrinolytics, NSAIDs, SNRIs, or SSRIs. Concurrent use of **P-gp inhibitors**, including **amiodarone, azithromycin, clarithromycin, ketoconazole** (oral), or **verapamil** ↑ blood levels and the risk of bleeding (↓ dose of bevacizumab); avoid concomitant use if patients also have severe renal impairment.

Route/Dosage

PO (Adults): 160 mg on Day 1, then 80 mg once daily starting on Day 2 for a total duration of 35–42 days;
Concurrent use of P-gp inhibitor—80 mg on Day 1, then 40 mg once daily starting on Day 2 for a total duration of 35–42 days.

Renal Impairment

(Adults): *CCr 15–29 mL/min*—80 mg on Day 1, then 40 mg once daily starting on Day 2 for a total duration of 35–42 days.

Availability

Capsules: 40 mg, 80 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for bleeding. Discontinue bevacizumab if active pathological bleeding occurs. Concomitant drugs (aspirin, other antiplatelet agents, other antithrombotic agents, fibrinolytic therapy, chronic use of NSAIDs) may increase risk of bleeding. Anticoagulant effects of bevacizumab persist for about 72 hr after last dose; there is no established way to reverse anticoagulant effects. Anticoagulant effects cannot be reliably monitored with standard laboratory tests. No reversal agent is available; protamine sulfate, vitamin K, and tranexamic acid do not reverse anticoagulant activity. Effects of hemodialysis are unknown.
- Monitor frequently for signs and symptoms of neurological impairment (numbness or weakness of legs, bowel, or bladder dysfunction, back pain, tingling, muscle weakness); if noted, urgent treatment is required. Intrathecal or epidural catheters should not be removed earlier than 72 hr after last dose of bevacizumab. Next dose of bevacizumab should not be given <5 hr after removal of catheter.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- **PO:** Administer once daily with food.

Patient/Family Teaching

- Instruct patient to take bevacizumab as directed. Take missed doses as soon as remembered on same day. Return to regular schedule next day. Do not double doses in one day. Do not discontinue without consulting health care professional; stopping may increase risk of stroke.
- Caution patient that they may bleed more easily, longer, or bruise more easily during therapy. Advise patient to notify health care professional immediately if bleeding or a fall, especially with head injury, occurs.

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other aspirin or NSAIDs.
- Advise patient to notify health care professional of therapy before surgery, medical, or dental procedures are scheduled.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Prevention of deep vein thrombosis and pulmonary embolism.

bevacizumab (be-va-siz-uh-mab)

Avastin

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

Indications

First- or second-line treatment of metastatic colon or rectal carcinoma (with IV 5-fluorouracil-based chemotherapy for first-line therapy; with fluoropyrimidine-irinotecan- or fluoropyrimidine-oxaliplatin-based chemotherapy for second-line therapy. First line treatment of patients with unresectable, locally advanced, recurrent or metastatic non-squamous, non-small cell lung cancer with carboplatin and paclitaxel. Patients with progressive glioblastoma following prior therapy. Metastatic renal cell carcinoma (with interferon alpha). Persistent, recurrent, or metastatic cervical carcinoma (with paclitaxel and cisplatin or paclitaxel and topotecan). Platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer (with paclitaxel, pegylated liposomal doxorubicin, or topotecan).

Action

A monoclonal antibody that binds to vascular endothelial growth factor (VEGF), preventing its attachment to binding sites on vascular endothelium, thereby inhibiting growth of new blood vessels (angiogenesis). **Therapeutic Effects:** Decreased metastatic disease progression and microvascular growth.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 20 days (range 11–50 days).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	14 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent hemoptysis or other serious recent bleeding episode; First 28 days after major surgery; **OB:** Pregnancy (can cause fetal harm); **Lactation:** Discontinue nursing during treatment and, due to long half-life, for several wk following treatment.

Use Cautiously in: Cardiovascular disease; Diabetes (↑ risk of arterial thromboembolic events); **OB:** Women with childbearing potential; **Pedi:** Safety not established (cases of non-mandibular osteonecrosis reported); **Ger:** ↑ risk of serious adverse reactions including arterial thromboembolic events.

Adverse Reactions/Side Effects

CNS: REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME (RPLS). **CV:** HF, THROMBOEMBOLIC EVENTS, hypertension, hypotension. **Resp:** HEMOPTYSIS, non-gastrointestinal fistulas, nasal septum perforation. **GI:** GI PERFORATION. **GU:** ↑ serum creatinine, nephrotic syndrome, ovarian failure, proteinuria. **Hemat:** BLEEDING. **Derm:** NECROTIZING FASCIITIS. **Misc:** WOUND DEHISCENCE, impaired wound healing, infusion reactions.

Interactions

Drug-Drug: ↑ blood levels of SN 38 (the active metabolite of irinotecan); significance is not known. ↑ risk of microangiopathic hemolytic anemia when used with sunitinib; concurrent use should be avoided.

Route/Dosage

Colorectal Cancer

IV (Adults): 5 mg/kg every 14 days when used in combination with bolus-IFL chemotherapy regimen; 10 mg/kg every 14 days when used with FOLFOX4 chemotherapy regimen; 5 mg/kg every 14 days or 7.5 mg/kg every 21 days when used in combination with a fluoropyrimidine-irinotecan or fluoropyrimidine-oxaliplatin based chemotherapy regimen.

Lung Cancer

IV (Adults): 15 mg/kg every 3 wk.

Glioblastoma

IV (Adults): 10 mg/kg every 14 days.

Renal Cell Carcinoma

IV (Adults): 10 mg/kg every 14 days.

Cervical Carcinoma

IV (Adults): 15 mg/kg every 3 wk.

Epithelial Ovarian, Fallopian Tube, or Primary Peritoneal Cancer

IV (Adults): 10 mg/kg every 2 wk when given with paclitaxel, pegylated liposomal doxorubicin, or topotecan (weekly) or 15 mg/kg every 3 wk when given with topotecan (every 3 wk).

Availability

Solution for injection (requires dilution): 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of GI perforation (abdominal pain associated with constipation, fever, nausea, and vomiting), fistula formation, and wound dehiscence during therapy; discontinue therapy if this occurs.
- Assess for signs of hemorrhage (epistaxis, hemoptysis, bleeding) and thromboembolic events (stroke, MI, deep vein thrombosis, pulmonary embolus) during therapy; may require discontinuation. Do not administer to patients with recent history of hemoptysis of $\geq 1/2$ teaspoon of red blood.
- Monitor BP every 2–3 wk during therapy. Temporarily suspend therapy during severe hypertension not controlled with medical management; permanently discontinue if hypertensive crisis occurs.
- Assess for infusion reactions (stridor, wheezing) during therapy.
- Assess for signs of HF (dyspnea, peripheral edema, rales/crackles, jugular venous distension) during therapy.
- Monitor for signs of RPLS (headache, seizure, lethargy, confusion, blindness). Hypertension may or may not be present. May occur within 16 hr to 1 yr of initiation of therapy. Treat hypertension if present and discontinue bevacizumab therapy. Symptoms usually resolve within days.
- **Lab Test Considerations:** Monitor serial urinalysis for proteinuria during therapy. Patients with a 2+ or greater urine dipstick require further testing with a 24-hr urine collection. Suspend therapy for ≥ 2 grams of proteinuria/24 hours and resume when proteinuria is <2 g/24 hours. Discontinue therapy in patients with nephrotic syndrome.
- May cause leukopenia, thrombocytopenia, hypokalemia, and bilirubinemia.
- May cause ↑ serum creatinine.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Adverse Reactions)

Implementation

- Avoid administration for at least 28 days following major surgery; surgical incision should be fully healed due to potential for impaired wound healing.

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute prescribed dose in 100 mL of 0.9% NaCl. Do not shake. Discard unused portions. Do not administer solution that is discolored or contains particulate matter. Stable if refrigerated for up to 8 hr. **Rate:** Administer initial dose over 90 min. If well tolerated, second in-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

fusion may be administered over 60 min. If well tolerated, all subsequent infusions may be administered over 30 min. **Do not administer as an IV push or bolus.**

- **Additive Incompatibility:** Do not mix or administer with dextrose solutions.

Patient/Family Teaching

- Inform patient of purpose of medication.
- Advise patient of the need for monitoring BP periodically during therapy; notify health care professional if BP is elevated.
- Advise patient to report any signs of bleeding, unusual bleeding, high fever, rigors, sudden onset of worsening neurological function, or persistent or severe abdominal pain, severe constipation, or vomiting immediately to health care professional.
- Inform patient of increased risk of wound healing complications and arterial thromboembolic events.
- **Rep:** Bevacizumab is teratogenic. Advise female patients to use effective contraception during and for at least 6 mo after last dose. Inform female patient of risk of ovarian failure that may lead to sterility following therapy.

Evaluation/Desired Outcomes

- Decreased metastatic disease progression and microvascular growth.

bezlotoxumab (bez-loe-tox-ue-mab)

Zinplava

Classification

Therapeutic: antidiarrheals

Pharmacologic: monoclonal antibodies

Indications

Reduction in recurrence of *Clostridium difficile* infection (CDI) in patients who are receiving antibacterial drug treatment of CDI and are at a high risk for CDI recurrence.

Action

Binds to *Clostridium difficile* toxin B and neutralizes its effects. **Therapeutic Effects:** Reduced CDI recurrence.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Minimally distributed to tissues.

Metabolism and Excretion: Eliminated primarily through catabolism.

Half-life: 19 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: None.

Use Cautiously in: Heart failure; **OB, Lactation:**

Safety not established; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: HF. **CNS:** headache. **GI:** nausea. **Misc:** infusion reactions, fever.

Interactions

Drug-Drug: None known.

Route/Dosage

IV (Adults): 10 mg/kg as a single dose.

Availability

Solution for injection (requires dilution): 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of CDI prior to and following therapy.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Not for treatment of CDI; must be used with antibacterial agents.

IV Administration

- **Intermittent Infusion:** **Diluent:** Withdraw volume from bezlotoxumab vial based on patient weight and transfer to IV bag of 0.9% NaCl or D5W. Invert gently to mix; do not shake. Solution is clear to moderately opalescent, colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. **Concentration:** 1 mg/mL to 10 mg/mL. Store in refrigerator for up to 24 hrs or at room temperature protected from light for up to 16 hrs prior to preparation; do not freeze. **Rate:** Infuse over 60 min using a sterile, non-pyrogenic, low-protein binding 0.205 micron in-line or add-on filter. Do not administer as IV push or bolus. May be infused via central line or peripheral catheter.
- **Y-Site Incompatibility:** Do not administer other drugs simultaneously through same infusion line.

Patient/Family Teaching

- Inform patient that bezlotoxumab does not replace antibacterial treatment for their CDI infection. Antibacterial medications must be continued as directed.
- **Rep:** Advise female patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

Evaluation/Desired Outcomes

- Decrease in recurrence of CDI.

bicalutamide

(bye-ka-loot-a-mide)
Casodex

Classification

Therapeutic: antineoplastics

Pharmacologic: antiandrogens

Indications

Treatment of metastatic prostate carcinoma in conjunction with luteinizing hormone–releasing hormone (LHRH) analogs (goserelin, leuprolide).

Action

Antagonizes the effects of androgen at the cellular level.

Therapeutic Effects: Decreased spread of prostate carcinoma.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Protein Binding: 96%.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 5.8 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	31.3 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Women.

Use Cautiously in: Moderate to severe liver impairment; **Rep:** Men with female partners of reproductive potential; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: weakness, dizziness, headache, insomnia. **Resp:** dyspnea. **CV:** chest pain, hypertension, peripheral edema. **GI:** HEPATOTOXICITY, constipation, diarrhea, nausea, abdominal pain, ↑ liver enzymes, vomiting.

GU: erectile dysfunction, ↓ fertility, hematuria, incontinence, nocturia, urinary tract infections. **Derm:** alopecia, photosensitivity, rash, sweating. **Endo:** breast pain, gynecomastia. **Hemat:** anemia. **Metab:** hyperglycemia, weight loss. **MS:** back pain, pelvic pain, bone pain. **Neuro:** paresthesia. **Misc:** generalized pain, hot flashes, flu-like syndrome, infection.

Interactions

Drug-Drug: May ↑ the effect of warfarin.

Route/Dosage

PO (Adults): 50 mg once daily (must be given concurrently with LHRH analog).

Availability (generic available)

Tablets: 50 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for adverse GI effects. Diarrhea is the most common cause of discontinuation of therapy.
- **Lab Test Considerations:** Monitor serum prostate-specific antigen (PSA) periodically to determine response to therapy. If levels rise, assess patient for disease progression. May require periodic LHRH analogue administration without bicalutamide.
- **Monitor serum transaminases before, regularly during first 4 mo of therapy, and periodically during therapy.** May cause ↑ serum alkaline phosphatase, AST, ALT, and bilirubin concentrations. If patient is jaundiced or if transaminases ↑ >2 times normal, discontinue bicalutamide; levels usually return to normal after discontinuation.
- May cause ↑ BUN and serum creatinine, and ↓ hemoglobin and WBCs.
- May cause ↓ glucose tolerance in males taking LHRH agonists concurrently; monitor blood glucose in patients receiving bicalutamide in combination with LHRH agonists.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

Implementation

- Start treatment with bicalutamide at the same time as LHRH analogue.
- **PO:** May be administered in the morning or evening, without regard to food.

Patient/Family Teaching

- Instruct patient to take bicalutamide along with the LHRH analog as directed at the same time each day. If a dose is missed, omit and take the next dose at regular time; do not double doses. Do not discontinue without consulting health care professional.
- Advise patient to read *Patient Information* prior to starting and with each Rx refill in case of changes.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to stop taking bicalutamide and notify health care professional immediately of symptoms of liver dysfunction (nausea, vomiting, abdominal pain, fatigue, anorexia, “flu-like” symptoms, dark urine, jaundice, or right upper quadrant tenderness) or interstitial lung disease (trouble breathing with or without a cough or fever).
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications.
- Instruct patient to report severe or persistent diarrhea.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Advise patient to use sunscreen, avoid sunlight or sunlamps and tanning beds, and wear protective clothing to prevent photosensitivity reactions.
- **Rep:** Advise female and male patients to use effective contraception during and for at least 130 days after last dose of therapy. Female patients should avoid breast feeding during therapy. Advise male patients bicalutamide may impair fertility.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress; monitor for side effects.

Evaluation/Desired Outcomes

- Decreased spread of prostate carcinoma.

bisacodyl (bis-a-koe-dill)

Bisac-Evac,  Bisacolax, Biscolax,  Carter's Little Pills,  Codulax, Correctol, Dacodyl, Doxidan, Dulcolax, Ex-Lax Ultra, Femilax, Fleet Laxative,  Soflax-Ex

Classification

Therapeutic: laxatives

Pharmacologic: stimulant laxatives

Indications

Treatment of constipation. Evacuation of the bowel before radiologic studies or surgery. Part of a bowel regimen in spinal cord injury patients.

Action

Stimulates peristalsis. Alters fluid and electrolyte transport, producing fluid accumulation in the colon. **Therapeutic Effects:** Evacuation of the colon.

Pharmacokinetics

Absorption: Variable absorption follows oral administration; rectal absorption is minimal; action is local in the colon.

Distribution: Small amounts of metabolites excreted in breast milk.

Metabolism and Excretion: Small amounts absorbed are metabolized by the liver.

Half-life: Unknown.

TIME/ACTION PROFILE (evacuation of bowel)

ROUTE	ONSET	PEAK	DURATION
PO	6–12 hr	unknown	unknown
Rectal	15–60 min	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain; Obstruction; Nausea or vomiting (especially with fever or other signs of an acute abdomen).

Use Cautiously in: Severe cardiovascular disease; Anal or rectal fissures; Excess or prolonged use (may

result in dependence); **OB, Lactation:** May be used during pregnancy and lactation.

Adverse Reactions/Side Effects

GI: abdominal cramps, nausea, diarrhea, rectal burning. **F and E:** hypokalemia (with chronic use). **MS:** muscle weakness (with chronic use). **Misc:** protein-losing enteropathy, tetany (with chronic use).

Interactions

Drug-Drug: Antacids, histamine H₂-receptor antagonists, and gastric acid–pump inhibitors may remove enteric coating of tablets resulting in gastric irritation/dyspepsia. May ↓ the absorption of other orally administered drugs because of ↑ motility and ↓ transit time.

Drug-Food: Milk may remove enteric coating of tablets, resulting in gastric irritation/dyspepsia.

Route/Dosage

PO (Adults and Children ≥12 yr): 5–15 mg/day (up to 30 mg/day) as a single dose.

PO (Children 3–11 yr): 5–10 mg/day (0.3 mg/kg) as a single dose.

Rect (Adults and Children ≥12 yr): 10 mg/day single dose.

Rect (Children 2–11 yr): 5–10 mg/day single dose.

Rect (Children <2 yr): 5 mg/day single dose.

Availability (generic available)

Enteric-coated tablets: 5 mg^{OTC}. **Enteric coated and delayed release:** 5 mg^{OTC}. **Suppositories:** 10 mg^{OTC}. **Rectal solution:** 10 mg/30 mL^{OTC}. **In combination with:** In Bowel Preparation kits with Magnesium citrate (Evac-Q-Kwik^{OTC}, EZ-EM Prep Kit^{OTC}, LiquiPrep Bowel Evacuant^{OTC}, Tridate Bowel Cleansing Kit^{OTC}), Phosphate/biphosphate (Fleet Prep Kit No. 1^{OTC}, Fleet Prep Kit No. 2^{OTC}, Fleet Prep Kit No. 3^{OTC}), senosides (X-Prep Bowel Evacuant Kit #1^{OTC}), senosides, magnesium citrate, magnesium sulfate (X-Prep Bowel Evacuant Kit #2^{OTC}). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- Do not confuse Dulcolax (bisacodyl) with Dulcolax (docusate sodium).
- May be administered at bedtime for morning results.
- **PO:** Taking on an empty stomach will produce more rapid results.
- Do not crush or chew enteric-coated tablets. Take with a full glass of water or juice.

- Do not administer oral doses within 1 hr of milk or antacids; this may lead to premature dissolution of tablet and gastric or duodenal irritation.
- **Rect:** Suppository or enema can be given at the time a bowel movement is desired. Lubricate suppositories with water or water-soluble lubricant before insertion. Encourage patient to retain the suppository or enema 15–30 min before expelling.

Patient/Family Teaching

- Advise patients, other than those with spinal cord injuries, that laxatives should be used only for short-term therapy. Prolonged therapy may cause electrolyte imbalance and dependence.
- Advise patient to increase fluid intake to at least 1500–2000 mL/day during therapy to prevent dehydration.
- Encourage patients to use other forms of bowel regulation (increasing bulk in the diet, increasing fluid intake, or increasing mobility). Normal bowel habits may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient that bisacodyl should not be used when constipation is accompanied by abdominal pain, fever, nausea, or vomiting.

Evaluation/Desired Outcomes

- Soft, formed bowel movement when used for constipation.
- Evacuation of colon before surgery or radiologic studies, or for patients with spinal cord injuries.

bisoprolol (bis-oh-proe-lol)

Zebeta

Classification

Therapeutic: antihypertensives
Pharmacologic: beta blockers

Indications

Management of hypertension.

Action

Blocks stimulation of beta₁ (myocardial)-adrenergic receptors. Does not usually affect beta₂ (pulmonary, vascular, uterine)-receptor sites. **Therapeutic Effects:** Decreased BP and heart rate.

Pharmacokinetics

Absorption: Well absorbed after oral administration, but 20% undergoes first-pass hepatic metabolism.

Distribution: Unknown.

Metabolism and Excretion: 50% excreted unchanged by the kidneys; remainder renally excreted as metabolites; 2% excreted in feces.

Half-life: 9–12 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.

Use Cautiously in: Renal impairment (dosage ↓ recommended); Hepatic impairment (dosage ↓ recommended); Pulmonary disease (including asthma; beta₁ selectivity may be lost at higher doses); avoid use if possible; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); **OB, Lactation, Pedi:** Safety not established; crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; **Ger:** ↑ sensitivity to beta blockers; initial dosage ↓ recommended.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** **BRADYCARDIA, HF, PULMONARY EDEMA,** hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, ↑ liver function tests, nausea, vomiting. **GU:** erectile dysfunction. ↓ libido, urinary frequency. **Derm:** rash. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthetics, IV phenytoin, and verapamil may cause additive myocardial depression. Additive bradycardia may occur with digoxin, diltiazem, verapamil, or clonidine. Additive hypotension may occur with other antihypertensives, acute ingestion of alcohol, or nitrates. Concurrent use with amphetamine, cocaine, ephedrine, epinephrine, norepinephrine, phenylephrine, or pseudoephedrine may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent thyroid preparation administration may ↓ effectiveness. May alter the effectiveness of insulins or oral hypoglycemic agents (dose adjustments may be necessary). May ↓ the effectiveness of theophylline. May ↓ the beta₁-cardiovascular effects of dopamine or dobutamine. Use cautiously within 14 days of MAO inhibitor therapy (may result in hypertension).

Route/Dosage

PO (Adults): 5 mg once daily, may be ↑ to 10 mg once daily (range 2.5–20 mg/day).

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Renal Impairment

Hepatic Impairment

PO (Adults): $CCr < 40 \text{ mL/min}$ —Initiate therapy with 2.5 mg/day, titrate cautiously.

Availability (generic available)

Tablets: 5 mg, 10 mg. **In combination with:** hydrochlorothiazide (Ziac). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor BP, ECG, and pulse frequently during dosage adjustment period and periodically throughout therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- **Lab Test Considerations:** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Take apical pulse before administering. If < 50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- May be administered without regard to meals.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. If a dose is missed, it should be taken as soon as possible up to 4 hr before next dose. **Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.**
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly and to report significant changes to health care professional.
- May cause drowsiness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal prod-

ucts, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.

- Diabetics should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in BP.

HIGH ALERT

bivalirudin (bi-val-i-roo-din)

Angiomax

Classification

Therapeutic: anticoagulants

Pharmacologic: thrombin inhibitors

Indications

Used in conjunction with aspirin in patients with unstable angina who are undergoing percutaneous transluminal angioplasty (PTCA). Used in conjunction with aspirin in patients with or at risk of heparin-induced thrombocytopenia (HIT) or heparin-induced thrombocytopenia and thrombosis syndrome (HITS) who are undergoing percutaneous coronary intervention (PCI). Used in conjunction with aspirin and with provisional glycoprotein IIb/IIIa inhibitor therapy in patients who are undergoing PCI.

Action

Specifically and reversibly inhibits thrombin by binding to its receptor sites. Inhibition of thrombin prevents activation of factors V, VIII, and XII; the conversion of fibrinogen to fibrin; platelet adhesion and aggregation.

Therapeutic Effects: Decreased acute ischemic complications in patients with unstable angina (death, MI, or the urgent need for revascularization procedures).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Cleared from plasma by a combination of renal mechanisms and proteolytic breakdown.

Half-life: 25 min (↑ in renal impairment).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1–2 hr

Contraindications/Precautions

Contraindicated in: Active major bleeding; Hypersensitivity.

Use Cautiously in: Any disease state associated with an ↑ risk of bleeding; Heparin-induced thrombocytopenia or heparin-induced thrombocytopenia-thrombosis syndrome; Patients with unstable angina not undergoing PTCA; Patients with other acute coronary syndromes; Concurrent use with other platelet aggregation inhibitors (safety not established); Renal impairment (↓ infusion rate if $CCr < 30$ mL/min); **Lactation, PEDI:** Safety not established; **OB:** Use only if clearly needed.

Adverse Reactions/Side Effects

CNS: headache, anxiety, insomnia, nervousness. **CV:** **ACUTE STENT THROMBOSIS** (especially in patients with ST-segment elevation MI undergoing PCI), hypotension, bradycardia, hypertension. **GI:** nausea, abdominal pain, dyspepsia, vomiting. **Hemat:** **BLEEDING**. **Local:** injection site pain. **MS:** back pain. **Misc:** pain, fever, pelvic pain.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **abciximab**, **heparin**, **low molecular weight heparins**, **clopidogrel**, **thrombolytics**, or any other **drugs that inhibit coagulation**.

Drug-Natural Products: ↑ risk of bleeding with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **gingko**, **Panax ginseng**, and others.

Route/Dosage

IV (Adults): 0.75 mg/kg as a bolus injection, followed by an infusion at a rate of 1.75 mg/kg/hr for the duration of the PCI/PTCA procedure. For patients without HIT/HITS, an activated clotting time (ACT) should be performed 5 min after bolus dose and an additional bolus dose of 0.3 mg/kg may be administered if needed. Continuation of the infusion (at a rate of 1.75 mg/kg/hr) for up to 4 hr post-procedure is optional (should be considered in patients with ST-segment elevation MI). If needed, the infusion may be continued beyond this initial 4 hr at a rate of 0.2 mg/kg/hr for up to 20 hr. Therapy should be initiated prior to the procedure and given in conjunction with aspirin.

Renal Impairment

IV (Adults): No ↓ in the bolus dose is needed in any patient with renal impairment. *GFR 10–29 mL/min*—↓ infusion rate to 1 mg/kg/hr; *Dialysis-dependent patients (off dialysis)*—↓ infusion rate to 0.25 mg/kg/hr. ACT should be monitored in all patients with renal impairment.

Availability (generic available)

Powder for injection: 250 mg/vial.

NURSING IMPLICATIONS

Assessment

- **Assess for bleeding.** Most common is oozing from the arterial access site for cardiac catheterization. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes should be minimized. Non-compressible sites for IV access should be avoided. If bleeding cannot be controlled with pressure, discontinue bivalirudin immediately.
- Monitor vital signs. May cause bradycardia, hypertension, or hypotension. An unexplained decrease in BP may indicate hemorrhage.
- Monitor patients with STEMI undergoing primary PCI with bivalirudin for acute stent thrombosis for at least 24 hrs in a facility capable of managing ischemic complications.
- **Lab Test Considerations:** Assess hemoglobin, hematocrit, and platelet count prior to bivalirudin therapy and periodically during therapy. May cause ↓ hemoglobin and hematocrit. An unexplained ↓ in hematocrit may indicate hemorrhage.
- Bivalirudin interferes with INR measurements; INR may not be useful in determining appropriate dose of warfarin.
- Monitor ACT periodically in patients with renal dysfunction.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- Administer IV just prior to PTCA, in conjunction with aspirin 300 mg to 325 mg/day. Do not administer IM.

IV Administration

- **IV Push:** (for bolus dose) Reconstitute each 250-mg vial with 5 mL of sterile water for injection. Reconstituted vials are stable for 24 hr if refrigerated. **Diluent:** Further dilute in 50 mL of D5W or 0.9% NaCl. Withdraw bolus dose out of bag. Infusion is stable for 24 hr at room temperature. **Concentration:** Final concentration of infusion is 5 mg/mL. **Rate:** Administer as a bolus injection.
- **Intermittent Infusion:** Reconstitute each 250-mg vial as per the above directions. **Diluent:** Further

* = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dilute in 50 mL of D5W or 0.9% NaCl. If infusion is to be continued after 4 hr (at a rate of 0.2 mg/kg/hr), reconstituted vial should be diluted in 500 mL of D5W or 0.9% NaCl. Infusion is stable for 24 hr at room temperature. **Concentration:** 5 mg/mL (for infusion rate of 1.75 mg/kg/hr); 0.5 mg/mL (for infusion rate of 0.2 mg/kg/hr). **Rate:** Based on patient's weight (see Route/Dosage section).

- Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, arsenic trioxide, atropine, azithromycin, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoprostenol, epifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glicopyrrolate, granisetron, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, leucovorin, levofloxacin, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin-tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, ranitidine, rimfenitanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid.
- Y-Site Incompatibility:** alteplase, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, caspofungin, chlorpromazine, dantrolene, di-

azepam, pentamidine, pentazocine, phenytoin, prochlorperazine, quinupristin/dalfopristin, reteplase, streptokinase, vancomycin.

Patient/Family Teaching

- Inform patient of the purpose of bivalirudin.
- Instruct patient to notify health care professional immediately if any bleeding or bruising is noted.**
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.

Evaluation/Desired Outcomes

- Decreased acute ischemic complications in patients with unstable angina (death, MI, or the urgent need for revascularization procedures).

HIGH ALERT

bleomycin (blee-oh-mye-sin) Blenoxane

Classification

Therapeutic: antineoplastics

Pharmacologic: antitumor antibiotics

Indications

Treatment of: Lymphomas, Squamous cell carcinoma, Testicular embryonal cell carcinoma, Choriocarcinoma, Teratocarcinoma. Intrapleural administration to prevent the reaccumulation of malignant effusions.

Action

Inhibits DNA and RNA synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Well absorbed from IM and subcut sites. Absorption follows intrapleural and intraperitoneal administration.

Distribution: Widely distributed, concentrates in skin, lungs, peritoneum, kidneys, and lymphatics.

Metabolism and Excretion: 60–70% excreted unchanged by the kidneys.

Half-life: 2 hr (↑ in renal impairment).

TIME/ACTION PROFILE (tumor response)

ROUTE	ONSET	PEAK	DURATION
IV, IM, Subcut	2–3 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Potential for fetal, infant harm.

Use Cautiously in: Renal impairment (dose ↓ required if $CCr < 35$ mL/min); Pulmonary impairment; Nonmalignant chronic debilitating illness; Patients with childbearing potential; **Geri:** ↑ risk of pulmonary toxicity and reduction in renal function.

Adverse Reactions/Side Effects

CNS: aggressive behavior, disorientation, weakness.

Resp: PULMONARY FIBROSIS, pneumonitis. **CV:** hypotension, peripheral vasoconstriction. **GI:** anorexia, nausea, stomatitis, vomiting. **Derm:** hyperpigmentation, mucocutaneous toxicity, alopecia, erythema, rashes, urticaria, vesiculation. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** pain at tumor site, phlebitis at IV site. **Metab:** weight loss. **Misc:** ANA-PHYLACTOID REACTIONS, chills, fever.

Interactions

Drug-Drug: Hematologic toxicity ↑ with concurrent use of **radiation therapy** and other **antineoplastics**. Concurrent use with **cisplatin** ↓ elimination of bleomycin and may ↑ toxicity. ↑ risk of pulmonary toxicity with other **antineoplastics** or thoracic **radiation therapy**. **General anesthesia** ↑ the risk of pulmonary toxicity. ↑ risk of Raynaud's phenomenon when used with **vinblastine**.

Route/Dosage

Lymphoma patients should receive initial test doses of 2 units or less for the first 2 doses.

IV, IM, Subcut (Adults and Children): 0.25–0.5 unit/kg (10–20 units/m²) weekly or twice weekly initially. If favorable response, lower maintenance doses given (1 unit/day or 5 units/wk IM or IV). May also be given as continuous IV infusion at 0.25 unit/kg or 15 units/m²/day for 4–5 days.

Intrapleural (Adults): 15–20 units instilled for 4 hr, then removed.

Availability (generic available)

Injection: 15 units/vial, 30 units/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess for fever and chills. May occur 3–6 hr after administration and last 4–12 hr.
- **Monitor for anaphylactic (fever, chills, hypotension, wheezing) and idiosyncratic (confusion, hypotension, fever, chills, wheezing) reactions.** Keep resuscitation equipment and medications on hand. Lymphoma patients are at particular risk for idiosyncratic reactions that may occur immediately or several hours after therapy, usually after the first or second dose.
- **Assess respiratory status for dyspnea and rales/crackles. Monitor chest x-ray before and periodically during therapy.** Pulmonary toxicity occurs primarily in geriatric patients (age 70 or older) who have received 400 or more units or at lower doses in patients who received other antineoplastics or thoracic radiation. May occur 4–10 wk after therapy.

Discontinue and do not resume bleomycin if pulmonary toxicity occurs.

- Assess nausea, vomiting, and appetite. Weigh weekly. Modify diet as tolerated. Antiemetics may be given before administration.
- **Lab Test Considerations:** Monitor CBC before and periodically during therapy. May cause thrombocytopenia and leukopenia (nadir occurs in 12 days and usually returns to pretreatment levels by day 17).
- Monitor baseline and periodic renal and hepatic function.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Disturbed body image (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Lymphoma patients should receive a 1- or 2-unit test dose 2–4 hr before initiation of therapy. Monitor closely for anaphylactic reaction. May not detect reactors.
- Premedication with acetaminophen, corticosteroids, and diphenhydramine may reduce drug fever and risk of anaphylaxis.
- Reconstituted solution is stable for 24 hr at room temperature and for 14 days if refrigerated.
- **IM, Subcut:** Reconstitute vial with 1–5 mL of sterile water for injection, 0.9% NaCl, or bacteriostatic water for injection. Do not reconstitute with diluents containing benzyl alcohol when used for neonates.

IV Administration

- **Intermittent Infusion:** Prepare IV doses by diluting 15-unit vial with at least 5 mL of 0.9% NaCl. **Diluent:** Further dilute dose in 50 to 1000 mL of D5W or 0.9% NaCl. **Rate:** Administer slowly over 10 min.
- **Y-Site Compatibility:** allopurinol, amifostine, aminocaproic acid, aminophylline, amiodarone, anidulafungin, atracurium, aztreonam, bivalirudin, bumetanide, busulfan, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefepime, chlorpromazine, cimetidine, cisatracurium, cisplatin, codeine, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dextrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium,

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

doxorubicin, doxorubicin liposome, droperidol, enalaprilat, epinephrine, epirubicin, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, filgrastim, fludarabine, fluorouracil, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, idarubicin, ifosfamide, insulin, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, milrinone, mitomycin, mitoxantrone, naloxone, nesiritide, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, procainamide, quinupristin/dalfopristin, rituximab, sargramostim, sodium acetate, teniposide, thiotepa, tirofiban, trastuzumab, vinblastine, vincristine, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** amphotericin B liposome, dantrolene, phenytoin, tigecycline.
- **Intraleural:** Dissolve 60 units in 50–100 mL of 0.9% NaCl.
- May be administered through thoracotomy tube. Position patient as directed.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever, chills, wheezing, faintness, diaphoresis, shortness of breath, prolonged nausea and vomiting, or mouth sores occur.
- **Encourage patient not to smoke because this may worsen pulmonary toxicity.**
- Explain to the patient that skin toxicity may manifest itself as skin sensitivity, hyperpigmentation (especially at skin folds and points of skin irritation), and skin rashes and thickening.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Opioid analgesics may be required if pain interferes with eating.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for contraception during therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in tumor size without evidence of hypersensitivity or pulmonary toxicity.

bortezomib (bor-tez-o-mib)

Velcade

Classification

Therapeutic: antineoplastics

Pharmacologic: proteasome inhibitors

Indications

Multiple myeloma (as initial therapy or after progression); with melphalan and prednisone. Mantle cell lymphoma.

Action

Inhibits proteasome, a regulator of intracellular protein catabolism, resulting in disruption of various intracellular processes. Cytotoxic to a variety of cancerous cells.

Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver (P450 enzymes); excretion is unknown.

Half-life: 9–15 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	38 days*	unknown

*Median time to response based on clinical parameters.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to bortezomib, boron, or mannitol; Intrathecal administration (may cause death); **OB:** Potential fetal harm; **Lactation:** Potential for serious adverse reaction in nursing infants.

Use Cautiously in: **OB:** Women with childbearing potential; Moderate to severe hepatic impairment (may ↑ levels, risk of toxicity); History of or risk factors for HF; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME (RPLS), fatigue, malaise, weakness, dizziness, syncope. **EENT:** blurred vision, diplopia. **CV:** hypotension, HF. **Resp:** pneumonia. **GI:** LIVER FAILURE, anorexia, constipation, diarrhea, nausea, vomiting. **Hemat:** BLEEDING, anemia, neutropenia, thrombocytopenia. **Neuro:** peripheral neuropathy. **Misc:** fever, tumor lysis syndrome.

Interactions

Drug-Drug: Concurrent neurotoxic medications including amiodarone, some antivirals, nitrofurantoin, isoniazid, or HMG-CoA reductase inhibitors may ↑ risk of peripheral neuropathy.

Route/Dosage

Previously Untreated Multiple Myeloma

IV, Subcut (Adults): 1.3 mg/m² twice weekly for Cycles 1–4 (days 1, 4, 8, 11, 22, 25, 29, and 32; no treatment during cycle 3), then once weekly for Cycles 5–9 (days 1, 8, 22, and 29; no treatment during Cycle 7); further cycles/doses depend on response and toxicity.

Previously Untreated Mantle Cell Lymphoma

IV, Subcut (Adults): 1.3 mg/m² twice weekly on days 1, 4, 8, and 11, followed by a 10-day rest (days 12–21); repeat for 5 additional cycles; further cycles/doses depend on response and toxicity.

Relapsed Multiple Myeloma and Mantle Cell Lymphoma

IV, Subcut (Adults): 1.3 mg/m² twice weekly for 2 wk (days 1, 4, 8, and 11), followed by a 10-day rest; further cycles/doses depend on response and toxicity. Patients with multiple myeloma who have previously responded to bortezomib therapy and who have relapsed ≥ 6 mo after prior bortezomib therapy can be started on their last tolerated dose; dose should be given twice weekly (days 1, 4, 8, and 11) q 3 wk for a maximum of 8 cycles.

Hepatic Impairment

IV (Adults): *Moderate or severe hepatic impairment*—0.7 mg/m² per injection for the first cycle, then may \uparrow to 1 mg/m² per injection or \downarrow further to 0.5 mg/m² per injection, based on tolerability.

Availability

Lyophilized powder for injection (requires reconstitution): 3.5 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during therapy. May cause fever and orthostatic hypotension requiring adjustment of antihypertensives, hydration, or administration of mineralocorticoids.
- Monitor for GI adverse effects. May require anti-diarrheals, antiemetics, and fluid and electrolyte replacement to prevent dehydration. Weigh weekly; modify diet as tolerated.
- Monitor for signs and symptoms of tumor lysis syndrome (tachypnea, tachycardia, hypotension, pulmonary edema). Patients with high tumor burden prior to treatment are at increased risk.
- **Monitor for signs of RPLS (headache, seizure, lethargy, confusion, blindness).** Hypertension may or may not be present. May occur within 16 hr to 1 yr of initiation of therapy. Treat hypertension if present and discontinue bortezomib therapy. Symptoms usually resolve within days.

- Assess for any new signs or symptoms that may be suggestive of PML, an opportunistic infection of the brain caused by the JC virus, that leads to death or severe disability; withhold dose and notify health care professional promptly. PML symptoms may begin gradually but usually worsen rapidly. Symptoms vary depending on which part of brain is infected (mental function declines rapidly and progressively, causing dementia; speaking becomes increasingly difficult; partial blindness; difficulty walking; rarely, headaches and seizures occur). Diagnosis is usually made via gadolinium-enhanced MRI and CSF analysis. Risk of PML increases with the number of infusions. Withhold bortezomib at first sign of PML.
- **Lab Test Considerations:** Monitor CBC frequently during therapy. Assess platelet count before each dose. Dose modifications for hematologic toxicity are made based on indication and concurrent drug therapy; see manufacturer's recommendations. The nadir of thrombocytopenia is day 11 and recovery is usually by next cycle. Occurs more commonly in cycles 1 and 2, but may occur throughout therapy. May require discontinuation of therapy.
- Monitor blood glucose levels closely in patients taking oral hypoglycemic agents; may require adjustment of antidiabetic agent dose.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- Should be administered under the supervision of a physician experienced in the use of antineoplastic therapy.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.

IV Administration

- **Subcut:** Reconstitute each vial with 1.4 mL of 0.9% NaCl. **Concentration:** 2.5 mg/mL. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. May inject into thigh or abdomen; rotate injection sites. Inject into sites at least 1 inch from other sites and avoid tender, bruised, erythematous, or indurated sites. If local injection site reactions occur, may inject a less concentrated (1 mg/mL) solution.
- **IV Push:** Reconstitute each vial with 3.5 mL of 0.9% NaCl. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. **Concentration:** 1 mg/mL. Administer reconstituted solution within 8 hr at room temperature; 3 of the 8 hr may be stored in a sy-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ringe. **Rate:** Administer as a 3–5 second bolus injection twice weekly for 2 wk followed by a 10-day rest period. At least 72 hr should elapse between consecutive doses.

- If peripheral neuropathy is Grade 1 (paresthesia or loss of reflexes without pain or loss of function) continue prescribed dose. If paresthesia is Grade 1 with pain or Grade 2 (interfering with function but not with daily activities) reduce dose to 1.0 mg/m². If peripheral neuropathy is Grade 2 with pain or Grade 3 (interfering with activities of daily living) withhold dose until toxicity resolves, then re-initiate with a reduced dose of 0.7 mg/m² and decrease frequency to once/wk. If peripheral neuropathy is Grade 4 (permanent sensory loss that interferes with daily function) discontinue bortezomib.

Patient/Family Teaching

- Caution the patient that dehydration may occur with vomiting or diarrhea. Advise patient to maintain fluid intake and to notify health care professional if dizziness or fainting occurs.
- Instruct patient to contact health care professional if they experience new or worsening signs of peripheral neuropathy (tingling, numbness, pain, burning feeling in the feet or hands, weakness in the arms or legs), **PML (progressive weakness on one side of the body or clumsiness of limbs; disturbance of vision; changes in thinking, memory, and orientation leading to confusion and personality changes)**, or if symptoms of dehydration (dizziness, fainting) due to vomiting or diarrhea; rash; shortness of breath; cough; swelling of feet, ankles, or legs; convulsions; persistent headache; reduced eyesight; increase in BP or blurred vision occur.
- May cause dizziness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking Rx, OTC, or herbal products, especially St. John's Wort.
- Advise diabetic patients taking oral hypoglycemic agents to monitor blood glucose frequently and notify health care professional of changes in blood sugar.
- Advise patient of the need for contraception and to avoid breast feeding during therapy. Patient should notify health care professional immediately if pregnancy is suspected.

Evaluation/Desired Outcomes

- Decrease in serum and urine myeloma protein.
- Decrease in size and spread of malignancy.

brentuximab (bren-tux-i-mab) Adcetris

Classification

Therapeutic: antineoplastics

Pharmacologic: drug-antibody conjugates

Indications

Treatment of Hodgkin's lymphoma in patients who have failed autologous hematopoietic stem cell transplant (auto-HSCT) or who have failed two prior multi-agent chemotherapies and are not candidates for auto-HSCT. Treatment of Hodgkin's lymphoma in patients who are at high risk of relapse or progression as post-auto-HSCT consolidation. Treatment of systemic anaplastic large cell lymphoma after failure of at least one multi-agent chemotherapy regimen.

Action

 An antibody-drug conjugate (ADC) made up three parts: an antibody specific for human CD30 (cAC10, a cell membrane protein of the tumor necrosis factor receptor), a microtubule disrupting agent monomethyl auristatin (MMAE), and a protease-cleavable linker that attaches MMAE covalently to cAC10. The combination disrupts the intracellular microtubule network causing cell-cycle arrest and apoptotic cellular death. **Therapeutic Effects:** Decreased spread of lymphoma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Small amounts of MMAE that are released are metabolized by the liver and eliminated mostly by the kidneys.

Half-life: ADC—4–6 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV (ADC)	unknown	end of infusion	3 wk
IV (MMAE)	unknown	1–3 days	3 wk

Contraindications/Precautions

Contraindicated in: Concurrent use of bleomycin (↑ risk of pulmonary toxicity); Severe renal impairment (CCr <30 mL/min); Moderate or severe hepatic impairment; **OB:** May cause fetal harm; avoid pregnancy; **Lactation:** Breast feeding should be avoided.

Use Cautiously in: **Rep:** Females of reproductive potential and males with female partners of reproductive potential (use effective contraception); **Ger:** Safety and effectiveness not established; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: **PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML)**, anxiety, dizziness, fatigue, headache, insomnia.

CV: peripheral edema. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, alopecia, night sweats, pruritus, rash, dry skin. **GI:** BOWEL OBSTRUCTION, GI HEMORRHAGE, GI PERFORATION, ILEUS, HEPATOTOXICITY, PANCREATITIS, abdominal pain, constipation, ↓ appetite, diarrhea, nausea, vomiting, enterocolitis, neutropenic colitis, ulcer. **GU:** ↓ fertility. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA, anemia. **Metab:** weight loss. **MS:** arthralgia, back pain, extremity pain, myalgia, muscle spasm. **Neuro:** peripheral neuropathy. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, INTERSTITIAL LUNG DISEASE, cough, dyspnea, oropharyngeal pain. **Misc:** infusion reactions including ANAPHYLAXIS, TUMOR LYSIS SYNDROME, fever, lymphadenopathy, chills.

Interactions

Drug-Drug: MMAE is both a substrate and inhibitor of the CYP3A4/5 enzyme system. **Bleomycin** may ↑ risk of pulmonary toxicity; concurrent use contraindicated. **Strong CYP3A4 inhibitors**, including ketoconazole may ↑ levels and risk of adverse reactions. **Strong CYP3A4 inducers**, including rifampin, may ↓ levels and effectiveness.

Route/Dosage

IV (Adults): 1.8 mg/kg (max dose = 180 mg) every 3 wk until disease progression or unacceptable toxicity. For Hodgkin's lymphoma post-auto-HSCT consolidation treatment, initiate therapy within 4–6 wk post-auto-HSCT or upon recovery of auto-HSCT; treatment should be continued for a maximum of 16 cycles or until disease progression or unacceptable toxicity.

Renal Impairment

IV (Adults): *CCr* <30 mL/min—Avoid use.

Hepatic Impairment

IV (Adults): *Mild (Child-Pugh A)*—1.2 mg/kg (max dose = 120 mg) every 3 wk until disease progression or unacceptable toxicity; *Moderate (Child-Pugh B)* or *severe (Child-Pugh C)*—Avoid use.

Availability

Lyophilized powder for IV injection: 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of peripheral neuropathy (hypoesthesia, hyperesthesia, paresthesia, discomfort, burning, neuropathic pain, weakness). For new or worsening neuropathy Grade 2 or 3, delay next dose until neuropathy improves to Grade 1 or baseline, then restart at 1.2 mg/kg.
- Assess for signs and symptoms of infusion-related reaction, including anaphylaxis (rash, pruritus, dyspnea, swelling of face and neck). If anaphylaxis occurs, discontinue infusion immediately; do not re-

start. Treat other infusion-related reactions by stopping and treating symptoms. Premedicate patient prior to subsequent infusions with acetaminophen, an antihistamine, and a corticosteroid.

- Monitor for tumor lysis syndrome due to rapid reduction in tumor volume (acute renal failure, hyperkalemia, hypocalcemia, hyperuricemia, or hypophosphatemia). Risks are higher in patients with greater tumor burden and rapidly proliferating tumors; may be fatal. Correct electrolyte abnormalities, monitor renal function and fluid balance, and administer supportive care, including dialysis, as indicated.
- Assess for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- Assess for any new signs or symptoms that may be suggestive of PML, an opportunistic infection of the brain caused by the JC virus, that leads to death or severe disability; withhold dose and notify health care professional promptly. PML symptoms may begin gradually but usually worsen rapidly. Symptoms vary depending on which part of brain is infected (mental function declines rapidly and progressively, causing dementia; speaking becomes increasingly difficult; partial blindness; difficulty walking; rarely, headaches and seizures occur). Diagnosis is usually made via gadolinium-enhanced MRI and CSF analysis. Risk of PML increases with the number of infusions. Withhold brentuximab at first sign of PML.
- Monitor for signs and symptoms of pulmonary toxicity (cough, dyspnea) during therapy. If new or worsening pulmonary symptoms occur, hold brentuximab during assessment and until symptoms improve.
- Monitor for severe abdominal pain during therapy; may cause pancreatitis.
- **Lab Test Considerations:** Monitor CBC prior to each dose and more frequently in patients with Grade 3 or 4 neutropenia. Prolonged (≥ 1 wk) severe neutropenia may occur. Hold dose of brentuximab for Grade 3 or 4 neutropenia until resolution to baseline or Grade 2 or lower. Consider growth factor support for subsequent cycles for patients who developed Grade 3 or 4 neutropenia. Discontinue brentuximab or reduce dose to 1.2 mg/kg in patients with recurrent Grade 4 neutropenia despite use of growth factors.
- Monitor liver enzymes and bilirubin periodically during therapy. Signs of new, worsening, or recurrent hepatotoxicity may require decrease in dose, or interruption or discontinuation of therapy.
- Verify negative pregnancy status prior to starting therapy.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

IV Administration

- **Intermittent Infusion:** Calculate dose and number of brexpiprazole vials needed. Calculate for 100 kg for patients weighing >100 kg. Reconstitute each 50 mg vial with 10.5 mL of Sterile Water for Injection for a concentration of 5 mg/mL. Direct stream to side of vial. Swirl gently; do not shake. Solution should be clear to slightly opalescent, and colorless. Do not administer solutions that are discolored or contain a precipitate. Withdraw volume of brexpiprazole dose from infusion bag of at least 100 mL. **Diluent:** 0.9% NaCl, D5W, or LR. Invert bag gently to mix. Dilute immediately into infusion bag or store solution in refrigerator; use within 24 hrs of reconstitution. Do not freeze. **Rate:** Infuse over 30 min. Do not administer as IV push or bolus.
- **Y-Site Incompatibility:** Do not administer with other products.

Patient/Family Teaching

- Instruct patient to notify health care professional of any numbness or tingling of hands or feet or any muscle weakness.
- Advise patient to notify health care professional immediately if signs and symptoms of infection (fever of ≥ 100.5 F $^{\circ}$, chills, cough, pain on urination), hepatotoxicity (fatigue, anorexia, right upper abdominal discomfort, dark urine, jaundice), PML (changes in mood or usual behavior, confusion, thinking problems, loss of memory, changes in vision, speech, or walking, decreased strength or weakness on one side of body), pulmonary toxicity, abdominal pain, or infusion reactions (fever, chills, rash, breathing problems within 24 hr of infusion) occur.
- **Rep:** Caution female and male patients with reproductive potential to use effective contraception during therapy and for at least 6 mo after last dose. Avoid pregnancy and breast feeding. If pregnancy is suspected, notify health care professional promptly. Inform male patients therapy may compromise fertility.

Evaluation/Desired Outcomes

- Decreased spread of lymphoma.

brexpiprazole
(brex-pip-ra-zole)
Rexulti

Classification

Therapeutic: none assigned, antipsychotics, antidepressants

Pharmacologic: serotonin-dopamine activity modulators (SDAM)

Indications

Treatment of schizophrenia. Adjunctive treatment of major depressive disorder.

Action

Psychotropic activity may be due to partial agonist activity at dopamine D₂ and serotonin 5-HT_{1A} receptors and antagonist activity at the 5-HT_{2A} receptor. **Therapeutic Effects:** Decreased manifestations of schizophrenia including excitable, paranoid, or withdrawn behavior. Improvement in symptoms of depression with increased sense of wellbeing.

Pharmacokinetics

Absorption: Well absorbed (95%) following oral administration.

Distribution: Displays extravascular distribution.

Protein Binding: >90%.

Metabolism and Excretion: Metabolized by CYP3A4 and CYP2D6; 25% excreted in urine (<1% unchanged), 46% in feces (14% unchanged).

Half-life: 91 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO (schizophrenia)	within 1–2 wk	4–6 wk	unknown
PO (depression)	within 1 wk	5 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: History of seizures, concurrent use of medications that may ↓ seizure threshold; Pre-existing cardiovascular disease, dehydration, hypotension, concurrent antihypertensives, diuretics, electrolyte imbalance (↑ risk of orthostatic hypotension, correct deficits before treatment); Pre-existing low WBC (may ↑ risk of leukopenia/neutropenia); History of diabetes, metabolic syndrome or dyslipidemia (may exacerbate); Patients <24 yr (may ↑ suicidal ideation/behaviors, monitor carefully); Patients at risk for falls; ❌ Poor CYP2D6 metabolizers (PM), dose ↓ required; **Ger:** Elderly patients with dementia-induced psychoses (↑ risk of serious adverse cardiovascular reactions and death), consider age, concurrent medical conditions and medications, renal/hepatic/cardiac function; **OB:** Safety not established; use during third trimester may result in extrapyramidal/withdrawal symptoms in infant; **Lactation:** Consider health benefits against risk of adverse effects in infant; **Pedi:** Safety and effectiveness not established (may ↑ suicidal ideation/behaviors).

Adverse Reactions/Side Effects

CNS: SEIZURES, abnormal dreams, dizziness, drowsiness, headache, restlessness. **EENT:** blurred vision.

CV: cerebrovascular adverse reactions (↑ in elderly patients with dementia-related psychoses), orthostatic

hypotension/syncope. **GI:** abdominal pain, constipation, diarrhea, dry mouth, dysphagia, excess salivation, flatulence. **Hemat:** agranulocytosis, leukopenia, neutropenia. **Metab:** ↑ appetite, ↑ weight, hyperglycemia/diabetes, dyslipidemia. **Neuro:** akathisia, dystonia, extrapyramidal symptoms, tardive dyskinesia, tremor.

Misc: **NEUROLEPTIC MALIGNANT SYNDROME**, allergic reactions including **ANAPHYLAXIS**, body temperature dysregulation.

Interactions

Drug-Drug: Concurrent use with strong CYP3A4 inhibitors including clarithromycin, itraconazole or ketoconazole ↑ blood levels, effects and risk of adverse reactions; ↓ dose of brexpiprazole required. Concurrent use with strong CYP2D6 inhibitors including fluoxetine, paroxetine, or quinidine ↑ blood levels, effects and risk of adverse reactions; ↓ dose of brexpiprazole required. Combined use of strong or moderate CYP3A4 inhibitors with strong or moderate CYP2D6 inhibitors in addition to brexpiprazole including the following combinations itraconazole + quinidine, fluconazole + paroxetine, itraconazole + duloxetine or fluconazole + duloxetine ↑ blood levels, effects and risk of toxicity; ↓ dose of brexpiprazole required. Concurrent use of strong inducers of CYP3A4 including rifampin ↓ blood levels and effectiveness; ↑ dose of brexpiprazole required. Concurrent use of antihypertensives or diuretics (↑ risk of hypotension). Concurrent use of medications that may ↓ seizure threshold (↑ risk of seizures).

Drug-Natural Products: Concurrent use of St. John's wort ↓ blood levels and effectiveness; ↑ dose of brexpiprazole required.

Route/Dosage

PO (Adults): *Schizophrenia*—1 mg once daily for the 1st 4 days (Days 1–4), then ↑ to 2 mg once daily for the next 3 days (Days 5–8), then ↑ to 4 mg once daily on Day 8 (not to exceed 4 mg once daily); *Major depressive disorder*—0.5 or 1 mg once daily initially, may be ↑ to 2 mg once daily (not to exceed 3 mg once daily); *Known CYP2D6 poor metabolizers*—use 50% of the usual dose. *Concurrent use of strong CYP2D6 inhibitors (schizophrenia only) or CYP3A4 inhibitors*—use 50% of the usual dose; *Concurrent use of strong/moderate CYP2D6 inhibitors AND strong/moderate CYP3A4 inhibitors*—use 25% of the usual dose; *Known CYP2D6 poor metabolizer taking concurrent strong/moderate CYP3A4 inhibitors*—use 25% of the usual dose; *Concurrent use of strong CYP3A4 inducers*—double usual dose over 1–2 wk; titrate by clinical response.

Hepatic Impairment

PO (Adults): *Moderate to severe hepatic impairment [Child-Pugh score ≥7]*—maximum daily dose

should not exceed 3 mg for schizophrenia or 2 mg for major depressive disorder.

Renal Impairment

PO (Adults): *Moderate/severe/end-stage renal impairment [CCr <60 mL/min]*—maximum daily dose should not exceed 3 mg for schizophrenia or 2 mg for major depressive disorder.

Availability

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies, especially during early therapy for depression. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs.
- Assess weight and BMI initially and throughout therapy.
- Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor BP (sitting, standing, lying), pulse, and respiratory rate before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- **Lab Test Considerations:** Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leuko-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

penia, neutropenia, or agranulocytosis. Discontinue therapy if severe neutropenia ($ANC < 1000 \text{ mm}^3$ occurs).

- Monitor blood glucose and cholesterol levels initially and periodically during therapy.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- **PO:** Administer once daily without regard to meals.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose. Do not stop taking brexpiprazole without consulting health care professional. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension. Protect from falls.
- Medication may cause drowsiness and lightheadedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Inform patient that brexpiprazole may cause weight gain. Advise patient to monitor weight periodically. Notify health care professional of significant weight gain.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications. Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Encourage pregnant patients to enroll in registry by contacting National Pregnancy Registry for Atypical Antipsychot-

ics at 1-866-961-2388 or visit <http://womensmental-health.org/clinical-and-research-programs/pregnancyregistry/>.

- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoid, or withdrawn behavior.
- Increased sense of wellbeing in patients with depression.

brigatinib (bri-ga-ti-nib) Alunbrig

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Indications

Metastatic non-small cell lung cancer (NSCLC) that is positive for anaplastic lymphoma kinase (ALK) in patients who have progressed on or intolerant to crizotinib.

Action

Inhibits receptor tyrosine kinases including anaplastic lymphoma kinase (ALK), insulin-like growth factor—1 receptor (IGF-1R), ROS1, and FMS-like tyrosine kinase-3 (FLT-3). **Therapeutic Effects:** Decreased spread of lung cancer.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Bioavailability reduced by high fat meals.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: Mostly metabolized by the liver (CYP2C8 and CYP3A4 isoenzymes); also induces CYP3A. 27% excreted in feces unchanged, 22% eliminated unchanged in urine.

Half-life: 25 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of strong inhibitors/inducers of the CYP3A enzyme system; **OB:** May cause fetal harm; **Lactation:** Avoid breast feeding.

Use Cautiously in: Diabetes; Moderate or severe hepatic impairment; Severe renal impairment; **Rep:** Women of reproductive potential and men with female sexual partners of reproductive potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache, insomnia. **CV:** BRADYCARDIA, HYPERTENSION. **Derm:** rash. **EENT:** blurred vision, ↓ visual

acuity, diplopia, cataracts, macular edema. **Endo:** hyperglycemia. **F and E:** hypophosphatemia. **GI:** abdominal pain, constipation, ↓ appetite, diarrhea, ↑ amylase, ↑ lipase, ↑ liver enzymes, nausea, vomiting. **Hemat:** anemia, ↑ activated partial thromboplastin time, lymphopenia. **MS:** arthralgia, back pain, ↑ creatine phosphokinase, muscle spasms, myalgia. **Neuro:** peripheral neuropathy. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS, cough, dyspnea, hypoxia, pneumonia. **Misc:** fatigue, fever.

Interactions

Drug-Drug: Strong CYP3A inhibitors, including clarithromycin, cobicistat, conivaptan, indinavir, itraconazole, ketoconazole, lopinavir, nefazodone, nelfinavir, posaconazole, ritonavir, saquinavir, and voriconazole may ↑ levels; concurrent use should be avoided. Strong CYP3A inducers, including carbamazepine, phenytoin, and rifampin may ↓ levels and effectiveness; concurrent use should be avoided. May ↓ levels of CYP3A substrates, including hormonal contraceptives. Beta-blockers, verapamil, diltiazem, digoxin, and clonidine may ↑ risk of bradycardia; avoid concurrent use, if possible.

Drug-Natural Products: Concurrent use of St. John's wort may ↓ levels and effectiveness and should be avoided.

Drug-Food: Grapefruit or grapefruit juice may ↑ levels and should be avoided.

Route/Dosage

PO (Adults): 90 mg once daily for 7 days, then 180 mg once daily. Continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A inhibitor* — ↓ dose by 50%.

Availability

Film-coated tablets: 30 mg, 90 mg.

NURSING IMPLICATIONS

Assessment

- Assess respiratory function (lung sounds, dyspnea, oxygen saturation) periodically during therapy.
- Monitor for signs and symptoms of interstitial lung disease (ILD) or pneumonitis (difficulty breathing, shortness of breath, cough with or without mucus, fever) periodically during therapy. **Grade 1:** *If new pulmonary symptoms occur during first 7 days of therapy*, withhold brigatinib until recovery to baseline, then resume at same dose and do not escalate to 180 mg if ILD/pneumonitis is suspected. *If new pulmonary symptoms occur after first 7 days of therapy*, withhold brigatinib until recovery to baseline, then resume at same dose. *If ILD/pneumonitis recurs*, permanently discontinue brigatinib. **Grade 2:** *If new pulmonary symptoms occur during first 7 days of therapy*, withhold brigatinib until recovery

to baseline, then resume at same dose and do not escalate to 180 mg if ILD/pneumonitis is suspected. *If new pulmonary symptoms occur after first 7 days of therapy*, withhold brigatinib until recovery to baseline, if ILD/pneumonitis is suspected, resume at next lower dose; if not, resume at same dose. *If ILD/pneumonitis recurs*, permanently discontinue brigatinib. **Grade 3 or 4:** Permanently discontinue brigatinib for ILD/pneumonitis.

- Monitor BP prior to therapy, after 2 wks, and monthly thereafter during therapy. Control BP prior to therapy. Monitor blood pressure after 2 wk and at least monthly thereafter during therapy. *If Grade 3 hypertension (SBP \geq 160 mmHg or DBP \geq 100 mmHg) occurs*, suspend therapy until hypertension recovered to \leq Grade 1 (SBP <140 mmHg and DBP <90 mmHg), then resume brigatinib at next lower dose. *If recurrence of Grade 3:* withhold therapy until recovery to \leq Grade 1, and resume at next lower dose or permanently discontinue treatment. *If Grade 4 hypertension (life-threatening consequences, urgent intervention indicated) occurs*, hold brigatinib until recovery to \leq Grade 1, and resume at next lower dose or permanently discontinue treatment. *Grade 4 recurrence:* permanently discontinue brigatinib.
- Monitor for bradycardia (HR <60 bpm) periodically during therapy, especially if concurrent medications decrease HR. *If symptomatic bradycardia (dizziness, lightheadedness, fainting) occurs*, hold brigatinib until asymptomatic bradycardia or resting heart rate of \geq 60 bpm. *If concomitant medication known to cause bradycardia is identified and discontinued or dose-adjusted*, resume at same dose once asymptomatic or resting heart rate of \geq 60 bpm. *If no concomitant medication known to cause bradycardia is identified, or if contributing concomitant medications are not discontinued or dose-adjusted*, resume brigatinib at next lower dose upon recovery to asymptomatic bradycardia or to resting heart rate of \geq 60 bpm. *If bradycardia with life-threatening consequences or urgent intervention needed*, permanently discontinue brigatinib if no contributing concomitant medication is identified. *If contributing concomitant medication is identified and discontinued or dose-adjusted*, resume therapy at next lower dose when recovered to asymptomatic bradycardia or to a resting heart rate of \geq 60 bpm, with frequent monitoring as clinically indicated. *Grade 4 recurrence:* permanently discontinue therapy.
- **Lab Test Considerations:** Monitor CPK levels periodically during therapy. *If Grade 3 CPK \uparrow ($>$ 5.0 \times upper limit of normal [ULN]) occurs*, suspend therapy until \leq Grade 1 (\leq 2.5 \times ULN) or to baseline, then resume at same dose. *If Grade 4 CPK \uparrow ($>$ 10.0*

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- × ULN) or recurrence of Grade 3 ↑ occurs, hold brigatinib until \leq Grade 1 ($\leq 2.5 \times$ ULN) or to baseline, then resume therapy at next lower dose.
- Monitor serum lipase and amylase periodically during therapy. If Grade 3 lipase or amylase \uparrow ($>2.0 \times$ ULN) occurs, suspend therapy until \leq Grade 1 ($\leq 1.5 \times$ ULN) or to baseline, then resume brigatinib at same dose. If Grade 4 lipase or amylase \uparrow ($>5.0 \times$ ULN) or recurrence of Grade 3 ↑ occurs, hold brigatinib until \leq Grade 1 ($\leq 1.5 \times$ ULN) or to baseline, then resume therapy at next lower dose.
 - Monitor fasting serum glucose prior to initiation starting and periodically during therapy. May cause new or worsening hyperglycemia. Use anti-hyperglycemic medications as needed. If adequate hyperglycemic control cannot be achieved with medical management, hold brigatinib until adequate hyperglycemic control is achieved and consider reducing dose.

Potential Nursing Diagnoses

Impaired gas exchange (Indications)

Implementation

- **PO:** Administer daily without regard to food. Swallow tablets whole; do not crush, break, or chew. If therapy is interrupted for 14 days or longer, other than adverse reactions, resume therapy at 90 mg once daily for 7 days before increasing to previously tolerated dose.

Patient/Family Teaching

- Instruct patient to take brigatinib as directed. If patient vomits or misses a dose, omit dose and take next dose as scheduled. Do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid eating grapefruit or drinking grapefruit juice during therapy.
- Advise patient to notify health care professional if visual changes (double vision, seeing flashes of light, blurry vision, light hurting eyes, new or increased floaters), symptoms of pancreatitis (upper abdominal pain, weight loss, nausea), new or worsening symptoms of myalgia (unexplained muscle pain, tenderness, or weakness), or hyperglycemia (feeling very thirsty, needing to urinate more than usual, feeling very hungry, nausea, feeling weak or tired, feeling confused) occur, may require dose reduction or discontinuation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's Wort.
- **Rep:** May be teratogenic. Advise female patient of reproductive potential to use effective non-hormonal contraception during and for at least 4 mo after final dose. Advise males with female partners of reproductive potential to use effective contraception dur-

ing and for at least 3 mo after last dose of brigatinib. Advise patient to avoid breast feeding during and for 1 wk after final dose. Inform male patient that brigatinib may reduce fertility.

Evaluation/Desired Outcomes

- Decreased spread in lung cancer.

brivaracetam
(briv-a-ra-se-tam)
Briviact,  Brivlera

Classification

Therapeutic: anticonvulsants

Indications

Partial-onset seizures (adjunct).

Action

Displays a high and selective affinity for synaptic vesicle protein 2A (SV2A) in the brain, which may contribute to its anticonvulsant effect. **Therapeutic Effects:** Decreased incidence of seizures.

Pharmacokinetics

Absorption: Rapidly and completely absorbed following oral administration.

Distribution: Widely distributed to tissues.

Metabolism and Excretion: Hepatic and extrahepatic amidase-mediated hydrolysis of the amide moiety to form carboxylic acid metabolite (primary route) and hydroxylation primarily by CYP2C19 to form the hydroxy metabolite (secondary route) (all metabolites inactive).  The CYP2C19 enzyme system exhibits genetic polymorphism; poor metabolizers may have significantly \uparrow brivaracetam concentrations and an \uparrow risk of adverse effects. $>95\%$ excreted by the kidneys ($<10\%$ excreted unchanged).

Half-life: 9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4hr [†]	unknown

[†]1 hr in fasting state; 4 hr with high-fat meal.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; End-stage renal disease; **Lactation:** Discontinue brivaracetam or discontinue breast feeding.

Use Cautiously in: All patients (may \uparrow risk of suicidal thoughts/behaviors);  Patients who are known or suspected to be poor CYP2C19 metabolizers (may require dose \downarrow); Hepatic impairment (dose \downarrow recommended); **OB:** Use only if potential benefit justifies potential risk to fetus; **Pedi:** Safety and effectiveness not established in children <16 yr; **Geri:** \downarrow renal and hepatic function (dose \downarrow may be necessary).

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS/BEHAVIOR**, aggression, agitation, anger, apathy, belligerence, anxiety, depression, dizziness, drowsiness, hallucinations, irritability, mood swings, paranoia, psychosis, restlessness, tearfulness, euphoria, fatigue. **EENT:** nystagmus. **GI:** constipation, dysgeusia, nausea, vomiting. **Hemat:** leukopenia.

Neuro: ataxia, balance disorder, coordination difficulties, vertigo. **Local:** infusion site pain. **Misc:** **HYPERSENSITIVITY** (including bronchospasm and angioedema).

Interactions

Drug-Drug: **CYP2C19 inducers** including rifampin may ↓ levels and effectiveness; ↑ dose of brivaracetam by up to 100%. Concurrent use with **carbamazepine** may ↑ levels of carbamazepine-epoxide (active metabolite); consider ↓ dose of carbamazepine if tolerability issues occur. May ↑ levels of **phenytoin**.

Route/Dosage

PO, IV (Adults and Children ≥16 yrs): 50 mg twice daily; may be titrated down to 25 mg twice daily or up to 100 mg twice daily based on tolerability and effectiveness.

Hepatic Impairment

PO, IV (Adults and Children ≥16 yrs): 25 mg twice daily; titrate based on tolerability and effectiveness (max dose = 75 mg twice daily).

Availability

Oral solution (raspberry-flavored): 10 mg/mL. **Tablets:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg. **Solution for injection:** 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor for signs and symptoms of bronchospasm (wheezing, dyspnea) and angioedema (rash, pruritus, perioral swelling) during therapy. If signs of hypersensitivity occur discontinue brivaracetam.
- **Lab Test Considerations:** May cause ↓ WBC and neutrophil counts.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- Initiate therapy with oral or IV administration. IV administration may be used when oral dose is not feasible; administer at same dose and frequency as oral doses.

- **PO:** Administer twice daily without regard to food. Swallow tablets whole with liquid; do not crush or chew.
- Use a calibrated measuring device for accuracy with oral solution. Dilution is not necessary. May be administered via nasogastric or gastrostomy tube. Oral solution is stable for 5 mo after opening.

IV Administration

- **Intermittent Infusion:** **Diluent:** May be administered undiluted or diluted with 0.9% NaCl, LR, or D5W. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Solution is stable for up to 4 hr at room temperature; may be stored in polyvinyl chloride bags. **Rate:** Administer over 2–15 min.

Patient/Family Teaching

- Instruct patient to take brivaracetam as directed. ↓ dose gradually; do not stop abruptly to minimize risk of ↑ seizure frequency and status epilepticus. Advise patient to read *Medication Guide* prior to therapy and with each Rx refill in case of changes.
- May cause drowsiness, fatigue, dizziness, and balance problems. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient and family to notify health care professional if behavioral changes, thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves.

Evaluation/Desired Outcomes

- Decreased incidence of partial-onset seizures.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

REMS

brodalumab (broe-dal-ue-mab)
Siliq**Classification**

Therapeutic: antipsoriatics

Pharmacologic: interleukin antagonists

Indications

Moderate-to-severe plaque psoriasis in patients who are candidates for systemic therapy or phototherapy and have failed to respond or have lost response to other systemic therapies.

Action

A monoclonal antibody that acts as an antagonist of interleukin (IL)–17RA by selectively binding to it and preventing its interaction with numerous interleukin cytokines. Antagonism prevents production of inflammatory cytokines and chemokines. **Therapeutic Effects:** Decreased plaque formation and spread.

Pharmacokinetics

Absorption: 55% absorbed following subcut administration.

Distribution: Minimally distributed to tissues.

Metabolism and Excretion: Primarily eliminated by being catabolized into small peptides and amino acids.

Half-life: Unknown.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	3 days	unknown

Contraindications/Precautions

Contraindicated in: Crohn's disease (may worsen disease); Active tuberculosis.

Use Cautiously in: History of suicidality or depression; Chronic infection or history of recurrent infection;

OB, Lactation: Safety not established; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS/BEHAVIORS**, headache.

EENT: oropharyngeal pain. **GI:** Crohn's disease, diarrhea, nausea. **Hemat:** neutropenia. **MS:** arthralgia, myalgia. **Misc:** **INFECTIONS** (including reactivation tuberculosis), fatigue, injection site reactions.

Interactions

Drug-Drug: May ↓ antibody response to **live-virus vaccine** and ↑ risk of adverse reactions (do not administer concurrently). May affect activity of CYP450 enzymes and may alter the effectiveness/toxicity of drugs that are substrates of CYP450 (including **warfarin** and **cyclosporine**); close monitoring is recommended and necessary dose modifications undertaken.

Route/Dosage

Subcut (Adults): 210 mg at Wk 0, 1, and 2 then 210 mg every 2 wk; consider discontinuing therapy if adequate response not achieved after 12–16 wk of therapy.

Availability

Solution for subcutaneous injection (prefilled syringes): 210 mg/1.5 mL.

NURSING IMPLICATIONS**Assessment**

- Assess skin lesions prior to and periodically during therapy.
- Assess for tuberculosis (TB) infection prior to starting therapy. Begin treatment for latent TB prior to brodalumab administration; do not administer to patients with active TB infection.
- **Assess for new or worsening symptoms of depression, anxiety, other mood disorders, or suicidality. Refer to mental health professional as appropriate. Re-evaluate risks and benefits of brodalumab if depression occurs.**
- Monitor for signs and symptoms of infection (fever, sweats, chills, muscle aches, cough, dyspnea, sore throat or difficulty swallowing, warm, red or painful skin or sores, diarrhea or stomach pain, burning or frequency of urination) during therapy. If serious infection develops or is not responding to therapy, monitor patient closely and discontinue brodalumab until infection resolves.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

Risk for suicide (Adverse Reactions)

Implementation

- Available only through restricted program called Siliq REMS due to suicide risks. Providers must be certified, patients must sign a Patient-Provider Agreement form, and pharmacies must be certified and only dispense to patients authorized to receive brodalumab. Further information and a list of qualified pharmacies can be found at www.SILIQREMS.com or by calling 855-511-6135.
- **Subcut:** Allow prefilled syringe to reach room temperature for approximately 30 min before injecting. Do not warm any other way. Solution is clear to slightly opalescent, colorless to slightly yellow. A few translucent to white, amorphous proteinaceous particles may be present; do not administer if solution is cloudy or discolored. Inject full dose (1.5 mL) into thigh, abdomen, or upper arm. Pinch skin and inject at a 45° or 90° angle. Do not rub injection site. Do not inject in skin areas that are tender, bruised, red, hard, thick, scaly, or affected by psoriasis. Store in refrigerator or at room temperature for up to 14 days; do not return to refrigerator after room temperature. Protect from light. Do not freeze.

Patient/Family Teaching

- Advise patient to administer injection as directed, according to schedule. Health care professional should supervise first self-injection. Instruct patient to inject full dose, and to use proper technique for syringe and needle disposal. Inform patient that they must enroll in SILIQ REMS program and to carry SILIQ Patient Wallet Card at all times and share with other health care professionals. Card describes symptoms which, if experienced, should prompt patient to seek immediate medical evaluation. Provide patient with telephone number and website for pharmacies participating in SILIQ REMS program.
- Caution patient to avoid live vaccines during therapy.
- **May cause depression or suicide.** Instruct patients and caregivers to monitor for emergence of suicidal thoughts and behaviors. Notify health care professional immediately if suicidal thoughts, new or worsening depression, anxiety, changes in behavior or mood, thoughts of suicide, dying, or hurting self, or acting on dangerous impulses occur. Instruct patient to carry wallet card and to call the national Suicide Prevention Lifeline at 1-800-273-8255 if they experience suicidal thoughts.
- Instruct patient to notify health care professional if signs and symptoms of infection occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- **Rep:** Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in plaque formation and spread of plaque psoriasis. Consider discontinuing if adequate response not achieved after 12–16 wks. Treatment beyond 16 wks in patients without an adequate response is not likely to result in greater success.

budesonide, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), and CORTICOSTEROIDS (SYSTEMIC).

bumetanide (byoo-met-a-nide)

~~Bumex~~,  Burinex

Classification

Therapeutic: diuretics

Pharmacologic: loop diuretics

Indications

Edema due to heart failure, hepatic disease, or renal impairment. **Unlabeled Use:** Reversal of oliguria in preterm neonates.

Action

Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium chloride, magnesium, potassium, and calcium. Effectiveness persists in impaired renal function. **Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions).

Pharmacokinetics

Absorption: Well absorbed after oral or IM administration.

Distribution: Widely distributed.

Protein Binding: 72–96%.

Metabolism and Excretion: Partially metabolized by liver; 50% eliminated unchanged by kidneys and 20% excreted in feces.

Half-life: 60–90 min (6 hr in neonates).

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	4–6 hr
IM	30–60 min	1–2 hr	4–6 hr
IV	2–3 min	15–45 min	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria.

Use Cautiously in: Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Diabetes mellitus; Increasing azotemia; **Lactation, Pedi:** Safety not established; bumetanide is a potent displacer of bilirubin and should be used cautiously in critically ill or jaundiced neonates because of risk of kernicterus. Injection contains benzyl alcohol, which may cause gasping syndrome in neonates; **Ger:** May have ↑ risk of side effects, especially hypotension and electrolyte imbalance, at usual doses.

Adverse Reactions/Side Effects

CNS: dizziness, encephalopathy, headache. **EENT:** hearing loss, tinnitus. **CV:** hypotension. **GI:** diarrhea, dry mouth, nausea, vomiting. **GU:** ↑ BUN, excessive urination. **Derm:** **STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS,** photosensitivity, pruritis, rash. **Endo:** hyperglycemia, hyperuricemia. **F and E:** dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **MS:** arthralgia, muscle cramps, myalgia.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: ↑ risk of hypotension with **anti-hypertensives, nitrates,** or acute ingestion of **alcohol.** ↑ risk of hypokalemia with other **diuretics, amphotericin B, stimulant laxatives,** and **corticosteroids.** Hypokalemia may ↑ risk of **digoxin** toxicity. ↓ **lithium** excretion, may cause **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides.** **NS-AIDS** ↓ effects of bumetanide.

Route/Dosage

PO (Adults): 0.5–2 mg/day given in 1–2 doses; titrate to desired response (maximum daily dose = 10 mg/day).

PO (Infants and Children): 0.015–0.1 mg/kg/dose every 6–24 hrs (maximum: 10 mg/day).

PO (Neonates): 0.01–0.05 mg/kg/dose every 12–24 in term neonates or every 24–48 hrs in preterm neonates.

IM, IV (Adults): 0.5–1 mg/dose, may repeat q 2–3 hr as needed (up to 10 mg/day).

IM, IV (Infants and Children): 0.015–0.1 mg/kg/dose every 6–24 hrs (maximum: 10 mg/day).

IM, IV (Neonates): 0.01–0.05 mg/kg/dose every 12–24 in term neonates or every 24–48 hrs in preterm neonates.

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg, ★ 5 mg. **Cost:** Generic—0.5 mg \$30.20/100, 1 mg \$44.52/100, 2 mg \$75.18/100. **Injection:** 0.25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess fluid status during therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor BP and pulse before and during administration. Monitor frequency of prescription refills to determine compliance.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion; ↑ risk of digoxin toxicity due to potassium-depleting effect of diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common after rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- **Assess patient for skin rash frequently during therapy.** Discontinue bumetanide at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic

epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.

- **Geriatric:** Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- **Lab Test Considerations:** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically during therapy. May cause ↓ serum sodium, potassium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, creatinine, and uric acid levels.

Potential Nursing Diagnoses

Excess fluid volume (Indications)

Risk for deficient fluid volume (Side Effects)

Implementation

- If administering twice daily, give last dose no later than 5 PM to minimize disruption of sleep cycle.
- IV is preferred over IM for parenteral administration.
- **PO:** May be taken with food to minimize gastric irritation.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted. **Concentration:** 0.25 mg/mL. **Rate:** Administer slowly over 1–2 min.
- **Continuous Infusion:** **Diluent:** May dilute in D5W or 0.9% NaCl. May also administer as undiluted drug. Protect from light. **Concentration:** Not to exceed 0.25 mg/mL. **Rate:** Infuse over 5 min. May be administered over 12 hr for patients with renal impairment.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carbustine, caspofungin, cefazolin, cefepime, cefotaxime, ceftazidime, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatidate, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, flucanazole, fludarabine, fluorouracil, folic acid, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin,

lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, methotrexate, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxime, ranitidine, remifentanyl, rifampin, rituximab, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, amphotericin B colloidal, azathioprine, chlorpromazine, dantrolene, diazepam, diazoxide, fenoldopam, ganciclovir, haloperidol, papaverine, pentamidine, phenytoin, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take bumetanide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that drinking alcohol, exercising during hot weather, or standing for long periods may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium. See Appendix K.
- Advise patient to contact health care professional of gain more than 3 lbs in one day.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if rash, muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise patients with diabetes to monitor blood glucose closely; may cause increased levels.

- Emphasize the importance of routine follow-up examinations.
- **Geriatric:** Caution older patients or their caregivers about increased risk for falls. Suggest strategies for fall prevention.

Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.

bupivacaine, See EPIDURAL LOCAL ANESTHETICS.

REMS HIGH ALERT

buprenorphine

(byoo-pre-nor-feen)

Belbuca, Buprenex, Butrans, Probuphine, ~~Subutex~~

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists/antagonists

Schedule III

Indications

IM, IV: Management of moderate to severe acute pain.

Buccal, Transdermal: Pain that is severe enough to require daily, around-the-clock long-term opioid treatment and for which alternative treatment options (e.g. non-opioid analgesics or immediate-release opioids) are inadequate. **SI:** Treatment of opioid dependence (preferred for induction only); suppresses withdrawal symptoms in opioid detoxification. **Subdermal:** Maintenance treatment of opioid dependence in patients who have achieved and sustained prolonged (≥ 3 mo) clinical stability on low-to-moderate doses of a transmucosal buprenorphine-containing product (≈ 8 mg/day).

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Has partial antagonist properties that may result in opioid withdrawal in physically dependent patients when used as an analgesic.

Therapeutic Effects: **IM, IV, Transdermal:** Decreased severity of pain. **SI:** Suppression of withdrawal symptoms during detoxification and maintenance from heroin or other opioids. Produces a relatively mild withdrawal compared to other agents. **Subdermal:** Continued cessation of opioid use.

Pharmacokinetics

Absorption: Well absorbed after IM and SL use; 46–65% absorbed with buccal use; 15% of transdermal

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dose absorbed through skin; IV administration results in complete bioavailability.

Distribution: Crosses the placenta; enters breast milk. CNS concentration is 15–25% of plasma.

Protein Binding: 96%.

Metabolism and Excretion: Mostly metabolized by the liver mostly via the CYP3A4 enzyme system; one metabolite is active; 70% excreted in feces; 27% excreted in urine.

Half-life: 2–3 hr (parenteral); 27 hr (buccal); 26 hr (transdermal); 37 hr (SL); 24–48 hr (subdermal).

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
IM	15 min	60 min	6 hr†
IV	rapid	less than 60 min	6 hr†
SL	unknown	unknown	unknown
Transdermal	unknown	unknown	7 days
Buccal	unknown	unknown	unknown
Subdermal	unknown	unknown	unknown

†4–5 hr in children.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant respiratory depression (transdermal, buccal); Acute or severe bronchial asthma (transdermal, buccal); Paralytic ileus (transdermal, buccal); Acute, mild, intermittent, or postoperative pain (transdermal); Long QT syndrome (transdermal, buccal); Concurrent use of class I or III antiarrhythmics (transdermal); **Lactation:** Enters breast milk; avoid use or discontinue nursing.

Use Cautiously in: ↑ intracranial pressure; Severe renal or pulmonary disease; Moderate or severe hepatic disease (dose ↓ needed for severe impairment); Hypothyroidism; Seizure disorders; Adrenal insufficiency; Alcoholism; Biliary tract disease; Acute pancreatitis; Debilitated patients (dose ↓ required); Oral mucositis (dose ↓ required) (buccal); Undiagnosed abdominal pain; Hypokalemia, hypomagnesemia, unstable atrial fibrillation, symptomatic bradycardia, unstable HF, or myocardial ischemia (transdermal, buccal); Prostatic hyperplasia; **OB:** Safety not established; prolonged use of buccal, transdermal, subdermal, or SL buprenorphine during pregnancy can result in neonatal opioid withdrawal syndrome; **Pedi:** Safety not established in children (SL and transdermal) or children <2 yr (parenteral); **Ger:** ↑ risk of respiratory depression (dose ↓ required).

Adverse Reactions/Side Effects

CNS: confusion, dysphoria, hallucinations, sedation, dizziness, euphoria, floating feeling, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** RESPIRATORY DEPRESSION. **CV:** hypertension, hypotension, palpitations, QT interval prolongation (transdermal). **Endo:** adrenal insufficiency. **GI:** HEPATOTOXICITY, nausea, constipation, dry mouth, ileus, vomiting. **GU:** urinary retention. **Derm:** sweat-

ing, clammy feeling, erythema, pruritus, rash. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, and bronchospasm), physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Concurrent use with class Ia antiarrhythmics, class III antiarrhythmics, or other QT interval prolonging medications may ↑ risk of QT interval prolongation; avoid concurrent use. Use with benzodiazepines or other CNS depressants including other opioids, non-benzodiazepine sedative/hypnotics, anxiolytics, general anesthetics, muscle relaxants, antipsychotics, and alcohol may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Use with extreme caution in patients receiving MAO inhibitors (↑ CNS and respiratory depression and hypotension—↓ buprenorphine dose by 50%; may need to ↓ MAO inhibitor dose; do not use transdermal formulation within 14 days of MAO inhibitor). May ↓ effectiveness of other opioid analgesics. Inhibitors of the CYP3A4 enzyme system including itraconazole, ketoconazole, erythromycin, ritonavir, indinavir, saquinavir, atazanavir, or fosamprenavir may ↑ blood levels and effects; may need to ↓ buprenorphine dose. Inducers of the CYP3A4 enzyme system including carbamazepine, rifampin, or phenytoin may ↓ blood levels and effects; buprenorphine dose modification may be necessary during concurrent use. Concurrent abuse of buprenorphine and benzodiazepines may result in coma and death. Drugs that affect serotonergic neurotransmitter systems, including tricyclic antidepressants, SSRIs, SNRIs, MAO inhibitors, TCAs, tramadol, trazodone, mirtazapine, 5-HT₃ receptor antagonists, linezolid, methylene blue, and triptans ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of kava-kava, valerian, chamomile, or hops can ↑ CNS depression.

Route/Dosage

Analgesia

IM, IV (Adults): 0.3 mg every 4–6 hr as needed. May repeat initial dose after 30 min (up to 0.3 mg every 4 hr or 0.6 mg every 6 hr); 0.6-mg doses should be given only IM.

IM, IV (Children 2–12 yr): 2–6 mcg (0.002–0.006 mg)/kg every 4–6 hr.

Transdermal (Adults): Opioid-naïve—Transdermal system delivering 5–20 mcg/hr applied every 7 days. Initiate with 5 mcg/hr system; each dose titration may occur after 72 hr; do not exceed dose of 20 mcg/hr (due to ↑ risk of QT interval prolongation); *Previously taking <30 mg/day of morphine or equivalent*—Initiate with 5 mcg/hr system; each dose titration may occur after 72 hr; do not exceed dose of 20 mcg/hr (due to ↑ risk of QT interval prolongation); ap-

ply patch every 7 days; *Previously taking 30–80 mg/day of morphine or equivalent*—Initiate with 10 mcg/hr system; each dose titration may occur after 72 hr; do not exceed dose of 20 mcg/hr (due to ↑ risk of QT interval prolongation); apply patch every 7 days; *Previously taking >80 mg/day of morphine or equivalent*—Consider use of alternate analgesic.

Buccal (Adults): Opioid-naïve—Initiate therapy with 75 mcg once daily or every 12 hr for ≥4 days, then ↑ dose to 150 mcg every 12 hr; may then titrate dose in increments of 150 mcg every 12 hr no more frequently than every 4 days; do not exceed dose of 450 mcg every 12 hr (based on clinical studies); *Previously taking <30 mg/day of morphine or equivalent*—Initiate therapy with 75 mcg once daily or every 12 hr for ≥4 days, then ↑ dose to 150 mcg every 12 hr; may then titrate dose in increments of 150 mcg every 12 hr no more frequently than every 4 days; do not exceed dose of 900 mcg every 12 hr (due to ↑ risk of QT interval prolongation); *Previously taking 30–89 mg/day of morphine or equivalent*—Initiate therapy with 150 mcg every 12 hr for ≥4 days; may then titrate dose in increments of 150 mcg every 12 hr no more frequently than every 4 days; do not exceed dose of 900 mcg every 12 hr (due to ↑ risk of QT interval prolongation); *Previously taking 90–160 mg/day of morphine or equivalent*—Initiate therapy with 300 mcg every 12 hr for ≥4 days; may then titrate dose in increments of 150 mcg every 12 hr no more frequently than every 4 days; do not exceed dose of 900 mcg every 12 hr (due to ↑ risk of QT interval prolongation); *Previously taking >160 mg/day of morphine or equivalent*—Consider use of alternate analgesic; *Patients with oral mucositis*—↓ initial dose by 50% then titrate dose in increments of 75 mcg every 12 hr no more frequently than every 4 days.

Hepatic Impairment

Transdermal (Adults): Mild to moderate hepatic impairment—Initiate with 5 mcg/hr system.

Hepatic Impairment

Buccal (Adults): Severe hepatic impairment—↓ initial dose by 50% then titrate dose in increments of 75 mcg every 12 hr no more frequently than every 4 days.

Treatment of opioid dependence

SL (Adults): Induction—8 mg once daily on Day 1, then 16 mg once daily on Day 2–4; **Maintenance**—Patients should preferably be transitioned to buprenorphine/naloxone; if patient cannot tolerate naloxone, then can use buprenorphine (dose can be ↑ or ↓ by 2–4 mg, as needed to prevent signs/symptoms of opioid withdrawal).

Hepatic Impairment

SL (Adults): Severe hepatic impairment—↓ initial dose and adjustment dose by 50%.

Subdermal (Adults): Insert 4 implants in inner side of upper arm and then remove at end of 6 mo.

Availability (generic available)

Sublingual tablets: 2 mg, 8 mg. **Injection (Buprenex):** 300 mcg (0.3 mg)/mL. **Transdermal system (Butrans):** 5 mcg/hr, 7.5 mcg/hr, 10 mcg/hr, 15 mcg/hr, 20 mcg/hr. **Buccal film (Belbuca):** 75 mcg, 150 mcg, 300 mcg, 450 mcg, 600 mcg, 750 mcg, 900 mcg. **Implant:** 74.2 mg/implant. **In combination with:** naloxone (Bunavail, Suboxone, Zubsolv). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of adrenal insufficiency (nausea, vomiting, anorexia, fatigue, weakness, dizziness, and low blood pressure) during therapy. If adrenal insufficiency is suspected, confirm with diagnostic testing. If confirmed, treat with physiologic doses of replacement corticosteroids. Wean patient off opioid to allow adrenal recovery and continue corticosteroids until adrenal function recovers. Other opioids may be tried.
- **Pain:** Assess type, location, and intensity of pain before and 1 hr after IM and 5 min (peak) after IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Single doses of 600 mcg (0.6 mg) should be administered IM. Patients requiring doses higher than 600 mcg (0.6 mg) should be converted to an opioid agonist. Buprenorphine is not recommended for prolonged use (except buccal or transdermal) or as first-line therapy for acute or cancer pain. SL and subdermal formulations should not be used to relieve pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess level of consciousness, BP, pulse, and respirations before and periodically during administration, especially within first 24–72 hrs of buccal therapy. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Buprenorphine 0.3–0.4 mg has approximately equal analgesic and respiratory depressant effects to morphine 10 mg.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, increased BP and temperature) in patients who are physically dependent on

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

opioid agonists. Symptoms may occur up to 15 days after discontinuation and persist for 1–2 wk.

- Buprenorphine has a lower potential for dependence than other opioids; however, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients receiving buprenorphine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- Assess bowel function routinely. Prevent constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Transdermal:** Assess risk for opioid addiction, abuse, or misuse prior to administration. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. Misuse or abuse of *Butrans* by chewing, swallowing, snorting or injecting buprenorphine extracted from transdermal system will result in the uncontrolled delivery of buprenorphine and risk of overdose and death.
- Maintain frequent contact during periods of changing analgesic requirements, including initial titration, between the prescriber, other members of the health-care team, the patient, and the caregiver/family.
- **Treatment of Opioid Dependence:** Assess patient for signs and symptoms of opioid withdrawal before and during therapy.
- Examine *Probuphine* insertion site 1 wk after insertion for infection, wound healing, and implant extrusion. Patients should be seen at least monthly for counseling and psychological support.
- **Lab Test Considerations:** May cause ↑ serum amylase and lipase levels.
- Monitor liver function tests prior to and periodically during opioid dependence therapy.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Naloxone may not completely reverse respiratory depressant effects of buprenorphine; may require mechanical ventilation, oxygen, IV fluids, and vasopressors.

Potential Nursing Diagnoses

Acute pain (Indications)

Risk for injury (Side Effects)

Ineffective coping (Indications)

Implementation

- **Pain:** Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics has additive effects and may permit lower opioid doses.
- **Buccal:** Have patient wet inside of cheek with tongue or rinse mouth with water. Apply film immediately after removal from package. Place yellow side of film against inside of cheek. Hold film in place with dry fingers for 5 seconds, then leave in place on inside of cheek until fully dissolved. If chewed or swallowed, may result in lower peak concentrations and lower bioavailability. Do not administer if package seal is broken or film is cut, damaged, or changed. Avoid applying to areas of mouth with sores or lesions. To dispose of unused film, remove from foil package, drop into toilet and flush.
- **IM:** Administer IM injections deep into well-developed muscle. Rotate sites of injections.

IV Administration

- **IV Push:** May give IV undiluted. **High Alert:** Administer slowly. Rapid administration may cause respiratory depression, hypotension, and cardiac arrest. **Rate:** Give over at least 2 minutes.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, amikacin, amino-caproic acid, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisraccurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, flucanazole, fludarabine, foscarnet, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin,

nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepe, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, aminophylline, ampicillin, azathioprine, dantrolene, diazepam, diazoxide, doxorubicin liposomal, fluorouracil, gemtuzumab, indomethacin, pantoprazole, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, trimethoprim/sulfamethoxazole.
- **Transdermal:** Buprenorphine may cause withdrawal in patients who are already taking opioids. For conversion from other opioids to buprenorphine transdermal, taper current around-the-clock opioids for up to 7 days to no more than 30 mg of morphine or equivalent per day before beginning treatment with buprenorphine transdermal. May use short-acting analgesics as needed until analgesic efficacy with buprenorphine transdermal is attained. Buprenorphine transdermal may not provide adequate analgesia for patients requiring greater than 80 mg/day oral morphine equivalents.
- Apply system to flat, hairless, nonirritated, and non-irradiated site on the upper outer arm, upper chest, upper back or the side of the chest. If skin preparation is necessary, use clear water and clip, do not shave, hair. Allow skin to dry completely before application. Apply immediately after removing from package. Do not alter the system (i.e., cut) in any way before application. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Remove used system and fold so that adhesive edges are together. Flush system down toilet immediately on removal or follow the institutional policy. Apply new system to a different site. After removal, wait a minimum of 3 wk before applying to the same site. If patch falls off during 7-day dosing interval, dispose of patch and place a new patch on at a different site.
- May be titrated no less than every 72 hrs. Dose adjustments in 5 mcg/hr, 7.5 mcg/hr, or 10 mcg/hr increments may be used by using no more than two patches.

- To discontinue, taper dose gradually to prevent signs and symptoms of withdrawal; consider introduction of immediate-release opioid medication.
- **Treatment of Opioid Dependence:** Must be prescribed by health care professional with special training.
- **SL:** Induction is usually started with buprenorphine SL over 3–4 days. Initial dose should be administered at least 4 hr after last opioid dose and preferably when early signs of opioid withdrawal appear. Once patient is on a stable dose, maintenance therapy with buprenorphine/naloxone (Suboxone) is preferred for continued, unsupervised treatment.
- Administer sublingually. Usually takes 2–10 min for tablets to dissolve. If more than one tablet is prescribed, place multiple tablets under the tongue or 2 at a time until all tablets are dissolved. Do not chew or swallow; decreases amount of medication absorbed. Not used for analgesia; may cause death in opioid naïve patients.
- **Subdermal:** Patient must meet selection criteria before insertion: Prolonged stability on transmucosal buprenorphine dose of ≤ 8 mg/day without supplementation for ≥ 3 mo. Rx for supplemental buprenorphine should not be provided. If additional doses are required assess patient promptly. Amount of buprenorphine may not be adequate for stable maintenance. Alternate products may be required.
- Follow package insert instructions for insertion of *Probuphine*. Inserts must be removed after 6 mo. A new implant may be inserted into contralateral arm for a second 6 mo period. No additional implants are allowed. If a second implant is not inserted, maintain patient on previous dose of transmucosal buprenorphine.
- *Probuphine* implants are only available through the Probuphine REMS Program at www.probuphinerems.com or by calling 1-844-859-6341. Due to risk of complications of migration, protrusion and expulsion, and nerve damage associated with the insertion and removal of implant, health care professionals must be certified by enrolling and completing live training with demonstrated competency, patients must be monitored to make sure implants are removed by a certified health care professional, and implants are available to certified prescribers through a restricted distribution program.

Patient/Family Teaching

- Instruct patient on risk of addiction, abuse, and misuse, which could lead to death. Advise patient not to share buprenorphine with others and to protect from theft or misuse.
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known, es-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- pecially within 24–48 hrs after subdermal implant insertion.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants.
 - Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products, especially CNS depressants.
 - Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. **OB:** Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy.
 - **Pain:** Instruct patient on how and when to ask for pain medication.
 - Encourage patients on bedrest to turn, cough, and deep-breathe every 2 hr to prevent atelectasis.
 - Instruct patient to change positions slowly to minimize orthostatic hypotension.
 - Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
 - **Buccal:** Instruct patient on proper technique of buccal film and to avoid eating or drinking until film dissolves. Apply at same time each day. Avoid touching or moving buccal film with tongue or fingers. Do not stop using buprenorphine without consulting health care professional. Advise patient to read *Instructions for Use* prior to starting therapy and with each Rx refill in case of changes.
 - Advise patient to notify health care professional if the dose does not control pain.
 - **Transdermal:** Instruct patient in correct method for application, removal, storage, and disposal of transdermal system. Wear patches for 7 days. May be worn while bathing, showering, or swimming. Do not discontinue or change dose without consulting health care professional. Instruct patient to read the *Medication Guide* prior to starting and with each Rx refill.
 - Advise patients and caregivers/family members of the potential side effects. Instruct patient to notify health care professional if pain is not controlled or if bothersome side effects occur. **Contact immediately if difficulty or changes in breathing, unusual deep “sighing” breathing, slow or shallow breathing, new or unusual snoring, slow heartbeat, severe sleepiness, cold, clammy skin, feeling faint, dizzy, confused, or cannot think, walk, or talk normally, or if swelling or blistering around patch occurs.**
 - Advise patient that fever, electric blankets, heating pads, saunas, hot tubs, and heated water beds increase release of buprenorphine from patch.
 - Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
 - **Opioid Dependence:** Explain techniques for use to patient.
 - Caution patient that buprenorphine may be a target for people who abuse drugs; store medications in a safe place to protect them from theft. Selling or giving this medication to others is against the law.
 - Caution patient that injection of *Suboxone* can lead to severe withdrawal symptoms.
 - Advise patient if admitted to the emergency room to inform treating health care professional and emergency room staff of physical dependence on opioids and of treatment regimen.
 - Advise patient to notify health care professional promptly if faintness, dizziness, confusion, slowed breathing, skin or whites of eyes turn yellow, urine turns dark, light-colored stools, decreased appetite, nausea, or abdominal pain occur.
 - **SL:** Instruct patient in correct use of medication; directions for use must be followed exactly. Medication must be used regularly, not occasionally. Take missed doses as soon as remembered; if almost time for next dose, skip missed dose and return to regular dosing schedule. Do not take 2 doses at once unless directed by health care professional. Do not discontinue use without consulting health care professional; abrupt discontinuation may cause withdrawal symptoms. If medication is discontinued, flush unused tablets down the toilet. **Subdermal:** Advise patient to notify health care professional if bleeding, signs and symptoms of infection (excessive or worsening itching, pain, irritation, redness, or swelling), weakness or numbness in arm after the insertion or removal procedure, shortness of breath) occur.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of withdrawal symptoms during detoxification and maintenance from heroin or other opioids.

buPROPion (byoo-proe-pee-on)

Aplenzin, Forfivo XL, Wellbutrin, Wellbutrin SR, Wellbutrin XL, Zyban

Classification

Therapeutic: antidepressants, smoking deterrents

Pharmacologic: aminoketones

Indications

Treatment of depression (with psychotherapy). Depression with seasonal affective disorder (Aplenzin and Wellbutrin XL only). Smoking cessation (Zyban only).

Unlabeled Use: Treatment of ADHD in adults (SR only). To increase sexual desire in women.

Action

Decreases neuronal reuptake of dopamine in the CNS. Diminished neuronal uptake of serotonin and norepinephrine (less than tricyclic antidepressants). **Therapeutic Effects:** Diminished depression. Decreased craving for cigarettes.

Pharmacokinetics

Absorption: Although well absorbed, rapidly and extensively metabolized by the liver.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver into 3 active metabolites (CYP2B6 involved in formation of one of the active metabolites).

Half-life: 14 hr (active metabolites may have longer half-lives).

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–3 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of ritonavir; Seizure disorders; Arteriovenous malformation, severe head injury, CNS tumor, CNS infection, severe stroke, anorexia nervosa, bulimia, or abrupt discontinuation of alcohol, benzodiazepines, barbiturates, or antiepileptic drugs (↑ risk of seizures); **Lactation:** Potential for serious adverse reactions in nursing infants.

Use Cautiously in: Renal/hepatic impairment (↓ dose recommended) (Forfivo XL not recommended in patients with renal or hepatic impairment); Recent history of MI; History of suicide attempt; Unstable cardiovascular status; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; this risk appears to be greater in adolescents or children; Psychiatric illness; Angle-closure glaucoma; **OB:** Use only if benefit to patient outweighs potential risk to fetus; **Geri:** ↑ risk of drug accumulation; ↑ sensitivity to effects.

Exercise Extreme Caution in: Severe hepatic cirrhosis (↓ dose required); **Pedi:** ↑ risk of suicidal thinking and behavior. Observe carefully, especially at initiation of therapy and during ↑ or ↓ in dose.

Adverse Reactions/Side Effects

CNS: **HOMICIDAL THOUGHTS/BEHAVIOR, SEIZURES, SUICIDAL THOUGHTS/BEHAVIOR, agitation, headache, aggression, anxiety, delusions, depression, hallucinations, hostility, insomnia, mania, panic, paranoia, psychoses.**

CV: hypertension. **GI:** dry mouth, nausea, vomiting, change in appetite, weight gain, weight loss. **Derm:** photosensitivity. **Endo:** hyperglycemia, hypoglycemia, syndrome of inappropriate ADH secretion. **Neuro:** tremor.

Interactions

Drug-Drug: Concurrent use with **MAO-inhibitors** may ↑ risk of hypertensive reactions; concurrent use contraindicated; at least 14 days should elapse between discontinuation of MAO inhibitor and initiation of bupropion (or visa versa). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of hypertensive reactions; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving bupropion, immediately discontinue bupropion and monitor for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume bupropion therapy 24 hr after last dose of linezolid or methylene blue). ↑ risk of adverse reactions when used with **amantadine** or **levodopa**. ↑ risk of seizures with **phenothiazines, antidepressants, theophylline, corticosteroids, OTC stimulants/anorectics**, or cessation of **alcohol** or **benzodiazepines** (avoid or minimize alcohol use). **Ritonavir, lopinavir/ritonavir, and efavirenz** may ↓ levels; may need to ↑ bupropion dose. May ↑ **citalopram** levels. **Carbamazepine** may ↓ blood levels and effectiveness. Concurrent use with **nicotine** replacement may cause hypertension. ↑ risk of bleeding with **warfarin**. Bupropion and one of its metabolites inhibit the CYP2D6 enzyme system and may ↑ levels and risk of toxicity from **antidepressants (SSRIs and tricyclic), haloperidol, risperidone, thioridazine, haloperidol, beta blockers, flecainide, and propafenone**. May ↓ levels and efficacy of **tamoxifen**. May ↓ the efficacy of **tamoxifen**. May ↓ **digoxin** levels.

Route/Dosage

Depression

PO (Adults): Immediate-release— 100 mg twice daily initially; after 3 days may ↑ to 100 mg 3 times daily; after at least 4 wk of therapy, may ↑ up to 450 mg/day in divided doses (not to exceed 150 mg/dose; wait at least 6 hr between doses at the 300 mg/day dose or at least 4 hr between doses at the 450-mg/day dose). **Sustained-release**— 150 mg once daily in the morning; after 3 days, may ↑ to 150 mg twice daily with at least 8 hr between doses; after at least 4 wk of therapy, may ↑ to a maximum daily dose of 400 mg given as 200 mg twice daily. **Extended-release (Wellbutrin XL)**— 150 mg once daily in the morning, may be ↑ after 4 days to 300 mg once daily; some patients may require up to 450 mg/day as a single daily dose. **Extended-release (Aplenzin)**— 174 mg once daily in the morning, may be ↑ after 4 days to 348 mg once daily; some patients may require up to 522 mg/day as a single daily dose. **Extended-release (Forfivo XL)**— 450 mg once daily (should NOT be used as initial therapy; it should only be used in patients who have been receiving 300

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

mg/day of another bupropion formulation for at least 2 wk and require titration up to 450 mg/day or in those patients receiving 450 mg/day of another bupropion formulation).

Hepatic Impairment

PO (Adults): *Moderate-to-severe hepatic impairment (Aplenzin)* — Max dose: 174 mg every other day.

Seasonal Affective Disorder

PO (Adults): *Extended-release (Wellbutrin XL)* — 150 mg/day in the morning; if dose is well tolerated, ↑ to 300 mg/day in one wk. Doses should be tapered to 150 mg/day for 2 wk before discontinuing; *Extended-release (Aplenzin)* — 174 mg once daily in the morning, may be ↑ after 7 days to 348 mg once daily.

Hepatic Impairment

PO (Adults): *Moderate-to-severe hepatic impairment (Aplenzin)* — Max dose: 174 mg every other day.

Smoking cessation

PO (Adults): *Zyban* — 150 mg once daily for 3 days, then 150 mg twice daily for 7–12 wk (doses should be at least 8 hr apart).

Availability (generic available)

Tablets: 75 mg, 100 mg. **Cost:** *Generic* — 75 mg \$79.43/100, 100 mg \$106.01/100. **Sustained-release tablets:** 100 mg, 150 mg, 200 mg. **Cost:** *Generic* — 100 mg \$51.12/180, 150 mg \$59.60/180, 200 mg \$52.33/180. **Extended-release tablets (Wellbutrin XL):** 150 mg, 300 mg. **Cost:** *Generic* — 150 mg \$74.84/90, 300 mg \$63.94/90. **Extended-release tablets (Aplenzin):** 174 mg, 348 mg, 522 mg. **Cost:** 174 mg \$359.09/30, 348 mg \$473.36/30, 522 mg \$1,077.23/30. **Extended-release tablets (Forfivo XL):** 450 mg. **Cost:** \$176.40/30.

NURSING IMPLICATIONS

Assessment

- Monitor mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess mental status and mood changes in all patients, especially during initial few mo of therapy and during dose changes. Risk may be increased in children, adolescents, and adults ≤24 yrs. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal/homicidal ideation). If so, restrict amount of drug available to patient.
- **Lab Test Considerations:** Monitor hepatic and renal function closely in patients with kidney or liver

impairment to prevent ↑ serum and tissue bupropion concentrations.

- May cause false-positive urine test for amphetamines.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Implementation

- Do not confuse bupropion with buspirone. Do not confuse Wellbutrin SR with Wellbutrin XL. Do not confuse Zyban with Diovan. Do not administer bupropion (Wellbutrin) with Zyban, which contain the same ingredients.
- Administer doses in equally spaced time increments during the day to minimize the risk of seizures. Risk of seizures increases fourfold in doses greater than 450 mg per day.
- May be initially administered concurrently with sedatives to minimize agitation. This is not usually required after the 1st wk of therapy.
- Insomnia may be decreased by avoiding bedtime doses. May require treatment during 1st wk of therapy.
- Nicotine patches, gum, inhalers, and spray may be used concurrently with bupropion.
- When converting from other brands of bupropion to *Aplenzin* 522 mg/day *Aplenzin* is equivalent to 450 mg/day bupropion HCl, 348 mg/day *Aplenzin* is equivalent to 300 mg/day bupropion HCl, and 174 mg/day *Aplenzin* is equivalent to 150 mg/day bupropion HCl.
- **PO:** Swallow sustained-release or extended-release tablets whole; do not break, crush, or chew.
- May be administered with food to lessen GI irritation.
- **Seasonal Affective Disorder:** Begin administration in autumn prior to the onset of depressive symptoms. Continue therapy through winter and begin to taper and discontinue in early spring.

Patient/Family Teaching

- Instruct patient to take bupropion as directed at the same time each day. Missed doses should be omitted. Do not double doses or take more than prescribed. May require 4 wk or longer for full effects. Do not discontinue without consulting health care professional. May require gradual reduction before discontinuation. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- May impair judgment or motor and cognitive skills. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agi-

tation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior occur.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to avoid alcohol during therapy and to consult with health care professional before taking other medications with bupropion, such as Zyban.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Advise patient to notify health care professional if rash or other troublesome side effects occur.
- Inform patient that unused shell of XL tablets may appear in stool; this is normal.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.
- **Smoking Cessation:** Smoking should be stopped during the 2nd wk of therapy to allow for the onset of bupropion and to maximize the chances of quitting.
- Advise patient to stop taking bupropion and contact a health care professional immediately if agitation, depressed mood, and any changes in behavior that are not typical of nicotine withdrawal, or if suicidal thoughts or behavior occur.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Acute episodes of depression may require several mo of treatment.
- Cessation of smoking.

bupropion/naltrexone (byoo-proe-pee-on nal-trex-one) Contrace

Classification

Therapeutic: weight control agents
Pharmacologic: aminoketones, opioid antagonists

Indications

Adjunct to calorie-reduced diet and increased physical activity for chronic weight management in obese pa-

tients (BMI ≥ 30 kg/m²) or overweight patients (BMI ≥ 27 kg/m²) with at least one other comorbidity (hypertension, type 2 diabetes, or dyslipidemia).

Action

Bupropion—an antidepressant that acts as a weak inhibitor of neuronal reuptake of dopamine and norepinephrine. **Naltrexone**—acts as an opioid antagonist. In combination they affect two different brain areas involved in food intake: the hypothalamic appetite regulatory center and mesolimbic dopamine circuit reward system. **Therapeutic Effects:** Decreased appetite with associated weight loss.

Pharmacokinetics

Bupropion

Absorption: Well absorbed but rapidly metabolized by the liver. Absorption is enhanced by a high-fat meal.

Distribution: Parent drug and metabolites enter breast milk.

Metabolism and Excretion: Extensively metabolized; three metabolites are pharmacologically active. Excretion is mostly renal as metabolites, minimal renal excretion of unchanged drug.

Half-life: 21 hr (longer for some metabolites).
Naltrexone

Absorption: Well absorbed orally, undergoes extensive first pass hepatic metabolism resulting in 5–40% bioavailability. Absorption is enhanced by a high-fat meal.

Distribution: Parent drug and metabolites enter breast milk.

Metabolism and Excretion: Metabolized to 6–beta-naltrexol. Both parent drug and metabolite are pharmacologically active. Excretion is mostly renal as metabolite, less than 2% as unchanged drug.

Half-life: naltrexone—5 hr; 6–beta-naltrexol—13 hr.

TIME/ACTION PROFILE (weight loss)

ROUTE	ONSET	PEAK	DURATION
PO	within 4 wk	6 mos	unknown

Contraindications/Precautions

Contraindicated in: Known hypersensitivity to bupropion or naltrexone; Uncontrolled hypertension; End-stage renal disease; Seizure disorders; Anorexia or bulimia; During withdrawal from or discontinuation of alcohol, benzodiazepines, barbiturates or antiepileptics; Chronic opioid/opiate agonist or partial agonist use or acute opiate withdrawal; During/within 14 days of MAOIs; Concurrent use of CYP2B6 inducers; Concurrent use of other bupropion-containing medications; **OB:** Pregnancy (may cause fetal harm); **Lactation:** Discontinue bupropion/naltrexone or discontinue breast feeding; **Pedi:** Not recommended for use in children.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Use Cautiously in: History of suicidal behavior/ideation; History of seizure risk (avoid administration with a high-fat meal, adhere to recommended dose); History of cardiac/cerebrovascular disease; History of angle-closure glaucoma; Diabetes mellitus (weight loss may result in hypoglycemia if treatment is not adjusted); Concurrent use of drugs that ↓ seizure threshold; Moderate to severe renal impairment (use lower dose); Hepatic impairment (use lower dose); **Ger:** Elderly may be ↑ sensitive to adverse CNS reactions and ↓ renal elimination; Concurrent ingestion of alcohol (avoid or reduce consumption).

Adverse Reactions/Side Effects

CNS: HOMICIDAL THOUGHTS/BEHAVIOR, SEIZURES, SUICIDAL THOUGHTS/BEHAVIOR, headache, aggression, agitation, anxiety, delusions, depression, dizziness, hallucinations, hostility, insomnia, mania, panic, paranoia, psychosis. **CV:** hypertension, tachycardia. **EENT:** angle-closure glaucoma (bupropion), tinnitus. **GI:** nausea, constipation, vomiting, abdominal pain, diarrhea, dry mouth, dysgeusia, hepatotoxicity (naltrexone).

Derm: hot flush, sweating. **Neuro:** tremor. **Misc:** allergic reactions including ANAPHYLAXIS/ANAPHYLACTOID REACTIONS.

Interactions

Drug-Drug: Concurrent or use within 14 days with MAOIs ↑ risk of hypertensive reactions. Bupropion inhibits the CYP2D6 enzyme system and can ↑ blood levels and risk of adverse reactions from antidepressants including SSRIs and many tricyclic antidepressants, antipsychotics including haloperidol, risperidone, and thioridazine, beta-blockers including metoprolol, and Type 1C antiarrhythmics including flecainide and propafenone. Dose adjustments may be necessary. Blood levels and effectiveness may be ↓ by CYP2B6 inducers including carbamazepine, efavirenz, ritonavir, lopinavir, phenobarbital, and phenytoin; concurrent use should be avoided. Blood levels and risk of toxicity of bupropion may be ↑ by CYP2B6 inhibitors including clopidogrel (dose should not exceed one tablet twice daily). Concurrent use of drugs that ↓ seizure threshold may ↑ risk of seizures. Dopaminergic drugs including amantadine and levodopa may ↑ risk of CNS toxicity. Concurrent use with opioids may ↑ risk of overdose. Concurrent ingestion of alcohol may ↑ risk of neuropsychiatric reactions (reduce consumption or avoid). May ↓ renal excretion of and ↑ blood levels/risk of toxicity from amantadine, amiloride, cimetidine, dopamine, famotidine, memantine, metformin, pindolol, procainamide, ranitidine, varenicline, and oxaliplatin (careful monitoring is recommended). May ↑ sensitivity to opioids.

Route/Dosage

PO (Adults): *Week 1*—one tablet in the morning; *week 2*—one tablet in the morning and one tablet in

the evening; *week 3*—two tablets in the morning and one tablet in the evening; *week 4 and onward*—two tablets in the morning and two tablets in the evening; *concurrent use of CYP2B6 inhibitors*—dose should not exceed one tablet twice daily.

Renal Impairment

PO (Adults): Moderate to severe renal impairment—dose should not exceed one tablet in the morning and one tablet in the evening.

Hepatic Impairment

PO (Adults): Dose should not exceed one tablet in the morning.

Availability

Extended-release tablets: 90 mg bupropion/8 mg naltrexone.

NURSING IMPLICATIONS

Assessment

- Monitor for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.
- Assess mental status and mood changes, especially during initial few mo of therapy. Risk may be increased in children, adolescents, and adults ≤24 yrs. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, irritability, hostility, suicide or homicide attempt or suicidal ideation). Restrict amount of drug available to patient.
- Monitor BP and heart rate periodically during therapy, especially in patient with hypertension.
- Monitor for signs and symptoms of anaphylactic reactions (pruritus, urticaria, hives, angioedema, dyspnea). Discontinue therapy and treat symptomatically.
- **Lab Test Considerations:** Monitor blood glucose prior to and during therapy in patients with type 2 diabetes; may cause hypoglycemia.
- May cause false-positive urine test for amphetamines.

Potential Nursing Diagnoses

Disturbed body image (Indications)

Imbalanced nutrition: more than body requirements (Indications)

Implementation

- **PO:** Administer in the morning and evening according to dose escalation schedule. Swallow tablets whole; do not break, crush, or chew.
- Do not administer with a high-fat meal; may increase risk of seizures.

Patient/Family Teaching

- Instruct patient to take medication as directed, following the dose escalation schedule. If a dose is missed, omit and wait until next scheduled dose; do not double doses. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Instruct patient to adhere to a reduced-calorie diet and increased physical activity.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy. Notify health care professional immediately if thoughts about suicide, homicide, or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, hostility, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Advise patient to notify health care professional if signs and symptoms of liver damage (stomach pain lasting more than a few days, dark urine, yellowing of skin and whites of eyes, tiredness) occurs.
- Advise patients they may be more sensitive to opioids, even at lower doses, during therapy. Patients physically dependant on opioid analgesics should wait at least 7–10 days without opioids, or 2 wks without methadone, before beginning bupropion/naltrexone.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and to minimize or avoid alcohol during therapy.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decreased appetite with associated weight loss. Evaluate therapy after 12 wks at maintenance dose. If patient has not lost 5% of baseline body weight discontinue medication; clinically meaningful weight loss is unlikely.

busPIRone (byoo-spye-ron)

BuSpar

Classification

Therapeutic: antianxiety agents

Indications

Management of anxiety.

Action

Binds to serotonin and dopamine receptors in the brain. Increases norepinephrine metabolism in the brain. **Therapeutic Effects:** Relief of anxiety.

Pharmacokinetics

Absorption: Rapidly absorbed.

Distribution: Unknown.

Protein Binding: 95% bound to plasma proteins.

Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 enzyme system); 20–40% excreted in feces.

Half-life: 2–3 hr.

TIME/ACTION PROFILE (relief of anxiety)

ROUTE	ONSET	PEAK	DURATION
PO	7–10 days	3–4 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic or renal impairment; Concurrent use of MAO inhibitors; Ingestion of large amounts of grapefruit juice.

Use Cautiously in: Patients receiving other antianxiety agents (other agents should be slowly withdrawn to prevent withdrawal or rebound phenomenon); Patients receiving other psychotropics; **Lactation, OB, PEDI:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, excitement, fatigue, headache, insomnia, nervousness, weakness, personality changes. **EENT:** blurred vision, nasal congestion, sore throat, tinnitus, altered taste or smell, conjunctivitis.

Resp: chest congestion, hyperventilation, shortness of breath. **CV:** chest pain, palpitations, tachycardia, hypertension, hypotension, syncope. **GI:** nausea, abdominal pain, constipation, diarrhea, dry mouth, vomiting.

GU: changes in libido, dysuria, urinary frequency, urinary hesitancy. **Derm:** rashes, alopecia, blisters, dry skin, easy bruising, edema, flushing, pruritus. **Endo:** irregular menses. **MS:** myalgia. **Neuro:** incoordination, numbness, paresthesia, tremor. **Misc:** clamminess, sweating, fever.

Interactions

Drug-Drug: Use with MAO inhibitors may result in hypertension and is not recommended. **Erythromycin, nefazodone, ketoconazole, itraconazole, ritonavir,** and other **inhibitors of CYP3A4** ↑ blood levels and effects of buspirone; dose reduction is recommended (↓ to 2.5 mg twice daily with erythromycin; ↓ to 2.5 mg once daily with nefazodone). **Rifampin, dexamethasone, phenytoin, phenobarbital, carbamazepine,** and other **inducers of CYP3A4** ↓ blood levels and effects of buspirone; dose adjustment may be necessary. Avoid concurrent use with **alcohol**.

Drug-Natural Products: Concomitant use of **kava-kava, valerian, or chamomile** can ↑ CNS depression.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Drug-Food: Grapefruit juice ↑ serum levels and effect; ingestion of large amounts of grapefruit juice is not recommended.

Route/Dosage

PO (Adults): 7.5 mg twice daily; ↑ by 5 mg/day q 2–4 days as needed (not to exceed 60 mg/day). Usual dose is 20–30 mg/day (in 2 divided doses).

Availability (generic available)

Tablets: 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg. **Cost:** *Generic*—5 mg \$77.12/100, 7.5 mg \$109.08/100, 10 mg \$134.50/100, 15 mg \$201.92/100, 30 mg \$218.10/100.

NURSING IMPLICATIONS

Assessment

- Assess degree and manifestations of anxiety before and periodically during therapy.
- Busiprone does not appear to cause physical or psychological dependence or tolerance. However, patients with a history of substance use disorder should be assessed for tolerance or impaired control. Restrict amount of drug available to these patients.

Potential Nursing Diagnoses

Anxiety (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse busiprone with bupropion.**
- Patients changing from other anti-anxiety agents should receive gradually decreasing doses. Busiprone will not prevent withdrawal symptoms.
- **PO:** May be administered with food to minimize gastric irritation. Food slows but does not alter extent of absorption.

Patient/Family Teaching

- Instruct patient to take busiprone exactly as directed. Take missed doses as soon as possible if not just before next dose; do not double doses. Do not take more than amount prescribed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products.
- Instruct patient to notify health care professional if any chronic abnormal movements occur (dystonia, motor restlessness, involuntary movements of facial or cervical muscles) or if pregnancy is suspected.
- Emphasize the importance of follow-up exams to determine effectiveness of medication.

Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety. Some improvement may be seen in 7–10 days. Optimal results take 3–4 wk of therapy. Busiprone is usually used for short-term therapy (3–4 wk). If prescribed for long-term therapy, efficacy should be periodically assessed.

HIGH ALERT

busulfan (byoo-sul-fan)

Busulfex, Myleran

Classification

Therapeutic: antineoplastics

Pharmacologic: alkylating agents

Indications

PO: Treatment of chronic myelogenous leukemia (CML) and bone marrow disorders. **IV:** With cyclophosphamide as a conditioning regimen before allogeneic hematopoietic progenitor cell transplantation for CML.

Action

Disrupts nucleic acid function and protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly growing cells, especially malignant ones.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver.

Half-life: 2.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	weeks	up to 1 mo†
IV	unknown	unknown	13 days‡

†Complete recovery may take up to 20 mo.

‡After administration of last dose.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Failure to respond to previous courses; **OB, Lactation:** Potential for serious side effects in fetus or infant.

Use Cautiously in: Active infections; ↓ bone marrow reserve; Obese patients (base dose on ideal body weight); Other chronic debilitating diseases; Patients with childbearing potential; **Geriatric:** Begin therapy at lower end of dose range due to ↑ frequency of impaired cardiac, hepatic, or renal function.

Adverse Reactions/Side Effects

Incidence and severity of adverse reactions and side effects are increased with IV use.

CNS: *IV*—SEIZURES, CEREBRAL HEMORRHAGE/COMA, anxiety, confusion, depression, dizziness, headache, encephalopathy, mental status changes, weakness.

EENT: *PO*—cataracts; *IV*, epistaxis, pharyngitis, ear disorders. **CV:** hepatic veno-occlusive disease (↑ allogeneic transplantation). **Resp:** *PO*—PULMONARY FIBROSIS; *IV*, alveolar hemorrhage, asthma, atelectasis, cough, hepatitis, nausea, vomiting; *IV*, abdominal enlargement, anorexia, constipation, diarrhea, dry mouth, hematemesis, nausea, rectal discomfort, vomiting, abdominal pain, dyspepsia, hepatomegaly, pancreatitis, stomatitis. **GU:** oliguria, dysuria, hematuria. **Derm:** *PO*—itching, rashes, acne, alopecia, erythema nodosum, exfoliative dermatitis, hyperpigmentation.

Endo: *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain.

Misc: allergic reactions, chills, fever, infection.

Endo: *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain.

Misc: allergic reactions, chills, fever, infection.

Endo: *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain.

Misc: allergic reactions, chills, fever, infection.

Endo: *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain.

Misc: allergic reactions, chills, fever, infection.

Endo: *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain.

Misc: allergic reactions, chills, fever, infection.

Endo: *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain.

Misc: allergic reactions, chills, fever, infection.

Endo: *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain.

Misc: allergic reactions, chills, fever, infection.

Endo: *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain.

Misc: allergic reactions, chills, fever, infection.

obese patients, dosage should be based on adjusted ideal body weight) for 4 days (total of 16 doses); given in combination with cyclophosphamide.

Availability (generic available)

Tablets: 2 mg. Solution for injection: 6 mg/mL.

NURSING IMPLICATIONS

Assessment

- **High Alert:** Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, emesis) and avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for at least 10 min. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, lower back or side pain, difficult or painful urination) during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension. Notify health care professional if these symptoms occur.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of gout (increased uric acid, joint pain, lower back or side pain, swelling of feet or lower legs). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may be given to decrease uric acid levels. Alkalinization of urine may be ordered to increase excretion of uric acid.
- Assess for pulmonary fibrosis (fever, cough, shortness of breath) periodically during and after therapy. Discontinue therapy at the first sign of pulmonary fibrosis. Usually occurs 8 mo–10 yr (average 4 yr) after initiation of therapy.
- **IV:** Premedicate patient with phenytoin before IV administration to minimize the risk of seizures.
- Administer antiemetics before IV administration and on a fixed schedule throughout IV administration.
- **Lab Test Considerations:** Monitor CBC with differential and platelet count before and weekly during therapy. The nadir of leukopenia occurs within 10–15 days and the nadir of WBC at 11–30 days. Recovery usually occurs within 12–20 wk. Notify health care professional if WBC is $<15,000/\text{mm}^3$ or if a precipitous drop occurs. Institute thrombocytopenia precautions if platelet count is $<150,000/\text{mm}^3$. Bone marrow depression may be severe and progressive, with recovery taking 1 mo–2 yr after discontinuation of therapy.
- Monitor serum ALT, bilirubin, alkaline phosphatase, and uric acid before and periodically during therapy. May cause ↑ uric acid levels.
- May cause false-positive cytology results of breast, bladder, cervix, and lung tissues.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Disturbed body image (Side Effects)

Risk for injury (Side Effects)

Risk for infection (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations, and infusion pump settings.
- **High Alert:** Do not confuse Myleran with Alkeran or Leukeran.
- **PO:** Administer at the same time each day. Administer on an empty stomach to decrease nausea and vomiting.

IV Administration

- **IV:** Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **Intermittent Infusion:** **Diluent:** Dilute with 10 times the volume of busulfan using 0.9% NaCl or D5W. **Concentration:** ≈ 0.5 mg/mL. When drawing busulfan from vial, use needle with 5-micron nylon filter provided, remove calculated volume from vial, remove needle and filter, replace needle and inject busulfan into diluent. Do not use polycarbonate syringes with busulfan. Only use filters provided with busulfan. Always add busulfan to diluent, not diluent to busulfan. Solution diluted with 0.9% NaCl or D5W is stable for 8 hr at room temperature and solution diluted with 0.9% NaCl is stable for 12 hr if refrigerated. Administration must be completed during this time. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. **Rate:** Administer via central venous catheter over 2 hr every 6 hr for 4 days for a total of 16 doses. Use infusion pump to administer entire dose over 2 hr.
- **Y-Site Compatibility:** acyclovir, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, bivalirudin, bleomycin, caspofungin, daptomycin, dexmedetomidine, diltiazem, docetaxel, dolasetron, ertapenem, fenoldopam, granisetron, hetastarch, hydromorphone, leucovorin calcium, levofloxacin, linezolid, lorazepam, meperidine, metronidazole, milrinone, moxifloxacin, nesiritide, octreotide, ondansetron, paclitaxel, palonosetron, pancuronium, piperacillin/tazobactam, potassium acetate, quinupristin/dalfopristin, rituximab, sodium acetate, tacrolimus, tigecycline, tirofiban, trastuzumab, vasopressin, vinblastine, zoledronic acid.

- **Y-Site Incompatibility:** idarubicin, thiotepa, vecuronium, voriconazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if nausea and vomiting are a problem. Consult health care professional if vomiting occurs shortly after dose is taken. If a dose is missed, do not take at all; do not double doses.
- Advise patient to notify health care professional if fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores in the mouth or on the lips; chills; dyspnea; persistent cough; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection occur.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient to notify health care professional if unusual bleeding; bruising; or flank, stomach, or joint pain occurs. Advise patients on long-term therapy to notify health care professional immediately if cough, shortness of breath, and fever occur or if darkening of skin, diarrhea, dizziness, fatigue, anorexia, confusion, or nausea and vomiting become pronounced.
- Inform patient of increased risk of a second malignancy with busulfan.
- Review need for contraception during therapy with patient. Women need to use contraception even if amenorrhea occurs.

Evaluation/Desired Outcomes

- Decrease in leukocyte count to within normal limits.
- Decreased night sweats.
- Increase in appetite.
- Increased sense of well-being. Therapy is resumed when leukocyte count reaches $50,000/\text{mm}^3$.

butenafine, See ANTIFUNGALS (TOPICAL).

butoconazole, See ANTIFUNGALS (VAGINAL).

HIGH ALERT

cabazitaxel (ka-ba-zi-tax-el)

Jevtana

Classification

Therapeutic: antineoplastics

Pharmacologic: taxoids

Indications

Hormone-refractory metastatic prostate cancer previously treated with a regimen including docetaxel (used in combination with prednisone).

Action

Binds to intracellular tubulin and promotes its assembly into microtubules while inhibiting disassembly. Result is inhibition of mitosis and interphase. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones, with ↓ spread of metastatic prostate cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Equally distributed between blood and plasma.

Metabolism and Excretion: Extensively (>95%) metabolized by the liver, 80–90% by CYP3A4/5 enzyme system. Metabolites are excreted in urine and feces.

Minimal renal excretion.

Half-life: *Terminal elimination*—95 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Severe hypersensitivity to cabazitaxel or polysorbate 80; Neutrophils $\leq 1,500/\text{mm}^3$; Hepatic impairment (total bilirubin $\geq 3\times$ upper limit of normal [ULN]); Concurrent use of strong CYP3A4 inhibitors or inducers; **OB:** Avoid use during pregnancy (may cause fetal harm); **Lactation:** Breast feeding should be avoided.

Use Cautiously in: Concurrent use of moderate CYP3A4 inhibitors; Patients with neutropenia or a history of pelvic radiation, adhesions, ulceration, or GI bleeding (↑ risk of GI adverse reactions); Concomitant use of steroids, NSAIDs, or antithrombotics (↑ risk of GI adverse reactions); Severe renal impairment (CCr < 30 mL/min) or end-stage renal disease; Hemoglobin < 10 g/dL; Lung disease (↑ risk of pulmonary toxicity); Mild or moderate hepatic impairment (dose ↓ required); **OB:** Patients with childbearing potential (preg-

nancy should be avoided); **Geri:** ↑ risk of adverse reactions; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: weakness, fatigue. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, INTERSTITIAL LUNG DISEASE, dyspnea. **CV:** arrhythmias, hypotension. **GI:** DIARRHEA, ENTEROCOLITIS, GI BLEED, GI PERFORATION, ILEUS, abdominal pain, abnormal taste, anorexia, constipation, nausea, vomiting, dyspepsia. **GU:** RENAL FAILURE, hematuria. **Derm:** alopecia. **F and E:** electrolyte imbalance. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA, anemia, leukopenia. **MS:** arthralgia, back pain, muscle spasms. **Neuro:** peripheral neuropathy. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Strong CYP3A inhibitors including ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, and voriconazole ↑ levels and risk of toxicity; concomitant use contraindicated.

Strong CYP3A inducers including phenytoin, carbamazepine, rifampin, rifabutin, rifapentin, and phenobarbital may ↓ levels and effectiveness; concomitant use contraindicated.

Drug-Natural Products: St. John's wort may ↓ levels and effectiveness; concomitant use contraindicated.

Route/Dosage

PO (Adults): 25 mg/m² every 3 wk (with prednisone 10 mg PO daily).

Hepatic Impairment

PO (Adults): Mild hepatic impairment (total bilirubin $> 1\times$ to $\leq 1.5\times$ ULN or AST $> 1.5\times$ ULN) — 20 mg/m² every 3 wk (with prednisone 10 mg PO daily); Moderate hepatic impairment (total bilirubin $> 1.5\times$ to $\leq 3\times$ ULN) — 15 mg/m² every 3 wk (with prednisone 10 mg PO daily); Severe hepatic impairment (total bilirubin $> 3\times$ ULN) — Contraindicated.

Availability

Viscous solution for injection (requires two dilutions prior to IV administration): 40 mg/mL (contains polysorbate 80) comes with diluent (5.7 mL of 13% [w/w] ethanol in water for injection).

NURSING IMPLICATIONS**Assessment**

- Assess for hypersensitivity reactions (generalized rash/erythema, hypotension, bronchospasm, swelling of face). May occur within minutes following initiation of infusion. If severe reactions occur, discontinue infusion immediately and provide supportive therapy.
- Assess for signs and symptoms of GI toxicity (abdominal pain and tenderness, fever, persistent con-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

stipation, nausea, vomiting, severe diarrhea); may result in death due to electrolyte imbalance. Premedication is recommended. Treat with rehydration, anti-diarrheal, or antiemetic therapy as needed. If Grade ≥ 3 diarrhea or persisting diarrhea occurs despite appropriate medication, fluid and electrolyte replacement, delay treatment until improvement or resolution, then reduce dose to 20 mg/mL.

- Assess for signs and symptoms of peripheral neuropathy (pain, burning, numbness in hands, feet, or legs) during therapy. *If Grade 2 occurs*, withhold until improvement or resolution, then reduce dose to 20 mg/mL. *If \geq Grade 3 occurs*, discontinue therapy.
- Monitor for signs and symptoms of respiratory compromise (trouble breathing, dyspnea, chest pain, cough, fever) during therapy. Interrupt therapy if new or worsening symptoms occur. Consider discontinuation.
- **Lab Test Considerations:** Monitor CBC weekly during cycle 1 and before each treatment cycle thereafter. Do not administer if neutrophils $\leq 1500/\text{mm}^3$. If prolonged grade 3 neutropenia (> 1 wk) despite appropriate medication including filgrastim, delay treatment until neutrophil count is $> 1500/\text{mm}^3$, then reduce dose to 20 mg/m². Use filgrastim for secondary prophylaxis. Risk is \uparrow in elderly patients.
- If febrile neutropenia occurs, delay therapy until improvement or resolution and neutrophil count is $> 1500/\text{mm}^3$, then reduce dose to 20 mg/m². Use filgrastim for secondary prophylaxis.
- Discontinue cabazitaxel if prolonged Grade 3 neutropenia, febrile neutropenia, or Grade 3 diarrhea occur at the 20 mg/m² dose.
- May cause hematuria.
- May cause Grade 3–4 \uparrow AST, \uparrow ALT, and \uparrow bilirubin.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order and dose calculations.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers. If solution comes in contact with skin or mucosa, wash with soap and water immediately.
- Premedicate at least 30 min before each dose with antihistamine (diphenhydramine 25 mg or equivalent), corticosteroid (dexamethasone 8 mg or equivalent), and H₂ antagonist (ranitidine 50 mg or equivalent). Antiemetic prophylaxis, PO or IV, is recommended.

IV Administration

- Two dilutions are required. Do not use PVC infusion containers or polyurethane infusion sets for preparation or infusion.
- **First Dilution: Diluent:** Mix vial with entire contents of supplied diluent. Direct needle to inside wall of vial and inject slowly to avoid foaming. Mix gently by repeated inversions for at least 45 sec; do not shake. Let stand for a few minutes to allow foam to dissipate. **Concentration:** 10 mg/mL. **Second Dilution: Diluent:** Withdraw recommended dose from cabazitaxel solution and dilute further into a sterile 250 mL PVC-free container of 0.9% NaCl or D5W. If dose > 65 mg is required, use a larger volume of infusion vehicle so concentration does not exceed 0.26 mg/mL. Gently invert container to mix. **Concentration:** 0.10–0.26 mg/mL. Stable for 8 hr (including 1 hr infusion) at room temperature or 24 hr if refrigerated. May crystallize over time. Do not use if crystallized, discolored, or contains particulate matter; discard. **Rate:** Infuse over 1 hr at room temperature through a 0.22 micrometer nominal pore size filter.
- **Y-Site Incompatibility:** Do not mix with other medication.

Patient/Family Teaching

- Instruct patient to take oral prednisone as prescribed and to notify health care professional if a dose is missed or not taken in time.
- Advise patient to notify health care professional immediately if signs or symptoms of hypersensitivity reactions; fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores on the mouth or on the lips; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; unusual swelling, shortness of breath, trouble breathing, chest pain, cough, or fever occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs; may precipitate GI hemorrhage.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- **Rep:** Advise female patients of the need for contraception and to avoid breast feeding during therapy. Advise male patients with female partners of reproductive potential to use effective contraception during and for at least 3 mo after last dose of cabazi-

taxel. May impair fertility in males of reproductive potential.

- Emphasize need for periodic lab tests to monitor for side effects. Advise patient to monitor temperature frequently.

Evaluation/Desired Outcomes

- ↓ in size and spread of metastatic prostate cancer.

cabergoline (ka-ber-goe-leen)

Destinex

Classification

Therapeutic: antihyperprolactinemic

Pharmacologic: dopamine agonists

Indications

Treatment of hyperprolactinemia (idiopathic or pituitary in origin).

Action

Inhibits secretion of prolactin by acting as a dopamine agonist. **Therapeutic Effects:** Decreased secretion of prolactin in hyperprolactinemia.

Pharmacokinetics

Absorption: Well absorbed but undergoes extensive first-pass hepatic metabolism.

Distribution: Widely distributed; concentrates in pituitary.

Metabolism and Excretion: Extensively metabolized by the liver; <4% excreted unchanged in urine.

Protein Binding: 40–42%.

Half-life: 63–69 hr.

TIME/ACTION PROFILE (effect on serum prolactin levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cabergoline or ergot alkaloids; Uncontrolled hypertension; History of pulmonary, pericardial, or retroperitoneal fibrotic disorders; History of cardiac valvular disease; **Lactation:** Has been associated with hypertension, stroke, and seizures. Not to be used for suppression of physiologic lactation.

Use Cautiously in: Hepatic impairment; Patients who have received medications associated with valvular disorders; **OB:** Use only if clearly needed; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache, depression, drowsiness, fatigue, impulse control disorders (gambling, sexual), nervousness, vertigo, weakness. **Resp:** PULMONARY FI-

BROSIS, pleural effusion. **EENT:** abnormal vision. **CV:** PERICARDIAL FIBROSIS, VALVULAR DISORDERS, postural hypotension, hot flashes. **GI:** RETROPERITONEAL FIBROSIS, constipation, nausea, abdominal pain, dyspepsia, vomiting. **GU:** dysmenorrhea. **Endo:** breast pain. **Neuro:** paresthesia.

Interactions

Drug-Drug: ↑ risk of hypotension with anti-hypertensives. May ↑ the effects of SSRIs and other serotonin agonists (induces serotonin syndrome). Effectiveness may be ↓ by phenothiazines, butyrophenones (haloperidol), thioxanthenes, or metoclopramide (avoid concurrent use).

Route/Dosage

PO (Adults): 0.25 mg twice weekly; may be ↑ at 4-wk intervals up to 1 mg twice weekly.

Availability (generic available)

Tablets: 0.5 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP before and frequently during initial therapy. Initial doses > 1 mg may cause orthostatic hypotension. Use with caution when administering concurrently with other medications that lower BP. Supervise ambulation and transfer during initial dosing to prevent injury from hypotension.
- Evaluate the cardiac status and monitor echocardiography at baseline and every 6–12 mo after initiation of therapy or as indicated clinically by signs and symptoms of valvular disease (dyspnea, edema, HF, new cardiac murmur). Use lowest dose and reassess need for therapy periodically.
- Monitor for signs and symptoms of pulmonary fibrosis (dyspnea, persistent coughing, difficulty with breathing while lying down, peripheral edema) periodically during therapy. Obtain chest x-ray prior to therapy and chest x-ray and CT scan periodically during therapy to assess for pulmonary fibrosis.
- **Lab Test Considerations:** Monitor serum prolactin concentrations monthly until normalized (<20 mcg/L in women and <15 mcg/L in men).
- Monitor erythrocyte sedimentation rate (ESR) and creatinine at baseline and as needed during therapy.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Impaired physical mobility (Indications)

Implementation

- **PO:** May be taken without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible within 1 or 2 days. If not remembered until time of next dose, double

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dose. If nausea occurs, discuss with health care professional.

- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol during therapy.
- Instruct patients taking cabergoline for pituitary tumors to inform health care professional immediately if signs of tumor enlargement occur (blurred vision, sudden headache, severe nausea, and vomiting).
- Advise patient to notify health care professional if signs of valvular disorders (shortness of breath, swelling in extremities) occurs.
- Advise patient to notify health care professional if new or increased gambling, sexual, or other impulse control disorders occur.
- Advise women to consult with health care professional regarding a nonhormonal method of birth control. Women should contact health care professional promptly if pregnancy is planned or suspected.
- Emphasize the importance of regular follow-up exams to determine effectiveness and monitor side effects.

Evaluation/Desired Outcomes

- Decrease in galactorrhea in patients with hyperprolactinemia.
- After a normal serum prolactin level has been maintained for more than 6 mo, cabergoline may be discontinued. Serum prolactin levels should be monitored periodically to determine necessity of reinstating cabergoline.

CALCITONIN

calcitonin (salmon)
(kal-si-toe-nin)

★ Calcimar, Miacalcin

Classification

Therapeutic: hypocalcemics
Pharmacologic: hormones

Indications

IM, Subcut: Treatment of Paget's disease of bone. Adjunctive therapy for hypercalcemia. **IM, Subcut, Intranasal:** Management of postmenopausal osteoporosis.

Action

Inhibits osteoclastic bone resorption and promotes renal excretion of calcium. **Therapeutic Effects:** Decreased rate of bone turnover. Lowering of serum calcium.

Pharmacokinetics

Absorption: Completely absorbed from IM and subcut sites. Rapidly absorbed from nasal mucosa; absorption is 3% compared with parenteral administration.

Distribution: Unknown.

Metabolism and Excretion: Rapidly metabolized in kidneys, blood, and tissues.

Half-life: 40–90 min.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM, subcut†	unknown	2 hr	6–8 hr
Intranasal‡	rapid	31–39 min	unknown

†Effects on serum calcium; effects on serum alkaline phosphates and urinary hydroxyproline in Paget's disease may require 6–24 mo of continuous treatment.

‡Serum levels of administered calcitonin.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to calcitonin, salmon protein or gelatin diluent (in some products); **OB, Lactation:** Use not recommended.

Use Cautiously in: **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: *nasal only*—headaches. **EENT:** *nasal only*—rhinitis, epistaxis, nasal irritation. **GI:** *IM, subcut*—nausea, vomiting. **GU:** *IM, subcut*—urinary frequency. **Derm:** rash. **Local:** injection site reactions. **MS:** *nasal*—arthralgia, back pain. **Misc:** **MALIGNANCY,** allergic reactions including **ANAPHYLAXIS,** facial flushing, swelling.

Interactions

Drug-Drug: Previous bisphosphonate therapy, including **alendronate, risedronate, etidronate, ibandronate,** or **pamidronate,** may ↓ response to calcitonin. May ↓ **lithium** levels.

Route/Dosage

Postmenopausal osteoporosis

IM, Subcut (Adults): 100 units every other day.

Intranasal (Adults): 1 spray (200 units)/day in alternating nostrils.

Paget's disease

IM, Subcut (Adults): 100 units/day initially, after titration, maintenance dose is usually 50 units/day or every other day.

Hypercalcemia

IM, Subcut (Adults): 4 units/kg every 12 hr; if adequate response not achieved, may ↑ dose after 1–2 days to 8 units/kg every 12 hr, and if necessary after 2 more days may be ↑ to 8 units/kg every 6 hr.

Availability (generic available)

Injection: 200 units/mL. **Nasal spray:** 200 units/actuation.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs of hypersensitivity (skin rash, fever, hives, anaphylaxis, serum sickness). Keep epinephrine, antihistamines, and oxygen nearby in the event of a reaction.
- Assess patient for signs of hypocalcemic tetany (nervousness, irritability, paresthesia, muscle twitching, tetanic spasms, seizures) during the first several doses of calcitonin. Parenteral calcium, such as calcium gluconate, should be available in case of this event.
- **Intranasal:** Assess nasal mucosa, septum, turbinates, and mucosal blood vessels periodically during therapy. If severe ulceration occurs, drug should be discontinued.
- **Lab Test Considerations:** Monitor serum calcium and alkaline phosphatase periodically during therapy. Levels should normalize within a few mo of initiation of therapy.
- Urine hydroxyproline (24 hr) may be monitored periodically in patients with Paget's disease.

Potential Nursing Diagnoses

Acute pain (Indications)

Risk for injury (Indications, Side Effects)

Implementation

- In patients with suspected sensitivity to calcitonin, skin test should be considered before starting therapy. Test dose is prepared in a dilution of 10 units/mL by withdrawing 0.05 mL in a tuberculin syringe and filling to 1 mL with 0.9% NaCl for injection. Mix well and discard 0.9 mL. Administer 0.1 mL intradermally on inner aspect on forearm and observe site for 15 min. More than mild erythema or wheal constitutes positive response.
- **IM, Subcut:** Inspect injection site for the appearance of redness, swelling, or pain. Rotate injection sites. Subcut is the preferred route. Use IM route if dose exceeds 2 mL in volume. Use multiple sites to minimize inflammatory reaction. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter.
- **Intranasal:** Store injection and unopened nasal spray bottle in refrigerator. Nasal spray bottle in use can be stored at room temperature.

Patient/Family Teaching

- Advise patient to take calcitonin as directed. If dose is missed and medication is scheduled for twice a day, take only if possible within 2 hr of correct time. If scheduled for daily dose, take only if remembered that day. If scheduled for every other day, take when remembered and restart alternate day schedule. If taking 1 dose 3 times weekly (Mon, Wed, Fri), take missed dose the next day and set each injection back

1 day; resume regular schedule the following week. Do not double doses.

- Instruct patient in the proper method of self-injection and care and disposal of equipment.
- Advise patient to report signs of hypercalcemic relapse (deep bone or flank pain, renal calculi, anorexia, nausea, vomiting, thirst, lethargy) or allergic response promptly.
- Reassure patient that flushing and warmth following injection are transient and usually last about 1 hr.
- Explain that nausea following injection tends to decrease even with continued therapy.
- Instruct patient to follow low-calcium diet if recommended by health care professional (see Appendix K). Women with postmenopausal osteoporosis should adhere to a diet high in calcium and vitamin D.
- Inform patient of increased risk of malignancy.
- **Osteoporosis:** Advise patients receiving calcitonin for the treatment of osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- **Intranasal:** Instruct patient on correct use of nasal spray. Demonstrate procedure for use. Before first use, activate pump by holding upright and depressing white side arms down toward bottle 5 times until a full spray is emitted. Following activation, place nozzle firmly in nostril with head in an upright position and depress the pump toward the bottle. The pump should NOT be primed before each daily use. Discard bottle 30 days after first use.
- Advise patient to notify health care professional if significant nasal irritation occurs.

Evaluation/Desired Outcomes

- Lowered serum calcium levels.
- Decreased bone pain.
- Slowed progression of postmenopausal osteoporosis. Significant increases in bone marrow density may be seen as early as 6 mo after initiation of therapy.

calcitriol, See VITAMIN D COMPOUNDS.

HIGH ALERT

CALCIUM SALTS

calcium acetate (25% Ca or 12.6 mEq/g)
(kal-see-um ass-e-tate)
Eliphos, PhosLo, Phoslyra

Cal-Lac

tricalcium phosphate (39% Ca or 19.5 mEq/g)

(tri-kal-see-um foss-fate)

Posture

ClassificationTherapeutic: mineral and electrolyte replacements/supplements
Pharmacologic: antacids**Indications****PO, IV:** Treatment and prevention of hypocalcemia.**PO:** Adjunct in the prevention of postmenopausal osteoporosis. **IV:** Emergency treatment of hyperkalemia and hypermagnesemia and adjunct in cardiac arrest or calcium channel blocking agent toxicity (calcium chloride, calcium gluconate). **Calcium carbonate:** May be used as an antacid. **Calcium acetate:** Control of hyperphosphatemia in end-stage renal disease.**Action**

Essential for nervous, muscular, and skeletal systems. Maintain cell membrane and capillary permeability. Act as an activator in the transmission of nerve impulses and contraction of cardiac, skeletal, and smooth mus-

cle. Essential for bone formation and blood coagulation. Binds to dietary phosphate to form an insoluble calcium phosphate complex, which is excreted in the feces, resulting in decreased serum phosphorus concentrations (calcium acetate). **Therapeutic Effects:** Replacement of calcium in deficiency states. Control of hyperphosphatemia in end-stage renal disease without promoting aluminum absorption (calcium acetate).**Pharmacokinetics****Absorption:** Absorption from the GI tract requires vitamin D. IV administration results in complete bioavailability.**Distribution:** Readily enters extracellular fluid. Crosses the placenta and enters breast milk.**Metabolism and Excretion:** Excreted mostly in the feces; 20% eliminated by the kidneys.**Half-life:** Unknown.

TIME/ACTION PROFILE (effects on serum calcium)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IV	immediate	immediate	0.5–2 hr

Contraindications/Precautions**Contraindicated in:** Hypercalcemia; Renal calculi; Ventricular fibrillation; Concurrent use of calcium supplements (calcium acetate).**Use Cautiously in:** Patients receiving digitalis glycosides; Severe respiratory insufficiency; Renal disease; Cardiac disease; **OB:** Hypercalcemia may ↑ risk of maternal and fetal complications; **Lactation:** Breast feeding not expected to harm infant provided that serum calcium levels monitored.**Adverse Reactions/Side Effects****CNS:** syncope (IV only), tingling. **CV:** **CARDIAC ARREST** (IV only), arrhythmias, bradycardia. **F and E:** hypercalcemia. **GI:** constipation, diarrhea (oral solution only), nausea, vomiting. **GU:** calculi, hypercalciuria.**Local:** phlebitis (IV only).**Interactions****Drug-Drug:** Hypercalcemia ↑ the risk of digoxin toxicity. Chronic use with antacids in renal insufficiency may lead to milk-alkali syndrome. **Calcium supplements,** including calcium-containing antacids, may ↑ risk of hypercalcemia; avoid concurrent use. Ingestion by mouth ↓ the absorption of orally administered phenytoin and iron salts; take 1 hr before or 3 hr after oral calcium supplements. Excessive amounts may ↓ the effects of calcium channel blockers. Calcium acetate may ↓ absorption of orally administered tetracyclines; take ≥1 hr before calcium acetate. Calcium acetate may ↓ absorption of orally administered fluoroquinolones; take ≥2 hr before or 6 hr after calcium acetate. Calcium acetate may ↓ absorption of

orally administered **levothyroxine**; take ≥ 4 hr before or 4 hr after calcium acetate. \downarrow absorption of **etidronate** and **risedronate** (do not take within 2 hr of calcium supplements). Concurrent use with **diuretics (thiazide)** may result in hypercalcemia. May \downarrow the ability of **sodium polystyrene sulfonate** to decrease serum potassium.

Drug-Food: Cereals, spinach, or rhubarb may \downarrow the absorption of calcium supplements.

Route/Dosage

Doses are expressed in mg, g, or mEq of calcium.

PO (Adults): *Prevention of hypocalcemia, treatment of depletion, osteoporosis*—1–2 g/day. *Antacid*—0.5–1.5 g as needed (calcium carbonate only). *Hyperphosphatemia in end-stage renal disease (calcium acetate only)*—1334 mg with each meal, may \uparrow gradually (in absence of hypercalcemia) to achieve target serum phosphate levels (usual dose = 2001–2668 mg with each meal).

PO (Children): *Supplementation*—45–65 mg/kg/day.

PO (Infants): *Neonatal hypocalcemia*—50–150 mg/kg (not to exceed 1 g).

IV (Adults): *Emergency treatment of hypocalcemia, cardiac standstill*—7–14 mEq. *Hypocalcemic tetany*—4.5–16 mEq; repeat until symptoms are controlled. *Hyperkalemia with cardiac toxicity*—2.25–14 mEq; may repeat in 1–2 min. *Hypermagnesemia*—7 mEq.

IV (Children): *Emergency treatment of hypocalcemia*—1–7 mEq. *Hypocalcemic tetany*—0.5–0.7 mEq/kg 3–4 times daily.

IV (Infants): *Emergency treatment of hypocalcemia*— <1 mEq. *Hypocalcemic tetany*—2.4 mEq/kg/day in divided doses.

Availability (generic available)

Calcium Acetate

Gelcaps: 667 mg (169 mg elemental Ca). **Tablets:** 667 mg (169 mg elemental Ca). **Oral solution:** 667 mg (169 mg elemental Ca)/5 mL.

Calcium Carbonate

Tablets: 500 mg (200 mg Ca)^{OTC}, 600 mg (240 mg Ca)^{OTC}, 650 mg (260 mg Ca)^{OTC}, 667 mg (266.8 mg Ca)^{OTC}, 1 g (400 mg Ca)^{OTC}, 1.25 g (500 mg Ca)^{OTC}, 1.5 g (600 mg Ca)^{OTC}. **Chewable tablets:** 350 mg (300 mg Ca)^{OTC}, 420 mg (168 mg Ca)^{OTC}, 450 mg^{OTC}, 500 mg (200 mg Ca)^{OTC}, 750 mg (300 mg Ca)^{OTC}, 1 g (400 mg Ca)^{OTC}, 1.25 g (500 mg Ca)^{OTC}. **Gum tablets:** 300 mg^{OTC}, 450 mg^{OTC}, 500 mg (200 mg Ca)^{OTC}. **Capsules:** 1.25 g (500 mg Ca)^{OTC}. **Lozenges:** 600 mg (240 mg Ca)^{OTC}. **Oral suspension:** 1.25 g (500 mg Ca)/5 mL^{OTC}. **Powder:** 6.5 g (2400 mg Ca)/packet^{OTC}.

Calcium Chloride

Injection: 10% (1.36 mEq/mL).

Calcium Citrate

Tablets: 250 mg^{OTC}.

Calcium Gluconate

Tablets: 500 mg (45 mg Ca)^{OTC}, 650 mg (58.5 mg Ca)^{OTC}, 975 mg (87.75 mg Ca)^{OTC}, 1 g (90 mg Ca)^{OTC}.

Injection: 10% (0.45 mEq/mL).

Calcium Lactate

Tablets: 325 mg (42.45 mg Ca)^{OTC}, 500 mg^{OTC}, 650 mg (84.5 mg Ca)^{OTC}.

Tricalcium Phosphate

Tablets: 600 mg (234 mg Ca)^{OTC}.

NURSING IMPLICATIONS

Assessment

- **Calcium Supplement/Replacement:** Observe patient closely for symptoms of hypocalcemia (paresthesia, muscle twitching, laryngospasm, colic, cardiac arrhythmias, Chvostek's or Trousseau's sign). Notify health care professional if these occur. Protect symptomatic patients by elevating and padding side rails and keeping bed in low position.
- **Monitor BP, pulse, and ECG frequently throughout parenteral therapy.** May cause vasodilation with resulting hypotension, bradycardia, arrhythmias, and cardiac arrest. Transient increases in BP may occur during IV administration, especially in geriatric patients or in patients with hypertension.
- Assess IV site for patency. Extravasation may cause cellulitis, necrosis, and sloughing.
- Monitor patient on digoxin for signs of toxicity.
- **Antacid:** When used as an antacid, assess for heartburn, indigestion, and abdominal pain. Inspect abdomen; auscultate bowel sounds.
- **Lab Test Considerations:** Monitor serum calcium or ionized calcium, chloride, sodium, potassium, magnesium, albumin, and parathyroid hormone (PTH) concentrations before and periodically during therapy for treatment of hypocalcemia.
- **For patients with hyperphosphatemia:** Monitor serum calcium twice weekly during adjustment phase. If serum calcium level is >12 mg/dL, discontinue therapy and start hemodialysis as needed; lower dose or temporarily stop therapy for calcium level between 10.5 and 11.9 mg/dL.
- May cause \downarrow serum phosphate concentrations with excessive and prolonged use. When used to treat hyperphosphatemia in renal failure patients, monitor phosphate levels.
- **Toxicity and Overdose:** Assess patient for nausea, vomiting, anorexia, thirst, severe constipation, paralytic ileus, and bradycardia. Contact health care professional immediately if these signs of hypercalcemia occur.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Risk for injury related to osteoporosis or electrolyte imbalance (Indications)

Implementation

- **High Alert:** Errors with IV calcium gluconate and chloride have occurred secondary to confusion over which salt is ordered. Clarify incomplete orders. Confusion has occurred with milligram doses of calcium chloride and calcium gluconate, which are not equal. Chloride and gluconate forms are routinely available on most hospital crash carts; specify form of calcium desired. Doses should be expressed in mEq.
- Do not confuse Os-Cal (calcium carbonate) with Asacol (mesalamine).
- In arrest situations, the use of calcium chloride is now limited to patients with hyperkalemia, hypocalcemia, and calcium channel blocker toxicity.
- **PO:** Administer calcium carbonate or phosphate 1–1.5 hr after meals and at bedtime. Chewable tablets should be well chewed before swallowing. Dissolve effervescent tablets in glass of water. Follow oral doses with a full glass of water, except when using calcium carbonate as a phosphate binder in renal dialysis. Administer on an empty stomach before meals to optimize effectiveness in patients with hyperphosphatemia.
- **IM:** IM administration of calcium salts can cause severe necrosis and tissue sloughing. Do not administer IM.

IV Administration

- **IV:** IV solution should be warmed to body temperature and given through a small-bore needle in a large vein to minimize phlebitis. Do not administer through a scalp vein. May cause cutaneous burning sensation, peripheral vasodilation, and drop in BP. Patient should remain recumbent for 30–60 min after IV administration.
- If infiltration occurs, discontinue IV. May be treated with application of heat, elevation, and local infiltration of normal saline, 1% procaine HCl, or hyaluronidase.
- **High Alert:** Administer slowly. High concentrations may cause cardiac arrest. Rapid administration may cause tingling, sensation of warmth, and a metallic taste. Halt infusion if these symptoms occur, and resume infusion at a slower rate when they subside.
- Do not administer solutions that are not clear or that contain a precipitate.

Calcium Chloride

IV Administration

- **IV Push:** May be administered undiluted by IV push.
- **Intermittent/Continuous Infusion:** May be diluted with D5W, D10W, 0.9% NaCl, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or D5/LR.

- **Rate:** Maximum rate for adults is 0.7–1.4 mEq/min (0.5–1 mL of 10% solution); for children, 0.5 mL/min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, bexloprol, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, cefotaxime, cefotetan, cefoxitin, ceftaroline, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, labetalol, leucovorin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitropruside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, penicillin G, pentazocine, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, promethazine, propranolol, protamine, pyridoxine, ranitidine, rocuronium, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vintorelbine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cefazolin, ceftazidime, ceftriaxone, cefuroxime, dantrolene, diazepam, diazoxide, doxorubicin liposomal, fluorouracil, folic acid, foscarnet, fosphenytoin, haloperidol, indomethacin, ketorolac, magnesium sulfate, methylprednisolone, pantoprazole, pemetrexed, phenytoin, potassium phosphates, prochlorperazine, propofol, quinupristin/dalfopristin, sodium bicarbonate, sodium phosphates, trimethoprim/sulfamethoxazole.

Calcium Gluconate

IV Administration

- **IV Push:** Administer slowly by IV push. **Rate:** Maximum administration rate for adults is 1.5–2 mL/min.
- **Continuous Infusion:** May be further diluted in 1000 mL of D5W, D10W, D20W, D5/0.9% NaCl, 0.9% NaCl, D5/LR, or LR.
- **Rate:** Administer at a rate not to exceed 200 mg/min over 12–24 hr.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, anidulafungin, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epitifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketamine, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, papaverine, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin,

trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, cangrelor, ceftriaxone, dantrolene, diazepam, diazoxide, foscarnet, fosphenytoin, indomethacin, methylprednisolone, mycophenolate, oxacillin, pemetrexed, phenytoin, potassium phosphates, quinupristin/dalfopristin, sodium bicarbonate, sodium phosphates, topotecan, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient not to take enteric-coated tablets within 1 hr of calcium carbonate; this will result in premature dissolution of the tablets.
- Do not administer concurrently with foods containing large amounts of oxalic acid (spinach, rhubarb), phytic acid (brans, cereals), or phosphorus (milk or dairy products). Administration with milk products may lead to milk-alkali syndrome (nausea, vomiting, confusion, headache). Do not take within 1–2 hr of other medications if possible.
- Instruct patients on a regular schedule to take missed doses as soon as possible, then go back to regular schedule.
- Advise patient that calcium carbonate may cause constipation. Review methods of preventing constipation (increasing bulk in diet, increasing fluid intake, increasing mobility) and using laxatives. Severe constipation may indicate toxicity.
- Advise patient to avoid excessive use of tobacco or beverages containing alcohol or caffeine.
- **Calcium Supplement:** Encourage patients to maintain a diet adequate in vitamin D (see Appendix K).
- **Osteoporosis:** Advise patients that exercise has been found to arrest and reverse bone loss. Patient should discuss any exercise limitations with health care professional before beginning program.
- **Hyperphosphatemia:** Advise patient to notify health care professional promptly if signs and symptoms of hypercalcemia (constipation, anorexia, nausea, vomiting, confusion, stupor) occur.
- Advise patient to avoid taking calcium-containing supplements, including calcium-based antacids during therapy.

Evaluation/Desired Outcomes

- Increase in serum calcium levels.
- Decrease in the signs and symptoms of hypocalcemia.
- Resolution of indigestion.
- Control of hyperphosphatemia in patients with renal failure (calcium acetate only).

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

canagliflozin

(kan-a-gli-floe-zin)

Invokana

Classification

Therapeutic: antidiabetics

Pharmacologic: sodium-glucose co-transporter 2 (SGLT2) inhibitors

Indications

Adjunct to diet and exercise in the management of type 2 diabetes mellitus. May be used with other antidiabetic agents.

Action

Inhibits proximal renal tubular sodium-glucose co-transporter 2 (SGLT2), which determines reabsorption of glucose from the tubular lumen. Inhibits reabsorption of glucose, lowers renal threshold for glucose, and increases excretion of glucose in urine. **Therapeutic Effects:** Improved glycemic control.

Pharmacokinetics

Absorption: Well absorbed (65%) following oral administration.

Distribution: Extensive tissue distribution.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized by UDP-glucuronyl transferases (UGT) to inactive metabolites, minimal metabolism by CYP3A4 (7%). 50% excreted in feces as parent drug and metabolites, 33% as metabolites in urine, <1% excreted in urine as unchanged drug.

Half-life: 10.6 hr.

TIME/ACTION PROFILE (effects on A1C)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment (eGFR <45 mL/min/1.73 m²), end-stage renal disease or on dialysis; Type 1 diabetes; Severe hepatic impairment; **Lactation:** Avoid use, discontinue breast feeding or discontinue canagliflozin.

Use Cautiously in: eGFR <60 mL/min/1.73 m² (monitor frequently) (↑ risk of adverse reactions related to ↓ intravascular volume); History of pancreatitis, pancreatic surgery, reduced caloric intake due to illness or surgery, or alcohol abuse (↑ risk of ketoacidosis); Hypovolemia, chronic kidney disease, HF, or concurrent use of diuretics, NSAIDs, ACE inhibitors, or ARBs (↑ risk of acute kidney injury); Previous amputation, peripheral vascular disease, or neuropathy (↑ risk of limb amputation); **Geri:** ↑ risk of adverse reactions related to ↓ intravascular volume; Hypotension (correct prior to treatment, especially if eGFR 30–60 mL/min, age >75 yr, or concurrent use of loop diuretics, ACE in-

hibitors, or ARBs; **OB:** Use during pregnancy only if potential maternal benefit justifies potential fetal risk;

Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: hypotension. **GI:** abdominal pain, constipation, nausea. **GU:** **UROSEPSIS**, female mycotic infections, acute kidney injury, glucosuria, male mycotic infections, ↓ renal function, urinary tract infection (including pyelonephritis), ↑ urination, vulvovaginal pruritus. **Endo:** hypoglycemia (↑ with other medications). **F and E:** **KETOACIDOSIS**, hyperkalemia, hypermagnesemia, hyperphosphatemia, thirst. **Metab:** hyperlipidemia. **MS:** bone fractures. **Misc:** **HYPERSENSITIVITY REACTIONS** (including anaphylaxis or angioedema).

Interactions

Drug-Drug: Blood levels are ↓ by **UGT inducers** including **phenobarbital**, **phenytoin**, **rifampin**, and **ritonavir**; ↑ dose may be required. ↑ risk of hypoglycemia with **insulin** or **insulin secretagogues**; dose adjustments may be required. May ↑ blood levels and effects of **digoxin**; levels should be monitored. ↑ risk of hyperkalemia with **potassium-sparing diuretics** or **medications that interfere with the renin-angiotensin-aldosterone system**. Concurrent use with **NSAIDs**, **diuretics**, **ACE inhibitors**, or **angiotensin receptor blockers** may ↑ risk of acute kidney injury.

Route/Dosage

PO (Adults): eGFR ≥ 60 mL/min/1.73 m²—100 mg once daily initially, may be ↑ to 300 mg once daily; **Concurrent use of UGT inducers (phenobarbital, phenytoin, rifampin, ritonavir)**—if maintenance dose is 100 mg daily, may require ↑ to 300 mg daily.

Renal Impairment

PO (Adults): eGFR 45–60 mL/min/1.73 m²—100 mg once daily.

Availability

Tablets: 100 mg, 300 mg. **In combination with:** metformin (Invokamet); metformin XR (Invokamet XR). See Appendix B.

NURSING IMPLICATIONS**Assessment**

- Observe patient for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Monitor for signs and symptoms of volume depletion (dizziness, feeling faint, weakness, orthostatic hypotension) after initiating therapy.
- Monitor for infection, new pain, tenderness, sores, or ulcers involving lower limbs; discontinue canagliflozin if these occur.
- **Lab Test Considerations:** Monitor hemoglobin A1C prior to and periodically during therapy.
- May cause ↑ uric acid levels.

- May ↑ serum creatinine and ↓ eGFR. Monitor renal function, especially in patients with eGFR <60 mL/min/1.73 m².
- May cause ↑ serum potassium, magnesium, and phosphate levels. Monitor electrolytes periodically during therapy.
- May cause ↑ LDL-C. Monitor serum lipid levels periodically during therapy.
- Causes positive test for urine glucose.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Correct volume depletion prior to beginning therapy with canagliflozin.
- **PO:** Administer before the first meal of the day.

Patient/Family Teaching

- Instruct patient to take canagliflozin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that canagliflozin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. Inform patient that canagliflozin will cause a positive test result when testing for urine glucose. Monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Inform patient that canagliflozin may cause yeast infections. Women may have signs and symptoms of a vaginal yeast infection (vaginal odor, white or yellow vaginal discharge [may be lumpy or look like cottage cheese], vaginal itching). Men may have signs and symptoms of a yeast infection of the penis (redness, itching, or swelling of penis; rash on penis; foul smelling discharge from penis; pain in skin

around penis). Advise patient to notify health care professional if yeast infection occurs.

- Advise patient to notify health care professional promptly if rash; hives; or swelling of face, lips, or throat occur.
- Inform patient of increased risk for urinary tract infections, hypotension, and bone fractures and discuss factors that may increase risk.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other oral hypoglycemic medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C and glycemic control in adults with Type II diabetes.

candesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

cangrelor (kan-grel-or)
Kengreal

Classification

Therapeutic: antiplatelet agents

Pharmacologic: platelet aggregation inhibitors

Indications

Adjunct to percutaneous coronary intervention (PCI) to ↓ risk of periprocedural MI, repeat coronary revascularization or stent thrombosis in patients not currently receiving a P2Y₁₂ platelet inhibitor and are not receiving a glycoprotein IIb/IIIa inhibitor.

Action

Inhibits platelet aggregation by reversibly interacting with platelet P2Y₁₂ADP-receptors, preventing signal transduction and platelet activation. **Therapeutic**

Effects: ↓ risk of periprocedural MI, repeat coronary revascularization or stent thrombosis associated with PCI.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unk.

Protein Binding: 97–98%.

Metabolism and Excretion: Metabolized rapidly in the blood stream; metabolites do not have antiplatelet activity. 58% excreted by kidneys, 35% in feces.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Half-life: 3–6 min.**TIME/ACTION PROFILE** (antiplatelet effect)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	2 min	1 hr†

† following discontinuation.

Contraindications/Precautions**Contraindicated in:** Hypersensitivity; Significant severe bleeding.**Use Cautiously in:** $CCr < 30$ mL/min (\uparrow risk of further decline in renal function); **OB:** Consider potential maternal benefits and fetal risks; **Pedi:** Safe and effective use in children has not been established.**Adverse Reactions/Side Effects****Resp:** dyspnea. **Hemat:** bleeding. **Misc:** allergic reactions including ANAPHYLAXIS.**Interactions****Drug-Drug:** Concurrent use of other $P2Y_{12}$ inhibitors including clopidogrel, prasugrel, or ticagrelor \uparrow risk of bleeding. Blocks antiplatelet effects of concurrently administered clopidogrel or prasugrel.**Route/Dosage****IV (Adults):** 30 mcg/kg bolus prior to PCI, then 4 mcg/kg/min infusion for 2 hr or duration of procedure, whichever is longer; should be followed by initiation of an oral $P2Y_{12}$ platelet inhibitor.**Availability****Lyophilized powder for IV injection (requires reconstitution):** 50 mg/vial.**NURSING IMPLICATIONS****Assessment**

- Monitor for signs and symptoms of bleeding during and following infusion.
- Monitor for signs and symptoms of hypersensitivity reaction (bronchospasm, angioedema, stridor) during therapy. Discontinue therapy and treat symptomatically.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- **IV Push:** Reconstitute each 50 mg vial with 5 mL of Sterile Water for injection. Swirl gently until dissolved; avoid vigorous mixing. Allow foam to settle. Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. **Diluent:** Withdraw reconstituted solution and add to 250 mL of 0.9% NaCl or D5W. Dilute immediately. Stable for 12 hrs if diluted with D5W or 24 hrs if diluted with 0.9% NaCl at room temperature. Discard unused portion. **Concentration:** 200 mcg/mL. Patients > 100 kg will require at least 2 bags. **Rate:** Administer rapidly over < 1 min from diluted bag via IV push or pump. En-

sure bolus completely administered before beginning infusion.

- **Intermittent Infusion:** Start infusion immediately after administration of bolus. **Rate:** 4 mcg/kg/min for at least 2 hrs or duration of PCI, whichever is longer.
- **Y-Site Incompatibility:** Infusion requires a dedicated line.
- To maintain platelet inhibition, administer either ticagrelor 180 mg PO at any time during or immediately after discontinuation, or prasugrel 60 mg PO or clopidogrel 600 mg PO immediately after discontinuation of infusion; do not administer prasugrel or clopidogrel prior to discontinuation of infusion.

Patient/Family Teaching

- Caution patient to notify health care professional if bleeding occurs.
- Advise female patient to notify health care professional if pregnancy is suspected or if breast feeding.

Evaluation/Desired Outcomes

- \downarrow risk of periprocedural MI, repeat coronary revascularization or stent thrombosis associated with PCI.

HIGH ALERT

capecitabine
(ka-pe-site-a-been)
Xeloda

Classification

Therapeutic: antineoplastics
Pharmacologic: antimetabolites

Indications

Metastatic colorectal cancer. Adjuvant treatment for Dukes' C colon cancer following primary resection. Metastatic breast cancer that has worsened despite prior therapy with anthracycline (daunorubicin, doxorubicin, idarubicin) (to be used in combination with docetaxel). Metastatic breast cancer that is resistant to both paclitaxel and an anthracycline (daunorubicin, doxorubicin, idarubicin) or is resistant to paclitaxel and further anthracycline therapy is contraindicated.

Action

☞ Converted in tissue to 5-fluorouracil (5-FU), which inhibits DNA and RNA synthesis by preventing thymidine production. The enzyme responsible for the final step in the conversion to 5-FU may be found in higher concentrations in some tumors. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics**Absorption:** Well absorbed after oral administration.**Distribution:** Unknown.**Metabolism and Excretion:** ☞ Metabolized mostly in tissue and by the liver to 5-FU; 5-FU is metabolized by dihydropyrimidine dehydrogenase to a less

toxic compound; inactive metabolites are excreted primarily in urine.

Half-life: 45 min.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown†	1.5 hr (2 hr for 5-FU)‡	unknown

†Onset of antineoplastic effect is 6 wk.

‡Peak 5-FU levels occur at 2 hr.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to capecitabine or 5-FU; Severe renal impairment (CCr <30 mL/min); **OB:** May cause fetal harm; **Lactation:** Potential for serious adverse effects in nursing infants.

Use Cautiously in: H Dihydropyrimidine dehydrogenase deficiency (patients at \uparrow risk of 5-FU toxicity); Mild-moderate renal impairment (\downarrow starting dose to 75% in patients with CCr 30–50 mL/min); Hepatic dysfunction; Coronary artery disease; **Rep:** Women of reproductive potential and men with female partners of reproductive potential (use effective contraception); **Pedi:** Safety not established; **Geri:** \uparrow risk of severe diarrhea in patients \geq 80 yr.

Adverse Reactions/Side Effects

CNS: fatigue, headache, dizziness, insomnia. **EENT:** eye irritation, epistaxis, rhinorrhea. **CV:** edema, chest pain. **GI:** **DIARRHEA**, **NECROTIZING ENTEROCOLITIS**, abdominal pain, anorexia, constipation, dysgeusia, hyperbilirubinemia, nausea, stomatitis, vomiting, dyspepsia, xerostomia. **Derm:** **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, dermatitis, hand-and-foot syndrome, nail disorder, alopecia, erythema, rashes. **F and E:** dehydration. **GU:** acute renal failure, \downarrow fertility. **Hemat:** anemia, leukopenia, thrombocytopenia. **MS:** arthralgia, myalgia. **Neuro:** peripheral neuropathy. **Resp:** cough, dyspnea. **Misc:** fever.

Interactions

Drug-Drug: May \uparrow risk of bleeding with **warfarin** (frequent monitoring of PT/INR recommended). Toxicity \uparrow by concurrent **leucovorin**. **Antacids** may \uparrow absorption. May \uparrow blood levels and risk of toxicity from **phenytoin** (may need to \downarrow phenytoin dose). \uparrow incidence of acute renal failure with other **nephrotoxic drugs**.

Drug-Food: Food \uparrow absorption, although capecitabine should be given within 30 min after a meal.

Route/Dosage

PO (Adults): 1250 mg/m² twice daily for 14 days, followed by 7-day rest period; given in 3-wk cycles.

Renal Impairment

PO (Adults): CCr 30–50 mL/min— \downarrow initial dose to 75% of usual.

Availability (generic available)

Tablets: 150 mg, 500 mg.

NURSING IMPLICATIONS

Assessment

- **Assess mucous membranes, number and consistency of stools, and frequency of vomiting.** Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, pain in lower back or side, difficult or painful urination). Assess for bleeding (bleeding gums; bruising; petechiae; and guaiac-test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- **Notify health care professional if symptoms of toxicity (stomatitis, uncontrollable vomiting, diarrhea, fever) occur; drug may need to be discontinued or dose decreased.** Patients with severe diarrhea should be monitored carefully, administered anti-diarrheal agents (loperamide) and given fluid and electrolyte replacements if they become dehydrated. Grade 2 diarrhea (4 to 6 stools/day or nocturnal stools), Grade 3 (7 to 9 stools/day or incontinence and malabsorption), Grade 4 (\geq 10 stools/day or grossly bloody diarrhea or need for parenteral support). If grade 2, 3, or 4 diarrhea occurs, immediately stop therapy until diarrhea resolves or decreases in intensity to Grade 1. Grade 3 or 4 diarrhea usually lasts 5 days.
- **Assess patient for mucocutaneous and dermatologic toxicity (Stevens-Johnson syndrome, toxic epidermal necrolysis, hand-and-foot syndrome).** Grade 1 (numbness, dysesthesia/paresthesia, tingling, painless swelling or erythema of hands and/or feet and/or discomfort which does not disrupt normal activities). Grade 2 (painful erythema and swelling of hands and/or feet and/or discomfort affecting the patient's activities of daily living). Grade 3 (moist desquamation, ulceration, blistering or severe pain of hands and/or feet and/or severe discomfort causing patient to be unable to work or perform activities of daily living). Persistent or severe hand-and-foot syndrome of Grade 2 and above can lead to loss of fingerprints, affecting patient identification. *If Grade 2 or 3 occurs, interrupt therapy until Grade 1. Decrease doses following Grade 3.*
- **Lab Test Considerations:** Monitor hepatic (serum alkaline phosphatase, AST, ALT, and bilirubin), renal, and hematologic (hematocrit, hemoglobin, leukocyte, platelet count) function before and periodically during therapy. May cause leukopenia, anemia, and thrombocytopenia. Leukopenia may require discontinuation of therapy. Therapy should be interrupted if serum bilirubin \uparrow to 1.5 times normal

* = Canadian drug name. H = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

or greater; may be reinstated after bilirubin returns to normal.

- **Monitor PT or INR frequently in patients receiving warfarin and capcetitabine to adjust warfarin dose.** May cause ↑ bleeding within a few days to several mo of initiation of therapy to 1 mo following discontinuation of therapy. Risk is greater in patients over 60 yr.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Imbalanced nutrition: less than body requirements (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations. Do not confuse capcetitabine (Xeloda) with orlistat (Xenical).
- Dose modifications are based on degree of toxicity encountered. Once a dose has been reduced because of toxicity, it should not be increased at a later time. See manufacturer's recommendations.
- **PO:** Administer every 12 hr for 2 wk, followed by a 1-wk rest period. Swallow tablets whole; do not crush or cut. Tablets should be taken with water within 30 min after a meal.

Patient/Family Teaching

- Instruct patient to take medication every 12 hr with water within 30 min after a meal. Missed doses should be omitted; continue regular schedule. Do not double dose. Advise patient to read *Patient Package Insert* before starting and with each Rx refill in case of changes.
- **Inform patient of the most common side effects.** Instruct patient to notify health care provider immediately if any of the following occur: diarrhea (>4 bowel movements in a day or any diarrhea at night), vomiting (more than once in 24 hr), nausea (loss of appetite and significant decrease in daily food intake), stomatitis (pain, redness, swelling, or sore in mouth), hand-and-foot syndrome (pain, swelling, or redness of hands and/or feet), fever, or infection (temperature of $\geq 100.5^\circ\text{F}$ or other signs of infection).
- Instruct patient to notify health care professional if he or she is taking folic acid.
- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; yellowing of skin or eyes; abdominal pain; joint or flank pain; swelling of feet or legs; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.

- Advise patient to rinse mouth with clear water after eating and drinking and to avoid flossing to minimize stomatitis. Viscous lidocaine may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Review with both female and male patients the need for contraception during therapy. Advise female patient to use effective contraception during and for at least 6 mo after last dose. Advise male patients with female partners of reproductive potential to use effective contraception for at least 3 mo after last dose. May impair infertility of female and male patients of reproductive potential.
- Emphasize the importance of routine follow-up lab tests to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Tumor regression.

capsaicin (kap-say-sin)

Capzasin-HP, Capzasin-P, DiabetAid Pain and Tingling Relief, Qutenza, Salonpas Hot, Zostrix Diabetic Foot Pain, Zostrix, Zostrix-HP

Classification

Therapeutic: nonopioid analgesics (topical)

Indications

Temporary management of pain due to rheumatoid arthritis and osteoarthritis. Treatment of pain associated with postherpetic neuralgia (topical and transdermal) or diabetic neuropathy. **Unlabeled Use:** Treatment of postmastectomy pain syndrome. Treatment of complex regional pain syndrome.

Action

Topical: May deplete and prevent the reaccumulation of a chemical (substance P) responsible for transmitting painful impulses from peripheral sites to the CNS. **Transdermal:** Initially stimulates the transient receptor potential vanilloid 1 (TRPV1) receptors on nociceptive nerve fibers in the skin; this is followed by pain relief thought to be due to a reduction in TRPV1-expressing nociceptive nerve endings. **Therapeutic Effects:** Relief of discomfort associated with painful peripheral syndromes.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
topical	1–2 wk	2–4 wk†	unknown
transdermal	unknown	unknown	unknown

†May take up to 6 wk for head and neck neuralgias.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to capsaicin or hot peppers; Not for use near eyes or on open or broken skin.

Use Cautiously in: **OB, Lactation:** Safety not established; **Pedi:** Safety not established in children <18 yr (transdermal) or <2 yr (topical).

Adverse Reactions/Side Effects

CV: *Patch*—↑ BP. **Resp:** cough. **Derm:** pain (after application of patch), transient burning.

Interactions

Drug-Drug: None significant.

Route/Dosage

Topical (Adults and Children ≥2 yr): Apply to affected areas 3–4 times daily.

Transdermal (Adults): Apply up to 4 patches for 60 min (single use); may be repeated q 3 mo, as needed based on pain (should not be used more frequently than q 3 mo).

Availability (generic available)

Cream: 0.1%^{OTC}, 0.025%^{OTC}, 0.035%^{OTC}, 0.075%^{OTC}.

Gel: 0.025%^{OTC}. **Lotion:** 0.025%^{OTC}. **Topical liquid:** 0.15%^{OTC}. **Transdermal patch (Qutenza):** 0.025%/patch, 8% (179 mg)/patch. **In combination with:** methylsalicylate (Ziks^{OTC}). See Appendix B.

NURSING IMPLICATIONS**Assessment**

- Assess pain intensity and location before and periodically throughout therapy.
- **Transdermal:** Monitor BP periodically during application.

Potential Nursing Diagnoses

Chronic pain (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse Zostrix with Zovirax.**
- **Topical:** Apply to affected area not more than 3–4 times daily. Avoid getting medication into eyes or on broken or irritated skin. Do not bandage tightly.
- Topical lidocaine may be applied during the first 1–2 wk of treatment to reduce initial discomfort.
- **Transdermal:** Identify treatment area (painful area including areas of hypersensitivity and allodynia) and mark on the skin. If needed, clip hair (do not shave) in and around treatment area to promote

patch adherence. Cut patch to size and shape of treatment area. Gently wash area with mild soap and water and dry thoroughly. Apply topical anesthetic to the entire treatment area and surrounding 1–2 cm and keep the local anesthetic in place until skin is anesthetized prior to the application of patch. Remove the topical anesthetic with a dry wipe. Gently wash treatment area with mild soap and water and dry. Use only nitrile gloves when handling capsaicin and cleaning capsaicin residue from skin; latex gloves do not provide adequate protection. Apply patch to dry, intact skin. Apply patch within 2 hr of opening pouch. Tear pouch open along the three dashed lines and remove patch. Inspect patch and identify the outer surface backing layer with the printing on one side and the capsaicin-containing adhesive on the other side. Adhesive side of the patch is covered by a clear, unprinted, diagonally cut release liner. Cut patch before removing protective release liner. Peel a small section of the release liner back and place adhesive side of patch on treatment area. While slowly peeling back release liner from under patch with one hand, use other hand to smooth the patch down on to skin. Once patch is applied, leave in place for 60 min. To ensure patch maintains contact with treatment area, a dressing, such as rolled gauze, may be used. Instruct the patient not to touch the patch or treatment area.

- Even following use of a local anesthetic prior to administration of capsaicin, patients may experience substantial procedural pain. Prepare to treat acute pain during and following application with local cooling (such as an ice pack) and/or appropriate analgesic medication (opioids).
- Remove patches by gently and slowly rolling inward. After removal, generously apply *Cleansing Gel* to treatment area and leave on for at least 1 min. Remove *Cleansing Gel* with a dry wipe and gently wash area with mild soap and water and dry thoroughly. Aerosolization of capsaicin can occur upon rapid removal of patches. Remove patches gently and slowly by rolling adhesive side inward. If irritation of eyes or airways occurs, remove affected individual from the vicinity. Flush eyes and mucous membranes with cool water. Inhalation of airborne capsaicin can result in coughing or sneezing. Provide supportive care if shortness of breath develops. If skin not intended to be treated comes in contact with capsaicin, apply *Cleansing Gel* for 1 min and wipe off with dry gauze. After *Cleansing Gel* has been wiped off, wash area with soap and water.

Patient/Family Teaching

- **Topical:** Instruct patient on the correct method for application of capsaicin. Rub cream into affected area well so that little or no cream is left on the surface. Gloves should be worn during application or

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

hands should be washed immediately after application. If application is to hands for arthritis, do not wash hands for at least 30 min after application.

- Advise patient to apply missed doses as soon as possible unless almost time for next dose. Pain relief lasts only as long as capsaicin is used regularly.
- Advise patient that transient burning may occur with application, especially if applied fewer than 3–4 times daily. Burning usually disappears after the first few days but may continue for 2–4 wk or longer. Burning is increased by heat, sweating, bathing in warm water, humidity, and clothing. Burning usually decreases in frequency and intensity the longer capsaicin is used. Decreasing number of daily doses will not lessen burning but may decrease amount of pain relief and may prolong period of burning.
- Caution patient to flush area with water if capsaicin gets into eyes and to wash with warm, but not hot, soapy water if capsaicin gets on other sensitive areas of the body.
- Instruct patient with herpes zoster (shingles) not to apply capsaicin cream until lesions have healed completely.
- Advise patient to discontinue use and notify health care professional if pain persists longer than 1 mo, worsens, or if signs of infection are present.
- **Transdermal:** Inform patient that treated area may be sensitive for a few days to heat (e.g., hot showers or baths, direct sunlight, vigorous exercise).
- Advise patient that exposure of skin to capsaicin may result in transient erythema and burning sensation. Instruct patients not to touch patch and if they accidentally touch patch it may burn and/or sting.
- Instruct patient to notify health care professional immediately if irritation of eyes or airways occurs, or if any of the side effects become severe.
- If opioids are used to treat pain from patch, caution patient that opioids may cause drowsiness and to avoid driving or other activities requiring alertness until response to medication is known.
- May cause transient increases in BP. Instruct patients to inform health care professional if they have experienced any recent cardiovascular event.
- Instruct patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in discomfort associated with:
- Postherpetic neuropathy.
- Diabetic neuropathy.
- Rheumatoid arthritis.
- Osteoarthritis. Pain relief usually begins within 1–2 wk with arthritis, 2–4 wk with neuralgias, and 4–6 wk with neuralgias of the head and neck.

captopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

carBAMazepine

(kar-ba-maz-e-peen)

Carbatrol, Carnexiv, Epitol, Equetro,
 ★ Mazepine, TEGretol, ★ TEGretol CR,
 TEGretol-XR, Teril

Classification

Therapeutic: anticonvulsants, mood stabilizers

Indications

IV, PO: Treatment of tonic-clonic, mixed, and complex-partial seizures. **PO:** Management of pain in trigeminal neuralgia. **Equetro only:** Acute manic or mixed episodes associated with bipolar I disorder. **Unlabeled Use:** Other forms of neurogenic pain.

Action

Decreases synaptic transmission in the CNS by affecting sodium channels in neurons. **Therapeutic Effects:** Prevention of seizures. Relief of pain in trigeminal neuralgia. Decreased mania.

Pharmacokinetics

Absorption: Oral absorption is slow but complete. Suspension produces earlier, higher peak, and lower trough levels. IV administration results in complete bioavailability.

Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta rapidly and enters breast milk in high concentrations.

Protein Binding: Carbamazepine—75–90%; epoxide—50%.

Metabolism and Excretion: Extensively metabolized in the liver by cytochrome P450 3A4 to active epoxide metabolite; epoxide metabolite has anticonvulsant and antineuralgic activity.

Half-life: Carbamazepine—single dose—25–65 hr, chronic dosing—Children—8–14 hr; Adults—12–17 hr; epoxide—34±9 hr.

TIME/ACTION PROFILE (anticonvulsant activity)

ROUTE	ONSET	PEAK	DURATION
PO	up to 1 mo†	4–5 hr‡	6–12 hr
PO-ER	up to 1 mo†	2–3–12 hr‡	12 hr
IV	unknown	unknown	unknown

†Onset of antineuralgic activity is 8–72 hr.

‡Listed for tablets; peak level occurs 1.5 hr after a chronic dose of suspension.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to carbamazepine or tricyclic antidepressants; Bone marrow suppression; Concomitant use or use within 14 days of MAO inhibitors; Concurrent use of nefazodone or NNRTIs that are CYP3A4 substrates; Moderate-to-severe renal impairment (IV only); **OB:** Use only if potential

benefits outweigh risks to the fetus; additional vitamin K during last wk of pregnancy has been recommended;

Lactation: Discontinue drug or bottle feed.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Cardiac or hepatic disease; Renal failure (dosing adjustment required for CCr <10 mL/min); Mild renal impairment (IV only); ↑ intraocular pressure; **Geri:** Older men with prostatic hyperplasia may be at ↑ risk for acute urinary retention or difficulty initiating stream; **Pedi:** Safety and effectiveness of IV formulation not established.

Exercise Extreme Caution in: ❌ Patients positive for HLA-B*1502 or HLA-A*3101 alleles (unless benefits clearly outweigh the risks) (↑ risk of serious skin reactions).

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS**, ataxia, drowsiness, fatigue, psychosis, sedation, vertigo. **EENT:** blurred vision, corneal opacities, nystagmus. **Resp:** pneumonitis. **CV:** HF, edema, heart block, hypertension, hypotension, syncope. **GI:** **HEPATOTOXICITY**, **PANCREATITIS**, ↑ liver enzymes, weight gain. **GU:** hesitancy, renal impairment (IV only), urinary retention. **Derm:** **DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)**, **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, nail shedding, photosensitivity, rash, urticaria. **F and E:** syndrome of inappropriate antidiuretic hormone (SIADH), hyponatremia. **Hemat:** **AGRANULOCYTOSIS**, **APLASTIC ANEMIA**, **THROMBOCYTOPENIA**, eosinophilia, leukopenia, lymphadenopathy. **Misc:** chills, fever.

Interactions

Drug-Drug: May significantly ↓ levels of **nefazodone** or **NNRTIs** that are CYP3A4 substrates; concurrent use contraindicated. Concurrent or recent (within 2 wk) use of **MAO inhibitors** may result in hyperpyrexia, hypertension, seizures, and death; use contraindicated. May ↓ levels/effectiveness of **acetaminophen**, **alprazolam**, **aprepitant**, **buprenorphine**, **bupropion**, **calcium channel blockers**, **citalopram**, **clonazepam**, **corticosteroids**, **cyclosporine**, **doxycycline**, **estrogen-containing contraceptives**, **everolimus**, **haloperidol**, **imatinib**, **itraconazole**, **lamotrigine**, **levothyroxine**, **methadone**, **midazolam**, **olanzapine**, **paliperidone**, **phenytoin**, **protease inhibitors**, **risperidone**, **sertraline**, **sirolimus**, **tacrolimus**, **tadalafil**, **theophylline**, **tiagabine**, **topiramate**, **tramadol**, **trazodone**, **tricyclic antidepressants**, **valproic acid**, **warfarin**, **ziprasidone**, and **zonisamide**. May ↓ **aripiprazole** levels; double the aripiprazole dose. May ↓ **temsolimus** and **lapatinib** levels; avoid concurrent use. **Aprepitant**, **cimetidine**, **cipfloxacin**, **clarithromycin**, **danazol**, **dantrolene**, **diltiazem**, **erythromycin**, **flucanazole**, **fluoxetine**, **fluvoxamine**, **isoniazid**, **itracon-**

azole, **ketoconazole**, **loratadine**, **olanzapine**, **omeprazole**, **oxybutynin**, **protease inhibitors**, **trazodone**, **voriconazole**, and **verapamil** may ↑ carbamazepine levels; may ↑ risk of toxicity. Enzyme inducers such as **rifampin**, **phenobarbital**, and **phenytoin** may ↓ levels. May ↑ risk of hepatotoxicity from **isoniazid**. May ↑ risk of CNS toxicity from **lithium**. May ↓ effects of **nondepolarizing neuromuscular blocking agents**. May ↑ risk of toxicity from **cyclophosphamide**.

Drug-Food: **Grapefruit juice** ↑ serum levels and oral bioavailability by 40% and therefore may ↑ effects.

Route/Dosage

IV route should only be used when oral administration is not possible. When converting from immediate-release to extended-release formulation, administer same total daily dose (in 2 divided doses).

Seizures

PO (Adults and Children >12 yr): 200 mg twice daily (immediate-release [IR] tablets and extended-release [ER] tablets/capsules) or 100 mg 4 times daily (suspension); ↑ by up to 200 mg/day in divided doses (every 12 hr for ER tablets; every 6–8 hr for IR tablets and suspension) every 7 days until therapeutic levels are achieved (usual range = 600–1200 mg/day); not to exceed 1000 mg/day in children 12–15 yrs old or 1200 mg/day in children 15–18 yrs old or 1600 mg/day in adults.

PO (Children 6–12 yr): 100 mg twice daily (IR tablets or ER tablets/capsules) or 50 mg 4 times daily (suspension). ↑ by up to 100 mg/day in divided doses (every 12 hr for ER tablets; every 6–8 hr for IR tablets and suspension) every 7 days until therapeutic levels are achieved (usual range = 400–800 mg/day); not to exceed 1000 mg/day.

PO (Children <6 yr): 10–20 mg/kg/day in 2–3 divided doses (IR tablets) or in 4 divided doses (suspension); may be ↑ at weekly intervals until optimal response and therapeutic levels are achieved; not to exceed 35 mg/kg/day.

IV (Adults): Total daily dose = 70% of total daily oral carbamazepine dose. Divide total daily dose into 4 separate doses administered every 6 hr. Should not be used for >7 days.

Trigeminal Neuralgia

PO (Adults): 100 mg twice daily (IR or ER tablets), 200 mg once daily (ER capsules), or 50 mg 4 times daily (suspension); ↑ by up to 200 mg/day in divided doses (every 12 hr for IR tablets or ER tablets/capsules; every 6 hr for suspension) as needed until pain is relieved (usual range = 400–800 mg/day); not to exceed 1200 mg/day.

* = Canadian drug name. ❌ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Acute Manic or Mixed Episodes Associated with Bipolar I Disorder

PO (Adults): *Equetro*—200 mg twice daily; ↑ by 200 mg/day until optimal response is achieved; not to exceed 1600 mg/day.

Availability (generic available)

Tablets: 200 mg. **Cost:** *Generic*—\$7.18/100. **Chewable tablets:** 100 mg, 200 mg. **Cost:** *Generic*—\$23.11/100. **Extended-release capsules (Carbatrol, Equetro):** 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—All strengths \$214.48/60. **Extended-release tablets (Tegretol XR):** 100 mg, 200 mg, 400 mg. **Cost:** *Generic*—200 mg \$113.31/100, 400 mg \$224.76/100. **Oral suspension (citrus/vanilla flavor):** 100 mg/5 mL. **Cost:** *Generic*—\$74.77/450 mL. **Solution for injection (requires dilution):** 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- ☹ Monitor for changes in skin condition in early therapy. Stevens-Johnson syndrome and toxic epidermal necrolysis are significantly more common in patients with a particular human leukocyte antigen (HLA) allele, HLA-B*1502 (occurs almost exclusively in patients with Asian ancestry, including South Asian Indians). Screen patients of Asian ancestry for the HLA-B*1502 allele before starting treatment with carbamazepine. If positive, carbamazepine should not be started unless the expected benefit outweighs increased risk of serious skin reactions. Patients who have been taking carbamazepine for more than a few mo without developing skin reactions are at low risk of these events ever developing.
- Monitor for signs and symptoms of DRESS syndrome (fever, rash, and/or lymphadenopathy with organ system involvement, [hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis] resembling an acute viral infection with eosinophilia. Discontinue carbamazepine if other cause not determined).
- **Seizures:** Assess frequency, location, duration, and characteristics of seizure activity.
- **Trigeminal Neuralgia:** Assess for facial pain (location, intensity, duration). Ask patient to identify stimuli that may precipitate facial pain (hot or cold foods, bedclothes, touching face).
- **Bipolar Disorder:** Assess mental status (mood, orientation, behavior) and cognitive abilities before and periodically during therapy.
- **Lab Test Considerations:** Monitor CBC, including platelet count, reticulocyte count, and serum iron, at baseline, weekly during the first 2 mo, and yearly thereafter for evidence of potentially fatal

blood cell abnormalities. Discontinue therapy if bone marrow depression occurs.

- ☹ Perform genetic testing for the HLA-B*1502 allele in patients of Asian ancestry prior to beginning therapy.
- Perform liver function tests, urinalysis, electrolytes, serum creatinine, and BUN at baseline and routinely performed. May cause ↑ AST, ALT, serum alkaline phosphatase, bilirubin, BUN, urine protein, and urine glucose levels.
- Monitor serum ionized calcium levels every 6 mo or if seizure frequency increases. Thyroid function tests and ionized serum calcium concentrations may be ↓ hypocalcemia ↓ seizure threshold.
- Monitor ECG and serum electrolytes before and periodically during therapy. May cause hyponatremia.
- May occasionally cause ↑ serum cholesterol, high-density lipoprotein, and triglyceride concentrations.
- May cause false-negative pregnancy test results with tests that determine human chorionic gonadotropin.
- **Toxicity and Overdose:** Serum blood levels should be routinely monitored during therapy. Therapeutic levels range from 4–12 mcg/mL.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Chronic pain (Indications)

Disturbed thought process (Indications)

Implementation

- Do not confuse carbamazepine with oxcarbazepine. Do not confuse Tegretol with Tegretol XR.
- Implement seizure precautions as indicated.
- **PO:** Administer medication with food to minimize gastric irritation. May take at bedtime to reduce daytime sedation. Tablets may be crushed if patient has difficulty swallowing. Do not crush or chew extended-release tablets. Extended-release capsules may be opened and the contents sprinkled on applesauce or other similar foods.
- Do not administer suspension simultaneously with other liquid medications or diluents; mixture produces an orange rubbery mass.

IV Administration

- Return to previous oral dose as soon as possible.
- **Intermittent Infusion:** Dilute dose in 100 mL of 0.9% NaCl, LR, or D5W and mix gently. Solution is stable for 4 hrs at room temperature or 24 hrs if refrigerated. Do not infuse solutions that are discolored, cloudy, or contain particulate matter. **Rate:** Infuse over 30 min.

Patient/Family Teaching

- Instruct patient to take carbamazepine around the clock, as directed. Take missed doses as soon as possible but not just before next dose; do not double doses. Notify health care professional if more than one dose is missed. Discontinued gradually to pre-

vent seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.

- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- May cause dizziness or drowsiness. Advise patients to avoid driving or other activities requiring alertness until response to medication is known.
- **Instruct patient to report behavioral changes, skin rash, fever, sore throat, mouth ulcers, easy bruising, petechiae, unusual bleeding, abdominal pain, chills, rash, pale stools, dark urine, or jaundice to health care professional immediately.** Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Inform patient that coating of *Tegretol XR* is not absorbed, but is excreted in feces and may be visible in stool.
- Advise patient not to take alcohol or other CNS depressants concurrently with this medication.
- Caution patients to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may help reduce dry mouth. Saliva substitute may be used. Consult dentist if dry mouth persists >2 wk.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- **Rep:** Advise female patients to use a nonhormonal form of contraception while taking carbamazepine, to avoid breast feeding, and to notify health care professional if pregnancy is planned or suspected or if breast feeding. Instruct patient to notify health care professional if pregnancy is planned or suspected. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves.
- Emphasize the importance of follow-up lab tests and eye exams to monitor for side effects.
- **Seizures:** Advise patients to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes

- Absence or reduction of seizure activity.
- Decrease in trigeminal neuralgia pain. Patients with trigeminal neuralgia who are pain-free should be re-evaluated every 3 mo to determine minimum effective dose.
- Decreased mania and depressive symptoms in bipolar I disorder.

carbidopa/levodopa

(kar-bi-doe-pa/lee-voe-doe-pa)

Duopa,  Duodopa, Rytary, Sinemet, Sinemet CR

Classification

Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Indications

Parkinson's disease. Not useful for drug-induced extrapyramidal reactions.

Action

Levodopa is converted to dopamine in the CNS, where it serves as a neurotransmitter. Carbidopa, a decarboxylase inhibitor, prevents peripheral destruction of levodopa. **Therapeutic Effects:** Relief of tremor and rigidity in Parkinson's syndrome.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed. *Levodopa*—enters the CNS in small concentrations. *Carbidopa*—does not cross the blood-brain barrier but does cross the placenta. Both enter breast milk.

Metabolism and Excretion: *Levodopa*—mostly metabolized by the GI tract and liver. *Carbidopa*—30% excreted unchanged by the kidneys.

Half-life: *Levodopa*—1 hr; *carbidopa*—1–2 hr.

TIME/ACTION PROFILE (antiparkinson effects)

ROUTE	ONSET	PEAK	DURATION
Carbidopa	unknown	unknown	5–24 hr
Levodopa	10–15 min	unknown	5–24 hr or more
Carbidopa/levodopa sustained release	unknown	2 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Nonselective MAO inhibitor therapy; Malignant melanoma; Undiagnosed skin lesions; Some products contain tartrazine, phenylalanine, or aspartame

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

and should be avoided in patients with known hypersensitivity.

Use Cautiously in: History of cardiac, psychiatric, or ulcer disease; **OB, PEDI:** Safety not established; **Lactation:** May ↓ serum prolactin; levodopa enters breast milk.

Adverse Reactions/Side Effects

CNS: depression, involuntary movements, anxiety, confusion, dizziness, drowsiness, hallucinations, memory loss, psychiatric problems, sudden sleep onset, urges (gambling, sexual). **CV:** orthostatic hypotension. **EENT:** blurred vision, mydriasis. **GI:** GI HEMORRHAGE (enteral suspension), GI ISCHEMIA (enteral suspension), GI OBSTRUCTION (enteral suspension), GI PERFORATION (enteral suspension), HEPATOTOXICITY, INTUSSUSCEPTION (enteral suspension), PANCREATITIS (enteral suspension), PERITONITIS (enteral suspension), constipation, nausea, vomiting, anorexia, bezoar (enteral suspension), dry mouth. **Derm:** melanoma. **Hemat:** hemolytic anemia, leukopenia. **MS:** dyskinesias. **Neuro:** neuropathy. **Misc:** MELANOMA, darkening of urine or sweat.

Interactions

Drug-Drug: Use with **nonselective MAO inhibitors** may result in hypertensive reactions; concurrent use contraindicated (MAO inhibitor must be discontinued ≥2 wk before initiating carbidopa/levodopa). ↑ risk of arrhythmias with **inhalation hydrocarbon anesthetics** (especially halothane; if possible discontinue 6–8 hr before anesthesia). **Phenothiazines, haloperidol, papaverine, phenytoin, and reserpine** may ↓ effect of levodopa. Large doses of **pyridoxine** may ↓ beneficial effects of levodopa. Concurrent use with **methyldopa** may alter the effectiveness of levodopa and ↑ risk of CNS side effects. ↑ hypotension may result with concurrent **antihypertensives**. **Anticholinergics** may ↓ absorption of levodopa. ↑ risk of adverse reactions with **selegiline** or **cocaine**.

Drug-Natural Products: Kava-kava may ↓ levodopa effectiveness.

Drug-Food: Ingestion of foods containing large amounts of **pyridoxine** may ↓ effect of levodopa.

Route/Dosage

Carbidopa/Levodopa

PO (Adults): 25 mg carbidopa/100 mg levodopa 3 times daily; may be ↑ every 1–2 days until desired effect is achieved (max = 8 tablets of 25 mg carbidopa/100 mg levodopa/day).

Enteral (Adults): Patients must be converted to and be on stable dose of PO immediate-release carbidopa/levodopa tablets before initiation enteral suspension therapy. *Morning dose for Day 1 (mL) (to be administered over 10–30 min)* = (Amount of levodopa (in mg) in first dose of immediate-release carbidopa/levodopa taken by patient on previous day * 0.8)/20; *Continuous dose for Day 1 (mL) (to be administered*

over 16 hr) = Determine amount of levodopa (in mg) patient received from immediate-release carbidopa/levodopa doses throughout 16 waking hours of previous day (do not include doses of immediate-release carbidopa/levodopa taken at night when calculating the levodopa amount). Then, subtract amount of first levodopa dose (in mg) taken by patient on previous day. Divide result by 20 to obtain the # of mL to be administered over 16 hr. Do not exceed dose of 2000 mg. At end of daily 16-hour infusion, patients will disconnect the pump from feeding tube and take their night-time dose of oral immediate-release carbidopa/levodopa tablets. Total daily dose can be titrated after Day 1 based on patient response and tolerability.

Carbidopa/Levodopa Extended-Release (doses of all other dosage forms of carbidopa/levodopa and Rytary are not interchangeable)

PO (Adults): *Patients not currently receiving levodopa (Sinemet CR)* — 50 mg carbidopa/200 mg levodopa twice daily (minimum of 6 hr apart) initially. *Patients not currently receiving levodopa (Rytary)* — 23.75 mg carbidopa/95 mg levodopa 3 times daily x 3 days, then 36.25 mg carbidopa/145 mg levodopa 3 times daily. May continue to ↑ dose as needed (max dose = 97.5 mg carbidopa/390 mg levodopa 3 times daily) May also ↑ frequency of administration up to 5 times daily (max dose = 612.5 mg carbidopa/2450 mg levodopa/day). *Conversion from immediate—release (IR) carbidopa/levodopa to Sinemet CR* — initiate therapy with at least 10% more levodopa content/day (may need up to 30% more) given at 4–8 hr intervals while awake. Allow 3 days between dosage changes; some patients may require larger doses and shorter dosing intervals. *Conversion from IR carbidopa/levodopa to Rytary* — If taking 400–549 mg/day of IR levodopa, give 3 capsules of Rytary 23.75 mg carbidopa/95 mg levodopa 3 times daily. If taking 550–749 mg/day of IR levodopa, give 4 capsules of Rytary 23.75 mg carbidopa/95 mg levodopa 3 times daily. If taking 750–949 mg/day of IR levodopa, give 3 capsules of Rytary 36.25 mg carbidopa/145 mg levodopa 3 times daily. If taking 950–1249 mg/day of IR levodopa, give 3 capsules of Rytary 48.75 mg carbidopa/195 mg levodopa 3 times daily. If taking ≥1250 mg/day of IR levodopa, give 4 capsules of Rytary 48.75 mg carbidopa/195 mg levodopa 3 times daily or 3 capsules of Rytary 61.25 mg carbidopa/245 mg levodopa 3 times daily; may then titrate as needed (max daily dose = 612.5 mg carbidopa/2450 mg levodopa).

Availability (generic available)

Tablets: 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa. **Cost:** *Generic* — 10 mg/100 mg \$25.28/100, 25 mg/100 mg \$28.91/100, 25 mg/250 mg \$19.22/100. **Orally disintegrating tablets (mint):** 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/

100 mg levodopa, 25 mg carbidopa/250 mg levodopa.
Cost: Generic—10 mg/100 mg \$121.48/100, 25 mg/100 mg \$137.18/100, 25 mg/250 mg \$174.76/100.
Extended-release tablets (Sinemet CR): 25 mg carbidopa/100 mg levodopa, 50 mg carbidopa/200 mg levodopa. **Cost: Generic**—25 mg/100 mg \$93.90/100, 50 mg/200 mg \$180.50/100. **Extended-release capsules (Rytary):** 23.75 mg carbidopa/95 mg levodopa, 36.25 mg carbidopa/145 mg levodopa, 48.75 mg carbidopa/195 mg levodopa, 61.25 mg carbidopa/245 mg levodopa. **Enteral suspension (Duopa):** 4.63 mg carbidopa/20 mg levodopa/mL in 100-mL single-use cassettes, * 5 mg carbidopa/20 mg levodopa/mL in 100-mL single-use cassettes. **In combination with:** entacapone (Stalevo); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian symptoms (akinesia, rigidity, tremors, pill rolling, shuffling gait, mask-like face, twisting motions, and drooling) during therapy. “On-off phenomenon” may cause symptoms to appear or improve suddenly.
- Assess BP and pulse frequently during period of dose adjustment.
- **Duopa:** Monitor for signs and symptoms of GI complications (abdominal pain, prolonged constipation, nausea, vomiting, fever, melanotic stool) during therapy.
- **Lab Test Considerations:** May cause false-positive test results in Coombs' test.
- May cause ↑ serum glucose. Dipstick for urine ketones may reveal false-positive results.
- Monitor hepatic and renal function and CBC periodically in patients on long-term therapy. May cause ↑ AST, ALT, bilirubin, alkaline phosphatase, LDH, and serum protein-bound iodine concentrations. May cause ↓ BUN, serum creatinine, and uric acid.
- May cause ↓ hemoglobin, ↓ hematocrit, agranulocytosis, hemolytic and nonhemolytic anemia, thrombocytopenia, leukopenia, and ↑ WBC.
- **Toxicity and Overdose:** Assess for signs of toxicity (involuntary muscle twitching, facial grimacing, spasmodic eye winking, exaggerated protrusion of tongue, behavioral changes). Consult health care professional if symptoms occur.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Risk for injury (Indications)

Implementation

- **Do not confuse Sinemet with Janumet.**
- In the carbidopa/levodopa combination, the number following the drug name represents the milligrams of each respective drug.

- In preoperative patients or patients who are NPO, confer with health care professional about continuing medication administration using oral disintegrating tablets.
- **PO:** Administer on a regular schedule. Hospitalized patients should be continued on same schedule as at home. Administer while awake, not around the clock to improve sleep and prevent side effects.
- Controlled-release tablets may be administered as whole or half tablets, but they should not be crushed or chewed.
- For orally disintegrating tablets, just prior to administration remove tablet from bottle with dry hands. Immediately place tablet on top of tongue. Tablet will dissolve in seconds, then swallow with saliva. Administration with liquid is not necessary.
- For enteral administration, administer DUOPA into the jejunum through a percutaneous endoscopic gastrostomy with jejunal tube (PEG-J) with CADD-Legacy 1400 portable infusion pump. Take suspension out of refrigerator 20 min prior to use; must be at room temperature for use. Administer over 16 hrs. If extra dose is needed, set function at 1 mL (20 mg of levodopa) when starting; may be adjusted in 0.2 mL increments. Limit to 1 extra dose every 2 hrs. Frequent extra doses may cause or worsen dyskinesias. Discontinue gradually; do not stop abruptly.
- For extended-release capsules, administer without regard to food. Swallow capsules whole; do not chew, divide, or crush. For patients with difficulty swallowing, open capsule and sprinkle entire contents on 1 to 2 tablespoons of applesauce; consume immediately. Do not store mixture for future use. Inform patients that first dose of day may be taken 1 to 2 hrs before eating, as a high fat, high calorie meal may delay the absorption of levodopa and onset of action by 2 to 3 hrs. Discontinue gradually; do not stop abruptly. When adjusting dose of extended-release capsules, keep dose of other Parkinson's medications stable; dose may need to be increased in patients taking COMT inhibitor. Extended-release capsules may be administered 3–5 times daily if more frequent dosing is needed and tolerated.

Patient/Family Teaching

- Instruct patient to take medication at regular intervals as directed. Do not change dose regimen or take additional antiparkinson drugs, including more carbidopa/levodopa, without consulting health care professional. Take missed doses as soon as remembered, unless next scheduled dose is within 2 hr; do not double doses.
- Explain that gastric irritation may be decreased by eating food shortly after taking medications but that high-protein meals may impair levodopa's effects. Dividing daily protein intake among all the meals

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

may help ensure adequate protein intake and drug effectiveness. Do not drastically alter diet during carbidopa/levodopa therapy without consulting health care professional.

- May cause sudden onset of sleep, drowsiness, or dizziness. Advise patient to avoid driving and other activities that require alertness until response to drug is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Health care professional should be notified if orthostatic hypotension occurs.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth.
- Caution patient to monitor skin lesions for any changes. Health care professional should be notified promptly because carbidopa/levodopa may activate malignant melanoma.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cold remedies. Large amounts of vitamin B₆ (pyridoxine) and iron may interfere with the action of levodopa.
- Inform patient that harmless darkening of saliva, urine, or sweat may occur.
- Advise patient to notify health care professional if signs and symptoms of GI complications, palpitations, urinary retention, involuntary movements, behavioral changes, severe nausea and vomiting, new skin lesions, or new or increased gambling, sexual, or other intense urges occur. Dose reduction may be required.
- Inform patient that sometimes a “wearing-off” effect may occur at end of dosing interval. Notify health care professional if this poses a problem to lifestyle.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of parkinsonian signs and symptoms. Therapeutic effects usually become evident after 2–3 wk of therapy but may require up to 6 mo. Patients who take this medication for several yr may experience a decrease in the effectiveness of this drug.

carbonyl iron, See IRON SUPPLEMENTS.

CARBOplatin (kar-boe-pla-tin) Paraplatin

Classification

Therapeutic: antineoplastics

Pharmacologic: alkylating agents

Indications

Advanced ovarian carcinoma (with other agents). Palliative treatment of ovarian carcinoma unresponsive to other modalities.

Action

Inhibits DNA synthesis by producing cross-linking of parent DNA strands (cell-cycle phase–nonspecific).

Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: Platinum is irreversibly bound to plasma proteins.

Metabolism and Excretion: Excreted mostly by the kidneys.

Half-life: *Carboplatin*—2.6–5.9 hr (increased in renal impairment); *platinum*—5 days.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	21 days	28 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to carboplatin, cisplatin, or mannitol; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Hearing loss; Electrolyte abnormalities; Renal impairment (dose ↓ recommended if CCr <60 mL/min); Active infections; Diminished bone marrow reserve (dose ↓ recommended); Other chronic debilitating illnesses; **Ger:** ↑ risk of thrombocytopenia, consider renal function in dose determination; Patients with childbearing potential; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: weakness. **EENT:** ototoxicity. **GI:** abdominal pain, nausea, vomiting, constipation, diarrhea, hepatitis, stomatitis. **GU:** gonadal suppression, nephrotoxicity. **Derm:** alopecia, rash. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hyponatremia. **Hemat:** ANEMIA, LEUKOPENIA, THROMBOCYTOPENIA. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy. **Misc:** hypersensitivity reactions including ANAPHYLACTIC-LIKE REACTIONS.

Interactions

Drug-Drug: ↑ nephrotoxicity and ototoxicity with other **nephrotoxic and ototoxic drugs (aminoglycosides, loop diuretics)**. ↑ bone marrow depression with other **bone marrow–depressing drugs or radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Other dosing formulas are used.

IV (Adults): Initial treatment—300 mg/m² with cyclophosphamide at 4-wk intervals. **Treatment of refractory tumors**—360 mg/m² as a single dose; may be repeated at 4-wk intervals, depending on response.

Renal Impairment

IV (Adults): CCr 41–59 mL/min—initial dose 250 mg/m²; **CCr 16–40 mL/min**—initial dose 200 mg/m².

Availability (generic available)

Solution for injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for nausea and vomiting; often occur 6–12 hr after therapy (1–4 hr for aqueous solution) and may persist for 24 hr. Prophylactic antiemetics may be used. Adjust diet as tolerated to maintain fluid and electrolyte balance and ensure adequate nutritional intake. May require discontinuation of therapy.
- **Monitor for bone marrow depression.** Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur and may be cumulative; transfusions are frequently required. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- **Monitor for signs of anaphylaxis (rash, urticaria, pruritus, facial swelling, wheezing, tachycardia, hypotension).** Discontinue medication immediately and notify physician if these occur. **Epinephrine and resuscitation equipment should be readily available.**
- Audiometry is recommended before initiation of therapy and subsequent doses. Ototoxicity manifests as tinnitus and unilateral or bilateral hearing loss in high frequencies and becomes more frequent and severe with repeated doses. Ototoxicity is more pronounced in children.
- **Lab Test Considerations:** **Monitor CBC, differential, and clotting studies before and weekly during therapy.** The nadirs of thrombocytopenia and leukopenia occur after 21 days and recover by 30 days after a dose. Nadir of granulocyte counts usually occurs after 21–28 days and recovers by day 35.

Withhold subsequent doses until neutrophil count is >2000/mm³ and platelet count is >100,000/mm³.

- Monitor renal function and serum electrolytes before initiation of therapy and before each course of carboplatin.
- Monitor hepatic function before and periodically during therapy. May cause ↑ serum bilirubin, alkaline phosphatase, and AST concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- **High Alert:** Do not confuse carboplatin with cisplatin.
- **High Alert:** Carboplatin should be administered in a monitored setting under the supervision of a physician experienced in cancer chemotherapy.

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Do not use aluminum needles or equipment during preparation or administration; aluminum reacts with the drug.
- **Intermittent Infusion: Concentration:** 0.5 mg/mL. Stable for 8 hr at room temperature. **Rate:** Infuse over 15–60 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cistracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, etoposide, erythromycin, esmolol, epinephrine, etoposide phosphate, famotidine, fenoldopam, fentanyl, fil-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

grastim, fluconazole, fludarabine, fluorouracil, fos-carnet, fosphenytoin, furosemide, ganciclovir, gem-citabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labeta-lol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperi-dine, meropenem, mesna, metaraminol, methotrex-ate, methylodopate, methylprednisolone, metoclopra-mide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nafcillin, nalbuphine, nal-oxone, nesiritide, nicardipine, nitroglycerine, nitro-prusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentami-dine, pentazocine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propofol, pro-pranolol, quinupristin/dalfopristin, ranitidine, remi-fentanil, rituximab, rocuronium, sargramostim, so-dium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopeta, tigecycline, tirofi-ban, tobramycin, trastuzumab, trimethoprim/sulfa-methoxazole, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zi-dovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, chlorpromazine, diazepam, leucovorin calcium, phenytoin, procainamide, thiopental.

Patient/Family Teaching

- **Instruct patient to notify health care professional promptly if fever; chills; sore throat; signs of infec-tion; lower back or side pain; difficult or painful uri-nation; bleeding gums; bruising; pinpoint red spots on skin; blood in stools, urine, or emesis; increased fatigue, dyspnea, or orthostatic hypotension occurs.**
- Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft tooth-brush and electric razor and to avoid falls. Caution patients not to drink alcoholic beverages or take medication containing aspirin or NSAIDs because they may precipitate gastric bleeding.
- Instruct patient to promptly report any numbness or tingling in extremities or face, decreased coordina-tion, difficulty with hearing or ringing in the ears, unusual swelling, or weight gain to health care pro-fessional.
- Instruct patient not to receive any vaccinations with-out advice of health care professional and to avoid contact with persons who have received oral polio vaccine within the past several mo.
- Advise patient of the need for contraception (if pa-tient is not infertile as a result of surgical or radia-tion therapy).

- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to notify health care professional, rinse mouth with wa-ter after eating, and use sponge brush. Mouth pain may require treatment with opioids.
- Discuss with patient the possibility of hair loss. Ex-plore methods of coping.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of ovarian carcinoma.

cariprazine (kar-ip-ra-zeen)

Vraylar

Classification

Therapeutic: antipsychotics

Indications

Treatment of schizophrenia. Acute treatment of mania/ mixed episodes due to bipolar I disorder.

Action

Acts as a partial agonist at dopamine D₂ receptors in the CNS and serotonin 5-HT_{1A}; also acts an antagonist at 5-HT_{2A} receptors. **Therapeutic Effects:** De-creased incidence and severity of symptoms of schizo-phrenia. Decreased occurrence and severity of mania associated with bipolar I disorder.

Pharmacokinetics

Absorption: Well absorbed following oral adminis-tration.

Distribution: Unknown.

Protein Binding: 91–97%.

Metabolism and Excretion: Two metabolites desmethyl cariprazine (DCAR) and didesmethyl cari-prazine (DDCAR) are have antipsychotic activity. Me-tabolism occurs mostly via the CYP3A4 enzyme system, with further metabolism resulting in inactive metabo-lites; 21% excreted urine, 1.2% as unchanged drug.

Half-life: Cariprazine—2–4 days; DDCAR—1–3 weeks.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO (schizo-phrenia)	within 1–2 wk	4–6 wk	2 wk†
PO (mania due to bi-polar I disorder)	within 5–7 days	2–3 wk	2 wk†

† Blood levels of drug and active metabolites following dis-continuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of strong CYP3A4 inhibitors; Concurrent use of strong CYP3A4 inducers.

Use Cautiously in: Known cerebrovascular/cardiovascular disease, dehydration, concurrent use of diuretics/antihypertensives or syncope (↑ risk of orthostatic hypotension); Pre-existing ↓ WBC or ANC or history of drug-induced leukopenia/neutropenia; Patients at risk of aspiration or falls; **OB:** Neonates exposed in the third trimester may experience extrapyramidal symptoms/withdrawal; **Lactation:** Consider maternal and fetal benefits against possible adverse effects in infant; **Pedi:** Safety and effectiveness not established; **Geri:** Elderly patients with dementia-related psychosis (↑ risk of adverse cardiovascular effects and death), consider age-related ↓ in renal/hepatic/cardiovascular function, concurrent disease states and medications (↓ initial dose recommended).

Adverse Reactions/Side Effects

CNS: drowsiness, headache, agitation, dizziness, fatigue, insomnia, restlessness. **EENT:** blurred vision.

Resp: cough. **CV:** hypertension, orthostatic hypotension, tachycardia. **GI:** dyspepsia, nausea, ↓ appetite, constipation, diarrhea, dry mouth, dysphagia (↑ aspiration risk), ↑ liver enzymes, vomiting. **Derm:** rash. **He-mat:** **AGRANULOCYTOSIS**, leukopenia, neutropenia. **Me-tab:** dyslipidemia, hyperglycemia/diabetes mellitus, weight gain. **MS:** arthralgia, back pain, extremity pain. **Neuro:** akathisia, extrapyramidal symptoms, tardive dyskinesia. **Misc:** **NEUROLEPTIC MALIGNANT SYNDROME**, body temperature dysregulation, late-occurring adverse reactions (consider long half-life of active drug).

Interactions

Drug-Drug: Blood levels, effects and risk of toxicity ↑ by concurrent use of **strong CYP3A4 inhibitors** including **itraconazole** and **ketoconazole**; concurrent use not recommended. Blood levels and effectiveness may be ↓ by concurrent use of **strong CYP3A4 inducers** including **carbamazepine** and **rifampin**; concurrent use not recommended. Concurrent use of **diuretics** or **antihypertensives** ↑ risk of orthostatic hypotension/syncope.

Route/Dosage

PO (Adults): *Schizophrenia*—1.5 mg/day initially, may be increased on second day to 3 mg, further increments of 1.5 mg or 3 mg may be made depending on response/tolerance up to maintenance dose of 1.5–6 mg/day; *Bipolar mania*—1.5 mg/day initially, may be increased on second day to 3 mg, further increments of 1.5 mg or 3 mg may be made depending on response/tolerance up to maintenance dose of 1.5–6 mg/day titrated up to 3–6 mg/day; *Concurrent use of strong CYP3A4 inhibitors*—decrease dose by 50%.

Availability

Capsules: 1.5 mg, 3 mg, 4.5 mg, 6 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy.
- Assess weight and BMI initially and throughout therapy.
- Monitor BP (sitting, standing, lying), pulse, and respiratory rate before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor for adverse reactions and patient response for several wk after starting therapy and after each dose increase. Due to long action, may not occur for several wks. Consider reducing dose or discontinuing drug if severe adverse reactions occur.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- **Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control).** Notify health care professional immediately if these symptoms occur.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- **Lab Test Considerations:** Monitor CBC frequently during therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if severe neutropenia (ANC <1000 mm³) occurs.
- Monitor fasting blood glucose and lipid profile initially and periodically during therapy.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Imbalanced nutrition: risk for more than body requirements (Side Effects)

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Implementation

- **PO:** Administer once daily without regard to meals.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose. Do not stop taking cariprazine without consulting health care professional.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension. Protect from falls.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional of new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Inform patient that cariprazine may cause weight gain. Advise patient to monitor weight periodically. Notify health care professional of significant weight gain.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications. Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Encourage pregnant patients to enroll in registry by contacting National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit <http://womensmental-health.org/clinical-and-research-programs/pregnancyregistry/>.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoid, or withdrawn behavior.
- Decreased occurrence and severity of mania associated with bipolar 1 disorder.

Classification

Therapeutic: skeletal muscle relaxants (centrally acting)

Schedule IV

Indications

Adjunct to rest and physical therapy in the treatment of muscle spasm associated with acute painful musculoskeletal conditions.

Action

Skeletal muscle relaxation, probably due to CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Crosses the placenta; high concentrations in breast milk.

Metabolism and Excretion: Mostly metabolized by the liver via CYP2C19 to meprobamate; \approx 2% of Whites, 4% of Blacks, and 14% of Asians have CYP2C19 genotype that results in reduced metabolism of carisoprodol (poor metabolizers) into its active metabolite (may result in \uparrow sedation).

Half-life: 8 hr.

TIME/ACTION PROFILE (skeletal muscle relaxation)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	unknown	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to carisoprodol or to meprobamate; Porphyria or suspected porphyria.

Use Cautiously in: Severe liver or kidney disease; **OB, Lactation, Pedi:** Safety not established for pregnant women, breast feeding infants, or children <16 yr; **Geri:** Poorly tolerated due to anticholinergic effects. Appears on Beers list.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, agitation, ataxia, depression, headache, insomnia, irritability, syncope. **Resp:** asthma attacks. **CV:** hypotension, tachycardia. **GI:** epigastric distress, hiccups, nausea, vomiting. **Derm:** flushing, rashes. **Hemat:** eosinophilia, leukopenia. **Misc:** ANAPHYLACTIC SHOCK, fever, psychological dependence, severe idiosyncratic reaction.

Interactions

Drug-Drug: Additive CNS depression with other CNS depressants including alcohol, antihistamines, opioid analgesics, and sedative/hypnotics.

Drug-Natural Products: Concomitant use of kava-kava, valerian, skullcap, chamomile, or hops can \uparrow CNS depression.

carisoprodol
(kar-i-sop-roe-dole)
Soma

Route/Dosage

PO (Adults ≥ 16 yr): 250–350 mg 4 times daily for no longer than 2–3 wk.

Availability (generic available)

Tablets: 250 mg, 350 mg. Cost: *Generic*—250 mg \$330.59/100, 350 mg \$59.62/100. **In combination with:** aspirin and codeine (generic only). See Appendix B.

NURSING IMPLICATIONS**Assessment**

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Observe patient for idiosyncratic symptoms that may appear within minutes or hours of administration during the first dose. Symptoms include extreme weakness, quadriplegia, dizziness, ataxia, dysarthria, visual disturbances, agitation, euphoria, confusion, and disorientation. Usually subsides over several hours.
- **Geri:** Assess geriatric patients for anticholinergic effects (sedation and weakness).

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired bed mobility (Indications)

Risk for injury (Side Effects)

Implementation

- Should be used **ONLY** for acute treatment periods of no more than 2–3 wk.
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** Administer with food to minimize GI irritation. Give dose at bedtime.

Patient/Family Teaching

- Instruct patient to take medication as directed. Missed doses should be taken within 1 hr; if not, omit and return to regular dosing schedule. Do not double doses.
- Inform patient that use is limited to acute relief of musculoskeletal discomfort of 2–3 wk. Prolonged use may lead to dependence, withdrawal, and abuse. Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat, etc). If musculoskeletal discomfort persists consult health care professional for further evaluation.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.

- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- **Instruct patient to notify health care professional if signs of allergy (rash, hives, swelling of tongue or lips, dyspnea) or idiosyncratic reaction occur.**

Evaluation/Desired Outcomes

- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

carvedilol (kar-ve-di-lole)

Coreg, Coreg CR

Classification

Therapeutic: antihypertensives

Pharmacologic: beta blockers

Indications

Hypertension. HF (ischemic or cardiomyopathic) with digoxin, diuretics, and ACE inhibitors. Left ventricular dysfunction after myocardial infarction.

Action

Blocks stimulation of beta₁ (myocardial) and beta₂ (pulmonary, vascular, and uterine)-adrenergic receptor sites. Also has alpha, blocking activity, which may result in orthostatic hypotension. **Therapeutic Effects:** Decreased heart rate and BP. Improved cardiac output, slowing of the progression of HF and decreased risk of death.

Pharmacokinetics

Absorption: Well absorbed but rapidly undergoes extensive first-pass hepatic metabolism, resulting in 25–35% bioavailability. Food slows absorption.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Extensively metabolized (primarily by CYP2D6 and CYP2C9; the CYP2D6 enzyme system exhibits genetic polymorphism); $\frac{1}{3}$ ~7% of population may be poor metabolizers and may have significantly \uparrow carvedilol concentrations and an \uparrow risk of adverse effects); excreted in feces via bile, <2% excreted unchanged in urine.

Half-life: 7–10 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	1–2 hr	12 hr
PO-CR	unknown	5 hr	24 hr

Contraindications/Precautions

Contraindicated in: History of serious hypersensitivity reaction (Stevens-Johnson syndrome, angio-

* = Canadian drug name. $\frac{1}{3}$ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

edema, anaphylaxis); Pulmonary edema; Cardiogenic shock; Bradycardia, heart block or sick sinus syndrome (unless a pacemaker is in place); Uncompensated HF requiring IV inotropic agents (wean before starting carvedilol); Severe hepatic impairment; Asthma or other bronchospastic disorders.

Use Cautiously in: HF (condition may deteriorate during initial therapy); Renal impairment; Hepatic impairment; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Peripheral vascular disease; History of severe allergic reactions (intensity of reactions may be increased); **OB:** Crosses placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression); **Lactation, Pedi:** Safety not established; **Geri:** ↑ sensitivity to beta blockers; initial dose reduction recommended.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, weakness, anxiety, depression, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, dry eyes, intraoperative floppy iris syndrome, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, HF, PULMONARY EDEMA. **GI:** diarrhea, constipation, nausea. **GU:** erectile dysfunction, ↓ libido. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, itching, rashes, urticaria. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** AN-PHYLAXIS, ANGIOEDEMA, drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthetics, IV phenytoin, diltiazem, and verapamil may cause ↑ myocardial depression. ↑ risk of bradycardia with digoxin. Amiodarone or fluconazole may ↑ levels. ↑ hypotension may occur with other antihypertensives, acute ingestion of alcohol, or nitrates. Concurrent use with clonidine ↑ hypotension and bradycardia. May ↑ withdrawal phenomenon from clonidine (discontinue carvedilol first). Concurrent administration of thyroid preparations may ↓ effectiveness. May alter the effectiveness of insulins or oral hypoglycemic agents (dose adjustments may be necessary). May ↓ effectiveness of theophylline. May ↓ beneficial beta₁-cardiovascular effects of dopamine or dobutamine. Use cautiously within 14 days of MAO inhibitor therapy (may result in hypotension/bradycardia). Cimetidine may ↑ toxicity from carvedilol. Concurrent NSAIDs may ↑ antihypertensive action. Effectiveness may be ↓ by rifampin. May ↑ serum digoxin levels. May ↑ blood levels of cyclosporine (monitor blood levels).

Route/Dosage

PO (Adults): Hypertension—6.25 mg twice daily, may be ↑ q 7–14 days up to 25 mg twice daily or extended-release—20 mg once daily, dose may be doubled every 7–14 days up to 80 mg once daily; HF—3.125 mg twice daily for 2 wk; may be ↑ to 6.25 mg

twice daily. Dose may be doubled q 2 wk as tolerated (not to exceed 25 mg twice daily in patients <85 kg or 50 mg twice daily in patients >85 kg) or extended-release—10 mg once daily, dose may be doubled every 2 wk as tolerated up to 80 mg once daily; Left ventricular dysfunction after MI—6.25 mg twice daily, ↑ after 3–10 days to 12.5 mg twice daily then to target dose of 25 mg twice daily; some patients may require lower initial doses and slower titration or extended-release—20 mg once daily, dose may be doubled every 3–10 days up to 80 mg once daily.

Availability (generic available)

Tablets: 3.125 mg, 6.25 mg, 12.5 mg, 25 mg. **Cost:** Generic—All strengths \$7.18/100. **Extended-release capsules:** 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** all strengths \$175.36/30.

NURSING IMPLICATIONS

Assessment

- **Monitor BP and pulse frequently during dose adjustment period and periodically during therapy.** Assess for orthostatic hypotension when assisting patient up from supine position.
- **Monitor intake and output ratios and daily weight.** Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention). Patients may experience worsening of symptoms during initiation of therapy for HF.
- **Hypertension:** Check frequency of refills to determine adherence.
- **Lab Test Considerations:** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- **Toxicity and Overdose:** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse carvedilol with captopril.**
- Discontinuation of concurrent clonidine should be gradual, with carvedilol discontinued first over 1–2 wk with limitation of physical activity; then, after several days, discontinue clonidine.
- **PO: Take apical pulse before administering.** If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer with food to minimize orthostatic hypotension.
- Administer extended-release capsules in the morning. Swallow whole; do not crush, break, or chew.

Extended-release capsules may be opened and sprinkled on cold applesauce and taken immediately; do not store mixture.

- To convert from immediate-release to extended-release product, doses of 3.125 mg twice daily can be converted to 10 mg daily; doses of 6.25 mg twice daily can be converted to 20 mg daily; doses of 12.5 mg twice daily can be converted to 40 mg daily; and doses of 25 mg twice daily can be converted to 80 mg daily.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well. Do not skip or double up on missed doses. Take missed doses as soon as possible up to 4 hr before next dose. **Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.**
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or BP changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask some signs of hypoglycemia, but dizziness and sweating may still occur.
- **Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.**
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, so-

dium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of detrimental side effects.
- Decrease in severity of HF.

casprofungin (kas-po-fun-gin) Candidas

Classification

Therapeutic: antifungals (systemic)
Pharmacologic: echinocandins

Indications

Invasive aspergillosis refractory to, or intolerant of, other therapies. Candidemia and associated serious infections (intra-abdominal abscesses, peritonitis, pleural space infections). Esophageal candidiasis. Suspected fungal infections in febrile neutropenic patients.

Action

Inhibits the synthesis of β (1, 3)-D-glucan, a necessary component of the fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed to tissues.

Protein Binding: 97%.

Metabolism and Excretion: Slowly and extensively metabolized; <1.5% excreted unchanged in urine.

Half-life: Polyphasic: β phase—9–11 hr; γ phase—40–50 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use with cyclosporine.

Use Cautiously in: Moderate hepatic impairment (↓ maintenance dose recommended).

Adverse Reactions/Side Effects

CNS: headache, chills. **GI:** diarrhea, ↑ liver enzymes, nausea, vomiting. **Resp:** bronchospasm. **GU:** ↑ serum creatinine. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, flushing, pruritis, rash. **Local:** venous irritation at injection site. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIOEDEMA, fever.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: Concurrent use with **cyclosporine** is not recommended due to ↑ risk of hepatic toxicity. May ↓ blood levels and effects of **tacrolimus**. Blood levels and effectiveness may be ↓ by **rifampin**; maintenance dose should be ↑ to 70 mg (in patients with normal liver function). Blood levels and effectiveness also may be ↓ by **efavirenz**, **nelfinavir**, **nevirapine**, **phenytoin**, **dexamethasone**, or **carbamazepine**; an ↑ in the maintenance dose to 70 mg should be considered in patients who are not clinically responding.

Route/Dosage

IV (Adults): 70 mg initially followed by 50 mg daily, duration determined by clinical situation and response; *Esophageal candidiasis*—50 mg daily, duration determined by clinical situation and response.

IV (Children ≥3 mo): 70 mg/m² (max: 70 mg) initially followed by 50 mg/m² daily (max: 70 mg/day), duration determined by clinical situation and response.

IV (Infants 1 to <3 mo and Neonates): 25 mg/m²/dose once daily.

Hepatic Impairment

IV (Adults): *Moderate hepatic impairment*—70 mg initially followed by 35 mg daily, duration determined by clinical situation and response.

Availability (generic available)

Powder for injection: 50 mg/vial, 70 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of fungal infections prior to and periodically during therapy.
- Assess for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- Monitor patient for signs of anaphylaxis (rash, dyspnea, stridor) during therapy.
- **Lab Test Considerations:** May cause ↑ serum alkaline phosphatase, serum creatinine, AST, ALT, eosinophils, and urine protein and RBCs. May also cause ↓ serum potassium, hemoglobin, hematocrit, and WBCs.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

IV Administration

- **Intermittent Infusion:** Allow refrigerated vial to reach room temperature. *For 70-mg or 50-mg dose*—Reconstitute vials with 10.8 mL of 0.9% NaCl, sterile water for injection, Bacteriostatic Water for Injection with methylparaben and propylparaben, or Bacteriostatic Water for Injection with 0.9% benzyl alcohol. Use preservative-free diluents for ne-

onates. Do not dilute with dextrose solutions. Reconstituted solution is stable for 1 hr at room temperature. **Diluent:** Withdraw 10 mL from vial and add to 250 mL of 0.9% NaCl, 0.45% NaCl, 0.225% NaCl, or LR. The 50-mg dose also can be diluted in 100 mL when volume restriction is necessary. Infusion is stable for 24 hr at room temperature or 48 hr if refrigerated. *For 35-mg dose*—Reconstitute a 50-mg or 70-mg vial as per the directions above. Remove the volume of drug equal to the calculated loading dose or calculated maintenance dose based on a concentration of 7 mg/mL (if reconstituted from the 70-mg vial) or a concentration of 5 mg/mL (if reconstituted from the 50-mg vial). White cake should dissolve completely. Mix gently until a clear solution is obtained. Do not use a solution that is cloudy, discolored, or contains precipitates. **Concentration:** 0.14–0.47 mg/mL. **Rate:** Infuse over 1 hr.

- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, aztreonam, bleomycin, bumetanide, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, chlorpromazine, ciprofloxacin, cisratarcurium, cisplatin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxycycline, droperidol, epinephrine, epirubicin, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, labetalol, leucovorin, levofloxacin, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methylodopate, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pentamidine, pentazocine, phentolamine, phenylephrine, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanyl, rocuronium, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, bivalirudin,

cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrone, dexamethasone, diazepam, digoxin, enalaprilat, ephedrine, ertapenem, fluorouracil, foscarnet, fosphenytoin, furosemide, heparin, ketorolac, lidocaine, methotrexate, methylprednisolone, nafcillin, nitroprusside, pamidronate, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium phosphates, ranitidine, sodium acetate, sodium bicarbonate, sodium phosphates, trimethoprim/sulfamethoxazole.

- **Solution Incompatibility:** Solutions containing dextrose.

Patient/Family Teaching

- Explain the purpose of caspofungin to patient and family.
- Advise patient to notify health care professional immediately if symptoms of allergic reactions (rash, facial swelling, pruritus, sensation of warmth, difficulty breathing) occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of fungal infections. Duration of therapy is determined based on severity of underlying disease, recovery from immunosuppression, and clinical response.

cefactor, See CEPHALOSPORINS—SECOND GENERATION.

cefadroxil, See CEPHALOSPORINS—FIRST GENERATION.

ceFAZolin, See CEPHALOSPORINS—FIRST GENERATION.

cefdinir, See CEPHALOSPORINS—THIRD GENERATION.

cefditoren, See CEPHALOSPORINS—THIRD GENERATION.

cefepime (seff-e-peem)
Maxipime

Classification

Therapeutic: anti-infectives
Pharmacologic: fourth-generation cephalosporins

Indications

Treatment of the following infections caused by susceptible organisms: Uncomplicated skin and skin structure infections, Bone and joint infections, Uncomplicated and complicated urinary tract infections, Respiratory tract infections, Complicated intra-abdominal infections (with metronidazole), Septicemia. Empiric treatment of febrile neutropenic patients.

Action

Binds to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of second- and third-generation cephalosporins, but activity against staphylococci is less, whereas activity against gram-negative pathogens is greater, even for organisms resistant to first-, second-, and third-generation agents. Notable is increased action against: *Enterobacter*, *Haemophilus influenzae* (including β -lactamase-producing strains), *Escherichia coli*, *Klebsiella pneumoniae*, *Neisseria*, *Proteus*, *Providencia*, *Pseudomonas aeruginosa*, *Serratia*, *Moraxella catarrhalis* (including β -lactamase-producing strains). Not active against methicillin-resistant staphylococci or enterococci.

Pharmacokinetics

Absorption: Well absorbed after IM administration; IV administration results in complete bioavailability.

Distribution: Widely distributed. Crosses the placenta; enters breast milk in low concentrations. Some CSF penetration.

Protein Binding: 20%.

Metabolism and Excretion: 85% excreted unchanged in urine.

Half-life: *Adults*—2 hr (\uparrow in renal impairment); *Children 2 mo–6 yr*—1.7–1.9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.

* = Canadian drug name. \boxtimes = Genetic implication. ~~_____~~ = Discontinued.
*CAPITALS indicates life-threatening; _____ indicates most frequent.

Use Cautiously in: Renal impairment (\downarrow dosing/ \uparrow dosing interval recommended if $\text{CCr} \leq 60$ mL/min); History of GI disease, especially colitis; Patients with hepatic dysfunction or poor nutritional status (may be at \uparrow risk of bleeding); Geriatric patients (dose adjustment due to age-related \downarrow in renal function may be necessary); **OB, Lactation:** Pregnancy and lactation (safety not established).

Adverse Reactions/Side Effects

CNS: ENCEPHALOPATHY, SEIZURES (\uparrow risk in renal impairment), aphasia, headache. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **Derm:** rashes, pruritis, urticaria. **Hemat:** bleeding, eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS, superinfection, fever.

Interactions

Drug-Drug: Probenecid \downarrow excretion and \uparrow blood levels. Concurrent use of loop diuretics or aminoglycosides may \uparrow risk of nephrotoxicity.

Route/Dosage

IM (Adults): Mild-to-moderate uncomplicated or complicated urinary tract infections due to *Escherichia coli*—0.5–1 g every 12 hr.

IV (Adults): Moderate-to-severe pneumonia—1–2 g every 12 hr. Mild-to-moderate uncomplicated or complicated urinary tract infections—0.5–1 g every 12 hr. Severe uncomplicated or complicated urinary tract infections, moderate-to-severe uncomplicated skin and skin structure infections, complicated intra-abdominal infections—2 g every 12 hr. Empiric treatment of febrile neutropenia—2 g every 8 hr.

IV (Children 1 mo–16 yr): Uncomplicated and complicated urinary tract infections, uncomplicated skin and skin structure infections, pneumonia—50 mg/kg every 12 hr (not to exceed 2 g/dose). Febrile neutropenia—50 mg/kg every 8 hr (not to exceed 2 g/dose).

IV (Neonates postnatal age ≥ 14 days): 50 mg/kg every 12 hr.

IV (Neonates postnatal age < 14 days): 30 mg/kg every 12 hr; consider 50 mg/kg every 12 hr for *Pseudomonas* infections.

Renal Impairment

IM, IV (Adults): (See Manufacturer's specific recommendations) $\text{CCr } 30\text{--}60$ mL/min—0.5–1 g every 24 hr or 2 g every 12–24 hr; $\text{CCr } 11\text{--}29$ mL/min—0.5–2 g every 24 hr; $\text{CCr } < 11$ mL/min—250 mg–1 g every 24 hr.

Availability (generic available)

Powder for injection: 500 mg, 1 g, 2 g. **Premixed containers:** 1 g/50 mL D5W, 2 g/100 mL D5W.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- **Lab Test Considerations:** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause \uparrow serum AST, ALT, bilirubin, BUN, and creatinine.
- May rarely cause leukopenia, neutropenia, thrombocytopenia, and eosinophilia.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Diarrhea (Adverse Reactions)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection, 0.9% NaCl, or D5W. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.
- IM route should only be used for treatment of mild-to-moderate uncomplicated or complicated urinary tract infections due to *Escherichia coli*.

IV Administration

- **IV:** Monitor injection site frequently for phlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.

- **Intermittent Infusion:** Reconstitute with 5 mL sterile water, 0.9% NaCl, or D5W for the 500-mg vial, or 10 mL for the 1-g or 2-g vials. **Diluent:** Dilute further in 50–100 mL of D5W, 0.9% NaCl, D10W, D5/0.9% NaCl, or D5/LR. **Concentration:** Maximum 40 mg/mL.
- Solution is stable for 24 hr at room temperature and 7 days if refrigerated. **Rate:** Administer over 20–30 min.
- **Y-Site Compatibility:** amikacin, amiodarone, amphotericin B lipid complex, ampicillin-sulbactam, anidulafungin, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, docetaxel, doxorubicin liposome, eptifibatide, fenoldopam, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gentamicin, granisetron, hetastarch, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, imipenem-cilastatin, insulin, ketamine, leucovorin, levofloxacin, linezolid, lorazepam, melphalan, mesna, methotrexate, methylprednisolone sodium succinate, metronidazole, milrinone, octreotide, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, piperacillin-tazobactam, potassium acetate, ranitidine, remifentanyl, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sufentanil, telavancin, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vasopressin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acetylcysteine, acyclovir, alemtuzumab, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, argatroban, caspofungin, chlorpromazine, ciprofloxacin, cisplatin, dacarbazine, daunorubicin, dexrazoxane, diazepam, diltiazem, diphenhydramine, dolasetron, doxorubicin hydrochloride, droperidol, enalaprilat, epirubicin, erythromycin, etoposide, etoposide phosphate, famotidine, filgrastim, floxuridine, ganciclovir, gemcitabine, haloperidol, idarubicin, ifosfamide, irinotecan, magnesium sulfate, mannitol, mechlorothamine, meperidine, metoclopramide, midazolam, mitomycin, mitoxantrone, nalbuphine, nesiritide, ondansetron, oxaliplatin, pantoprazole, pemetrexed, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, streptozocin, tacrolimus, theophylline, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole.

Patient/Family Teaching

- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool con-**

tains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

ceftaroline (sef-tar-oh-leen)

Teflaro

Classification

Therapeutic: anti-infectives

Pharmacologic: cephalosporin derivatives

Indications

Acute bacterial skin/skin structure infections. Community-acquired pneumonia.

Action

Binds to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** *Treatment of skin/skin structure infections*—Active against *Staphylococcus aureus* (including methicillin-susceptible and -resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Escherichia coli*, *Klebsiella pneumoniae*, and *Klebsiella oxytoca*; *Treatment of*

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

community acquired pneumonia—*Streptococcus pneumoniae* (including pneumonia with bacteremia), *Staphylococcus aureus* (methicillin-susceptible strains only), *Haemophilus influenzae*, *Klebsiella pneumoniae*, *Klebsiella oxytoca*, and *Escherichia coli*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability of parent drug.

Distribution: Unknown.

Metabolism and Excretion: Ceftaroline fosamil is rapidly converted by plasma phosphatases to ceftaroline, the active metabolite; 88% excreted in urine, 6% in feces.

Half-life: 2.6 hr (after multiple doses).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Known serious hypersensitivity to cephalosporins.

Use Cautiously in: Known hypersensitivity to other beta-lactams; Renal impairment (dosage ↓ required for $CCr \leq 50$ mL/min); **Geri:** Dose adjustment may be necessary for age-related ↓ in renal function; **OB:** Use only if potential benefit outweighs potential risk to fetus; **Lactation:** Use cautiously if breast feeding; **Pedi:** Infants <2 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects

GI: CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea. **Derm:** rash. **Hemat:** hemolytic anemia. **Local:** phlebitis at injection site.

Misc: hypersensitivity reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: None noted.

Route/Dosage

Acute Bacterial Skin/Skin Structure Infections

IV (Adults): 600 mg every 12 hr for 5–14 days.

IV (Children 2–17 yr and >33 kg): 400 mg every 8 hr or 600 mg every 12 hr.

IV (Children 2–17 yr and ≤33 kg): 12 mg/kg every 8 hr.

IV (Children 2 mo-<2 yr): 8 mg/kg every 8 hr.

Renal Impairment

IV (Adults): $CCr >30$ to ≤ 50 mL/min—400 mg every 12 hr; $CCr \geq 15$ to ≤ 30 mL/min—300 mg every 12 hr; $CCr <15$ mL/min including hemodialysis—200 mg every 12 hr.

Community-Acquired Pneumonia

IV (Adults): 600 mg every 12 hr for 5–7 days.

IV (Children 2–17 yr and >33 kg): 400 mg every 8 hr or 600 mg every 12 hr.

IV (Children 2–17 yr and ≤33 kg): 12 mg/kg every 8 hr.

IV (Children 2 mo-<2 yr): 8 mg/kg every 8 hr.

Renal Impairment

IV (Adults): $CCr >30$ to ≤ 50 mL/min—400 mg every 12 hr; $CCr \geq 15$ to ≤ 30 mL/min—300 mg every 12 hr; $CCr <15$ mL/min including hemodialysis—200 mg every 12 hr.

Availability

Powder for injection: 400 mg/vial, 600 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or carbapenems. Persons with a negative history of sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD). May begin up to 30 mo following cessation of therapy.
- **Lab Test Considerations:** May cause seroconversion from a negative to a positive direct Coombs' test. If anemia develops during or after therapy, perform a direct Coombs' test. If drug-induced hemolytic anemia is suspected, discontinue ceftaroline and provide supportive care.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Diarrhea (Adverse Reactions)

Implementation

IV Administration

- **Intermittent Infusion:** Reconstitute with 20 mL of sterile water for injection, 0.9% NaCl, D5W, or LR. **Diluent:** Dilute further with 50–250 mL of same diluent unless reconstituted with Sterile Water for Injection, then use 0.9% NaCl, D5W, D2.5W, 0.45% NaCl, or LR. Mix gently to dissolve. Solution is clear to light or dark yellow; do not administer solutions that are discolored or contain particulate matter. So-

lution is stable for 6 hr at room temperature or 24 hr if refrigerated. **Rate:** Infuse over 5–60 min.

- **Y-Site Compatibility:** acyclovir, aminophylline, amiodarone, azithromycin, bumetanide, calcium chloride, calcium gluconate, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, dexamethasone, digoxin, diltiazem, diphenhydramine, dopamine, enalaprilat, esomeprazole, famotidine, fentanyl, fluconazole, furosemide, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, insulin, insulin lispro, levofloxacin, lidocaine, lorazepam, mannitol, meperidine, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, moxifloxacin, multivitamins, norepinephrine, ondansetron, pantoprazole, potassium chloride, promethazine, propofol, ranitidine, remifentanyl, sodium bicarbonate, trimethoprim/sulfamethoxazole, vasopressin, voriconazole.
- **Y-Site Incompatibility:** amphotericin B colloidal, caspofungin, diazepam, filgrastim, labetalol, potassium phosphates, sodium phosphates.

Patient/Family Teaching

- Explain the purpose of ceftaroline to patient. Emphasize the importance of completing therapy, even if feeling better.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

cefTAZIDIME, See CEPHALOSPORINS—THIRD GENERATION.

ceftazidime/avibactam (sef-tay-zi-deem/tay-zoe-bak-tam) Avycaz

Classification

Therapeutic: anti-infectives

Pharmacologic: third-generation cephalosporins, beta lactamase inhibitors

Indications

Complicated intra-abdominal infections (in combination with metronidazole). Complicated urinary tract infections (cUTIs).

Action

Ceftazidime—Binds to the bacterial cell wall membrane, causing cell death. **Avibactam**—Inhibits beta-lactamase, an enzyme that destroys penicillins and cephalosporins. **Therapeutic Effects:** Death of susceptible bacteria with resolution of infection. **Spectrum:** Active against *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Providencia stuartii*, *Enterobacter cloacae*, *Klebsiella oxytoca*, *Pseudomonas aeruginosa*, *Citrobacter koserii*, *Enterobacter aerogenes*, *Citrobacter freundii*, and *Proteus* spp.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: *Ceftazidime*—Widely distributed, enters breast milk in low concentrations; *avibactam*—widely distributed.

Metabolism and Excretion: *ceftazidime*—minimally metabolized, 80–90% excreted unchanged in urine; *avibactam*—minimally metabolized, mainly excreted unchanged in urine.

Half-life: *Ceftazidime*—2.8–3.3 hr (↑ in renal impairment); *avibactam*—2.2–2.7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr (↑ in renal impairment)

Contraindications/Precautions

Contraindicated in: Known hypersensitivity to ceftazidime, other cephalosporins or avibactam-containing products; cross-sensitivity with other penicillins, carbapenems, and cephalosporins may occur.

Use Cautiously in: CCr 30–50 mL/min (efficacy may be ↓, monitor renal function frequently and adjust dose if necessary); **Ger:** Consider age-related impairment of renal function; **OB:** Use during pregnancy only if clearly needed; **Lactation:** Use cautiously in breastfeeding women; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: SEIZURES (↑ in renal impairment), anxiety, dizziness, headache. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **F and E:** hypokalemia. **Hemat:** eosinophilia, thrombocytopenia. **Misc:** hypersensitivity reactions including ANAPHYLAXIS and SERIOUS SKIN REACTIONS.

Interactions

Drug-Drug: **Probenecid** may ↓ renal excretion of avibactam; concurrent administration is not recommended.

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

IV (Adults CCr >50 mL/min): 2.5 g (2 g ceftazidime/0.5 g avibactam) every 8 hr.

Renal Impairment

(Adults): *CCr 31–50 mL/min*—1.25 g (1 g ceftazidime/0.25 g avibactam) every 8 hr; *CCr 16–30 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 12 hr; *CCr 6–15 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 24 hr; *CCr 6–15 mL/min*—0.94 g (0.75 g ceftazidime/0.19 g avibactam) every 48 hr; *hemodialysis*—Administer dose after or on day of hemodialysis.

Availability

Powder for IV injection: ceftazidime 2 g/avibactam 0.5 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins, cephalosporins or carbapenems. Persons with a negative history of sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- **Observe patient for signs and symptoms of anaphylaxis** (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several mo following cessation of therapy.
- **Monitor for signs and symptoms of encephalopathy** (disturbance of consciousness including confusion, hallucinations, stupor, coma), myoclonus, and seizures during and following therapy. May require immediate treatment, dose adjustment, or discontinuation of therapy.
- **Lab Test Considerations:** May cause seroconversion from a negative to a positive direct Coombs' test. If anemia develops during or after therapy, perform a direct Coombs' test.
- May cause a false-positive reaction for glucose in urine with certain methods; use enzymatic glucose oxidase reactions.

Potential Nursing Diagnoses

Risk for infection (Indications)

Diarrhea (Adverse Reactions)

Implementation

- Reconstitute with 10 mL of Sterile Water for injection. 0.9% NaCl, D5W, D5/0.9% NaCl, D5/0.45% NaCl, D2.5/0.9% NaCl, D2.5/0.45% NaCl, or LR. Mix gently. **Diluent:** Use same diluent used for reconstitution for a volume between 50 mL and 250 mL. **Concentration:** 40 and 10 mg/mL of ceftazidime and avibactam, respectively to 8 and 2 mg/mL of ceftazidime and avibactam, respectively. Solution ranges from clear to light yellow; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 12 hrs at room temperature or 24 hrs if refrigerated. **Rate:** Infuse over 2 hrs.

Patient/Family Teaching

- Explain the purpose of ceftazidime/avibactam to patient.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- **Advise patient to notify health care professional immediately if signs and symptoms of allergic reactions or nervous system reactions occur.**
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

ceftolozane/tazobactam (sef-tol-o-zane/taz-oh-bak-tam) Zerbaxa

Classification

Therapeutic: anti-infectives
Pharmacologic: cephalosporin derivatives, beta lactamase inhibitors

Indications

Treatment of complicated intra-abdominal infections (with metronidazole) and complicated urinary tract infections (including pyelonephritis).

Action

Ceftolozane binds to bacterial cell wall membrane, causing cell death. Spectrum is extended compared with other penicillins. Tazobactam: Inhibits beta-lactamase, an enzyme that can destroy penicillins. **Therapeutic Effects:** Death of susceptible bacteria. **Spectrum:** Active against *Enterobacter cloacae*, *Escherichia coli*, *Klebsiella oxytoca*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Pseudomonas aeruginosa*, *Bacteroides fragilis*, *Streptococcus anginosus*, *Streptococcus constellatus*, and *Streptococcus salivarius*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: *Ceftolozane*—minimal metabolism, excreted almost entirely (>95%) unchanged in urine; *tazobactam*—80% excreted unchanged in urine, some metabolized to an inactive M1 metabolite which is excreted unchanged in urine.

Half-life: *Ceftolozane*—2.8 hr; *tazobactam*—0.9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Known serious hypersensitivity to ceftolozane/tazobactam, piperacillin/tazobactam or other beta-lactams.

Use Cautiously in: CCr 30–<50 mL/min (effectiveness may be ↓, adjust dose if necessary); CCr <50 mL/min (dose adjustment recommended); **OB:** Use during pregnancy only if potential benefit outweighs potential risks; **Lactation:** Use cautiously if breast feeding; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: anxiety, dizziness, headache, insomnia. **CV:** atrial fibrillation, hypotension. **GI:** abdominal pain, constipation, diarrhea, **CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD)**, nausea, vomiting. **Derm:** rash.

F and E: hypokalemia. **Hemat:** anemia, thrombocytosis. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**.

Interactions

Drug-Drug: None noted.

Route/Dosage

IV (Adults): 1.5 g (1 g ceftolozane/0.5 g tazobactam) every 8 hr for 4–14 days for intra-abdominal infections or 7 days for urinary tract infections.

Renal Impairment

(Adults): *CCr 30–50 mL/min*—750 mg (500 mg ceftolozane/250 mg tazobactam) every 8 hr; *CCr 15–29 mL/min*—375 mg (250 mg ceftolozane/125 mg tazobactam) every 8 hr; *End-stage renal disease on hemodialysis*—Single loading dose of 750 mg (500 mg ceftolozane/250 mg tazobactam), then 150 mg (100 mg ceftolozane/50 mg tazobactam) every 8 hr (on dialysis days administer as soon as possible after dialysis).

Availability

Powder for intravenous injection (requires reconstitution): 1 g ceftolozane/0.5 g tazobactam per vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactams. Persons with a negative history of sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- **Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing).** Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of (CDAD). May begin up to several mo following cessation of therapy.
- **Lab Test Considerations:** Monitor creatinine clearance at least daily in patients with changing renal function and adjust dose accordingly.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)

Implementation

IV Administration

- **Intermittent Infusion:** Reconstitute with 10 mL of sterile water for injection or 0.9% NaCl for injection; shake gently to dissolve for final volume of 11.4 mL. **Diluent:** Withdraw 11.4 mL for 1.5 g (1.0 g/0.5 g dose, 5.7 mL for 750 mg (500 mg/250 mg) dose, 2.9 mL for 375 mg (250 mg/125 mg) dose, or 1.2 mL for 150 mg (100 mg/50 mg) dose and add to 100 mL of 0.9% NaCl or D5W. Solution is clear, colorless to slightly yellow; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr at room temperature or 7 days if refrigerated; do not freeze. **Rate:** Infuse over 1 hr.
- **Additional Incompatibility:** Do not mix with other drugs or solutions.

★ = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underline indicate most frequent.

Patient/Family Teaching

- Explain the purpose of ceftolazane/tazobactam to patient.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

cefTRIAxone, See CEPHALOSPORINS—THIRD GENERATION.

cefuroxime, See CEPHALOSPORINS—SECOND GENERATION.

celecoxib (sel-e-kox-ib) CeleBREX

Classification

Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents
Pharmacologic: COX-2 inhibitors

Indications

Relief of signs and symptoms of osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and juvenile rheumatoid arthritis. Management of acute pain including primary dysmenorrhea.

Action

Inhibits the enzyme COX-2. This enzyme is required for the synthesis of prostaglandins. Has analgesic, anti-inflammatory, and antipyretic properties. **Therapeutic Effects:** Decreased pain and inflammation caused by arthritis or spondylitis. Decreased pain.

Pharmacokinetics

Absorption: Bioavailability unknown.

Distribution: 97% bound to plasma proteins; extensive tissue distribution.

Metabolism and Excretion: Mostly metabolized by the hepatic CYP2C9 isoenzyme; $\frac{1}{2}$ the CYP2C9 enzyme system exhibits genetic polymorphism; poor metabolizers may have significantly \uparrow celecoxib concentrations and an \uparrow risk of adverse effects; <3% excreted unchanged in urine and feces.

Half-life: 11 hr.

TIME/ACTION PROFILE (pain reduction)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	unknown	12–24 hr†

†After discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; History of allergic-type reactions to sulfonamides; History of asthma, urticaria, or allergic-type reactions to aspirin or other NSAIDs, including the aspirin triad (asthma, nasal polyps, and severe hypersensitivity reactions to aspirin); Advanced renal disease; Severe hepatic dysfunction; Coronary artery bypass graft (CABG) surgery; **OB:** Should not be used in late pregnancy (may cause premature closure of the ductus arteriosus).

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may \uparrow risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Pre-existing renal disease, heart failure, liver dysfunction, concurrent diuretic, or ACE inhibitor therapy (\uparrow risk of renal impairment); Hypertension or fluid retention; Renal impairment (may precipitate acute renal failure); Serious dehydration (correct deficits before administering); $\frac{1}{2}$ Patients who are known or suspected to be poor CYP2C9 metabolizers (\downarrow initial dose by 50%); Pre-existing asthma; **Pedi:** Safety not established in children <2 yr or for longer than 6 mo; **Geri:** Concurrent therapy with corticosteroids or anticoagulants, long duration of NSAID therapy, history of smoking, alcoholism, geriatric patients, or poor general health status (\uparrow risk of GI bleeding); **Lactation:** Lactation.

Exercise Extreme Caution in: History of ulcer disease or GI bleeding.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia. **CV:** HF, MYOCARDIAL INFARCTION, STROKE, THROMBOSIS, edema, hypertension. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, flatulence, nausea. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **F and E:** hyperkalemia.

Interactions

Drug-Drug: CYP2C9 inhibitors may \uparrow levels. May \downarrow effectiveness of ACE inhibitors, thiazide diuretics, and furosemide. Fluconazole \uparrow levels (use lowest recommended dosage). \uparrow risk of bleeding with anticoagulants, aspirin, clopidogrel, ticagrelor, prasugrel, corticosteroids, fibrinolytics, SNRIs, or SSRIs. May \uparrow serum lithium levels. Does not inhibit the cardioprotective effect of low-dose aspirin.

Route/Dosage

PO (Adults): Osteoarthritis—200 mg once daily or 100 mg twice daily. Rheumatoid arthritis—100–200

mg twice daily. *Ankylosing spondylitis*—200 mg once daily or 100 mg twice daily; dose may be ↑ after 6 wk to 400 mg daily. *Acute pain, including dysmenorrhea*—400 mg initially, then a 200-mg dose if needed on the first day; then 200 mg twice daily as needed.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh Class B)*—↓ dose by 50%.

PO (Children ≥2 yr, ≥10 kg–≤25 kg): *Juvenile rheumatoid arthritis*—50 mg twice daily.

PO (Children ≥2 yr, ≥25 kg): *Juvenile rheumatoid arthritis*—100 mg twice daily.

Availability (generic available)

Capsules: 50 mg, 100 mg, 200 mg, 400 mg. **Cost:** 100 mg \$387.18/100, 200 mg \$621.67/100, 400 mg \$1,576.25/180.

NURSING IMPLICATIONS

Assessment

- Assess range of motion, degree of swelling, and pain in affected joints before and periodically throughout therapy.
- Assess patient for allergy to sulfonamides, aspirin, or NSAIDs. Patients with these allergies should not receive celecoxib.
- Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- **Lab Test Considerations:** May cause ↑ AST and ALT levels.
- May cause hypophosphatemia, hyperkalemia, and ↑ BUN.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

Implementation

- Do not confuse with *Celexa* (citalopram) or *Cerebyx* (fosphenytoin).
- **PO:** May be administered without regard to meals. Capsules may be opened and sprinkled on applesauce and ingested immediately with water. Mixture may be stored in the refrigerator for up to 6 hr.

Patient/Family Teaching

- Instruct patient to take celecoxib exactly as directed. Do not take more than prescribed dose. Increasing doses does not appear to increase effectiveness. Use lowest effective dose for shortest period of time.
- Advise patient to notify health care professional promptly if signs or symptoms of GI toxicity (abdominal pain, black stools), skin rash, unexplained weight gain, edema, or chest pain occurs. Patients

should discontinue celecoxib and notify health care professional if signs and symptoms of hepatotoxicity (nausea, fatigue, lethargy, pruritus, jaundice, upper right quadrant tenderness, flu-like symptoms) occur.

- Advise patient to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Reduction in joint pain in patients with osteoarthritis.
- Reduction in joint tenderness, pain, and joint swelling in patients with rheumatoid arthritis and juvenile rheumatoid arthritis.
- Decreased pain.
- Decreased pain with dysmenorrhea.

cephalexin, See CEPHALOSPORINS—FIRST GENERATION.

CEPHALOSPORINS—FIRST GENERATION

cefadroxil (sef-a-drox-ill)
Duricef

ceFAZolin (sef-a-zoe-lin)
Acef

cephalexin (sef-a-lex-in)
Keflex

Classification

Therapeutic: anti-infectives
Pharmacologic: first-generation cephalosporins

Indications

Treatment of the following infections caused by susceptible organisms: Skin and skin structure infections (including burn wounds), Pneumonia, Urinary tract infections, Bone and joint infections, Septicemia. Not suitable for the treatment of meningitis. **Cefadroxil:** Pharyngitis and/or tonsillitis. **Cefazolin:** Perioperative prophylaxis, biliary tract infections, genital infections, bacterial endocarditis prophylaxis for dental and upper respiratory tract procedures. **Cephalexin:** Otitis media.

Action

Bind to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against many gram-positive cocci including: *Streptococcus pneumoniae*, Group A beta-hemolytic streptococci, Penicillinase-producing staphylococci. Not active

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

against: Methicillin-resistant staphylococci, *Bacteroides fragilis*, *Enterococcus*. Active against some gram-negative rods including: *Klebsiella pneumoniae*, *Proteus mirabilis*, *Escherichia coli*.

Pharmacokinetics

Absorption: *Cefadroxil* and *cephalexin* are well absorbed following oral administration. *Cefazolin* is well absorbed following IM administration.

Distribution: Widely distributed. Cefazolin penetrates bone and synovial fluid well. All cross the placenta and enter breast milk in low concentrations. Minimal CSF penetration.

Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.

Half-life: *Cefadroxil*—60–120 min; *cefazolin*—90–150 min; *cephalexin*—50–80 min (all are ↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Cefadroxil PO	rapid	1.5–2 hr	12–24 hr
Cefazolin IM	rapid	0.5–2 hr	6–12 hr
Cefazolin IV	rapid	5 min	6–12 hr
Cephalexin PO	rapid	1 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.

Use Cautiously in: Renal impairment (dosage ↓ and/or ↑ dosing interval recommended for: *cefadroxil* and *cephalexin*, if $CCr \leq 50$ mL/min, and *cefazolin*, if $CCr < 30$ mL/min; History of GI disease, especially colitis; **Geriatric:** Dose adjustment due to age-related ↓ in renal function may be necessary; **OB, Lactation:** Half-life is shorter and blood levels lower during pregnancy; have been used safely.

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting, cramps. **Derm:** STEVENS-JOHNSON SYNDROME, rashes, pruritis, urticaria. **Hemat:** agranulocytosis, eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ blood levels of renally excreted cephalosporins. Concurrent use of loop diuretics or aminoglycosides may ↑ risk of renal toxicity.

Route/Dosage

Cefadroxil

PO (Adults): Pharyngitis and tonsillitis—500 mg q 12 hr or 1 g q 24 hr for 10 days. Skin and soft-tissue infections—500 mg q 12 hr or 1 g q 24 hr. Urinary

tract infections—500 mg–1 g q 12 hr or 1–2 g q 24 hr.

PO (Children): Pharyngitis, tonsillitis, or impetigo—15 mg/kg q 12 hr or 30 mg/kg q 24 hr for 10 days. Skin and soft-tissue infections—15 mg/kg q 12 hr. Urinary tract infections—15 mg/kg q 12 hr.

Renal Impairment

PO (Adults): $CCr 25–50$ mL/min—500 mg q 12 hr; $CCr 10–25$ mL/min—500 mg q 24 hr; $CCr < 10$ mL/min—500 mg q 36 hr.

Cefazolin

IM, IV (Adults): Moderate to severe infections—500 mg–2 g q 6–8 hr (maximum 12 g/day). Mild infections with gram-positive cocci—250–500 mg q 8 hr. Uncomplicated urinary tract infections—1 g q 12 hr. Pneumococcal pneumonia—500 mg q 12 hr. Infective endocarditis or septicemia—1–1.5 g q 6 hr. Perioperative prophylaxis—1 g given 30–60 min prior to incision. Additional 500 mg–1 g should be given for surgeries ≥ 2 hr. 500 mg–1 g should then be given for all surgeries q 6–8 hr for 24 hr postoperatively.

IM, IV (Children and Infants >1 mo): 16.7–33.3 mg/kg q 8 hr (maximum 6 g/day); Bacterial endocarditis prophylaxis in penicillin-allergic patients: 25 mg/kg 30 min prior to procedure (maximum dose = 1 g).

IM, IV (Neonates ≤ 7 days): 40 mg/kg/day divided q 12 hr.

IM, IV (Neonates >7 days and ≤ 2 kg): 40 mg/kg/day divided q 12 hr.

IM, IV (Neonates >7 days and >2 kg): 60 mg/kg/day divided q 8 hr.

Renal Impairment

IM, IV (Adults): $CCr 10–30$ mL/min—Administer q 12 hr; $CCr \leq 10$ mL/min—Administer q 24 hr.

Cephalexin

PO (Adults): Most infections—250–500 mg q 6 hr. Uncomplicated cystitis, skin and soft-tissue infections, streptococcal pharyngitis—500 mg q 12 hr.

PO (Children): Most infections—25–50 mg/kg/day divided q 6–8 hr (can be administered q 12 hr in skin/skin structure infections or streptococcal pharyngitis). Otitis media—18.75–25 mg/kg q 6 hr (maximum = 4 g/day).

Renal Impairment

PO (Adults): $CCr 10–50$ mL/min—500 mg q 8–12 hr; $CCr < 10$ mL/min—250–500 mg q 12–24 hr.

Availability

Cefadroxil (generic available)

Capsules: 500 mg. **Tablets:** 1 g. **Oral suspension (orange-pineapple flavor):** 250 mg/5 mL, 500 mg/5 mL.

Cefazolin (generic available)

Powder for injection: 500 mg/vial, 1 g/vial, 10 g/vial, 20 g/vial. **Premixed containers:** 1 g/50 mL D5W, 2 g/50 mL D5W.

Cephalexin (generic available)

Capsules: 250 mg, 500 mg, 750 mg. **Tablets:** 250 mg, 500 mg. **Oral suspension:** 125 mg/5 mL, 250 mg/5 mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning and during therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess patient for skin rash frequently during therapy. Discontinue cephalosporins at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- **Lab Test Considerations:** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, creatinine.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, or eosinophilia.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)

Implementation

- Do not confuse cefazolin with cefotetan, cefoxitin, ceftazidime, or ceftriaxone. Do not confuse Keflex with Keppra.

- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering. Use calibrated measuring device with liquid preparations. Refrigerate oral suspensions.

Cefazolin

- **IM:** Reconstitute IM doses with 2 mL or 2.5 mL of sterile water for injection to achieve a final concentration of 225–330 mg/mL.
- Inject deep into a well-developed muscle mass; massage well.

IV Administration

- **IV:** Monitor site frequently for thrombophlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- Do not use solutions that are cloudy or contain a precipitate.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush line between medications.
- **IV Push:** **Diluent:** 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR. **Concentration:** 100 mg/mL. May use up to 138 mg/mL in fluid-restricted patients. **Rate:** May administer over 3–5 min.
- **Intermittent Infusion:** **Diluent:** Reconstituted 500-mg or 1-g solution may be diluted in 50–100 mL of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR. Solution is stable for 24 hr at room temperature and 10 days if refrigerated. **Concentration:** 20 mg/mL. **Rate:** Administer over 10–60 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, alprostadiol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, docetaxel, doxacurium, doxapram, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatid, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluroouracil, folic acid, foscarnet, furosemide, gemcitabine, glycopyrrrolate, granisetron, heparin, hydrocortisone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ke-

★ = Canadian drug name. ☒ = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tamine, ketorolac, leucovorin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methylglucate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penicillin G, perphenazine, phenobarbital, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propofol, propranolol, ranitidine, remifentanyl, rituximab, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tolazoline, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, amphotericin B cholesteryl, azathioprine, calcium chloride, caspofungin, cefotaxime, chlorpromazine, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, dolasetron, dopamine, doxorubicin hydrochloride, doxycycline, erythromycin, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, levofloxacin, mitoxantrone, mycophenolate, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxime, quinupristin/dalfopristin, sodium citrate, tobramycin, trimethoprim/sulfamethoxazole, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the medication completely as directed, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Instruct parents or caregivers to use calibrated measuring device with liquid preparations. Advise patient that sharing this medication may be dangerous.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if rash, or fever and diarrhea develop, especially if diarrhea contains blood, mucus, or pus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

CEPHALOSPORINS—SECOND GENERATION

cefaclor (sef-a-klor)

★ Ceclor

cefotETan (sef-oh-tee-tan)

Cefotan

cefOXitin (se-fox-i-tin)

Mefoxin

cefprozil (sef-proe-zil)

★ Cefzil

cefuroxime (se-fyoor-ox-eem)

Ceftin, Zinacef

Classification

Therapeutic: anti-infectives

Pharmacologic: second-generation cephalosporins

Indications

Treatment of the following infections caused by susceptible organisms: Respiratory tract infections, Skin and skin structure infections, Bone and joint infections (not cefaclor or cefprozil), Urinary tract infections (not cefprozil). **Cefotetan** and **cefoxitin**: Intra-abdominal and gynecologic infections. **Cefuroxime**: Meningitis, gynecologic infections, and Lyme disease. **Cefaclor**, **cefprozil**, **cefuroxime**: Otitis media. **Cefoxitin** and **cefuroxime**: Septicemia. **Cefotetan**, **cefoxitin**, **cefuroxime**: Perioperative prophylaxis.

Action

Bind to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of first-generation cephalosporins but have ↑ activity against several other gram-negative pathogens including: *Haemophilus influenzae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Morganella morganii*, *Neisseria gonorrhoeae* (including penicillinase-producing strains), *Proteus*, *Providencia*, *Serratia marcescens*, *Moraxella catarrhalis*. Not active against methicillin-resistant staphylococci or enterococci. **Cefuroxime:** Active against *Borrelia burgdorferi*. **Cefotetan** and **cefoxitin:** Active against *Bacteroides fragilis*.

Pharmacokinetics

Absorption: **Cefotetan**, **cefoxitin**, and **cefuroxime**—well absorbed following IM administration. **Cefaclor**, **cefprozil**, and **cefuroxime**—well absorbed following oral administration.

Distribution: Widely distributed. Penetration into CSF is poor, but adequate for cefuroxime (IV) to be used in treating meningitis. All cross the placenta and enter breast milk in low concentrations.

Metabolism and Excretion: Excreted primarily unchanged by the kidneys.

Half-life: *Cefaclor*—30–60 min; *cefotetan*—3–4.6 hr; *cefoxitin*—40–60 min; *cefpimizil*—90 min; *cefuroxime*—60–120 min (all are ↑ in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cefaclor PO	rapid	30–60 min	6–12 hr
Cefaclor PO-CD	unknown	unknown	12 hr
Cefotetan IM	rapid	1–3 hr	12 hr
Cefotetan IV	rapid	end of infusion	12 hr
Cefoxitin IM	rapid	30 min	4–8 hr
Cefoxitin IV	rapid	end of infusion	4–8 hr
Cefprozil PO	unknown	1–2 hr	12–24 hr
Cefuroxime PO	unknown	2–3 hr	8–12 hr
Cefuroxime IM	rapid	15–60 min	6–12 hr
Cefuroxime IV	rapid	end of infusion	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.

Use Cautiously in: Renal impairment (↓ dose/↑ dosing interval recommended for: *cefotetan* if CCr ≤30 mL/min, *cefoxitin* if CCr ≤50 mL/min, *cefpimizil* if CCr <30 mL/min, *cefuroxime* if CCr <30 mL/min); Patients with hepatic dysfunction, poor nutritional state, or cancer may be at ↑ risk for bleeding; History of GI disease, especially colitis; *Cefprozil (oral suspension)* contains aspartame and should be avoided in patients with phenylketonuria; **Geri:** Dose adjustment due to age-related ↓ in renal function may be necessary; may also be at ↑ risk for bleeding with *cefotetan* or *cefoxitin*; **OB, Lactation:** Have been used safely.

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, cramps, nausea, vomiting. **Derm:** rashes, urticaria. **Hemat:** agranulocytosis, bleeding (↑ with cefotetan and cefoxitin), eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ blood levels. If alcohol is ingested within 48–72 hr of cefotetan, a disulfiram-like reaction may occur. Cefotetan may ↑ risk of bleeding with anticoagulants, antiplatelet agents, thrombolytics, and NSAIDs. Antacids ↓ absorption of cefaclor. Concurrent use of ami-

noglycosides or loop diuretics may ↑ risk of nephrotoxicity.

Route/Dosage

Cefaclor

PO (Adults): 250–500 mg every 8 hr or 375–500 mg every 12 hr as extended-release tablets.

PO (Children >1 mo): 6.7–13.4 mg/kg every 8 hr or 10–20 mg/kg every 12 hr (up to 1 g/day).

Cefotetan

IM, IV (Adults): Most infections—1–2 g every 12 hr. *Severe/life-threatening infections*—2–3 g every 12 hr. *Urinary tract infections*—500 mg–2 g every 12 hr or 1–2 g every 24 hr. *Perioperative prophylaxis*—1–2 g 30–60 min before initial incision (one-time dose).

Renal Impairment

IM, IV (Adults): CCr 10–30 mL/min—Usual adult dose every 24 hr or ½ usual adult dose every 12 hr; **<CCr 10 mL/min**—Usual adult dose every 48 hr or ¼ usual adult dose every 12 hr.

Cefoxitin

IM, IV (Adults): Most infections—1 g every 6–8 hr. *Severe infections*—1 g every 4 hr or 2 g every 6–8 hr. *Life-threatening infections*—2 g every 4 hr or 3 g every 6 hr. *Perioperative prophylaxis*—2 g 30–60 min before initial incision, then 2 g every 6 hr for up to 24 hr.

IM, IV (Children and Infants >3 mo): Most infections—13.3–26.7 mg/kg every 4 hr or 20–40 mg/kg every 6 hr. *Perioperative prophylaxis*—30–40 mg/kg within 60 min of initial incision, then 30–40 mg/kg every 6 hr for up to 24 hr.

Renal Impairment

IM, IV (Adults): CCr 30–50 mL/min—1–2 g every 8–12 hr; **CCr 10–29 mL/min**—1–2 g every 12–24 hr; **CCr 5–9 mL/min**—0.5–1 g every 12–24 hr; **CCr <5 mL/min**—0.5–1 g every 24–48 hr.

Cefprozil

PO (Adults): Most infections—250–500 mg every 12 hr or 500 mg every 24 hr.

PO (Children 6 mo–12 yr): Otitis media—15 mg/kg every 12 hr. *Acute sinusitis*—7.5–15 mg/kg every 12 hr (higher dose should be used for moderate-to-severe infections).

PO (Children 2–12 yr): Pharyngitis/tonsillitis—7.5 mg/kg every 12 hr. *Skin/skin structure infections*—20 mg/kg every 24 hr.

Renal Impairment

PO (Adults and Children ≥6 mo): CCr <30 mL/min—½ of usual dose at normal dosing interval.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued. *CAPITALS indicates life-threatening; _____ indicate most frequent.

Cefuroxime

PO (Adults and Children >12 yr): *Pharyngitis/tonsillitis, maxillary sinusitis, uncomplicated UTIs*—250 mg every 12 hr. *Bronchitis, uncomplicated skin/skin structure infections*—250–500 mg every 12 hr. *Gonorrhea*—1 g (single dose). *Lyme disease*—500 mg every 12 hr for 20 days.

PO (Children 3 mo–12 yr): *Otitis media, acute bacterial maxillary sinusitis, impetigo*—250 mg every 12 hr.

IM, IV (Adults): *Uncomplicated urinary tract infections, skin/skin structure infections, disseminated gonococcal infections, uncomplicated pneumonia*—750 mg every 8 hr. *Bone/joint infections, severe or complicated infections*—1.5 g every 8 hr. *Life-threatening infections*—1.5 g every 6 hr. *Meningitis*—3 g every 8 hr. *Perioperative prophylaxis*—1.5 g IV 30–60 min before initial incision; 750 mg IM/IV every 8 hr can be given when procedure prolonged. *Prophylaxis during open-heart surgery*—1.5 g IV at induction of anesthesia and then every 12 hr for 3 additional doses. *Gonorrhea*—1.5 g IM (750 mg in two sites) with 1 g probenecid PO.

IM, IV (Children and Infants >3 mo): *Most infections*—12.5–25 mg/kg every 6 hr or 16.7–33.3 mg/kg every 8 hr (max dose = 6 g/day). *Bone and joint infections*—50 mg/kg every 8 hr (max dose = 6 g/day). *Bacterial meningitis*—50–60 mg/kg every 6 hr or 66.7–80 mg/kg every 8 hr.

Renal Impairment

IM, IV (Adults): *CCr 10–29 mL/min*—Give standard dose every 24 hr; *CCr <10 mL/min (no hemodialysis)*—Give standard dose every 48 hr; *Hemodialysis*—Give an additional dose at end of each dialysis session.

Availability**Cefaclor (generic available)**

Capsules: 250 mg, 500 mg. **Extended-release tablets:** 375 mg, 500 mg. **Oral suspension (strawberry):** 125 mg/5 mL, 187 mg/5 mL, 250 mg/5 mL, 375 mg/5 mL.

Cefotetan (generic available)

Powder for injection: 1 g/vial, 2 g/vial, 10 g/vial.
Premixed containers: 1 g/50 mL, 2 g/50 mL.

Cefoxitin (generic available)

Powder for injection: 1 g/vial, 2 g/vial, 10 g/vial.
Premixed containers: 1 g/50 mL D5W, 2 g/50 mL D5W.

Cefprozil (generic available)

Tablets: 250 mg, 500 mg. **Oral suspension (bubblegum flavor):** 125 mg/5 mL, 250 mg/5 mL.

Cefuroxime (generic available)

Tablets: 250 mg, 500 mg. **Powder for injection:** 750 mg/vial, 1.5 g/vial, 7.5 g/vial. **Premixed containers:** 750 mg/50 mL, 1.5 g/50 mL.

NURSING IMPLICATIONS**Assessment**

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning and during therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- **Lab Test Considerations:** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- *Cefotetan*—monitor prothrombin time and assess patient for bleeding (guaiac stools; check for hematuria, bleeding gums, ecchymosis) daily in high-risk patients; may cause hypoprothrombinemia.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and serum creatinine.
- *Cefoxitin* may cause falsely ↑ test results for serum and urine creatinine; do not obtain serum samples within 2 hr of administration.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, and eosinophilia.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Diarrhea (Adverse Reactions)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not confuse cefotetan with cefazolin, cefoxitin, ceftazidime, or ceftriaxone.
- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with

food may minimize GI irritation. Shake oral suspension well before administering.

- Administer cefaclor extended-release tablets with food; do not crush, break, or chew.
- Do not administer *cefactor* within 1 hr of antacids.
- *Cefuroxime* tablets should be swallowed whole, not crushed; crushed tablets have a strong, persistent bitter taste. Tablets may be taken without regard to meals.
- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection or 0.9% NaCl for injection. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.

IV Administration

- **IV:** Change sites every 48–72 hr to prevent phlebitis. Monitor site frequently for thrombophlebitis (pain, redness, swelling).
- If aminoglycosides are administered concurrently, administer in separate sites if possible, at least 1 hr apart. If second site is unavailable, flush line between medications.
- **IV Push:** Dilute each cephalosporin in at least 1 g/10 mL. Do not use preparations containing benzyl alcohol for neonates. **Rate:** Administer slowly over 3–5 min.

Cefotetan

- **Intermittent Infusion:** **Diluent:** Reconstituted solution may be further diluted in 50–100 mL of D5W or 0.9% NaCl. Solution may be colorless or yellow. Solution is stable for 24 hr at room temperature or 96 hr if refrigerated. **Concentration:** 10–40 mg/mL. **Rate:** Administer over 20–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imi-

penem/cilastatin, irinotecan, isoproterenol, ketorolac, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, methotrexate, methylprednisolone, metoclopramide, metoprolol, meronidazole, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penicillin G, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propofol, propranolol, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, amiodarone, amphotericin B colloidal, amphotericin B liposome, azathioprine, caspofungin, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, diphenhydramine, dobutamine, dolasetron, doxorubicin hydrochloride, doxycycline, epirubicin, erythromycin, esmolol, ganciclovir, gentamicin, haloperidol, hydralazine, hydroxyzine, idarubicin, indomethacin, labetalol, minocycline, mitomycin, mycophenolate, pantoprazole, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vinorelbine.

Cefoxitin

- **Intermittent Infusion:** **Diluent:** Reconstituted solution may be further diluted in 50–100 mL of D5W, D10W, 0.9% NaCl, dextrose/saline combinations, D5/LR, Ringer's or LR. Stable for 24 hr at room temperature and 1 wk if refrigerated. Darkening of powder does not alter potency. **Concentration:** 40 mg/mL. **Rate:** Administer over 30–60 min.
- **Continuous Infusion:** May be diluted in 500–1000 mL for continuous infusion.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefa-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

zolin, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatid, esmolol, etoposide, etoposide phosphate, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, fosfarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, leucovorin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pantoprazole, penicillin G, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propofol, propranolol, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, streptokinase, succinylcholine, sufentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, azathioprine, caspofungin, chlorpromazine, dantrolene, daunorubicin, diazepam, diazoxide, diphenhydramine, dobutamine, dolasetron, doxorubicin hydrochloride, doxycycline, epirubicin, erythromycin, fenoldopam, filgrastim, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, insulin, labetalol, levofloxacin, methylprednisolone, minocycline, mitoxantrone, mycophenolate, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trastuzumab, trimethoprim/sulfamethoxazole, vinorelbine.

Cefuroxime

- **Intermittent Infusion:** **Diluent:** Solution may be further diluted in 50–100 mL of 0.9% NaCl, D5W, D10W, or dextrose/saline combinations. Stable for 24 hr at room temperature and 48 hr if refrigerated. **Concentration:** 10–40 mg/mL. **Rate:** Administer over 15–60 min.
- **Continuous Infusion:** May also be diluted in 500–1000 mL for continuous infusion.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, at-

ropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, chloramphenicol, cisplatin, clindamycin, cyclophosphamide, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, docetaxel, dopamine, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatid, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, fosfarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, perphenazine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propofol, propranolol, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanyl, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, azathioprine, calcium chloride, caspofungin, chlorpromazine, dantrolene, daunorubicin hydrochloride, dexamethasone, diazepam, diazoxide, diphenhydramine, dobutamine, dolasetron, doxorubicin hydrochloride, doxycycline, epirubicin, filgrastim, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, labetalol, magnesium sulfate, midazolam, minocycline, mitomycin, mitoxantrone, mycophenolate, nicardipine, papaverine, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trimethoprim/sulfamethoxazole, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the medication completely, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Use calibrated measuring device with liquid preparations. Advise patient that sharing of this medication may be dangerous.

- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Caution patients that concurrent use of alcohol with *cefotetan* may cause a disulfiram-like reaction (abdominal cramps, nausea, vomiting, headache, hypotension, palpitations, dyspnea, tachycardia, sweating, flushing). Alcohol and alcohol-containing medications should be avoided during and for several days after therapy.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

CEPHALOSPORINS—THIRD GENERATION

cefdinir (sef-di-nir)
 Omnicef

cefditoren (sef-dye-tor-en)
 Spectracef

cefixime (sef-ik-seem)
 Suprax

cefotaxime (sef-oh-taks-eem)
 Claforan

cefpodoxime (sef-poe-dox-eem)
 Vantin

ceftAZidime (sef-tay-zi-deem)
 Fortaz, Tazicef

cefTRIAxone (sef-try-ax-one)
 Rocephin

Classification

Therapeutic: anti-infectives
 Pharmacologic: third-generation cephalosporins

Indications

Treatment of the following infections caused by susceptible organisms: Skin and skin structure infections (not cefixime), Urinary and gynecologic infections (not cefdinir or cefditoren), Respiratory tract infections (not cefdinir or cefditoren). **Cefotaxime, ceftazidime,**

ceftriaxone: Meningitis and bone/joint infections. **Cefotaxime, ceftazidime, ceftriaxone:** Intra-abdominal infections and septicemia. **Cefdinir, cefixime, cefpodoxime, ceftriaxone:** Otitis media. **Cefotaxime, ceftriaxone:** Perioperative prophylaxis. **Ceftazidime:** Febrile neutropenia. **Cefotaxime, ceftriaxone:** Lyme disease.

Action

Bind to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of second-generation cephalosporins, but activity against staphylococci is less, whereas activity against gram-negative pathogens is greater, even for organisms resistant to first- and second-generation agents. Notable is increased action against: *Enterobacter, Haemophilus influenzae, Escherichia coli, Klebsiella pneumoniae, Neisseria gonorrhoeae, Citrobacter, Morganella, Proteus, Providencia, Serratia, Moraxella catarrhalis, Borrelia burgdorferi.* Some agents have activity against *N. meningitidis* (cefotaxime, ceftazidime, ceftriaxone). Some agents have enhanced activity against *Pseudomonas aeruginosa* (ceftazidime). Not active against methicillin-resistance staphylococci or enterococci. Some agents have activity against anaerobes, including *Bacteroides fragilis* (cefotaxime, ceftriaxone).

Pharmacokinetics

Absorption: *Cefotaxime, ceftazidime, and ceftriaxone* are well absorbed after IM administration. *Cefixime* 40–50% absorbed after oral administration (oral suspension); *cefdinir* 16–25% absorbed after oral administration. *Cefditoren pivoxil* and *cefpodoxime proxetil* are prodrugs that are converted to their active components in GI tract during absorption (*cefditoren*—14% absorbed [\uparrow by high-fat meal] *cefpodoxime*—50% absorbed).

Distribution: Widely distributed. Cross the placenta; enter breast milk in low concentrations. CSF penetration better than with first- and second-generation agents.

Protein Binding: *Ceftriaxone* \geq 90%.

Metabolism and Excretion: *Cefdinir, ceftazidime, and cefditoren*— $>$ 85% excreted in urine. *Cefpodoxime*—30% excreted in urine. *Ceftriaxone* and *cefotaxime*—partly metabolized and partly excreted in the urine. *Cefixime*—50% excreted unchanged in urine, \geq 10% in bile.

Half-life: *Cefdinir*—1.7 hr; *cefditoren*—1.6 hr; *cefixime*—3–4 hr; *cefotaxime*—1–1.5 hr; *cefpodoxime*—2–3 hr; *ceftazidime*—2 hr; *ceftriaxone*—6–9 hr (all except *ceftriaxone* are \uparrow in renal impairment).

* = Canadian drug name. \boxtimes = Genetic implication. ~~Strikethrough~~ = Discontinued.
 *CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cefdinir PO	rapid	2–4 hr	12–24 hr
Cefditoren PO	rapid	1.5–3 hr	12 hr
Cefixime PO	rapid	2–6 hr	24 hr
Cefotaxime IM	rapid	0.5 hr	4–12 hr
Cefotaxime IV	rapid	end of infusion	4–12 hr
Cefpodoxime PO	unknown	2–3 hr	12 hr
Ceftazidime IM	rapid	1 hr	6–12 hr
Ceftazidime IV	rapid	end of infusion	6–12 hr
Ceftriaxone IM	rapid	1–2 hr	12–24 hr
Ceftriaxone IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins; **Pedi:** Premature neonates up to a postmenstrual age of 41 wk (ceftriaxone only); **Pedi:** Hyperbilirubinemic neonates (may lead to bilirubin encephalopathy); **Pedi:** Neonates ≤ 28 days requiring calcium-containing IV solutions (\uparrow risk of precipitation formation); Carnitine deficiency or inborn errors of metabolism (cefditoren only); Hypersensitivity to milk protein (cefditoren only); contains sodium caseinate).

Use Cautiously in: Renal impairment (\downarrow dosing/ \uparrow dosing interval recommended for: *cefdinir* if $CCr < 30$ mL/min, *cefixime* if $CCr \leq 60$ mL/min, *cefotaxime* if $CCr < 20$ mL/min, *cefpodoxime* if $CCr < 30$ mL/min, *ceftazidime* if $CCr \leq 50$ mL/min, *cefditoren* if $CCr < 50$ mL/min); Combined severe hepatic and renal impairment (dose \downarrow/\uparrow dosing interval recommended for *ceftriaxone*); Diabetes (*cefdinir* suspension contain sucrose); History of GI disease, especially colitis; **Geri:** Dose adjustment due to age-related \downarrow in renal function may be necessary; **Pedi:** \uparrow risk of urolithiasis and acute renal failure (ceftriaxone only); **OB, Lactation:** Have been used safely.

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses), headache. **GI:** *Clostridium difficile*-ASSOCIATED DIARRHEA, diarrhea, nausea, vomiting, cholelithiasis (ceftriaxone), cramps, pancreatitis (ceftriaxone). **Derm:** STEVENS-JOHNSON SYNDROME, rash, urticaria. **GU:** acute renal failure (ceftriaxone), urolithiasis (ceftriaxone). **Hemat:** agranulocytosis, bleeding, eosinophilia, hemolytic anemia, lymphocytosis, neutropenia, thrombocytopenia, thrombocytosis. **GU:** hematuria, vaginal moniliasis. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid \downarrow excretion and \uparrow serum levels (cefdinir, cefditoren, cefixime, cefotaxime, cefpodoxime, ceftriaxone). Concurrent use of loop diuretics, aminoglycosides, or NSAIDs may \uparrow risk of nephrotoxicity. Antacids \downarrow absorption of cefdinir, cefditoren, and cefpodoxime. Iron supplements \downarrow absorption of cefdinir. **H₂-receptor antagonists** \downarrow absorption of cefditoren and cefpodoxime. Cefixime may \uparrow carbamazepine levels. Ceftriaxone should not be administered concomitantly with any calcium-containing solutions. Ceftriaxone may \uparrow risk of bleeding with warfarin.

Route/Dosage

Cefdinir

PO (Adults ≥ 13 yr): 300 mg every 12 hr or 600 mg every 24 hr (use every 12 hr dosing only for community-acquired pneumonia or skin and skin structure infections).

PO (Children 6 mo–12 yr): 7 mg/kg every 12 hr (use only for skin/skin structure infections) or 14 mg/kg every 24 hr; dose should not exceed 600 mg/day.

Renal Impairment

PO (Adults and Children ≥ 13 yr): $CCr < 30$ mL/min—300 mg every 24 hr.

Renal Impairment

PO (Children 6 mo–12 yr): $CCr < 30$ mL/min—7 mg/kg every 24 hr.

Cefditoren

PO (Adults and Children ≥ 12 yr): Pharyngitis/tonsillitis, skin/skin structure infections—200 mg twice daily; Acute bacterial exacerbation of chronic bronchitis or community acquired pneumonia—400 mg twice daily.

Renal Impairment

PO (Adults): $CCr 30$ – 49 mL/min—dose should not exceed 200 mg twice daily; $CCr < 30$ mL/min—dose should not exceed 200 mg once daily.

Cefixime

PO (Adults and Children >12 yr or >50 kg): Most infections—400 mg once daily; Gonorrhea—400 mg single dose.

PO (Children): 8 mg/kg once daily or 4 mg/kg every 12 h.

Renal Impairment

PO (Adults): $CCr 21$ – 60 mL/min—75% of standard dose once daily; $CCr \leq 20$ mL/min—50% of standard dose once daily.

Cefotaxime

IM, IV (Adults and Children >12 yr): Most uncomplicated infections—1 g every 12 hr. Moderate or severe infections—1–2 g every 6–8 hr. Life-threatening infections—2 g every 4 hr (maximum dose = 12

g/day). *Gonococcal urethritis/cervicitis or rectal gonorrhea in females*—500 mg IM (single dose). *Rectal gonorrhea in males*—1 g IM (single dose). *Perioperative prophylaxis*—1 g 30–90 min before initial incision (one-time dose).

IM, IV (Children 1 mo–12 yr): <50 kg—100–200 mg/kg/day divided every 6–8 hr. *Meningitis*—200 mg/kg/day divided every 6 hr. *Invasive pneumococcal meningitis*—225–300 mg/kg/day divided every 6–8 hr. ≥50 kg—see adult dosing.

IV (Neonates 1–4 wk): 50 mg/kg every 6–8 hr.

IV (Neonates ≤1 wk): 50 mg/kg every 8–12 hr.

Renal Impairment

(Adults): *CCr* <20 mL/min—↓ dose by 50%.

Cefpodoxime

PO (Adults): *Most infections*—200 mg every 12 hr. *Skin and skin structure infections*—400 mg every 12 hr. *Urinary tract infections/pharyngitis*—100 mg every 12 hr. *Gonorrhea*—200 mg single dose.

PO (Children 2 mo–12 yr): *Pharyngitis/tonsillitis/otitis media/acute maxillary sinusitis*—5 mg/kg every 12 hr (not to exceed 200 mg/dose).

Renal Impairment

PO (Adults): *CCr* <30 mL/min—↑ dosing interval to every 24 hr.

Ceftazidime

IM, IV (Adults and Children ≥12 yr): *Pneumonia and skin/skin structure infections*—500 mg–1 g every 8 hr. *Bone and joint infections*—2 g every 12 hr. *Severe and life-threatening infections*—2 g every 8 hr. *Complicated urinary tract infections*—500 mg every 8–12 hr. *Uncomplicated urinary tract infections*—250 mg every 12 hr. *Cystic fibrosis lung infection caused by P. aeruginosa*—30–50 mg/kg every 8 hr (maximum dose = 6 g/day).

IM, IV (Children 1 mo–12 yr): 33.3–50 mg/kg every 8 hr (maximum dose = 6 g/day).

IM, IV (Neonates ≤4 wk): 50 mg/kg every 8–12 hr.

Renal Impairment

IM, IV (Adults): *CCr* 31–50 mL/min—1 g every 12 hr; *CCr* 16–30 mL/min—1 g every 24 hr; *CCr* 6–15 mL/min—500 mg every 24 hr; *CCr* <5 mL/min—500 mg every 48 hr.

Ceftriaxone

IM, IV (Adults): *Most infections*—1–2 g every 12–24 hr. *Gonorrhea*—250 mg IM (single dose). *Meningitis*—2 g every 12 hr. *Perioperative prophylaxis*—1 g 30–120 min before initial incision (single dose).

IM, IV (Children): *Most infections*—25–37.5 mg/kg every 12 hr or 50–75 mg/kg every 24 hr; dose should not exceed 2 g/day. *Meningitis*—100 mg/kg every 24 hr or 50 mg/kg every 12 hr; dose should not

exceed 4 g/day. *Acute otitis media*—50 mg/kg IM single dose; dose should not exceed 1 g. *Uncomplicated gonorrhea*—125 mg IM (single dose).

Availability

Cefdinir (generic available)

Oral suspension (strawberry): 125 mg/5 mL, 250 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL \$51.00/60 mL, 250 mg/5 mL \$99.48/60 mL. **Capsules:** 300 mg.

Cefditoren (generic available)

Tablets: 200 mg, 400 mg. **Cost:** *Generic*—All strengths \$294.81/20.

Cefixime (generic available)

Capsules: 400 mg. **Oral suspension (strawberry):** 100 mg/5 mL, 200 mg/5 mL, 500 mg/5 mL. **Cost:** 100 mg/5 mL \$170.77/50 mL, 200 mg/5 mL \$341.55/50 mL, 500 mg/5 mL \$170.77/10 mL. **Tablets:** 400 mg. **Cost:** \$1008.49/50. **Chewable tablets:** 100 mg, 150 mg, 200 mg. **Cost:** 100 mg \$170.77/10, 200 mg \$341.51/10.

Cefotaxime (generic available)

Powder for injection: 500 mg/vial, 1 g/vial, 2 g/vial, 10 g/vial.

Cefpodoxime (generic available)

Tablets: 100 mg, 200 mg. **Cost:** *Generic*—100 mg \$134.74/20, 200 mg \$169.14/20. **Oral suspension (lemon creme):** 50 mg/5 mL, 100 mg/5 mL. **Cost:** *Generic*—50 mg/5 mL \$35.28/50 mL, 100 mg/5 mL \$86.17/50 mL.

Ceftazidime (generic available)

Powder for injection: 500 mg/vial, 1 g/vial, 2 g/vial, 6 g/vial. **Premixed containers:** 1 g/50 mL, 2 g/50 mL.

Ceftriaxone (generic available)

Powder for injection: 250 mg/vial, 500 mg/vial, 1 g/vial, 2 g/vial, 10 g/vial. **Premixed containers:** 1 g/50 mL, 2 g/50 mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Dis-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

continue drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.

- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- **Assess patient for skin rash frequently during therapy.** Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- **Pedi:** Assess newborns for jaundice and hyperbilirubinemia before making decision to use ceftriaxone (should not be used in jaundiced or hyperbilirubinemic neonates).
- **Lab Test Considerations:** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- Monitor prothrombin time and assess patient for bleeding (guaiac stools; check for hematuria, bleeding gums, ecchymosis) daily in patients receiving *cefditoren*, as this agent may cause hypoprothrombinemia.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and serum creatinine.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, eosinophilia, lymphocytosis, and thrombocytosis.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Diarrhea (Adverse Reactions)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Do not confuse ceftazidime with cefazolin, cefoxitin, cefotetan, or ceftriaxone.**
- *Cefditoren* is not recommended for prolonged use since other pirlate-containing compounds have caused clinical manifestations of carnitine deficiency when used over a period of mo.
- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering. Administer *cefditoren* with meals to enhance absorption. Administer *cefpodoxime tablets* with meals to enhance absorption (suspension may be administered without regard to meals).
- *Cefixime oral suspension* should be used to treat otitis media (results in higher peak concentrations than tablets).
- Do not administer *cefdinir* or *cefpodoxime* within 2 hr before or after an antacid. Do not administer *cef-*

podoxime within 2 hr before or after an H₂ receptor antagonist. Do not administer *cefdinir* within 2 hr before or after iron supplements. Do not administer *cefditoren* concomitantly with antacids.

- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection or 0.9% NaCl for injection. May be diluted with lidocaine to minimize injection discomfort. Do not administer lidocaine-containing ceftriaxone IV.
- Inject deep into a well-developed muscle mass; massage well.

IV Administration

- **IV:** Monitor injection site frequently for phlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.
- **IV Push:** Dilute cephalosporins in at least 1 g/10 mL. Avoid IV push administration of *ceftriaxone*. Do not use preparations containing benzyl alcohol for neonates. **Rate:** Administer slowly over 3–5 min.

Cefotaxime

- **Intermittent Infusion:** **Diluent:** Reconstituted solution may be further diluted in 50–100 mL of D5W, D10W, LR, dextrose/saline combinations, or 0.9% NaCl. Solution may appear light yellow to amber. Solution is stable for 24 hr at room temperature and 5 days if refrigerated. **Concentration:** 20–60 mg/mL. **Rate:** Administer over 20–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, alprostadil, amifostine, aminophylline, aminocaproic acid, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benztrapine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefotetan, cefoxitin, ceftriaxone, cefuroxime, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketamine, ketorolac, leucovorin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, nal-

oxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penicillin G, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propofol, propranolol, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vasopressin, verapamil, vinblastine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, allopurinol, amiodarone, amphotericin B liposome, azathioprine, caspofungin, ceftazolid, ceftazidime, chloramphenicol, chlorpromazine, dacarbazine, dantrolene, daunorubicin, diazepam, diphenhydramine, dobutamine, dolasetron, doxorubicin hydrochloride, filgrastim, ganciclovir, gemcitabine, haloperidol, hetastarch, hydralazine, hydroxyzine, idarubicin, irinotecan, labetalol, methylprednisolone, minocycline, mitomycin, mitoxantrone, mycophenolate, pantoprazole, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trastuzumab, trimethoprim/sulfamethoxazole, vecuronium.

Ceftazidime

- **Intermittent Infusion:** **Diluent:** Reconstituted solution may be further diluted in at least 1 g/10 mL of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, or LR. Dilution causes CO₂ to form inside vial, resulting in positive pressure; vial may require venting after dissolution to preserve sterility of vial. Not required with L-arginine formulation (Ceftaz). Solution may appear yellow to amber; darkening does not alter potency. Solution is stable for 18 hr at room temperature and 7 days if refrigerated. **Concentration:** 40 mg/mL. **Rate:** Administer over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, anakinra, anidulafungin, argatroban, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, cangrelor, carboplatin, carmustine, ceftazolin, cefotetan, cefoxitin, ceftriaxone, cefuroxime, ciprofloxacin, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, docetaxel, dolasetron, dopamine, enalaprilat,

ephedrine, epinephrine, epoetin alfa, eptifibatid, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glicopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ibuprofen, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitomycin, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propranolol, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium bicarbonate, sodium citrate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, thiotepa, tigecycline, tirofiban, trastuzumab, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acetylcysteine, alemtuzumab, amiodarone, amphotericin B liposome, amscarine, ascorbic acid, azathioprine, calcium chloride, caspofungin, cefotaxime, chloramphenicol, chlorpromazine, dantrolene, daunorubicin, diazepam, diazoxide, diphenhydramine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, epirubicin, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, midazolam, mitoxantrone, mycophenolate, nitroprusside, papaverine, pemetrexed, pentamidine, pentazocine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, thiamine, topotecan, trimethoprim/sulfamethoxazole, verapamil, warfarin.

Ceftriaxone

- **Intermittent Infusion:** Reconstitute each 250-mg vial with 2.4 mL, each 500-mg vial with 4.8 mL, each 1-g vial with 9.6 mL, and each 2-g vial with 19.2 mL of sterile water for injection, 0.9% NaCl, or D5W for a concentration of 100 mg/mL. **Diluent:** Solution should be further diluted in 50–100 mL of 0.9% NaCl, D5W, D10W, D5/0.45% NaCl, or D5/0.9% NaCl. Solution may appear light yellow to amber. Solution is stable for 3 days at room temperature. **Concentration:** 40 mg/mL. **Rate:** Infuse over 30 min.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, allopurinol, amifostine, aminocaproic

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, atropine, aztreonam, benzotropine, bivalirudin, bumetanide, buprenorphine, butorphanol, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, cefuroxime, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, epitifibatid, erythromycin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, indomethacin, insulin, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pantoprazole, pemetrexed, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, propranolol, pyridoxine, ranitidine, remifentanyl, rituximab, rucuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, warfarin, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, amsacrine, ascorbic acid, azathioprine, calcium chloride, calcium gluconate, caspofungin, chloramphenicol, chlorpromazine, clindamycin, dacarbazine, dantrolene, daunorubicin, diazepam, diazoxide, diphenhydramine, dobutamine, dolasetron, doxorubicin hydrochloride, epirubicin, filgrastim, ganciclovir, haloperidol, hetastarch, hydralazine, hydroxyzine, idarubicin, imipenem/cilastatin, irinotecan, labetalol, leucovorin, mitoxantrone, mycophenolate, papaverine, pentamidine, pentazocine, pentobarbital, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, tobramycin, trimethoprim/sulfamethoxazole, vinorelbine. Calcium-containing solutions, including parenteral nutrition, should not be mixed or co-administered, even via different infusion lines at different sites in patients <28 days old. In older patients, flush line thoroughly between infusions.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the medication completely, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patient that sharing of this medication may be dangerous.
- **Pedi:** Instruct parents or caregivers to use calibrated measuring device with liquid preparations.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- **Instruct patient to notify health care professional if rash, fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

ceritinib (se-ri-ti-nib)

Zykadia

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

 Anaplastic lymphoma kinase (ALK)-positive, metastatic non-small cell lung cancer (NSCLC).

Action

Acts as a tyrosine kinase inhibitor, inhibiting anaplastic lymphoma kinase as well as other kinases, resulting in decreased growth of certain malignant cell lines.

Therapeutic Effects: Slowed progression of metastatic NSCLC.

Pharmacokinetics

Absorption: Absorption follows oral administration; food significantly ↑ absorption and may ↑ risk of adverse reactions.

Distribution: Slight preference to distribute from plasma into red blood cells.

Metabolism and Excretion: Metabolized in the liver (mostly by CYP3A) and is a substrate of P-glycoprotein (P-gp); 68% eliminated unchanged in feces, 1.3% in urine.

Half-life: 41 hr.

TIME/ACTION PROFILE (clinical response)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–6 hr (blood level)	7.1–7.4 mos

Contraindications/Precautions

Contraindicated in: **OB:** Pregnancy (may cause fetal harm); **Lactation:** Discontinue ceritinib or discontinue breast feeding; Congenital long QT syndrome.

Use Cautiously in: Moderate to severe hepatic impairment/severe renal impairment (CCr <30 mL/min); HF, bradycardia, electrolyte abnormalities, or concurrent use of QT prolonging medications; Concurrent use of strong CYP3A4 inhibitors; **Rep:** Women of reproductive potential and men with female partners of reproductive potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS. **CV:** BRADYCARDIA, TORSADE DE POINTES, QT interval prolongation. **GI:** HEPATOTOXICITY, PANCREATITIS, abdominal pain, ↓ appetite, constipation, diarrhea, esophagitis/reflux/dysphagia, ↑ liver enzymes, nausea, vomiting. **Derm:** rash. **Endo:** hyperglycemia. **F and E:** hypophosphatemia. **GU:** ↑ creatinine. **Hemat:** anemia. **Metab:** ↑ lipase.

Interactions

Drug-Drug: Concurrent use of strong CYP3A inhibitors including ketoconazole, and nefazodone ↑ blood levels and the risk of toxicities; avoid concurrent use; if unavoidable, ↓ ceritinib dose. Strong CYP3A inducers including carbamazepine, phenytoin, and rifampin may ↓ blood levels and effectiveness; avoid concurrent use. May ↑ blood levels and the risk of toxicity of CYP3A4 and CYP2C9 substrates, including alfentanil, cyclosporine, dihydroergotamine, ergotamine, fentanyl, phenytoin, pimozone, quinidine, sirolimus, tacrolimus, and warfarin; dose of these medications may need to be ↓. Beta-blockers, diltiazem, verapamil, digoxin, and clonidine may ↑ risk of bradycardia; avoid concurrent use, if possible. Concurrent use of QT interval prolonging medications may ↑ risk of QT interval prolongation and torsade de pointes.

Drug-Food: Grapefruit/grapefruit juice ↑ blood levels and the risk of toxicity; concurrent ingestion should be avoided. **St. John's wort** ↓ blood levels and effectiveness; concurrent use should be avoided.

Route/Dosage

PO (Adults): 750 mg once daily; continue until disease progression or unacceptable toxicity; *Concurrent use of strong CYP3A inhibitors*—↓ dose by ½ rounded to the nearest 150-mg strength.

Availability

Capsules: 150 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of interstitial lung disease or pneumonitis (trouble breathing, shortness of breath, fever, cough with or without mucus, chest pain). If these symptoms occur, discontinue therapy permanently.
- Monitor ECG periodically during therapy. If QTc interval is >500 msec on at least 2 separate ECGs, withhold ceritinib until QTc interval <481 msec or recovery to baseline if QTc ≥481 msec, then resume ceritinib with a 150 mg dose reduction. If QTc interval prolongation occurs in combination with torsades de pointes or polymorphic ventricular tachycardia or signs and symptoms of serious arrhythmia, discontinue ceritinib permanently.
- If symptomatic bradycardia that is not life-threatening occurs, withhold ceritinib until recovery to asymptomatic bradycardia or a heart rate ≥ 60 bpm, evaluate concurrent medications causing bradycardia, and adjust dose of ceritinib. If clinically significant bradycardia requiring intervention or life-threatening bradycardia in patients taking concurrent medication known to cause bradycardia or a medication known to cause hypotension occurs, withhold ceritinib until recovery to asymptomatic bradycardia or a heart rate ≥60 bpm. If concurrent medication can be adjusted or discontinued, resume ceritinib with a 150 mg dose reduction and frequent monitoring. If life-threatening bradycardia occurs in patients not taking medications known to cause bradycardia or hypotension, discontinue ceritinib permanently.
- Assess for nausea, vomiting, diarrhea. If severe or intolerable nausea, vomiting, or diarrhea continue despite optimal antiemetic or anti-diarrheal therapy, withhold ceritinib until improved; then resume with a 150 mg dose reduction.
- **Lab Test Considerations:** Test patient for ALK positivity in tumor specimens through an FDA approved test prior to starting therapy.
- Monitor liver function tests at least monthly. If ALT or AST >5 times the upper limit of normal and total bilirubin is ≤2 times the upper limit of normal, withhold ceritinib until recovery to baseline or less than or equal to 3 times the upper limit of normal, then resume ceritinib with a 150 mg dose reduction. If ALT or AST >3 times the upper limit of normal and total bilirubin is >2 times the upper limit of normal in the absence of cholestasis or hemolysis, permanently discontinue ceritinib.
- Monitor fasting blood glucose prior to and periodically during therapy. If persistent hyperglycemia >250 mg/dL despite anti-hyperglycemic therapy, withhold ceritinib until hyperglycemia is adequately controlled, then resume with a 150 mg dose reduction.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tion. If adequate hyperglycemic control cannot be achieved, discontinue therapy.

- May cause ↓ hemoglobin and serum phosphate; ↑ creatinine.
- Monitor serum lipase and amylase prior to and periodically during therapy. May cause ↑ serum lipase and amylase. If ↑ lipase or amylase >2 x upper limit of normal, withhold certitinib and monitor serum lipase and amylase. When recovery to <1.5 x upper limit of normal, resume with 150 mg dose.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer on an empty stomach, at least 1 hr before or 2 hr after meals.

Patient/Family Teaching

- Instruct patient to take certitinib as directed. Take missed doses as soon as remembered unless within 12 hrs of next dose. If vomiting occurs, do not administer additional dose, continue with next scheduled dose. Instruct patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes.
- Inform patient to avoid consuming grapefruit and grapefruit juice during therapy.
- Advise patient to notify health care professional if nausea, vomiting, and diarrhea is severe or persistent; if signs and symptoms of hepatotoxicity (feeling tired, itchy skin, skin or whites of eyes turn yellow, nausea and vomiting, decreased appetite, pain on right side of stomach, dark or brown, tea-colored urine, bleed or bruise easily); pneumonitis; QTc interval prolongation or bradycardia (new chest pain, changes in heartbeat, palpitations, dizziness, fainting, or changes in or use of a new heart or BP medication); hyperglycemia (increased thirst, increased hunger, headaches, trouble thinking or concentration, urinating often, blurred vision, tiredness, breath smells like fruit).
- **Rep:** Advise female patient of reproductive potential to use effective contraceptives during and for at least 6 mo following completion of therapy and to notify health care provider if pregnancy is planned or suspected and to avoid breast feeding during and for at least 2 wks after end of therapy. Advise males with female partners of reproductive potential to use condoms during therapy and for 3 mo following completion of therapy.

Evaluation/Desired Outcomes

- Slowed progression of metastatic NSCLC.

certolizumab (ser-toe-liz-u-mab) Cimzia

Classification

Therapeutic: gastrointestinal anti-inflammatories, antirheumatics

Pharmacologic: tumor necrosis factor blockers, DMARDs, monoclonal antibodies

Indications

Moderately-to-severely active Crohn's disease when response to conventional therapy has been inadequate.

Moderately-to-severely active rheumatoid arthritis. Active psoriatic arthritis. Active ankylosing spondylitis.

Action

Neutralizes tumor necrosis factor (TNF), a prime mediator of inflammation; pegylation provides a long duration of action. **Therapeutic Effects:** Decreased signs/symptoms of Crohn's disease. Decreased pain and swelling, decreased rate of joint destruction and improved physical function in rheumatoid arthritis. Decreased joint swelling and pain in psoriatic arthritis. Decreased spinal pain and inflammation in ankylosing spondylitis.

Pharmacokinetics

Absorption: 80% absorbed following SC administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 14 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	50–120 hr	2–4 wk

Contraindications/Precautions

Contraindicated in: Active infection (including localized); Concurrent use of anakinra.

Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection; History of exposure to tuberculosis; History of opportunistic infection; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycoses, or blastomycosis is endemic; History of demyelinating disorders (may exacerbate); History of heart failure; **Geri:** May ↑ risk of infections; **OB:** Use in pregnancy only if clearly needed; **Lactation:** Breast feed only if potential benefits justify potential risk to fetus; **Pedi:** Safety not established; ↑ risk of lymphoma (including hepatosplenic T-cell lymphoma [HSTCL] in patients with Crohn's disease), leukemia, and other malignancies.

Adverse Reactions/Side Effects

Derm: psoriasis, skin reactions (rarely severe). **Hemat:** hematologic reactions. **MS:** arthralgia. **Misc:**

hypersensitivity reactions including **ANAPHYLAXIS AND ANGIOEDEMA**, **INFECTIONS** (including reactivation tuberculosis, hepatitis B reactivation, and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), **MALIGNANCY** (including lymphoma, HSTCL, leukemia, and skin cancer), lupus-like syndrome.

Interactions

Drug-Drug: Concurrent use with **anakinra** ↑ risk of serious infections (contraindicated). Concurrent use with **azathioprine** and/or **methotrexate** may ↑ risk of HSTCL. May ↓ antibody response to or ↑ risk of adverse reactions to **live vaccines** (contraindicated).

Route/Dosage

Crohn's Disease

Subcut (Adults): 400 mg initially, repeat 2 and 4 wk later; may be followed by maintenance dose of 400 mg every 4 wk.

Rheumatoid Arthritis, Psoriatic Arthritis, and Ankylosing Spondylitis

Subcut (Adults): 400 mg initially, repeat 2 and 4 wk later; then maintenance dose of 200 mg every 2 wk (400 mg every 4 wk may be used alternatively).

Availability

Lyophilized powder for subcutaneous injection: 200 mg/vial. **Prefilled syringe:** 200 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Crohn's Disease:** Assess abdominal pain and frequency, quantity, and consistency of stools at beginning and during therapy.
- **Arthritis/Ankylosing Spondylitis:** Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, sore throat, dyspnea, WBC) prior to and during therapy. Monitor all patients for active TB (persistent cough, wasting, weight loss, low grade fever) during therapy, even if initial test was negative. Do not begin certolizumab during an active infection, including chronic or localized infections. If infection develops, monitor closely and discontinue certolizumab if infection becomes serious.
- Evaluate patients at risk for hepatitis B virus (HBV) infection for prior evidence of HBV infection before initiating therapy. Monitor carriers of HBV closely for clinical and lab signs of active HBV infection during and for several mo following discontinuation of therapy. If HBV reactivation occurs, discontinue certolizumab and initiate antiviral therapy.
- Monitor for signs of hypersensitivity reactions (angioedema, dyspnea, hypotension, rash, serum sick-

ness, urticaria). If reactions occur, discontinue certolizumab and treat symptomatically.

- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping certolizumab until the infection has been diagnosed and adequately treated.
- **Lab Test Considerations:** May cause anemia, leukopenia, pancytopenia, and thrombocytopenia.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue certolizumab if symptoms of blood dyscrasias (persistent fever) occur.
- May cause ↑ liver enzymes.
- May cause erroneously ↑ aPTT.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Implementation

- Perform test for latent TB. If positive for latent TB, active TB in whom an adequate course of treatment cannot be confirmed, and for patients with a negative test for TB who have risk factors for tuberculosis infection, begin treatment for TB prior to starting certolizumab therapy. Monitor for TB throughout therapy, even if latent TB test is negative.
- Allow vial to sit at room temperature for 30 min prior to reconstituting; do not use other warming methods. Reconstitute vial by adding 1 mL of Sterile Water for injection, using a 20-gauge needle, for a concentration of 200 mg/mL. Gently swirl so all powder comes into contact with sterile water; do not shake. Leave vial undisturbed for as long as 30 min to fully reconstitute. Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. Do not leave reconstituted solution at room temperature for >2 hr prior to injection. May be refrigerated for up to 24 hr prior to injection; do not freeze.
- **Subcut:** Allow solution to sit at room temperature for 30 min prior to injection; do not use other warming methods. Using a new 20-gauge needle for each vial, withdraw reconstituted solution into 2 separate syringes each containing 1 mL (200 mg/mL) of certolizumab. Switch each 20-gauge needle to a 23-gauge needle and inject the full contents of each syringe subcut into separate sides of the abdomen or thigh.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Patient/Family Teaching

- Advise patient of potential benefits and risks of certolizumab. Advise patient to read the *Medication Guide* prior to starting therapy.
- Inform patient of risk of infection. Advise patient to notify health care professional if symptoms of infection (fever, cough, flu-like symptoms, or open cuts or sores), including TB or reactivation of HBV infection, occur.
- Counsel patient about possible risk of lymphoma and other malignancies while receiving certolizumab.
- Advise patient to notify health care professional if signs of hypersensitivity reactions (rash, swollen face, difficulty breathing), or new or worsening medical conditions such as heart or neurological disease or autoimmune disorders occur and to report signs of bone marrow depression (bruising, bleeding, or persistent failure).
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage women who become pregnant to enroll in the MotherToBaby Pregnancy Studies conducted by the Organization of Teratology Information Specialists (OTIS). The OTIS Auto-Immune Diseases Study at 1-877-311-8972 or visit <http://mothertobaby.org/pregnancy-studies/>.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of Crohn's disease.
- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased joint swelling and pain in psoriatic arthritis.
- Decreased spinal pain and inflammation in ankylosing spondylitis.

cetirizine (se-ti-ra-zeen)

★ Aller Relief, ★ Reactine,
★ Rhinaris Relief, ZyrTEC

Classification

Therapeutic: allergy, cold, and cough remedies, antihistamines
Pharmacologic: piperazines (peripherally selective)

Indications

Relief of allergic symptoms caused by histamine release including: Seasonal and perennial allergic rhinitis, Chronic urticaria.

Action

Antagonizes the effects of histamine at H₁-receptor sites; does not bind to or inactivate histamine. Anticholinergic

effects are minimal and sedation is dose related.

Therapeutic Effects: Decreased symptoms of histamine excess (sneezing, rhinorrhea, ocular tearing and redness, pruritus).

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 93%.

Metabolism and Excretion: Excreted primarily unchanged by the kidneys.

Half-life: 7.4–9 hr (↓ in children to 6.2 hr, ↑ in renal impairment up to 19–21 hr).

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	4–8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cetirizine, hydroxyzine or any component; **Lactation:** Excreted in breast milk; not recommended for use.

Use Cautiously in: Patients with hepatic or renal impairment (dose ↓ recommended if CCr ≤ 31 mL/min or hepatic function is impaired); **OB, Pedi:** Safety not established for pregnant women or children <6 mo; **Ger:** Initiate at lower doses.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness (significant with doses >10 mg/day), fatigue. **Derm:** acute generalized exanthematous pustulosis. **EENT:** pharyngitis. **GI:** dry mouth.

Interactions

Drug-Drug: Additive CNS depression may occur with alcohol, opioid analgesics, or sedative/hypnotics. **Theophylline** may ↓ clearance and ↑ toxicity.

Route/Dosage

PO (Adults and children ≥6 yr): 5–10 mg given once or divided twice daily.

PO (Children 2–5 yr): 2.5 mg once daily initially, may be ↑ to 5 mg once daily or 2.5 mg every 12 hr.

PO (Children 1–2 yr): 2.5 mg once daily; may be ↑ to 2.5 mg every 12 hr.

PO (Children 6–12 mo): 2.5 once daily.

Hepatic/Renal Impairment

PO (Adults and Children ≥12 yr): CCr ≤ 31 mL/min, hepatic impairment or hemodialysis—5 mg once daily.

Hepatic/Renal Impairment

PO (Children 6–11 yr): start therapy at <2.5 mg/day.

Hepatic/Renal Impairment

PO (Children <6 yr): use not recommended.

Availability (generic available)

Tablets: 5 mg^{OTC}, 10 mg^{OTC}. **Capsules:** 5 mg^{OTC}, 10 mg^{OTC}. **Chewable tablets (grape):** 5 mg^{OTC}, 10 mg^{OTC}.

Orally disintegrating tablets: 10 mg. **Syrup (banana-grape and bubblegum flavors):** 1 mg/mL^{OTC}.

In combination with: pseudoephedrine (Zyrtec-D 12 hr) (See Appendix B).

NURSING IMPLICATIONS**Assessment**

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- **Lab Test Considerations:** May cause false-negative result in allergy skin testing.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Risk for injury (Adverse Reactions)

Implementation

- Do not confuse cetirizine with sertraline or stavudine. Do not confuse Zyrtec (cetirizine) with Zerit (Stavudine), Lipitor (atorvastatin), Zantac (ranitidine), Zocor (simvastatin), Zyprexa (olanzapine), Zyrtec-D (cetirizine/pseudoephedrine), Zyrtec Itchy Eye Drops (ketotifen fumarate).
- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Instruct patient to contact health care professional if rash or dizziness occurs or if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.

☞ cetuximab (se-tux-i-mab)

Erbitux

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

Indications

Locally or regionally advanced squamous cell carcinoma of the head and neck with radiation. Recurrent or

metastatic squamous cell carcinoma of the head and neck progressing after platinum-based therapy. Recurrent or metastatic squamous cell carcinoma of the head and neck in combination with platinum-based therapy with 5-fluorouracil. ☞ *K-ras* wild-type, epidermal growth factor receptor (EGFR)-expressing metastatic colorectal cancer in patients who have not responded to irinotecan and oxaliplatin or are intolerant to irinotecan. ☞ In combination with irinotecan in patients with *K-ras* wild-type, EGFR-expressing metastatic colorectal cancer who have not responded to irinotecan alone. ☞ First-line treatment of *K-ras* wild-type, EGFR-expressing metastatic colorectal cancer in combination with irinotecan, 5-fluorouracil, and leucovorin (FOLFIRI).

Action

☞ Binds specifically to EGFR, thereby preventing the binding of endogenous epidermal growth factor (EGF). This prevents cell growth and differentiation processes. Combination with irinotecan enhances antitumor effects of irinotecan. **Therapeutic Effects:** Decreased tumor growth and spread.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 97–114 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cetuximab or murine (mouse) proteins; ☞ *RAS*-mutant metastatic colorectal cancer or unknown *RAS* mutation status (↑ mortality and tumor progression); **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Exposure to sunlight (may exacerbate dermatologic toxicity); **Pedi:** Safety not established.

Adverse Reactions/Side Effects

Most adverse reactions reflect combination therapy with irinotecan.

CNS: malaise, depression, headache, insomnia.

EENT: conjunctivitis, ulcerative keratitis. **Resp:** cough, dyspnea, interstitial lung disease. **CV:** CARDIOPULMONARY ARREST, PULMONARY EMBOLISM, SUDDEN CARDIAC DEATH. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, anorexia, stomatitis. **GU:** renal failure. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, acneform dermatitis, hypertrichosis, nail disorder, pruritus, skin desquamation, skin infection. **F and E:** dehydration, hypomagnesemia, pe-

* = Canadian drug name. ☞ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ripheral edema. **Hemat:** anemia, leukopenia. **MS:** back pain. **Metab:** weight loss. **Misc:** **INFUSION REACTIONS,** fever, desquamation of mucosal epithelium.

Interactions

Drug-Drug: None noted.

Route/Dosage

Head & Neck Cancer with Radiation or in Combination with Platinum-Based Therapy with 5-Fluorouracil

IV (Adults): 400 mg/m² administered 1 wk prior to initiation of radiation therapy or on the day of initiation of platinum-based therapy with 5-fluorouracil (complete infusion 1 hr prior to starting platinum-based therapy with 5-fluorouracil), followed by weekly maintenance doses of 250 mg/m² for the duration of radiation therapy or until disease progression or unacceptable toxicity with platinum-based therapy with 5-fluorouracil (complete infusion 1 hr prior to radiation therapy or platinum-based therapy with 5-fluorouracil). Dose modification recommended for dermatologic toxicity.

Head and Neck Cancer Monotherapy

IV (Adults): 400 mg/m² initial loading dose, followed by weekly maintenance doses of 250 mg/m² until disease progression or unacceptable toxicity; dose modification recommended for dermatologic toxicity.

Colorectal Cancer

IV (Adults): 400 mg/m² initial loading dose, followed by weekly maintenance doses of 250 mg/m² until disease progression or unacceptable toxicity; dose modification recommended for dermatologic toxicity.

Availability

Solution for injection: 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for infusion reaction (rapid onset of airway obstruction [bronchospasm, stridor, hoarseness], urticaria, hypotension, loss of consciousness, myocardial infarction, cardiopulmonary arrest) for at least 1 hr following infusion. Longer observation periods may be required for those who experience infusion reactions. Most reactions occur during first dose, but may also occur in later doses. For severe reactions, immediately stop infusion and discontinue cetuximab permanently. Epinephrine, corticosteroids, IV antihistamines, bronchodilators, and oxygen should be available for reactions. Mild to moderate reactions (chills, fever, dyspnea) may be managed by slowing rate of infusion and administration of antihistamines.
- Assess for onset or worsening of pulmonary symptoms. Interrupt therapy to determine nature of symptoms. If interstitial lung disease is confirmed, discontinue cetuximab and treat appropriately.

- Assess for dermatologic toxicities (acneform rash, skin drying and fissuring, inflammatory and infectious sequelae [blepharitis, cheilitis, cellulitis, cyst]). Treat symptomatically. Acneform rash usually occurs within initial 2 wk of therapy and resolves following cessation, but may continue up to 28 days following therapy. For 1st occurrence of acneform rash, delay infusion 1–2 wks; if improvement, continue at 250 mg/m², if no improvement, discontinue cetuximab. For 2nd occurrence, delay infusion 1–2 wks; if improvement, reduce dose to 200 mg/m², if no improvement, discontinue cetuximab. For 3rd occurrence, delay infusion 1–2 wks; if improvement, reduce dose to 150 mg/m², if no improvement, discontinue cetuximab. For 4th occurrence, discontinue cetuximab.
- **Lab Test Considerations:** ☒ Determine Ras mutation and EGFR-expression status using FDA-approved tests prior to initiating treatment. Only patients whose tumors are K-Ras wild-type should receive cetuximab.
- **Lab Test Considerations:** May cause anemia and leukopenia.
- Monitor serum electrolytes, especially serum magnesium, potassium, and calcium, closely during and periodically for at least 8 wk following infusion. May cause hypomagnesemia, hypocalcemia, and hypokalemia; may occur from days to mo after initiation of therapy. May require electrolyte replacement. May lead to cardiopulmonary arrest and sudden death.

Potential Nursing Diagnoses

Ineffective breathing pattern (Adverse Reactions)
Impaired skin integrity (Adverse Reactions)

Implementation

- Premedicate with histamine antagonist (diphenhydramine 50 mg) 30–60 min prior to first dose; base subsequent administration on presence and severity of infusion reactions.
- Administer through a low protein binding 0.22-micrometer in-line filter placed as proximal to patient as possible. Solution should be clear and colorless and may contain a small amount of white amorphous cetuximab particles. Do not shake or dilute.
- Can be administered via infusion pump or syringe pump. Cetuximab should be piggybacked to the patient's infusion line.
- Observe patient for 1 hr following infusion.

IV Administration

- **Intermittent Infusion:** For administration via infusion pump: Draw up volume of a vial using vented spike needle or other transfer device. Transfer to a sterile evacuated container or bag. Repeat with new needle for each vial until calculated volume is in container. Affix infusion line and prime with cetuximab before starting infusion.
- For administration via syringe pump: Draw up volume of a vial using sterile syringe attached to an

appropriate vented spike needle. Place syringe into syringe driver of a syringe pump and set rate. Connect infusion line and prime with cetuximab. Use a new needle and filter for each vial. **Diluent:** Do not dilute. **Concentration:** 2 mg/mL. **Rate:** Administer over 2 hr at a rate not to exceed 10 mg/min. Use 0.9% NaCl to flush line at end of infusion.

- Cetuximab infusion must be completed 1 hr prior to FOLFIRI (irinotecan, 5-fluorouracil, leucovorin) regimen. May infuse subsequent weekly infusions over 1 hr.

Patient/Family Teaching

- Explain purpose of cetuximab and potential side effects to patient.
- Advise patient to report dermatologic changes and signs and symptoms of infusion reactions (fever, chills, or breathing problems) promptly.
- Caution patient to wear sunscreen and hats and limit sun exposure during therapy during and for 2 mo following last dose of cetuximab.
- **Rep:** Advise both female and male patients to use adequate contraception during and for 6 mo following therapy and to avoid breast feeding during and for 2 mo following therapy.

Evaluation/Desired Outcomes

- Decreased tumor growth and spread.

chlorthiazide, See DIURETICS (THIAZIDE).

chlorthalidone (thiazide-like), See DIURETICS (THIAZIDE).

cholecalciferol, See VITAMIN D COMPOUNDS.

choline and magnesium salicylates, See SALICYLATES.

ciclesonide, See CORTICOSTEROIDS (NASAL).

ciclopirox, See ANTIFUNGALS (TOPICAL).

cilostazol (sil-os-tah-zol)

Plata[†]

Classification

Therapeutic: antiplatelet agents

Pharmacologic: platelet aggregation inhibitors

Indications

Reduction of the symptoms of intermittent claudication as measured by increased walking distance.

Action

Inhibits the enzyme cyclic adenosine monophosphate (cAMP) phosphodiesterase III (PDE III), which results in increased cAMP in platelets and blood vessels, producing inhibition of platelet aggregation and vasodilation. **Therapeutic Effects:** Reduced symptoms of intermittent claudication with improved walking distance.

Pharmacokinetics

Absorption: Slowly absorbed after oral administration.

Distribution: Unknown.

Protein Binding: 95–98% bound to plasma proteins; one active metabolite is 97.4% bound, the other is 66% bound.

Metabolism and Excretion: Extensively metabolized by the liver, two metabolites have platelet aggregation inhibitory activity; metabolites are mostly excreted by the kidneys.

Half-life: *Cilostazol and its active metabolites*—11–13 hr.

TIME/ACTION PROFILE (symptom reduction)

ROUTE	ONSET	PEAK	DURATION
PO	2–4 wk	up to 12 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; HF; **OB:** Potential for congenital defects, stillbirth, and low birth weight; **Lactation:** Potential risk to nursing infants; discontinue or bottle feed.

Use Cautiously in: **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, dizziness. **CV:** hypotension, left ventricular outflow obstruction, palpitations, tachycardia.

GI: diarrhea.

Interactions

Drug-Drug: Concurrent administration of **ketoconazole**, **itraconazole**, **erythromycin**, **diltiazem**, **fluconazole**, **miconazole**, **fluvoxamine**, **fluoxetine**, **nefazodone**, **sertraline**, or **omeprazole** ↓ metabo-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

lism and ↑ levels and activity of cilostazol (use lower doses). Concurrent use with **aspirin** has additive effects on platelet function.

Drug-Food: Grapefruit juice inhibits metabolism and ↑ effects; concurrent use should be avoided.

Route/Dosage

PO (Adults): 100 mg twice daily (50 mg twice daily if receiving inhibitors of cilostazol metabolism).

Availability (generic available)

Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for intermittent claudication before and periodically during therapy.
- **Lab Test Considerations:** May occasionally cause anemia, hyperlipemia, hyperuricemia, and albuminuria. May prolong bleeding time.

Potential Nursing Diagnoses

Activity intolerance (Indications)

Implementation

- **PO:** Administer on an empty stomach, 1 hr before or 2 hr after meals.

Patient/Family Teaching

- Instruct patient to take cilostazol on an empty stomach, exactly as directed.
- Advise patient to avoid grapefruit juice during therapy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid smoking; nicotine constricts blood vessels.

Evaluation/Desired Outcomes

- Relief from cramping in calf muscles, buttocks, thighs, and feet during exercise.
- Improvement in walking endurance. Therapeutic effects may be seen in 2–4 wk.

cimetidine, See HISTAMINE H₂ ANTAGONISTS.

cinacalcet (sin-a-kal-set)

Sensipar

Classification

Therapeutic: hypocalcemics

Pharmacologic: calcimimetic agents

Indications

Secondary hyperparathyroidism in patients with chronic kidney disease (CKD) on dialysis. Hypercalcemia caused by parathyroid carcinoma. Severe hyper-

calcemia in patients with primary hyperparathyroidism in patients who are unable to undergo parathyroidectomy.

Action

Increases sensitivity of calcium-sensing receptors located on the surface of chief cells of parathyroid gland to levels of extracellular calcium. This decreases parathyroid hormone production with resultant decrease in serum calcium. **Therapeutic Effects:** Decreased bone turnover and fibrosis. Decreased serum calcium.

Pharmacokinetics

Absorption: Well absorbed following oral administration, absorption is enhanced by food and further enhanced by a high fat meal.

Distribution: Unknown.

Protein Binding: 93–97%.

Metabolism and Excretion: Highly metabolized by CYP3A4, CYP2D6, and CYP1A2 enzyme systems; 80% excreted in urine as metabolites, 15% in feces.

Half-life: 30–40 hr.

TIME/ACTION PROFILE (effect on PTH levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–6 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypocalcemia; **Lactation:** Discontinue drug or bottle-feed.

Use Cautiously in: History of seizure disorder (↑ risk of seizures with hypocalcemia); Chronic kidney disease patients who are not being dialyzed (↑ risk of hypocalcemia); Intact parathyroid hormone (iPTH) level <150 pg/mL (dose ↓ or discontinuation may be warranted); Moderate to severe hepatic impairment; Congenital long QT syndrome, QT interval prolongation, family history of long QT syndrome or sudden cardiac death, or concurrent use of QT interval prolonging medications; **OB:** Use only if benefits justify risks to fetus; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: seizures. **CV:** ARRHYTHMIA, TORSADE DE POINTES, HF exacerbation, hypotension, QT interval prolongation. **GI:** nausea, vomiting. **F and E:** HYPOCALCEMIA.

Metab: adynamic bone disease.

Interactions

Drug-Drug: Concurrent use of QT interval prolonging medications may ↑ risk of QT interval prolongation and/or torsade de pointes, especially in patients with hypocalcemia. Inhibits CYP2D6 and may ↑ levels of flecainide, vinblastine, thioridazine, metoprolol, carvedilol, and most tricyclic antidepressants; dose adjustments may be necessary. Blood levels are ↑ by strong CYP3A4 inhibitors including ketoconazole, itraconazole, and erythromycin; monitoring and dose adjustment may be necessary.

Route/Dosage

PO (Adults): *Secondary hyperparathyroidism in CKD patients on dialysis*—30 mg once daily; may ↑ dose every 2–4 wk (dose range 30–180 mg once daily) based on iPTH levels; *Parathyroid carcinoma or primary hyperparathyroidism*—30 mg twice daily; may titrate every 2–4 wk up to 90 mg 3–4 times daily based on serum calcium levels.

Availability

Tablets: 30 mg, 60 mg, 90 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hypocalcemia (paresthesias, myalgias, cramping, tetany, convulsions) during therapy. If calcium levels decrease to below normal, serum calcium may be increased by adjusting dose (see Lab Test Considerations) and providing supplemental serum calcium, initiating or increasing dose of calcium-based phosphate binder or vitamin D.
- **Monitor ECG for prolonged QT interval periodically during therapy.**
- **Lab Test Considerations:** Monitor serum calcium and phosphorus levels within 1 wk after initiation of therapy or dose adjustment and monthly for patients with hyperparathyroidism or every 2 mo for patients with parathyroid carcinoma once maintenance dose has been established, especially in patients with a history of seizure disorder. Therapy should not be initiated in patients with serum calcium less than the lower limit of normal (8.4 mg/dL).
- If serum calcium ↓ below 8.4 mg/dL but remains above 7.5 mg/dL, or if symptoms of hypocalcemia occur, use calcium-containing phosphate binders and/or vitamin D sterols to ↑ serum calcium. If serum calcium ↓ below 7.5 mg/dL, or if symptoms of hypocalcemia persist and the dose of vitamin D cannot be ↑, withhold administration of cinacalcet until serum calcium levels reach 8.0 mg/dL, and/or symptoms of hypocalcemia resolve. Re-initiate therapy using next lowest dose of cinacalcet.
- Monitor serum iPTH levels 1 to 4 wk after initiation of therapy or dose adjustment, and every 1 to 3 mo after maintenance dose has been established. If iPTH levels ↓ below 150–300 pg/mL, reduce dose or discontinue cinacalcet.
- Monitor liver function tests in patients with moderate to severe hepatic impairment during therapy.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Cinacalcet may be used alone or in combination with vitamin D and/or phosphate binders.
- **PO:** Administer with food or shortly after a meal. Take tablets whole, do not crush, break or chew.

Patient/Family Teaching

- Instruct patient to take cinacalcet as directed.
- Advise patient to report signs and symptoms of hypocalcemia, GI bleeding (black tarry stools, abdominal pain), nausea and vomiting to health care professional promptly.
- Emphasize the importance of follow-up lab tests to monitor safety and efficacy.

Evaluation/Desired Outcomes

- Decreased serum calcium levels.

HIGH ALERT

CISplatin (sis-pla-tin) Platinol

Classification

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Indications

Metastatic testicular and ovarian carcinoma. Advanced bladder cancer. Head and neck cancer. Cervical cancer. Lung cancer. Other tumors.

Action

Inhibits DNA synthesis by producing cross-linking of parent DNA strands (cell-cycle phase–nonspecific).

Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed; accumulates for months; enters breast milk.

Metabolism and Excretion: Excreted mainly by the kidneys.

Half-life: 30–100 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	18–23 days	39 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Hearing loss; Renal impairment (dosage ↓ recommended); HF; Electrolyte abnormalities; Active infections; Bone marrow depression; **Geri:**

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

↑ risk of nephrotoxicity and peripheral neuropathy;
Rep: Women of reproductive potential.

Adverse Reactions/Side Effects

CNS: REVERSIBLE POSTERIOR LEUKENCEPHALOPATHY SYNDROME (RPLS), SEIZURES, malaise, weakness.

EENT: ototoxicity, tinnitus. **GI:** HEPATOTOXICITY, nausea, vomiting, diarrhea. **GU:** nephrotoxicity, sterility.

Derm: alopecia. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia. **Hemat:** LEUKOPENIA, THROMBOCYTOPENIA, anemia. **Local:** phlebitis at IV site. **Me-tab:** hyperuricemia. **Neuro:** peripheral neuropathy. **Misc:** anaphylactoid reactions.

Interactions

Drug-Drug: ↑ risk of nephrotoxicity and ototoxicity with other nephrotoxic and ototoxic drugs (aminoglycosides, loop diuretics). ↑ risk of hypokalemia and hypomagnesemia with loop diuretics and amphotericin B. May ↓ phenytoin levels. ↑ bone marrow depression with other antineoplastics or radiation therapy. May ↓ antibody response to live-virus vaccines and ↑ adverse reactions.

Route/Dosage

Other regimens are used.

IV (Adults): *Metastatic testicular tumors*—20 mg/m² daily for 5 days repeated every 3–4 wk. *Metastatic ovarian cancer*—75–100 mg/m², repeat every 4 wk in combination with cyclophosphamide or 100 mg/m² every 3 wk if used as a single agent. *Advanced bladder cancer*—50–70 mg/m² every 3–4 wk as a single agent.

Availability (generic available)

Injection: 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during administration. Report significant changes.
- Monitor intake and output and specific gravity frequently during therapy. To reduce risk of nephrotoxicity, maintain urinary output of at least 100 mL/hr for 4 hr before initiating and for at least 24 hr after administration.
- Encourage patient to drink 2000–3000 mL/day of water to promote excretion of uric acid. Allopurinol and alkalinization of urine may be used to help prevent uric acid nephropathy.
- Assess patency of IV site frequently during therapy. Cisplatin may cause severe irritation and necrosis of tissue if extravasation occurs. If a large amount of highly concentrated cisplatin solution extravasates, mix 4 mL of 10% sodium thiosulfate with 6 mL of sterile water or 1.6 mL of 25% sodium thiosulfate with 8.4 mL of sterile water and inject 1–4 mL (1 mL for each mL extravasated) through existing line or cannula. Inject subcut if needle has been removed. Sodium thiosulfate inactivates cisplatin.

- Severe and protracted nausea and vomiting usually occur 1–4 hr after a dose; vomiting may last for 24 hr. Administer parenteral antiemetic agents 30–45 min before therapy and routinely around the clock for the next 24 hr. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration. Nausea and anorexia may persist for up to 1 wk.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor for signs of anaphylaxis (facial edema, wheezing, dizziness, fainting, tachycardia, hypotension). Discontinue medication immediately and report symptoms. Epinephrine and resuscitation equipment should be readily available.
- Medication may cause ototoxicity and neurotoxicity. Assess patient frequently for dizziness, tinnitus, hearing loss, loss of coordination, loss of taste, or numbness and tingling of extremities; may be irreversible. Notify health care professional promptly if these occur. Audiometry should be performed before initiation of therapy and before subsequent doses. Hearing loss is more frequent with children and usually occurs first with high frequencies and may be unilateral or bilateral.
- Monitor for inadvertent cisplatin overdose. Doses >100 mg/m²/cycle once every 3–4 wk are rarely used. Differentiate daily doses from total dose/cycle. Symptoms of high cumulative doses include muscle cramps (localized, painful involuntary skeletal muscle contractions of sudden onset and short duration) and are usually associated with advanced stages of peripheral neuropathy.
- Monitor for signs of RPLS (headache, seizure, lethargy, confusion, blindness). Hypertension may or may not be present. May occur within 16 hr to 1 yr of initiation of therapy. Treat hypertension if present and discontinue cisplatin therapy. Symptoms usually resolve within days.
- **Lab Test Considerations:** Monitor CBC with differential and platelet count before and routinely throughout therapy. The nadir of leukopenia, thrombocytopenia, and anemia occurs within 18–23 days and recovery 39 days after a dose. Withhold further doses until WBC is >4000/mm³ and platelet count is >100,000/mm³.
- Monitor BUN, serum creatinine, and CCr before initiation of therapy and before each course of cisplatin to detect nephrotoxicity. May cause ↑ BUN and creatinine and ↓ calcium, magnesium, phosphate, sodium, and potassium levels that usually occur 2nd wk after a dose. Do not administer additional doses until BUN is <25 mg/dL and serum creatinine is

<1.5 mg/dL. May cause ↑ uric acid level, which usually peaks 3–5 days after a dose.

- May cause transiently ↑ serum bilirubin and AST concentrations.
- May cause positive Coombs' test result.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- Do not confuse cisplatin with carboplatin. To prevent confusion, orders should include generic and brand names. Administer under supervision of a physician experienced in use of cancer chemotherapeutic agents.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers.
- Hydrate patient with at least 1–2 L of IV fluid 8–12 hr before initiating therapy with cisplatin. Amifostine may be administered to minimize nephrotoxicity.
- Do not use aluminum needles or equipment during preparation or administration. Aluminum reacts with this drug, forms a black or brown precipitate, and renders the drug ineffective.
- Unopened vials of powder and constituted solution must not be refrigerated.

IV Administration

- **Intermittent Infusion:** Solution should be clear and colorless; discard if turbid or if it contains precipitates.
- **Diluent:** Dilute in 2 L of 5% dextrose in 0.3% or 0.45% NaCl containing 37.5 g of mannitol is recommended. **Concentration:** Keep under 0.5 mg/mL to prevent tissue necrosis. **Rate:** Variable. Administer over 6–8 hr. Maximum rate 1 mg/min.
- **Continuous Infusion:** Has been administered as continuous infusion over 24 hr to 5 days with resultant decrease in nausea and vomiting. **High Alert:** Clarify dose to ensure cumulative dose is not confused with daily dose; errors may be fatal.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butor-

phanol, calcium chloride, calcium gluconate, carmustine, caspofungin, ceftazolin, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cladrubine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, etarpenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, heparin, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meprenem, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, moxifloxacin, nafcillin, naloxone, nesiritide, nifedipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, phenytoin, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amifostine, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, cefepime, dantrolene, diazepam, insulin, pantoprazole, piperacillin/tazobactam, thiopeta.

Patient/Family Teaching

- Instruct patient to report pain at injection site immediately.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ing; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.

- Instruct patient to report promptly any numbness or tingling in extremities or face, difficulty with hearing or tinnitus, unusual swelling, or joint pain.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient of the need for contraception, although cisplatin may cause infertility.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies. Therapy should not be administered more frequently than every 3–4 wk, and only if lab values are within acceptable parameters and patient is not exhibiting signs of ototoxicity or other serious adverse effects.

citalopram (si-tal-oh-pram)

CeleXA

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Depression. **Unlabeled Use:** Premenstrual dysphoric disorder (PMDD). Obsessive-compulsive disorder (OCD). Panic disorder. Generalized anxiety disorder (GAD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia).

Action

Selectively inhibits the reuptake of serotonin in the CNS.

Therapeutic Effects: Antidepressant action.

Pharmacokinetics

Absorption: 80% absorbed after oral administration.

Distribution: Enters breast milk.

Metabolism and Excretion: $\frac{\text{H}}$ Mostly metabolized by the liver (10% by CYP3A4 and 2C19 enzymes); excreted unchanged in urine.

Half-life: 35 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or

methylene blue); Concurrent use of pimozide; Congenital long QT syndrome, bradycardia, hypokalemia, hypomagnesemia, recent myocardial infarction, decompensated heart failure (\uparrow risk of QT interval prolongation); Concurrent use of QT interval prolonging drugs.

Use Cautiously in: History of mania; History of suicide attempt/ideation (\uparrow risk during early therapy and during dose adjustment); History of seizure disorder; Illnesses or conditions that are likely to result in altered metabolism or hemodynamic responses; Severe renal or hepatic impairment (maximum dose of 20 mg/day in patients with hepatic impairment); $\frac{\text{H}}$ Poor metabolizers of CYP2C19 (\uparrow risk of QT interval prolongation) (maximum dose of 20 mg/day); Concurrent use of CYP2C19 inhibitors (\uparrow risk of QT interval prolongation) (maximum dose of 20 mg/day); Angle-closure glaucoma; **OB:** Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; **Lactation:** Present in breast milk and may result in lethargy with \downarrow feeding in infants; weigh risk/benefits; **Pedi:** May \uparrow risk of suicide attempt/ideation especially during early treatment or dose adjustment in children/adolescents (unlabeled for pediatric use); **Geri:** \downarrow doses recommended (maximum dose of 20 mg/day in patients >60 yr).

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, apathy, confusion, drowsiness, insomnia, weakness, agitation, amnesia, anxiety, \downarrow libido, dizziness, fatigue, impaired concentration, \uparrow depression, migraine headache.** **EENT:** abnormal accommodation. **Resp:** cough. **CV:** **TORSADE DE POINTES**, postural hypotension, QT interval prolongation, tachycardia. **GI:** abdominal pain, anorexia, diarrhea, dry mouth, dyspepsia, flatulence, \uparrow saliva, nausea, altered taste, \uparrow appetite, vomiting. **GU:** amenorrhea, dysmenorrhea, ejaculatory delay, erectile dysfunction, polyuria. **Derm:** sweating, photosensitivity, pruritus, rash. **Metab:** weight loss, weight gain. **F and E:** hyponatremia. **MS:** arthralgia, myalgia. **Neuro:** tremor, paresthesia. **Misc:** **SEROTONIN SYNDROME**, fever, yawning.

Interactions

Drug-Drug: May cause serious, potentially fatal reactions when used with **MAO inhibitors**; concurrent use contraindicated; allow at least 14 days between citalopram and **MAO inhibitors**. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue**, may \uparrow risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving citalopram, immediately discontinue citalopram and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume citalopram therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **pi-**

mozide may result in prolongation of the QTc interval and is contraindicated. **QT interval prolonging drugs** may ↑ the risk of QT interval prolongation and torsade de pointes (concurrent use should be avoided). **CYP2C19 inhibitors**, including **cimetidine** may ↑ levels and the risk of toxicity (maximum dose = 20 mg/day). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **bupirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. Use cautiously with other **centrally acting drugs** (including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**; concurrent use with **alcohol** is not recommended). Serotonergic effects may be ↑ by **lithium** (concurrent use should be carefully monitored). **Ketoconazole**, **itraconazole**, **erythromycin**, and **omeprazole** may ↑ levels. **Carbamazepine** may ↓ blood levels. May ↑ levels of **metoprolol**. Use cautiously with **tricyclic antidepressants** due to unpredictable effects on serotonin and norepinephrine reuptake. ↑ risk of bleeding with **aspirin**, **NSAIDs**, **clopidogrel**, or **warfarin**.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAME**.

Route/Dosage

PO (Adults): 20 mg once daily initially, may be ↑ in 1 wk to 40 mg/day (maximum dose); *Poor metabolizer of CYP2C19 or concurrent use of CYP2C19 inhibitor*—Do not exceed dose of 20 mg/day.

PO (Geriatric Patients): 20 mg once daily initially (do not exceed dose of 20 mg/day in patients >60 yr).

Hepatic Impairment

PO (Adults): 20 mg once daily (do not exceed dose of 20 mg/day).

Availability (generic available)

Tablets: 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—10 mg \$7.11/100, 20 mg \$9.73/100, 40 mg \$10.83/100.

Oral solution (peppermint flavor): 10 mg/5 mL. **Cost:** *Generic*—10 mg/5 mL \$117.50/240 mL.

NURSING IMPLICATIONS

Assessment

- Monitor mood changes during therapy.
- Assess for suicidal tendencies, especially during early therapy and dose changes. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for the next 4 wk, and on advice of health care professional thereafter.
- Assess for sexual dysfunction (erectile dysfunction; decreased libido).

- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Lab Test Considerations:** Monitor electrolytes (potassium and magnesium) in patients at risk for electrolyte imbalances prior to and periodically during therapy.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Sexual dysfunction (Side Effects)

Implementation

- Do not confuse with Celebrex (celecoxib), Cerebyx (fosphenytoin), or Zyprexa (olanzapine).
- **PO:** Administer as a single dose in the morning or evening without regard to food.

Patient/Family Teaching

- Instruct patient to take citalopram as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Do not stop abruptly; may cause anxiety, irritability, high or low mood, feeling restless or changes in sleep habits, headache, sweating, nausea, dizziness, electric shock-like sensations, shaking, and confusion. Advise patient to read the *Medication Guide* prior to starting therapy and with each refill in case of changes.
- May cause drowsiness, dizziness, impaired concentration, and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially alcohol or other CNS depressants and St. John's wort.
- Caution patient to change positions slowly to minimize dizziness.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected, or if breast feeding. If used during pregnancy should be tapered during third trimester to avoid neonatal serotonin syndrome.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.

clarithromycin

(kla-rith-roe-mye-sin)
Biaxin, Biaxin XL

Classification

Therapeutic: agents for atypical mycobacterium, anti-infectives, antiulcer agents
Pharmacologic: macrolides

Indications

Respiratory tract infections including streptococcal pharyngitis, sinusitis, bronchitis, and pneumonia. Treatment (with ethambutol) and prevention of disseminated *Mycobacterium avium* complex (MAC). Treatment of following pediatric infections: Otitis media, Sinusitis, Pharyngitis, Skin/skin structure infections. Part of a combination regimen for ulcer disease due to *Helicobacter pylori*. Endocarditis prophylaxis.

Action

Inhibits protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action. **Spectrum:** Active against these gram-positive aerobic bacteria: *Staphylococcus aureus*, *S. pneumoniae*, *S. pyogenes* (group A strep). Active against these gram-negative aerobic bacteria: *Haemophilus influenzae*, *Moraxella catarrhalis*. Also active against: *Mycoplasma*, *Legionella*, *H. pylori*, *M. avium*.

Pharmacokinetics

Absorption: Rapidly absorbed (50%) after oral administration.

Distribution: Widely distributed; tissue levels may exceed those in serum.

Protein Binding: 65–70%.

Metabolism and Excretion: 10–15% converted by the liver to 14-hydroxylclarithromycin, which has anti-infective activity; 20–30% excreted unchanged in urine. Metabolized by and also inhibits the CYP3A enzyme system.

Half-life: Dose-dependent and prolonged with renal dysfunction *250-mg dose*—3–4 hr; *500-mg dose*—5–7 hr.

TIME/ACTION PROFILE (serum levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	12 hr
PO-XL	unknown	4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to clarithromycin, erythromycin, or other macrolide anti-infectives; History of cholestatic jaundice or hepatic dysfunction with clarithromycin; Concurrent use of pimozide, ergotamine, dihydroergotamine, lovastatin, simvastatin, quinidine, procainamide, dofetilide, amiodarone, or sotalol; Concurrent use of colchicine in patients with hepatic or renal impairment; QT interval prolongation, hypokalemia, hypomagnesemia, or bradycardia; **OB:** Avoid use during pregnancy unless no alternatives are available; **Lactation:** Not recommended for breast-feeding women.

Use Cautiously in: Severe liver or renal impairment (dose adjustment required if CCr <30 mL/min); Myasthenia gravis; **Geri:** May have ↑ risk of QT interval prolongation.

Adverse Reactions/Side Effects

CNS: headache. **CV:** **TORSADES DE POINTES**, QT interval prolongation. **Derm:** **STEVENS-JOHNSON SYNDROME**, pruritus, rash. **GI:** **HEPATOTOXICITY**, **CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD)**, abdominal pain/discomfort, abnormal taste, diarrhea, dyspepsia, nausea.

Misc: **ANGIOEDEMA**.

Interactions

Drug-Drug: Clarithromycin is an inhibitor of the CYP3A enzyme system. Concurrent use with other agents metabolized by this system can ↑ levels and risk of toxicity. May prolong the QT interval and ↑ risk of arrhythmias with **pimozide**; concurrent use contraindicated. May ↑ levels of **ergotamine** and **dihydroergotamine** and risk for acute ergot toxicity; concurrent use contraindicated. **Quinidine**, **procainamide**, **dofetilide**, **sotalol**, and **amiodarone** may ↑ risk of QT interval prolongation; concurrent use should be avoided. ↑ risk of rhabdomyolysis with **lovastatin** and **simvastatin**; concurrent use contraindicated. May ↑ serum levels and the risk of toxicity from **carbamazepine**, some **benzodiazepines** (midazolam, triazolam, alprazolam), cyclosporine, disopyramide, quinidine, ergot alkaloids, felodipine, omeprazole, tacrolimus, digoxin, quetiapine, or theophylline. May ↑ levels and effects of **omeprazole**. **Ritonavir** ↑ blood levels (↓ clarithromycin dose in patients with CCr <60 mL/min). ↑ levels and risk of myopathy from **atorvastatin** and **pravastatin**; use lowest dose of these agents; do not exceed atorvastatin dose of 20 mg/day or pravastatin dose of 40 mg/day. May ↑ or ↓

effects of **zidovudine**. Blood levels are ↑ by **delavirdine** and **fluconazole**. Blood levels may be ↓ by **rifampin**, **rifabutin**, **efavirenz**, and **nevirapine**. May ↑ levels and risk of toxicity from **colchicine**; ↓ colchicine dose in patients with normal renal and hepatic function; concurrent use is contraindicated in patients with renal or hepatic impairment. May ↑ **verapamil** levels and the risk for hypotension, bradycardia, and lactic acidosis. Concomitant use with **calcium channel blockers** metabolized by CYP3A4, including **verapamil**, **diltiazem**, **amlodipine**, and **nifedipine** may ↑ the risk of acute kidney injury, especially in patients older than 65 yr. May ↑ **warfarin** levels and the risk for bleeding. May ↑ blood levels and effects of **sildenafil**, **tadalafil**, and **ildenafil**; concurrent use not recommended. May ↑ levels of **tolterodine**. Concurrent use with **atazanavir** may ↑ clarithromycin and atazanavir levels; ↓ clarithromycin dose by 50%. Concurrent use with **itraconazole** may ↑ clarithromycin and itraconazole levels. Concurrent use with **saquinavir** may ↑ clarithromycin and saquinavir levels.

Route/Dosage

PO (Adults): *Pharyngitis/tonsillitis*—250 mg every 12 hr for 10 days; *Acute maxillary sinusitis*—500 mg every 12 hr for 14 days or 1000 mg once daily for 14 days as XL tablets; *Acute exacerbation of chronic bronchitis*—250–500 mg every 12 hr for 7–14 days or 1000 mg once daily for 7 days as XL tablets; *Community-acquired pneumonia*—250 mg every 12 hr for 7–14 days or 1000 mg once daily for 7 days as XL tablets; *Skin/skin structure infections*—250 mg every 12 hr for 7–14 days; *H. pylori*—500 mg 2–3 times daily with a proton pump inhibitor (lansoprazole or omeprazole) or ranitidine with or without amoxicillin for 10–14 days; *Endocarditis prophylaxis*—500 mg 1 hr before procedure; *MAC prophylaxis/treatment*—500 mg twice daily, for active infection another antimicrobial is required.

PO (Children): *Most infections*—15 mg/kg/day divided every 12 hr for 7–14 days (up to 500 mg/dose for MAC). *Endocarditis prophylaxis*—15 mg/kg 1 hr before procedure.

Renal Impairment

PO (Adults): *CCr* <30 mL/min—250 mg 1–2 times daily, a 500-mg initial dose may be used.

PO (Children): *CCr* <30 mL/min—↓ dose by 50% or double dosing interval.

Availability (generic available)

Tablets: 250 mg, 500 mg. **Extended-release tablets:** 500 mg. **Oral suspension (fruit punch and vanilla flavors):** 125 mg/5 mL, 250 mg/5 mL. **In combination with:** amoxicillin and lansoprazole as part of a compliance package (Prevpac); See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess patient for skin rash frequently during therapy. Discontinue clarithromycin at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- **Ulcers:** Assess patient for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Lab Test Considerations:** May rarely cause ↑ serum AST, ALT, total bilirubin, and alkaline phosphatase concentrations.
- May occasionally cause ↑ BUN.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock, without regard to meals; may be administered with milk. Food slows but does not decrease the extent of absorption.
- Administer XL tablets with food or milk; do not crush, break, or chew.
- Shake suspension well before administration. Store suspension at room temperature; do not refrigerate.
- Do not administer within 4 hr of zidovudine.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as possible, unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools).
- Instruct patient to notify health care professional if rash, or fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Caution patients taking zidovudine that clarithromycin and zidovudine must be taken at least 4 hr apart.
- Advise patient to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding.
- Instruct the patient to notify health care professional if symptoms do not improve within a few days.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Treatment of ulcers.
- Endocarditis prophylaxis.

clindamycin (klin-da-mye-sin)

Cleocin, Cleocin T, Clinda-Derm,
 * Clinda-T, Clindagel, Clindesse, Clindets,
 * Dalacin C, * Dalacin T, Evoclin

Classification

Therapeutic: anti-infectives

Indications

PO, IM, IV: Treatment of: Skin and skin structure infections, Respiratory tract infections, Septicemia, Intra-abdominal infections, Gynecologic infections, Osteomyelitis, Endocarditis prophylaxis. **Topical:** Severe acne. **Vag:** Bacterial vaginosis. **Unlabeled Use: PO, IM, IV:** Treatment of *Pneumocystis jirovecii* pneumonia, CNS toxoplasmosis, and babesiosis.

Action

Inhibits protein synthesis in susceptible bacteria at the level of the 50S ribosome. **Therapeutic Effects:** Bactericidal or bacteriostatic, depending on susceptibility and concentration. **Spectrum:** Active against most gram-positive aerobic cocci, including: Staphylococci, *Streptococcus pneumoniae*, other streptococci, but not enterococci. Has good activity against those anaerobic bacteria that cause bacterial vaginosis, including *Bacteroides fragilis*, *Gardnerella vaginalis*, *Mobiluncus* spp., *Mycoplasma hominis*, and *Corynebacterium*. Also active against *Pneumocystis jirovecii* and *Toxoplasma gondii*.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration. Minimal absorption following topical/vaginal use.

Distribution: Widely distributed. Does not significantly cross blood-brain barrier. Crosses the placenta; enters breast milk.

Protein Binding: 94%.

Metabolism and Excretion: Mostly metabolized by the liver (by CYP3A4).

Half-life: Neonates: 3.6–8.7 hr; Infants up to 1 yr: 3 hr; Children and adults: 2–3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	60 min	6–8 hr
IM	rapid	1–3 hr	6–8 hr
IV	rapid	end of infusion	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Regional enteritis or ulcerative colitis (topical foam); Previous *Clostridium difficile*-associated diarrhea; Severe liver impairment; Diarrhea; Known alcohol intolerance (topical solution, suspension).

Use Cautiously in: **OB:** Safety not established for topical administration; systemic administration during 2nd and 3rd trimesters not associated with ↑ risk of congenital abnormalities; approved for vaginal use in 3rd trimester of pregnancy; injection contains benzyl alcohol which can cross placenta; **Lactation:** Has been used safely but appears in breast milk and exposes infant to drug and its side effects; **Pedi:** Injection contains benzyl alcohol which can cause gasping syndrome in infants and neonates.

Adverse Reactions/Side Effects

CNS: dizziness, headache, vertigo. **CV:** arrhythmias, hypotension. **GI:** CLOSTRIDIUM DIFFICILE ASSOCIATED DIARRHEA, diarrhea, bitter or metallic taste, nausea, vomiting. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, urticaria. **Local:** local irritation (topical products), phlebitis at IV site. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Kaolin/pectin may ↓ GI absorption. May enhance the neuromuscular blocking action of other neuromuscular blocking agents. CYP3A4 inhibitors may ↑ levels. CYP3A4 inducers, including rifampin may ↓ levels and lead to therapeutic failure. **Topical:** Concurrent use with irritants, abrasives, or desquamating agents may result in additive irritation.

Route/Dosage

PO (Adults): Most infections—150–450 mg every 6 hr. *Pneumocystis jirovecii* pneumonia—1200–1800 mg/day in divided doses with 15–30 mg primaquine/day (unlabeled). *CNS toxoplasmosis*—1200–2400 mg/day in divided doses with pyrimethamine 50–100 mg/day (unlabeled); *Bacterial endocarditis prophylaxis*—600 mg 1 hr before procedure.

PO (Children >1 mo): 10–30 mg/kg/day divided every 6–8 hr; maximum dose 1.8 g/day. *Bacterial endocarditis prophylaxis*—20 mg/kg 1 hr before procedure.

IM, IV (Adults): Most infections—300–600 mg every 6–8 hr or 900 mg every 8 hr (up to 4.8 g/day IV has been used; single IM doses of >600 mg are not rec-

ommended). *P. carinii pneumonia*—2400–2700 mg/day in divided doses with primaquine (unlabeled). *Toxoplasmosis*—1200–4800 mg/day in divided doses with pyrimethamine. *Bacterial endocarditis prophylaxis*—600 mg 30 min before procedure.

IM, IV (Children >1 mo): 25–40 mg/kg/day divided every 6–8 hr; maximum dose: 4.8 g/day. *Bacterial endocarditis prophylaxis*—20 mg/kg 30 min before procedure; maximum dose: 600 mg.

IM, IV (Infants <1 mo and <2 kg): 5 mg/kg every 8–12 hr; ≥ 2 kg—20–30 mg/kg/day divided every 6–8 hr.

Vag (Adults and Adolescents): *Cleocin, Clindamax*—1 applicatorful (5 g) at bedtime for 3 or 7 days (7 days in pregnant patients); *Clindesse*—one applicatorful (5 g) single dose; or 1 suppository (100 mg) at bedtime for 3 nights.

Topical (Adults and Adolescents): *Solution*—1% solution/suspension applied twice daily (range 1–4 times daily). *Foam, gel*—1% foam or gel applied once daily.

Availability (generic available)

Capsules: 75 mg, 150 mg, 300 mg. **Oral suspension:**

75 mg/5 mL. **Injection:** 150 mg/mL. **Premixed infusion:**

300 mg/50 mL, 600 mg/50 mL, 900 mg/50 mL.

Topical: 1% lotion, gel, foam, solution, suspension, single-use applicators. **Vaginal cream:** 2%. **Vaginal suppositories (ovules):** 100 mg. **In combination with:** benzoyl peroxide (Acanya, BenzaClin, Duac, Onexton), tretinoin (Veltin, Ziana); (see Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- **Monitor bowel elimination.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to several wk following the cessation of therapy.
- **Assess patient for hypersensitivity (skin rash, urticaria).**
- **Lab Test Considerations:** Monitor CBC; may cause transient ↓ in leukocytes, eosinophils, and platelets.
- May cause ↑ alkaline phosphatase, bilirubin, CPK, AST, and ALT concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Diarrhea (Side Effects)

Implementation

- **Do not confuse Clindesse with Clindets.**

- **PO:** Administer with a full glass of water. May be given with or without meals. Shake liquid preparations well. Do not refrigerate. Stable for 14 days at room temperature.

- **IM:** Inject undiluted. Do not administer >600 mg in a single IM injection.

IV Administration

- **Intermittent Infusion:** *Diluent:* Vials must be diluted before use. Dilute a dose of 300 mg or 600 mg in 50 mL and a dose of 900 mg or 1200 mg in 100 mL. Compatible diluents include D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.45% NaCl, or LR. Admixed solution stable for 16 days at room temperature. Premixed infusion is already diluted and ready to use.

Concentration: Not to exceed 18 mg/mL. **Rate:** Infuse over 10–60 min. Not to exceed 30 mg/min. Hypotension and cardiopulmonary arrest have been reported following rapid IV administration.

- **Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftazidime, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatid, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechloroethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitropruside, norepinephrine, octreotide, ondansetron, oxacillin, oxalipatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, peni-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

collin G, pentazocine, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propofol, propranolol, protamine, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, azathioprine, caspofungin, ceftriaxone, chlorpromazine, dantrolene, daunorubicin, diazepam, idgrastim, ganciclovir, haloperidol, hydroxyzine, ifidarbucin, mitomycin, mitoxantrone, mycophenolate, papaverine, pentamidine, pentobarbital, phenolamine, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, toptecan, trastuzumab, trimethoprim/sulfamethoxazole.
- **Vag:** Applicators are supplied for vaginal administration. When treating bacterial vaginosis, concurrent treatment of male partner is not usually necessary.
- **Topical:** Contact with eyes, mucous membranes, and open cuts should be avoided during topical application. If accidental contact occurs, rinse with copious amounts of cool water.
- Wash affected areas with warm water and soap, rinse, and pat dry prior to application. Apply to entire affected area.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish completely as directed, even if feeling better. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- **Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.**
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal or anal itching or discharge).
- Notify health care professional if no improvement within a few days.
- Patients with a history of rheumatic heart disease or valve replacement need to be taught the importance of antimicrobial prophylaxis before invasive medical or dental procedures.
- **IV:** Inform patient that bitter or metallic taste occurring with IV administration is not clinically significant.
- **Vag:** Instruct patient on proper use of vaginal applicator. Insert high into vagina at bedtime. Instruct patient to remain recumbent for at least 30 min follow-

ing insertion. Advise patient to use sanitary napkin to prevent staining of clothing or bedding. Continue therapy during menstrual period.

- Advise patient to refrain from vaginal sexual intercourse during treatment.
- Caution patient that mineral oil in clindamycin cream may weaken latex or rubber contraceptive devices. Such products should not be used within 72 hr of vaginal cream.
- **Topical:** Caution patient applying topical clindamycin that solution is flammable (vehicle is isopropyl alcohol). Avoid application while smoking or near heat or flame.
- Advise patient to notify health care professional if excessive drying of skin occurs.
- Advise patient to wait 30 min after washing or shaving area before applying.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.
- Improvement in acne vulgaris lesions. Improvement should be seen in 6 wk but may take 8–12 wk for maximum benefit.

clobetazol, See CORTICOSTEROIDS (TOPICAL/LOCAL).

clorcortolone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

clonazePAM (kloe-na-ze-pam)

KlonoPIN, ★ Rivotril

Classification

Therapeutic: anticonvulsants
Pharmacologic: benzodiazepines

Schedule IV

Indications

Treatment of Lennox-Gastaut, akinetic, or myoclonic seizures. Panic disorder with or without agoraphobia.

Unlabeled Use: Uncontrolled leg movements during sleep. Neuralgias. Infantile spasms. Sedation. Adjunct management of acute mania, acute psychosis, or insomnia.

Action

Anticonvulsant effects may be due to presynaptic inhibition. Produces sedative effects in the CNS, probably by stimulating inhibitory GABA receptors. **Therapeutic Effects:** Prevention of seizures. Decreased manifestations of panic disorder.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Probably crosses the blood-brain barrier and the placenta.

Protein Binding: 85%.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 18–50 hr.

TIME/ACTION PROFILE (anticonvulsant activity)

ROUTE	ONSET	PEAK	DURATION
PO	20–60 min	1–2 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to clonazepam or other benzodiazepines; Severe hepatic impairment; **OB:** May cause fetal harm; **Lactation:** Use not recommended while breast feeding.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Angle-closure glaucoma; Obstructive sleep apnea; Chronic respiratory disease; History of porphyria; Do not discontinue abruptly; **Geri:** May experience excessive sedation at usual doses; ↓ dosage recommended; **Pedi:** Children <18 yr (panic disorder) (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS,** behavioral changes, drowsiness, fatigue, slurred speech, ataxia, sedation, abnormal eye movements, diplopia, nystagmus. **Resp:** ↑ secretions. **CV:** palpitations. **Dem:** rash. **GI:** constipation, diarrhea, hepatitis, weight gain. **GU:** dysuria, nocturia, urinary retention. **Hemat:** anemia, eosinophilia, leukopenia, thrombocytopenia. **Neuro:** ataxia, hypotonia. **Misc:** fever, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **opioids** or other **CNS depressants**, including other **benzodiazepines**, **nonbenzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propranolol**, or **valproic acid** may ↓ metabolism and ↑ toxicity of clonazepam. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ metabolism and ↓ effectiveness. Sedative effects may be ↓ by **theophylline**. May ↑ serum **phenytoin** levels. **Phenytoin** may ↓ levels.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

PO (Adults): 0.5 mg 3 times daily; may ↑ by 0.5–1 mg q 3 days. Total daily maintenance dose not to exceed 20 mg. **Panic disorder**—0.125 mg twice daily; ↑ after 3 days toward target dose of 1 mg/day (some patients may require up to 4 mg/day).

PO (Children ≤10 yr or ≤30 kg): Initial daily dose 0.01–0.03 mg/kg/day (not to exceed 0.05 mg/kg/day) given in 2–3 equally divided doses; ↑ by no more than 0.25–0.5 mg q 3 days until therapeutic blood levels are reached (not to exceed 0.2 mg/kg/day).

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg. **Cost: Generic**—0.5 mg \$11.77/100, 1 mg \$11.25/100, 2 mg \$15.59/100.

Orally disintegrating tablets: 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost: Generic**—0.125 mg \$77.93/60, 0.25 mg \$77.93/60, 0.5 mg \$77.80/60, 1 mg \$88.91/60, 2 mg \$123.19/60.

NURSING IMPLICATIONS

Assessment

- Observe and record intensity, duration, and location of seizure activity.
- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess need for continued treatment regularly.
- Assess patient for drowsiness, unsteadiness, and clumsiness. These symptoms are dose related and most severe during initial therapy; may decrease in severity or disappear with continued or long-term therapy.
- **Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.**
- **Lab Test Considerations:** Patients on prolonged therapy should have CBC and liver function test results evaluated periodically. May cause an ↑ in serum bilirubin, AST, and ALT.
- May cause ↓ thyroidal uptake of ^{123}I , and ^{131}I .
- **Toxicity and Overdose:** Therapeutic serum concentrations are 20–80 mg/mL. Flumazenil antagonizes clonazepam toxicity or overdose (may induce seizures in patients with history of seizure disorder or who are on tricyclic antidepressants).

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Implementation

- **Do not confuse clonazepam with clonidine, clozapine, clobazam, or lorazepam. Do not confuse Klonopin with clonidine.**

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Institute seizure precautions for patients on initial therapy or undergoing dose manipulations.
- **PO:** Administer with food to minimize gastric irritation. Tablets may be crushed if patient has difficulty swallowing. Administer largest dose at bedtime to avoid daytime sedation. Taper by 0.25 mg every 3 days to decrease signs and symptoms of withdrawal. Some patients may require longer taper period (months).
- Orally disintegrating tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses within 1 hr or omit; do not double doses. Abrupt withdrawal of clonazepam may cause status epilepticus, tremors, nausea, vomiting, and abdominal and muscle cramps. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- Advise patient that clonazepam is usually prescribed for short-term use and does not cure underlying problems.
- Advise patient to not share medication with others.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products. Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- **Instruct patient and family to notify health care professional of unusual tiredness, bleeding, sore throat, fever, clay-colored stools, yellowing of skin, or behavioral changes. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.**
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in North American Antiepileptic Drug (NAAED) Pregnancy Registry to collect information about safety of antiepileptic drugs during pregnancy. To enroll, patients can call 1-888-233-2334.
- Patient on anticonvulsant therapy should carry identification at all times describing disease process and medication regimen.

- Emphasize the importance of follow-up exams to determine effectiveness of the medication.

Evaluation/Desired Outcomes

- Decrease or cessation of seizure activity without undue sedation. Dose adjustments may be required after several mo of therapy.
- Decrease in frequency and severity of panic attacks.
- Relief of leg movements during sleep.
- Decrease in pain from neuralgia.

clonidine (klon-i-deen)

Catapres, Catapres-TTS, Duraclon, Kapvay

Classification

Therapeutic: antihypertensives
Pharmacologic: adrenergics (centrally acting)

Indications

PO, Transdermal: Mild to moderate hypertension.
PO: Attention-deficit hyperactivity disorder (ADHD) (as monotherapy or as adjunctive to stimulants) (Kapvay only). **Epidural:** Management of cancer pain unresponsive to opioids alone. **Unlabeled Use:** Management of opioid withdrawal. Adjunctive treatment of neuropathic pain.

Action

Stimulates alpha-adrenergic receptors in the CNS, which results in decreased sympathetic outflow inhibiting cardioacceleration and vasoconstriction centers. Prevents pain signal transmission to the CNS by stimulating alpha-adrenergic receptors in the spinal cord.

Therapeutic Effects: Decreased BP. Decreased pain. Improvement in ADHD symptoms.

Pharmacokinetics

Absorption: Well absorbed from the GI tract and skin. Enters systemic circulation following epidural use. Some absorption follows sublingual administration.

Distribution: Widely distributed; enters CNS.

Crosses the placenta readily; enters breast milk in high concentrations.

Metabolism and Excretion: Mostly metabolized by the liver; 40–60% eliminated unchanged in urine.

Half-life: Neonates—44–72 hr; Children—8–12 hr; Adults: Plasma—12–16 hr (↑ in renal impairment); CNS—1.3 hr.

TIME/ACTION PROFILE (PO, TD = antihypertensive effect; epidural = analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–3 hr	8–12 hr
Transdermal	2–3 days	unknown	7 days†
Epidural	unknown	unknown	unknown

†8 hr following removal of patch.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; *Epidural*—injection site infection, anticoagulant therapy, or bleeding problems.

Use Cautiously in: Serious cardiac or cerebrovascular disease; Renal insufficiency; **Pedi:** Safety and efficacy not established for ADHD in children <6 yr; evaluation for cardiac disease should precede initiation of therapy for ADHD in children; **Ger:** Appear on Beers list due to ↑ risk of orthostatic hypotension and adverse CNS effects in geriatric patients (↓ dose recommended); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: drowsiness, depression, dizziness, hallucinations, nervousness, nightmares. **EENT:** dry eyes. **CV:** AV block, bradycardia, hypotension (↑ with epidural), palpitations. **GI:** dry mouth, constipation, nausea, vomiting. **GU:** erectile dysfunction. **Derm:** rash, sweating. **F and E:** sodium retention. **Metab:** weight gain. **Neuro:** paresthesia. **Misc:** withdrawal phenomenon.

Interactions

Drug-Drug: Additive sedation with CNS depressants, including alcohol, antihistamines, opioid analgesics, and sedative/hypnotics. Additive hypotension with other antihypertensives and nitrates. Additive bradycardia with beta blockers, diltiazem, verapamil, or digoxin. MAO inhibitors, amphetamines, or tricyclic antidepressants may ↓ antihypertensive effect. Withdrawal phenomenon may be ↑ by discontinuation of beta blockers. Epidural clonidine prolongs the effects of epidurally administered local anesthetics. May ↓ effectiveness of levodopa.

Route/Dosage

PO (Adults and Adolescents ≥12 yr): Hypertension (immediate-release)—100 mcg (0.1 mg) twice daily, ↑ by 100–200 mcg (0.1–0.2 mg)/day every 2–4 days; usual maintenance dose is 200–600 mcg (0.2–0.6 mg)/day in 2–3 divided doses (up to 2.4 mg/day).

Urgent treatment of hypertension (immediate-release)—200 mcg (0.2 mg) loading dose, then 100 mcg (0.1 mg) every hr until BP is controlled or 800 mcg (0.8 mg) total has been administered; follow with maintenance dosing; **Opioid withdrawal (immediate-release)**—300 mcg (0.3 mg)–1.2 mg/day, may be ↓ by 50%/day for 3 days, then discontinued or ↓ by 100–200 mcg (0.1–0.2 mg)/day.

PO (Geriatric Patients): Hypertension (immediate-release)—100 mcg (0.1 mg) at bedtime initially, ↑ as needed.

PO (Children): Hypertension (immediate-release)—Initial 5–10 mcg/kg/day divided into 2 or 3 doses, then ↑ gradually to 5–25 mcg/kg/day in divided doses every 6 hr; maximum dose: 0.9 mg/day. **ADHD (Kapvay-extended release) (children >6 yr)**—0.1

mg once daily at bedtime; after 1 wk, ↑ dose to 0.1 mg in AM and at bedtime; after 1 wk, ↑ dose to 0.1 mg in AM and 0.2 mg at bedtime; after 1 wk, ↑ dose to 0.2 mg in AM and at bedtime (max dose = 0.4 mg/day). **ADHD (Immediate release) (children >6 yr, <45 kg)**—0.05 mg once daily at bedtime; then ↑ every 3–7 days to 0.05 mg twice daily; then 0.05 mg 3 times daily; then 0.05 mg 4 times daily. **Neuropathic pain (immediate-release)**—2 mcg/kg/dose every 4–6 hr then ↑ gradually over days up to 4 mcg/kg/dose every 4–6 hr.

PO (Neonates): Neonatal abstinence syndrome—0.5–1 mcg/kg/dose every 4–6 hr. Once stabilized taper by 0.25 mcg/kg/dose every 6 hr.

Transdermal (Adults): Hypertension—Transdermal system delivering 100–300 mcg (0.1–0.3 mg)/24 hr applied every 7 days. Initiate with 100 mcg (0.1 mg)/24 hr system; dosage increments may be made every 1–2 wk when system is changed.

Transdermal (Children): Once stable oral dose is reached, children may be switched to a transdermal system equivalent closest to the total daily oral dose.

Epidural (Adults): 30 mcg/hr initially; titrated according to need.

Epidural (Children): 0.5 mcg/kg/hr initially; titrated according to need up to 2 mcg/kg/hr.

Availability (generic available)

Tablets: * 25 mcg (0.025 mg), 100 mcg (0.1 mg), 200 mcg (0.2 mg), 300 mcg (0.3 mg). **Cost:** *Generic*—0.1 mg \$6.80/100, 0.2 mg \$6.99/100, 0.3 mg \$6.99/100. **Extended-release tablets (Kapvay):** 0.1 mg. **Cost:** All strengths \$366.60/60. **Transdermal systems:** Catapres-TTS 1, releases 0.1 mg/24 hr, Catapres-TTS 2, releases 0.2 mg/24 hr, Catapres-TTS 3, releases 0.3 mg/24 hr. **Cost:** *Generic*—0.1 mg/24 hr \$132.49/4 patches, 0.2 mg/24 hr \$223.06/4 patches, 0.3 mg/24 hr \$309.44/4 patches. **Solution for epidural injection (Duraclon):** 100 mcg/mL, 500 mcg/mL.

NURSING IMPLICATIONS

Assessment

- **Hypertension:** Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy.
- Monitor BP and pulse prior to starting, frequently during initial dose adjustment and dose increases and periodically throughout therapy. Titrate slowly in patients with cardiac conditions or those taking other sympatholytic drugs. Report significant changes.
- **Pain:** Assess location, character, and intensity of pain prior to, frequently during first few days, and routinely throughout administration.
- Monitor for fever as potential sign of catheter infection.
- **Opioid Withdrawal:** Monitor patient for signs and symptoms of opioid withdrawal (tachycardia, fever,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

rummy nose, diarrhea, sweating, nausea, vomiting, irritability, stomach cramps, shivering, unusually large pupils, weakness, difficulty sleeping, gooseflesh).

- **ADHD:** Assess attention span, impulse control, and interactions with others.
- **Lab Test Considerations:** May cause transient ↑ in blood glucose levels.
- May cause ↓ urinary catecholamine and vanillylmandelic acid (VMA) concentrations; these may ↑ on abrupt withdrawal.
- May cause weakly positive Coombs' test result.

Potential Nursing Diagnoses

Chronic pain (Indications)

Impaired social interaction (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse clonidine with clonazepam (Klonopin) or clozapine.**
- Do not substitute between clonidine products on a mg-per-mg basis, because of differing pharmacokinetic profiles.
- In the perioperative setting, continue clonidine up to 4 hr prior to surgery and resume as soon as possible thereafter. Do not interrupt *transdermal clonidine* during surgery. Monitor BP carefully.
- **PO:** Administer last dose of the day at bedtime. May be taken without regard for food.
- Swallow extended-release tablets whole; do not crush, break, or chew.
- **Transdermal:** Transdermal system should be applied once every 7 days. May be applied to any hairless site; avoid cuts or calluses. Absorption is greater when placed on chest or upper arm and decreased when placed on thigh. Rotate sites. Wash area with soap and water; dry thoroughly before application. Apply firm pressure over patch to ensure contact with skin, especially around edges. Remove old system and discard. System includes a protective adhesive overlay to be applied over medication patch to ensure adhesion, should medication patch loosen.
- **Epidural:** Dilute 500 mcg/mL with 0.9% NaCl for a concentration of 100 mcg/mL. Do not administer solutions that are discolored or contain a precipitate. Discard unused portion.

Patient/Family Teaching

- Instruct patient to take clonidine at the same time each day, even if feeling well. Take missed doses as soon as remembered. If dose of extended-release product is missed, omit dose and take next dose as scheduled. Do not take more than the prescribed daily dose in any 24 hr. If more than 1 oral dose in a row is missed or if transdermal system is late in being changed by 3 or more days, consult health care professional. All routes of clonidine should be gradually discontinued over 2–4 days to prevent rebound hypertension.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A

written prescription may be kept in wallet in case of emergency.

- May cause drowsiness, which usually diminishes with continued use. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may increase orthostatic hypotension.
- If dry mouth occurs, frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease effect. If dry mouth continues for more than 2 wk, consult health care professional.
- Caution patients with contact lenses that clonidine may cause dryness of eyes.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially cough, cold, or allergy remedies.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if itching or redness of skin (with transdermal patch), mental depression, swelling of feet and lower legs, paleness or cold feeling in fingertips or toes, or vivid dreams or nightmares occur. May require discontinuation of therapy, especially with depression.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, and stress management). Medication helps control but does not cure hypertension.
- Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and report significant changes.
- **Transdermal:** Instruct patient on proper application of transdermal system. Do not cut or trim unit. Transdermal system can remain in place during bathing or swimming.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **Pedi:** Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in severity of pain.
- Decrease in the signs and symptoms of opioid withdrawal.
- Improved attention span and social interactions in ADHD.

clopidogrel (kloh-pid-oh-grel)

Plavix

Classification

Therapeutic: antiplatelet agents

Pharmacologic: platelet aggregation inhibitors

Indications

Acute coronary syndrome (ST-segment elevation MI, non-ST-segment elevation MI, or unstable angina). Patients with established peripheral arterial disease, recent MI, or recent stroke.

Action

Inhibits platelet aggregation by irreversibly inhibiting the binding of ATP to platelet receptors. **Therapeutic Effects:** Reduction in risk of MI and stroke.

Pharmacokinetics

Absorption: Well absorbed following oral administration; rapidly metabolized to an active antiplatelet compound. Parent drug has no antiplatelet activity.

Distribution: Unknown.

Protein Binding: *Clopidogrel*—98%; *active metabolite*—94%.

Metabolism and Excretion: Rapidly and extensively converted by the liver (CYP2C19) to its active metabolite, which is then eliminated 50% in urine and 45% in feces; $\frac{\text{H}}$ 2% of Whites, 4% of Blacks, and 14% of Asians have CYP2C19 genotype that results in reduced metabolism of clopidogrel (poor metabolizers) into its active metabolite (may result in \downarrow antiplatelet effects).

Half-life: 6 hr (active metabolite 30 min).

TIME/ACTION PROFILE (effects on platelet function)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	3–7 days	5 days \dagger

\dagger Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to clopidogrel or prasugrel; Pathologic bleeding (peptic ulcer, intracranial hemorrhage); Concurrent use of omeprazole or esomeprazole; $\frac{\text{H}}$ CYP2C19 poor metabolizers; **Lactation:** Lactation.

Use Cautiously in: Patients at risk for bleeding (trauma, surgery, or other pathologic conditions); History of GI bleeding/ulcer disease; Severe hepatic impairment; Hypersensitivity to another thienopyridine (prasugrel); **OB:** Use only if clearly indicated; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

Incidence of adverse reactions similar to that of aspirin. **CNS:** depression, dizziness, fatigue, headache. **EENT:** epistaxis. **Resp:** cough, dyspnea, eosinophilic pneumonia. **CV:** chest pain, edema, hypertension. **GI:** **GI BLEEDING**, abdominal pain, diarrhea, dyspepsia, gastritis. **Derm:** **ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS**, **DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS**, **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, pruritus, purpura, rash. **Hemat:** **BLEEDING**, **NEUTROPENIA**, **THROMBOTIC THROMBOCYTOPENIC PURPURA**. **Metab:** hypercholesterolemia. **MS:** arthralgia, back pain. **Misc:** fever, hypersensitivity reactions.

Interactions

Drug-Drug: Concurrent **abciximab**, **eptifibatid**, **tirofiban**, **aspirin**, **NSAIDs**, **heparin**, **LMWHs**, **thrombolytic agents**, **SSRIs**, **SNRIs**, **prasugrel**, or **warfarin** may \uparrow risk of bleeding. May \downarrow metabolism and \uparrow effects of **phenytoin**, **tolbutamide**, **tamoxifen**, **torsemide**, **fluvastatin**, and many **NSAIDs**. Concurrent use with the CYP2C19 inhibitors, **omeprazole**, or **esomeprazole** may \downarrow antiplatelet effects; avoid concurrent use; may consider using **H2 antagonist** or another **proton pump inhibitor** (e.g., **dexlansoprazole**, **lansoprazole**, or **pantoprazole**).

Drug-Natural Products: \uparrow bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **fenugreek**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Route/Dosage**Recent MI, Stroke, or Peripheral Arterial Disease**

PO (Adults): 75 mg once daily.

Acute Coronary Syndrome

PO (Adults): 300 mg initially, then 75 mg once daily; aspirin 75–325 mg once daily should be given concurrently.

Availability (generic available)

Tablets: 75 mg, 300 mg. **Cost:** *Generic*—75 mg \$23.46/90.

NURSING IMPLICATIONS**Assessment**

- Assess patient for symptoms of stroke, peripheral vascular disease, or MI periodically during therapy.
- Monitor patient for signs of thrombotic thrombocytopenic purpura (thrombocytopenia, microangiopathic hemolytic anemia, neurologic findings, renal dysfunction, fever). May rarely occur, even after short exposure (<2 wk). Requires prompt treatment.
- **Lab Test Considerations:** Monitor bleeding time during therapy. Prolonged bleeding time, which is time- and dose-dependent, is expected.

* = Canadian drug name. $\frac{\text{H}}$ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor CBC with differential and platelet count periodically during therapy. Neutropenia and thrombocytopenia may rarely occur.
- May cause ↑ serum bilirubin, hepatic enzymes, total cholesterol, nonprotein nitrogen (NPN), and uric acid concentrations.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Implementation

- Do not confuse Plavix with Paxil.
- Discontinue clopidogrel 5–7 days before planned surgical procedures. If clopidogrel must be temporarily discontinued, restart as soon as possible. Premature discontinuation of therapy may increase risk of cardiovascular events.
- PO: Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Do not discontinue clopidogrel without consulting health care professional; may increase risk of cardiovascular events. Advise patient to read the *Medication Guide* before starting clopidogrel and with each Rx refill in case of changes.
- Advise patient to notify health care professional promptly if fever, weakness, chills, sore throat, rash, unusual bleeding or bruising, extreme skin paleness, purple skin patches, yellowing of skin or eyes, or neurological changes occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially those containing aspirin or NSAIDs or proton pump inhibitors.
- Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Prevention of stroke, MI, and vascular death in patients at risk.

clotrimazole, See ANTIFUNGALS (TOPICAL) and ANTIFUNGALS (VAGINAL).

REMS

cloZAPine (kloe-za-peen)
Clozaril, FazaClo, Versacloz

Classification

Therapeutic: antipsychotics

Indications

Schizophrenia unresponsive to or intolerant of standard therapy with other antipsychotics (treatment refractory). To reduce recurrent suicidal behavior in schizophrenic patients.

Action

Binds to dopamine receptors in the CNS. Also has anticholinergic and alpha-adrenergic blocking activity. Produces fewer extrapyramidal reactions and less tardive dyskinesia than standard antipsychotics but carries high risk of hematologic abnormalities. **Therapeutic Effects:** Diminished schizophrenic behavior. Diminished suicidal behavior.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Rapid and extensive distribution; crosses blood-brain barrier and placenta.

Protein Binding: 95%.

Metabolism and Excretion: Mostly metabolized on first pass through the liver (by CYP1A2, CYP2D6, and CYP3A4 isoenzymes); H (the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ clozapine concentrations and an ↑ risk of adverse effects).

Half-life: 8–12 hr.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	wk	4–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Bone marrow depression; Severe CNS depression/coma; Uncontrolled epilepsy; Clozapine-induced agranulocytosis or severe granulocytopenia; **Lactation:** Discontinue drug or bottle-feed.

Use Cautiously in: Long QT syndrome; Risk factors for QT interval prolongation or ventricular arrhythmias (i.e., recent myocardial infarction, heart failure, arrhythmias); Concurrent use of CYP1A2, CYP2D6, or CYP3A4 inhibitors or QT-interval prolonging drugs; Hypokalemia or hypomagnesemia; Prostatic enlargement; Angle-closure glaucoma; Malnourished or dehydrated patients, patients with cardiovascular, cerebrovascular, hepatic, or renal disease, or patients on antihypertensives (use lower initial dose, titrate more slowly); Risk factors for stroke (↑ risk of stroke in patients with dementia); Diabetes; Seizure disorder; Patients at risk for falls; **OB:** Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if benefit outweighs risk to fetus; **Pedi:** Children <16 yr (safety not established); **Geri:** ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME**, **SEIZURES**, **dizziness**, **sedation**. **EENT:** visual disturbances. **CV:** **CARDIAC ARREST**, **DEEP VEIN THROMBOSIS**, **HF**, **MITRAL VALVE INCOMPETENCE**, **MYOCARDITIS**, **TORSADE DE POINTES**, **VENTRICULAR ARRHYTHMIAS**, **hypotension**, **tachycardia**, **bradycardia**, **ECG changes**, **hypertension**, **syncope**, **QT interval prolongation**. **GI:** **HEPATOTOXICITY**, **constipation**, **abdominal discomfort**, **dry mouth**, **↑ salivation**, **nausea**, **vomiting**, **weight gain**. **GU:** **nocturnal enuresis**. **Derm:** **rash**, **sweating**. **Endo:** **hyperglycemia**, **hyperlipidemia**, **weight gain**. **Hemat:** **AGRANULOCYTOSIS**, **LEUKOPENIA**. **Neuro:** **extrapyramidal reactions**. **Resp:** **PULMONARY EMBOLISM**. **Misc:** **fever**.

Interactions

Drug-Drug: ↑ anticholinergic effects with other agents having anticholinergic properties, including antihistamines, quinidine, disopyramide, and antidepressants. Concurrent use with strong CYP1A2 inhibitors, including fluvoxamine or ciprofloxacin may ↑ levels; ↓ clozapine dose to 1/3 of the original dose during concurrent use. Concurrent use with moderate or weak CYP1A2 inhibitors, including oral contraceptives or caffeine may ↑ levels; consider ↓ clozapine dose. Concurrent use with CYP2D6 inhibitors or CYP3A4 inhibitors, including cimetidine, escitalopram, erythromycin, paroxetine, bupropion, fluoxetine, quinidine, duloxetine, terbinafine, or sertraline may ↑ levels; consider ↓ clozapine dose. Concurrent use with CYP1A2 inducers or CYP3A4 inducers, including nicotine, carbamazepine, phenytoin, or rifampin may ↓ levels; concurrent use with strong CYP3A4 inducers not recommended. ↑ CNS depression with alcohol, antidepressants, antihistamines, opioid analgesics, or sedative/hypnotics. ↑ hypotension with nitrates, acute ingestion of alcohol, or antihypertensives. ↑ risk of bone marrow suppression with antineoplastic or radiation therapy. Use with lithium ↑ risk of adverse CNS reactions, including seizures. ↑ risk of QT interval prolongation with other agents causing QT interval prolongation.

Drug-Natural Products: Caffeine-containing herbs (cola nut, tea, coffee) may ↑ serum levels and side effects. St. John's wort may ↓ blood levels and efficacy.

Route/Dosage

PO (Adults): 12.5 mg 1–2 times daily initially; ↑ by 25–50 mg/day over a period of 2 wk up to target dose of 300–450 mg/day. May then be ↑ by up to 100 mg/day once or twice weekly (not to exceed 900 mg/day). Treatment should be continued for at least 2 yr in patients with suicidal behavior.

Availability (generic available)

Tablets: 25 mg, 100 mg. **Orally disintegrating tablets (mint):** 12.5 mg, 25 mg, 100 mg, 150 mg, 200 mg. **Oral suspension:** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy. Titrate slowly and monitor closely; may cause orthostatic hypotension, bradycardia, syncope, and cardiac arrest.
- Monitor BP (sitting, standing, lying) and pulse rate before and frequently during initial dose titration.
- Assess weight and BMI initially and periodically during therapy. Refer as appropriate for nutritional/weight management and medical management.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor for signs of myocarditis (unexplained fatigue, dyspnea, tachypnea, fever, chest pain, palpitations, other signs and symptoms of heart failure, ECG changes, such as ST-T wave abnormalities, arrhythmias, or tachycardia during first mo of therapy). If these occur, clozapine should be discontinued and not restarted.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (parkinsonian—difficulty speaking or swallowing, loss of balance control, pill-rolling motion of hands, mask-like face, shuffling gait, rigidity, tremors and dystonic muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Notify health care professional if these symptoms occur; reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benztropine may be used to control these symptoms.
- Monitor for possible tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Report these symptoms immediately; may be irreversible.
- Monitor frequency and consistency of bowel movements. Increasing bulk and fluids in the diet may help to minimize constipation.
- Clozapine lowers the seizure threshold. Institute seizure precautions for patients with history of seizure disorder.
- Transient fevers may occur, especially during first 3 wk of therapy. Fever is usually self-limiting but may require discontinuation of medication. Also, monitor for development of neuroleptic malignant syndrome

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

(fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.

- Assess respiratory status during therapy. If deep-vein thrombosis, acute dyspnea, chest pain, or other respiratory signs and symptoms occur, consider pulmonary embolism.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- **Lab Test Considerations:** Monitor WBC, absolute neutrophil count (ANC), and differential count before initiation of therapy. ANC must be $\geq 1500/\text{mm}^3$ for the general population and $\geq 1000/\text{mm}^3$ for patients with documented Benign Ethnic Neutropenia (BEN) for patient to begin therapy. Monitor ANC weekly for the first 6 mo, then biweekly for the second 6 mo, then, if maintained within acceptable parameters, monthly after 12 mo. *If mild neutropenia (ANC 1000–1499/ mm^3) occurs, continue therapy and monitor ANC 3 times/wk until ANC $\geq 1500/\text{mm}^3$. Once ANC $\geq 1500/\text{mm}^3$, return to patient's last ANC monitoring interval. If moderate neutropenia (ANC 500–999/ mm^3) occurs, recommend hematology consultation. Interrupt therapy for suspected clozapine-induced neutropenia. Resume therapy once ANC $\geq 1000/\text{mm}^3$. Monitor ANC daily until ANC $\geq 1000/\text{mm}^3$ then 3 times/wk until ANC $\geq 1500/\text{mm}^3$. Once ANC $\geq 1500/\text{mm}^3$, check ANC weekly for 4 wks, then return to patient's last ANC monitoring interval. If severe neutropenia ($<500/\text{mm}^3$) occurs, recommend hematology consultation. Interrupt therapy for suspected clozapine-induced neutropenia. Do not rechallenge unless benefit outweighs risk. Monitor ANC daily until ANC $\geq 1000/\text{mm}^3$, then 3 times/wk until ANC $\geq 1500/\text{mm}^3$. If patient rechallenged, resume therapy as a new patient using normal monitoring once ANC $\geq 1500/\text{mm}^3$. For patients with Benign Ethnic Neutropenia (BEN), obtain at least 2 baseline ANC levels before starting therapy. Monitor ANC weekly for the first 6 mo, then biweekly for the second 6 mo, then, if maintained within acceptable parameters, monthly after 12 mo. *If neutropenia (ANC 500–999/ mm^3) occurs, recommend hematology consultation and continue therapy. Monitor ANC 3 times/wk until ANC $\geq 1000/\text{mm}^3$ or at patient's known baseline. Once ANC $\geq 1000/\text{mm}^3$, check ANC weekly for 4 wks, then return to patient's last ANC monitoring interval. If severe neutropenia ($<500/\text{mm}^3$) occurs, recommend hematology consultation. Interrupt therapy for suspected clozapine-induced neutropenia. Do not rechallenge. Monitor ANC daily until ANC $\geq 500/\text{mm}^3$, then 3 times/wk until ANC \geq patient's baseline. If patient rechallenged, resume therapy as a new patient using normal monitoring once ANC $\geq 1000/\text{mm}^3$ or at patient's baseline.**

- Assess fasting blood glucose and cholesterol levels initially and throughout therapy.
- **Toxicity and Overdose:** Overdose is treated with activated charcoal and supportive therapy. Monitor patient for several days because of risk of delayed effects.
- Avoid use of epinephrine and its derivatives when treating hypotension, and avoid quinidine and procainamide when treating arrhythmias.

Potential Nursing Diagnoses

Risk for other-directed violence (Indications)

Disturbed thought process (Indications)

Risk for injury (Side Effects)

Implementation

- Do not confuse clozapine with clonazepam or clonidine. Do not confuse Clozaril with Colazal.
- Because of the risk of severe neutropenia, clozapine is only available through restricted program called *Clozapine REMS Program*. Health care professionals must be trained and certified to prescribe clozapine. Patients must be enrolled in the program and comply with ANC testing and monitoring requirements. Pharmacies dispensing clozapine must be trained and certified with program and must dispense only to patients eligible to receive clozapine.
- **PO:** Administer capsules with food or milk to decrease gastric irritation.
- Leave oral disintegrating tablet in blister until time of use. Do not push tablet through foil. Just before use, peel foil and gently remove disintegrating tablet. Immediately place tablet in mouth and allow to disintegrate and swallow with saliva. If $\frac{1}{2}$ tablet dose used, destroy other half of tablet.
- Oral solution may be taken without regard to food. Shake bottle for suspension for 10 sec prior to withdrawing. Use oral syringes and oral adaptor provided for accurate dosing. Do not store dose in syringe; wash between doses.

Patient/Family Teaching

- Instruct patient to take medication as directed. If clozapine is stopped for >2 days, do not restart medication, notify health care professional for new dosing instructions. Patients on long-term therapy may need to discontinue gradually over 1–2 wk.
- Explain purpose and procedures for *Clozapine REMS Program* to patient.
- Inform patient of possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately.
- Inform patient that cigarette smoking can decrease clozapine levels. Risk for relapse increases if patient begins or increases smoking.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause seizures and drowsiness. Caution patient to avoid driving or other activities requiring alertness while taking clozapine.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other medications. Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- **Instruct patient to notify health care professional promptly if unexplained fatigue, dyspnea, tachypnea, chest pain, palpitations, sore throat, fever, lethargy, weakness, malaise, or flu-like symptoms occur.**
- **Rep:** Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Consider early screening for gestational diabetes if used during pregnancy. Neonates exposed to antipsychotic drugs during third trimester are at risk for extrapyramidal and/or withdrawal symptoms following delivery. Monitor neonates for symptoms of agitation, hypertonia, hypotonia, tremor, somnolence, respiratory distress, and feeding difficulties. May require NICU.
- Advise patient of need for continued medical follow-up for psychotherapy, eye exams, and laboratory tests.

Evaluation/Desired Outcomes

- Decreased positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunt affect) of schizophrenia.

cobimetinib
(koe-bi-me-ti-nib)
Cotellic

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

⚡ Treatment of metastatic/unresectable melanoma with the BRAF V600E or V600K mutation (in combination with vemurafenib).

Action

Inhibits the activity of mitogen-activated extracellular kinase (MEK) 1 and 2 which are enzymes that normally promote cellular proliferation. **Therapeutic Effects:** Decreased progression of melanoma.

Pharmacokinetics

Absorption: 46% absorbed following oral administration.

Distribution: Extensively distributed to tissues.

Protein Binding: 95%.

Metabolism and Excretion: Mostly metabolized by the liver (via CYP3A4 enzyme system and glucuronidation). 6.6% excreted in feces unchanged; 20% excreted in urine (mostly as metabolites).

Half-life: 44 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2.4 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of strong or moderate CYP3A4 inhibitors or inducers; **OB:** May cause fetal harm; **Lactation:** Breast feeding should be avoided during treatment and for 2 wk after therapy.

Use Cautiously in: Left ventricular ejection fraction <50%; Severe renal impairment (CCr <30 mL/min); **Rep:** Women of childbearing potential (use effective contraception); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: **CARDIOMYOPATHY**, hypertension. **Derm:** alopecia, erythema, photosensitivity, rash. **EENT:** retinopathy. **F and E:** hyperkalemia, hypocalcemia, hypokalemia, hypонатremia, hypophosphatemia. **GI:** **HEPATOTOXICITY**, diarrhea, hypoalbuminemia, nausea, stomatitis, vomiting. **GU:** ↑ serum creatinine, ↓ fertility. **Hemat:** **HEMORRHAGE**, anemia, lymphopenia, thrombocytopenia. **MS:** ↑ creatine kinase, **RHABDOMYOLYSIS**. **Misc:** **MALIGNANCY**, fever.

Interactions

Drug-Drug: Strong or moderate CYP3A4 inhibitors, including **itraconazole**, may ↑ levels; avoid concurrent use. Strong or moderate CYP3A4 inducers, including **carbamazepine**, **efavirenz**, **phenytoin**, and **rifampin** may ↓ levels; avoid concurrent use.

Drug-Natural Products: **St. John's wort** may ↓ levels; avoid concurrent use.

Route/Dosage

PO (Adults): 60 mg once daily for days 1–21 of each 28–day cycle; continue until disease progression or unacceptable toxicity; *Concurrent short-term use of moderate CYP3A4 inhibitor*—20 mg once daily; resume 60 mg once daily once 3A4 inhibitor discontinued (avoid use of strong or moderate CYP3A4 inhibitor if patient already taking reduced dose of 20–40 mg once daily).

Availability

Tablets: 20 mg.

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess skin prior to starting therapy and every 2 mo during and for 6 mo following therapy for new lesions. If new lesions appear evaluate and remove as needed. If Grade 2 (intolerable), Grade 3 or 4 rash or other skin reactions occur, withhold or reduce dose.
- Monitor for bleeding and hemorrhage periodically during therapy. *If Grade 3 hemorrhage occurs*, withhold therapy for up to 4 wks. If improved to Grade 0 or 1, resume at next lower dose. If not improved within 4 weeks, permanently discontinue. *If Grade 4 hemorrhage occurs*, permanently discontinue therapy.
- Monitor left ventricular ejection fraction (LVEF) prior to initiation, 1 mo after initiation, and every 3 mo until discontinuation. *If asymptomatic, absolute ↓ LVEF from baseline of >10% and <institutional lower limit of normal (LLN)*, withhold therapy for 2 wks; repeat LVEF. *Resume at next lower dose if all of following are present:* LVEF is ≥LLN and absolute ↓ from baseline LVEF ≤10%. *Discontinue permanently if any of following are present:* LVEF is <LLN or absolute ↓ from baseline LVEF >10%. *If symptomatic LVEF ↓ from baseline*, withhold therapy for up to 4 wks, repeat LVEF. *Resume at next lower dose if all of following are present:* symptoms resolve and LVEF is ≥LLN and absolute ↓ from baseline LVEF is ≤10%. *Discontinue permanently if any of following are present:* symptoms persist, or LVEF <LLN, or absolute ↓ from baseline LVEF >10%. If restarting cobimetinib after a dose reduction or interruption, evaluate LVEF at approximately 2 wks, 4 wks, 10 wks, and 16 wks, and as clinically indicated.
- Perform ophthalmological evaluations periodically during therapy and if patient reports new or worsening visual disturbances. *If serious retinopathy occurs*, withhold therapy for up to 4 weeks. If signs and symptoms improve, resume at next lower dose. If not improved or symptoms recur at lower dose within 4 weeks, permanently discontinue. *If retinal vein occlusion occurs*, permanently discontinue therapy.
- Assess for photosensitivity during therapy. *If Grade 2 (intolerable), Grade 3 or Grade 4 photosensitivity occurs*, withhold therapy up to 4 wks. If improved to Grade 0 or 1, resume at next lower dose. If not improved within 4 wks, permanently discontinue.
- **Lab Test Considerations:** May cause ↑ AST, ALT, alkaline phosphatase, and GGT. Monitor liver function tests before initiation and monthly during therapy, and as clinically indicated. *For 1st occurrence of Grade 4 hepatotoxicity*, withhold therapy up to 4 wks. If improved to Grade 0 or 1, resume at next lower dose. If not improved to Grade 0 or 1 within 4 wks, permanently discontinue. *If Grade 4 hepatotoxicity recurs*, discontinue therapy permanently.

- Obtain CPK and serum creatinine levels at baseline and periodically during therapy. If Grade 4 CPK ↑ or any CPK ↑ and myalgia occur, withhold therapy up to 4 wks. If improved to Grade 3 or lower, resume at next lower dose level. If not improved within 4 wks, permanently discontinue.
- May cause hypophosphatemia, hyponatremia, hypocalcemia, hypokalemia, hyperkalemia, and hypocalcemia.
- May cause anemia, lymphopenia, and thrombocytopenia.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer three 20-mg tablets once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take cobimetinib as directed. If dose is missed or vomiting occurs after dose, do not repeat, take next dose as scheduled.
- Advise patient to notify health care professional immediately if skin changes (new wart, skin sore that bleeds or does not heal, change in size or color of mole, signs and symptoms of bleeding (blood in urine, red or black stools, unusual or excessive vaginal bleeding, bleeding of gums, abdominal pain, headache, dizziness, feeling weak), cardiomyopathy (persistent coughing or wheezing, tiredness, shortness of breath, increased heart rate, swelling of ankles and feet), eye problems (blurred vision, halos, distorted vision,TM her vision changes, partly missing vision), liver injury (yellowing of skin or white of eyes, feeling tired or weak, dark or brown (tea color) urine, loss of appetite, nausea or vomiting), rhabdomyolysis (muscle aches, dark, reddish urine, muscle spasms, weakness), or rash occur.
- Advise patient to avoid sun exposure, wear protective clothing and use a broad-spectrum UVA/UVB sunscreen and lip balm (SPF ≥30) when outdoors. May require dose reduction or discontinuation.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- **Rep:** May be teratogenic. Advise patient use effective contraception and avoid breast feeding during and for at least 2 wks following therapy. May reduce fertility in females and males of reproductive potential.

Evaluation/Desired Outcomes

- Decrease in progression of melanoma.

HIGH ALERT

codeine (koe-deen)**Classification**

Therapeutic: allergy, cold, and cough remedies, antitussives, opioid analgesics
Pharmacologic: opioid agonists

Schedule II, III, IV, V (depends on content)

Indications

Management of mild to moderate pain. Antitussive (in smaller doses). **Unlabeled Use:** Management of diarrhea.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Decreases cough reflex. Decreases GI motility. **Therapeutic Effects:** Decreased severity of pain. Suppression of the cough reflex. Relief of diarrhea.

Pharmacokinetics

Absorption: 50% absorbed from the GI tract.

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Protein Binding: 7%.

Metabolism and Excretion: Mostly metabolized by the liver (primarily via CYP2D6); 10% converted to morphine; H the CYP2D6 enzyme system exhibits genetic polymorphism (some patients [1–10% Whites, 3% African Americans, 16–28% North Africans/Ethiopians/Arabs] may be ultra-rapid metabolizers and may have \uparrow morphine concentrations and an \uparrow risk of adverse effects); 5–15% excreted unchanged in urine.

Half-life: 2.5–4 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	30–45 min	60–120 min	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; H Ultra-rapid metabolizers of codeine; **Lactation:** Avoid use in breast feeding (\uparrow risk of drowsiness and respiratory difficulty in infant); **Pedi:** Children <12 yr and children <18 yr following tonsillectomy and/or adenoidectomy (\uparrow risk of respiratory depression and death).

Use Cautiously in: Head trauma; \uparrow intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Prostatic hyperplasia; Undiagnosed abdominal pain; **Geri:** Geriatric or debilitated patients (dose \downarrow required; more susceptible to CNS depression, constipation); **OB:** Has been used during labor; respiratory depression

may occur in the newborn; **Pedi:** Children 12–18 yr who are postoperative; have obstructive sleep apnea, obesity, or severe pulmonary disease, neuromuscular disease; or are taking other medications that cause respiratory depression (\uparrow risk of respiratory depression).

Adverse Reactions/Side Effects

CNS: confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (\downarrow initial dose to 25% of usual dose). Additive CNS depression with **alcohol, antidepressants, antihistamines, and sedative/hypnotics**. **CYP3A4 inhibitors**, including **erythromycin, clarithromycin, ketoconazole, itraconazole, and protease inhibitors** may \uparrow levels and risk of respiratory depression. **CYP3A4 inducers** may \downarrow levels. **CYP2D6 inhibitors**, including **amiodarone and quinidine** may \downarrow analgesic effects. Administration of **partial antagonists (buprenorphine, butorphanol, nalbuphine, or pentazocine)** may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may \downarrow analgesia. **Drug-Natural Products:** Concomitant use of **kava-kava, valerian, skullcap, chamomile, or hops** can \uparrow CNS depression.

Route/Dosage

PO (Adults): *Analgesic*—15–60 mg q 3–6 hr as needed. *Antitussive*—10–20 mg q 4–6 hr as needed (not to exceed 120 mg/day). *Antidiarrheal*—30 mg up to 4 times daily.

PO (Children 6–12 yr): *Analgesic*—0.5–1 mg/kg (up to 60 mg) q 4–6 hr (up to 4 times daily) as needed. *Antitussive*—5–10 mg q 4–6 hr as needed (not to exceed 60 mg/day). *Antidiarrheal*—0.5 mg/kg up to 4 times daily.

PO (Children 2–5 yr): *Analgesic*—0.5–1 mg/kg (up to 60 mg) q 4–6 hr (up to 4 times daily) as needed. *Antitussive*—1–1.5 mg/kg divided q 4–6 hr as needed. *Antidiarrheal*—0.5 mg/kg up to 4 times daily.

Renal Impairment

(Adults and Children): *CCr 10–50 mL/min*—Administer 75% of the dose; *CCr <10 mL/min*—Administer 50% of the dose.

Availability (generic available)

Tablets: 15 mg, 30 mg, 60 mg. **Oral solution:** \star 10 mg/5 mL, \star 25 mg/5 mL. **In combination with:** antihistamines, decongestants, antipyretics, caffeine, butalbital, and nonopioid analgesics. See Appendix B.

\star = Canadian drug name. H = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids, bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Pain:** Assess type, location, and intensity of pain before and 1 hr (peak) after administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive codeine for pain do not develop psychological dependence. If progressively higher doses are required, consider conversion to a stronger opioid.
- **Cough:** Assess cough and lung sounds during antitussive use.
- **Lab Test Considerations:** May cause ↑ plasma amylase and lipase concentrations.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)

Disturbed sensory perception (visual, auditory) (Side Effects)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second prac-

itioner independently check dose calculations and route of administration.

- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower doses.
- Medications should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- When combined with nonopioid analgesics (aspirin, acetaminophen) #2 = 15 mg, #3 = 30 mg, #4 = 60 mg codeine. Codeine as an individual drug is a Schedule II substance. In combination with other drugs, tablet form is Schedule III, and elixir or cough suppressant is Schedule V (see Appendix I).
- **PO:** Oral doses may be administered with food or milk to minimize GI irritation.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- Advise patient that codeine is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution ambulatory patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of cough.
- Control of diarrhea.

HIGH ALERT

colchicine (kol-chi-seen)

Colcrys, Mitigare

Classification

Therapeutic: antigout agents

Indications

Prophylaxis and treatment of acute attacks of gouty arthritis. Familial Mediterranean fever.

Action

Interferes with the functions of WBCs in initiating and perpetuating the inflammatory response to monosodium urate crystals. **Therapeutic Effects:** Decreased pain and inflammation in acute attacks of gout. Reduced number of attacks of gout and familial Mediterranean fever.

Pharmacokinetics

Absorption: 45% absorbed from the GI tract, then re-enters GI tract from biliary secretions, when more absorption may occur.

Distribution: Concentrates in WBCs.

Metabolism and Excretion: Partially metabolized by the liver by CYP3A4; also a substrate for P-glycoprotein. Secreted in bile back into GI tract; eliminated in the feces. 40–65% excreted in the urine as unchanged drug.

Half-life: 27–31 hr.

TIME/ACTION PROFILE (anti-inflammatory activity)

ROUTE	ONSET	PEAK	DURATION
PO	12 hr	24–72 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Use of P-glycoprotein inhibitors or strong CYP3A4 inhibitors in patients with renal or hepatic impairment; Renal and hepatic impairment.

Use Cautiously in: Geri: Elderly or debilitated patients (toxicity may be cumulative); Renal impairment (dose ↓ suggested if CCr <80 mL/min); OB, Lactation, Pedi: Safety not established for gout.

Adverse Reactions/Side Effects

GI: diarrhea, nausea, vomiting, abdominal pain.

Derm: alopecia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, thrombocytopenia. **Neuro:** peripheral neuritis.

Interactions

Drug-Drug: Concurrent use of strong CYP3A4 inhibitors, including atazanavir, clarithromycin, darunavir/ritonavir, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, nefazodone, nelfinavir, ritonavir, saquinavir, or tipranavir/ritonavir, may ↑ levels and risk of toxicity; ↓ colchicine dose in patients with normal renal or hepatic function; concurrent use in patients with renal or hepatic impairment is contraindicated. Concurrent use of P-glycoprotein inhibitors, including cyclosporine or ranolazine may ↑ levels and risk of toxicity; ↓ colchicine dose in patients with normal renal or hepatic function; concurrent use in patients with renal or hepatic impairment is contraindicated. Moderate CYP3A4 inhibi-

tors, including aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, or verapamil may ↑ levels and risk of toxicity; ↓ colchicine dose. Additive bone marrow depression may occur with bone marrow depressants or radiation therapy. ↑ risk of rhabdomyolysis with HMG-CoA reductase inhibitors, gemfibrozil, fenofibrate, or digoxin. Additive adverse GI effects with NSAIDs. May cause reversible malabsorption of vitamin B₁₂.

Drug-Food: Grapefruit juice may ↑ levels and risk of toxicity; ↓ colchicine dose.

Route/Dosage

Treatment of Acute Gout Attacks

PO (Adults): 1.2 mg initially, then 0.6 mg 1 hr later (maximum dose of 1.8 mg in 1 hr); *Concomitant use of strong CYP3A4 inhibitors in patients with normal renal and hepatic function (atazanavir, clarithromycin, darunavir/ritonavir, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, nefazodone, nelfinavir, ritonavir, saquinavir, tipranavir/ritonavir)*—0.6 mg × 1 dose, then 0.3 mg 1 hr later (do not repeat treatment course for ≥3 days); *Concomitant use of moderate CYP3A4 inhibitors (aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, grapefruit juice, verapamil)*—1.2 mg × 1 dose (do not repeat for ≥3 days); *Concomitant use of P-glycoprotein inhibitors (cyclosporine, ranolazine) in patients with normal renal and hepatic function*—0.6 mg × 1 dose (do not repeat for ≥3 days).

Renal Impairment

PO (Adults): CCr <30 mL/min—1.2 mg initially, then 0.6 mg 1 hr later; do not repeat treatment course for ≥2 wk; Dialysis—0.6 mg × 1 dose; do not repeat treatment course for ≥2 wk.

Prevention of Acute Gout Attacks

PO (Adults): 0.6 mg once or twice daily; *Concomitant use of strong CYP3A4 inhibitors (atazanavir, clarithromycin, darunavir/ritonavir, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, nefazodone, nelfinavir, ritonavir, saquinavir, tipranavir/ritonavir) or P-glycoprotein inhibitors (cyclosporine, ranolazine) in patients with normal renal and hepatic function*—if original dose was 0.6 mg twice daily, ↓ to 0.3 mg once daily; if original dose was 0.6 mg once daily, ↓ to 0.3 mg every other day; *Concomitant use of moderate CYP3A4 inhibitors (aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, grapefruit juice, verapamil)*—if original dose was 0.6 mg twice daily, ↓ to 0.3 mg twice daily or 0.6 mg once daily; if original dose was 0.6 mg once daily, ↓ to 0.3 mg once daily.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Renal Impairment

PO (Adults): *CCr* <30 mL/min—0.3 mg/day; *Dialysis*—0.3 mg twice weekly.

Familial Mediterranean Fever

PO (Adults and Children >12 yr): 1.2–2.4 mg daily (in 1–2 divided doses); may ↑ or ↓ dose in 0.3-mg/day increments based on safety and efficacy; *Concomitant use of strong CYP3A4 inhibitors (atazanavir, clarithromycin, darunavir/ritonavir, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, nefazodone, nelfinavir, ritonavir, saquinavir, tipranavir/ritonavir) or P-glycoprotein inhibitors (cyclosporine, ranolazine) in patients with normal renal and hepatic function*—Do not exceed 0.6 mg/day (may be given as 0.3 mg twice daily); *Concomitant use of moderate CYP3A4 inhibitors (aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, grapefruit juice, verapamil)*—Do not exceed 1.2 mg/day (may be given as 0.6 mg twice daily).

PO (Children 6–12 yr): 0.9–1.8 mg daily (in 1–2 divided doses).

PO (Children 4–6 yr): 0.3–1.8 mg daily (in 1–2 divided doses).

Renal Impairment

PO (Adults): *CCr* 30–50 mL/min—dose ↓ may be necessary; *CCr* <30 mL/min or *dialysis*—0.3 mg/day.

Availability (generic available)

Tablets: 0.6 mg, ★ 1 mg. **Capsules:** 0.6 mg. **In combination with:** probenecid (Col-Probenecid). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios. Fluids should be encouraged to promote a urinary output of at least 2000 mL/day.
- **Gout:** Assess involved joints for pain, mobility, and edema throughout therapy. During initiation of therapy, monitor for drug response every 1–2 hr.
- **Familial Mediterranean fever:** Assess for signs and symptoms of familial Mediterranean fever (abdominal pain, chest pain, fever, chills, recurrent joint pain, red and swollen skin lesions) periodically during therapy.
- **Lab Test Considerations:** In patients receiving prolonged therapy, monitor baseline and periodic CBC; report significant ↓ in values. May cause ↓ platelet count, leukopenia, aplastic anemia, and agranulocytosis.
- May cause ↑ in AST and alkaline phosphatase.
- May cause false-positive results for urine hemoglobin.
- May interfere with results of urinary 17-hydroxycorticosteroid concentrations.
- **Toxicity and Overdose: High Alert:** Assess patient for toxicity (muscle pain or weakness, tingling or numbness in fingers or toes; pale or gray color to

lips, tongue, or palms of hands; severe diarrhea or vomiting; unusual bleeding, bruising, sore throat, fatigue, malaise, or weakness or tiredness). If these symptoms occur, discontinue colchicine and treat symptomatically. Opioids may be needed to treat diarrhea.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired walking (Indications)

Implementation

- Do not confuse colchicine with Cortrosyn.
- Intermittent therapy with 3 days between courses may be used to decrease risk of toxicity.
- **PO:** Administer without regard to meals.

Patient/Family Teaching

- Review medication administration schedule. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- Instruct patients taking prophylactic doses not to increase therapeutic doses during an acute attack to prevent toxicity. An NSAID or corticosteroid, preferably via intrasynovial injection, should be used to treat acute attacks.
- Advise patient to avoid grapefruit and grapefruit juice during therapy; may increase risk of toxicity.
- Advise patient to follow recommendations of health care professional regarding weight loss, diet, and alcohol consumption.
- Instruct patient to report muscle pain or weakness, tingling or numbness in fingers or toes; pale or gray color to lips, tongue, or palms of hands; severe diarrhea or vomiting; unusual bleeding, bruising, sore throat, fatigue, malaise, or weakness or tiredness promptly. Medication should be withheld if symptoms of toxicity occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to notify health care professional before taking any other Rx, OTC, or herbal products.
- Surgery may precipitate an acute attack of gout. Advise patient to confer with health care professional regarding dose 3 days before surgical or dental procedures.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in pain and swelling in affected joints within 12 hr.
- Relief of symptoms within 24–48 hr.
- Prevention of acute gout attacks.
- Reduced number of attacks of familial Mediterranean fever.

colesevelam (koe-le-sev-e-lam)

*Lodalis, Welchol

Classification

Therapeutic: lipid-lowering agents

Pharmacologic: bile acid sequestrants

Indications

Adjunctive therapy to diet and exercise for the reduction of LDL cholesterol in patients with primary hypercholesterolemia; may be used alone or in combination with statins. Adjunctive therapy to diet and exercise for the reduction of LDL cholesterol in children 10–17 yr with heterozygous familial hypercholesterolemia if diet therapy fails (LDL cholesterol remains ≥ 190 mg/dL or remains ≥ 160 mg/dL [with family history of premature cardiovascular disease or ≥ 2 risk factors for cardiovascular disease]); may be used alone or in combination with statin. Adjunctive therapy to diet and exercise to improve glycemic control in patients with type 2 diabetes.

Action

Binds bile acids in the GI tract. Result in increased clearance of cholesterol. Mechanism for lowering blood glucose unknown. **Therapeutic Effects:** Decreased cholesterol and blood glucose.

Pharmacokinetics

Absorption: Not absorbed; action is primarily local in the GI tract.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (cholesterol-lowering effect)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Bowel obstruction; Triglycerides >500 mg/dL; History of pancreatitis due to hypertriglyceridemia.

Use Cautiously in: Triglycerides >300 mg/dL; Dysphagia, swallowing disorders, severe GI motility disorders, or major GI tract surgery; **OB, Lactation, Pedi:** Pregnancy, lactation, or children <10 yr (safety not established).

Adverse Reactions/Side Effects

GI: constipation, dyspepsia.

Interactions

Drug-Drug: May ↓ absorption of **glyburide, glimepiride, glipizide, levothyroxine, olmesartan, phe-**

ntoin, cyclosporine, warfarin, and estrogen-containing oral contraceptives (give ≥ 4 hr before colesevelam). May ↑ levels of **metformin extended-release**.

Route/Dosage**Hyperlipidemia**

PO (Adults): 3 tablets twice daily or 6 tablets once daily.

PO (Adults and Children 10–17 yr): *Suspension*—one 3.75-g packet once daily or one 1.875-g packet twice daily.

Type 2 Diabetes

PO (Adults): 3 tablets twice daily or 6 tablets once daily; *Suspension*—one 3.75-g packet once daily or one 1.875-g packet twice daily.

Availability

Tablets: 625 mg. **Granules for oral suspension:** 1.875 g/packet (contains 13.5 mg phenylalanine), 3.75 g/packet (contains 27 mg phenylalanine).

NURSING IMPLICATIONS**Assessment**

- **Hypercholesterolemia:** Obtain a diet history, especially in regard to fat consumption.
- **Type 2 Diabetes:** Observe patient for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- **Lab Test Considerations:** Monitor serum total cholesterol, LDL, and triglyceride levels before initiating, 4–6 wk after starting, and periodically during therapy.
- Monitor serum glucose and glycosylated hemoglobin periodically during therapy in patients with diabetes.

Potential Nursing Diagnoses

Constipation (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** Administer once or twice daily with meals. Colesevelam should be taken with a liquid. For oral suspension, empty the entire contents of one packet into a glass or cup. Add $\frac{1}{2}$ to 1 cup (4 to 8 ounces) of water, fruit juice, or a diet soft drink; do not take in dry form to avoid esophageal distress.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not skip doses or double up on missed doses.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-

* = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ucts being taken and consult health care professional before taking other Rx, OTC, or herbal products. Advise patients taking oral vitamin supplementation or oral contraceptives to take their vitamins at least 4 hr prior to colessevelam.

- Instruct patient to consume a diet that promotes bowel regularity. Patients should be instructed to promptly discontinue colessevelam and notify health care professional if severe abdominal pain or severe constipation or symptoms of acute pancreatitis (severe abdominal pain with or without nausea and vomiting) occur.
- **Hypercholesterolemia:** Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- **Diabetes:** Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to drink a glass of orange juice or ingest 2–3 tsp of sugar, honey, or corn syrup dissolved in water or an appropriate number of glucose tablets and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.
- Insulin is the recommended method of controlling blood sugar during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in serum total cholesterol, LDL cholesterol, apolipoprotein, and blood glucose levels.
- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

conivaptan (con-i-vap-tan)

Vaprisol

Classification

Therapeutic: electrolyte modifiers

Pharmacologic: vasopressin antagonists

Indications

To increase serum sodium in hospitalized patients with euvolemic or hypervolemic hyponatremia.

Action

Antagonizes vasopressin at V_2 receptor sites in renal collecting ducts, resulting in excretion of free water.

Therapeutic Effects: Increased serum sodium concentrations. Improved fluid status.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: 99% protein bound.

Metabolism and Excretion: Metabolized solely by the CYP3A4 enzyme system. 83% excreted in feces as metabolites, 12% in urine (as metabolites).

Half-life: 5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	12 hr	end of infusion

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypovolemic hyponatremia; Concurrent use of ketonconazole, itraconazole, clarithromycin, ritonavir, or indinavir; **Lactation:** Avoid breast feeding.

Use Cautiously in: Moderate or severe hepatic impairment (\downarrow dose recommended); Severe renal impairment (not recommended if $\text{CCr} < 30$ mL/min); **OB:** Safety not established; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache, confusion, insomnia. **CV:** hypertension, hypotension. **GI:** diarrhea. **GU:** \downarrow fertility (females), polyuria. **F and E:** dehydration, hypokalemia, hypomagnesemia, hyponatremia. **Local:** infusion reactions. **Misc:** fever, thirst.

Interactions

Drug-Drug: Blood levels and effects are \uparrow by ketoconazole, itraconazole, clarithromycin, ritonavir, or indinavir; concurrent use is contraindicated. \uparrow blood levels and may \uparrow effects of midazolam, simvastatin, lovastatin, amlodipine, and other drugs metabolized by CYP3A4; careful monitoring recommended. May \uparrow digoxin levels.

Route/Dosage

IV (Adults): 20 mg loading dose initially, followed by 20 mg/day as a continuous infusion for 2–4 days. May titrate conivaptan up to 40 mg/day as a continuous infusion if serum sodium is not rising at desired rate. Total duration of therapy should not exceed 4 days.

Hepatic Impairment

(Adults): *Moderate or severe hepatic impairment*—10 mg loading dose initially, followed by 10 mg/day as a continuous infusion for 2–4 days; may titrate up to 20 mg/day as a continuous infusion if serum sodium is not rising at desired rate.

Availability

Premixed infusion: 20 mg/100 mL D5W.

NURSING IMPLICATIONS

Assessment

- Monitor injection site during administration. Frequently causes erythema, pain, swelling and phlebitis. May require discontinuation of therapy.
- Monitor vital signs frequently during therapy. Discontinue therapy if patient becomes hypovolemic and hypotensive. Therapy may be resumed at a reduced dose once patient is euvolesmic and no longer hypotensive, if patient remains hyponatremic.
- Assess neurologic status during administration. Overly rapid rise in serum sodium may cause neurologic sequelae.
- **Lab Test Considerations:** Monitor serum sodium concentration frequently during therapy. If serum sodium rises at an undesirably rapid rate (>12 mEq/L/24 hr), discontinue administration of convaptan. If serum sodium continues to rise, do not resume therapy. If hyponatremia persists or recurs (after discontinuation for rapid rise of serum sodium) and patient has no evidence of neurologic sequelae from rapid increase, convaptan may be resumed at a reduced dose.
- May cause hyperglycemia, hypoglycemia, hypokalemia, hypomagnesemia, and hyponatremia.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

IV Administration

- Administer IV through large veins and rotate infusion site every 24 hr to minimize risk if vascular irritation.

Loading Dose

- **Intermittent Infusion:** **Diluent:** Premixed containers require no further dilution. **Concentration:** 0.2 mg/mL. **Rate:** Administer over 30 min.

Continuous Infusion

- **Continuous Infusion:** **Diluent:** Premixed containers require no further dilution. **Concentration:** 0.2 mg/mL. **Rate:** Administer continuous infusion at a rate of 20 mg/24 hr. If patient requires 40 mg/24 hr continuous infusion, infuse 20 mg over 12 hr, followed by 20 mg over 12 hr.

- **Additive Incompatibility:** Do not admix with LR, furosemide, or combine with any other product in the same IV line or bag.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Instruct patient to notify health care professional if pain or redness occurs at infusion site.

Evaluation/Desired Outcomes

- Restoration of normal fluid and electrolyte balance.

Classification

Therapeutic: contraceptive hormones

Indications

Prevention of pregnancy. Regulation of menstrual cycle. Emergency contraception (some products). Treatment of heavy menstrual bleeding in women who choose to

use intrauterine contraception as their method of contraception (Mirena). Treatment of heavy menstrual bleeding in women who choose to use an oral contraceptive as their method of contraception (Natazia). Treatment of premenstrual dysphoric disorder (Beyaz, Yaz, Yasmin). Management of acne in women >14 yr who desire contraception, have no health problems, and have failed topical treatment. Increase folate levels in women who desire oral contraception to reduce the risk of neural tube defects in a pregnancy that occurs while taking or shortly after discontinuing the product.

Action

Monophasic Oral Contraceptives: Provide a fixed dosage of estrogen/progestin over a 21-day cycle. Ovulation is inhibited by suppression of follicle-stimulating hormone (FSH) and luteinizing hormone (LH). May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. **Biphasic Oral Contraceptives:** Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. In addition, smaller dose of progestin in phase 1 allows for proliferation of endometrium. Larger amount in phase 2 allows for adequate secretory development.

Triphasic Oral Contraceptives: Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Varying doses of estrogen/progestin may more closely mimic natural hormonal fluctuations. **Fourphasic Oral Contraceptives:** Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Doses of estrogen decrease while doses of progestin increase over the 28-day cycle. **Extended-cycle:** Provides continuous estrogen/progestin for 84 days (365 days for Lybrel), then off for 7 days (low-dose estrogen-only tablet taken during these 7 days with LoSeasonique and Seasonique), resulting in 4 menstrual periods/year (no periods/year for Lybrel). **Progressive Estrogen:** Contains constant amount of progestin with 3 progressive doses of estrogen. **Progestin-Only Contraceptives/Contraceptive Implant/Intrauterine Levonorgestrel/Medroxyprogesterone Injection:** Mechanism not clearly known. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Ovulation may also be suppressed. **Emergency Contraceptive Pills (ECPs):** Inhibit ovulation/fertilization; may also alter tubal transport of sperm/egg and prevent implantation. **Vaginal Ring, Transdermal Patch:** Inhibits ovulation, decreases sperm entry into uterus, decreases likelihood of implantation. **Anti-acne effect:** Combination of es-

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicates most frequent.

trogen/progestin may increase sex hormone binding globulin (SHBG) resulting in decreased unbound testosterone, which may be a cause of acne. **Therapeutic Effects:** Prevention of pregnancy. Decreased severity of acne. Decrease in menstrual blood loss. Decrease in premenstrual dysphoric disorder. Decrease in vasomotor symptoms or symptoms of vulvar and vaginal atrophy due to menopause. Increase in folate levels and prevention of neural tube defects.

Pharmacokinetics

Absorption: *Ethinyl estradiol*—rapidly absorbed; *Norethindrone*—65% absorbed; *Desogestrel and levonorgestrel*—100% absorbed; *Dienogest*—91% absorbed. Others are well absorbed after oral administration. Slowly absorbed from implant, subcutaneous or IM injection. Some absorption follows intrauterine implantation.

Distribution: Unknown.

Protein Binding: *Ethinyl estradiol*—97–98%; *Drospirenone*—97%; *Dienogest*—90%; *Ulipristal*—>94%.

Metabolism and Excretion: *Ethinyl estradiol and norethindrone*—undergo extensive first-pass hepatic metabolism. *Mestranol*—is rapidly converted to ethinyl estradiol. *Desogestrel*—is rapidly metabolized to 3-keto-desogestrel, the active metabolite. Most agents are metabolized by the liver.

Half-life: *Ethinyl estradiol*—6–20 hr; *Levonorgestrel*—45 hr; *Norethindrone*—5–14 hr; *Desogestrel (metabolite)*—38 ± 20 hr; *Drospirenone*—30 hr; *Norgestimate (metabolite)*—12–20 hr; *Dienogest*—11 hr; *others*—unknown; *Ulipristal*—32 hr.

TIME/ACTION PROFILE (prevention of pregnancy)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	1 mo	1 mo†
Implant	1 mo	1 mo	5 yr
Intrauterine system	1 mo	1 mo	5 yr
IM	1 mo	1 mo	3 mo
Subcut	unknown	1 wk	3 mo

†Only during mo of taking contraceptive.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** Pregnancy; History of cigarette smoking or age >35 yr (↑ risk of cardiovascular or thromboembolic phenomenon); History of thromboembolic disease (e.g., DVT, PE, MI, stroke); Protein C, protein S, or antithrombin deficiency or other thrombophilic disorder; Valvular heart disease; Major surgery with extended periods of immobility; Diabetes with vascular involvement; Headache with focal neurological symptoms; Uncontrolled hypertension; History of breast, endometrial, or estrogen-dependent cancer; Abnormal genital bleeding; Liver disease; Hypersensitivity to parabens (injectable only); *Drospirone-containing products only*—

Renal impairment, liver disease, or adrenal insufficiency (↑ risk of hyperkalemia); *Intrauterine levonorgestrel only*—Intrauterine anomaly, postpartum endometriosis, multiple sexual partners, pelvic inflammatory disease, liver disease, genital actinomycosis, immunosuppression, IV drug abuse, untreated genitourinary infection, history of ectopic pregnancy; **Lactation:** Avoid use; ↑ risk of uterine rupture with intrauterine levonorgestrel.

Use Cautiously in: Presence of other cardiovascular risk factors (obesity, hyperglycemia, hypertension); History or family history of hypertriglyceridemia (↑ risk of pancreatitis); History of diabetes mellitus, bleeding disorders, concurrent anticoagulant therapy or headaches; History of hereditary angioedema; **Pedi:** Avoid use before menarche.

Adverse Reactions/Side Effects

CNS: depression, headache. **EENT:** contact lens intolerance, optic neuritis, retinal thrombosis. **CV:** **THROMBOEMBOLISM** (risk is greatest during first 6 mo of therapy or after restarting the same or different therapy), edema, hypertension, Raynaud's phenomenon, thrombophlebitis. **F and E:** *Drospirone-containing products only*—hyperkalemia. **GI:** **PANCREATITIS**, abdominal cramps, bloating, cholestatic jaundice, gallbladder disease, liver tumors, nausea, vomiting. **GU:** amenorrhea, breakthrough bleeding, dysmenorrhea, spotting, *Intrauterine levonorgestrel only*—uterine imbedment/uterine rupture. **Derm:** melasma, rash. **Endo:** hyperglycemia. **MS:** *Injectable medroxyprogesterone only*—bone loss. **Misc:** weight change.

Interactions

Drug-Drug: Oral contraceptive efficacy may be ↓ by penicillins, chloramphenicol, barbiturates, chronic alcohol use, carbamazepine, oxcarbazepine, bosentan, felbamate, systemic corticosteroids, phenytoin, topiramate, primidone, modafinil, rifampin, rifabutin, nelfinavir, ritonavir, darunavir/ritonavir, fosamprenavir/ritonavir, lopinavir/ritonavir, tipranavir/ritonavir, nevirapine, colesevelam, or tetracyclines. CYP3A4 inducers, including barbiturates, bosentan, carbamazepine, oxcarbazepine, phenytoin, topiramate, felbamate, rifampin may ↓ effectiveness of ulipristal; avoid concomitant use. May ↑ effects/risk of toxicity of some benzodiazepines, beta blockers, corticosteroids, cyclosporine, tizanidine, theophylline, and voriconazole. ↑ risk of hepatic toxicity with dantrolene (estrogen only). Indinavir, atazanavir/ritonavir, etravirine, itraconazole, ketoconazole, fluconazole, voriconazole, rosuvastatin, and atorvastatin may ↑ effects/risk of toxicity. **Smoking** ↑ risk of thromboembolic phenomena (estrogen only). May ↓ levels of acetaminophen, temazepam, lamotrigine, lorazepam, oxazepam, or morphine. *Drospirone-containing products only*—concurrent use with NSAIDs, potassium-

sparing diuretics, potassium supplements, ACE inhibitors, aldosterone receptor antagonists, or angiotensin II receptor antagonists may result in hyperkalemia. *Drosperinone-containing products only*—concurrent use with strong **CYP3A4 inhibitors**, including **ketoconazole, itraconazole, voriconazole, protease inhibitors, or clarithromycin** may ↑ risk of hyperkalemia; consider monitoring K⁺ concentrations. Ulipristal may ↑ levels of **P-glycoprotein substrates**, including **digabigatran and digoxin**. **Drug-Natural Products:** Concomitant use with **St. John's wort** may ↓ contraceptive efficacy and cause breakthrough bleeding and irregular menses.

Drug-Food: **Grapefruit juice** may ↑ effects/risk of toxicity.

Route/Dosage

Monophasic Oral Contraceptives

PO (Adults): On 21-day regimen, take first tablet on first Sunday after menses begins (take on Sunday if menses begins on Sunday) for 21 days, then skip 7 days and begin again. Regimen may also be started on first day of menses, continue for 21 days, then skip 7 days and begin again. Some regimens contain 7 placebo tablets, so that 1 tablet is taken every day for 28 days.

Biphasic Oral Contraceptives

PO (Adults): Given in 2 phases. First phase is 10 days of smaller amount of progestin. Second phase is larger amount of progestin. Amount of estrogen remains constant for same length of time (total of 21 days), then skip 7 days and begin again. Some regimens contain 7 placebo tablets for 28-day regimen.

Triphasic Oral Contraceptives

PO (Adults): Progestin amount varies throughout 21-day cycle. Estrogen component stays the same or may vary. Some regimens contain 7 placebo tablets for 28-day regimen.

Fourphasic Oral Contraceptives

PO (Adults): Given in 4 phases. First phase contains higher amount of estrogen and no progestin. Second and third phases contains lower amount of estrogen, and increasing amounts of progestin. Fourth phase contains low dose of estrogen only. Also contains 2 placebo tablets to complete 28-day regimen.

Extended-Cycle Contraceptive

PO (Adults): *Daysee, LoSeasonique, Quartette, Seasonale and Seasonique*. Start taking first active pill on first Sunday after menses begins (if first day is Sunday, begin then), continue for 84 days of active pill, followed by 7 days of placebo tablets (low-dose estrogen tablets for *Daysee, LoSeasonique, Quartette, and Seasonique*), then resume 84/7 cycle again. For *Lybrel*, begin taking

the first pill during the first day of the menstrual cycle and start the next pack the day after the previous pack ends.

Progestin-Only Oral Contraceptives

PO (Adults): Start on first day of menses. Taken daily and continuously.

Progressive Estrogen Oral Contraceptives

PO (Adults): Estrogen amount increases q 7 days throughout 21-day cycle. Progestin component stays the same. Some regimens contain 7 placebo tablets for 28-day regimen.

Emergency Contraceptive

PO (Adults and Adolescents): *Plan B*—1 tablet within 72 hr of unprotected intercourse followed by 1 more tablet 12 hr later; *Lo/Ovral*—4 white tablets within 72 hr of unprotected intercourse followed by 4 more white tablets 12 hr later; *Leven, Nordette*—4 light orange tablets within 72 hr of unprotected intercourse followed by 4 more light orange tablets 12 hr later; *Tripbasil, Tri-Leven*—4 yellow tablets within 72 hr of unprotected intercourse followed by 4 more yellow tablets 12 hr later; *Ulipristal*—1 tablet as soon as possible within 120 hr (5 days) after unprotected intercourse or known/suspected contraceptive failure.

Injectable Contraceptive

medroxyprogesterone (Depo-Provera)

IM (Adults): 150 mg within first 5 days of menses or within 5 days postpartum, if not breast feeding. If breast feeding, give 6 wk postpartum; repeat q 3 mo.

medroxyprogesterone (Depo-Sub Q Provera 104)

Subcut (Adults): 104 mg within first 5 days of menses or within 5 days postpartum, if not breast feeding. If breast feeding, give 6 wk postpartum; repeat q 12–14 wk.

Intrauterine Contraceptive

Intrauterine (Adults): Insert one device into uterine cavity within 7 days of menses or immediately after 1st trimester abortion. *Kyleena* and *Mirena* should be removed or replaced after 5 yr. *Liletta* and *Skyla* should be removed or replaced after 3 yr.

Vaginal Ring Contraceptive

Vag (Adults): One ring inserted on or prior to day 5 of menstrual cycle. Ring is left in place for 3 wk, then removed for 1 wk, then a new ring is inserted.

Transdermal Patch

Transdermal (Adults): Patch is applied on day 1 of menstrual cycle (or convenient day in first week), changed weekly thereafter for 3 wk. Week 4 is patch-free. Cycle is then repeated.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Acne

PO (Adults): *Ortho Tri-Cyclen*—Take daily for 21 days, off for 7 days.

Availability

Combination Estrogen/Progestin Oral Contraceptives (generic available)

Oral contraceptive tablets: Usually in monthly packs with enough (21) active tablets to complete a 28-day cycle. Some contain 7 inert tablets to complete the cycle with or without supplemental iron, *Beyaz* and *Safyral*—contain 0.451 mg of levomefolate calcium/tablet.

Extended-Cycle Contraceptive

Tablets: *LoSeasonique*—active tablets containing 0.02 mg ethinyl estradiol, 0.1 mg levonorgestrel, and 7 tablets containing 0.01 mg ethinyl estradiol; *Quartette*—42 tablets containing 0.02 mg ethinyl estradiol and 0.15 mg levonorgestrel, 21 tablets containing 0.025 mg ethinyl estradiol and 0.15 mg levonorgestrel, 21 tablets containing 0.03 mg ethinyl estradiol and 0.15 mg levonorgestrel, and 7 tablets containing 0.01 mg ethinyl estradiol; *Seasonale*—84 active tablets containing 0.03 mg ethinyl estradiol and 0.15 mg levonorgestrel and 7 inactive tablets; *Daysee and Seasonique*—active tablets containing 0.03 mg ethinyl estradiol, 0.15 mg levonorgestrel, and 7 tablets containing 0.01 mg ethinyl estradiol; *Lybrel*—28 active tablets containing 0.09 mg levonorgestrel and 0.02 mg ethinyl estradiol.

Levonorgestrel (generic available)

Emergency contraceptives: 2 tablets containing 0.75 mg levonorgestrel (Plan B). **Implant:** Rod contains 68 mg etonogestrel. **Intrauterine system (Kyleena):** contains 19.5 mg levonorgestrel (releases 9 mcg/day). **Intrauterine system (Liletta):** contains 52 mg levonorgestrel (releases 15.6 mcg/day). **Intrauterine system (Mirena):** contains 52 mg levonorgestrel (releases 20 mcg/day). **Intrauterine system (Skyla):** contains 13.5 mg levonorgestrel (releases 14 mcg/day).

Ulipristal

Tablets: 30 mg.

Medroxyprogesterone (generic available)

Injectable IM: 150 mg/mL. **Injectable Subcutaneous:** 104 mg/0.65 mL (in pre-filled syringes).

Vaginal Ring Contraceptive

Ring: delivers 0.015 mg ethinyl estradiol and 0.120 mg etonogestrel/day.

Transdermal Patch

Patch (Xulane): contains 0.53 mg ethinyl estradiol and 4.86 mg of norelgestromin; releases 35 mcg ethinyl estradiol/150 mcg norelgestromin per 24 hr.

NURSING IMPLICATIONS

Assessment

- Assess BP before and periodically during therapy.
- Exclude the possibility of pregnancy on the basis of history and/or physical exam or a pregnancy test before administering emergency contraceptives.
- **Acne:** Assess skin lesion before and periodically during therapy.
- **Menopausal Symptoms:** Assess vasomotor symptoms or symptoms of vulvar and vaginal atrophy due to menopause prior to and periodically during therapy.
- **Lab Test Considerations:** Monitor hepatic function periodically during therapy.
- **Estrogens only**—May cause ↑ serum glucose, sodium, triglyceride, VHDL, total cholesterol, prothrombin, and factors VII, VIII, IX, and X levels. May cause ↓ LDL and antithrombin III levels.
- May cause false interpretations of thyroid function tests.
- **Progestins only**—May cause ↑ LDL concentrations. May cause ↓ serum alkaline phosphatase and HDL concentrations.
- **Drospiridone-containing contraceptives**—monitor serum potassium during first treatment cycle in women on long-term treatment with strong CYP3A4 inhibitors; may ↑ serum potassium concentration.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse Ortho Tri-Cyclen with Ortho Tri-Cyclen Lo. Do not confuse Yasmin with Yaz.**
- **PO:** Oral doses may be administered with or immediately after food to reduce nausea. Chewable tablets may be swallowed whole or chewed; if chewed follow with 8 ounces of liquid.
- For extended-cycle tablets, *Jolessa*, *Quasense*, *Seasonale*, *Seasonique*, or *LoSeasonique*—take active tablets for 84 days and followed by the placebo tablets for 7 days; for *Lybrel*—Take 1 pill each day for 28 days, then start the next set of pills daily for the next 28 days.
- For **Emergency Contraception:** Tablets are taken as soon as possible and within 72 hr after unprotected intercourse. Two doses are taken 12 hr apart. Emergency contraception products are available without a prescription to all women of child-bearing age.
- **Ulipristal:** Administer 1 tablet as soon as possible within 120 hr (5 days) after unprotected intercourse or a known or suspected contraceptive failure. May be taken without regard to food. If vomiting occurs within 3 hr of dose, may repeat. May be taken at any time during the menstrual cycle. Ulipristal may be less effective in women with a body mass index >30 kg/m².
- **Subcut:** Shake vigorously before use to form a uniform suspension. Inject slowly (over 5–7 sec) at a

45° angle into fatty area of anterior thigh or abdomen every 12 to 14 wk. If more than 14 wk elapse between injections, rule out pregnancy prior to administration. **Do not rub area after injection.**

- When switching from other hormonal contraceptives, administer within dosing period (7 days after taking last active pill, removing patch or ring, or within the dosing period for IM injection).
- **IM:** Shake vial vigorously just before use to ensure uniform suspension. Administer deep IM into gluteal or deltoid muscle. If period between injections is >14 wk, determine that patient is not pregnant before administering the drug.
- Injectable medroxyprogesterone may lead to bone loss, especially in women younger than 21 yr. Injectable medroxyprogesterone should be used for >2 yr only if other methods of contraception are inadequate. If used long term, women should use supplemental calcium and vitamin D, and monitor bone mineral density.
- **Intrauterine system:** Should be inserted by a trained health care provider. Health care providers are advised to become thoroughly familiar with the insertion instructions before attempting insertion. Following insertion counsel patient on what to expect following insertion. Give patient *Follow-up Reminder Card* provided with product. Discuss expected bleeding patterns during the first mo of use. Prescribe analgesics, if indicated. Patients should be reexamined and evaluated 4 to 12 wk after insertion and once a year thereafter, or more frequently if clinically indicated.

Patient/Family Teaching

- Instruct patient to take oral medication as directed at the same time each day. Pills should be taken in proper sequence and kept in the original container. Advise patient not to skip pills even if not having sex very often. Advise patient to read *Patient Guide* before starting and with each Rx refill in case of changes.
- *If single daily dose is missed:* Take as soon as remembered; if not until next day, take 2 tablets and continue on regular dosing schedule. *If 2 days in a row are missed:* Take 2 tablets a day for the next 2 days and continue on regular dosing schedule, using a second method of birth control for the remaining cycle. *If 3 days in a row are missed:* Discontinue medication and use another form of birth control until period begins or pregnancy is ruled out; then begin a new cycle of tablets. *For 28-day dosing schedule:* If schedule is followed for first 21 days and 1 dose is missed of the last 7 tablets, it is important to take the 1st tablet of next month's cycle on the regularly scheduled day. Advise patient taking *Natazia* to follow *Patient Guide* for what to do if a pill is missed.

- Advise patient taking *Jolessa*, *Quasense*, *Seasonale*, *Sesonique*, or *LoSeasonique extended-cycle tablets* that withdrawal bleeding should occur during the 7 days following discontinuation of the active tablets. If withdrawal bleeding does not occur, notify health care professional. Advise patient taking *Lybrel* that no withdrawal bleeding should occur.
- For initial use of *Jolessa*, *Quasense*, *Seasonale*, *Sesonique*, or *LoSeasonique extended cycle tablets*, caution patient to use a nonhormonal method of contraception until she has taken the first 7 days of active tablets. Each 91-day cycle should start on the same day of the week. If started later than the proper day or 2 or more days are missed, a second nonhormonal method of contraception should be used until she has taken the pink tablet for 7 days. Transient spotting or bleeding may occur. If bleeding is persistent or prolonged, notify health care professional.
- Advise patient taking extended cycle tablets that spotting or light bleeding may occur, especially during first 3 mo. Continue medication; notify health care professional if bleeding lasts >70 k days.
- Advise patient of the need to use another form of contraception for the first 3 wk when beginning to use *oral contraceptives*.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient that a second method of birth control should also be used during each cycle in which any of the following are used: *Oral contraceptives*—ampicillin, corticosteroids, antiretroviral protease inhibitors, barbiturates, carbamazepine, chloramphenicol, dihydroergotamine, corticosteroids (systemic), mineral oil, oral neomycin, oxcarbazepine, penicillin V, phenylbutazone, primidone, rifampin, sulfonamides, tetracyclines, topiramate, bosentan, or valproic acid.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding.
- If nausea becomes a problem, advise patient that eating solid food often provides relief. If nausea persists or vomiting or diarrhea occur, use a nonhormonal method of contraception and notify health care professional.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding. Women with a strong family history of breast cancer, fibrocystic breast disease, abnormal mammograms,

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

or cervical dysplasia should be monitored for breast cancer at least yearly. Risk of thromboembolism is highest in 1st year of use and increased when a combination hormonal contraceptive is restarted after a break in use of at least 4 wks.

- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Caution patients to use sunscreen and protective clothing to prevent increased pigmentation.
- Caution patient that hormonal contraceptives do not protect against HIV or other sexually transmitted diseases.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up physical exams including BP; breast, abdomen, and pelvic examinations; and Papanicolaou smears every 6–12 mo.
- **Emergency Contraception:** Instruct patient to take emergency contraceptive as directed. Advise patient that they should not take emergency contraceptives if they know or suspect they are pregnant; emergency contraceptives are not for use to end an existing pregnancy. Advise patient to contact health care professional if they vomit within 3 hr after taking *ulipristal*.
- Inform patient that *ulipristal* may reduce the effectiveness of hormonal contraceptives. Advise patient to use a non-hormonal contraceptive during that menstrual cycle. If a hormonal contraceptive is used, do not use less than 5 days after taking *ulipristal*.
- Advise patient to notify health care professional and consider the possibility of pregnancy of their period is delayed by more than 1 wk beyond the expected date after taking *ulipristal*.
- Inform patient that emergency contraceptives are not to be used as a routine form of contraception or to be used repeatedly within the same menstrual cycle.
- Advise patient to notify health care professional if severe lower abdominal pain occurs 3–5 wk after taking *ulipristal* to be evaluated for an ectopic pregnancy.
- Advise female patients to avoid breast feeding if taking *ulipristal*.
- **IM, Subcut:** Advise patient to maintain adequate amounts of dietary calcium and vitamin D to help prevent bone loss.
- **Transdermal:** Instruct patient on application of patch. First patch should be applied within 24 hr of menstrual period. If applied after Day 1 of menstrual period, a nonhormonal method of contraception should be used for the next 7 days. Day of application becomes *Patch Change Day*. Patches are worn for 1 wk and changed on the same day of each wk for 3 wk. Week 4 is patch-free. Withdrawal bleeding is expected during this time.
- Apply patch to clean, dry, intact, healthy skin on buttock, abdomen, upper outer arm, or upper torso in a place where it won't be rubbed by tight clothing. Do not place on skin that is red, irritated, or cut, and do not place on breasts. Do not apply make-up, creams, lotions, powders, or other topical products to area of patch application.
- To apply patch open foil pouch by tearing along edge using fingers. Peel pouch apart and open flat. Grasp a corner of the patch firmly and remove gently from foil pouch. Use fingernail to lift one corner of the patch and peel patch **and** the plastic liner off the foil liner. Do not remove clear liner as patch is removed. Peel away half of the clear liner without touching sticky surface. Apply the sticky surface and remove the rest of the liner. Press down firmly with palm of hand for 10 sec; make sure the edges stick well.
- On *Patch Change Day* remove patch and apply new one immediately. Used patch still contains some active hormones; fold in half so it sticks to itself and throw away. Apply new patches to a new spot to prevent skin irritation; may be applied in same anatomic area.
- Following patch-free week, apply a new patch on *Patch Change Day*, the day after Day 28, no matter when the menstrual cycle begins.
- If patch becomes partially or completely detached for less than 1 day, reapply patch or apply new patch. If patch is detached for more than 1 day, apply a new patch immediately and use a nonhormonal form of contraception for the next 7 days. Cycle will now start over with a new *Patch Change Day*. If patch is no longer sticky, apply a new patch; do not use tape or wraps to keep patch in place.
- If patch is not changed on *Patch Change Day* in the first wk of the cycle, apply new patch immediately upon remembering and use a nonhormonal method of contraception for next 7 days. If patch change is missed in for 1 or 2 days during Week 2 or 3, apply new patch immediately and apply next patch on usual *Patch Change Day*. No backup contraception is needed. If patch change is missed for more than 2 days during Week 2 or 3, stop the cycle and start a new 4-wk contraceptive cycle by applying new patch immediately and using a nonhormonal method of contraception for the next 7 days. If patch is not removed on *Patch Change Day* in Week 4, remove as soon as remembered and start next cycle on usual *Patch Change Day*. No additional contraception is needed.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **NuvaRing:** If a hormonal contraceptive was not used in the past month, insert *NuvaRing* between

Days 1 and 5 of the menstrual cycle (Day 1 = first day of menstrual period), even if bleeding has not finished. Use a nonhormonal method of birth control other than a diaphragm during the first 7 days of ring use. *If switching from a combination estrogen/progesterone oral contraceptive*, insert *NuvaRing* any time during first 7 days after last tablet and no later than the day a new pill cycle would have started. No extra birth control is needed. *If switching from a mini-pill*, start using *NuvaRing* on any day of the month; do not skip days between last pill and first day of *NuvaRing* use. *If switching from an implant*, start using *NuvaRing* on same day implant is removed. *If switching from an injectable contraceptive*, start using *NuvaRing* on the day when next injection is due. *If switching from a progestin-containing IUD*, start using *NuvaRing* on the same day as IUD is removed. A nonhormonal method of contraception, other than the diaphragm, should be used for the first 7 days of *NuvaRing* use when switching from the mini-pill, implant, injectable contraceptive, or IUD.

- *NuvaRing* comes in a reclosable foil pouch. Instruct patient to wash hands, then remove *NuvaRing* from pouch; keep pouch for ring disposal. Using a position of comfort (lying down, squatting, or standing with one leg up), hold *NuvaRing* between thumb and index finger and press opposite sides of the ring together. Gently push folded ring into vagina. Exact position is not important for function of *NuvaRing*. Most women do not feel *NuvaRing* once it is in place. If discomfort is felt, *NuvaRing* may not be inserted far enough into vagina; use finger to push further into vagina. *There is no danger of NuvaRing being pushed in too far or getting lost.* Once inserted, leave *NuvaRing* in place for 3 wk.
- Remove ring 3 wk after insertion on same day and time of insertion. Remove by hooking finger under forward rim or by holding ring between index and middle finger and pulling out. Place ring in foil pouch and dispose; do not throw in toilet. Menstrual period will usually start 2–3 days after ring is removed and may not have finished before next ring is inserted. To continue contraceptive protection, new ring must be inserted 1 wk after last one was removed, even if menstrual period has not stopped.
- If *NuvaRing* slips out of vagina and has been out less than 3 hr, contraceptive protection is still in place. *NuvaRing* can be rinsed in cool to tepid water and should be reinserted as soon as possible. If ring is lost, insert a new ring and continue same schedule as lost ring. If *NuvaRing* has been out of vagina for more than 3 hr, a nonhormonal method of contraception, other than a diaphragm, should be used for the next 7 days.

- *If NuvaRing has been left in for an extra wk or less (4 wk total or less)*, remove and insert a new ring after a 1-wk ring-free break. If *NuvaRing* has been left in place for more than 4 wk, woman should check to be sure she is not pregnant. A nonhormonal method of contraception, other than a diaphragm, must be used for the next 7 days.

- **Intrauterine system:** Advise patient to notify health care professional if pelvic pain or pain during sex, unusual vaginal discharge or genital sores, unexplained fever, exposure to sexually transmitted infections, very severe or migraine headaches, yellowing of skin or whites of the eyes, very severe vaginal bleeding or bleeding that lasts a long time occurs, if a menstrual period is missed, or if *Mirena's* threads cannot be felt.

Evaluation/Desired Outcomes

- Prevention of pregnancy.
- Regulation of the menstrual cycle.
- Decrease in menstrual blood loss.
- Decrease in acne.
- Decrease in symptoms of premenstrual dysphoric disorder.
- Decrease in vasomotor symptoms or symptoms of vulvar and vaginal atrophy due to menopause.

CORTICOSTEROIDS (INHALATION)

beclomethasone
(be-kloe-meth-a-sonē)
QVAR

budesonide (byoo-dess-oh-nide)
Pulmicort Respules, Pulmicort Flexhaler

flunisolide (floo-niss-oh-lide)
Aerospan HFA

fluticasone (floo-ti-ka-sonē)
Arnuity Ellipta, Flovent Diskus, Flovent HFA

mometasone (mo-met-a-sonē)
Asmanex HFA, Asmanex Twisthaler

Classification

Therapeutic: antiasthmatics, anti-inflammatories (steroidal)
Pharmacologic: corticosteroids (inhalation)

Indications

Maintenance treatment of asthma as prophylactic therapy. May decrease the need for or eliminate use of systemic corticosteroids in patients with asthma.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Action

Potent, locally acting anti-inflammatory and immune modifier. **Therapeutic Effects:** Decreased frequency and severity of asthma attacks. Improves asthma symptoms.

Pharmacokinetics

Absorption: *Beclomethasone*—20%; *budesonide*—6–13% (Flexhaler), 6% (Respules); *flunisolide*—40%; *fluticasone*—<7% (aerosol), 8–14% (powder); *mometasone*—<1%. Action is primarily local after inhalation.

Distribution: 10–25% is deposited in airways if a spacer device is not used. All cross the placenta and enter breast milk in small amounts.

Metabolism and Excretion: *Beclomethasone*—after inhalation, beclomethasone dipropionate is converted to beclomethasone monopropionate, an active metabolite that adds to its potency, primarily excreted in feces (<10% excreted in urine); *Budesonide*, *flunisolide*, *fluticasone*, *mometasone*—metabolized by the liver (primarily by CYP3A4) after absorption from lungs; *Budesonide*—60% excreted in urine, 40% in feces; *flunisolide*—50% excreted in urine, 50% in feces; *fluticasone*—primarily excreted in feces (<5% excreted in urine); *mometasone*—75% excreted in feces.

Half-life: *Beclomethasone*—2.8 hr; *budesonide*—2–3.6 hr; *flunisolide*—1.8 hr; *fluticasone*—7.8 hr (propionate); 24 hr (furoate); *mometasone*—5 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
Inhalation	within 24 hr [‡]	1–4 wk [†]	unknown

[†]Improvement in pulmonary function; [‡]airway responsiveness may take longer.

[‡]2–8 days for budesonide respule.

Contraindications/Precautions

Contraindicated in: Some products contain alcohol or lactose and should be avoided in patients with known hypersensitivity or intolerance; Acute attack of asthma/status asthmaticus.

Use Cautiously in: Active untreated infections; Diabetes or glaucoma; Underlying immunosuppression (due to disease or concurrent therapy); Systemic corticosteroid therapy (should not be abruptly discontinued when inhalation therapy is started; additional corticosteroids needed in stress or trauma); Hepatic dysfunction (*fluticasone*); **OB, Lactation:** Safety not established; **Pedi:** Prolonged or high-dose therapy may lead to complications.

Adverse Reactions/Side Effects

CNS: headache, agitation, depression, dizziness, fatigue, insomnia, restlessness. **EENT:** dysphonia, hoarseness, cataracts, glaucoma, nasal congestion, pharyngitis, sinusitis. **Resp:** bronchospasm, cough,

wheezing. **GI:** diarrhea, dry mouth, dyspepsia, esophageal candidiasis, taste disturbances, nausea. **Endo:** adrenal suppression (↑ dose, long-term therapy only), ↓ growth (children), ↓ bone mineral density. **MS:** back pain. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, LARYNGEAL EDEMA, URTICARIA, and BRONCHOSPASM, CHURG-STRAUSS SYNDROME.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including ritonavir, atazanavir, clarithromycin, conivaptan, indinavir, itraconazole, ketoconazole, lopinavir, nefazodone, nelfinavir, saquinavir, and voriconazole ↓ metabolism and ↑ levels of budesonide, mometasone, and fluticasone; concurrent use with fluticasone not recommended.

Route/Dosage**Beclomethasone**

Inhaln (Adults and Children ≥12 yr): *Previously on bronchodilators alone*—40–80 mcg twice daily (not to exceed 320 mcg twice daily); *Previously on inhaled corticosteroids*—40–160 mcg twice daily (not to exceed 320 mcg twice daily).

Inhaln (Children 5–11 yr): *Previously on bronchodilators alone*—40 mcg twice daily (not to exceed 80 mcg twice daily); *Previously on inhaled corticosteroids*—40 mcg twice daily (not to exceed 80 mcg twice daily).

Budesonide (Pulmicort Flexhaler)

Inhaln (Adults): 180–360 mcg twice daily (not to exceed 720 mcg twice daily).

Inhaln (Children ≥6 yr): 180–360 mcg twice daily (not to exceed 360 mcg twice daily).

Budesonide (Pulmicort Respules)

Inhaln (Children 1–8 yr): *Previously on bronchodilators alone*—0.5 mg once daily or 0.25 mg twice daily (not to exceed 0.5 mg/day); *Previously on other inhaled corticosteroids*—0.5 mg once daily or 0.25 mg twice daily (not to exceed 1 mg/day); *Previously on oral corticosteroids*—1 mg once daily or 0.5 mg twice daily (not to exceed 1 mg/day).

Flunisolide

Inhaln (Adults and Children ≥12 yr): 160 mcg (2 inhalations) twice daily (not to exceed 4 inhalations twice daily).

Inhaln (Children 6–11 yr): 80 mcg (1 inhalation) twice daily (not to exceed 2 inhalations twice daily).

Fluticasone (Aerosol Inhaler)

Inhaln (Adults and Children ≥12 yr): *Previously on bronchodilators alone*—88 mcg twice daily initially, may be ↑ up to 440 mcg twice daily; *Previously on other inhaled corticosteroids*—88–220 mcg twice daily initially, may be ↑ up to 440 mcg twice daily; *Previously on oral corticosteroids*—440 mcg twice daily initially, may be ↑ up to 880 mcg twice daily.

Inhale (Children 4–11 yr): 88 mcg twice daily (not to exceed 88 mcg twice daily).

Fluticasone (Dry Powder Inhaler)

Inhale (Adults and Children ≥12 yr): *Previously on bronchodilators alone*—Propionate: 100 mcg twice daily initially, may be ↑ up to 500 mcg twice daily; Furoate: 100 mcg once daily, may be ↑ up to 200 mcg once daily after 2 wk; *Previously on other inhaled corticosteroids*—Propionate: 100–250 mcg twice daily initially, may be ↑ up to 500 mcg twice daily; *Previously on oral corticosteroids*—Propionate: 500–1000 mcg twice daily.

Inhale (Children 4–11 yr): *Previously on bronchodilators alone*—50 mcg twice daily initially, may be ↑ up to 100 mcg twice daily; *Previously on other inhaled corticosteroids*—50 mcg twice daily, may be ↑ up to 100 mcg twice daily.

Mometasone (Aerosol Inhaler)

Inhale (Adults and Children ≥12 yr): *Previously on medium-dose inhaled corticosteroids*—Two 100–mcg inhalations twice daily; *Previously on high-dose inhaled corticosteroids or oral corticosteroids*—Two 200–mcg inhalations twice daily (not to exceed 800 mcg/day).

Mometasone (Dry Powder Inhaler)

Inhale (Adults and Children ≥12 yr): *Previously on bronchodilators or other inhaled corticosteroids*—220 mcg once daily in evening, up to 440 mcg/day as a single dose or 2 divided doses; *Previously on oral corticosteroids*—440 mcg twice daily (not to exceed 880 mcg/day).

Inhale (Children 4–11 yr): 110 mcg once daily in evening (not to exceed 110 mcg/day).

Availability

Beclomethasone

Inhalation aerosol: 40 mcg/metered inhalation in 8.7-g canister (delivers 120 metered inhalations), 80 mcg/metered inhalation in 8.7-g canister (delivers 120 metered inhalations). **Cost:** 40 mcg/metered inhalation \$130.16/inhale, 80 mcg/metered inhalation \$173.67/inhale.

Budesonide (generic available)

Inhalation powder (Flexhaler): 90 mcg/metered inhalation (delivers 60 metered inhalations), 180 mcg/metered inhalation (delivers 120 metered inhalations). **Cost:** 90 mcg/metered inhalation \$143.87/inhale, 180 mcg/metered inhalation \$192.65/inhale. **Inhalation suspension (Respules):** 0.25 mg/2 mL in single-dose ampules (5 ampules/envelope), 0.5 mg/2 mL in single-dose ampules (5 ampules/envelope), 1 mg/2 mL in single-dose ampules (5 ampules/envelope). **In combination with:** formoterol (Symbicort). See Appendix B.

Flunisolide

Inhalation aerosol: 80 mcg/metered inhalation in 5.1-g canisters (delivers 60 metered inhalations) or 8.9-g canisters (delivers 120 metered inhalations).

Fluticasone

Inhalation aerosol (propionate) (Flovent-HFA): 44 mcg/metered inhalation in 10.6-g canisters (delivers 120 metered inhalations), 110 mcg/metered inhalation in 12-g canisters (delivers 120 metered inhalations), 220 mcg/metered inhalation in 12-g canisters (delivers 120 metered inhalations). **Cost:** 44 mcg/inhalation \$137.82/inhale, 110 mcg/inhalation \$181.43/inhale, 220 mcg/inhalation \$278.14/inhale. **Powder for inhalation (propionate) (Flovent Diskus):** 50 mcg/blister, 100 mcg/blister, 250 mcg/blister. **Cost:** 50 mcg \$144.47/60 blisters, 250 mcg \$134.71/28 blisters. **Powder for inhalation (furoate) (Arnuity El-lipta):** 100 mcg/blister, 200 mcg/blister. **In combination with:** salmeterol (Advair), vilanterol (Breo El-lipta). See Appendix B.

Mometasone

Inhalation aerosol (Asmanex HFA): 100 mcg/metered inhalation in 13-g canisters (120 metered inhalations), 200 mcg/metered inhalation in 13-g canisters (120 metered inhalations). **Powder for inhalation (Asmanex Twisthaler):** 110 mcg (delivers 100 mcg/metered inhalation; in packages of 7 and 30 inhalation units), 220 mcg (delivers 200 mcg/metered inhalation; in packages of 14, 30, 60, and 120 inhalation units). **Cost:** 110 mcg \$88.75/7 inhalation units, 110 mcg \$157.90/30 inhalation units, 220 mcg \$88.75/14 inhalation units, 220 mcg \$170.47/30 inhalation units, 220 mcg \$200.32/60 inhalation units, 220 mcg \$287.09/120 inhalation units.

NURSING IMPLICATIONS

Assessment

- Monitor respiratory status and lung sounds. Assess pulmonary function tests periodically during and for several mo after a transfer from systemic to inhaled corticosteroids.
- Assess patients changing from systemic corticosteroids to inhaled corticosteroids for signs of adrenal insufficiency (anorexia, nausea, weakness, fatigue, hypotension, hypoglycemia) during initial therapy and periods of stress. If these signs appear, notify health care professional immediately; condition may be life-threatening.
- Monitor for withdrawal symptoms (joint or muscular pain, lassitude, depression) during withdrawal from oral corticosteroids.
- Monitor growth rate in children receiving chronic therapy; use lowest possible dose.
- May cause decreased bone mineral density during prolonged therapy. Monitor patients with increased

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; underline indicate most frequent.

risk (prolonged immobilization, family history of osteoporosis, postmenopausal status, tobacco use, advanced age, poor nutrition, chronic use of drugs that can reduce bone mass [anticonvulsants, oral corticosteroids]) for fractures.

- **Monitor for signs and symptoms of hypersensitivity reactions** (rash, pruritis, swelling of face and neck, dyspnea) periodically during therapy.
- **Lab Test Considerations:** Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in chronic therapy. Children and patients using higher than recommended doses are at highest risk for HPA suppression.
- May cause ↑ serum and urine glucose concentrations if significant absorption occurs.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Risk for infection (Side Effects)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Do not confuse Flovent with Flonase.**
- After desired clinical effect has been obtained, attempts should be made to decrease dose to lowest amount required to control symptoms. Gradually decrease dose every 2–4 wk as long as desired effect is maintained. If symptoms return, dose may briefly return to starting dose.
- **Inhale:** Allow at least 1 min between inhalations.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Instruct patient to read the *Patient Information and Instructions for Use* before using and with each Rx refill, in case of new information. Advise patient not to discontinue medication without consulting health care professional; gradual decrease is required.
- Advise patients using inhalation corticosteroids and bronchodilator to use bronchodilator first and to allow 5 min to elapse before administering the corticosteroid, unless otherwise directed by health care professional.
- Advise patient that inhalation corticosteroids should not be used to treat an acute asthma attack but should be continued even if other inhalation agents are used.
- Patients using inhalation corticosteroids to control asthma may require systemic corticosteroids for acute attacks. Advise patient to use regular peak flow monitoring to determine respiratory status.
- Caution patient to avoid smoking, known allergens, and other respiratory irritants.
- Advise patient to notify health care professional if sore throat or sore mouth occurs.

- **Advise patient to stop using medication and notify health care professional immediately if signs and symptoms of hypersensitivity reactions occur.**
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient whose systemic corticosteroids have been recently reduced or withdrawn to carry a warning card indicating the need for supplemental systemic corticosteroids in the event of stress or severe asthma attack unresponsive to bronchodilators.
- **Metered-Dose Inhaler:** Instruct patient in proper use of metered-dose inhaler. Most inhalers require priming before first use. Shake inhaler well. Exhale completely, and then close lips firmly around mouthpiece. While breathing in deeply and slowly, press down on canister. Hold breath for as long as possible to ensure deep instillation of medication. Remove inhaler from mouth and breathe out gently. Allow 1–2 min between inhalations. Rinse mouth with water or mouthwash after each use to minimize fungal infections, dry mouth, and hoarseness. Clean mouthpiece weekly with clean, dry tissue or cloth. Do not place in water (see Appendix D).
- **Pulmicort Flexhaler:** Advise patient to follow instructions supplied. Before first-time use, prime unit by turning cover and lifting off; hold upright with mouthpiece up and twist brown grip fully to right, then fully to left until it clicks. To administer dose, hold upright, twist brown grip fully to right, then fully to left until it clicks. Turn head away from inhaler and exhale (do not blow into inhaler). Do not shake inhaler. Place mouthpiece between lips and inhale deeply and forcefully. Remove inhaler from mouth and exhale (do not exhale into mouthpiece). Repeat procedure if 2nd dose required. Replace cover; rinse mouth with water (do not swallow).
- **Pulmicort Respules:** Administer with a jet nebulizer connected to adequate air flow, equipped with a mouthpiece or face mask. Adjust face mask to avoid exposing eyes to nebulized medication. Wash face after use of face mask. Ultrasonic nebulizers are not adequate for administration and not recommended. Store respules upright, away from heat and protected from light. Do not refrigerate or freeze. Respules are stable for 2 wk at room temperature after opening aluminum foil envelope. Open respules must be used promptly. Unused respules should be returned to aluminum foil envelope.
- **Flovent Diskus/Arnuity Ellipta:** Do not use with a spacer. Exhale completely and then close lips firmly around mouthpiece. While breathing in deeply and slowly, press down on canister. Hold breath for as long as possible to ensure deep instillation of medication. Remove inhaler from mouth and breathe out gently. Allow 1–2 min between inhalations. After inhalation, rinse mouth with water and spit out (see Appendix D). Never wash the mouthpiece or any

part of the Diskus inhaler. Discard Diskus inhaler device (Flovent Diskus) 6 wks (50-mcg strength) or 2 mo (100-mcg and 250-mcg strengths) or blister tray (Arnuity Ellipta) 6 wks after removal from protective foil overwrap pouch or after all blisters have been used (whichever comes first).

- **Asmanex Twisthaler:** Advise patient to remove cap while device is in upright position. To administer dose, exhale fully, then place mouthpiece between lips and inhale deeply and forcefully. Remove device from mouth and hold breath for 10 sec before exhaling (do not exhale into mouthpiece). Wipe the mouthpiece dry, if necessary, and replace the cap on the device. Rinse mouth with water. Advise patient to discard twisthaler 45 days from opening or when dose counter reads "00", whichever comes first.

Evaluation/Desired Outcomes

- Management of the symptoms of chronic asthma.
- Improvement in symptoms of asthma.

CORTICOSTEROIDS (NASAL)

beclomethasone

(be-kloe-meth-a-son)

Beconase AQ, QNASL, ★ Rivanase AQ

budesonide (byoo-dess-oh-nide)

Rhinocort Allergy, Rhinocort Aqua

ciclesonide (sy-eh-kles-oh-nide)

★ Drymira, Omnaris, Zetonna

flunisolide (floo-niss-oh-lide)

Nasalide, ★ Rhinalar

fluticasone (floo-ti-ka-son)

★ Avamys, Flonase Allergy Relief, Flonase Sensimist

mometasone (moe-met-a-son)

Nasonex

triamcinolone

(trye-am-sin-oh-lone)

Nasacort Allergy 24 HR

Classification

Therapeutic: anti-inflammatories (steroidal)
Pharmacologic: corticosteroids (nasal)

Indications

Seasonal or perennial allergic rhinitis. Nonallergic rhinitis (fluticasone). Treatment of nasal polyps.

Action

Potent, locally acting anti-inflammatory and immune modifier. **Therapeutic Effects:** ↓ in symptoms of allergic or nonallergic rhinitis. ↓ in symptoms of nasal polyps.

Pharmacokinetics

Absorption: *Beclomethasone*—27–44% absorbed; *budesonide*—34% absorbed; *flunisolide*—50% absorbed; *ciclesonide*, *fluticasone*, *mometasone*—negligible absorption. Action of all agents is primarily local following nasal use.

Distribution: All agents cross the placenta and enter breast milk in small amounts.

Metabolism and Excretion: Following absorption from nasal mucosa, corticosteroids are rapidly and extensively metabolized by the liver.

Half-life: *Beclomethasone*—2.7 hr; *budesonide*—2–3 hr; *ciclesonide*—unknown; *flunisolide*—1–2 hr; *fluticasone*—7.8 hr; *mometasone*—5.8 hr; *triamcinolone*—3–5.4 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
Beclomethasone	1–3 days	up to 2 wk	unknown
Budesonide	1–2 days	2 wk	unknown
Ciclesonide	1–2 days	2–5 wk	unknown
Flunisolide	few days	up to 3 wk	unknown
Fluticasone	few days	unknown	unknown
Mometasone	within 2 days	1–2 wk	unknown
Triamcinolone	few days	3–4 days	unknown

Contraindications/Precautions

Contraindicated in: Some products contain alcohol, propylene, or polyethylene glycol and should be avoided in patients with known hypersensitivity or intolerance.

Use Cautiously in: Active untreated infections; Diabetes or glaucoma; Underlying immunosuppression (due to disease or concurrent therapy); Systemic corticosteroid therapy (should not be abruptly discontinued when intranasal therapy is started); History of ↑ intraocular pressure, glaucoma, or cataracts; Recent nasal trauma, septal ulcers, or surgery (wound healing may be impaired by nasal corticosteroids); **OB, Lactation, Pedi:** Pregnancy, lactation, or children <12 yr (beclomethasone [QNASL]), <6 yr (beclomethasone [Beconase AQ], budesonide, ciclesonide, flunisolide) <4 yr (fluticasone [Flonase Allergy Relief]) or <2 yr (fluticasone [Flonase Sensimist], mometasone, triamcinolone) (safety not established; prolonged or high-dose therapy may lead to complications).

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** epistaxis, nasal burning, nasal congestion, nasal irritation, nasal perforation, nasal ulceration, pharyngitis, rhinorrhea, sneezing, tearing eyes. **GI:** dry mouth, esophageal candidiasis, nausea, vomiting. **Derm:** rash (fluticasone), urticaria (fluticasone). **Endo:** adrenal suppression (high-dose, long-term therapy only), growth suppression (children). **Resp:** bronchospasm, cough. **Misc:** ANAPHYLAXIS, ANGIOEDEMA.

Interactions

Drug-Drug: Ketoconazole ↑ effects of budesonide, ciclesonide, and fluticasone. **Ritonavir** ↑ effects of fluticasone (avoid concurrent use).

Route/Dosage

Beclomethasone

Intranasal (Adults and Children ≥12 yr): *Beconase AQ*—1–2 sprays in each nostril twice daily (not to exceed 2 metered sprays in each nostril twice daily); *QNASL*—2 sprays in each nostril once daily.

Intranasal (Children 6–12 yr): 1–2 sprays in each nostril twice daily; once adequate control achieved, ↓ dose to 1 spray in each nostril twice daily.

Budesonide

Intranasal (Adults and Children ≥12 yr): 1 spray in each nostril once daily (not to exceed 4 sprays in each nostril once daily). For OTC use, administer 2 sprays in each nostril once daily; once symptoms improve, ↓ to 1 spray in each nostril once daily.

Intranasal (Children 6–11 yr): 1 spray in each nostril once daily (not to exceed 2 sprays in each nostril once daily).

Ciclesonide

Intranasal (Adults and Children ≥12 yr): *Omnaris* (for perennial allergic rhinitis only)—2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril/day); *Zetonna*—1 spray in each nostril once daily (not to exceed 1 spray in each nostril/day).

Intranasal (Adults and Children ≥6 yr): *Ommaris* (for seasonal allergic rhinitis only)—2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril/day).

Flunisolide

Intranasal (Adults and Children >14 yr): 2 sprays in each nostril twice daily, may be ↑ to 2 sprays in each nostril 3 times daily if greater effect needed after 4–7 days (not to exceed 8 sprays in each nostril/day).

Intranasal (Children 6–14 yr): 1 spray in each nostril 3 times daily or 2 sprays in each nostril twice daily (not to exceed 4 sprays in each nostril/day).

Fluticasone

Intranasal (Adults): *Fluticasone Rx*—2 sprays in each nostril once daily or 1 spray in each nostril twice daily (not to exceed 2 sprays in each nostril/day); after several days, attempt to ↓ dose to 1 spray in each nostril once daily.

Intranasal (Adults and Children ≥12 yr): *Flonase Sensimist (OTC)* and *Flonase Allergy Relief (OTC)*—2 sprays in each nostril once daily; after 1 wk, may adjust to 1–2 sprays in each nostril once daily; discuss with health care professional if need to continue longer than 6 mo.

Intranasal (Children 4–11 yr): *Flonase Allergy Relief (OTC)*—1 spray in each nostril once daily; discuss with health care professional if need to continue longer than 2 mo.

Intranasal (Children ≥4 yr): *Fluticasone Rx*—1 spray in each nostril once daily; may ↑ to 2 sprays in each nostril once daily if no response; once symptoms controlled, attempt to ↓ dose to 1 spray in each nostril once daily.

Intranasal (Children 2–11 yrs): *Flonase Sensimist (OTC)*—1 spray in each nostril once daily; discuss with health care professional if need to continue longer than 2 mo.

Mometasone

Intranasal (Adults and Children >12 yr): *Treatment of seasonal and perennial allergic rhinitis*—2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril once daily).

Intranasal (Adults): *Nasal polyps*—2 sprays in each nostril twice daily (not to exceed 2 sprays in each nostril twice daily).

Intranasal (Children 2–11 yr): *Treatment of seasonal and perennial allergic rhinitis*—1 spray in each nostril once daily.

Triamcinolone

Intranasal (Adults and Children ≥12 yr): 2 sprays in each nostril once daily.

Intranasal (Children 6–11 yr): 1 spray in each nostril once daily (not to exceed 2 sprays in each nostril/day).

Intranasal (Children 2–5 yr): 1 spray in each nostril once daily.

Availability

Beclomethasone

Nasal spray (Beconase AQ): 42 mcg/metered spray in 25-g bottles (delivers 180 metered sprays). **Cost:** \$173.37/bottle. **Nasal spray (QNASL):** 80 mcg/metered spray in 8.7-g bottles (delivers 120 metered sprays). **Cost:** \$139.94/bottle. **Nasal spray (Rivonase AQ):** ★ 50 mcg/metered spray in 25-g bottles (delivers 200 metered sprays).

Budesonide (generic available)

Nasal spray: 32 mcg/metered spray in 8.6-g canister (delivers 120 metered sprays), 5-mL bottle (delivers 60 metered sprays)^{OTC}, and 8.43-mL bottle (delivers 120 metered sprays)^{OTC}. **Cost:** \$153.97/bottle.

Ciclesonide

Nasal spray (Omnaris): 50 mcg/metered spray in 12.5-g bottle (delivers 120 metered sprays). **Cost:** \$152.07/bottle. **Nasal spray (Zetonna):** 37 mcg/ac-tuation in 6.1-g bottle (delivers 60 metered sprays). **Cost:** \$159.43/bottle.

Flunisolide (generic available)

Nasal solution: 25 mcg/metered spray in 25-mL bot-tle (delivers 200 metered sprays). **Cost:** *Generic*—\$44.56/bottle.

Fluticasone (generic available)

Nasal spray: 50 mcg/metered spray in 16-g bottle (delivers 120 metered sprays). **Cost:** *Generic*—\$19.52/bottle. **Nasal spray (Flonase Allergy Re-lief):** 50 mcg/metered spray in 9.9-mL bottle (deliv-ers 60 metered sprays)^{OTC}. **Nasal spray (Flonase Sensimist):** 27.5 mcg/spray in 9.9 mL bottle (delivers 60 metered sprays). **In combination with:** azelas-tine (Dymista); see Appendix B.

Mometasone (generic available)

Nasal spray (scent-free): 50 mcg/metered spray in 17-g bottle (delivers 120 metered sprays). **Cost:** \$162.27/bottle.

Triamcinolone (generic available)

Nasal spray: 55 mcg/metered spray in 16.5-g bottle (120 metered sprays)^{OTC}. **Cost:** *Generic*—\$86.05/ bottle.

NURSING IMPLICATIONS**Assessment**

- Monitor degree of nasal stuffiness, amount and color of nasal discharge, and frequency of sneezing.
- Patients on long-term therapy should have periodic otolaryngologic examinations to monitor nasal mu-cosa and passages for infection or ulceration.
- Monitor growth rate in children receiving chronic therapy; use lowest possible dose.
- **Lab Test Considerations:** Periodic adrenal func-tion tests may be ordered to assess degree of hypo-thalamic-pituitary-adrenal (HPA) axis suppression in chronic therapy. Children and patients using higher than recommended doses are at highest risk for HPA suppression.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Risk for infection (Side Effects)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Do not confuse Flonase with Flovent.**
- After desired clinical effect has been obtained, at-tempt to decrease dose to lowest amount. Gradually decrease dose every 2–4 wk as long as desired ef-fect is maintained. If symptoms return, dose may briefly return to starting dose.
- **Intranasal:** Patients also using a nasal decongestant should be given decongestant 5–15 min before cor-ticosteroid nasal spray. If patient is unable to breathe freely through nasal passages, instruct pa-tient to blow nose gently in advance of medication administration.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose.
- Caution patient not to exceed maximal daily dose of nasal spray.
- Instruct patient in correct technique for adminis-tering nasal spray (see Appendix D). Most nasal sprays include directions with pictures. Instruct patient to read patient information sheet prior to use. Most na-sal sprays require priming prior to first use or use after 7 days. Shake well before use. Warn patient that temporary nasal stinging may occur.
- Instruct patient to gently blow nose to clear nostrils prior to administering dose.
- **Instruct patient to stop medication and notify health care professional immediately if signs of anaphylaxis (rash, hives, difficulty breathing, swollen lips or throat) or if changes in vision occur.**
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-ucts being taken and consult health care profes-sional before taking other Rx, OTC, or herbal prod-ucts.
- Advise female patients to notify health care profes-sional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to notify health care professional if symptoms do not improve within 1 mo, if symptoms worsen, or if sneezing or nasal irritation occurs.

Evaluation/Desired Outcomes

- Resolution of nasal stuffiness, discharge, and sneez-ing in seasonal or perennial allergic rhinitis or non-allergic rhinitis.
- Reduction in symptoms of nasal polyps.

Decadron, ✳️ Dexasone

Classification

Therapeutic: antiasthmatics, corticosteroids

Pharmacologic: corticosteroids (systemic)

Indications

Cortisone, hydrocortisone: Management of adrenocortical insufficiency. **Betamethasone, dexamethasone, hydrocortisone, prednisolone, prednisone, methylprednisolone, triamcinolone:** Used systemically and locally in a wide variety of chronic diseases including: Inflammatory, Allergic, Hematologic, Neoplastic, Autoimmune disorders. **Methylprednisolone, prednisone:** With other immunosuppressants in the prevention of organ rejection in transplantation surgery. Asthma. **Dexamethasone:** Management of cerebral edema: Diagnostic agent in adrenal disorders. **Bu-**

desonide (Entocort EC): Treatment of mild to moderate Crohn's disease involving ileum and/or ascending colon. **Budesonide (Entocort EC):** Maintenance of clinical remission for up to 3 mo of mild to moderate Crohn's disease involving ileum and/or ascending colon. **Budesonide (Uceris):** Induction of remission of active, mild to moderate ulcerative colitis.

Unlabeled Use: Short-term administration to high-risk mothers before delivery to prevent respiratory distress syndrome in the newborn (betamethasone, dexamethasone). Adjunctive therapy of hypercalcemia (prednisone, prednisolone, methylprednisolone). Management of acute spinal cord injury (methylprednisolone). Adjunctive management of nausea and vomiting from chemotherapy (dexamethasone, prednisone, prednisolone, methylprednisolone). Management of croup (dexamethasone). Treatment of airway edema prior to extubation (dexamethasone). Facilitation of ventilator weaning in neonates with bronchopulmonary dysplasia (dexamethasone).

Action

In pharmacologic doses, all agents suppress inflammation and the normal immune response. All agents have numerous intense metabolic effects (see Adverse Reactions/Side Effects). Suppress adrenal function at chronic doses of *betamethasone*—0.6 mg/day; *cortisone, hydrocortisone*—20 mg/day; *dexamethasone*—0.75 mg/day; *methylprednisolone, triamcinolone*—4 mg/day; *prednisone/prednisolone*—5 mg/day. **Cortisone, hydrocortisone:** Replace endogenous cortisol in deficiency states. **Cortisone, hydrocortisone:** Have potent mineralocorticoid (sodium-retaining) activity. **Prednisolone, prednisone:** Have minimal mineralocorticoid activity. **Betamethasone, dexamethasone, methylprednisolone, triamcinolone:** Have negligible mineralocorticoid activity. **Budesonide:** Local anti-inflammatory activity in the lumen of the GI tract. **Therapeutic Effects:** Suppression of inflammation and modification of the normal immune response. Replacement therapy in adrenal insufficiency. **Budesonide:** Improvement in symptoms/sequelae of Crohn's disease and induction of remission of ulcerative colitis.

Pharmacokinetics

Absorption: Well absorbed after oral administration (except budesonide). Sodium phosphate and sodium succinate salts are rapidly absorbed after IM administration. Acetate and acetonide salts are slowly but completely absorbed after IM administration. Absorption from local sites (intra-articular, intralesional) is slow but complete. Bioavailability of budesonide is 9–21%.

Distribution: All are widely distributed, cross the placenta, and probably enter breast milk.

Metabolism and Excretion: All are metabolized mostly by the liver to inactive metabolites. *Cortisone* is converted by the liver to hydrocortisone. *Prednisone* is converted by the liver to prednisolone, which is then metabolized by the liver.

Half-life: *Betamethasone*—3–5 hr (plasma), 36–54 hr (tissue). *Budesonide*—2.0–3.6 hr. *Cortisone*—0.5 hr (plasma), 8–12 hr (tissue). *Dexamethasone*—3–4.5 hr (plasma), 36–54 hr (tissue). *Hydrocortisone*—1.5–2 hr (plasma), 8–12 hr (tissue). *Methylprednisolone*—>3.5 hr (plasma), 18–36 hr (tissue). *Prednisolone*—2.1–3.5 hr (plasma), 18–36 hr (tissue). *Prednisone*—3.4–3.8 hr (plasma), 18–36 hr (tissue). *Triamcinolone*—2–5 hr (plasma), 18–36 hr (tissue).

TIME/ACTION PROFILE (anti-inflammatory activity)

ROUTE	ONSET	PEAK	DURATION
Betamethasone IM (acetate/sodium phosphate)	1–3 hr	unknown	1 wk
Budesonide PO	unknown	unknown	unknown
Cortisone PO	rapid	2 hr	1.25–1.5 days
Dexamethasone PO	unknown	1–3 hr	2.75 days
Dexamethasone IM, IV (sodium phosphate)	rapid	unknown	2.75 days
Hydrocortisone PO	unknown	1–2 hr	1.25–1.5 days
Hydrocortisone IM (sodium succinate)	rapid	1 hr	variable
Hydrocortisone IV (sodium succinate)	rapid	unknown	unknown
Methylprednisolone PO	unknown	1–2 hr	1.25–1.5 days
Methylprednisolone IM (acetate)	6–48 hr	4–8 days	1–4 wk
Methylprednisolone IM, IV (sodium succinate)	rapid	unknown	unknown
Prednisolone PO	unknown	1–2 hr	1.25–1.5 days
Prednisone PO	unknown	1–2 hr	1.25–1.5 days
Triamcinolone IM (acetonide)	24–48 hr	unknown	1–6 wk
Triamcinolone Intralesional (hexacetonide)	slow	unknown	4 days–4 wk

Contraindications/Precautions

Contraindicated in: Active untreated infections (may be used in patients being treated for some forms of meningitis); **Lactation:** Avoid chronic use; Known alcohol, bisulfite, or tartrazine hypersensitivity or intoler-

ance (some products contain these and should be avoided in susceptible patients); Administration of live virus vaccines.

Use Cautiously in: Chronic treatment (will lead to adrenal suppression; use lowest possible dose for shortest period of time); Hypothyroidism; Immunosuppression; Cirrhosis; Stress (surgery, infections); sup-plemental doses may be needed; Potential infections may mask signs (fever, inflammation); Traumatic brain injury (high doses may be associated with ↑ mortality); **OB:** Safety not established; **Pedi:** Children (chronic use will result in ↓ growth; use lowest possible dose for shortest period of time); **Pedi:** Neonates (avoid use of benzyl alcohol containing injectable preparations; use preservative-free formulations).

Adverse Reactions/Side Effects

Adverse reactions/side effects are much more common with high-dose/long-term therapy.

CNS: depression, euphoria, headache, ↑ intracranial pressure (children only), personality changes, psychoses, restlessness. **EENT:** cataracts, ↑ intraocular pressure. **CV:** hypertension. **GI:** PEPTIC ULCERATION, anorexia, nausea, vomiting. **Derm:** acne, ↓ wound healing, ecchymoses, fragility, hirsutism, petechiae.

Endo: PHEOCHROMOCYTOMA, adrenal suppression, hyperglycemia. **F and E:** fluid retention (long-term high doses), hypokalemia, hypokalemic alkalosis. **Hemat:** THROMBOEMBOLISM, leukocytosis, thrombophlebitis.

Metab: weight gain. **MS:** muscle wasting, osteoporosis, avascular necrosis of joints, muscle pain. **Misc:** cushingoid appearance (moon face, buffalo hump), ↑ susceptibility to infection.

Interactions

Drug-Drug: ↑ risk of hypokalemia with thiazide and loop diuretics, or amphotericin B. Hypokalemia may ↑ risk of digoxin toxicity. May increase requirement for insulin or oral hypoglycemic agents. **Phenytoin, phenobarbital, and rifampin** ↑ metabolism; may ↓ effectiveness. **Hormonal contraceptives** may ↓ metabolism. ↑ risk of adverse GI effects with **NSAIDs** (including aspirin). At chronic doses that suppress adrenal function, may ↓ antibody response to and ↑ risk of adverse reactions from live-virus vaccines. May ↑ serum concentrations of cyclosporine and tacrolimus. May ↑ risk of tendon rupture from fluoroquinolones. **Antacids** ↓ absorption of prednisone and dexamethasone. Known inhibitors of the CYP3A4 enzyme including ketoconazole, itraconazole, ritonavir, indinavir, saquinavir, and erythromycin may ↑ blood levels and effects of budesonide (↓ dose may be necessary). May ↓ isoniazid levels and effectiveness. May antagonize the effects of anticholinergic agents in myasthenia gravis.

Drug-Food: Grapefruit juice ↑ serum levels and effects of budesonide (avoid concurrent use).

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage**Betamethasone**

IM (Adults): 0.5–9 mg as betamethasone sodium phosphate/acetate suspension. *Prevention of respiratory distress syndrome in newborn*—12 mg daily for 2–3 days before delivery (unlabeled).

IM (Children): *Adrenocortical insufficiency*—17.5 mcg/kg/day (500 mcg/m²/day) in 3 divided doses every 3rd day or 5.8–8.75 mcg/kg (166–250 mcg/m²/day) as a single dose.

Budesonide

PO (Adults): *Active Crohn's disease (Entocort EC)*—9 mg once daily in the morning for ≤8 wk; may repeat 8-wk course for recurring episodes. *Maintenance of remission of Crohn's disease (Entocort EC)*—6 mg once daily for up to 3 mo; once symptoms are controlled, taper to complete cessation; *Induction of remission of ulcerative colitis (Uceris)*—9 mg once daily for up to 8 wk; once symptoms are controlled, taper to complete cessation.

PO (Children 8–17 yr and >25 kg): *Active Crohn's disease (Entocort EC)*—9 mg once daily in the morning for up to 8 wk, then 6 mg once daily in the morning for 2 wk.

Hepatic Impairment

(Adults): *Moderate hepatic impairment (Child-Pugh Class B)*—3 mg once daily in the morning.

Cortisone

PO (Adults): 25–300 mg/day in divided doses q 12–24 hr.

PO (Children): *Adrenocortical insufficiency*—0.7 mg/kg/day (20–25 mg/m²/day) in divided doses q 8 hr. *Other uses*—2.5–10 mg/kg/day (75–300 mg/m²/day) in divided doses q 6–8 hr.

Dexamethasone

PO, IM, IV (Adults): *Anti-inflammatory*—0.75–9 mg daily in divided doses q 6–12 hr. *Airway edema or extubation*—0.5–2 mg/kg/day divided q 6 hr; begin 24 hr prior to extubation and continue for 24 hr post-extubation. *Cerebral edema*—10 mg IV, then 4 mg IM or IV q 6 hr until maximal response achieved, then switch to PO regimen and taper over 5–7 days.

PO, IM, IV (Children): *Airway edema or extubation*—0.5–2 mg/kg/day divided q 6 hr; begin 24 hr prior to extubation and continue for 24 hr post-extubation. *Anti-inflammatory*—0.08–0.3 mg/kg/day or 2.5–10 mg/m²/day divided q 6–12 hr. *Physiologic replacement*—0.03–0.15 mg/kg/day or 0.6–0.75 mg/m²/day divided q 6–12 hr.

PO (Adults): *Suppression test*—1 mg at 11PM or 0.5 mg q 6 hr for 48 hr.

IV (Children): *Chemotherapy-induced emesis*—5–20 mg given 15–30 min before treatment; *Cerebral edema*—Loading dose 1–2 mg/kg followed by 1–1.5 mg/kg/day divided q 4–6 hr for 5 days (not to exceed

16 mg/day); then taper over 1–6 wk; *Bacterial meningitis*—0.6 mg/kg/day divided q 6 hr for 4 days (start at time of first antibiotic dose).

IV, PO (Adults): *Chemotherapy-induced emesis*—10–20 mg given 15–30 min before each treatment or 10 mg q 12 hr on each treatment day; *Delayed nausea/vomiting*—4–10 mg PO 1–2 times/day for 2–4 days or 8 mg PO q 12 hr for 2 days, then 4 mg PO q 12 hr for 2 days or 20 mg PO 1 hr before chemotherapy, then 10 mg PO q 12 hr after chemotherapy, then 8 mg PO q 12 hr for 2 days, then 4 mg PO q 12 hr for 2 days.

IS (Adults): 0.4–6 mg/day.

Hydrocortisone

PO (Adults): 20–240 mg/day in 1–4 divided doses.

PO (Children): *Adrenocortical insufficiency*—0.56 mg/kg/day (15–20 mg/m²/day) as a single dose or in divided doses. *Other uses*—2–8 mg/kg/day (60–240 mg/m²/day) as a single dose or in divided doses.

IM, IV (Adults): 100–500 mg q 2–6 hr (range 100–8000 mg/day).

IM, IV (Children): *Adrenocortical insufficiency*—0.186–0.28 mg/kg/day (10–12 mg/m²/day) in 3 divided doses. *Other uses*—0.666–4 mg/kg (20–120 mg/m²) q 12–24 hr.

Rect (Adults): *Retention enema*—100 mg nightly for 21 days or until remission occurs.

Methylprednisolone

PO (Adults): *Multiple sclerosis*—160 mg/day for 7 days, then 64 mg every other day for 1 mo. *Other uses*—2–60 mg/day as a single dose or in 2–4 divided doses. *Asthma exacerbations*—120–180 mg/day in divided doses 3–4 times/day for 48 hr, then 60–80 mg/day in 2 divided doses.

PO (Children): *Anti-inflammatory/Immunosuppressive*—0.5–1.7 mg/kg/day (5–25 mg/m²/day) in divided doses q 6–12 hr. *Asthma exacerbations*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum: 60 mg/day) divided twice daily.

IM, IV (Adults): *Most uses: methylprednisolone sodium succinate*—40–250 mg q 4–6 hr. *High-dose "pulse" therapy: methylprednisolone sodium succinate*—30 mg/kg IV q 4–6 hr for up to 72 hr. *Status asthmaticus: methylprednisolone sodium succinate*—2 mg/kg IV, then 0.5–1 mg/kg IV q 6 hr for up to 5 days. *Multiple sclerosis: methylprednisolone sodium succinate*—160 mg/day for 7 days, then 64 mg every other day for 1 mo. *Adjunctive therapy of Pneumocystis jirovecii pneumonia in AIDS patients: methylprednisolone sodium succinate*—30 mg twice daily for 5 days, then 30 mg once daily for 5 days, then 15 mg once daily for 10 days. *Acute spinal cord injury: methylprednisolone sodium succinate*—30 mg/kg IV over 15 min initially, followed in 45 min with a continuous infusion of 5.4 mg/kg/hr for 23 hr (unlabeled).

IM, IV (Children): *Anti-inflammatory/Immunosuppressive*—0.5–1.7 mg/kg/day (5–25 mg/m²/day) in divided doses q 6–12 hr. *Acute spinal cord injury:*

methylprednisolone sodium succinate—30 mg/kg IV over 15 min initially, followed in 45 min with a continuous infusion of 5.4 mg/kg/hr for 23 hr (unlabeled). *Status asthmaticus*—2 mg/kg IV, then 0.5–1 mg/kg IV q 6 hr. *Lupus nephritis*—30 mg/kg IV every other day for 6 doses.

IM (Adults): *Methylprednisolone acetate*—40–120 mg daily, weekly, or every 2 wk.

Prednisolone

PO (Adults): *Most uses*—5–60 mg/day as a single dose or in divided doses. *Multiple sclerosis*—200 mg/day for 7 days, then 80 mg every other day for 1 mo. *Asthma exacerbations*—120–180 mg/day in divided doses 3–4 times/day for 48 hr, then 60–80 mg/day in 2 divided doses.

PO (Children): *Anti-inflammatory/Immunosuppressive*—0.1–2 mg/kg/day in 1–4 divided doses; *Nephrotic syndrome*—2 mg/kg/day (60 mg/m²/day) in 1–3 divided doses daily (maximum dose: 80 mg/day) until urine is protein-free for 4–6 wk, followed by 2 mg/kg/dose (40 mg/m²/dose) every other day in the morning; gradually taper off over 4–6 wk; *Asthma exacerbations*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum: 60 mg/day) divided twice daily.

Prednisone

PO (Adults): *Most uses*—5–60 mg/day as a single dose or in divided doses. *Multiple sclerosis*—200 mg/day for 1 wk, then 80 mg every other day for 1 mo. *Adjunctive therapy of P. jirovecii pneumonia in AIDS patients*—40 mg twice daily for 5 days, then 40 mg once daily for 5 days, then 20 mg once daily for 10 days.

PO (Children): *Nephrotic syndrome*—2 mg/kg/day initially given in 1–3 divided doses (maximum 80 mg/day) until urine is protein-free for 4–6 wk. Maintenance dose of 2 mg/kg/day every other day in the morning, gradually taper off after 4–6 wk. *Asthma exacerbation*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum 60 mg/day) in divided doses twice daily.

Triamcinolone

IM (Adults): *Triamcinolone acetonide*—40–80 mg q 4 wk.

Intra-articular (Adults): *Triamcinolone hexacetonide*—2–20 mg q 3–4 wk (dose depends on size of joint to be injected, amount of inflammation, and amount of fluid present).

IM (Children): *Triamcinolone acetonide*—40 mg q 4 wk or 30–200 mcg/kg (1–6.25 mg/m²) q 1–7 days.

Availability

Betamethasone (generic available)

Suspension for injection (sodium phosphate and acetate): 6 mg (total)/mL.

Budesonide (generic available)

Capsules (Entocort EC): 3 mg. **Cost:** *Generic*—\$397.88/30. **Extended-release tablets (Uceris):** 9 mg. **Cost:** \$1,482.00/30.

Cortisone (generic available)

Tablets: 25 mg. **Cost:** *Generic*—\$108.00/100.

Dexamethasone (generic available)

Tablets: 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg. **Cost:** *Generic*—0.5 mg \$20.76/100, 0.75 mg \$36.39/100, 1 mg \$35.00/100, 1.5 mg \$27.14/100, 2 mg \$68.54/100, 4 mg \$64.25/100, 6 mg \$107.07/100.

Elixir (raspberry flavor): 0.5 mg/5 mL. **Cost:** *Generic*—\$63.68/237 mL. **Oral solution (cherry flavor):** 0.5 mg/5 mL, 1 mg/mL. **Cost:** *Generic*—0.5 mg/5 mL \$63.69/240 mL, 1 mg/mL \$23.74/30 mL. **Solution for injection (sodium phosphate):** 4 mg/mL, 10 mg/mL.

Hydrocortisone (generic available)

Tablets: 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—5 mg \$16.95/50, 10 mg \$57.30/100, 20 mg \$78.81/100. **Enema:** 100 mg/60 mL. **Cost:** *Generic*—\$48.80/480 mL. **Powder for injection (sodium succinate):** 100 mg, 250 mg, 500 mg, 1 g.

Methylprednisolone (generic available)

Tablets: 4 mg, 8 mg, 16 mg, 32 mg. **Cost:** *Generic*—4 mg \$142.93/100, 8 mg \$50.26/25, 16 mg \$155.29/50, 32 mg \$115.62/25. **Powder for injection (sodium succinate):** 40 mg, 125 mg, 500 mg, 1 g, 2 g. **Suspension for injection (acetate):** 20 mg/mL, 40 mg/mL, 80 mg/mL.

Prednisolone (generic available)

Tablets: 5 mg. **Cost:** \$256.35/30. **Orally disintegrating tablets (grape flavor):** 10 mg, 15 mg, 30 mg. **Cost:** 10 mg \$394.84/48, 15 mg \$593.71/48, 30 mg \$846.02/48. **Oral solution:** 5 mg/5 mL, 10 mg/5 mL, 15 mg/5 mL, 20 mg/5 mL, 25 mg/5 mL. **Cost:** *Generic*—5 mg/5 mL \$98.09/120 mL, 15 mg/5 mL \$25.80/237 mL, 25 mg/5 mL \$186.00/237 mL. **Oral suspension:** 15 mg/5 mL. **Cost:** \$124.77/30 mL.

Prednisone (generic available)

Tablets: 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg. **Cost:** *Generic*—1 mg \$11.04/30, 2.5 mg \$7.41/30, 5 mg \$8.32/30, 10 mg \$10.84/30, 50 mg \$13.77/30. **Oral solution:** 1 mg/mL, 5 mg/mL. **Cost:** *Generic*—1 mg/mL \$24.45/120 mL, 5 mg/mL \$42.32/30 mL.

Triamcinolone (generic available)

Suspension for injection (acetate): 10 mg/mL, 40 mg/mL, 80 mg/mL. **Suspension for injection (hexacetonide):** 5 mg/mL, 20 mg/mL.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- These drugs are indicated for many conditions. Assess involved systems before and periodically during therapy.
- Assess for signs of adrenal insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness) before and periodically during therapy.
- Monitor intake and output ratios and daily weights. Observe patient for peripheral edema, steady weight gain, rales/crackles, or dyspnea. Notify health care professional if these occur.
- Children should have periodic evaluations of growth; may slow growth.
- **Cerebral Edema:** Assess for changes in level of consciousness and headache during therapy.
- **Budesonide:** Assess signs of Crohn's disease and ulcerative colitis (diarrhea, crampy abdominal pain, fever, bleeding from rectum) during therapy. Monitor frequency and consistency of bowel movements periodically during therapy.
- **Rect:** Assess symptoms of ulcerative colitis (diarrhea, bleeding, weight loss, anorexia, fever, leukocytosis) periodically during therapy.
- **Lab Test Considerations:** Monitor serum electrolytes and glucose. May cause hyperglycemia, especially in persons with diabetes. May cause hypokalemia. Patients on prolonged therapy should routinely have CBC, serum electrolytes, and serum and urine glucose evaluated. May ↓ WBCs. May ↓ serum potassium and calcium and ↑ serum sodium concentrations.
- Guaiac-test stools. Promptly report presence of guaiac-positive stools.
- May ↑ serum cholesterol and lipid values. May ↓ uptake of thyroid ¹²³I or ¹³¹I.
- Suppress reactions to allergy skin tests.
- Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal axis suppression in systemic and chronic topical therapy.
- **Dexamethasone Suppression Test:** To diagnose Cushing's syndrome: Obtain baseline cortisol level; administer dexamethasone at 11 PM and obtain cortisol levels at 8 AM the next day. Normal response is a ↓ cortisol level.
- Alternative method: Obtain baseline 24-hr urine for 17-hydroxycorticosteroid (OHCS) concentrations, then begin 48-hr administration of dexamethasone. Second 24-hr urine for 17-OHCS is obtained after 24 hr of dexamethasone.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Disturbed body image (Side Effects)

Implementation

- Do not confuse prednisone with prednisolone. Do not confuse Solu-Cortef with Solu-Medrol.

- If dose is ordered daily or every other day, administer in the morning to coincide with the body's normal secretion of cortisol.
- Periods of stress, such as surgery, may require supplemental systemic corticosteroids.
- Patients with mild to moderate Crohn's disease may be switched from oral prednisolone without adrenal insufficiency by gradually decreasing prednisolone doses and adding budesonide.
- **PO:** Administer with meals to minimize GI irritation.
- Tablets may be crushed and administered with food or fluids for patients with difficulty swallowing. Capsules and extended-release tablets should be swallowed whole; do not open, crush, break, or chew.
- Use calibrated measuring device to ensure accurate dose of liquid forms.
- For orally disintegrating tablets (ODT), remove tablet from blister just prior to dosing. Peel blister pack open, and place tablet on tongue; may be swallowed whole or allowed to dissolve in mouth, with or without water. Tablets are friable; do not cut, split, or break.
- Avoid consumption of grapefruit juice during therapy with budesonide or methylprednisolone.
- **IM, Subcut:** Shake suspension well before drawing up. IM doses should not be administered when rapid effect is desirable. Do not dilute with other solution or admix. Do not administer suspensions IV.

Dexamethasone

IV Administration

- **IV Push:** **Diluent:** May be given undiluted. **Concentration:** 4–10 mg/mL. **Rate:** Administer over 1–4 min if dose is <10 mg.
- **Intermittent Infusion:** **Diluent:** High-dose therapy should be added to D5W or 0.9% NaCl solution. Solution should be clear and colorless to light yellow; use diluted solution within 24 hr. **Concentration:** Up to 10 mg/mL. **Rate:** Administer infusions over 15–30 min.
- **Y-Site Compatibility:** acetaminophen, acyclovir, allentaniol, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, blemycin, bumetanide, buprenorphine, butorphanol, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftriaxone, ceftazidime, ceftriaxone, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cyclosporine, cyclosporine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatid, etarpenem, etoposide, etoposide phos-

phate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, fosaprepitant, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meprobem, metaraminol, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, morphine, moxifloxacin, multivitamin, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, pyridoxime, ranitidine, remifentanyl, rituximab, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tozoline, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, amiodarone, amphotericin B colloidal, caspofungin, cefuroxime, ciprofloxacin, dacarbazine, dantrolene, daunorubicin, diazepam, diazoxide, diphenhydramine, dobutamine, doxycycline, epirubicin, erythromycin, esmolol, fenoldopam, haloperidol, hydroxyzine, idarubicin, labetalol, magnesium sulfate, midazolam, mitoxantrone, mycophenolate, nicardipine, pantoprazole, papaverine, pentamidine, pentazocine, phenytoin, prochlorperazine, protamine, quinapristin/dalfopristin, tobramycin, topotecan, trimethoprim/sulfamethoxazole.

Hydrocortisone

IV Administration

- **IV Push:** **Diluent:** Reconstitute with provided solution (i.e., Act-O-Vials) or 2 mL of bacteriostatic water or saline for injection. **Concentration:** 50 mg/mL. **Rate:** Administer each 100 mg over at least 30 sec. Doses 500 mg and larger should be infused over at least 10 min.
- **Intermittent/Continuous Infusion:** **Diluent:** May be added to 50–1000 mL of D5W, 0.9% NaCl, or D5/0.9% NaCl. Diluted solutions should be used within 24 hr. **Concentration:** 1–5 mg/mL. Concentrations of up to 60 mg/mL have been used in

fluid restricted adults. **Rate:** Administer over 20–30 min or at prescribed rate.

- **Hydrocortisone sodium succinate: Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, amoxicillin, ampicillin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, cangrelor, carboplatin, carmustine, caspofungin, ceftazidime, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmethasone, dexmedetomidine, dexrazoxane, digoxin, doxetaxel, dopamine, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatid, ertapenem, erythromycin, estrogens, conjugated, etoposide, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, metaraminol, methotrexate, methoxamine, methyldopate, methylergonovine, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, nafcillin, naloxone, neostigmine, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, ranitidine, rituximab, scopolamine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiotepa, tigecycline, tirofiban, topotecan, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, ampicillin/sulbactam, azathioprine, ciprofloxacin, dantrolene, diazepam, diazoxide, dobutamine, dolasetron, doxycycline, ganciclovir, haloperidol, idarubicin, labetalol, midazolam, myco-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

phenolate, nalbuphine, pentamidine, phenytoin, protamine, pyridoxime, quinupristin/dalfopristin, rocuronium, sargramostim, thiamine, trimethoprim/sulfamethoxazole.

Methylprednisolone sodium succinate

IV Administration

- **IV Push:** *Diluent:* Reconstitute with provided solution (Act-O-Vials, Univals) or 2 mL of bacteriostatic water (with benzyl alcohol) for injection. Use preservative-free diluent for use in neonates. Acetate injection is not for IV use. *Concentration:* Maximum concentration 125 mg/mL. *Rate:* Low dose (<1.8 mg/kg or <125 mg/dose): May be administered IV push over 1 to several minutes. Moderate dose (2 mg/kg or 250 mg/dose): give over 15–30 min. High dose (15 mg/kg or 500 mg/dose): give over 30 min. Doses 15 mg/kg or 1 g give over 1 hr.
- **Intermittent/Continuous Infusion:** *Diluent:* May be diluted further in D5W, 0.9% NaCl, or D5/0.9% NaCl and administered as intermittent or continuous infusion at the prescribed rate. *Concentration:* Maximum 2.5 mg/mL. Solution may form a haze upon dilution.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alfentanil, alprostadil, amifostine, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotetan, ceftaroline, ceftazidime, ceftioxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, dobutamine, dopamine, doxacurium, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatid, ertapenem, erythromycin, etoposide, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, fosaprepitant, furosemide, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, metaraminol, methotrexate, methoxamine, methylodopate, metoclopramide, metoprolol, metronidazole, milrinone, morphine, moxifloxacin, multivitamin, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, pamidronate, pancuronium, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, procainamide, prochlorperazine, propranolol, ranitidine, remifentanyl, rituximab, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tirofiban, tobramycin,

tolazoline, topotecan, trastuzumab, vasopressin, verapamil, vincristine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, allopurinol, amphotericin B colloidal, ampicillin/sulbactam, am-sacrine, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefoxitin, ciprofloxacin, dacarbazine, dantrolene, daunorubicin, dexrazoxane, diazepam, diazoxide, diphenhydramine, docetaxel, dolasetron, doxycycline, epirubicin, etoposide phosphate, fenoldopam, filgrastim, foscarnet, ganciclovir, gemcitabine, haloperidol, hydralazine, idarubicin, irinotecan, magnesium sulfate, mitoxantrone, mycophenolate, nalbuphine, paclitaxel, palonosetron, pantoprazole, papaverine, pentamidine, pentazocine, phenytoin, promethazine, propofol, protamine, pyridoxime, quinupristin/dalfopristin, rocuronium, sargramostim, thiamine, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine.

Patient/Family Teaching

- Instruct patient on correct technique of medication administration. Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses. **Stopping the medication suddenly may result in adrenal insufficiency (anorexia, nausea, weakness, fatigue, dyspnea, hypotension, hypoglycemia). If these signs appear, notify health care professional immediately. This can be life threatening.**
- Advise patient to avoid consumption of grapefruit juice during therapy with *budesonide* or *methylprednisolone*.
- Corticosteroids cause immunosuppression and may mask symptoms of infection. Instruct patient to avoid people with known contagious illnesses and to report possible infections immediately.
- *Prelone* syrup should not be refrigerated, *Pediapred* solution may be refrigerated, *Orapred* solution should be refrigerated.
- Caution patient to avoid vaccinations without first consulting health care professional.
- Review side effects with patient. **Instruct patient to inform health care professional promptly if severe abdominal pain or tarry stools occur.** Patient should also report unusual swelling, weight gain, tiredness, bone pain, bruising, nonhealing sores, visual disturbances, or behavior changes.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products.
- Instruct patient to notify health care professional immediately if exposed to chicken pox or measles.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Discuss possible effects on body image. Explore coping mechanisms.
- Instruct patient to inform health care professional if symptoms of underlying disease return or worsen.

- Advise patient to carry identification describing disease process and medication regimen in the event of emergency in which patient cannot relate medical history.
- Explain need for continued medical follow-up to assess effectiveness and possible side effects of medication. Periodic lab tests and eye exams may be needed.
- **Long-term Therapy:** Encourage patient to eat a diet high in protein, calcium, and potassium, and low in sodium and carbohydrates (see Appendix K). Alcohol should be avoided during therapy; may ↑ risk of GI irritation.
- If rectal dose used 21 days, decrease to every other night for 2–3 wk to decrease gradually.

Evaluation/Desired Outcomes

- Decrease in presenting symptoms with minimal systemic side effects.
- Suppression of the inflammatory and immune responses in autoimmune disorders, allergic reactions, and neoplasms.
- Management of symptoms in adrenal insufficiency.
- Improvement of symptoms/sequelae of Crohn's disease and ulcerative colitis (decreased frequency of liquid stools, decreased abdominal complaints, improved sense of well being).
- Improvement in symptoms of ulcerative colitis. Clinical symptoms usually improve in 3–5 days. Mucosal appearance may require 2–3 mo to improve.

Classification

Therapeutic: anti-inflammatories (steroidal)

Pharmacologic: corticosteroids (topical)

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Management of inflammation and pruritis associated with various allergic/immunologic skin problems.

Action

Suppress normal immune response and inflammation.

Therapeutic Effects: Suppression of dermatologic inflammation and immune processes. Clearing of plaques.

Pharmacokinetics

Absorption: Minimal. Prolonged use on large surface areas, application of large amounts, or use of occlusive dressings may ↑ systemic absorption.

Distribution: Remain primarily at site of action.

Metabolism and Excretion: Usually metabolized in skin; some have been modified to resist local metabolism and have a prolonged local effect.

Half-life: *Betamethasone*—3–5 hr (plasma), 36–54 hr (tissue). *Dexamethasone*—3–4.5 hr (plasma), 36–54 hr (tissue). *Hydrocortisone*—1.5–2 hr (plasma), 8–12 hr (tissue). *Triamcinolone*—2–>5 hr (plasma), 18–36 hr (tissue).

TIME/ACTION PROFILE (response depends on condition being treated)

ROUTE	ONSET	PEAK	DURATION
Topical	min–hr	hr–days	hr–days

Contraindications/Precautions

Contraindicated in: Hypersensitivity or known intolerance to corticosteroids or components of vehicles (ointment or cream base, preservative, alcohol); Untreated bacterial or viral infections.

Use Cautiously in: Hepatic dysfunction; Diabetes mellitus, cataracts, glaucoma, or tuberculosis (use of large amounts of high-potency agents may worsen condition); Patients with pre-existing skin atrophy; **OB, Lactation:** Chronic use at high dosages may result in adrenal suppression in mother and growth suppression in children; **Pedi:** Children may be more susceptible to adrenal and growth suppression. Clobetasol not recommended for children <12 yr; desoximetasone not recommended for children <10 yr (cream, ointment, gel) or <18 yr (spray).

Adverse Reactions/Side Effects

Derm: allergic contact dermatitis, atrophy, burning, dryness, edema, folliculitis, hypersensitivity reactions, hypertrichosis, hypopigmentation, irritation, maceration, miliaria, perioral dermatitis, secondary infection, striae. **Misc:** adrenal suppression (↑ dose, long-term therapy).

Interactions

Drug-Drug: None significant.

Route/Dosage

Topical (Adults and Children): 1–4 times daily (depends on product, preparation, and condition being treated).

Rect (Adults): hydrocortisone Aerosol foam—90 mg 1–2 times/day for 2–3 wk; then adjusted.

Availability**Alclometasone (generic available)**

Cream: 0.05%. **Cost:** *Generic*—\$97.51/45 g. **Ointment:** 0.05%. **Cost:** *Generic*—\$50.47/15 g.

Amincinonide (generic available)

Cream: 0.1%. **Cost:** *Generic*—\$38.88/30 g. **Lotion:** 0.1%. **Cost:** *Generic*—\$325.73/60 mL. **Ointment:** 0.1%. **Cost:** *Generic*—\$388.80/60 g.

Cream: 0.05%. **Cost:** *Generic*—\$169.23/30 g. **Ointment:** 0.05%. **Cost:** *Generic*—\$179.53/30 g.

Fluocinolone (generic available)

Cream: 0.01%, 0.025%. **Cost:** *Generic*—0.01% \$44.57/15 g, 0.025% \$33.93/15 g. **Ointment:** 0.025%. **Cost:** *Generic*—\$33.93/15 g. **Solution:** 0.01%. **Cost:** *Generic*—\$178.80/60 mL. **Shampoo:** 0.01%. **Cost:** \$416.76/120 mL. **Oil:** 0.01%. **Cost:** *Generic*—\$197.90/20 mL. **In combination with:** hydroquinone and tretinoin (Tri-Luma). See Appendix B.

Fluocinonide (generic available)

Cream: 0.05%, 0.1%. **Cost:** *Generic*—0.05% \$22.32/30 g; *Vanos (0.1%)*—\$965.89/60 g. **Gel:** 0.05%. **Cost:** *Generic*—\$67.10/60 g. **Ointment:** 0.05%. **Cost:** *Generic*—\$55.76/60 g. **Solution:** 0.05%. **Cost:** *Generic*—\$100.99/60 mL.

Flurandrenolide (generic available)

Cream: 0.025%, 0.05%. **Cost:** 0.05% \$204.60/30 g. **Lotion:** 0.05%. **Cost:** \$394.68/60 mL. **Tape:** 4 mcg/cm². **Cost:** \$214.96/1 unit.

Fluticasone (generic available)

Cream: 0.05%. **Cost:** *Generic*—\$34.37/30 g. **Lotion:** 0.05%. **Cost:** *Generic*—\$389.95/60 mL. **Ointment:** 0.005%. **Cost:** *Generic*—\$34.30/30 g.

Halcinonide

Cream: 0.1%. **Cost:** \$226.55/60 g. **Ointment:** 0.1%. **Cost:** \$133.22/30 g.

Halobetasol (generic available)

Cream: 0.05%. **Cost:** *Generic*—\$193.26/50 g. **Ointment:** 0.05%. **Cost:** *Generic*—\$88.67/15 g.

Hydrocortisone (generic available)

Cream: 0.1%, 0.2%, 0.5%^{Rx, OTC}, 1%^{Rx, OTC}, 2.5%. **Gel:** 1%^{Rx, OTC}. **Ointment:** 0.1%, 0.2%, 0.5%^{Rx, OTC}, 1%^{Rx, OTC}, 2.5%. **Lotion:** 1%^{Rx, OTC}, 2.5%. **Solution:** 1%, 2.5%. **Spray:** 0.5%^{Rx, OTC}, 1%^{Rx, OTC}. **Rectal cream:** 1%. **Rectal aerosol:** 10%. **In combination with:** acetic acid, antifungals, anti-infectives, antihistamines, urea, and benzoyl peroxide in various otic and topical preparations. See Appendix B.

Mometasone (generic available)

Cream: 0.1%. **Cost:** *Generic*—\$15.59/15 g. **Ointment:** 0.1%. **Cost:** *Generic*—\$28.10/15 g. **Lotion:** 0.1%. **Cost:** \$58.20/30 mL.

Prednicarbate (generic available)

Cream: 0.1%. **Cost:** *Generic*—\$23.08/15 g. **Ointment:** 0.1%. **Cost:** *Generic*—\$30.00/15 g.

Triamcinolone (generic available)

Cream: 0.025%, 0.1%, 0.5%. **Cost:** *Generic*—0.025% \$4.45/15 g, 0.1% \$5.57/15 g, 0.5% \$10.11/15 g. **Ointment:** 0.025%, 0.1%, 0.5%. **Cost:** *Generic*—0.025% \$10.11/80 g, 0.1% \$5.58/15 g, 0.5% \$10.10/15 g. **Lotion:** 0.025%, 0.1%. **Cost:** *Generic*—0.025% \$37.79/60 mL, 0.1% \$90.00/60 mL. **In combination with:** acetic acid, antifungals, anti-infectives, antihistamines, urea, and benzoyl peroxide in various otic and topical preparations. See Appendix B.

NURSING IMPLICATIONS**Assessment**

- Assess affected skin before and daily during therapy. Note degree of inflammation, pruritus, and/or

plaques. Notify health care professional if symptoms of infection (increased pain, erythema, purulent exudate) develop.

- **Lab Test Considerations:** Adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in long-term topical therapy. Children and patients with dose applied to a large area, using an occlusive dressing, or using high-potency products are at highest risk for HPA suppression.
- May cause ↑ serum and urine glucose concentrations if significant absorption occurs.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

Risk for infection (Side Effects)

Implementation

- Choice of vehicle depends on site and type of lesion. Ointments are more occlusive and preferred for dry, scaly lesions. Creams should be used on oozing or intertriginous areas, where the occlusive action of ointments might cause folliculitis or maceration. Creams may be preferred for esthetic reasons even though they may dry skin more than ointments. Gels, aerosols, lotions, and solutions are useful in hairy areas.
- **Topical:** Apply *ointments, creams, or gels* sparingly as a thin film to clean, slightly moist skin. Wear gloves. Apply occlusive dressing only if specified by health care professional.
- Apply *lotion, solution, or gel* to hair by parting hair and applying a small amount to affected area. Rub in gently. Protect area from washing, clothing, or rubbing until medication has dried. Hair may be washed as usual but not right after applying medication.
- Use *aerosols* by shaking well and spraying on affected area, holding container 3–6 in. away. Spray for about 2 sec to cover an area the size of a hand. Do not inhale. If spraying near face, cover eyes.
- Shake *Sernivo spray* before using. Spray affected area and rub in gently. Discontinue if control not achieved or after 4 wk of use.

Patient/Family Teaching

- Instruct patient on correct technique of medication administration. Emphasize importance of avoiding the eyes. Apply missed doses as soon as remembered unless almost time for the next dose.
- Caution patient to use only as directed. Avoid using cosmetics, bandages, dressings, or other skin products over the treated area unless directed by health care professional.
- Advise parents of pediatric patients not to apply tight-fitting diapers or plastic pants on a child treated in the diaper area; these garments work as an occlusive dressing and may cause more of the drug to be absorbed.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to consult health care professional before using medicine for condition other than indicated.
- Caution women that medication should not be used extensively, in large amounts, or for protracted periods if they are pregnant or planning to become pregnant. Advise female patients taking *Sernivo* to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to inform health care professional if symptoms of underlying disease return or worsen or if symptoms of infection develop.
- **Fluticasone:** Advise patient to avoid excessive natural or artificial exposure (tanning booth, sun lamp) to areas where lotion is applied.

Evaluation/Desired Outcomes

- Resolution of skin inflammation, pruritus, or other dermatologic conditions.
- Clearing of plaques in plaque psoriasis.

cortisone, See CORTICOSTEROIDS (SYSTEMIC).

crizotinib (kri-zoh-ti-nib)

Xalkori

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Indications

 Metastatic non-small cell lung cancer (NSCLC) that is positive for anaplastic lymphoma kinase (ALK).  Metastatic NSCLC that is positive for ROS1.

Action

Inhibits receptor tyrosine kinases including anaplastic lymphoma kinase (ALK), Hepatocyte Growth Factor Receptor (HGFR, c-Met), ROS1, and Recepteur d'Origine Nantais (RON). **Therapeutic Effects:** Decreased spread of lung cancer and improved survival.

Pharmacokinetics

Absorption: 43% absorbed following oral administration.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4/5 enzyme system) also acts as a inhibitor of CYP3A. 53% excreted in feces unchanged, 2.3% eliminated unchanged in urine.

Half-life: 42 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–6 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of strong inhibitors/inducers of the CYP3A enzyme system; Congenital long QT syndrome; **OB:** May cause fetal harm; **Lactation:** Breast feeding should be avoided.

Use Cautiously in: Heart failure, bradyarrhythmias, electrolyte abnormalities, concurrent medications that prolong QT interval (↑ risk of arrhythmias);  Asian patients (↑ blood levels); Hepatic impairment; Severe renal impairment; **Rep:** Women of reproductive potential and men with female sexual partners of reproductive potential (use effective contraception); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue, headache, insomnia. **EENT:** visual disturbances. **Resp:** PNEUMONITIS. **CV:** QT INTERVAL PROLONGATION, bradycardia, edema, chest pain. **Derm:** rash. **Endo:** ↓ testosterone. **GI:** HEPATOTOXICITY, constipation, diarrhea, nausea, vomiting, abdominal pain, dysgeusia, esophagitis, ↓ appetite, stomatitis. **GU:** ↓ fertility. **Neuro:** neuropathy. **Misc:** fever.

Interactions

Drug-Drug: Strong CYP3A inhibitors including atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, and voriconazole may ↑ levels; concurrent use should be avoided. Strong CYP3A inducers including carbamazepine, phenobarbital, phenytoin, rifabutin, and rifampin may ↓ levels and effectiveness; concurrent use should be avoided. May ↑ levels of alfentanil, cyclosporine, dihydroergotamine, ergotamine, fentanyl, pimozone, quinidine, sirolimus, and tacrolimus; avoid concurrent use. Beta-blockers, verapamil, diltiazem, digoxin, and clonidine may ↑ risk of bradycardia; avoid concurrent use, if possible.

Drug-Natural Products: Concurrent use of St. John's wort may ↓ levels and effectiveness and should be avoided.

Drug-Food: Grapefruit or grapefruit juice may ↑ levels and should be avoided.

Route/Dosage

PO (Adults): 250 mg twice daily until disease progression or no longer tolerated by patient.

Renal Impairment

PO (Adults): *CCr* <30 mL/min (not on dialysis) — 250 mg once daily.

Availability

Capsules: 200 mg, 250 mg.

NURSING IMPLICATIONS

Assessment

- Assess respiratory function (lung sounds, dyspnea, oxygen saturation) periodically during therapy.
- Monitor for signs and symptoms of pneumonitis (difficulty breathing, shortness or breath, cough

with or without mucus, fever) periodically during therapy. *If any Grade of pneumonitis occurs, permanently discontinue.*

- Assess for signs and symptoms of neuropathy (burning, dysesthesia, hyperesthesia, hypoesthesia, neuralgia, paresthesia, peripheral neuropathy sensory and motor) periodically during therapy. Usually Grade 1.
- Monitor ECG periodically during therapy in patients with HF, bradyarrhythmias, electrolyte imbalances, or taking medications that may prolong QT interval. *If QTc >500 ms on at least 2 separate ECGs, withhold until recovery to baseline or to a QTc <481 ms, then resume at reduced dose. If QTc >500 ms or ≥ 60 ms change from baseline with torsade de pointes or polymorphic ventricular tachycardia or signs/symptoms of serious arrhythmia, permanently discontinue. If symptomatic bradycardia occurs, withhold dose until heart rate return to ≥ 60 bpm. Evaluate concomitant medications, if contributing medication is identified and dose reduced or discontinued, return to previous dose of crizotinib once heart rate is ≥ 60 bpm and/or bradycardia is asymptomatic. If no contributing medication is identified or dose modifications are not made, resume crizotinib at a reduced dose once heart rate ≥ 60 bpm and/or bradycardia is asymptomatic. If bradycardia is life-threatening and no contributing medication identified, discontinue crizotinib. If contributing medication is identified and dose is reduced or discontinued, reduce crizotinib dose to 250 mg once daily with frequent monitoring once heart rate ≥ 60 bpm and/or bradycardia is asymptomatic.*
- Monitor vision during therapy. If visual loss (Grade 4 Ocular Disorder) occurs, discontinue crizotinib during evaluation of severe vision loss. Perform an ophthalmological evaluation consisting of best corrected visual acuity, retinal photographs, visual fields, optical coherence tomography (OCT) and other evaluations as appropriate for new onset of severe visual loss.
- **Lab Test Considerations:** Monitor CBC with differential monthly and as clinically indicated; more frequently if Grade 3 or 4 toxicities occur. *If Grade 3 hematologic toxicity occurs, withhold dose until recovery to Grade ≤ 2 , then resume same dose schedule. If Grade 4 hematologic toxicity occurs, withhold until recovery to Grade ≤ 2 , then resume at 200 mg twice daily. May also cause Grade 3 or 4 neutropenia, thrombocytopenia, and lymphopenia.*
- Monitor liver function tests monthly and as clinically indicated; more frequently if Grade 2, 3, 4 abnormalities occur. *If ALT or AST $\uparrow > 5 \times$ upper limit of normal (ULN) with total bilirubin ≤ 1.5 times ULN, withhold crizotinib until recovery to baseline or*

$\leq 3 \times$ ULN, then resume at reduced dose. If ALT or AST $\uparrow > 3 \times$ ULN with concurrent total bilirubin $\uparrow > 1.5 \times$ ULN (in the absence of cholestasis or hemolysis), permanently discontinue crizotinib. If Grade 3 or 4 AST or ALT \uparrow with Grade ≤ 1 total bilirubin occurs, withhold until recovery to Grade ≤ 1 or baseline, then resume at 200 mg twice daily. If Grade 2, 3, or 4 AST or ALT \uparrow with concurrent Grade 2, 3, or 4 total bilirubin \uparrow (with no cholestasis or hemolysis), permanently discontinue.

Potential Nursing Diagnoses

Impaired gas exchange (Indications)

Implementation

- **PO:** Administer twice daily without regard to food. Swallow capsules whole, do not crush, dissolve, or open.

Patient/Family Teaching

- Instruct patient to take crizotinib as directed; do not change dose or stop taking without consulting health care professional. If vomiting occurs, do not take extra dose, just take next dose at regular scheduled time. Take missed doses as soon as remembered unless <6 hr until next dose. If <6 hr to next dose, skip dose and return to regular schedule; do not double doses. Advise patient to read the *Patient Information leaflet* before starting and with each Rx refill in case of changes.
- Advise patient to avoid eating grapefruit or drinking grapefruit juice during therapy.
- Caution patient that dizziness and visual disorders may occur. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. Visual disturbances generally start within 2 wk of therapy. Instruct patient to notify health care professional if flashes of light, blurry vision, light sensitivity, or new or worse vitreous floaters occur; ophthalmological evaluation should be considered.
- Advise patient to notify health care professional immediately if symptoms of weakness, fatigue, anorexia, nausea, vomiting, abdominal pain (especially RUQ abdominal pain), jaundice, dark urine, generalized pruritus, and bleeding occur, especially in combination with fever and rash.
- Inform patient that nausea, diarrhea, vomiting, and constipation are common side effects and usually occur during first few days of therapy. Standard antiemetic, antidiarrheal, and laxative medications are usually effective.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Rep:** Instruct women of childbearing age to use effective contraception during and for at least 45 days following discontinuation of therapy and to avoid breast feeding during therapy. Because of potential for genotoxicity, advise males with female partners of reproductive potential to use condoms during treatment and for at least 90 days after final dose. May cause reduced fertility in females and males of reproductive potential; may be irreversible.

Evaluation/Desired Outcomes

- Decrease spread of non-small cell lung cancer.

cyanocobalamin, See VITAMIN B₁₂ PREPARATIONS.

cyclobenzaprine

(sy-e-kloe-ben-za-preen)

Amrix, Flexeril

Classification

Therapeutic: skeletal muscle relaxants (centrally acting)

Indications

Management of acute painful musculoskeletal conditions associated with muscle spasm. **Unlabeled Use:** Management of fibromyalgia.

Action

Reduces tonic somatic muscle activity at the level of the brainstem. Structurally similar to tricyclic antidepressants. **Therapeutic Effects:** Reduction in muscle spasm and hyperactivity without loss of function.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Unknown.

Protein Binding: 93%.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 1–3 days.

TIME/ACTION PROFILE (skeletal muscle relaxation)

ROUTE	ONSET	PEAK†	DURATION
PO	within 1 hr	3–8 hr	12–24 hr
Extended-release	unknown	unknown	24 hr

†Full effects may not occur for 1–2 wk.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Should not be used within 14 days of MAO inhibitor therapy; Immediate period after MI; Severe or symptomatic cardiovascular disease; Cardiac conduction disturbances; Hypert thyroidism.

Use Cautiously in: Cardiovascular disease; **Geri:** Appears on Beers list. Poorly tolerated due to anticholinergic effects; **OB, Lactation, Pedi:** Pregnancy, lactation, and children <15 yr (safety not established).

linergic effects; **OB, Lactation, Pedi:** Pregnancy, lactation, and children <15 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, confusion, fatigue, headache, nervousness. **EENT:** dry mouth, blurred vision.

CV: arrhythmias. **GI:** constipation, dyspepsia, nausea, unpleasant taste. **GU:** urinary retention.

Interactions

Drug-Drug: Additive CNS depression with other CNS depressants, including alcohol, antihistamines, opioid analgesics, and sedative/hypnotics. Additive anticholinergic effects with drugs possessing anticholinergic properties, including antihistamines, antidepressants, atropine, disopyramide, haloperidol, and phenothiazines. Avoid use within 14 days of MAO inhibitors (hyperpyretic crisis, seizures, and death may occur). Drugs that affect serotonergic neurotransmitter systems, including tricyclic antidepressants, SSRIs, SNRIs, fentanyl, buspirone, tramadol, and triptans ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of kava-kava, valerian, chamomile, or hops can ↑ CNS depression.

Route/Dosage

PO (Adults): *Acute painful musculoskeletal conditions*—Immediate-release: 10 mg 3 times daily (range 20–40 mg/day in 2–4 divided doses; not to exceed 60 mg/day); Extended-release: 15–30 mg once daily. *Fibromyalgia*—5–40 mg at bedtime (unlabeled).

Availability (generic available)

Tablets: 5 mg, 7.5 mg, 10 mg. **Cost:** *Generic*—5 mg \$9.43/100, 10 mg \$8.32/100. **Extended-release capsules (Amrix):** 15 mg, 30 mg. **Cost:** All strengths \$1,437.60/60.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- **Geri:** Assess geriatric patients for anticholinergic effects (sedation and weakness).
- **Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).**

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)

Implementation

- **PO:** May be administered with meals to minimize gastric irritation.

- Swallow extended-release capsules whole; do not open, crush, or chew. Capsules may be opened and contents sprinkled onto applesauce; swallow immediately without chewing. Rinse mouth to make sure contents have been swallowed.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day; do not take more than the prescribed amount. Take missed doses within 1 hr of time ordered; otherwise, return to normal dose schedule. Do not double doses.
- Medication may cause drowsiness, dizziness, and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- If constipation becomes a problem, advise patient that increasing fluid intake and bulk in diet and stool softeners may alleviate this condition.
- Advise patient to notify health care professional if symptoms of urinary retention (distended abdomen, feeling of fullness, overflow incontinence, voiding small amounts) occur.
- **Instruct patient to notify health care professional immediately if signs and symptoms of serotonin syndrome occur.**
- Inform patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may help relieve dry mouth.

Evaluation/Desired Outcomes

- Relief of muscular spasm in acute skeletal muscle conditions. Maximum effects may not be evident for 1–2 wk. Use is usually limited to 2–3 wk; however, has been effective for at least 12 wk in the management of fibromyalgia.

HIGH ALERT

cyclophosphamide (sy-e-kloe-fos-fa-mide)

Cytosan, ★ Procytox

Classification

Therapeutic: antineoplastics, immunosuppressants

Pharmacologic: alkylating agents

Indications

Alone or with other modalities in the management of: Hodgkin's disease, Malignant lymphomas, Multiple myeloma, Leukemias, Mycosis fungoides, Neuroblastoma, Ovarian carcinoma, Breast carcinoma, and a variety of other tumors. Minimal change nephrotic syndrome in children. **Unlabeled Use:** Severe active rheumatoid arthritis or granulomatosis with polyangiitis.

Action

Interferes with DNA replication and RNA transcription, ultimately disrupting protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressant action in smaller doses.

Pharmacokinetics

Absorption: Inactive parent drug is well absorbed from the GI tract. Converted to active drug by the liver.

Distribution: Widely distributed. Limited penetration of the blood-brain barrier. Crosses the placenta; enters breast milk.

Metabolism and Excretion: Converted to active drug by the liver; 30% eliminated unchanged by the kidneys.

Half-life: 4–6.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO, IV	7 days	7–15 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Active infections; Bone marrow depression; Other chronic debilitating illnesses; **OB:** Patients with childbearing potential.

Adverse Reactions/Side Effects

Resp: PULMONARY FIBROSIS. **CV:** MYOCARDIAL FIBROSIS, hypotension. **GI:** anorexia, nausea, vomiting. **GU:** HEMORRHAGIC CYSTITIS, hematuria. **Derm:** alopecia.

Endo: gonadal suppression, syndrome of inappropriate antidiuretic hormone (SIADH). **Hemat:** LEUKOPENIA, thrombocytopenia, anemia. **Metab:** hyperuricemia. **Misc:** secondary neoplasms.

Interactions

Drug-Drug: Phenobarbital or rifampin may ↑ toxicity of cyclophosphamide. Concurrent allopurinol or thiazide diuretics may exaggerate bone marrow depression. May prolong neuromuscular blockade from succinylcholine. Cardiotoxicity may be additive with other cardiotoxic agents (e.g., cytarabine, daunorubicin, doxorubicin). May ↓ serum digoxin levels. Additive bone marrow depression with other antineoplastics or radiation therapy. May potentiate the effects of warfarin. May ↓ antibody response to live-virus vaccines and ↑ risk of adverse reactions. Prolongs the effects of cocaine.

Route/Dosage

Many regimens are used.

PO (Adults): 1–5 mg/kg/day.

PO (Children): Induction—2–8 mg/kg/day (60–250 mg/m²/day) in divided doses for 6 days or longer.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Maintenance—2–5 mg/kg (50–150 mg/m²/day) twice weekly.

IV (Adults): 40–50 mg/kg in divided doses over 2–5 days or 10–15 mg/kg q 7–10 days or 3–5 mg/kg twice weekly or 1.5–3 mg/kg/day. Other regimens may use larger doses.

IV (Children): **Induction**—2–8 mg/kg/day (60–250 mg/m²/day) in divided doses for 6 days or longer. Total dose for 7 days may be given as a single weekly dose. **Maintenance**—10–15 mg/kg every 7–10 days or 30 mg/kg q 3–4 wk.

Availability (generic available)

Capsules: 25 mg, 50 mg. **Lyophilized powder for injection:** 500 mg/vial, 1 g/vial, 2 g/vial.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- **Monitor urinary output frequently during therapy.** To reduce the risk of hemorrhagic cystitis and to promote excretion of uric acid, fluid intake should be at least 3000 mL/day for adults and 1000–2000 mL/day for children. May be administered with mesna. Alkalinization of the urine may be used to help prevent uric acid nephropathy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess nausea, vomiting, and appetite. Weigh weekly. Antiemetics may be given 30 min before administration of medication to minimize GI effects. Anorexia and weight loss can be minimized by feeding frequent light meals.
- Assess cardiac and respiratory status for dyspnea, rales/crackles, cough, weight gain, edema. Pulmonary toxicity may occur after prolonged therapy. Cardiotoxicity may occur early in therapy and is characterized by symptoms of HF.
- **Lab Test Considerations:** Monitor CBC with differential and platelet count before and periodically during therapy. The nadir of leukopenia occurs in 7–12 days (recovery in 17–21 days). Leukocytes should be maintained at 2500–4000/mm³. May also cause thrombocytopenia (nadir 10–15 days), and rarely causes anemia.
- Monitor BUN, creatinine, and uric acid before and frequently during therapy to detect nephrotoxicity.
- Monitor ALT, AST, LDH, and serum bilirubin before and frequently during therapy to detect hepatotoxicity.

- Urinalysis should be evaluated before initiating therapy and frequently during therapy to detect hematuria or change in specific gravity indicative of SIADH.
- May suppress positive reactions to skin tests for *Candida*, mumps, *Trichophyton*, and tuberculin purified-protein derivative (PPD). May also produce false-positive results in Papanicolaou smears.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Disturbed body image (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- Do not confuse cyclophosphamide with cyclosporine.
- **PO:** Administer in the morning. Swallow tablets whole; do not crush, break, or chew.
- **IV:** Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers.

IV Administration

- **IV Push:** Reconstitute each 100 mg with 5 mL of 0.9% NaCl. Swirl gently to dissolve. Do not reconstitute with sterile water for injection; results in a hypotonic solution not suitable for IV push. **Concentration:** 20 mg/mL. Administer reconstituted solution undiluted. **Rate:** Inject very slowly.
- **Intermittent Infusion:** Reconstitute each 100 mg with 5 mL of 0.9% NaCl or Sterile Water for injection. Swirl gently to dissolve. Use solution reconstituted with Sterile Water for injection immediately; solution reconstituted with 0.9% NaCl may be stored at room temperature for 24 hr or if refrigerated for 6 days. Do not administer solutions that contain clear or yellow viscous liquid. **Diluent:** May be further diluted in up to 250 mL of D5W, D5/0.9% NaCl, or 0.45% NaCl. **Concentration:** minimum 2 mg/mL. **Rate:** Infuse very slowly. May reduce rate-dependent adverse reactions (facial swelling, headache, nasal congestion, scalp burning).
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, cef-

triazone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclosporine, cytarabine, dacarbazine, dactinomycin, dapotomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, etrapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargamostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, diazepam, phenytoin.

Patient/Family Teaching

- Instruct patient to take dose in early morning. Emphasize need for adequate fluid intake for 72 hr after therapy. Patient should void frequently to decrease bladder irritation from metabolites excreted by the kidneys. Report hematuria immediately. If a dose is missed, contact health care professional. Advise caregivers to use gloves when handling capsules. If capsule opens, wash hands thoroughly.

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores in the mouth or on the lips; yellow discoloration of skin or eyes; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; unusual swelling of ankles or legs; joint pain; shortness of breath; cough, palpitations, weight gain of more than 5 lb in 24 hr, dizziness, loss of consciousness or confusion occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs; may precipitate GI hemorrhage.
- Discuss with patient the possibility of hair loss. Explore methods of coping. May also cause darkening of skin and fingernails.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- **Rep:** Advise patient that this medication may cause sterility and menstrual irregularities or cessation of menses. This drug is also teratogenic; females should use highly effective contraceptive measures for up to 1 yr after completion and men should continue to wear condoms for at least 4 mo after completion of therapy.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignant tumors.
- Improvement of hematologic status in patients with leukemia. Maintenance therapy is instituted if leukocyte count remains between 2500 and 4000/mm³ and if patient does not demonstrate serious side effects.
- Management of minimal change nephrotic syndrome in children.

cycloSPORINE†

(sye-kloe-spor-eeen)

Gengraf, Neoral, SandIMMUNE

Classification

Therapeutic: immunosuppressants, antirheumatics (DMARD)

Pharmacologic: polypeptides (cyclic)

†See Appendix C for ophthalmic use

Indications

PO, IV: Prevention and treatment of rejection in renal, cardiac, and hepatic transplantation (with corticosteroids). **PO:** Treatment of severe active rheumatoid arthritis (Neoral only). Treatment of severe recalcitrant psoriasis in adult nonimmunocompromised patients (Neoral only). **Unlabeled Use:** Management of re-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

calcitriol ulcerative colitis. Treatment of steroid-resistant nephrotic syndrome. Treatment of severe steroid-resistant autoimmune disease. Prevention and treatment of graft vs. host disease in bone marrow transplant patients.

Action

Inhibits normal immune responses (cellular and humoral) by inhibiting interleukin-2, a factor necessary for initiation of T-cell activity. **Therapeutic Effects:** Prevention of rejection reactions. Slowed progression of rheumatoid arthritis or psoriasis.

Pharmacokinetics

Absorption: Erratically absorbed (range 10–60%) after oral administration, with significant first-pass metabolism by the liver. Microemulsion (Neoral) has better bioavailability.

Distribution: Widely distributed, mainly into extracellular fluid and blood cells. Crosses the placenta; enters breast milk.

Protein Binding: 90–98%.

Metabolism and Excretion: Extensively metabolized by the liver by CYP3A4 (first pass); excreted in bile, small amounts excreted unchanged in urine.

Half-life: Children—7 hr; adults—19 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown†	2–6 hr	unknown
IV	unknown	end of infusion	unknown

†Onset of action in rheumatoid arthritis is 4–8 wk and may last 4 wk after discontinuation; for psoriasis, onset is 2–6 wk and lasts 6 wk following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cyclosporine or polyoxyethylated castor oil (vehicle for IV form); Disulfiram therapy or known alcohol intolerance (IV and oral liquid dose forms contain alcohol); Patients with psoriasis receiving immunosuppressants or radiation; Renal impairment (in patients with rheumatoid arthritis or psoriasis); Uncontrolled hypertension; **OB, Lactation:** Should not be given unless benefits outweigh risks.

Use Cautiously in: Severe hepatic impairment (dose ↓ recommended); Renal impairment (frequent dose changes may be necessary); Active infection; **Pedi:** Larger or more frequent doses may be required.

Adverse Reactions/Side Effects

CNS: **POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME**, **PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY**, **SEIZURES**, tremor, confusion, flushing, headache, psychiatric problems. **CV:** hypertension. **GI:** **HEPATOTOXICITY**, diarrhea, nausea, vomiting, abdominal discomfort, anorexia, pancreatitis. **GU:** nephrotoxicity. **Derm:** hirsutism, acne, psoriasis. **F and E:** hyperkalemia, hypomagnesemia. **Hemat:** anemia, leukopenia,

thrombocytopenia. **Metab:** hyperlipidemia, hyperuricemia. **Neuro:** hyperesthesia, paresthesia. **MS:** lower extremity pain. **Misc:** gingival hyperplasia, hypersensitivity reactions, infections (including activation of latent viral infections such as BK virus-associated nephropathy), malignancy.

Interactions

Drug-Drug: Azithromycin, clarithromycin, allopurinol, amiodarone, bromocriptine, colchicine, danazol, digoxin, diltiazem, erythromycin, flucanazole, fluoroquinolones, imatinib, itraconazole, ketoconazole, voriconazole, metoclopramide, methylprednisolone, nefazodone, nocardipine, protease inhibitors, quinupristin/dalfopristin, verapamil, or hormonal contraceptives may ↑ serum levels and risk of toxicity. ↑ immunosuppression with other immunosuppressants (cyclophosphamide, azathioprine, corticosteroids). Carbamazepine, nafcillin, octreotide, orlistat, oxcarbazepine, phenobarbital, phenytoin, rifampin, rifabutin, or terbinafine may ↓ levels and effect. Bosentan may significantly ↓ levels; avoid concurrent use. ↑ risk of hyperkalemia with potassium-sparing diuretics, potassium supplements, or ACE inhibitors. May ↑ levels and risk of toxicity of aliskiren, bosentan, colchicine, digoxin, etoposide, HMG-CoA reductase inhibitors, methotrexate, nifedipine, repaglinide, and sirolimus. May ↑ levels and risk of toxicity of ambrisentan; do not titrate dose of ambrisentan up to maximum daily dose. May ↑ levels of and risk of bleeding with dabigatran; avoid concurrent use. May ↓ antibody response to live-virus vaccines and ↑ risk of adverse reactions; avoid concurrent use. Concurrent use with tacrolimus should be avoided. ↑ risk of renal impairment with ciprofloxacin, aminoglycosides, vancomycin, trimethoprim/sulfamethoxazole, melphalan, amphotericin B, ketoconazole, colchicine, NSAIDs, cimetidine, ranitidine, or fibric acid derivatives.

Drug-Natural Products: Concomitant use with echinacea and melatonin may interfere with immunosuppression. Use with St. John's wort may cause ↓ serum levels and organ rejection for transplant patients.

Drug-Food: Concurrent ingestion of grapefruit or grapefruit juice may ↑ serum levels and should be avoided. Food ↓ absorption of microemulsion products (Neoral).

Route/Dosage

Doses are adjusted on the basis of serum level monitoring.

Prevention of Transplant Rejection (Sandimmune)

PO (Adults and Children): 14–18 mg/kg/dose 4–12 hr before transplant then 5–15 mg/kg/day divided every 12–24 hr postoperatively, taper by 5% weekly to maintenance dose of 3–10 mg/kg/day.

IV (Adults and Children): 5–6 mg/kg/dose 4–12 hr before transplant, then 2–10 mg/kg/day in divided doses every 8–24 hr; change to PO as soon as possible.

Prevention of Transplant Rejection (Neoral)

PO (Adults and Children): 4–12 mg/kg/day divided every 12 hr (dose varies depending on organ transplanted).

Rheumatoid Arthritis (Neoral only)

PO (Adults and Children): 2.5 mg/kg/day given in 2 divided doses; may ↑ by 0.5–0.75 mg/kg/day after 8 and 12 wk, up to 4 mg/kg/day. ↓ dose by 25–50% if adverse reactions occur.

Severe Psoriasis (Neoral only)

PO (Adults): 2.5 mg/kg/day given in 2 divided doses, for at least 4 wk; then may ↑ by 0.5 mg/kg/day every 2 wk, up to 4 mg/kg/day. ↓ dose by 25–50% if adverse reactions occur.

Autoimmune Diseases (Neoral only)

PO (Adults and Children): 1–3 mg/kg/day.

Availability (generic available)

Microemulsion soft gelatin capsules (Gengraf, Neoral): 25 mg, 50 mg, 100 mg. **Microemulsion oral solution (Gengraf, Neoral):** 100 mg/mL. **Soft gelatin capsules (Sandimmune):** 25 mg, 100 mg. **Oral solution (Sandimmune):** 100 mg/mL. **Injection (Sandimmune):** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor serum creatinine level, intake and output ratios, daily weight, and BP during therapy. Report significant changes.
- Assess for any new signs or symptoms that may be suggestive of progressive multifocal leukoencephalopathy (PML), an opportunistic infection of the brain caused by the Jakob Cruzfeldt (JC) virus, that may be fatal; withhold dose and notify health care professional promptly. PML symptoms may begin gradually (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) and may include deteriorating renal function and renal graft loss.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (PRES) (impaired consciousness, convulsions, visual disturbances including blindness, loss of motor function, movement disorders and psychiatric disturbances, papilloedema, visual impairment). Usually reversible with discontinuation of cyclosporine. Occurs more often in patients with liver transplant than kidney transplant.
- **Prevention of Transplant Rejection:** Assess for symptoms of organ rejection throughout therapy.

- **IV:** Monitor patient for signs and symptoms of hypersensitivity (wheezing, dyspnea, flushing of face or neck) continuously during at least the first 30 min of each treatment and frequently thereafter. Oxygen, epinephrine, and equipment for treatment of anaphylaxis should be available with each IV dose.
- **Arthritis:** Assess pain and limitation of movement prior to and during administration.
- Prior to initiating therapy, perform a physical exam including BP on 2 occasions to determine baseline. Monitor BP every 2 wk during initial 3 mo, then monthly if stable. If hypertension occurs, dose should be reduced.
- **Psoriasis:** Assess skin lesions prior to and during therapy.
- **Lab Test Considerations:** Measure serum creatinine, BUN, CBC, magnesium, potassium, uric acid, and lipids at baseline, every 2 wk during initial therapy, and then monthly if stable. Nephrotoxicity may occur; report significant increases.
- May cause hepatotoxicity; monitor for ↑ AST, ALT, alkaline phosphatase, amylase, and bilirubin.
- May cause ↑ serum potassium and uric acid levels and ↓ serum magnesium levels.
- Serum lipid levels may be ↑.
- **Toxicity and Overdose:** Evaluate serum cyclosporine levels periodically during therapy. Dose may be adjusted daily, in response to levels, during initiation of therapy. Guidelines for desired serum levels will vary among institutions.

Potential Nursing Diagnoses

Chronic pain (Indications)

Risk for infection (Side Effects)

Implementation

- Do not confuse cyclosporine with cyclophosphamide or cycloserine. Do not confuse Sandimmune with Sandostatin.
- Given with other immunosuppressive agents. Protect transplant patients from staff and visitors who may carry infection. Maintain protective isolation as indicated.
- Microemulsion products (Neoral) and other products (Sandimmune) are not interchangeable.
- **PO:** Draw up oral solution in the pipette provided with the medication. Mix oral solution with milk, chocolate milk, apple juice, or orange juice, preferably at room temperature. Stir well and drink at once. Use a glass container and rinse with more diluent to ensure that total dose is taken. Administer oral doses with meals. Wipe pipette dry; do not wash after use.

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute each 1 mL (50 mg) of IV concentrate immediately before use

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

with 20–100 mL of D5W or 0.9% NaCl for injection. Solution is stable for 24 hr in D5W. In 0.9% NaCl, it is stable for 6 hr in a polyvinylchloride container and 12 hr in a glass container at room temperature.

Concentration: 2.5 mg/mL. **Rate:** Infuse slowly over 2–6 hr via infusion pump.

- **Continuous Infusion:** May be administered over 24 hr.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, meperidine, meropenem, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, nafcillin, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B liposome, cyanocobalamin, dantrolene, diazepam, idarubicin, nalbuphine, pentobarbital, phenobarbital, phenyt-

oin, rituximab, trastuzumab, trimethoprim/sulfamethoxazole, voriconazole.

Patient/Family Teaching

- Instruct patient to take medication at the same time each day with meals, as directed. Take missed doses as soon as remembered within 12 hr. Do not skip doses or double up on missed doses. Do not discontinue medication without advice of health care professional.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ, and stress need to notify health care professional immediately if they occur.
- Instruct patients and/or parents to notify health care professional if diarrhea develops; decreases absorption of cyclosporine and can result in rejection.
- Instruct patient to avoid grapefruit and grapefruit juice to prevent interaction with cyclosporine.
- Advise patient of common side effects (nephrotoxicity, ↑ BP, hand tremors, increased facial and body hair, gingival hyperplasia). Advise patients that if hair growth is excessive, depilatories or waxing can be used.
- Teach patient the correct method for monitoring BP. Instruct patient to notify health care professional of significant changes in BP or if hematuria, increased frequency, cloudy urine, decreased urine output, fever, sore throat, tiredness, or unusual bruising occurs.
- Instruct patient on proper oral hygiene. Meticulous oral hygiene and dental examinations for teeth cleaning and plaque control every 3 mo will help decrease gingival inflammation and hyperplasia.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking other Rx, OTC, or herbal products or receiving any vaccinations while taking this medication.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of follow-up exams and lab tests.

Evaluation/Desired Outcomes

- Prevention of rejection of transplanted tissues.
- Decrease in severity of pain in patients with rheumatoid arthritis.
- Increased ease of joint movement in patients with rheumatoid arthritis.
- Decrease in progression of psoriasis.

HIGH ALERT

cytarabine (syeh-tare-a-been)
 cytosine arabinoside,  Cytosar, Cyto-
 sar-U

Classification

Therapeutic: antineoplastics
 Pharmacologic: antimetabolites

Indications

IV: Used mainly in combination chemotherapeutic regimens for the treatment of leukemias and non-Hodgkin's lymphomas. **IT:** Prophylaxis and treatment of meningeal leukemia.

Action

Inhibits DNA synthesis by inhibiting DNA polymerase (cell-cycle S-phase-specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Absorption occurs from subcut sites, but blood levels are lower than with IV administration; IT administration results in negligible systemic exposure.

Distribution: Widely distributed; IV- and subcut-administered cytarabine crosses the blood-brain barrier but not in sufficient quantities. Crosses the placenta.

Metabolism and Excretion: Metabolized mostly by the liver; <10% excreted unchanged by the kidneys. Metabolism to inactive drug in the CSF is negligible because the enzyme that metabolizes it is present in very low concentrations in the CSF.

Half-life: IV, subcut—1–3 hr; IT—100–236 hr.

TIME/ACTION PROFILE (IV, subcut—effects on WBCs; IT—levels in CSF)

ROUTE	ONSET	PEAK	DURATION
Subcut, IV (1st phase)	24 hr	7–9 days	12 days
Subcut, IV (2nd phase)	15–24 days	15–24 days	25–34 days
IT	rapid	5 hr	14–28 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy or lactation; Active meningeal infection (IT only).

Use Cautiously in: Active infections; ↓ bone marrow reserve; Renal/hepatic impairment; Other chronic debilitating illnesses; **Rep:** Women of reproductive potential.

Adverse Reactions/Side Effects

CNS: CNS dysfunction (high dose), confusion, drowsiness, headache. **EENT:** corneal toxicity (high dose), hemorrhagic conjunctivitis (high dose), visual disturbances (including blindness). **Resp:** **PULMONARY EDEMA** (high dose). **CV:** edema. **GI:** nausea, vomiting, hepatotoxicity, severe GI ulceration (high dose), stomatitis. **GU:** urinary incontinence. **Derm:** alopecia, rash. **Endo:** sterility. **Hemat:** (less with IT use)—anemia, leukopenia, thrombocytopenia. **Metab:** hyperuricemia. **Neuro:** Intrathecally only—**CHEMICAL ARACHNOIDITIS**, abnormal gait. **Misc:** cytarabine syndrome, fever.

Interactions

Drug-Drug: ↑ bone marrow depression with other antineoplastics or radiation therapy. ↑ risk of cardiomyopathy when used in high-dose regimens with cyclophosphamide. May ↓ antibody response to live-virus vaccines and ↑ risk of adverse reactions. May ↓ absorption of digoxin tablets. May ↓ the efficacy of gentamicin when used to treat *Klebsiella pneumoniae* infections. Recent treatment with asparaginase may ↑ risk of pancreatitis. ↑ neurotoxicity with concurrently administered IT antineoplastics (IT only).

Route/Dosage

Dose regimens vary widely.

IV (Adults): Induction dose—200 mg/m²/day for 5 days q 2 wk as a single agent or 2–6 mg/kg/day (100–200 mg/m²/day) as a single daily dose or in 2–3 divided doses for 5–10 days or until remission occurs as part of combination chemotherapy. Maintenance—70–200 mg/m²/day for 2–5 days monthly. Refractory leukemias/lymphomas—3 g/m² q 12 hr for up to 12 doses.

Subcut (Adults): Maintenance—1–1.5 mg/kg q 1–4 wk.

IT (Adults): Usual dose = 30 mg/m² every 4 days; range = 5–75 mg/m² once daily for 4 days or every 4 days until CNS findings normalize, followed by one additional treatment.

Availability (generic available)

Powder for injection: 100 mg, 500 mg, 1 g, 2 g. **Solution for injection:** 20 mg/mL, 100 mg/mL.

NURSING IMPLICATIONS**Assessment**

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may decrease uric acid levels. Alkalinization of urine may increase excretion of uric acid.
- Assess nutritional status. Nausea and vomiting may occur within 1 hr of administration, especially if IV dose is administered rapidly, less severe if medication is infused slowly. Administering an antiemetic prior to and periodically throughout therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor patient for development of *cytarabine* or *ara-C syndrome* (fever, myalgia, bone pain, chest pain, maculopapular rash, conjunctivitis, malaise), which usually occurs 6–12 hr following administration. Corticosteroids may be used for treatment or prevention. If patient responds to corticosteroids, continue cytarabine and corticosteroids.
- **Assess patient for respiratory distress and pulmonary edema. Occurs with high doses rarely; may be fatal.**
- **Monitor patient for signs of anaphylaxis (rash, dyspnea, swelling). Epinephrine, corticosteroids, and resuscitation equipment should be readily available.**
- **IT:** CSF flow should be evaluated prior to IT therapy. Administer directly into CSF via an intraventricular reservoir or by direct injection into the lumbar sac slowly over 1–5 min. Following administration by lumbar puncture, patient should lie flat for 1 hr. **Chemical arachnoiditis (nausea, vomiting, headache, fever, back pain, CSF pleocytosis and neck rigidity, neck pain, or meningism) is an expected side effect of IT cytarabine. Incidence and severity of symptoms may be decreased with coadministration of dexamethasone. 4 mg bid, PO or IV, for 5 days beginning on day of injection.**
- Monitor patients receiving IT therapy continuously for the development of neurotoxicity (myelopathy, personality changes, dysarthria, ataxia, confusion, somnolence, coma). If neurotoxicity develops, decrease amount of subsequent doses and discontinue if neurotoxicity persists. Risk may be increased if cytarabine is administered intrathecally and IV within a few days.
- **Lab Test Considerations:** Monitor CBC with differential and platelet count prior to and frequently during therapy. Leukocyte counts begin to drop within 24 hr of administration. The initial nadir occurs in 7–9 days. After a small ↑ in the count, the second, deeper nadir occurs 15–24 days after administration. Platelet counts begin to ↓ 5 days after a dose, with a nadir at 12–15 days. Leukocyte and thrombocyte counts usually begin to ↑ 10 days after the nadirs. Therapy is usually withdrawn if leukocyte count is <1000/mm³ or platelet count is <50,000/

mm³. Bone marrow aspirations are recommended every 2 wk until remission occurs.

- Monitor renal (BUN and creatinine) and hepatic function (AST, ALT, bilirubin, alkaline phosphatase, and LDH) prior to and routinely during therapy.
- May cause ↑ uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- **High Alert:** Do not confuse high-dose and regular therapy. Fatalities have occurred with high-dose therapy.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- May be given subcut, direct IV, intermittent IV, continuous IV, or IT.
- **IV, Subcut:** Reconstitute 100-mg vials with 5 mL of bacteriostatic water for injection with benzyl alcohol 0.9% for a concentration of 20 mg/mL. Reconstitute 500-mg vials with 10 mL for a concentration of 50 mg/mL, 1-g vials with 10 mL, and 2-g vials with 20 mL for a concentration of 100 mg/mL. Reconstituted solution is stable for 48 hr. Do not administer a cloudy or hazy solution.

IV Administration

- **IV Push:** **Diluent:** Administer undiluted. **Concentration:** 100 mg/mL. **Rate:** Administer each 100 mg over 1–3 min.
- **Intermittent Infusion:** **Diluent:** May be further diluted in 0.9% NaCl, D5W, D10W, D5/0.9% NaCl, Ringer's solution, LR, or D5/LR. **Concentration:** Dilute doses in 100 mL of diluent. **Rate:** Infuse over 15–30 min.
- **Continuous Infusion:** Rate and concentration for IV infusion are ordered individually.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amifostine, amakacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, amsacrine, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, daunorubicin

hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxycycline, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meprobamate, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, amiodarone, amphotericin B colloidal, daptomycin, diazepam, ganciclovir, phenytoin.
- **IT Reconstitute IT doses with preservative-free 0.9% NaCl or autologous spinal fluid. Use immediately to prevent bacterial contamination.**

tion., Instruct patient to lie flat for 1 hr following IT injection. Monitor for immediate toxic reactions.

Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Report symptoms of infection (fever, chills, cough, hoarseness, sore throat, lower back or side pain, painful or difficult urination) immediately.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions (use soft toothbrush and electric razor, avoid falls, do not drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding).
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis may require treatment with opioid analgesics.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- **Rep:** Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 mo after therapy is concluded.
- Emphasize the need for periodic lab tests to monitor for side effects.
- **IT:** Inform patient about the expected side effects (headache, nausea, vomiting, fever) and about early signs of neurotoxicity. Instruct patient to notify health care professional if these signs occur.

Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemias.
- Decrease in size and spread of the tumor in non-Hodgkin's lymphomas. Therapy is continued every 2 wk until patient is in complete remission or thrombocyte count or leukocyte count falls below acceptable levels.
- Treatment of lymphomatous meningitis.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dabigatran (da-bi-gat-ran)

Pradaxa

Classification

Therapeutic: anticoagulants

Pharmacologic: thrombin inhibitors

Indications

To reduce the risk of stroke/systemic embolization associated with nonvalvular atrial fibrillation. Treatment of deep vein thrombosis or pulmonary embolism in patients who have been treated with parenteral anticoagulant for 5–10 days. To reduce the risk of recurrence of deep vein thrombosis or pulmonary embolism in patients who have been previously treated. Prevention of deep vein thrombosis and pulmonary embolism following hip replacement surgery.

Action

Acts as a direct inhibitor of thrombin. **Therapeutic Effects:** Lowered risk of thrombotic sequelae (stroke and systemic embolization) of nonvalvular atrial fibrillation.

Pharmacokinetics

Absorption: 3–7% absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Of the amount absorbed, mostly excreted by kidneys (80%); 86% of ingested dose is eliminated in feces due to poor bioavailability.

Half-life: 12–17 hr.

TIME/ACTION PROFILE (effects on coagulation)

ROUTE	ONSET	PEAK	DURATION
PO	within hours	unknown	2 days†

†Following discontinuation, 3–5 days in renal impairment.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active pathological bleeding; Concurrent use of P-glycoprotein (P-gp) inducers; Prosthetic heart valves (mechanical or bioprosthetic).

Use Cautiously in: Neuroaxial spinal anesthesia or spinal puncture, especially if concurrent with an indwelling epidural catheter, drugs affecting hemostasis, history of traumatic/repeated spinal puncture or spinal deformity (↑ risk of spinal hematoma); Concurrent medications/pre-existing conditions that ↑ bleeding-risk (other anticoagulants, antiplatelet agents, fibrinolytics, heparins, chronic NSAID use, labor and delivery); Renal impairment; Surgical procedures (discontinue 1–2 days prior if CCr ≥50 mL/min or 3–4 days prior if

CCr <50 mL/min; **Geri:** ↑ risk of bleeding; **Lactation:** Use cautiously during breast feeding; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

GI: abdominal pain, diarrhea, dyspepsia, gastritis, esophageal ulceration, nausea. **Hemat:** BLEEDING, thrombocytopenia. **Misc:** ANGIOEDEMA, hypersensitivity reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Concurrent use of other anticoagulants, antiplatelet agents, fibrinolytics, heparins, prasugrel, clopidogrel, or chronic use of NSAIDs ↑ risk of bleeding. Concurrent use of P-gp inducers including rifampin ↓ levels and effectiveness; avoid concurrent use. P-gp inhibitors, including dronedarone, ketoconazole (systemic), verapamil, quinidine, and ticagrelor may ↑ levels and the risk of bleeding; concomitant use should be avoided in patients with CCr 15–30 mL/min.

Route/Dosage**Reduction in Risk of Stroke/Systemic Embolism in Nonvalvular Atrial Fibrillation**

PO (Adults): 150 mg twice daily.

Renal Impairment

PO (Adults): CCr 30–50 mL/min and taking dronedarone or systemic ketoconazole—75 mg twice daily; CCr <30 mL/min and taking P-gp inhibitor—Avoid concomitant use; CCr 15–30 mL/min—75 mg twice daily; CCr <15 mL/min or on dialysis—Not recommended.

Treatment of and Reduction in Risk of Recurrence of Deep Vein Thrombosis or Pulmonary Embolism

PO (Adults): 150 mg twice daily.

Renal Impairment

PO (Adults): CCr <50 mL/min and taking P-gp inhibitor—Avoid concomitant use; CCr <30 mL/min or on dialysis—Not recommended.

Prevention of Deep Vein Thrombosis and Pulmonary Embolism Following Hip Replacement Surgery

PO (Adults): 110 mg taken 1–4 hr after surgery and once hemostasis achieved, then 220 mg once daily for 28–35 days; if unable to start on day of surgery, once hemostasis achieved, start with 220 mg once daily.

Renal Impairment

PO (Adults): CCr ≤30 mL/min or on dialysis—Not recommended; CCr <50 mL/min and taking P-gp inhibitor—Avoid concomitant use.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Availability

Capsules: 75 mg, 110 mg, 150 mg.

NURSING IMPLICATIONS**Assessment**

- Assess for symptoms of stroke or peripheral vascular disease periodically during therapy.
- Assess for symptoms of bleeding and blood loss; may be fatal. If reversal of anticoagulant effect is required, may use idarucizumab.
- **Lab Test Considerations:** Use aPTT or ECT, not INR, to assess anticoagulant activity, if needed.
- Monitor renal function prior to and periodically during therapy. Patients with renal impairment may require dose reduction or discontinuation.

Potential Nursing Diagnoses

Activity intolerance

Implementation

- When *converting from warfarin*, discontinue warfarin and start dabigatran when INR is <2.0.
- When *converting from dabigatran to warfarin*, adjust starting time based on creatinine clearance. For *CCr >50 mL/min*, start warfarin 3 days before discontinuing dabigatran. For *CCr 31–50 mL/min*, start warfarin 2 days before discontinuing dabigatran. For *CCr 15–30 mL/min*, start warfarin 1 day before discontinuing dabigatran. For *CCr <15 mL/min*, no recommendations can be made. INR will better reflect warfarin's effect after dabigatran has been stopped for at least 2 days.
- When *converting from parenteral anticoagulants*, start dabigatran up to 2 hr before next dose of parenteral drug is due or at time of discontinuation of parenteral therapy.
- When *converting to dabigatran from parenteral anticoagulants*, wait 12 hrs (*CCr ≥30 mL/min*) or 24 hr (*CCr <30 mL/min*) after last dose of dabigatran before initiating parenteral anticoagulant therapy.
- *For surgery*, discontinue dabigatran 1–2 days (*CCr ≥50 mL/min*) or 3–5 days (*CCr <50 mL/min*) before invasive or surgical procedures; consider longer times for major surgery, spinal puncture, or placement of a spinal or epidural catheter. If surgery cannot be delayed, bleeding risk is ↑. Assess bleeding risk with ecarin clotting time (ECT) or a PTT if ECT is not available.
- **PO:** Administer twice daily with a full glass of water without regard to food. Swallow capsule whole; do not open, crush, or chew; may result in increased exposure.
- If dabigatran is discontinued, consider starting another anticoagulant; discontinuation of dabigatran increases risk of thromboembolic events.

Patient/Family Teaching

- Instruct patient to take dabigatran as directed. Take missed doses as soon as remembered within 6 hr. If

<6 hr until next dose, skip dose and take next dose when scheduled; do not double doses. Do not discontinue without consulting health care professional. If temporarily discontinued, restart as soon as possible. Store dabigatran at room temperature. After opening bottle, use within 4 mo; discard unused dabigatran after 4 mo.

- Inform patient that they may bleed more easily or longer than usual. Advise patient to notify health care professional immediately if signs of bleeding (unusual bruising; pink or brown urine; red or black, tarry stools; coughing up blood; vomiting blood; pain or swelling in a joint; headache; dizziness; weakness; recurring nose bleeds; unusual bleeding from gums; heavier than normal menstrual bleeding; dyspepsia; abdominal pain; epigastric pain) occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Reduction in the risk of stroke and systemic embolism.

dabrafenib (da-braf-e-nib) Tafinlar

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

 Treatment of metastatic/unresectable melanoma in patients with the BRAF V600E mutation.  Treatment of metastatic/unresectable melanoma in patients with the BRAF V600E or V600K mutation (in combination with trametinib).

Action

Inhibits kinase, an enzyme that promotes cell proliferation. **Therapeutic Effects:** Decreased spread/progression of melanoma.

Pharmacokinetics

Absorption: Well absorbed (95%) following oral administration.

Distribution: Unknown.

Protein Binding: 99.7%.

Metabolism and Excretion: Mostly metabolized by CYP 2C8 and CYP3A4 enzyme systems. Two metabolites (hydroxy-dabrafenib and desmethyl-1–dabrafenib) have antineoplastic activity. Excreted as metabolites in feces (72%) and urine (23%).

Half-life: *Dabrafenib*—8 hr; *hydroxy-dabrafenib*—10 hr, *desmethyl-1-dabrafenib*—21–22 hr.

TIME/ACTION PROFILE (progression-free survival)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 mo	1–2 mo	8 mo

Contraindications/Precautions

Contraindicated in: **OB:** Pregnancy (may cause fetal harm); **Lactation:** Breast feeding should be avoided; Concurrent use of CYP3A4/CYP2C8 inhibitors or inducers (may significantly alter levels and effects).

Use Cautiously in: BRAF Wild-type melanoma (may ↑ proliferation); **⚠** History of glucose-6-phosphate dehydrogenase deficiency (may cause hemolytic anemia); Moderate to severe hepatic impairment (blood levels may be ↑); Moderate to severe renal impairment; **OB:** Patients with reproductive potential (hormonal contraceptives may be less effective, additional methods required); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache, fatigue. **CV:** HF, THROMBOEMBOLISM. **EENT:** iritis, retinal detachment, uveitis. **Endo:** hyperglycemia. **Resp:** cough, nasopharyngitis. **GI:** constipation, pancreatitis. **Derm:** alopecia, hyperkeratosis, palmar-plantar erythrodysesthesia, papilloma, cutaneous squamous cell carcinoma. **F and E:** hypophosphatemia, hyponatremia. **Hemat:** BLEEDING. **MS:** arthralgia, back pain, myalgia. **Misc:** MALIGNANCY, fever including serious febrile reactions, ↑ alkaline phosphatase, chills, tumor promotion.

Interactions

Drug-Drug: Concurrent use of strong inhibitors of CYP3A4 or CYP2C8, including ketoconazole, nefazodone, clarithromycin and gemfibrozil ↑ blood levels and the risk of toxicity and should be avoided. Careful monitoring for toxicity is required. Concurrent use of strong inducers of CYP3A4 or CYP2C8 including carbamazepine, phenobarbital, phenytoin, and rifampin ↓ blood levels and may ↓ effectiveness. Careful monitoring for decreased results is required. **Drugs that ↑ gastric pH** including antacids, H₂-receptor antagonists and proton pump inhibitors may ↓ blood levels and effectiveness. May ↓ effectiveness of other CYP3A4 substrates and CYP2C9 substrates, including midazolam, warfarin, dexamethasone, and hormonal contraceptives.

Drug-Natural Products: St. John's wort ↓ blood levels and may ↓ effectiveness; concurrent use should be avoided.

Route/Dosage

PO (Adults): 150 mg twice daily, continued until disease progression or unacceptable toxicity. Dose modifications recommended for various levels of related toxicities.

Availability

Capsules: 50 mg, 75 mg.

NURSING IMPLICATIONS

Assessment

- Perform skin examinations prior to starting therapy and every 2 mo during and for 6 mo after completion of therapy. *If intolerable Grade 2 skin toxicity, Grade 3 or Grade 4 occurs, withhold dabrafenib for up to 3 wks; if used with trametinib, withhold trametinib for up to 3 wks. If improved, resume at a lower dose. If not improved, permanently discontinue.*
- Monitor temperature. *If fever is 101.3°F to 104°F, withhold dabrafenib until fever resolves, then resume at same dose. If fever is >104°F or complicated by rigors, hypotension, dehydration, or renal failure, withhold until fever resolves, then resume at a reduced dose. For first reduction, decrease dose to 100 mg twice daily. For second dose reduction, decrease dose to 75 mg twice daily. For third dose reduction, decrease dose to 50 mg twice daily. If unable to tolerate 50 mg twice daily, discontinue dabrafenib.*
- Monitor for signs and symptoms of ocular toxicities (blurred vision, loss of vision, other vision changes, see color dots, halo around objects), swelling, redness, photophobia, eye pain). May require steroid and mydriatic ophthalmic drops. *If Grade 2-3 retinal pigment epithelial detachments (RPED) occur, do not modify dabrafenib dose. Withhold trametinib for up to 3 weeks. If improved to Grade 0-1, resume at lower dose. If not improved, permanently discontinue. If retinal vein occlusion occurs, do not modify dabrafenib dose. Discontinue trametinib permanently. If uveitis and iritis occur, withhold dabrafenib for up to 6 weeks. If improved to Grade 0-1, resume at same dose. If not improved, permanently discontinue dabrafenib. Do not modify trametinib dose.*
- Monitor cardiac function during therapy. *If asymptomatic, absolute decrease in LVEF ≥10% from baseline occurs and is below institutional lower limits of normal (LLN) from pretreatment value, do not modify dose if only taking dabrafenib. If also taking trametinib, withhold trametinib for up to 4 wks. If improved to normal LVEF, resume at lower dose. If not improved to normal LVEF value, permanently discontinue trametinib. If symptomatic congestive heart failure occurs with absolute decrease in LVEF >20% from baseline that is below*

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

LLN, withhold dabrafenib, if improved, resume at same dose. Permanently discontinue trametinib.

- Monitor for signs and symptoms of venous thromboembolism (shortness of breath, chest pain, arm or leg swelling, cool or pale arm or leg) during therapy. *If uncomplicated deep vein thrombosis (DVT) or pulmonary embolus (PE) occur, do not modify dabrafenib dose. Withhold trametinib for up to 3 weeks. If improved to Grade 0-1, resume at lower dose. If not improved, permanently discontinue. If life-threatening PE occurs, permanently discontinue dabrafenib and trametinib.*
- Monitor for signs and symptoms of interstitial lung disease or pneumonitis (cough, dyspnea, hypoxia, pleural effusion, infiltrates) during therapy. If signs and symptoms occur, do not modify dabrafenib dose; permanently discontinue trametinib.
- Assess for bleeding (headaches, dizziness, feeling weak, coughing up blood or blood clots, vomiting blood or vomit looks like “coffee grounds”, red or black stools that look like tar) during therapy. *If Grade 3 hemorrhagic event occurs, withhold dabrafenib and trametinib for up to 3 wks, if improved resume at lower level. If Grade 4 hemorrhagic event occurs, permanently discontinue dabrafenib and trametinib.*
- **Lab Test Considerations:** May cause hyperglycemia requiring increase in dose of or initiation of insulin or oral hypoglycemic agents. Monitor serum glucose levels in patients with pre-existing diabetes or hyperglycemia.
- May cause hypophosphatemia, ↑ alkaline phosphatase, and hyponatremia.
- Monitor for hemolytic anemia in patients with glucose-6-phosphate dehydrogenase (G6PD) deficiency.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

Implementation

- **⚠** Evidence of BRAF V600E or V600K mutation status must be confirmed prior to starting therapy with dabrafenib.
- **PO:** Administer twice daily about 12 hrs apart. Administer on an empty stomach at least 1 hr before or 2 hrs after a meal. Swallow capsules whole; do not open, crush, break, or chew.
- When administered with trametinib, administer once-daily dose of trametinib at same time each day with either morning or evening dose of dabrafenib.

Patient/Family Teaching

- Instruct patient to take dabrafenib as directed at least 1 hr before or 2 hrs after meals. Take missed doses as soon as remembered unless within 6 hrs of next dose, then skip missed dose and take regularly scheduled dose.
- Inform patient that dabrafenib increases risk of developing new cutaneous malignancies. Notify health

care professional immediately if new lesions (wart, skin sore or reddish bump that bleeds or does not heal) or changes in size or color of existing moles or lesions occur.

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John’s wort.
- Inform patient of potential side effects. Advise patient to notify health care professional if fever, signs and symptoms of hyperglycemia (increased thirst, urinating more often than normal, breath smells like fruit), or eye problems, bleeding, thromboembolism, heart failure (heart pounding or racing, shortness of breath, swelling of ankles and feet, feeling lightheaded) occur.
- **Rep:** Advise female patient to use a highly effective form of contraception during and for at least 2 wks after dabrafenib alone or 4 mo after treatment with dabrafenib and trametinib. Use a non-hormonal form of contraception; dabrafenib may decrease effectiveness of hormonal contraceptives. Advise patient to notify health care professional if pregnancy is suspected and to avoid breast feeding. Advise patients to seek counseling on fertility and family planning prior to beginning therapy; may impair fertility in females and may cause spermatogenesis in males.

Evaluation/Desired Outcomes

- Decrease in progression of malignant melanoma.

HIGH ALERT

dacarbazine (da-kar-ba-zeen)

★DTIC, DTIC-Dome

Classification

Therapeutic: antineoplastics

Pharmacologic: alkylating agents

Indications

Treatment of metastatic malignant melanoma (single agent). Treatment of Hodgkin’s disease as second-line therapy (with other agents).

Action

Disrupts DNA and RNA synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly growing tissue cells, especially malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Large volume of distribution; probably concentrates in liver; some CNS penetration.

Metabolism and Excretion: 50% metabolized by the liver, 50% excreted unchanged by the kidneys.

Half-life: 5 hr (↑ in renal and hepatic dysfunction).

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV (WBCs)	16–20 days	21–25 days	3–5 days
IV (platelets)	unknown	16 days	3–5 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Active infections; Bone marrow depression; **Pedi:** Children (safety not established); Renal dysfunction; Hepatic dysfunction.

Adverse Reactions/Side Effects

GI: **HEPATIC NECROSIS,** anorexia, nausea, vomiting, diarrhea, hepatic vein thrombosis. **Derm:** alopecia, facial flushing, photosensitivity, rash. **Endo:** gonadal suppression. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** pain at IV site, phlebitis at IV site, tissue necrosis. **MS:** myalgia. **Neuro:** facial paresthesia.

Misc: **ANAPHYLAXIS,** fever, flu-like syndrome, malaise.

Interactions

Drug-Drug: Additive bone marrow depression with other antineoplastics. Carbamazepine, phenobarbital, and rifampin may ↑ metabolism and decrease effectiveness. Blood levels may be ↑ with amiodarone, ciprofloxacin, fluvoxamine, ketoconazole, ofloxacin, isoniazid, or miconazole. May ↓ antibody response to live-virus vaccines and ↑ risk of adverse reactions.

Route/Dosage

Other regimens are used.

IV (Adults): *Malignant melanoma*—2–4.5 mg/kg/day for 10 days administered every 4 wk or 250 mg/m²/day for 5 days administered every 3 wk. *Hodgkin's disease*—150 mg/m²/day for 5 days (in combination with other agents) administered every 4 wk or 375 mg/m² (in combination with other agents) administered every 15 days.

Availability

Powder for injection: 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs prior to and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- Monitor IV site closely. Dacarbazine is an irritant. Instruct patient to notify health care professional immediately if discomfort at IV site occurs. Discontinue IV immediately if infiltration occurs. Applications of hot packs may relieve pain, burning sensation, and irritation at injection site.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which may be severe and last 1–12 hr. Administration of an antiemetic prior to and periodically during therapy, restricting oral intake for 4–6 hr prior to administration, and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status. Nausea usually decreases on subsequent doses.
- **Lab Test Considerations:** Monitor CBC and differential prior to and periodically throughout therapy. The nadir of thrombocytopenia occurs in 16 days. The nadir of leukopenia occurs in 3–4 wk. Recovery begins in 5 days. Withhold dose and notify physician if platelet count is <100,000/mm³ or leukocyte count is <4000/mm³.
- **Monitor for increased AST, ALT, BUN, and serum creatinine. May cause hepatic necrosis.**

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

IV Administration

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Reconstitute each 200-mg vial with 19.7 mL of sterile water for injection. Solution is colorless or clear yellow. Do not use solution that has turned pink. **Concentration:** 10 mg/mL. Solution is stable for 8 hr at room temperature and for 72 hr if refrigerated.
- **Intermittent Infusion:** **Diluent:** Further dilute with up to 250 mL of D5W or 0.9% NaCl. Stable for 24 hr if refrigerated or 8 hr at room temperature. **Rate:** Administer over 30–60 min.
- **Y-Site Compatibility:** amifostine, aztreonam, bivalirudin, caspofungin, daptomycin, dexmedetomidine, docetaxel, doxorubicin liposome, ertapenem, etoposide phosphate, fenoldopam, filgrastim, fludarabine, granisetron, hetastarch, levofloxacin, mechlorethamine, melphalan, nesiritide, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, quinu-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

pristin/dalfopristin, sargramostim, teniposide, thiopeta, tigecycline, tirofiban, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** allopurinol, amphotericin B liposome, cefepime, pantoprazole, pemetrexed, piperacillin/tazobactam.

Patient/Family Teaching

- **Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; abdominal pain; yellowing of eyes; or blood in urine, stool, or emesis occurs.** Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs; may increase GI irritation.
- May cause photosensitivity. Instruct patient to avoid sunlight or wear protective clothing and use sunscreen for 2 days after therapy.
- Instruct patient to inform health care professional if flu-like syndrome occurs. Symptoms include fever, myalgia, and general malaise. May occur after several courses of therapy. Usually occurs 1 wk after administration. May persist for 1–3 wk. Acetaminophen may be used for relief of symptoms.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for a nonhormonal method of contraception.
- Instruct patient not to receive any vaccinations without advice of health care professional.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignant melanoma or Hodgkin's lymphoma.

daclatasvir (da-kla-tass-veer)

Daklinza

Classification

Therapeutic: antivirals

Pharmacologic: NS5A inhibitors

Indications

⊕ Treatment of chronic hepatitis C virus (HCV) genotype 1 or 3 infection in combination with sofosbuvir.

Action

⊕ Acts as a direct acting antiviral. Inhibits NS5A, a HCV-encoded protein, resulting in inhibited viral RNA replication and virion assembly. **Therapeutic Effects:** Decreased presence of HCV with decreased sequelae of HCV infection.

Pharmacokinetics

Absorption: Well absorbed (67%) following oral administration.

Distribution: Unknown.

Protein Binding: 99%.

Metabolism and Excretion: Metabolized mostly by the CYP3A enzyme system. 88% excreted in feces (53% as unchanged drug); 6.6% excreted unchanged in urine.

Half-life: 12–15 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A inducers.

Use Cautiously in: Cirrhosis (sustained virologic response is ↓); Concurrent use with dabigatran; Receiving immunosuppressant or chemotherapy medications (↑ risk of hepatitis B virus reactivation); **OB:** Consider benefits and risks carefully; **Lactation:** Beneficial effects of breast feeding should be weighed against potential adverse drug effects; **Pedi:** Safety and effectiveness not established.

Exercise Extreme Caution in: Concurrent use of amiodarone (with sofosbuvir).

Adverse Reactions/Side Effects

CNS: fatigue, headache. **GI:** diarrhea, nausea. **Misc:** HEPATITIS B VIRUS REACTIVATION.

Interactions

Drug-Drug: **Strong CYP3A inducers** including carbamazepine, phenytoin and rifampin may ↓ levels and effectiveness; concurrent use contraindicated.

Moderate CYP3A inducers including bosentan, dexamethasone, efavirenz, modafinil, nafcillin and rifapentine may ↓ levels and effectiveness (↑ dose required). Concurrent use with amiodarone and sofosbuvir ↑ risk of serious bradycardia and should be avoided, especially if beta blockers are being used/concurrent cardiovascular/liver disease is present.

Strong CYP3A inhibitors, including atazanavir/ritonavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, posaconazole, saquinavir, and voriconazole ↑ blood levels and risk of adverse effects (↓ dose required). Concurrent use of moderate CYP3A inhibitors, including atazanavir, ciprofloxacin, darunavir/ritonavir, diltiazem, erythromycin, fluconazole, fosamprenavir and verapamil ↑ blood levels and may ↑ risk of adverse reactions (clinical monitoring recommended). ↑ levels and risk of toxicity with digoxin (↓ initial dose of digoxin/↓ dose of chronic digoxin may be necessary, careful clinical monitoring recommended). ↑ levels and risk of adverse effects including myopathy with HMG-CoA reductase inhibitors (monitor effects and ↓ dose if necessary).

Drug-Natural Products: Concurrent use of St. John's wort ↓ levels and effectiveness; concurrent use contraindicated.

Route/Dosage

PO (Adults): *Genotype 1 (without cirrhosis or with compensated cirrhosis [Cbild-Pugh A])*—60 mg once daily with sofosbuvir for 12 wk; *Genotype 1 (with decompensated cirrhosis [Cbild-Pugh B or C] or post-liver transplant)*—60 mg once daily with sofosbuvir and ribavirin for 12 wk; *Genotype 3 (without cirrhosis)*—60 mg once daily with sofosbuvir for 12 wk; *Genotype 3 (with compensated cirrhosis [Cbild-Pugh A], decompensated cirrhosis [Cbild-Pugh B or C], or post-liver transplant)*—60 mg once daily with sofosbuvir and ribavirin for 12 wk; *Concurrent use of strong CYP3A inhibitors*—30 mg once daily; *Concurrent use of moderate CYP3A inducers or nevirapine*—90 mg once daily.

Availability

Tablets: 30 mg, 60 mg, 90 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of chronic hepatitis C.
- Monitor for clinical and laboratory signs of hepatitis flare or HBV reactivation during therapy and post-treatment follow-up in patients with serologic evidence of HBV infection. Initiate therapy for HBV infection as indicated.
- **Lab Test Considerations:** Test all patients for current or prior hepatitis B virus (HBV) infection by measuring hepatitis B surface antigen (HBsAg) and hepatitis B core antibody (anti-HBc) before starting therapy. Monitor for HBV reactivation during and following therapy.
- \mathbb{H} Obtain NS5A resistance testing in patients with HCV genotype 1a and cirrhosis prior to starting therapy.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Must be administered in conjunction with sofosbuvir. If sofosbuvir is permanently discontinued, daclatasvir must also be discontinued.
- **PO:** Administer once daily without regard to food for 12 wk.

Patient/Family Teaching

- Instruct patient to take daclatasvir with sofosbuvir as directed. Take missed dose as soon as remembered in same day. If not until next day, skip dose and take next dose as scheduled; do not double doses. Advise patient to read *Patient Information* for each medication before starting therapy and with each Rx refill in case of changes.
- Advise patient receiving beta-blockers or having underlying significant cardiovascular/hepatic disease

to notify health care professional if signs and symptoms of bradycardia (near-fainting or fainting, dizziness, malaise, weakness, excessive tiredness, shortness of breath, chest pain, confusion, memory problems) occur.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased presence of HCV with decreased sequelae of HCV infection.

dalbavancin (dal-ba-van-sin)

Dalvance

Classification

Therapeutic: anti-infectives
Pharmacologic: lipoglycopeptides

Indications

Treatment of skin/skin structure infections due to susceptible bacteria.

Action

Binds to bacterial cell wall resulting in cell death.

Therapeutic Effects: Bactericidal action against susceptible bacteria with resolution of infection. **Spec-trum:** Active against *Staphylococcus aureus* (including methicillin-susceptible and resistant strains), *Streptococcus agalactiae*, *Streptococcus anginosus* (including *S. anginosus*, *S. intermedius* and *S. constellatus*) and *Streptococcus pyogenes*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Penetrates tissues and fluids.

Metabolism and Excretion: 33% eliminated unchanged in urine, 12% eliminated as inactive metabolite, 20% excreted in feces.

Half-life: 346 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	1 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal impairment (dose adjustment required for CrCl <30 mL/min; Moderate to severe

* = Canadian drug name. \mathbb{H} = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

hepatic impairment; **Geri**: Consider age-related decrease in renal function; **OB**: Use during pregnancy only if potential benefit justifies potential risk to the fetus; **Lactation**: Use cautiously if breast feeding; **Pedi**: Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: headache. **GI**: **DIARRHEA** including *Clostridium difficile*, ↑ ALT, nausea. **Derm**: pruritus, rash. **Misc**: hypersensitivity reactions including **ANAPHYLAXIS**, infusion reactions including Red-Man Syndrome.

Interactions

Drug-Drug: None noted.

Route/Dosage

IV (Adults): 1500 mg once or 1000 mg followed 1 wk later by 500 mg.

Renal Impairment

IV (Adults): *CCr* <30 mL/min—1125 mg once or 750 mg followed 1 wk later by 375 mg.

Availability

Lyophilized powder for intravenous injection: 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridium difficile*-associated diarrhea (CDAD). May begin up to 2 mo following cessation of therapy.
- Monitor for infusion reactions (Red-man syndrome—flushing of upper body, urticaria, pruritus, rash). May resolve with stopping or slowing infusion.
- **Lab Test Considerations:** Monitor hepatic function tests. May cause ↑ ALT, AST, and bilirubin.

Potential Nursing Diagnoses

Risk for infection (Indications)

Diarrhea (Adverse Reactions)

Implementation

IV Administration

- **Intermittent Infusion:** Reconstitute with 25 mL of Sterile water or D5W in each 500 mg vial. Alternate gentle swirling and inverting to avoid foaming, until completely dissolved. Do not shake. Reconstituted vial contains a clear colorless to yellow solution. Do not administer solutions that are discolored or contain particulate matter. Transfer reconstituted solution into D5W. **Concentration:** 1 mg/mL to 5 mg/

mL. Discard unused solution. May be refrigerated or kept at room temperature; do not freeze. Infuse within 48 hr of reconstitution. Do not administer solutions containing particulate matter. **Rate:** Infuse over 30 min.

- **Y-Site Incompatibility:** Do not infuse with other medications or electrolytes. Saline solutions may cause precipitation. Flush line before and after infusion with D5W.

Patient/Family Teaching

- **Instruct patient to notify health care professional if signs and symptoms of hypersensitivity reactions (rash, hives, dyspnea, facial swelling) occur.**
- **Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with anti-diarrheals without consulting health care professional.**
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise female patients to use effective contraception during therapy and to notify health care professional if pregnancy is suspected or if breast feeding.
- Instruct the patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

dalfampridine

(dal-fam-pri-deen)

Ampyra, ★ Fampyra

Classification

Therapeutic: anti-multiple sclerosis agents
Pharmacologic: potassium channel blockers

Indications

Treatment of multiple sclerosis, to improve walking speed.

Action

Acts as a potassium channel blocker, which may increase conduction of action potentials. **Therapeutic Effects:** Increased walking speed in patients with multiple sclerosis.

Pharmacokinetics

Absorption: Rapidly and completely absorbed (96%).

Distribution: Unknown.

Metabolism and Excretion: 96% eliminated in urine, 0.5% in feces.

Half-life: 5.2–6.5 hr.

TIME/ACTION PROFILE (improvement in walking speed)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of seizures; Moderate/severe renal impairment (CCr \leq 50 mL/min) (\uparrow risk of seizures); **Lactation:** Avoid use.

Use Cautiously in: Mild renal impairment (CCr 51–80 mL/min) (\uparrow risk of seizures); **Geriatric:** Consider age-related \downarrow in renal function; **OB:** Use only if potential benefit justifies potential risk to fetus; **Pediatric:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache, insomnia, weakness. **EENT:** nasopharyngitis, pharyngolaryngeal pain. **GI:** constipation, dyspepsia, nausea. **GU:** urinary tract infection. **MS:** back pain. **Neuro:** balance disorder, multiple sclerosis relapse, paresthesia. **Misc:** ANAPHYLAXIS.

Interactions

Drug-Drug: None noted.

Route/Dosage

PO (Adults): 10 mg twice daily.

Availability (generic available)

Extended-release tablets: 10 mg.

NURSING IMPLICATIONS**Assessment**

- Assess walking speed in patients with multiple sclerosis prior to and periodically during therapy.
- Monitor for seizures during therapy, risk increases with increased dose. If seizure occurs, discontinue therapy.
- Monitor for signs and symptoms of anaphylaxis (dyspnea, wheezing, urticaria, angioedema of the throat or tongue) during therapy.
- **Lab Test Considerations:** Monitor CCr prior to and at least yearly during therapy; renal impairment may require dose reduction or discontinuation.

Potential Nursing Diagnoses

Impaired walking (Indications)

Implementation

- Administer tablets twice daily approximately 12 hr apart without regard to food. Swallow tablets whole; do not break, crush, chew, or dissolve.

Patient/Family Teaching

- Instruct patient to take dalfampridine as directed, with approximately 12 hrs between tablets. If a dose is missed, omit and take next scheduled dose on

time; do not double doses. May increase risk of seizures. Advise patient to read *Medication Guide* prior to beginning therapy and with each Rx refill; new information may be available.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- If a seizure or signs or symptoms of anaphylaxis occur, advise patient to notify health care professional immediately, to discontinue dalfampridine and do not restart medication.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved walking and increased walking speed in patients with multiple sclerosis.

dalteparin, See HEPARINS (LOW MOLECULAR WEIGHT).**dantrolene** (dan-troe-leen)

Dantrium, Ryanodex

Classification

Therapeutic: skeletal muscle relaxants (direct acting)

Indications

PO: Treatment of spasticity associated with: Spinal cord injury, stroke, cerebral palsy, multiple sclerosis. Prophylaxis of malignant hyperthermia. **IV:** Emergency treatment of malignant hyperthermia. Prevention of malignant hyperthermia in patients at high risk. **Unlabeled Use:** Management of neuroleptic malignant syndrome.

Action

Acts directly on skeletal muscle, causing relaxation by decreasing calcium release from sarcoplasmic reticulum in muscle cells. Prevents intense catabolic process associated with malignant hyperthermia. **Therapeutic Effects:** Reduction of muscle spasticity. Treatment and prevention of malignant hyperthermia.

Pharmacokinetics

Absorption: 35% absorbed after oral administration. IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Almost entirely metabolized by the liver.

Half-life: 8.7–11.4 hr.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (effects on spasticity)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	unknown	6–12 hr
IV	rapid	rapid	unknown

Contraindications/Precautions

Contraindicated in: No contraindications to IV form in treatment of malignant hyperthermia; **Lactation:** Lactation; Situations in which spasticity is used to maintain posture or balance.

Use Cautiously in: Cardiac, pulmonary, or previous liver disease; Women and patients >35 yr (↑ risk of hepatotoxicity); **Geri:** Use lowest possible dose (may have ↑ risk of hepatotoxicity); **OB:** Use only if benefit outweighs potential risk to fetus.

Adverse Reactions/Side Effects

CNS: drowsiness, muscle weakness, confusion, dizziness, headache, insomnia, malaise, nervousness.

EENT: excessive lacrimation, visual disturbances.

Resp: dyspnea, pleural effusions, respiratory depression. **CV:** changes in BP, heart failure, tachycardia. **GI:** HEPATOTOXICITY, diarrhea, anorexia, cramps, dysphagia, GI bleeding, nausea, vomiting. **GU:** crystalluria, dysuria, frequency, erectile dysfunction, incontinence, nocturia. **Derm:** flushing, pruritus, sweating, urticaria. **Hemat:** anemia, aplastic anemia, eosinophilia, leukopenia, thrombocytopenia. **Local:** irritation at IV site, phlebitis. **MS:** myalgia. **Misc:** ANAPHYLAXIS, chills, drooling, fever.

Interactions

Drug-Drug: Calcium channel blockers may ↑ risk of cardiovascular collapse; avoid concomitant use. Additive CNS depression with CNS depressants, including alcohol, antihistamines, opioid analgesics, sedative/hypnotics, and parenteral magnesium sulfate. ↑ risk of hepatotoxicity with other hepatotoxic agents or estrogens. ↑ risk of arrhythmias with verapamil. ↑ neuromuscular blocking effects of vecuronium.

Drug-Natural Products: Concomitant use of kava-kava, valerian, chamomile, or hops can ↑ CNS depression.

Route/Dosage

PO (Adults): Spasticity—25 mg once daily for 7 days, then 25 mg 2 times daily for 7 days, then 50 mg 3 times daily for 7 days, then 100 mg 3 times daily; may ↑ to 100 mg 4 times daily, if needed. *Prevention of malignant hyperthermia*—4–8 mg/kg/day in 3–4 divided doses for 1–2 days before procedure, last dose 3–4 hr preop. *Posthyperthermic crisis follow-up*—4–8 mg/kg/day in 3–4 divided doses for 1–3 days after IV treatment.

PO (Children >5 yr): Spasticity—0.5 mg/kg once daily for 7 days, then 0.5 mg/kg 3 times daily for 7 days, then 1 mg/kg 3 times daily for 7 days, then 2 mg/kg 3 times daily (not to exceed 400 mg/day). *Prevention of*

malignant hyperthermia—4–8 mg/kg/day in 3–4 divided doses for 1–2 days before procedure, last dose 3–4 hr preop. *Posthyperthermic crisis follow-up*—4–8 mg/kg/day in 3–4 divided doses for 1–3 days after IV treatment.

IV (Adults and Children): *Treatment of malignant hyperthermia*—at least 1 mg/kg, continued until symptoms ↓ or a cumulative dose of 10 mg/kg has been given. If symptoms reappear, dose may be repeated. *Prevention of malignant hyperthermia*—2.5 mg/kg given 75 min before surgery.

Availability (generic available)

Capsules: 25 mg, 50 mg, 100 mg. **Powder for injection:** 20 mg/vial, 250 mg/vial.

NURSING IMPLICATIONS**Assessment**

- Assess bowel function periodically. Persistent diarrhea may warrant discontinuation of therapy.
- **Muscle Spasticity:** Assess neuromuscular status and muscle spasticity before initiating and periodically during therapy to determine response.
- **Malignant Hyperthermia:** Assess previous anesthesia history of all surgical patients. Also assess for family history of reactions to anesthesia (malignant hyperthermia or perioperative death).
- Monitor ECG, vital signs, electrolytes, and urine output continuously when administering IV for malignant hyperthermia.
- Monitor patient for difficulty swallowing and choking during meals on the day of administration.
- **Lab Test Considerations:** Monitor liver function frequently during therapy. Liver function abnormalities (↑ AST, ALT, alkaline phosphatase, bilirubin, GGTP) may require discontinuation of therapy.
- Evaluate renal function and CBC before and periodically during therapy in patients receiving prolonged therapy.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Acute pain (Indications)

Risk for injury (Side Effects)

Implementation

- **PO:** If gastric irritation becomes a problem, may be administered with food. Oral suspensions may be made by opening capsules and adding them to fruit juices or other liquids. Drink immediately after mixing.
- Oral dose for spasticity should be divided into 4 doses/day.
- Oral dose is not indicated for neuroleptic malignant syndrome.

IV Administration

- Reconstitute each 20 mg of **Dantrium** with 60 mL of sterile water for injection (without a bacteriostatic agent). Shake until solution is clear. Solution must

be used within 6 hr. Protect diluted solution from direct light.

- Reconstitute **Ryanodex** by adding 5 mL of Sterile Water for Injection; do not reconstitute with other solutions. Shake vial to ensure uniform orange suspension. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 6 hrs at room temperature.

Treatment of Malignant Hyperthermia

- **IV Push:** Administer reconstituted solution without further dilution. **Rate:** Administer each single dose by rapid continuous IV push through Y-tubing. Follow immediately with subsequent doses as indicated. Medication is very irritating to tissues; observe infusion site frequently to avoid extravasation.

Prevention of Malignant Hyperthermia

- **IV Push:** Rates of products for prevention differ. **Rate:** Inject **Ryanodex** over at least 1 min starting 75 min before surgery into catheter with free flowing 0.9% NaCl or D5W or into a patent indwelling catheter, flush before and after injection.
- **Intermittent Infusion:** Reconstitute required number of **Dantrium** vials as above and transfer to a larger volume sterile plastic bag (do not use glass bottles). **Rate:** Administer over 1 hr beginning 75 min before anesthesia.
- **Y-Site Compatibility:** acyclovir, paclitaxel, palonosetron.
- **Y-Site Incompatibility:** alemtuzumab, alfentanil, amikacin, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, asparaginase, atropine, azathioprine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carmustine, caspofungin, cefotaxime, cefotetan, ceftaxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclosporine, dactinomycin, daptomycin, dexamethasone, diazepam, diazoxide, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gencitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, hydroxyzine, idarubicin, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperi-

dine, mesna, metamamol, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, phenytoin, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zoledronic acid.

Patient/Family Teaching

- Advise patient not to take more medication than the amount prescribed, to minimize risk of hepatotoxicity and other side effects. If a dose is missed, do not take unless remembered within 1 hr. Do not double doses.
- May cause dizziness, drowsiness, visual disturbances, and muscle weakness. Advise patient to avoid driving and other activities requiring alertness until response to drug is known. After IV dose for surgery, patients may experience decreased grip strength, leg weakness, light-headedness, and difficulty swallowing for up to 48 hr. Caution patients to avoid activities requiring alertness and to use caution when walking down stairs and eating during this period.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Instruct patient to notify health care professional if rash; itching; yellow eyes or skin; dark urine; or clay-colored, bloody, or black, tarry stools occur or if nausea, weakness, malaise, fatigue, or diarrhea persists. May require discontinuation of therapy.
- Advise patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the importance of follow-up exams to check progress in long-term therapy and blood tests to monitor for side effects.
- **Malignant Hyperthermia:** Patients with malignant hyperthermia should carry identification describing disease process at all times.

Evaluation/Desired Outcomes

- Relief of muscle spasm in musculoskeletal conditions. One wk or more may be required to see im-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

provement; if there is no observed improvement in 45 days, the medication is usually discontinued.

- Prevention of or decrease in temperature and skeletal rigidity in malignant hyperthermia.

DAPToMycin (dap-to-mye-sin)

Cubicin, Cubicin RF

Classification

Therapeutic: anti-infectives

Pharmacologic: cyclic lipopeptide antibacterial agents

Indications

Complicated skin and skin structure infections caused by aerobic Gram-positive bacteria. *Staphylococcus aureus* bacteremia, including right-sided infective endocarditis caused by methicillin-susceptible and methicillin-resistant strains.

Action

Causes rapid depolarization of membrane potential following binding to bacterial membrane; this results in inhibition of protein, DNA, and RNA synthesis. **Therapeutic Effects:** Death of bacteria with resolution of infection. **Spectrum:** Active against *Staphylococcus aureus* (including methicillin-resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, some *S. dysgalactiae*, and *Enterococcus faecalis* (vancomycin-susceptible strains).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: 92%.
Metabolism and Excretion: Metabolism not known; mostly excreted by kidneys.
Half-life: 8.1 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: CCr <30 mL/min (dose ↓ required); Moderate-to-severe renal impairment (may have ↓ clinical response); **Geri:** May have ↓ clinical response with ↑ risk of adverse reactions; **OB:** Use only if clearly needed; **Lactation:** Lactation; **Pedi:** Children <1 yr (↑ risk of muscular, neuromuscular, and CNS effects; avoid use).

Adverse Reactions/Side Effects

CNS: dizziness. **Resp:** EOSINOPHILIC PNEUMONIA, dyspnea. **CV:** hypertension, hypotension. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), constipation,

diarrhea, nausea, vomiting, ↑ liver enzymes. **GU:** renal failure. **Derm:** DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), pruritus, rash. **Hemat:** anemia. **Local:** injection site reactions. **MS:** ↑ CPK. **Misc:** ANGIOEDEMA, fever.

Interactions

Drug-Drug: Tobramycin ↑ blood levels. Concurrent HMG-CoA reductase inhibitors may ↑ the risk of myopathy.

Route/Dosage

Complicated Skin/Skin Structure Infections

IV (Adults): 4 mg/kg every 24 hr for 7–14 days.

IV (Children 12–17 yr): 5 mg/kg every 24 hr for up to 14 days.

IV (Children 7–11 yr): 7 mg/kg every 24 hr for up to 14 days.

IV (Children 2–6 yr): 9 mg/kg every 24 hr for up to 14 days.

IV (Children 1–<2 yr): 10 mg/kg every 24 hr for up to 14 days.

Renal Impairment

IV (Adults): CCr <30 mL/min—4 mg/kg every 48 hr for 7–14 days; Hemodialysis and CAPD—4 mg/kg every 48 hr for 2–6 wk with dose administered after hemodialysis on hemodialysis days.

Staphylococcus aureus Bacteremia/Right-Sided Infective Endocarditis)

IV (Adults): 6 mg/kg every 24 hr for 2–6 wk.

IV (Adults): CCr <30 mL/min—6 mg/kg every 48 hr for 2–6 wk; Hemodialysis and CAPD—6 mg/kg every 48 hr for 2–6 wk with dose administered after hemodialysis on hemodialysis days.

Renal Impairment

IV (Adults): CCr <30 mL/min—6 mg/kg every 48 hr for 2–6 wk; Hemodialysis and CAPD—6 mg/kg every 48 hr for 2–6 wk with dose administered after hemodialysis on hemodialysis days.

Availability (generic available)

Lyophilized powder for injection: 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Monitor for signs and symptoms of eosinophilic pneumonia (new onset or worsening fever, dyspnea,

difficulty breathing, new infiltrates on chest imaging studies). Discontinue daptomycin if symptoms occur.

- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- Monitor for development of muscle pain or weakness, particularly of distal extremities. Discontinue daptomycin in patients with unexplained signs and symptoms of myopathy in conjunction with CPK elevation > 1000 U/L, or in patients without reported symptoms who have marked elevations in CPK > 2000 U/L. Consider temporarily suspending agents associated with rhabdomyolysis (HMG-CoA reductase inhibitors) in patients receiving daptomycin.
- **Lab Test Considerations:** Monitor CPK weekly, more frequently in patients with unexplained ↑. Discontinue daptomycin if CPK > 1000 units/L and signs and symptoms of myopathy occur. In patients with renal insufficiency, monitor both renal function and CPK more frequently.
- May cause false prolongation of PT and ↑ INR.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- Do not confuse daptomycin with dactinomycin.

IV Administration

Cubicin

- **IV Push:** Reconstitute 500-mg vial with 10 mL of 0.9% NaCl inserted toward wall of vial. Rotate vial gently to wet powder. Allow to stand for 10 min undisturbed. Swirl vial gently to completely reconstitute solution. Reconstituted vials are stable for 12 hr at room temperature or 48 hr if refrigerated. **Concentration:** 50 mg/mL. **Rate:** Administer over 2 min (for adults only).
- **Intermittent Infusion: Adults: Diluent:** Dilute further in 50 mL of 0.9% NaCl. Solution is stable for 12 hr at room temperature or 48 hr if refrigerated. Do not administer solutions that are cloudy or contain a precipitate. **Rate:** Infuse over 30 min. Do not infuse daptomycin with ReadyMED elastomeric infusion pumps due to incompatibility.
- **Intermittent Infusion: Children 1–6 yrs: Diluent:** Dilute further into a 25 mL IV infusion bag of 0.9% NaCl. **Rate:** Infuse over 60 min at a rate of 0.42 mL/min.
- **Intermittent Infusion: Children 7–17 yrs: Diluent:** Dilute further into a 50 mL IV infusion bag of

0.9% NaCl. **Rate:** Infuse over 30 min at a rate of 1.67 mL/min.

Cubicin RF

- **IV Push:** Reconstitute with 10 mL of Sterile Water for Injection or Bacteriostatic Water for Injection through center of rubber stopper into vial. Use a beveled sterile transfer needle that is 21 gauge or smaller, pointing transfer needle toward the wall of the vial. Rotate or swirl vial to mix. **Concentration:** 50 mg/mL. Do not use saline solutions to reconstitute. Remove reconstituted solution from vial using a beveled sterile needle that is 21 gauge or smaller. Solution is stable for 1 day at room temperature or 3 days if refrigerated. Do not administer solutions that are cloudy or contain particulate matter. **Rate:** Inject over 2 min (for adults only).
- **Intermittent Infusion: Adults: Diluent:** Dilute further diluted into a 50 mL IV infusion bag of 0.9% NaCl. If reconstituted with Sterile Water, solution is stable for 19 hrs at room temperature or 3 days if refrigerated. If reconstituted with Bacteriostatic Water, solution is stable for 2 days at room temperature or 5 days if refrigerated. **Rate:** Infuse over 30 min.
- **Intermittent Infusion: Children 1–6 yrs: Diluent:** Dilute further into a 25 mL IV infusion bag of 0.9% NaCl. **Rate:** Infuse over 60 min at a rate of 0.42 mL/min.
- **Intermittent Infusion: Children 7–17 yrs: Diluent:** Dilute further into a 50 mL IV infusion bag of 0.9% NaCl. **Rate:** Infuse over 30 min at a rate of 1.67 mL/min.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, calciprotein, carmustine, caspofungin, ce-fazolin, cefepime, cefotaxime, cefotetan, ceftazidime, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daunorubicin hydrochloride, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, eripapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin,

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

hydralazine, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, rocuronium, sodium acetate, sodium bicarbonate, sodium citrate, sodium phosphates, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, alemtuzumab, allopurinol, amphotericin B colloidal, amphotericin B lipid complex, cytarabine, dantrolene, gemcitabine, imipenem/cilastatin, methotrexate, metronidazole, mitomycin, nesiritide, nitroglycerin, pantoprazole, pentazocine, pentobarbital, phenytoin, remifentanyl, streptozocin, sufentanyl, thiopental, vancomycin.

- **Solution Incompatibility:** D5W.

Patient/Family Teaching

- Inform patient of purpose of daptomycin.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Advise patient to notify health care professional immediately if signs and symptoms of eosinophilic pneumonia occur.**

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

darbepoetin (dar-be-poh-e-tin)

Aranesp

Classification

Therapeutic: antianemics

Pharmacologic: hormones (rDNA), erythropoiesis stimulating agents (ESA)

Indications

Anemia associated with chronic kidney disease (CKD). Chemotherapy-induced anemia in patients with non-myeloid malignancies when there is ≥ 2 additional mo of planned chemotherapy.

Action

Stimulates erythropoiesis (production of red blood cells). **Therapeutic Effects:** Maintains and may elevate red blood cell counts, decreasing the need for transfusions.

Pharmacokinetics

Absorption: 30–50% following subcut administration; IV administration results in complete bioavailability.

Distribution: Confined to the intravascular space.

Metabolism and Excretion: Unknown.

Half-life: *Subcut*—49 hr; *IV*—21 hr.

TIME/ACTION PROFILE (↑ in RBCs)

ROUTE	ONSET	PEAK	DURATION
IV, Subcut	2–6 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled hypertension; Patients with cancer receiving hormonal agents, biologic products, or radiotherapy, unless also receiving concomitant myelosuppressive chemotherapy; Patients receiving chemotherapy when anticipated outcome is cure; Patients with cancer receiving myelosuppressive chemotherapy in whom the anemia can be managed by transfusion; Patients who require immediate correction of anemia when RBC transfusions can be used instead.

Use Cautiously in: Cardiovascular disease or stroke; Underlying hematologic diseases, including hemolytic anemia, sickle-cell anemia, thalassemia and porphyria (safety not established); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, fatigue, headache, weakness.

Resp: cough, dyspnea, bronchitis. **CV:** HF, MI, STROKE, THROMBOEMBOLIC EVENTS (especially with hemoglobin > 11 g/dL), edema, hypertension, hypotension, chest pain. **GI:** abdominal pain, nausea, diarrhea, vomiting, constipation. **Derm:** STEPHENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus. **Hemat:** pure red cell aplasia. **MS:** myalgia, arthralgia, back pain, limb pain. **Misc:** fever, allergic reactions, flu-like

syndrome, sepsis, ↑ mortality and ↑ tumor growth (with hemoglobin ≥ 12 g/dL).

Interactions

Drug-Drug: None reported.

Route/Dosage

Anemia due to Chronic Kidney Disease

(Do not initiate if hemoglobin ≥ 10 g/dL; should only consider initiating therapy in patients not on dialysis if rate of hemoglobin decline indicates likelihood of requiring a red blood cell transfusion and a goal is to reduce the risk of alloimmunization and/or red blood cell transfusion risks).

IV, Subcut (Adults): *Starting treatment with darbepoetin (no previous epoetin)*—0.45 mcg/kg once weekly or 0.75 mcg/kg q 2 wk (for patients on dialysis); 0.45 mcg/kg q 4 wk (for patients not on dialysis); use lowest dose sufficient to ↓ the need for red blood cell transfusions (do not exceed hemoglobin of 10 g/dL [patients not on dialysis] or 11 g/dL [patients on dialysis]); if Hgb ↑ by >1.0 g/dL in 2 wk, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than q 4 wk. *Conversion from epoetin to darbepoetin*—weekly epoetin dose <2500 units = 6.25 mcg/week darbepoetin, weekly epoetin dose 2500–4999 units = 12.5 mcg/week darbepoetin, weekly epoetin dose 5000–10,999 units = 25 mcg/week darbepoetin, weekly epoetin dose 11,000–17,999 units = 40 mcg/week darbepoetin, weekly epoetin dose 18,000–33,999 units = 60 mcg/week darbepoetin, weekly epoetin dose 34,000–89,999 units = 100 mcg/week darbepoetin, weekly epoetin dose $>90,000$ units = 200 mcg/week darbepoetin.

IV, Subcut (Children): *Starting treatment with darbepoetin (no previous epoetin)*—0.45 mcg/kg once weekly (may also start with 0.75 mcg/kg q 2 wk in patients not on dialysis); use lowest dose sufficient to ↓ the need for red blood cell transfusions (do not exceed hemoglobin of 12 g/dL; if Hgb ↑ by >1.0 g/dL in 2 wk, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than q 4 wk.

Anemia due to Chemotherapy

(Use only for chemotherapy-related anemia and discontinue when chemotherapy course is completed; do not initiate if hemoglobin ≥ 10 g/dL.)

Subcut (Adults): 2.25 mcg/kg weekly or 500 mcg q 3 wk; target Hgb should not exceed 12 g/dL. If Hgb ↑ by >1.0 g/dL in 2 wk or or reaches a level needed to avoid red blood cell transfusions, ↓ dose by 40%; if Hgb ↑ by <1.0 g/dL after 6 wk of therapy, ↑ dose to 4.5 mcg/kg weekly.

Availability

Solution for injection (single-dose vials): 25 mcg/1 mL, 40 mcg/1 mL, 60 mcg/1 mL, 100 mcg/1 mL, 150 mcg/0.75 mL, 200 mcg/1 mL, 300 mcg/1 mL, 500 mcg/1 mL. **Solution for injection (pre-filled syringes):** 10 mcg/0.4 mL, 25 mcg/0.42 mL, 40 mcg/0.4 mL, 60 mcg/0.3 mL, 100 mcg/0.5 mL, 150 mcg/0.3 mL, 200 mcg/0.4 mL, 300 mcg/0.6 mL, 500 mcg/1 mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP before and during therapy. Inform health care professional if severe hypertension is present or if BP begins to increase. Additional anti-hypertensive therapy may be required during initiation of therapy.
- Monitor response for symptoms of anemia (fatigue, dyspnea, pallor).
- Monitor dialysis shunts (thrill and bruit) and status of artificial kidney during hemodialysis. May need to increase heparin dose to prevent clotting. Monitor patients with underlying vascular disease for impaired circulation.
- Monitor for allergic reactions (rash, urticaria). Discontinue darbepoetin if signs of anaphylaxis (dyspnea, laryngeal swelling) occur.
- **Assess patient for skin rash frequently during therapy. Discontinue darbepoetin at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.**
- **Lab Test Considerations:** May cause ↑ in WBCs and platelets. May ↓ bleeding times.
- Monitor serum ferritin, transferrin, and iron levels prior to and during therapy to assess need for concurrent iron therapy. Administer supplemental iron therapy if transferrin saturation $<20\%$ or serum ferritin is <100 mcg/mL.
- **Monitor hemoglobin before and weekly during initial therapy, for 4 wk after a change in dose, and regularly after target range has been reached and maintenance dose is determined. Monitor other hematopoietic parameters (CBC with differential and platelet count) before and periodically during therapy. *If hemoglobin ↑ of more than 1.0 g/dL in any 2-wk period or hemoglobin reaches a level needed to avoid RBC transfusion, ↓ dose by 40%. If hemoglobin exceeds a level needed to avoid RBC transfusion, withhold dose until hemoglobin approaches level where RBC transfusions may be required and reintitiate at a dose 40% below the previous dose. If hemoglobin ↑ by less than 1 g/dL and remains below 10 g/dL after 6 wk of therapy, ↑ dose to 4.5 mcg/kg/wk (if on weekly therapy) or do not adjust dose (if on every 3 wk schedule). If there is no re-***

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

sponse as measured by hemoglobin levels or if RBC transfusions are still required after 8 wks of therapy, following completion of a chemotherapy course, discontinue darbepoetin. Hemoglobin >11 g/dL increases the likelihood of life-threatening cardiovascular complications, cardiac arrest, neurologic events (seizures, stroke), hypertensive reactions, HF, vascular thrombosis/ischemia/infarction, acute MI, and fluid overload/edema.

- If ↑ in hemoglobin is less than 1 g/dL over 4 wk and iron stores are adequate, dose may be ↑ by 25% of previous dose. Use the lowest dose possible to avoid transfusions.
- Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure.

Potential Nursing Diagnoses

Anemia (Intolerance)

Implementation

- Transfusions are still required for severe symptomatic anemia. Supplemental iron should be initiated with darbepoetin and continued during therapy. Correct deficiencies of folic acid or vitamin B₁₂ prior to therapy.
- **Institute seizure precautions in patients who experience greater than a 1.0 g/dL increase in hemoglobin in a 2-wk period or exhibit any change in neurologic status.**
- **For conversion from epoetin alfa to darbepoetin**, if epoetin was administered 2–3 times/wk administer darbepoetin once a week. If patient was receiving epoetin once/wk, darbepoetin may be administered once every 2 wk. Route of administration should remain consistent.
- Dose adjustments should not be more frequent than once/mo.
- Do not shake vial; inactivation of medication may occur. Do not administer vials containing solution that is discolored or contains particulate matter. Discard vial immediately after withdrawing dose. Do not pool unused portions.
- **Subcut:** This route is often used for patients not requiring dialysis.

IV Administration

- **IV Push:** Administer undiluted. **Rate:** May be administered as direct injection or bolus over 1–3 min into IV tubing or via venous line at end of dialysis session.
- **Y-Site Incompatibility:** Do not administer in conjunction with other drugs or solutions.

Patient/Family Teaching

- Instruct patient to read the *Medication Guide* prior to beginning therapy. Inform patients of risks and benefits of darbepoetin. Inform patients with cancer that they must sign the patient-health care provider

acknowledgment form before the start of each treatment course.

- Discuss ways of preventing self-injury in patients at risk for seizures. Driving and activities requiring continuous alertness should be avoided.
- Advise patient to stop darbepoetin and notify health care professional immediately if severe skin reactions (skin rash with itching, blisters, skin sores, peeling, areas of skin coming off) or signs and symptoms of serious allergic reactions (rash, itching, shortness of breath, wheezing, dizziness and fainting due to drop in blood pressure, swelling around mouth or eyes, fast pulse, sweating) occur.
- **Inform patient that use of darbepoetin may result in shortened overall survival and/or ↓ time to tumor progression. May also cause MI or stroke. Advise patient to notify health care professional immediately if chest pain; trouble breathing or shortness of breath; pain in legs, with or without swelling; a cool or pale arm or leg; sudden confusion, trouble speaking, or trouble understanding others' speech; sudden numbness or weakness in face, arm, or leg, especially on one side of body; sudden trouble seeing; sudden trouble walking, dizziness, loss of balance or coordination; loss of consciousness (fainting); or hemodialysis vascular access stops working.**
- Advise patient to notify health care professional of darbepoetin prior to surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage women who become pregnant during therapy to enroll in Amgen's Pregnancy Surveillance Program by calling 1-800-772-6436 (1-800-77-AMGEN).
- **Anemia of Chronic Kidney Disease:** Stress importance of compliance with dietary restrictions, medications, and dialysis. Foods high in iron and low in potassium include liver, pork, veal, beef, mustard and turnip greens, peas, eggs, broccoli, kale, blackberries, strawberries, apple juice, watermelon, oatmeal, and enriched bread. Darbepoetin will result in increased sense of well-being, but it does not cure underlying disease.
- **Home Care Issues:** Home dialysis patients determined to be able to safely and effectively administer darbepoetin should be taught proper dose, administration technique with syringe, auto-injector or IV use, and disposal of equipment. *Information for Patients and Caregivers* should be provided to patient along with medication.

Evaluation/Desired Outcomes

- Increase in hemoglobin not to exceed 11 g/dL with improvement in symptoms of anemia in patients with chronic renal failure or with chemotherapy-induced anemia.

darifenacin (dar-i-fen-a-sin)

Enablex

Classification

Therapeutic: urinary tract antispasmodics

Pharmacologic: anticholinergics

Indications

Overactive bladder with symptoms (urge incontinence, urgency, frequency).

Action

Acts as a muscarinic (cholinergic) receptor antagonist; antagonizes bladder smooth muscle contraction.

Therapeutic Effects: Decreased symptoms of overactive bladder.

Pharmacokinetics

Absorption: 15–19% absorbed.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Extensively metabolized by the CYP2D6 enzyme system in most individuals; H poor metabolizers (7% of Caucasians, 2% of African Americans) have less CYP2D6 activity with less metabolism occurring. Some metabolism via CYP3A4 enzyme system. 60% excreted renally as metabolites, 40% in feces as metabolites.

Half-life: 13–19 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	7 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Urinary retention; Gastric retention; Uncontrolled angle-closure glaucoma; Severe hepatic impairment.

Use Cautiously in: Concurrent use of CYP3A4 inhibitors (use lower dose/clinical monitoring may be necessary); Moderate hepatic impairment (lower dose recommended); Bladder outflow obstruction; GI obstructive disorders, ↓ GI motility, severe constipation or ulcerative colitis; Myasthenia gravis; Angle-closure glaucoma; **Lactation, PEDI:** Safety not established; **OB:** Use only if maternal benefit outweighs fetal risk.

Adverse Reactions/Side Effects

CNS: confusion, dizziness, drowsiness, hallucinations, headache. **EENT:** blurred vision. **GI:** constipation, dry mouth, dyspepsia, nausea. **Metab:** heat intolerance.

Misc: ANGIOEDEMA.

Interactions

Drug-Drug: Blood levels and risk of toxicity are ↑ by concurrent use of strong CYP3A4 inhibitors including

ketoconazole, itraconazole, ritonavir, nelfinavir, clarithromycin, and nefazodone; daily dose should not exceed 7.5 mg. Concurrent use of moderate inhibitors of CYP3A4, especially those with narrow therapeutic indices, including flecainide, thioridazine, and tricyclic antidepressants, should be undertaken with caution.

Route/Dosage

PO (Adults): 7.5 mg once daily, may be ↑ after 2 wk to 15 mg once daily.

Availability

Extended-release tablets: 7.5 mg, 15 mg. **Cost:** All strengths \$599.48/90.

NURSING IMPLICATIONS**Assessment**

- Monitor voiding pattern and assess symptoms of overactive bladder (urinary urgency, urinary incontinence, urinary frequency) to and periodically during therapy.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Implementation

- Do not confuse Enablex with Effexor XR.
- **PO:** Administer once daily without regard to food. Extended-release tablets must be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take darifenacin as directed. If a dose is missed, skip dose and take next day; do not take 2 doses in same day. Advise patient to read the *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Do not share darifenacin with others; may be dangerous.
- Inform patient of potential anticholinergic side effects (constipation, urinary retention, blurred vision, heat prostration in a hot environment).
- May cause dizziness, drowsiness, confusion, and blurred vision. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in symptoms of overactive bladder (urge urinary incontinence, urgency, frequency).

* = Canadian drug name. H = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

darunavir (da-ru-na-veer)

Prezista

Classification

Therapeutic: antiretrovirals

Pharmacologic: protease inhibitors

Indications

HIV infection (must be used with ritonavir and with other antiretrovirals).

Action

Inhibits HIV-1 protease, selectively inhibiting the cleavage of HIV-encoded specific polyproteins in infected cells. This prevents the formation of mature virus particles. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

Pharmacokinetics

Absorption: *Without ritonavir*—37% absorbed following oral administration; *with ritonavir*—82%. Food ↑ absorption by 30%.

Distribution: Unknown.

Protein Binding: 95% bound to plasma proteins.

Metabolism and Excretion: Extensively metabolized by CYP3A enzyme system. 41% eliminated unchanged in feces, 8% in urine.

Half-life: 15 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2.5–4 hr	12 hr

Contraindications/Precautions

Contraindicated in: Concurrent alfuzosin, dronedarone, colchicine (in renal/hepatic impairment), ranolazine, sildenafil (Revatio), ergot derivatives, lurasidone, midazolam (PO), pimozone, triazolam, lovastatin, simvastatin, rifampin, or St. John's wort; **Lactation:** Avoid breast feeding (HIV may be transmitted in human milk).

Use Cautionally in: Hepatic impairment; Sulfa allergy; **Geri:** Consider age-related impairment in hepatic function, concurrent chronic disease states and drug therapy; **OB:** May be used during pregnancy (if benefits of use generally outweigh fetal risk); **Pedi:** Children <3 yr (safety and efficacy not established).

Adverse Reactions/Side Effects

Based on concurrent use with ritonavir.

GI: HEPATOTOXICITY, constipation, diarrhea, nausea, vomiting. **Endo:** hyperglycemia. **Metab:** body fat redistribution. **Derm:** DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, acute generalized exanthematous pustulosis. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: Darunavir and ritonavir are both inhibitors of CYP3A, CYP2D6, and P-gp and are metabolized by CYP3A. Multiple drug-drug interactions can be expected with drugs that share, inhibit, or induce these pathways. Consult product information for more specific details. ↑ blood levels and risk of toxicity from **ergot derivatives** (dihydroergotamine, ergotamine, methylergonovine), sildenafil (Revatio), alfuzosin, dronedarone, ranolazine, lurasidone, pimozone, lovastatin, simvastatin, midazolam (oral), and triazolam; concurrent use is contraindicated. May ↑ **colchicine** levels and cause serious/life-threatening reactions; ↓ dose of colchicine; concurrent use contraindicated in patients with renal or hepatic impairment. **Rifampin** ↑ metabolism and may ↓ antiretroviral effectiveness, concurrent use is contraindicated. Concurrent use with **indinavir** may ↑ darunavir and indinavir levels. ↑ levels and risk of myopathy from **atorvastatin, rosuvastatin, or pravastatin**; use lowest dose of these agents; do not exceed atorvastatin dose of 20 mg/day. Concurrent use with **efavirenz** results in ↓ darunavir levels and ↑ efavirenz levels; use combination cautiously. **Lopinavir/ritonavir** may ↓ levels; concurrent use not recommended. **Saquinavir** may ↓ levels; concurrent use not recommended. May ↑ **maraviroc** levels; ↓ maraviroc dose to 150 mg twice daily. May ↑ levels of **lidocaine, quinidine, disopyramide, mexiletine, propafenone, flecainide, and amiodarone**; use cautiously and with available blood level monitoring. ↑ **digoxin** levels; blood level monitoring recommended. May ↑ **carbamazepine** levels; blood level monitoring recommended. May ↓ **phenytoin** or **phenobarbital** levels; blood level monitoring recommended. May ↓ levels of **warfarin**; monitor INR. May ↑ levels of **trazodone, amitriptyline, desipramine, imipramine, and nortriptyline**; use cautiously and ↓ dose if necessary. May ↑ levels of **clarithromycin**; ↓ dose of clarithromycin if Ccr ≤60 mL/min. May ↑ levels of **ketoconazole** and **itraconazole**; do not exceed itraconazole or ketoconazole dose >200 mg/day. **Ketoconazole** and **itraconazole** may ↑ levels. May ↓ levels of **voriconazole**; concurrent use not recommended. Concurrent use with **rifabutin** ↑ rifabutin levels and ↑ darunavir levels; (may be due to ritonavir); ↓ rifabutin dose to 150 mg every other day. **Rifapentin** may ↓ levels; concurrent use not recommended. May ↑ levels of **beta-blockers**; may need to ↓ dose. May ↑ levels of **amlodipine, diltiazem, felodipine, nifedipine, nicardipine, or verapamil**; monitor clinical response carefully. **Dexamethasone** may ↓ levels and effectiveness. May ↑ levels and the risk of Cushing's syndrome and adrenal suppression with systemic **budesonide** and **prednisone**; consider alternative therapy. May ↑ levels of inhaled/nasal **fluticasone** and **budesonide**; choose alternative inhaled/nasal corticosteroid. May ↑ levels of **cyclosporine, tacrolimus, or sirolimus**; blood level monitoring recommended. May ↑ levels of **everolimus**; concurrent use

not recommended. May ↓ levels of **methadone**. May ↑ **risperidone** and **thioridazine** levels; may need to ↓ dose. May ↑ levels of **sildenafil**, **varденаfil**, **тадалафил**, or **аванафил**; single dose should not exceed the following (sildenafil 25 mg in 48 hr; varденаfil 2.5 mg in 72 hr; тадалафил 10 mg in 72 hr); concurrent use with avanafil not recommended. May ↓ levels of **сертралин** and **пароксетин**; adjust dose by clinical response. May ↓ levels and contraceptive efficacy of some combined **hormonal contraceptives** and **progesterin-only contraceptives** (alternative methods of nonhormonal contraception recommended). May ↑ levels of **сальметерол**; concurrent use not recommended. May ↑ **босентан** levels; initiate bosentan at 62.5 mg once daily or every other day once patient receiving darunavir for ≥10 days; if patient already receiving bosentan, discontinue bosentan ≥36 hr before initiation of darunavir and then restart bosentan ≥10 days later at 62.5 mg once daily or every other day. May ↑ **тадалафил (Адцирка)** levels; initiate тадалафил (Адцирка) at 20 mg once daily once patient receiving darunavir for ≥1 wk; if patient already receiving тадалафил (Адцирка), discontinue тадалафил (Адцирка) ≥24 hr before initiation of darunavir and then restart тадалафил (Адцирка) ≥7 days later at 20 mg once daily. Concurrent use with **симепревив** results in ↑ darunavir levels and ↑ симепревив levels; concurrent use not recommended. May ↑ **лумефантрин** levels and risk of QT interval prolongation. May ↑ **quetiapine** levels; ↓ quetiapine dose to 1/2 of current dose. May ↑ levels of and risk of bleeding with **апиксан**, **дабигатран**, and **ривароксан**; concurrent use not recommended. May ↑ **дасатиниб** and **нилотиниб** levels; may need to ↓ dose or ↑ dosing interval of dasatinib and nilotinib. May ↑ **винбластин** and **винкрестин** levels; may need to temporarily hold darunavir-ritonavir or initiate another antiretroviral regimen. May ↑ levels of **буспирон**, **диазепам**, **эстазолам**, **midazolam (IV)**, and **золепидем**; ↓ dose of sedative. May ↓ **омепразол** levels; consider ↑ омепразол dose (not to exceed 40 mg/day).

Drug-Natural Products: **St. John's wort** ↑ metabolism and may ↓ antiretroviral effectiveness; concurrent use contraindicated.

Route/Dosage

Genotypic testing of the baseline virus is recommended prior to initiating treatment in therapy-experienced patients. This testing is performed to screen for darunavir resistance associated substitutions, which may be helpful in determining whether the HIV virus will be susceptible to darunavir.

☞ **PO (Adults):** *Therapy-naïve*—800 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—800 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced (with ≥1 darunavir*

resistance associated substitution or if genotypic testing not performed)—600 mg twice daily with ritonavir 100 mg twice daily; *Pregnancy*—600 mg twice daily with ritonavir 100 mg twice daily; if patient taking 800 mg once daily with ritonavir 100 mg once daily before pregnancy, may continue with this regimen if they are virologically suppressed (HIV-1 RNA <50 copies/mL), and if switch to twice daily regimen may compromise tolerability or compliance.

PO (Oral suspension or tablets) (Children 3–17 yr and ≥40 kg): *Therapy-naïve*—800 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—800 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced (with ≥1 darunavir resistance associated substitution or if genotypic testing not performed)*—600 mg twice daily with ritonavir 100 mg twice daily.

PO (Oral suspension or tablets) (Children 3–17 yr and 30–39.9 kg): *Therapy-naïve*—675 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—675 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced (with ≥1 darunavir resistance associated substitution or if genotypic testing not performed)*—450 mg twice daily with ritonavir 60 mg twice daily.

PO (Oral suspension or tablets) (Children 3–17 yr and 15–29.9 kg): *Therapy-naïve*—600 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—600 mg once daily with ritonavir 100 mg once daily; *Therapy-experienced (with ≥1 darunavir resistance associated substitution or if genotypic testing not performed)*—375 mg twice daily with ritonavir 48 mg twice daily.

PO (Oral suspension only) (Children 3–17 yr and 14–14.9 kg): *Therapy-naïve*—490 mg once daily with ritonavir 96 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—490 mg once daily with ritonavir 96 mg once daily; *Therapy-experienced (with ≥1 darunavir resistance associated substitution or if genotypic testing not performed)*—280 mg twice daily with ritonavir 48 mg twice daily.

PO (Oral suspension only) (Children 3–17 yr and 13–13.9 kg): *Therapy-naïve*—455 mg once daily with ritonavir 80 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—455 mg once daily with ritonavir 80 mg once daily; *Therapy-experienced (with ≥1 darunavir resistance associated substitution or if genotypic testing not performed)*—260 mg twice daily with ritonavir 40 mg twice daily.

PO (Oral suspension only) (Children 3–17 yr and 12–12.9 kg): *Therapy-naïve*—420 mg once

* = Canadian drug name. ☞ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

daily with ritonavir 80 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—420 mg once daily with ritonavir 80 mg once daily; *Therapy-experienced (with ≥ 1 darunavir resistance associated substitution or if genotypic testing not performed)*—240 mg twice daily with ritonavir 40 mg twice daily.

PO (Oral suspension only) (Children 3–17 yr and 11–11.9 kg): *Therapy-naïve*—385 mg once daily with ritonavir 64 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—385 mg once daily with ritonavir 64 mg once daily; *Therapy-experienced (with ≥ 1 darunavir resistance associated substitution or if genotypic testing not performed)*—220 mg twice daily with ritonavir 32 mg twice daily.

PO (Oral suspension only) (Children 3–17 yr and 10–10.9 kg): *Therapy-naïve*—350 mg once daily with ritonavir 64 mg once daily; *Therapy-experienced (with no darunavir resistance associated substitution)*—350 mg once daily with ritonavir 64 mg once daily; *Therapy-experienced (with ≥ 1 darunavir resistance associated substitution or if genotypic testing not performed)*—200 mg twice daily with ritonavir 32 mg twice daily.

Availability

Tablets: 75 mg, 150 mg, 600 mg, 800 mg. **Oral suspension:** 100 mg/mL. **In combination with:** cobicistat (Prezcobix). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess for allergy to sulfonamides.
- Monitor patient for development of rash; usually maculopapular and self-limited. **May cause Stevens-Johnson syndrome or toxic epidermal necrolysis.** Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **Lab Test Considerations:** Monitor viral load and CD4 counts regularly during therapy.
- May cause \uparrow serum AST, ALT, GGT, total bilirubin, alkaline phosphatase, pancreatic amylase, pancreatic lipase, triglycerides, total cholesterol, and uric acid concentrations. **Monitor hepatic function prior to and periodically during therapy.** Hepatotoxicity

may require interruption or discontinuation of therapy.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Must be administered with a meal or light snack along with ritonavir 100 mg to be effective. The type of food is not important. Tablets should be swallowed whole with water or milk; do not chew.
- Administer oral suspension 8 mL dose and two 4-mL doses using syringe provided along with ritonavir and food.

Patient/Family Teaching

- Emphasize the importance of taking darunavir with ritonavir exactly as directed, at evenly spaced times throughout day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. If a dose of darunavir or ritonavir is missed by more than 6 hr, wait and take next dose at regularly scheduled time. If missed by less than 6 hr, take darunavir and ritonavir immediately and then take next dose at regularly scheduled time. If a dose is skipped, do not double doses. Advise patient to read the *Patient Information* sheet before starting therapy and with each Rx renewal in case changes have been made.
- Instruct patient that darunavir should not be shared with others.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Inform patient that darunavir does not cure AIDS or prevent associated or opportunistic infections. Darunavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of darunavir are unknown at this time.
- Inform patient that darunavir may cause hyperglycemia, hepatotoxicity, and severe skin reactions. Advise patient to notify health care professional promptly if signs of hyperglycemia (increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin), **hepatotoxicity (unexplained fatigue, anorexia, nausea, jaundice, abdominal pain, or dark urine)**, DRESS, or rash occur.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.

- **Rep:** Instruct females using hormonal contraceptives to use an alternative nonhormonal method of contraception. Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding. If pregnant patient is exposed to darunavir, register patient in *Antiretroviral Pregnancy Registry* by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

HIGH ALERT

DAUNOrubicin hydrochloride (daw-noe-roo-bi-sin hye-dro-klor-ide)

★ Cerubidine

Classification

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

Indications

In combination with other antineoplastics in the treatment of leukemias.

Action

Forms a complex with DNA, which subsequently inhibits DNA and RNA synthesis (cell-cycle phase-nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Widely distributed. Crosses the placenta.

Metabolism and Excretion: Extensively metabolized by the liver. Converted partially to a compound that also has antineoplastic activity (daunorubicinol); 40% eliminated by biliary excretion.

Half-life: *Daunorubicin* — 18.5 hr. *Daunorubicinol* — 26.7 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	7–10 days	10–14 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to daunorubicin or any other components in the formulation; Symptomatic HF/arrhythmias; Pregnant or lactating women.

Use Cautiously in: Active infections or decreased bone marrow reserve; Geriatric patients or patients with other chronic debilitating illnesses (dosage reduction recommended for patients ≥ 60 yr); May reactivate skin lesions produced by previous radiation therapy; Hepatic or renal impairment (dosage reduction recommended if serum creatinine >3 m g/dL or serum bilirubin >1.2 m g/dL); Patients who have received previous anthracycline therapy or who have underlying cardiovascular disease (increased risk of cardiotoxicity); Patients with child-bearing potential.

Adverse Reactions/Side Effects

EENT: rhinitis, abnormal vision, sinusitis. **CV:** CARDIOTOXICITY, arrhythmias. **GI:** nausea, vomiting, esophagitis, hepatotoxicity, stomatitis. **GU:** red urine, gonadal suppression. **Derm:** alopecia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Misc:** chills, fever.

Interactions

Drug-Drug: Additive myelosuppression with other antineoplastics. May decrease antibody response to live-virus vaccines and increase risk of adverse reactions. **Cyclophosphamide** increases the risk of cardiotoxicity. Increased risk of hepatic toxicity with other hepatotoxic agents.

Route/Dosage

Other dose regimens are used. In adults, cumulative dose should not exceed 550 mg/m² (450 mg/m² if previous chest radiation).

IV (Adults <60 yr): 45 mg/m²/day for 3 days in first course, then for 2 days of second course (as part of combination regimen).

IV (Adults ≥ 60 yr): 30 mg/m²/day for 3 days in first course, then for 2 days of second course (as part of combination regimen).

IV (Children >2 yr): 25 mg/m² once weekly (as part of combination regimen). In children <2 yr or BSA <0.5 m², dosage should be determined on a mg/kg basis.

Availability (generic available)

Powder for injection: ★ 20 mg/vial. **Solution for injection:** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums; bruising; petechiae;

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- Assess IV site frequently for inflammation or infiltration. Instruct patient to notify nurse immediately if pain or irritation at injection site occurs. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Notify physician immediately. Daunorubicin is a vesicant. Standard treatments include local injections of steroids and application of ice compresses.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which, although mild, may persist for 24–48 hr. Administration of an antiemetic before and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalinization of the urine may be used to help prevent urate stone formation.
- Assess patient for evidence of cardiotoxicity, which manifests as HF (peripheral edema, dyspnea, rales/crackles, weight gain, jugular venous distention) and usually occurs 1–6 mo after initiation of therapy. Chest x ray, echocardiography, ECGs, and radionuclide angiography determination of ejection fraction may be ordered before and periodically throughout therapy. A 30% decrease in QRS voltage and decrease in systolic ejection fraction are early signs of cardiotoxicity. Patients who receive total cumulative doses >550/mm², who have a history of cardiac disease, or who have received mediastinal radiation are at greater risk of developing cardiotoxicity. May be irreversible and fatal, but usually responds to early treatment.
- **Lab Test Considerations:** Monitor uric acid levels.
- **Daunorubicin hydrochloride:** Monitor CBC and differential before and periodically throughout therapy. The leukocyte count nadir occurs 10–14 days after administration. Recovery usually occurs within 21 days after administration of daunorubicin.
- Monitor AST, ALT, LDH, and serum bilirubin. May cause transiently ↑ serum alkaline phosphatase, bilirubin, and AST concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Decreased cardiac output (Side Effects)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse daunorubicin hydrochloride with doxorubi-

cin, doxorubicin hydrochloride liposome, or idarubicin. To prevent confusion, orders should include generic and brand name.

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **IV:** Reconstitute each 20 mg with 4 mL of sterile water for injection for a concentration of 5 mg/mL. Shake gently to dissolve. Reconstituted medication is stable for 24 hr at room temperature, 48 hr if refrigerated. Protect from sunlight.
- Do not use aluminum needles when reconstituting or injecting daunorubicin, as aluminum darkens the solution.

IV Administration

- **IV Push:** **Diluent:** Dilute further in 10–15 mL of 0.9% NaCl. Administer IV push through Y-site into free-flowing infusion of 0.9% NaCl or D5W. **Rate:** Administer over at least 2–3 min. Rapid administration rate may cause facial flushing or erythema along the vein.
- **Intermittent Infusion:** **Diluent:** May also be diluted in 50–100 mL of 0.9% NaCl. **Rate:** Administer 50 mL over 10–15 min or 100 mL over 30–45 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, amiodarone, anidulafungin, argatroban, atracurium, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, carboplatin, carmustine, caspofungin, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hetastarch, hydralazine, hydrocortisone, hydro-morphine, idarubicin, imipenem/cilastatin, insulin, irinotecan, isoproterenol, labetalol, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mepoprenem, metaraminol, methotrexate, methylodopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pentamidine, pentazocine, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinuapristin/dalfopristin, ranitidine, remifentanyl, rituximab, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide,

theophylline, thiotepa, tigecycline, tobramycin, tozalone, topotecan, trastuzumab, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, aztreonam, cefazolin, cefepime, cefoperazonecefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, ertapenem, fludarabine, foscarnet, fosphenytoin, furosemide, ganciclovir, heparin, indomethacin, ketorolac, levofloxacin, methylprednisolone, mitoxantrone, nafcillin, nitroprusside, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, thiopental, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Manufacturer does not recommend admixing daunorubicin hydrochloride.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics. Period of highest risk is 3–7 days after administration of dose.
- **Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, or swelling of lower extremities occurs.**
- Discuss with patient possibility of hair loss. Explore methods of coping. Regrowth of hair usually begins within 5 wk after discontinuing therapy.
- Inform patient that medication may turn urine reddish color for 1–2 days after administration.
- Inform patient that this medication may cause irreversible gonadal suppression. Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 mo after therapy is concluded.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

deferoxamine (de-fer-ox-a-meen) Desferal

Classification

Therapeutic: antidotes

Pharmacologic: heavy metal antagonists

Indications

Acute toxic iron ingestion. Secondary iron overload syndromes associated with multiple transfusion therapy.

Action

Chelates unbound iron, forming a water-soluble complex (ferrioxamine) in plasma that is easily excreted by the kidneys. **Therapeutic Effects:** Removal of excess iron. Also chelates aluminum.

Pharmacokinetics

Absorption: Poorly absorbed after oral administration. Well absorbed after IM administration and subcut administration.

Distribution: Appears to be widely distributed.

Metabolism and Excretion: Metabolized by tissues and plasma enzymes. Unchanged drug and chelated form excreted by the kidneys; 33% of iron removed is eliminated in the feces via biliary excretion.

Half-life: 1 hr.

TIME/ACTION PROFILE (effects on hematologic parameters)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	unknown
IM	unknown	unknown	unknown
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Severe renal disease; Anuria;

OB: Rep: Early pregnancy or childbearing potential (however, may be used safely in pregnant patients with moderate-to-severe acute iron intoxication).

Use Cautiously in: **Pedi:** Children <3 yr (safety not established).

Adverse Reactions/Side Effects

EENT: blurred vision, cataracts, ototoxicity. **CV:** hypotension, tachycardia. **GI:** abdominal pain, diarrhea. **GU:** red urine. **Derm:** erythema, flushing, urticaria. **Local:** induration at injection site, pain at injection site. **MS:** leg cramps. **Misc:** allergic reactions, fever, shock after rapid IV administration.

Interactions

Drug-Drug: **Ascorbic acid** may ↑ effectiveness of deferoxamine but may also ↑ cardiac iron toxicity.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

Acute Iron Ingestion

IM, IV (Adults and Children ≥ 3 yr): 1 g, then 500 mg q 4 hr for 2 doses. Additional doses of 500 mg q 4–12 hr may be needed (not to exceed 6 g/24 hr).

Chronic Iron Overload

IM, IV (Adults and Children ≥ 3 yr): 500 mg–1 g daily IM; additional doses of 2 g should be given IV for each unit of blood transfused (not to exceed 1 g/day in absence of transfusions; 6 g/day if patient receives transfusions).

Subcut (Adults and Children ≥ 3 yr): 1–2 g/day (20–40 mg/kg/day) infused over 8–24 hr.

Availability (generic available)

Powder for injection: 500 mg/vial, 2 g/vial.

NURSING IMPLICATIONS

Assessment

- In acute poisoning, assess time, amount, and type of iron preparation ingested.
- Monitor signs of iron toxicity: early acute (abdominal pain, bloody diarrhea, emesis), late acute (decreased level of consciousness, shock, metabolic acidosis).
- Monitor vital signs closely, especially during IV administration. Report hypotension, erythema, urticaria, or signs of allergic reaction. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- May cause oculotoxicity or ototoxicity. Report decreased visual acuity or hearing loss. Audiovisual exams should be performed every 3 mo in patients with chronic iron overload.
- Monitor intake and output and urine color. Inform health care professional if patient is anuric. Chelated iron is excreted primarily by the kidneys; urine may turn red.
- **Lab Test Considerations:** Monitor serum iron, total iron binding capacity (TIBC), ferritin levels, and urinary iron excretion before and periodically during therapy.
- Monitor liver function studies to assess damage from iron poisoning.

Potential Nursing Diagnoses

Risk for injury poisoning (Indications)

Implementation

- IM route is preferred in acute iron intoxication unless patient is in shock.
- Reconstitute 500-mg vial with 2 mL and 2-g vial with 8 mL of sterile water for injection for a concentration of 213 mg/mL. Dissolve powder completely before administration. Solution is yellow and is stable for 1 wk after reconstitution if protected from light. Discard unused portion.
- Used in conjunction with induction of emesis or gastric aspiration and lavage with sodium bicarbonate,

and supportive measures for shock and metabolic acidosis in acute poisoning.

- **IM:** Administer deep IM and massage well. Rotate sites. IM administration may cause transient severe pain.
- **Subcut:** Reconstitute 500-mg vial with 5 mL and 2-g vial with 20 mL of sterile water for injection. **Concentration:** 95 mg/mL. Subcut route used to treat chronically elevated iron therapy is administered into abdominal subcut tissue via infusion pump for 8–24 hr per treatment.

IV Administration

- **IV:** Reconstitute 500-mg vial with 5 mL and 2-g vial with 20 mL of sterile water for injection. **Concentration:** 95 mg/mL. **Diluent:** D5W, 0.9% NaCl, 0.45% NaCl, or LR. Dissolve powder completely before administration. Solution is clear and colorless to slightly yellow. Administer within 3 hr of reconstitution; 24 hr if prepared under laminar flow hood. Discard unused portion. **Rate:** Maximum infusion rate is 15 mg/kg/hr for first 1000 mg. May be followed by 500 mg infused over 4 hr at a slower rate not to exceed 125 mg/hr. Rapid infusion rate may cause hypotension, erythema, urticaria, wheezing, convulsions, tachycardia, or shock.
- May be administered at the same time as blood transfusion in persons with chronically elevated serum iron levels. Use separate site for administration.

Patient/Family Teaching

- Reinforce need to keep iron preparations, all medications, and hazardous substances out of the reach of children.
- Reassure patient that red coloration of urine is expected and reflects excretion of excess iron.
- May cause dizziness or impairment of vision or hearing. Caution patient to avoid driving or other activities requiring alertness until response from medication is known.
- Advise patient not to take vitamin C preparations without consulting health care professional, because tissue toxicity may increase.
- Encourage patients requiring chronic therapy to keep follow-up appointments for lab tests. Eye and hearing exams may be monitored every 3 mo.

Evaluation/Desired Outcomes

- Return of serum iron concentrations to a normal level (50–150 mcg/100 mL).

degarelix (deg-a-rel-ix) Firmagon

Classification

Therapeutic: antineoplastics

Pharmacologic: GnRH antagonist

Indications

Management of advanced prostate cancer.

Action

Reversibly brings to GnRH receptors in the pituitary gland, causing a decrease in the release of gonadotropins and testosterone. **Therapeutic Effects:** Decreased spread of prostate cancer.

Pharmacokinetics

Absorption: Well absorbed from depot following water.

Distribution: .

Metabolism and Excretion: 70–80% undergoes hepatic metabolism and biliary excretion, most metabolites excreted in feces; 20–30% excreted unchanged in urine.

Half-life: 53 days.

TIME/ACTION PROFILE (decrease in testosterone levels)

ROUTE	ONSET	PEAK	DURATION
SC	within 1 wk	2 wk	1 mo

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity; **OB:** Pregnancy (may cause fetal harm) or child-bearing women; **Lactation:** Not recommended for use in women.

Use Cautiously in: Severe hepatic/renal impairment; Previous history of cardiovascular disease including congenital long QT syndrome, electrolyte abnormalities, HF, concurrent use of class IA or class III antiarrhythmics (may ↑ the risk of QT prolongation); **Geri:** May be more sensitive to drug effects; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia, weakness. **CV:** **QT INTERVAL PROLONGATION.** **GI:** ↑ liver enzymes, diarrhea, nausea. **GU:** erectile dysfunction, testicular atrophy. **Endo:** gynecomastia, pituitary gonadal suppression. **Local:** injection site reactions. **Metab:** hot flashes, weight gain, ↓ bone density. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS, ANGIOEDEMA, AND URTICARIA**, fever, sweating.

Interactions

Drug-Drug: Concurrent use with **class IA antiarrhythmics**, including **procainamide** and **quinidine** or **class III antiarrhythmics** including **amiodarone** or **sotalol** may ↑ risk of QT prolongation and serious arrhythmias.

Route/Dosage

Subcut (Adults): 240 mg initially (given as two injections of 120 mg each), followed by maintenance dose of 80 mg every 28 days.

Availability

Powder for subcutaneous injection (requires reconstitution): 80 mg/vial, 120 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for hot flashes and other side effects.
- **Monitor for signs and symptoms of hypersensitivity reactions (rash, wheezing, shortness of breath).** **Treat symptomatically and discontinue degarelix if symptoms occur.**
- Monitor ECG periodically during therapy, especially in patients with congenital long QT syndrome, HF, frequent electrolyte abnormalities, and in patients taking drugs known to prolong QT interval.
- **Lab Test Considerations:** Measure serum prostate-specific antigen (PSA) periodically to determine effect. If PSA ↑, measure serum testosterone concentrations.
- May effect pituitary gonadotropic or gonadal functions.
- Monitor electrolyte levels periodically during therapy; correct abnormalities.

Potential Nursing Diagnoses

Sexual dysfunction (Side Effects)

Implementation

- **Subcut:** Reconstitute each 120-mg vial with 3 mL and each 80-mg vial with 4.2 mL sterile water using 21 gauge, 2-inch reconstitution needle. Keep vial upright and swirl very gently until liquid is clear, without undissolved powder or particles. If powder adheres to vial over the liquid surface, vial can be tilted slightly to dissolve powder. Avoid shaking to prevent foam; ring of small air bubbles on surface of liquid is acceptable. Tilt vial slightly, keeping needle in lowest part of vial and withdraw 3 mL for 120-mg dose or 4 mL for 80-mg dose. Exchange reconstitution needle for 27 gauge, 1 1/4-inch administration needle. Remove air bubbles. Grasp abdominal skin and insert needle deeply at angle not <45°. Inject in an area free of pressure from belts, waistbands, or other types of clothing. Administer immediately after reconstitution. If administering 240-mg loading dose, repeat 120-mg injection for the second dose.

Patient/Family Teaching

- Explain purpose of medication to patient. Instruct patient to notify health care professional if an injection is missed. Advise patient to read *Patient Labeling* before starting and with each Rx refill in case of changes.
- Inform patient of possible side effects (hot flashes, flushing, increased weight, decreased sex drive, erectile dysfunction). Advise patient that redness, swelling, and itching at injection site is usually mild, self-limiting, and decreases within 3 days.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient that women who are pregnant or who plan to become pregnant or breast feed should not take degarelix.

Evaluation/Desired Outcomes

- Decrease in the spread of prostate cancer.

REMS

denosumab (de-no-su-mab)

Prolia, Xgeva

Classification

Therapeutic: bone resorption inhibitors
Pharmacologic: monoclonal antibodies

Indications

Prolia. Treatment of osteoporosis in postmenopausal women who are at high risk for fracture or those who have failed/are intolerant of conventional osteoporosis therapy. To increase bone mass in men with osteoporosis who are at high risk for fracture or those who have failed/are intolerant of conventional osteoporosis therapy. To increase bone mass in men receiving androgen deprivation therapy for nonmetastatic prostate cancer who are at high risk for fracture. To increase bone mass in women receiving adjuvant aromatase inhibitor therapy for breast cancer who are at high risk for fracture. **Xgeva.** Prevention of skeletal-related events in patients with bone metastases from solid tumors. Giant cell tumor of bone that is unresectable or where surgical resection is likely to result in severe morbidity. Treatment of hypercalcemia of malignancy that is refractory to bisphosphonate therapy.

Action

A monoclonal antibody that binds specifically to the human receptor activator of nuclear factor kappa-B-ligand (RANKL), which is required for formation, function, and survival of osteoclasts. Binding inhibits osteoclast formation, function, and survival. **Therapeutic Effects:** ↓ bone resorption with ↓ occurrence of fractures (vertebral, nonvertebral, hip) or other skeletal-related events (e.g., radiation therapy to bone, surgery to bone, spinal cord compression). ↑ bone mass.

Pharmacokinetics

Absorption: Well absorbed following subcutaneous administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 25.4 days.

TIME/ACTION PROFILE (effects on bone resorption)

ROUTE	ONSET	PEAK	DURATION
Subcut	1 mo	unknown†	12 mo‡

†Maximum ↓ in serum calcium occurs at 10 days.

‡Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypocalcemia (correct before administering); adequate supplemental calcium and vitamin D required; **OB:** May cause fetal harm; **Lactation:** Avoid use; ↓ mammary gland development and lactation.

Use Cautiously in: Conditions associated with hypocalcemia including hypoparathyroidism, previous thyroid/parathyroid surgery, malabsorption syndromes, history of small intestinal excision, inadequate/no calcium supplementation, renal impairment/hemodialysis (CCr < 30 mL/min and/or on dialysis); monitoring of calcium levels and calcium and vitamin D intake recommended; Invasive dental procedures, cancer, receiving chemotherapy, corticosteroids, or angiogenesis inhibitors, poor oral hygiene, diabetes, gingival infections, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis); Concurrent use of immunosuppressants or diseases resulting in immunosuppression (↑ risk of infection); **Geri:** May be more sensitive to drug effects; **Rep:** Women of reproductive potential (use effective contraception) (for Xgeva only); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache. **GI:** PANCREATITIS, diarrhea, nausea. **GU:** cystitis. **Derm:** dermatitis, eczema, rashes. **F and E:** hypocalcemia, hypophosphatemia, hypercalcemia. **Metab:** hypercholesterolemia. **MS:** back pain, extremity pain, musculoskeletal pain, atypical femoral fracture, osteonecrosis of the jaw, suppression of bone turnover. **Resp:** dyspnea, cough. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, infection.

Interactions

Drug-Drug: Concurrent use of immunosuppressants ↑ risk of infection.

Route/Dosage

Prolia

Subcut (Adults): 60 mg every 6 mo.

Xgeva

Subcut (Adults): Bone metastasis from solid tumors—120 mg every 4 weeks; Giant cell tumor of bone—120 mg every 4 weeks, with additional doses of 120 mg given on Days 8 and 15 of first mo of therapy; Hypercalcemia of malignancy—120 mg every 4 weeks, with additional doses of 120 mg given on Days 8 and 15 of first mo of therapy.

Availability

Solution for subcutaneous injection (Prolia) (prefilled syringe): 60 mg/mL. **Solution for subcutaneous injection (Xgeva):** 120 mg/1.7 mL.

NURSING IMPLICATIONS

Assessment

- Assess patients via bone density study for low bone mass before and periodically during therapy.
- Perform a routine oral exam prior to initiation of therapy. Dental exam with appropriate preventative dentistry should be considered prior to therapy. Patients with history of tooth extraction, poor oral hygiene, gingival infections, diabetes, or use of a dental appliance or those taking immunosuppressive therapy, angiogenesis inhibitors, or systemic corticosteroids are at greater risk for osteonecrosis of the jaw.
- **Monitor for signs and symptoms of hypersensitivity reactions (hypotension, dyspnea, upper airway edema, lip swelling, rash, pruritus, urticaria). Treat symptomatically and discontinue medication if symptoms occur.**
- **Lab Test Considerations:** Verify negative pregnancy status of patient before starting therapy.
- Assess serum calcium, phosphorous, and magnesium levels before and periodically during therapy, especially during first wks of therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating therapy. May cause mild, transient ↑ of calcium and phosphate. Administer calcium, magnesium, and vitamin D as needed.
- May cause anemia.
- May cause hypercholesterolemia.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- Grey needle cap on single-use prefilled *Prolia* syringe should not be handled by people sensitive to latex.
- **Subcut:** Remove from refrigerator and bring to room temperature by standing in original container for 15–30 min prior to administration; do not warm in any other way. Do not shake. Administer using a 27-gauge needle in the upper arm, upper thigh, or abdomen. Solution is clear and colorless to pale yellow, and may contain trace amounts of translucent to white proteinaceous particles. Do not use if solution is discolored or contains many particles. Manually activate the green safety guard *after* the injection is given, not before.
- Patients should receive calcium 1000 mg and 400 IU vitamin D daily.

Patient/Family Teaching

- Explain the purpose of denosumab to patient. If a dose is missed, administer injection as soon as possible.

- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D (see Appendix K).
- Advise patient to notify health care professional immediately if signs of hypersensitivity, hypocalcemia (spasms, twitches, or cramps in muscles; numbness or tingling in fingers, toes, or around mouth), infection (fever, chills, skin that is red, swollen, hot, or tender to touch; severe abdominal pain, frequent or urgent need to urinate or burning during urination), or skin reactions (redness, itching, rash, dry or leathery feeling, blisters that ooze or become crusty, peeling), or osteonecrosis of the jaw (pain, numbness, swelling of or drainage from the jaw, mouth, or teeth) occur.
- Encourage patient to participate in regular exercise and to modify behaviors that ↑ the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise patient to take good care of teeth and gums (brush and floss regularly) and to inform health care professional of therapy prior to dental surgery.
- Inform patient of increased risk of fractures upon discontinuation. If denosumab is discontinued, consider another bone resorption inhibitor.
- **Rep:** Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. For Xgeva only, instruct female patient to use highly effective contraception during and for at least 5 mo after therapy is completed.

Evaluation/Desired Outcomes

- Reversal of the progression of osteoporosis with ↓ fractures and other sequelae.
- ↑ bone mass.
- Decreased growth of giant cell tumors.
- Reduction in hypercalcemia of malignancy that is refractory to bisphosphonate therapy.

desipramine (dess-ip-ra-meen) Norpramin

Classification

Therapeutic: antidepressants

Pharmacologic: tricyclic antidepressants

Indications

Depression. **Unlabeled Use:** Chronic pain syndromes. Anxiety. Insomnia.

Action

Potentiates the effect of serotonin and norepinephrine in the CNS. Has significant anticholinergic properties.

Therapeutic Effects: Antidepressant action (may develop only over several weeks).

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Widely distributed.

Protein Binding: 90–92%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 isoenzyme); one metabolite is pharmacologically active (2-hydroxydesipramine); the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ desipramine concentrations and an ↑ risk of adverse effects. Small amounts enter breast milk.

Half-life: 12–27 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk	2–6 wk	days–wk

Contraindications/Precautions

Contraindicated in: Angle-closure glaucoma; Recent MI, heart failure, known history of QTc prolongation.

Use Cautiously in: Patients with pre-existing cardiovascular disease; Family history of sudden death, cardiac arrhythmias, or conduction disturbances; Prostatic hyperplasia (↑ susceptibility to urinary retention); History of seizures (threshold may be ↓ seizures may precede the development of cardiac arrhythmias or death); May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; **OB:** Use during pregnancy only if potential maternal benefit outweighs risks to fetus; use during lactation may result in neonatal sedation; **Pedi:** Children <12 yr (safety not established); **Ger:** ↑ sensitivity to effects.

Adverse Reactions/Side Effects

CNS: drowsiness, fatigue. **EENT:** blurred vision, dry eyes, dry mouth. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, drug-induced hepatitis, paralytic ileus, ↑ appetite, weight gain. **GU:** urinary retention, ↓ libido. **Derm:** photosensitivity. **Endo:** changes in blood glucose, gynecomastia. **Hemat:** blood dyscrasias.

Interactions

Drug-Drug: Desipramine is metabolized in the liver by the cytochrome P450 2D6 enzyme and its action may be affected by drugs which compete for metabolism by or alter the activity of this enzyme including other antidepressants, phenothiazines, carbamazepine, class 1C antiarrhythmics (propafenone or flecainide); when used concurrently dose ↓ of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including cimetidine, quinidine, amiodarone, and ritonavir, may result in ↑ effects. May cause hypotension, tachycardia, and potentially fatal reactions when used with MAO inhibitors (avoid concurrent use—

discontinue 2 wk prior to). Concurrent use with SSRI antidepressants may result in ↑ toxicity and should be avoided (fluoxetine should be stopped 5 wk before). Concurrent use with clonidine may result in hypertensive crisis and should be avoided. Phenytoin may ↓ levels and effectiveness; ↑ doses of desipramine may be required to treat depression. Concurrent use with levodopa may result in delayed/↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by rifampin, carbamazepine, and barbiturates. Concurrent use with moxifloxacin ↑ risk of adverse cardiovascular reactions. ↑ CNS depression with other CNS depressants including alcohol, antihistamines, clonidine, opioid analgesics, and sedative/hypnotics. Barbiturates may alter blood levels and effects. Adrenergic and anticholinergic side effects may be ↑ with other agents having these properties. Hormonal contraceptives ↑ levels and may cause toxicity. Cigarette smoking may ↑ metabolism and alter effects.

Drug-Natural Products: Concomitant use of kava-kava, valerian, or chamomile can ↑ CNS depression. ↑ anticholinergic effects with jimson weed and scopolia.

Route/Dosage

PO (Adults): 100–200 mg/day as a single dose or in divided doses (up to 300 mg/day).

PO (Geriatric Patients): 25–50 mg/day in divided doses (up to 150 mg/day).

PO (Children >12 yr): 25–50 mg/day in divided doses, may ↑ as needed up to 100 mg/day.

PO (Children 6–12 yr): 10–30 mg/day (1–5 mg/kg/day) in divided doses.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Obtain weight and BMI initially and periodically throughout therapy.
- Assess FBS and cholesterol levels for overweight/obese individuals.
- Refer as appropriate for nutrition/weight management and medical management.
- Monitor BP and pulse prior to and during initial therapy. Notify physician or other health care professional of decreases in BP (10–20 mm Hg) or sudden increase in pulse rate. Patients taking high doses or with a history of cardiovascular disease should have ECG monitored prior to and periodically during therapy.
- **Depression:** Monitor mental status (orientation, mood, behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Assess mental status and mood changes, especially during initial few mo of therapy and during dose**

changes. Risk may be increased in children, adolescents, and adults ≤ 24 yrs. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal ideation). Restrict amount of drug available to patient.

- **Pain:** Assess intensity, quality, and location of pain periodically throughout therapy. Use pain scale to monitor effectiveness of medication.
- **Lab Test Considerations:** Assess leukocyte and differential blood counts, liver function, and serum glucose periodically. May cause an \uparrow serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be \uparrow or \downarrow .
- **Lab Test Considerations:** Serum levels may be monitored in patients who fail to respond to usual therapeutic dose.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Chronic pain (Indications)

Implementation

- Do not confuse despiramine with disopyramide.
- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take wk to mo. May give entire dose at bedtime.
- Taper to avoid withdrawal effects. Reduce dose by half for 3 days then reduce again by half for 3 days, then discontinue.
- **PO:** Administer medication with or immediately after a meal to minimize gastric upset. Tablet may be crushed and given with food or fluids.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea; vomiting; diarrhea; headache; trouble sleeping, with vivid dreams; and irritability. Instruct patient to read the *Medication Guide* prior to starting and with each Rx refill in case of changes.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in the elderly. Protect patient from falls. Institute fall precau-

tions. Advise patient to make position changes slowly.

- Advise patient to avoid alcohol or other CNS depressant drugs during and for 3–7 days after therapy has been discontinued.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluids or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Alert patient that medication may turn urine blue-green in color.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to monitor effectiveness and side effects and to improve coping skills.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in chronic pain symptoms.
- Full therapeutic effects may be seen 2–6 wk after initiating therapy.

desmopressin

(des-moe-press-in)

DDAVP, \star DDAVP Melt, DDAVP Rhinal Tube, \star DDAVP Rhinyle, \star Nocurna, Noctiva, Stimate

Classification

Therapeutic: hormones

Pharmacologic: antidiuretic hormones

\star = Canadian drug name. \boxtimes = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

PO, SL, Subcut, IV, Intranasal: Treatment of central diabetes insipidus caused by a deficiency of vasopressin. **IV, Intranasal:** Controls bleeding in certain types of hemophilia and von Willebrand's disease. **Intranasal:** Nocturia due to nocturnal polyuria in patients who awaken ≥ 2 times per night to void (Noctiva only). **SL:** Nocturia in adults with ≤ 4 nocturnal voids (Nocturna only). **PO, SL:** Primary nocturnal enuresis.

Action

An analogue of naturally occurring vasopressin (antidiuretic hormone). Primary action is enhanced reabsorption of water in the kidneys. **Therapeutic Effects:** Prevention of nocturnal enuresis. Maintenance of appropriate body water content in diabetes insipidus. Control of bleeding in certain types of hemophilia or von Willebrand's disease. Reduction in number of episodes of nocturia.

Pharmacokinetics

Absorption: $<1\%$ absorbed following oral or SL administration; nasal solution 10–20% absorbed; nasal spray 3–4% absorbed.

Distribution: Distribution not fully known. Enters breast milk.

Metabolism and Excretion: Primarily excreted in urine.

Half-life: *PO*—1.5–2.5 hr; *SL*—2.8 hr; *IV*—75 min (\uparrow in renal impairment); *Intranasal*—1.8–3.5 hr.

TIME/ACTION PROFILE (*PO*, intranasal = antidiuretic effect; *IV* = effect on factor VIII activity)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	4–7 hr	unknown
SL	unknown	unknown	unknown
Intranasal	1 hr	1–5 hr	8–20 hr
IV	within min	15–30 min	3 hr \dagger

$\dagger 4$ –24 hr in mild hemophilia A.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to chlorbutanol; Patients with severe type I, type IIB, or platelet-type (pseudo) von Willebrand's disease, hemophilia A with factor VIII levels $<5\%$ or hemophilia B; Renal impairment ($CCr < 50$ mL/min); Hyponatremia; Polydipsia (Noctiva only); Primary nocturnal enuresis (Noctiva only); Concurrent use with loop diuretics or systemic/inhaled glucocorticoids (Noctiva only); Known or suspected syndrome of inappropriate antidiuretic hormone secretion (Noctiva only); Conditions that can lead to electrolyte or fluid imbalances, including gastroenteritis, salt-wasting nephropathies, or infection (Noctiva only); HF (NYHA class II–IV) (Noctiva only); Uncontrolled hypertension (Noctiva only).

Use Cautiously in: Angina pectoris; Hypertension; Patients at risk for hyponatremia; Patients at risk for \uparrow intracranial hypertension (Noctiva only); Urinary reten-

tion (Noctiva only); HF (NYHA class I) (Noctiva only); Patients who require use of other intranasal medications; **Ger:** \uparrow risk of hyponatremia; **OB, Lactation:** Safety not established; Noctiva not recommended for treatment of nocturia in pregnancy.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, drowsiness, headache, listlessness. **EENT:** *intranasal*—epistaxis, nasal congestion, nasal discomfort, rhinitis, sneezing. **Resp:** dyspnea. **CV:** hypertension, hypotension, tachycardia (large *IV* doses only). **GI:** mild abdominal cramps, nausea. **GU:** vulval pain. **Derm:** flushing. **F and E:** fluid retention, hyponatremia. **MS:** back pain. **Local:** phlebitis at *IV* site.

Interactions

Drug-Drug: **Loop diuretics, systemic glucocorticoids, or inhaled glucocorticoids** \uparrow risk of severe hyponatremia; concurrent use with Noctiva contraindicated. **Chlorpromazine, SSRIs, TCAs, NSAIDs, thiazide diuretics, or carbamazepine** may \uparrow risk of fluid retention and hyponatremia. **Demeclocycline, lithium, or norepinephrine** may diminish the antidiuretic response to desmopressin. Large doses may enhance the effects of vasopressors.

Route/Dosage

Two sprays of Noctiva 0.83 mcg/spray are not interchangeable with one spray of 1.66 mcg/spray formulation; the 1.66 mcg/spray formulation should be used for those patients who are taking 1.66 mcg dose.

Primary Nocturnal Enuresis

PO (Adults and Children ≥ 6 yr): 0.2 mg at bedtime; may be titrated up to 0.6 mg at bedtime to achieve desired response.

SL (Adults and Children): 120 mcg 1 hr before bedtime; may be titrated up to 360 mcg at bedtime to achieve desired response.

Diabetes Insipidus

PO (Adults and Children): 0.05 mg twice daily; adjusted as needed (usual range: 0.1–1.2 mg/day for adults or 0.1–0.8 mg/day for children in 2–3 divided doses).

SL (Adults and Children): 60 mcg 3 times daily; adjusted as needed (usual range: 120–720 mcg/day in 2–3 divided doses).

Intranasal (Adults and Children ≥ 12 yr): *DDAVP*—5–40 mcg (0.0.05–0.4 mL) in 1–3 divided doses.

Intranasal (Children 3 mo–12 yr): *DDAVP*—5–30 mcg (0.05–0.3 mL) in 1–2 divided doses.

Subcut, IV (Adults and Children ≥ 12 yr): 2–4 mcg/day in 2 divided doses.

Subcut, IV (Children <12 yr): 0.1–1 mcg/day in 1–2 divided doses.

Hemophilia A/von Willebrand's disease

Intranasal (Adults and Children >50 kg): *Stimate*—1 spray (150 mcg) in each nostril.

Intranasal (Adults and Children ≤50 kg): *Stimate*—1 spray (150 mcg) in one nostril.

IV (Adults and Children >3 mo): 0.3 mcg/kg, repeated as needed.

Nocturia

SL (Adults): *Women*—25 mcg at bedtime; *Men*—50 mcg at bedtime.

Intranasal (Adults ≥65 yr or other patients at ↑ risk for hyponatremia): *Noctiva*—1 spray (0.83 mcg) in one nostril 30 min before bedtime; after ≥7 days, may ↑ to 1 spray (1.66 mcg) in one nostril 30 min before bedtime.

Intranasal (Adults <65 yr): *Noctiva*—1 spray (1.66 mcg) in one nostril 30 min before bedtime.

Availability (generic available)

Sublingual tablet: * 25 mcg, * 50 mcg, * 60 mcg, * 120 mcg, * 240 mcg. **Tablets:** 0.1 mg, 0.2 mg. **Nasal spray (DDAVP):** 10 mcg/spray. **Nasal spray (Noctiva):** 0.83 mcg/spray, 1.66 mcg/spray. **Nasal spray (Stimate):** 150 mcg/spray. **Rhinal tube delivery system-nasal solution:** 2.5-mL vials with applicator tubes (0.1 mg/mL). **Injection:** 4 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Chronic intranasal use may cause tolerance or if administered more frequently than every 24–48 hr IV tachyphylaxis (short-term tolerance) may develop.
- **Nocturnal Enuresis:** Monitor frequency of enuresis throughout therapy. Use cautiously in patients at risk for water intoxication with hyponatremia.
- Do not use intranasal form for nocturnal enuresis.
- **Diabetes Insipidus:** Monitor urine and plasma osmolality and urine volume frequently. Assess patient for symptoms of dehydration (excessive thirst, dry skin and mucous membranes, tachycardia, poor skin turgor). Weigh patient daily and assess for edema.
- **Hemophilia:** Monitor plasma factor VIII coagulant, factor VIII antigen, and ristocetin cofactor. May also assess activated partial thromboplastin time (aPTT) for hemophilia A and skin bleeding time for von Willebrand's disease. Assess patient for signs of bleeding.
- Monitor BP and pulse during IV infusion.
- Monitor intake and output and adjust fluid intake (especially in children and elderly) to avoid overhydration in patients receiving desmopressin for hemophilia.
- **Toxicity and Overdose:** Signs and symptoms of water intoxication include confusion, drowsiness,

headache, weight gain, difficulty urinating, seizures, and coma.

- Treatment of overdose includes decreasing dose and, if symptoms are severe, administration of furosemide.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)

Excess fluid volume (Adverse Reactions)

Implementation

- IV desmopressin has 10 times the antidiuretic effect of intranasal desmopressin.
- **PO:** Begin oral doses 12 hr after last intranasal dose. Monitor response closely.
- **Diabetes Insipidus:** Parenteral dose for antidiuretic effect is administered IV push or subcut.
- **Hemophilia:** Parenteral dose for control of bleeding is administered via IV infusion. If used preoperatively, administer 30 min prior to procedure.
- **SL:** Place tablet under tongue and allow to dissolve completely.

IV Administration

- **IV Push:** (for diabetes insipidus) **Diluent:** Administer undiluted. **Concentration:** 4 mcg/mL. **Rate:** Administer over 1 min.
- **Intermittent Infusion (for hemophilia and von Willebrand's disease):** **Diluent:** Dilute each dose in 50 mL of 0.9% NaCl for adults and children >10 kg and in 10 mL in children weighing <10 kg. **Concentration:** maximum 0.5 mcg/mL. **Rate:** Infuse slowly over 15–30 min.
- **Y-Site Compatibility:** No information available.
- **Intranasal** If intranasal dose is used preoperatively, administer 2 hr before procedure.

Patient/Family Teaching

- Advise patient to notify health care professional if bleeding is not controlled or if headache, dyspnea, heartburn, nausea, abdominal cramps, vulval pain, or severe nasal congestion or irritation occurs.
- Caution patient to avoid concurrent use of alcohol with this medication.
- **Diabetes Insipidus:** Instruct patient on intranasal administration. Medication is supplied with a flexible calibrated catheter (rhinyle). Draw solution into rhinyle. Insert one end of tube into nostril, blow on the other end to deposit solution deep into nasal cavity. An air-filled syringe may be attached to the plastic catheter for children, infants, or obtunded patients. Tube should be rinsed under water after each use.
- If nasal spray is used, prime pump prior to first use by pressing down 4 times. Caution patient that nasal spray should not be used beyond the labeled number of sprays; subsequent sprays may not deliver ac-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

curate dose. Do not attempt to transfer remaining solution to another bottle.

- Instruct patient to take missed doses as soon as remembered but not if it is almost time for the next dose. Do not double doses.
- Advise patient that rhinitis or upper respiratory infection may decrease effectiveness of this therapy. If increased urine output occurs, patient should contact health care professional for dosage adjustment.
- Patients with diabetes insipidus should carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Decreased frequency of nocturnal enuresis.
- Decrease in urine volume.
- Relief of polydipsia.
- Increased urine osmolality.
- Control of bleeding in hemophilia.

desonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

desoximetasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

desvenlafaxine (des-ven-la-fax-een)

Khedezla, Pristiq

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

Indications

Major depressive disorder.

Action

Inhibits serotonin and norepinephrine reuptake in the CNS. **Therapeutic Effects:** Decrease in depressive symptomatology, with fewer relapses/recurrences.

Pharmacokinetics

Absorption: 80% absorbed following oral administration.

Distribution: Enters breast milk.

Metabolism and Excretion: 55% metabolized by the liver, 45% excreted unchanged in urine.

Half-life: 10 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	7.5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to venlafaxine or desvenlafaxine; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Should not be used concurrently with venlafaxine.

Use Cautiously in: Untreated cerebrovascular or cardiovascular disease, including untreated hypertension (control BP before initiating therapy); Bipolar disorder (may activate mania/hypomania); Renal impairment (consider modifications, dose should not exceed 50 mg/day, especially in moderate to severe renal impairment); History of seizures or neurologic impairment; Hepatic impairment (dose should not exceed 100 mg/day); Angle-closure glaucoma; **Geri:** Consider age-related ↓ in renal function, ↓ body mass, concurrent disease states, and medications; **OB, Lactation:** Use only if maternal benefit outweighs fetal/infant risk; **Pedi:** ↑ risk of suicidal thinking and behavior (suicidality) in children and adolescents with major depressive disorder and other psychiatric disorders. Observe closely for suicidality and behavior changes.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, anxiety, dizziness, drowsiness, insomnia, headache, teeth grinding, vertigo. **EENT:** ↑ intraocular pressure, mydriasis. **Resp:** eosinophilic pneumonia, interstitial lung disease. **CV:** hypertension. **GI:** PANCREATITIS, ↓ appetite, constipation, nausea. **GU:** male sexual dysfunction. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, sweating. **F and E:** hyponatremia. **Hemat:** ↑ risk of bleeding. **Metab:** hypercholesterolemia, hyperlipidemia. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with MAO inhibitors may result in serious, potentially fatal reactions (wait at least 2 wk after stopping MAO inhibitor before initiating desvenlafaxine; wait at least 1 wk after stopping desvenlafaxine before starting an MAO inhibitor). Concurrent use with MAO-inhibitor like drugs, such as linezolid or methylene blue may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving linezolid or methylene blue; if linezolid or methylene blue need to be started in a patient receiving desvenlafaxine, immediately discontinue desvenlafaxine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume desvenlafaxine therapy 24 hr after last dose of linezolid or methylene blue). ↑ risk of bleeding with other drugs that ↑ bleeding risk including anticoagulants, antithrombotics, platelet aggregation inhibitors, and NSAIDs. Use cautiously with other CNS-active drugs, including alcohol or sedative/hypnotics; effects of combination are unknown. Drugs that affect serotonergic neurotransmitter systems, including tricyclic antidepressants.

sants, SNRIs, fentanyl, buspirone, tramadol, amphetamines, and triptans ↑ risk of serotonin syndrome. **Ketoconazole** may ↑ the effects of desvenlafaxine. May ↑ levels of CYP2D6 substrates, including **desipramine, atomoxetine, dextromethorphan, metoprolol, nebivolol, perphenazine, and tolterodine**; if using desvenlafaxine at dose of 400 mg/day, ↓ dose of CYP2D6 substrate by 50%.

Route/Dosage

PO (Adults): 50 mg once daily (range = 50–400 mg/day).

Renal Impairment

PO (Adults): *CCr* 30–50 mL/min—50 mg once daily; *CCr* <30 mL/min—50 mg every other day or 25 mg once daily.

Hepatic Impairment

PO (Adults): *Moderate-to-severe hepatic impairment*—50 mg once daily (not to exceed 100 mg/day).

Availability (generic available)

Extended-release tablets: 25 mg, 50 mg, 100 mg.

Cost: *Generic*—All strengths \$174.14/30.

NURSING IMPLICATIONS

Assessment

- Assess mental status and mood changes, especially during initial few mo of therapy and during dose changes. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings or guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal ideation).
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- Monitor BP before and periodically during therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake; weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may de-

velop. Treat symptomatically; may recur once treatment is stopped.

- **Lab Test Considerations:** May cause ↑ fasting serum total cholesterol, LDL, cholesterol, and triglycerides.
- May cause transient proteinuria, not usually associated with ↑ BUN or creatinine.
- May cause hyponatremia.
- May cause false-positive immunoassay screening tests for phencyclidine (PCP) and amphetamine.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse Pristiq with Prilosec.**
- **PO:** Administer at the same time each day, with or without food. Swallow tablets whole; do not crush, break, chew, or dissolve.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed at the same time each day. Take missed doses as soon as possible unless almost time for next dose. Do not double doses or discontinue abruptly; gradually decrease before discontinuation to prevent dizziness, nausea, headache, irritability, insomnia, diarrhea, anxiety, fatigue, abnormal dreams, and hyperhidrosis.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Caution patient to avoid taking alcohol or other CNS-depressant drugs during therapy and of increased risk of bleeding with concomitant use of NSAIDs, aspirin, or other drugs that affect coagulation or bleeding. Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, especially St. John's Wort and to consult health care professional before taking other Rx, OTC, or herbal products.
- Instruct patient to notify health care professional if signs of allergy (rash, hives, swelling, difficulty breathing) occur.
- Inform patient that remains of tablet may pass into stool, but medication has already been absorbed.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected or and to avoid breast feeding.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Therapy is usually continued for several mo.

dexamethasone, See CORTICOSTEROIDS (SYSTEMIC).

dexlansoprazole (dex-lan-soe-pra-zole) Dexilant, Dexilant SoluTab

Classification

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

Indications

Healing of erosive esophagitis (EE) (capsules only). Maintenance of healed EE and relief of heartburn (capsules and orally disintegrating tablets [ODTs]). Treatment of heartburn from nonerosive gastroesophageal reflux disease (GERD) (capsules and ODTs).

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 96–99%.

Metabolism and Excretion: Extensively metabolized by the liver (CYP2C19 and CYP3A4 enzyme systems are involved); $\frac{\text{X}}$ the CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly \uparrow dexlansoprazole concentrations and an \uparrow risk of adverse effects) no active metabolites. No renal elimination.

Half-life: 1–2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK*	DURATION
PO	unknown	1–2 hr (1st); 4–5 hr (2nd)	24 hr

*Reflects effects of delayed release capsule.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic impairment; Concurrent use of rilpivirine; **Lactation:** Lactation.

Use Cautiously in: Moderate hepatic impairment (daily dose should not exceed 30 mg); Patients using high doses for >1 year (\uparrow risk of hip, wrist, or spine fractures); Patients using therapy for >3 yr (\uparrow risk of vitamin B₁₂ deficiency; **Pedi:** Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: cutaneous lupus erythematosus. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain, diarrhea, flatulence, nausea, vomiting. **F and E:** hypomagnesemia (especially if treatment duration \geq 3 mo). **GU:** acute interstitial nephritis. **Hemat:** vitamin B₁₂ deficiency. **MS:** bone fracture. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), systemic lupus erythematosus.

Interactions

Drug-Drug: May \downarrow absorption of drugs requiring acid pH, including ketoconazole, itraconazole, atazanavir, nelfinavir, rilpivirine, ampicillin esters, iron salts, erlotinib, and mycophenolate mofetil; concurrent use with rilpivirine contraindicated; avoid concurrent use with atazanavir and nelfinavir. May \uparrow levels of digoxin, methotrexate, and tacrolimus. May \uparrow effect of warfarin. Hypomagnesemia \uparrow risk of digoxin toxicity.

Route/Dosage

ODT formulation is NOT indicated for healing of EE (two 30-mg ODTs are NOT interchangeable with one 60-mg delayed release capsule)

PO (Adults and Children \geq 12 yr): Healing of EE (capsules only)—60 mg once daily for up to 8 wk; Maintenance of healed EE—30 mg once daily for up to 6 mo (adults) and up to 16 wk (12–17 yr old); GERD—30 mg once daily for 4 wk.

Hepatic Impairment

PO (Adults): Moderate hepatic impairment—daily dose should not exceed 30 mg.

Availability (generic available)

Delayed release capsules: 30 mg, 60 mg. Orally disintegrating tablets: 30 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- Monitor bowel elimination. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD).

- **Lab Test Considerations:** May cause abnormal liver function tests, including ↑AST, ALT, and ↑ or ↓ serum bilirubin.
- May cause ↑ serum creatinine and BUN, ↑ blood glucose, and ↑ serum potassium, and ↓ serum magnesium levels.
- May cause ↓ platelet levels.
- May also cause ↑ gastrin and total protein levels.
- Monitor INR and prothrombin time in patients taking warfarin.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not substitute two 30 mg *Dexilant SoluTabs* for one 60 mg *Dexilant* capsule; dose forms are not interchangeable.
- **PO:** May be administered without regard to food. Swallow capsules whole or may be opened and sprinkled on 1 tsp of applesauce and swallowed immediately, without crushing or chewing, for patients with difficulty swallowing.
- Capsules may be opened and granules emptied into 20 mL water. Withdraw entire mixture into syringe; swirl gently to mix. Administer mixture into mouth or NG tube immediately; do not save for later. Rinse syringe with 10 mL or water twice to ensure all medication administered.
- Administer *SoluTab* 30 min before meals. Do not break or cut. Place on tongue, allow to disintegrate and swallow microgranules without water; do not chew microgranules. May also be swallowed whole with water. Avoid alcohol when taking *SoluTabs*. May be placed in an oral syringe or catheter-tip with 20 mL water. Swirl for quick dispersal. After dispersed, administer immediately into mouth or NG tube; do not save for later. Refill syringe with 10 mL water, gently shake, administer remaining contents twice to ensure all medication is administered.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly, especially if accompanied by fever or bloody stools. Do not treat with antidiarrheals without consulting health care professional.
- Advise patient to notify health care professional if signs and symptoms of hypomagnesemia (seizures, dizziness, abnormal or fast heartbeat, jitteriness, jerking movements or shaking [tremors], muscle

weakness, spasms of the hands and feet, cramps or muscle aches, spasm of the voice box) occur.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain, heartburn, gastric irritation, and bleeding in patients with GERD; may require up to 4 wk of therapy.
- Healing in patients with erosive esophagitis; may require up to 8 wk of therapy for healing and 6 mo of therapy for maintenance.

dexmedetomidine (dex-me-de-to-mi-deen) Precedex

Classification

Therapeutic: sedative/hypnotics

Indications

Sedation of initially intubated and mechanically ventilated patients during treatment in an intensive care setting; should not be used for >24 hr. Sedation of non-intubated patients before and/or during surgical and other procedures.

Action

Acts as a relatively selective alpha-adrenergic agonist with sedative properties. **Therapeutic Effects:** Sedation.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: 94%.

Metabolism and Excretion: Mostly metabolized by the liver, some metabolism by P450 enzyme system. Metabolites are mostly excreted in urine.

Half-life: 2 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Hepatic impairment (lower doses may be required); Advanced heart block; Severe left ventricular dysfunction; **Geriatric:** ↑ risk of bradycardia

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

and hypotension (consider dose ↓); **OB, Lactation, PEDI:** Safety not established.

Adverse Reactions/Side Effects

Resp: hypoxia. **CV:** BRADYCARDIA, SINUS ARREST, hypotension, transient hypertension. **GI:** dry mouth, nausea, vomiting. **Hemat:** anemia. **Misc:** fever.

Interactions

Drug-Drug: Sedation is enhanced by anesthetics, other sedative/hypnotics, and opioid analgesics.

Drug-Natural Products: Concomitant use of kava-kava, valerian, skullcap, chamomile, or hops can ↑ CNS depression.

Route/Dosage

ICU Sedation

IV (Adults): *Loading infusion*—1 mcg/kg over 10 min followed by *maintenance infusion* of 0.2–0.7 mcg/kg/hr for maximum of 24 hr; rate is adjusted to achieve desired level of sedation.

IV (Children): *Loading infusion*—0.5–1 mcg/kg followed by *maintenance infusion* of 0.2–1 mcg/kg/hr. Children <1 yr may require higher end of infusion rate.

Procedural Sedation

IV (Adults): *Loading infusion*—1 mcg/kg (0.5 mcg/kg for ophthalmic surgery or patients >65 yr) over 10 min followed by *maintenance infusion* of 0.6 mcg/kg/hr; rate is adjusted to achieve desired level of sedation (usual range 0.2–1 mcg/kg/hr) (maintenance infusion of 0.7 mcg/kg/hr recommended for fiberoptic intubation until endotracheal tube secured).

Availability (generic available)

Solution for injection (requires further dilution): 100 mcg/mL. **Premixed infusion (in 0.9% NaCl):** 4 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess level of sedation throughout therapy. Dose is adjusted based on level of sedation.
- **Monitor ECG and BP continuously throughout therapy.** May cause hypotension, bradycardia, and sinus arrest.
- **Toxicity and Overdose:** Atropine IV may be used to modify the vagal tone.

Potential Nursing Diagnoses

Anxiety (Indications)

Implementation

- Dexmedetomidine should be administered only in intensive care settings with continuous monitoring.
- A loading dose may not be required when converting patient from another sedative.

IV Administration

- **Continuous Infusion:** **Diluent:** To prepare infusion, withdraw 2 mL of dexmedetomidine and add to

48 mL of 0.9 NaCl for a total of 50 mL. **Concentration:** 4 mcg/mL. Shake gently. Solution should be clear; do not administer solutions that are discolored or contain particulate matter. Ampules and vials are for single use only. **Rate:** Administer *loading infusion* over 10 minutes, followed by *maintenance infusion* of 0.2–0.7 mcg/kg/hr for ICU sedation and 0.2–1.0 mcg/kg/hr for procedural sedation. Adjust dose to achieve desired level of sedation. Administer via infusion pump to ensure accurate rate.

- **Y-Site Compatibility:** 20% mannitol, acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, asparaginase, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisplatin, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, methelothamine, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, plasma substitute, potassium acetate, potassium chloride, potassium phosphate, prochlorperazine, promethazine, propofol, propranolol, quinapristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thio-pental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblas-

tine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, blood, diazepam, irinotecan, pantoprazole, plasma, phenytoin.

Patient/Family Teaching

- Explain to patient and family the purpose of the medication.

Evaluation/Desired Outcomes

- Sedation for up to 24 hr.

dextrazoxane (dex-ra-zox-ane)

Totect, Zinecard

Classification

Therapeutic: cardioprotective agents

Indications

Reducing incidence and severity of cardiomyopathy from doxorubicin in women with metastatic breast cancer who have already received a cumulative dose of doxorubicin >300 mg/m². Treatment of extravasation resulting from IV anthracycline chemotherapy.

Action

Acts as an intracellular chelating agent. **Therapeutic Effects:** Diminishes the cardiotoxic effects of doxorubicin. Decreased damage from extravasation of anthracyclines.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Some metabolism occurs; 42% eliminated in urine.

Half-life: 2.1–2.5 hr.

TIME/ACTION PROFILE (cardioprotective effect)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Any other type of chemotherapy except other anthracyclines (doxorubicin-like agents); May cause fetal harm.

Use Cautiously in: CCr <40 mL/min (dose ↓ required); **Lactation:** Lactation; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

Hemat: myelosuppression. **Local:** pain at injection site. **Misc:** **MALIGNANCY.**

Interactions

Drug-Drug: Myelosuppression may be ↑ by **anti-neoplastics** or **radiation therapy**. Antitumor effects of concurrent combination chemotherapy with **fluorouracil** and **cyclophosphamide** may be ↓ by dextrazoxane.

Route/Dosage

Cardioprotective

IV (Adults): 10 mg of dextrazoxane/1 mg doxorubicin.

Renal Impairment

IV (Adults): ↓ dose by 50%.

Extravasation Protection

IV (Adults): 1000 mg/m² (maximum 2000 mg) given on days 1 and 2, and followed by a dose of 500 mg/m² (maximum 1000 mg) on day 3.

Renal Impairment

IV (Adults CCr <40 mL/min): ↓ dose by 50%.

Availability (generic available)

Injection (Zinecard): 250 mg/vial, 500 mg/vial. **Injection (Totect):** 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- **Cardioprotective:** Assess extent of cardiomyopathy (cardiomegaly on x ray, basilar rales, S gallop, dyspnea, decline in left ventricular ejection fraction) prior to and periodically during therapy.
- **Extravasation protection:** Assess site of extravasation for pain, burning, swelling, and redness.
- **Lab Test Considerations:** Monitor CBC and platelet count frequently during therapy. Thrombocytopenia, leukopenia, neutropenia, and granulocytopenia from chemotherapy may be more severe at nadir with dextrazoxane therapy.
- Monitor liver function tests periodically during therapy. May cause reversible ↑ of liver enzymes.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Risk for impaired skin integrity (Indications)

Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- Do not administer solutions that are discolored or contain particulate matter. Reconstituted solution and diluted solution are stable in an IV bag for 6 hr at room temperature or if refrigerated. Discard unused solutions.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

IV Administration

- **Cardioprotective:** Doxorubicin should be administered within 30 min following dexrazoxane administration.
- **IV Push:** **Diluent:** Reconstitute dexrazoxane with 0.167 molar (M/6) sodium lactate injection. **Concentration:** 10 mg/mL. **Rate:** Administer via slow IV push.
- **Intermittent Infusion:** **Diluent:** Reconstituted solution may also be diluted with 0.9% NaCl or D5W. Solution is stable for 6 hr at room temperature or refrigerated. **Concentration:** 1.3–5 mg/mL. **Rate:** May also be administered via rapid IV infusion over 15–30 min.
- **Additive Incompatibility:** Do not mix with other medications.
- **Extravasation Protection:** Administer as soon as possible within 6 hr of extravasation. Remove cooling procedures, such as ice packs, at least 15 min before administration to allow sufficient blood flow to area of extravasation.
- **Intermittent Infusion:** **Diluent:** Dilute each vial in 50 mL of diluent provided by manufacturer. Add contents of all vials into 1000 mL of 0.9% NaCl for further dilution. Solution is slightly yellow. Use diluted solutions within 2 hr of dilution. Store at room temperature. **Rate:** Administer over 1–2 hr.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, buprenorphine, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftazidime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, doxetaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eftibatide, srtapenem, erythromycin, esmolol, stoposide, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gentamycin, glycopyrrolate, grani-setron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlor-ethamine, melphalan, meperidine, meropenem, metaraminol, methyl-dopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, minocycline, mitoxantrone, morphine, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine,

nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentazocine, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, polymyxin B, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuro-nium, sodium acetate, sodium bicarbonate, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotape, tigecycline, tirofi-ban, tobramycin, vancomycin, vasopressin, vecuro-nium, verapamil, vinblastine, vincristine, vinorel-bine, voriconazole, zoledronic acid.

- **Additive Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, cefepime, dantrolene, diazepam, dobutamine, furosemide, ganciclovir, methotrexate, methylprednisolone, nafcillin, pantoprazole, pentobarbital, phenytoin, sodium phosphates, thiopental, trimethoprim/sulfamethoxazole, zidovudine.

Patient/Family Teaching

- Explain the purpose of the medication to the patient.
- Emphasize the need for continued monitoring of cardiac function.
- Advise patient to notify health care professional if pregnancy is suspected or planned or if breast feeding. Dexrazoxane may be teratogenic. Breast feeding should be avoided during therapy.

Evaluation/Desired Outcomes

- Reduction of incidence and severity of cardiomyopathy associated with doxorubicin administration in women with metastatic breast cancer.
- Decrease in late sequelae (site pain, fibrosis, atrophy, and local sensory disturbance) following extravasation of anthracycline chemotherapeutic agents.

dextromethorphan

Classification

Therapeutic: allergy, cold, and cough remedies, antitussives

Indications

Symptomatic relief of coughs caused by minor viral upper respiratory tract infections or inhaled irritants. Most effective for chronic nonproductive cough. A common ingredient in nonprescription cough and cold preparations.

Action

Suppresses the cough reflex by a direct effect on the cough center in the medulla. Related to opioids structurally but has no analgesic properties. **Therapeutic Effects:** Relief of irritating nonproductive cough.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract. Extended-release product is slowly absorbed.

Distribution: Unknown. Probably crosses the placenta and enters breast milk.

Metabolism and Excretion: Metabolized to dextrophan, an active metabolite. Dextromethorphan and dextrophan are renally excreted.

Half-life: Unknown.

TIME/ACTION PROFILE (cough suppression)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	unknown	3–6 hr†
PO-ER	unknown	unknown	9–12 hr

†Up to 8 hr for gelcaps.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Patients taking MAO inhibitors or SSRIs; Should not be used for chronic productive coughs; Some products contain alcohol and should be avoided in patients with known intolerance.

Use Cautiously in: Cough that lasts more than 1 wk or is accompanied by fever, rash, or headache—

health care professional should be consulted; History of drug abuse or drug-seeking behavior (capsules have been abused resulting in deaths); Diabetes (some products contain sucrose); **OB:** Pregnancy (has been used safely); **Lactation:** Lactation; **Pedi:** Children <4 yr (OTC cough and cold products containing this medication should be avoided).

Adverse Reactions/Side Effects

CNS: *high dose*—dizziness, sedation. **GI:** nausea.

Interactions

Drug-Drug: Use with **MAO inhibitors** may result in serotonin syndrome (nausea, confusion, changes in BP); concurrent use should be avoided. ↑ CNS depression with **antihistamines, alcohol, antidepressants, sedative/hypnotics, or opioids.** **Amiodarone, fluoxetine, or quinidine** may ↑ blood levels and adverse reactions from dextromethorphan.

Route/Dosage

PO (Adults and Children >12 yr): 10–20 mg q 4 hr or 30 mg q 6–8 hr or 60 mg of extended-release preparation bid (not to exceed 120 mg/day).

PO (Children 6–12 yr): 5–10 mg q 4 hr or 15 mg q 6–8 hr or 30 mg of extended-release preparation q 12 hr (not to exceed 60 mg/day).

PO (Children 4–6 yr): 2.5–5 mg q 4 hr or 7.5 mg q 6–8 hr or 15 mg of extended-release preparation q 12 hr (not to exceed 30 mg/day).

Availability (generic available)

Gelcaps: 30 mg^{OTC}. **Lozenges (cherry):** 2.5 mg^{OTC}, 5 mg^{OTC}. **Liquid (cherry, grape):** 3.5 mg/5 mL^{OTC}, 5 mg/5 mL, 7.5 mg/5 mL^{OTC}, 15 mg/5 mL^{OTC}, 30 mg/5 mL^{OTC}. **Syrup (cherry, cherry bubblegum):** 7.5 mg/5 mL^{OTC}, 15 mg/15 mL^{OTC}, 10 mg/5 mL^{OTC}. **Extended-release suspension (orange):** 30 mg/5 mL^{OTC}.

Drops (Grape): 7.5 mg/0.8 mL^{OTC}, 7.5 mg/1 mL^{OTC}. **Orally-disintegrating strips (cherry, grape):** 7.5 mg^{OTC}, 15 mg^{OTC}. **In combination with:** antihistamines, decongestants, and expectorants in cough and cold preparations^{OTC}, quinidine sulfate (Nuedextra). See Appendix B.

Drops (Grape): 7.5 mg/0.8 mL^{OTC}, 7.5 mg/1 mL^{OTC}. **Orally-disintegrating strips (cherry, grape):** 7.5 mg^{OTC}, 15 mg^{OTC}. **In combination with:** antihistamines, decongestants, and expectorants in cough and cold preparations^{OTC}, quinidine sulfate (Nuedextra). See Appendix B.

Drops (Grape): 7.5 mg/0.8 mL^{OTC}, 7.5 mg/1 mL^{OTC}. **Orally-disintegrating strips (cherry, grape):** 7.5 mg^{OTC}, 15 mg^{OTC}. **In combination with:** antihistamines, decongestants, and expectorants in cough and cold preparations^{OTC}, quinidine sulfate (Nuedextra). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 mL to decrease viscosity of bronchial secretions.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Dextromethorphan 15–30 mg is equivalent in cough suppression to codeine 8–15 mg.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **PO:** Do not give fluids immediately after administering to prevent dilution of vehicle. Shake oral suspension well before administration.

Patient/Family Teaching

- Instruct patient to cough effectively: Sit upright and take several deep breaths before attempting to cough.
- Advise patient to minimize cough by avoiding irritants, such as cigarette smoke, fumes, and dust. Humidification of environmental air, frequent sips of water, and sugarless hard candy may also decrease the frequency of dry, irritating cough.
- Caution patient to avoid taking more than the recommended dose or taking alcohol or other CNS depressants concurrently with this medication; fatalities have occurred. **Caution parents to avoid OTC cough and cold products while breast feeding or to children <4 yrs.**
- May occasionally cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient that any cough lasting over 1 wk or accompanied by fever, chest pain, persistent headache, or skin rash warrants medical attention.

Evaluation/Desired Outcomes

- Decrease in frequency and intensity of cough without eliminating patient's cough reflex.

diazepam (dye-az-e-pam) Diastat, Valium

Classification

Therapeutic: antianxiety agents, anticonvulsants, sedative/hypnotics, skeletal muscle relaxants (centrally acting)

Pharmacologic: benzodiazepines

Schedule IV

Indications

Adjunct in the management of: Anxiety Disorder, Athetosis, Anxiety relief prior to cardioversion (injection), Stiffman Syndrome, Preoperative sedation, Conscious sedation (provides light anesthesia and anterograde amnesia). Treatment of status epilepticus/uncontrolled seizures (injection). Skeletal muscle relaxant. Management of the symptoms of alcohol withdrawal. **Unlabeled Use:** Anxiety associated with acute myocardial infarction, insomnia.

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. Produces skeletal muscle relaxation by inhibiting spinal polysynaptic afferent pathways. Has anticonvulsant properties due to enhanced presynaptic inhibition. **Therapeutic Effects:** Relief of anxiety. Sedation. Amnesia. Skeletal muscle relaxation. Decreased seizure activity.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract. Absorption from IM sites may be slow and unpredictable. Well absorbed (90%) from rectal mucosa.

Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.

Metabolism and Excretion: Highly metabolized by the hepatic P450 enzymes (CYP2C19 and CYP3A4); the CYP2C19 enzyme system exhibits genetic polymorphism; \approx 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly \uparrow diazepam concentrations and an \uparrow risk of adverse effects. Some products of metabolism are active as CNS depressants.

Half-life: Neonates: 50–95 hr; Infants 1 mo–2 yr: 40–50 hr; Children 2–12 yr: 15–21 hr; Children 12–16 yr: 18–20 hr; Adults: 20–50 hr (up to 100 hr for metabolites).

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	up to 24 hr
IM	within 20 min	0.5–1.5 hr	unknown
IV	1–5 min	15–30 min	15–60 min†
Rectal	2–10 min	1–2 hr	4–12 hr

†In status epilepticus, anticonvulsant duration is 15–20 min.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Comatose patients; Myasthenia gravis; Severe pulmonary impairment; Sleep apnea; Severe hepatic dysfunction; Pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Some products contain alcohol, propylene glycol, or tartrazine and should be avoided in patients with known hypersensitivity or intolerance; **OB:** \uparrow risk of congenital malformations; **Pedi:** Children <6 mo (for oral; safety not established); **Lactation:** Recommend to discontinue drug or bottle-feed.

Use Cautiously in: Severe renal impairment; History of suicide attempt or drug dependence; Debilitated patients (dose \downarrow required); Patients with low albumin; **Pedi:** Metabolites can accumulate in neonates. Injection contains benzyl alcohol which can cause potentially fatal gasping syndrome in neonates; **Ger:** Long-acting benzodiazepines cause prolonged sedation in the elderly. Appears on *Beers list* and is associated with \uparrow risk of falls (\downarrow dose required or consider short-acting benzodiazepine).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy, depression, hangover, ataxia, slurred speech, headache, paradoxical excitation. **EENT:** blurred vision. **Resp:** RESPIRATORY DEPRESSION. **CV:** hypotension (IV only). **GI:** constipation, diarrhea (may be caused by propylene glycol content in oral solution), nausea, vomiting, weight gain. **Derm:** rashes. **Local:** pain (IM), phlebitis (IV), ve-

nous thrombosis. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **opioids** or other **CNS depressants**, including other **benzodiazepines**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propranolol**, or **valproic acid** may ↓ the metabolism of diazepam, enhancing its actions. May ↓ the efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ the metabolism and ↓ effectiveness of diazepam. Sedative effects may be ↓ by **theophylline**. Concurrent use of **ritonavir** is not recommended.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

Antianxiety

PO (Adults): 2–10 mg 2–4 times daily.

IM, IV (Adults): 2–10 mg, may repeat in 3–4 hr as needed.

PO (Children >6 mo): 1–2.5 mg 3–4 times daily.

IM, IV (Children >1 mo): 0.04–0.3 mg/kg/dose q 2–4 hr to a maximum of 0.6 mg/kg within an 8 hr period if necessary.

Precardioversion

IV (Adults): 5–15 mg 5–10 min precardioversion.

Pre-endoscopy

IV (Adults): 2.5–20 mg.

IM (Adults): 5–10 mg 30 min pre-endoscopy.

Pediatric Conscious Sedation for Procedures

PO (Children >6 mo): 0.2–0.3 mg/kg (not to exceed 10 mg/dose) 45–60 min prior to procedure.

Status Epilepticus/Acute Seizure Activity

IV (Adults): 5–10 mg, may repeat q 10–15 min to a total of 30 mg, may repeat regimen again in 2–4 hr (IM route may be used if IV route unavailable); larger doses may be required.

IM, IV (Children ≥5 yr): 0.05–0.3 mg/kg/dose given over 3–5 min q 15–30 min to a total dose of 10 mg, repeat q 2–4 hr.

IM, IV (Children 1 mo–5 yr): 0.05–0.3 mg/kg/dose given over 3–5 min q 15–30 min to maximum dose of 5 mg, repeat in 2–4 hr if needed.

IV (Neonates): 0.1–0.3 mg/kg/dose given over 3–5 min q 15–30 min to maximum dose of 2 mg.

Rect (Adults and Children >12 yr): 0.2 mg/kg; may repeat 4–12 hr later.

Rect (Children 6–11 yr): 0.3 mg/kg; may repeat 4–12 hr later.

Rect (Children 2–5 yr): 0.5 mg/kg; may repeat 4–12 hr later.

Febrile Seizure Prophylaxis

PO (Children >1 mo): 1 mg/kg/day divided q 8 hr at first sign of fever and continue for 24 hr after fever is gone.

Skeletal Muscle Relaxation

PO (Adults): 2–10 mg 3–4 times daily.

PO (Geriatric Patients or Debilitated Patients): 2–2.5 mg 1–2 times daily initially.

PO (Children >6 mo): 1–2.5 mg 3–4 times daily.

IM, IV (Adults): 5–10 mg; may repeat in 2–4 hr (larger doses may be required for tetanus).

IM, IV (Geriatric Patients or Debilitated Patients): 2–5 mg; may repeat in 2–4 hr (larger doses may be required for tetanus).

IM, IV (Children ≥5 yr): *Tetanus*—5–10 mg q 3–4 hr.

IM, IV (Children >1 mo): *Tetanus*—1–2 mg q 3–4 hr.

Alcohol Withdrawal

PO (Adults): 10 mg 3–4 times in first 24 hr, ↓ to 5 mg 3–4 times daily.

IM, IV (Adults): 10 mg initially, then 5–10 mg in 3–4 hr as needed; larger or more frequent doses have been used.

Psychoneurotic Reactions

IM, IV (Adults): 2–10 mg, may be repeated in 3–4 hr.

Availability (generic available)

Tablets: 2 mg, 5 mg, 10 mg. **Cost:** *Generic*—2 mg \$7.51/100, 5 mg \$10.74/100, 10 mg \$10.84/100. **Oral solution:** 1 mg/mL, 5 mg/mL (Intensol). **Cost:** *Generic*—1 mg/mL \$2.44/5 mL, 5 mg/mL \$33.98/30 mL.

Injection: 5 mg/mL (contains 10% alcohol and 40% propylene glycol). **Rectal gel delivery system:** 2.5 mg, 10 mg, 20 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory rate prior to and periodically throughout therapy and frequently during IV therapy.
- Assess IV site frequently during administration; diazepam may cause phlebitis and venous thrombosis.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient. Observe depressed patients closely for suicidal tendencies.

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Conduct regular assessment of continued need for treatment.
- **Geriatrics:** Assess risk of falls and institute fall prevention strategies.
- **Anxiety:** Assess mental status (orientation, mood, behavior) and degree of anxiety.
- Assess level of sedation (ataxia, dizziness, slurred speech) prior to and periodically throughout therapy.
- **Seizures:** Observe and record intensity, duration, and location of seizure activity. The initial dose of diazepam offers seizure control for 15–20 min after administration. Institute seizure precautions.
- **Muscle Spasms:** Assess muscle spasm, associated pain, and limitation of movement prior to and during therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect patient from injury.
- **Lab Test Considerations:** Evaluate hepatic and renal function and CBC periodically during prolonged therapy. May cause ↑ transaminases and alkaline phosphatase.
- **Toxicity and Overdose:** Flumazenil is an adjunct in the management of toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants.)

Potential Nursing Diagnoses

Anxiety (Indications)

Impaired physical mobility (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse diazepam with diltiazem.**
- Patient should be kept on bedrest and observed for at least 3 hr following parenteral administration.
- If opioid analgesics are used concurrently with parenteral diazepam, decrease opioid dose by $\frac{1}{2}$ and titrate dose to effect.
- Use lowest effective dose. Taper by 2 mg every 3 days to decrease withdrawal symptoms. Some patients may require longer taper periods (mo).
- **PO:** Tablets may be crushed and taken with food or water if patient has difficulty swallowing.
- Mix Intensol preparation with liquid or semisolid food such as water, juices, soda, applesauce, or pudding. Administer entire amount immediately. Do not store.
- **IM:** IM injections are painful and erratically absorbed. If IM route is used, inject deeply into deltoid muscle for maximum absorption.

IV Administration

- **IV:** Resuscitation equipment should be available when diazepam is administered IV.
- **IV Push:** *Diluent:* For IV administration do not dilute or mix with any other drug. If IV push is not feasible, administer IV push into tubing as close to in-

sertion site as possible. Continuous infusion is not recommended due to precipitation in IV fluids and absorption of diazepam into infusion bags and tubing. Injection may cause burning and venous irritation; avoid small veins. **Concentration:** 5 mg/mL.

Rate: Administer slowly at a rate of 5 mg/min in adults. Infants and children should receive 1–2 mg/min. Rapid injection may cause apnea, hypotension, bradycardia, or cardiac arrest.

- **Y-Site Compatibility:** docetaxel, methadone, piperacillin/tazobactam, teniposide.
- **Y-Site Incompatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, azithromycin, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, ceftioxin, cefaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dantrolene, dexamethasone, dexmedetomidine, dexrazoxane, diazoxide, digoxin, diltiazem, diphenhydramine, dopamine, doxacurium, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, fosfarnet, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydroxycobalamin, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, magnesium chloride, mannitol, mechlorethamine, meperidine, meprobem, metaraminol, methotrexate, methoxamine, methyl-dopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, multivitamin, mycophenolate, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenitiazine, phenylephrine, phenytoin, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, rocuronium, sodium ace-

tate, sodium bicarbonate, streptokinase, succinylcholine, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Rect:** Do not repeat *Diastat* rectal dose more than 5 times/mo or 1 episode every 5 days. Round dose up to next available dose unit.
- Diazepam injection has been used for rectal administration. Instill via catheter or cannula fitted to the syringe or directly from a 1-mL syringe inserted 4–5 cm into the rectum. A dilution of diazepam injection with propylene glycol containing 1 mg/mL has also been used.
- Do not dilute with other solutions, IV fluids, or medications.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to take more than prescribed or increase dose if less effective after a few wk without checking with health care professional. Review package insert for *Diastat* rectal gel with patient/caregiver prior to administration. Abrupt withdrawal of diazepam may cause insomnia, unusual irritability or nervousness, and seizures. Advise patient that sharing of this medication may be dangerous.
- Medication may cause drowsiness, clumsiness, or unsteadiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. **Geri:** Advise geriatric patients of increased risk for CNS effects and potential for falls.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up examinations to determine effectiveness of the medication.
- **Seizures:** Patients on anticonvulsant therapy should carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in anxiety level. Full therapeutic antianxiety effects occur after 1–2 wk of therapy.
- Decreased recall of surgical or diagnostic procedures.
- Control of seizures.
- Decrease in muscle spasms.
- Decreased tremulousness and more rational ideation when used for alcohol withdrawal.

DICLOFENAC† (dye-kloe-fen-ak)

diclofenac (oral)

Zorvolex

diclofenac potassium (oral)

Cambia, ~~Cataflam~~, Zipsor

diclofenac sodium (oral)

★ Voltaren, ★ Voltaren SR, ~~Voltaren XR~~

diclofenac sodium (rectal suppository)

★ Voltaren

diclofenac sodium (topical gel)

Solaraze, Voltaren Gel

diclofenac sodium (topical solution)

Pennsaid

diclofenac epolamine (transdermal patch)

Flector

Classification

Therapeutic: nonopioid analgesics, nonsteroidal anti-inflammatory agents

†For ophthalmic use see Appendix C

Indications

PO: Management of inflammatory disorders including: Rheumatoid arthritis, Osteoarthritis, Ankylosing spondylitis. Primary dysmenorrhea. Relief of mild to moderate pain. Acute treatment of migraines (powder for oral solution). **Topical:** Management of: Actinic keratoses (Solaraze), Osteoarthritis (Voltaren Gel, Pennsaid [for knees]). **Transdermal:** Acute pain due to minor strains, sprains, and contusions.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation. Relief of acute migraine attacks. **Topical (Solaraze):** Clearance of actinic keratosis lesions.

Pharmacokinetics

Absorption: Undergoes first-pass metabolism by liver which results in 50% bioavailability. Oral diclofenac sodium is a delayed-release dose form. Diclofenac potassium is an immediate-release dose form. 6–10% of topical gel is systemically absorbed.

Distribution: Crosses the placenta.

Protein Binding: >99%.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Metabolism and Excretion: Metabolized by the liver (primarily by CYP2C9) to several metabolites; 65% excreted in urine, 35% in bile.

Half-life: 2 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (inflammation)	few days–1 wk	≈2 wk	unknown
PO (pain)	30 min	unknown	up to 8 hr
Top (gel and patch)	unknown	10–20 hr	unknown
Top (solution)	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to diclofenac or other components of formulation; Cross-sensitivity may occur with other NSAIDs including aspirin; Active GI bleeding/ulcer disease; Coronary artery bypass graft (CABG) surgery; Exudative dermatitis, eczema, infectious lesions, burns, or wounds.

Use Cautiously in: Severe renal/hepatic disease; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Heart failure or edema; History of porphyria; History of peptic ulcer disease and/or GI bleeding; **Geriatric:** Dose ↓ recommended; more susceptible to adverse effects, including GI bleeding; Bleeding tendency or concurrent anticoagulant therapy; **OB, Lactation:** Not recommended for use during second half of pregnancy; **Pediatric:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension. **EENT:** tinnitus. **GI:** GI BLEEDING, HEPATOTOXICITY, abdominal pain, constipation, diarrhea, dyspepsia, flatulence, heartburn, ↑ liver enzymes, nausea, vomiting. **GU:** acute renal failure, hematuria. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritis, rashes, eczema, photosensitivity. **F and E:** hyperkalemia. **Hemat:** anemia, prolonged bleeding time. **Local:** Topical only—contact dermatitis, dry skin, exfoliation.

Misc: allergic reactions including ANAPHYLAXIS.

Interactions

Primarily noted for oral administration.

Drug-Drug: ↑ adverse GI effects with aspirin, other NSAIDs, or corticosteroids. May ↓ effectiveness of diuretics or antihypertensives. May ↑ levels/risk of toxicity from cyclosporine, lithium, or methotrexate. ↑ risk of bleeding with anticoagulants, aspirin, clopidogrel, ticagrelor, prasugrel, corticosteroids, fibrinolytics, SNRIs, or SSRIs. CYP2C9 inhibitors, including voriconazole may ↑ levels/risk of toxicity. CYP2C9 inducers, including rifampin may ↓ levels/effectiveness. Concurrent use of oral NSAIDs

during topical diclofenac therapy should be minimized.

Drug-Natural Products: ↑ bleeding risk with arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, Panax ginseng, and others.

Route/Dosage

Different formulations of oral diclofenac (diclofenac capsules, diclofenac sodium enteric-coated tablets, diclofenac sodium extended-release tablets, and diclofenac potassium immediate-release tablets) are not bioequivalent and should not be substituted on a mg-to-mg basis.

Diclofenac

PO (Adults): Acute pain—18–35 mg 3 times daily; Osteoarthritis—35 mg 3 times daily.

Hepatic Impairment

PO (Adults): Do not exceed dose of 18 mg 3 times daily.

Diclofenac Potassium

PO (Adults): Analgesic/antidysmenorrheal (Cataflam)—100 mg initially, then 50 mg 3 times daily as needed; Analgesic (Zipsor)—25 mg 4 times daily; Rheumatoid arthritis (Cataflam)—50 mg 3–4 times daily; Osteoarthritis (Cataflam)—50 mg 2–3 times daily; Osteoarthritis (Cambia)—one packet (50 mg) given as a single dose.

Diclofenac Sodium

PO (Adults): Rheumatoid arthritis (delayed-release [enteric-coated] tablets)—50 mg 3–4 times daily or 75 mg twice daily (usual maintenance dose 25 mg 3 times daily). Rheumatoid arthritis (extended-release tablets)—100 mg once daily; if unsatisfactory response, dose may be ↑ to 100 mg twice daily. Osteoarthritis (delayed-release [enteric-coated] tablets)—50 mg 2–3 times daily or 75 mg twice daily. Osteoarthritis (extended-release tablets)—100 mg once daily. Ankylosing spondylitis (delayed-release [enteric-coated] tablets)—25 mg 4 times daily, with an additional 25 mg given at bedtime, if necessary.

Topical (Adults): Solaraze—Apply to lesions twice daily for 60–90 days; Voltaren gel—Lower extremities (knees, ankles, feet): Apply 4 g to affected area 4 times daily (maximum of 16 g per joint/day); Upper extremities (elbows, wrists, hands): Apply 2 g to affected area 4 times daily (maximum of 8 g per joint/day); Maximum total body dose should not exceed 32 g/day; Pennsaid—Apply 40 drops to affected knee(s) 4 times daily.

Rect (Adults): Insert 50 mg or 100 mg rectally as single dose to substitute for final oral daily dose (max combined dose [rectal and oral]: 100 mg/day).

Diclofenac Epolamine

Topical (Adults): Flector—Apply 1 patch to most painful area twice daily.

Availability (generic available)

Diclofenac capsules (Zorvolex): 18 mg, 35 mg. Diclofenac potassium immediate-release tablets (Cataflam): 50 mg. Cost: Generic—\$156.55/100. Diclofenac potassium liquid-filled capsules (Zip-

tor): 25 mg. **Cost:** \$478.80/100. **Diclofenac potassium powder for oral solution (Cambia):** 50 mg/packet. **Cost:** \$29.04/1 pkt. **Diclofenac sodium delayed-release (enteric-coated) tablets (Voltaren):** 25 mg, 50 mg, 75 mg. **Cost:** *Generic*—25 mg \$142.18/100, 50 mg \$147.23/100, 75 mg \$177.39/100. **Diclofenac sodium extended-release tablets (Voltaren XR):** * 75 mg, 100 mg. **Cost:** *Generic*—100 mg \$281.42/100. **Diclofenac sodium gel:** 1% (Voltaren gel), 3% (Solaraze). **Cost:** 1% \$46.48/100 g, 3% \$931.92/100 g. **Diclofenac sodium rectal suppository:** * 50 mg, * 100 mg. **Diclofenac sodium topical solution:** 1.5%. **Cost:** \$289.67/150 mL. **Diclofenac epolamine transdermal patch:** 180 mg/patch. **Cost:** \$239.70/30. **In combination with:** misoprostol (Arthrotec). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Patients who have asthma, aspirin-induced allergy, and nasal polyps are at ↑ risk for developing hypersensitivity reactions.**
- Monitor BP closely during initiation of treatment and periodically during therapy in patients with hypertension.
- **Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.**
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity before and 30–60 min after administration.
- **Arthritis:** Assess arthritic pain (note type, location, intensity) and limitation of movement before and periodically during therapy.
- **Actinic Keratosis:** Assess lesions prior to and periodically during therapy.
- **Lab Test Considerations:** Diclofenac has minimal effect on bleeding time and platelet aggregation.
- May cause ↓ in hemoglobin and hematocrit.
- Monitor CBC and liver function tests within 4–8 wk of initiating diclofenac and periodically during therapy. May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- Monitor BUN and serum creatinine periodically during therapy. May cause ↑ BUN and serum creatinine.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may

cause increased side effects. Use lowest effective dose for shortest period of time.

- **PO:** **Take with food or milk to minimize gastric irritation.** May take first 1–2 doses on an empty stomach for more rapid onset. Do not crush or chew enteric-coated or extended-release tablets.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.
- **Topical:** **Gel** should be applied to intact skin; do not use on open wounds. An adequate amount of gel should be applied to cover the entire lesion.
- **Topical:** Dispense **solution** 10 drops at a time either directly onto knee or first into the hand and then onto knee. Spread solution evenly around front, back, and sides of the knee. Repeat until 40 drops have been applied and knee is completely covered with solution.
- **Transdermal:** Apply patch to the most painful area twice a day. Do not apply to nonintact or damaged skin resulting from any etiology (exudative dermatitis, eczema, infected lesion, burns, wounds). Avoid contact with eyes; wash hands after applying, handling, or removing patch.

Patient/Family Teaching

- Instruct patient to take diclofenac as directed and not take more than recommended.
- Caution patient to avoid concurrent use of alcohol, aspirin, acetaminophen, other NSAIDs, or other OTC medications without consulting health care professional.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- **May cause serious side effects: CV (MI or stroke), GI (ulcers, bleeding), skin (exfoliative dermatitis, Stevens-Johnson Syndrome, toxic epidermal necrolysis), and hypersensitivity (anaphylaxis). May occur without warning symptoms. Advise patient to stop medication and notify health care professional immediately if symptoms of CV side effects (chest pain, shortness of breath, weakness, slurring of speech), GI side effects (epigastric pain, dyspepsia, melena, hematemesis), skin side effects (skin rash, blisters, fever, itching), or hypersensitivity reactions (difficulty breathing or swelling of face or throat) occur. Inform patient that risk for heart attack or stroke that can lead to death increases with longer use of NSAID medications and in people who have heart disease and that risk of ulcer increases with concurrent use of corticosteroids and anticoagulants, longer use, smoking, drinking alcohol, older age, and having poor health.**
- Advise patient to notify health care professional promptly if unexplained weight gain, swelling of arms and legs or hands and feet, nausea, fatigue,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

lethargy, rash, pruritis, yellowing of skin or eyes, itching, stomach pain, vomiting blood, bloody or tarry stools, or flu-like symptoms occur.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct female patients to inform health care professional if they plan or suspect pregnancy. Caution female patient to avoid use of diclofenac in last trimester of pregnancy and to notify health care professional if breast feeding.
- **PO:** Instruct patient to take diclofenac with a full glass of water and to remain in an upright position for 15–30 min after administration. Take missed doses as soon as possible within 1–2 hr if taking once or twice a day or unless almost time for next dose if taking more than twice a day. Do not double doses.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- **Topical:** Advise patient to minimize use of concurrent NSAIDs during topical therapy. Instruct patient to read *Medication Guide* before starting therapy and with each Rx refill in case changes have been made.
- **Pennsaid:** Instruct patient to avoid touching treated knee and allowing another person to touch knee until completely dry. Cover knee with clothing until completely dry. Avoid covering lesion with occlusive dressing or tight clothing, and avoid applying sunscreen, insect repellent, lotion, moisturizer, cosmetics to the affected area. Do not use heating pads, sunlamps, and tanning beds. Protect treated knee from sunlight; wear protective clothes when in sunlight. Avoid showers or baths for at least 30 minutes after application.
- **Solarze:** Advise patient that it may take up to 1 mo for complete healing of the lesion to occur.
- **Transdermal:** Instruct patient on correct application procedure for patch. Apply patch to most painful area. Change patch every 12 hr. Remove patch if irritation occurs. Fold used patches so adhesive sticks to itself and discard where children and pets cannot get them. Encourage patient to read the *NSAID Medication Guide* that accompanies the prescription.
- Instruct patients if patch begins to peel off to tape the edges. Do not wear patch during bathing or showering. Bathing should take place between scheduled patch removal and application.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

Evaluation/Desired Outcomes

- Decrease in severity of mild-to-moderate pain.
- Increased ease of joint movement. Patients who do not respond to one NSAID may respond to another. May require 2 wk or more for maximum effects.
- Decrease in or healing of lesions in actinic keratosis. Optimal effect may not be seen until 30 days after discontinuation of therapy. Lesions that do not heal should be re-evaluated.

dicloxacillin, See PENICILLINS, PENICILLINASE RESISTANT.

diflorasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

HIGH ALERT

digoxin (di-jox-in)

Lanoxin,  Toloxin

Classification

Therapeutic: antiarrhythmics, inotropics
Pharmacologic: digitalis glycosides

Indications

Heart failure. Atrial fibrillation and atrial flutter (slows ventricular rate). Paroxysmal atrial tachycardia.

Action

Increases the force of myocardial contraction. Prolongs refractory period of the AV node. Decreases conduction through the SA and AV nodes. **Therapeutic Effects:** Increased cardiac output (positive inotropic effect) and slowing of the heart rate (negative chronotropic effect).

Pharmacokinetics

Absorption: 60–80% absorbed after oral administration of tablets; 70–85% absorbed after administration of elixir; 80% absorbed from IM sites (IM route not recommended due to pain/irritation).

Distribution: Widely distributed; crosses placenta and enters breast milk.

Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.

Half-life: 36–48 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antiarrhythmic or inotropic effects, provided that a loading dose has been given)

ROUTE	ONSET	PEAK	DURATION
Digoxin–PO	30–120 min	2–8 hr	2–4 days†
Digoxin–IM	30 min	4–6 hr	2–4 days†
Digoxin–IV	5–30 min	1–4 hr	2–4 days†

†Duration listed is that for normal renal function; in impaired renal function, duration will be longer.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled ventricular arrhythmias; AV block (in absence of pacemaker); Idiopathic hypertrophic subaortic stenosis; Constrictive pericarditis; Known alcohol intolerance (elixir only).

Use Cautiously in: Hypokalemia (\uparrow risk of digoxin toxicity); Hypercalcemia (\uparrow risk of toxicity, especially with mild hypokalemia); Hypomagnesemia (\uparrow risk of digoxin toxicity); Diuretic use (may cause electrolyte abnormalities including hypokalemia and hypomagnesemia); Hypothyroidism; Myocardial infarction; Renal impairment (dose \downarrow required); Obesity (base dose on ideal body weight); **Geri:** Very sensitive to toxic effects; dose adjustments required for age-related \downarrow in renal function and body weight; **OB:** Although safety has not been established, has been used without adverse effects on the fetus; **Lactation:** Similar concentrations in serum and breast milk result in subtherapeutic levels in infant, use with caution.

Adverse Reactions/Side Effects

CNS: fatigue, headache, weakness. **EENT:** blurred vision, yellow or green vision. **CV:** **ARRHYTHMIAS**, **bradycardia**, ECG changes, AV block, SA block. **GI:** **anorexia**, **nausea**, **vomiting**, **diarrhea**. **Hemat:** thrombocytopenia. **Metab:** electrolyte imbalances with acute digoxin toxicity.

Interactions

Drug-Drug: **Thiazide** and **loop diuretics**, **piperacillin**, **amphotericin B**, **corticosteroids**, and excessive use of **laxatives** may cause hypokalemia which may \uparrow risk of toxicity. **Quinidine** and **ritonavir** may \uparrow levels and lead to toxicity; \downarrow digoxin dose by 30–50%. **Amiodarone** may \uparrow levels and lead to toxicity; \downarrow digoxin dose by 50%. **Cyclosporine**, **itraconazole**, **propafenone**, **quinine**, **spironolactone**, and **verapamil** may \uparrow levels and lead to toxicity; serum level monitoring/dose \downarrow may be required. Levels may be \downarrow by some **antineoplastics** (**bleomycin**, **carmustine**, **cyclophosphamide**, **cytarabine**, **doxorubicin**, **methotrexate**, **procarbazine**, **vincristine**), **activated charcoal**, **cholestyramine**, **colestipol**, **kaolin/pectin**, **metoclopramide**, **penicillamine**, **rifampin**, or **sulfasalazine**. In a small percentage (10%) of patients gut bacteria metabolize digoxin to inactive compounds; **macrolide anti-infectives** (**erythromycin**, **azithromycin**, **clarithromycin**) and **tetracyclines**, by killing these bacteria, will cause \uparrow levels and toxicity; dose may need to be \downarrow for up to 9 wk. Additive bradycardia may occur with **beta blockers**, **diltiazem**, **verapamil**, **clonidine**, **ivabradine**, and other **antiarrhythmics** (**quinidine**, **disopyramide**). Concurrent use of **sympathomimetics** may \uparrow risk of arrhythmias. **Thyroid hormones** may \downarrow therapeutic effects.

Drug-Natural Products: **Licorice** and stimulant natural products (**aloe**) may \uparrow risk of potassium depletion. **St. John's wort** may \downarrow levels and effect.

Drug-Food: Concurrent ingestion of a **high-fiber meal** may \downarrow absorption. Administer digoxin 1 hour before or 2 hours after such a meal.

Route/Dosage

For rapid effect, a larger initial loading/digitalizing dose should be given in several divided doses over 12–24 hr. Maintenance doses are determined for digoxin by renal function. All dosing must be evaluated by individual response. In general, doses required for atrial arrhythmias are higher than those for inotropic effect.

IV, IM (Adults): *Digitalizing dose*—0.5–1 mg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Children >10 yr): *Digitalizing dose*—8–12 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Children 5–10 yr): *Digitalizing dose*—15–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Children 2–5 yr): *Digitalizing dose*—25–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Children 1–24 mo): *Digitalizing dose*—30–50 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Infants—full term): 20–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

IV, IM (Infants—premature): *Digitalizing dose*—15–25 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals.

PO (Adults): *Digitalizing dose*—0.75–1.5 mg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—0.125–0.5 mg/day depending on patient's lean body weight, renal function, and serum level.

PO (Geriatric Patients): Initial daily dosage should not exceed 0.125 mg.

PO (Children >10 yr): *Digitalizing dose*—10–15 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—2.5–5 mcg/kg given daily as a single dose.

PO (Children 5–10 yr): *Digitalizing dose*—20–35 mcg/kg given as 50% of the dose initially and one quar-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.
 *CAPITALS indicates life-threatening; underlines indicate most frequent.

ter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. **Maintenance dose**—5–10 mcg/kg given daily in 2 divided doses.

PO (Children 2–5 yr): *Digitalizing dose*—30–40 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—7.5–10 mcg/kg given daily in 2 divided doses.

PO (Children 1–24 mo): *Digitalizing dose*—35–60 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—10–15 mcg/kg given daily in 2 divided doses.

PO (Infants—full term): *Digitalizing dose*—25–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—6–10 mcg/kg given daily in 2 divided doses.

PO (Infants—premature): *Digitalizing dose*—20–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—5–7.5 mcg/kg given daily in 2 divided doses.

Availability (generic available)

Tablets: 0.0625 mg, 0.125 mg, 0.1875 mg, 0.25 mg.

Cost: *Generic*—All strengths \$27.75/10. **Elixir (lime flavor):** 0.05 mg/mL. **Cost:** *Generic*—\$42.10/60 mL.

Injection: 0.25 mg/mL. **Pediatric injection:** 0.1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor apical pulse for 1 full min before administering. Withhold dose and notify health care professional if pulse rate is <60 bpm in an adult, <70 bpm in a child, or <90 bpm in an infant. Also notify health care professional promptly of any significant changes in rate, rhythm, or quality of pulse.
- **Pedi:** Heart rate varies in children depending on age, ask health care professional to specify at what heart rates digoxin should be withheld.
- Monitor BP periodically in patients receiving IV digoxin.
- **Monitor ECG throughout IV administration and 6 hr after each dose.** Notify health care professional if bradycardia or new arrhythmias occur.
- Observe IV site for redness or infiltration; extravasation can lead to tissue irritation and sloughing.
- Monitor intake and output ratios and daily weights. Assess for peripheral edema, and auscultate lungs for rales/crackles throughout therapy.
- Before administering initial loading dose, determine whether patient has taken any digoxin in the preceding 2–3 wk.
- **Lab Test Considerations:** Evaluate serum electrolyte levels (especially potassium, magnesium, and calcium) and renal and hepatic functions periodically during therapy. Notify health care professional

before giving dose if patient is hypokalemic. Hypokalemia, hypomagnesemia, or hypercalcemia may make the patient more susceptible to digitalis toxicity. **Pedi:** Neonates may have falsely elevated serum digoxin concentrations due to a naturally occurring substance chemically similar to digoxin.

- **Toxicity and Overdose:** Therapeutic serum digoxin levels range from 0.5–2 ng/mL. Serum levels may be drawn 6–8 hr after a dose is administered, although they are usually drawn immediately before the next dose. **Geri:** Older adults are at increased risk for toxic effects of digoxin (appears on Beers list) due to age-related decreased renal clearance, which can exist even when serum creatinine levels are normal. Digoxin requirements in the older adult may change and a formerly therapeutic dose can become toxic.
- Observe for signs and symptoms of toxicity. *In adults and older children*, the first signs of toxicity usually include abdominal pain, anorexia, nausea, vomiting, visual disturbances, bradycardia, and other arrhythmias. *In infants and small children*, the first symptoms of overdose are usually cardiac arrhythmias. If these appear, withhold drug and notify health care professional immediately.
- If signs of toxicity occur and are not severe, discontinuation of digoxin may be all that is required.
- Correct electrolyte abnormalities, thyroid dysfunction, and concomitant medications. Administer potassium so that serum potassium is maintained between 4.0 and 5.5 mmol/L. Monitor ECG for evidence of potassium toxicity (peaking of T waves).
- Treatment of life-threatening arrhythmias may include administration of digoxin immune Fab (*Digibind*), which binds to the digitalis glycoside molecule in the blood and is excreted by the kidneys.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Do not confuse Lanoxin with levothyroxine or naloxone.**
- **High Alert:** Digoxin has a narrow therapeutic range. Medication errors associated with digoxin include miscalculation of pediatric doses and insufficient monitoring of digoxin levels. **Have second practitioner independently check original order and dose calculations.**
- For rapid digitalization, initial dose is higher than maintenance dose; 50% of total digitalizing dose is given initially. Remainder of dose will be administered in 25% increments at 4–8 hr intervals.
- When changing from parenteral to oral dose forms, dose adjustments may be necessary because of pharmacokinetic variations in percentage of digoxin absorbed: 100 mcg (0.1 mg) digoxin injection = 125

mcg (0.125 mg) tablet or 125 mcg (0.125 mg) of elixir.

- **PO:** Administer oral preparations consistently with regard to meals. Tablets can be crushed and administered with food or fluids if patient has difficulty swallowing. Use calibrated measuring device for elixir; calibrated dropper is not accurate for doses of less than 0.2 mL or 10 mcg.
- **IM:** Administer deep into gluteal muscle and massage well to reduce painful local reactions. Do not administer more than 2 mL of digoxin in each IM site. IM administration is not generally recommended.

IV Administration

- **IV Push:** **Diluent:** May be administered undiluted. May also dilute 1 mL of digoxin in 4 mL of sterile water for injection, D5W, or 0.9% NaCl. Less diluent will cause precipitation. Use diluted solution immediately. **Rate:** Administer over at least 5 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, mesna, methohexital, methotrexate, methylodopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepineph-

rine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotape, tigecycline, tirofiban, tobramycin, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, amphotericin B liposome, caspofungin, dantrolene, diazepam, diazoxide, doxorubicin, foscarnet, idarubicin, mitoxantrone, paclitaxel, pentamidine, phenytoin, propofol, quinupristin/dalfopristin, telavancin, topotecan, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at same time each day. Teach parents or caregivers of infants and children how to accurately measure medication. Take missed doses within 12 hr of scheduled dose or omit. Do not double doses. Consult health care professional if doses for 2 or more days are missed. Do not discontinue medication without consulting health care professional.
- **Teach patient to take pulse and to contact health care professional before taking medication if pulse rate is <60 or >100.**
- **Pedi:** Teach parents or caregivers that changes in heart rate, especially bradycardia, are among the first signs of digoxin toxicity in infants and children. Instruct parents or caregivers in apical heart rate assessment and ask them to notify health care professional if heart rate is outside of range set by health care professional before administering the next scheduled dose.
- Review signs and symptoms of digitalis toxicity with patient and family. Advise patient to notify health care professional immediately if these or symptoms of HF occur. Inform patient that these symptoms may be mistaken for those of colds or flu.
- Instruct patient to keep digoxin tablets in their original container and not to mix in pill boxes with other medications; they may look similar to and may be mistaken for other medications.
- Advise patient that sharing of this medication can be dangerous.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ucts being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's wort. Advise patient to avoid taking antacids or antiarrhythmals within 2 hr of digoxin.

- Advise patient to notify health care professional of this medication regimen before treatment.
- Patients taking digoxin should carry identification describing disease process and medication regimen at all times.
- **Geri:** Review fall prevention strategies with older adults and their families.
- Advise female patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of routine follow-up exams to determine effectiveness and to monitor for toxicity.

Evaluation/Desired Outcomes

- Decrease in severity of HF.
- Increase in cardiac output.
- Decrease in ventricular response in atrial tachyarrhythmias.
- Termination of paroxysmal atrial tachycardia.

diltiazem (dil-tye-a-zem)

Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Taztia XT, Tiazac,
 * Tiazac XC

Classification

Therapeutic: antianginals, antiarrhythmics (class IV), antihypertensives
 Pharmacologic: calcium channel blockers

Indications

Hypertension. Angina pectoris and vasospastic (Prinzmetal's) angina. Supraventricular tachyarrhythmias and rapid ventricular rates in atrial flutter or fibrillation.

Action

Inhibits transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased BP. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina. Reduction of ventricular rate in atrial fibrillation or flutter.

Pharmacokinetics

Absorption: Well absorbed, but rapidly metabolized after oral administration.

Distribution: Unknown.

Protein Binding: 70–80%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system).

Half-life: 3.5–9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2–3 hr	6–8 hr
PO—CD, LA, XT	unknown	14 days†	up to 24 hr
IV	2–5 min	2–4 hr	unknown

†Maximum antihypertensive effect with chronic therapy.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic BP <90 mm Hg; Recent MI or pulmonary congestion; Concurrent use of rifampin.

Use Cautiously in: Severe hepatic impairment (↓ dose recommended); **Geri:** ↓ dose; slower IV infusion rate recommended; ↑ risk of hypotension; consider age-related decrease in body mass, ↓ hepatic/renal/cardiac function, concurrent drug therapy and other disease states); Severe renal impairment; Serious ventricular arrhythmias or HF; **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** **ARRHYTHMIAS, HF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia.** **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** **STEVENS-JOHNSON SYNDROME, dermatitis, erythema multiforme, flushing, sweating, photosensitivity, pruritus/urticaria, rash.** **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** gingival hyperplasia.

Interactions

Drug-Drug: ↑ hypotension may occur when used with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by **NSAIDs**. May ↑ **digoxin** levels. May ↑ levels of and risk of myopathy from **simvastatin** and **lovastatin**. Concurrent use with **beta blockers**, **clonidine**, **digoxin**, **disopyramide**, **ivabradine**, or **phenytoin** may result in bradycardia, conduction defects, or HF; avoid concurrent use with **ivabradine**. **Phenobarbital** and **phenytoin** may ↑ metabolism and ↓ effectiveness. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **quinidine**, or **carbamazepine**. **Cimetidine** and **ranitidine** ↑ levels and effects. May ↑ or ↓ the effects of **lithium** or **theophylline**.

Drug-Food: **Grapefruit juice** ↑ levels and effect.

Route/Dosage

PO (Adults): 30–120 mg 3–4 times daily or 180–240 mg once daily as CD or XR capsules or LA tablets (up to 360 mg/day); *Concurrent simvastatin therapy*—Diltiazem dose should not exceed 240 mg/day and simvastatin dose should not exceed 10 mg/day.

IV (Adults): 0.25 mg/kg; may repeat in 15 min with a dose of 0.35 mg/kg. May follow with continuous infusion at 10 mg/hr (range 5–15 mg/hr) for up to 24 hr.

Availability (generic available)

Tablets: 30 mg, 60 mg, 90 mg, 120 mg. **Cost:** *Generic*—30 mg \$10.44/100, 60 mg \$22.25/100, 90 mg \$26.89/100. **Extended-release capsules (Cardizem CD, Tiazac, Cartia XT, Taztia XT):** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. **Cost:** *Generic*—180 mg \$58.19/100, 240 mg \$63.54/100, 420 mg \$171.49/100. **Extended-release tablets (Cardizem LA):** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. **Solution for injection:** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse prior to therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy. May cause prolonged PR interval.
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- Patients receiving digoxin concurrently with calcium channel blockers should have routine serum digoxin levels checked and be monitored for signs and symptoms of digoxin toxicity.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Arrhythmias:** Monitor ECG continuously during administration. Report bradycardia or prolonged hypotension promptly. Emergency equipment and medication should be available. Monitor BP and pulse before and frequently during administration.
- **Lab Test Considerations:** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ the risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ in hepatic

enzymes after several days of therapy, which return to normal on discontinuation of therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Decreased cardiac output (Adverse Reactions)

Implementation

- Do not confuse Cardizem (diltiazem) with Cardene (nicardipine). Do not confuse Tiazac (diltiazem) with Ziac (bisoprolol/hydrochlorothiazide). Do not confuse diltiazem with diazepam.
- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, crush, break, or chew extended-release tablets. Empty tablets that appear in stool are not significant.

IV Administration

- **IV Push:** **Diluent:** Administer bolus dose undiluted. **Concentration:** 5 mg/mL. **Rate:** Administer over 2 min.
- **Continuous Infusion:** **Diluent:** Dilute 125 mg in 100 mL, 250 mg in 250 mL, or 250 mg in 500 mL of 0.9% NaCl, D5W, or D5/0.45% NaCl. Infusion is stable for 24 hr at room temperature or if refrigerated. **Concentration:** 125 mg/125 mL (1 mg/mL), 250 mg/300 mL (0.83 mg/mL), 250 mg/500 mL (0.45 mg/mL). **Rate:** See Route/Dosage section. Titrate to patient's heart rate and BP response.
- **Y-Site Compatibility:** albumin, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B colloidal, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dextrazoxane, digoxin, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatid, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fosfarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hetastarch, hydralazine, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, labetalol, leucovorin calcium, levofloxacin, lidocaine, lidazolol, lorazepam, magnesium sulfate, mannitol, mech-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

loretamine, melphalan, meperidine, meropenem, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G potassium, pentamidine, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, streptozocin, succinylcholine, sufentanyl, tacrolimus, telavancin, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, toptotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, amphotericin B lipid complex, amphotericin B liposome, cefepime, chloramphenicol, dantrolene, diazepam, doxorubicin liposomal, fluorouracil, furosemide, ganciclovir, ketorolac, methotrexate, micafungin, mitomycin, pantoprazole, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, rifampin, thiopental.

Patient/Family Teaching

- Advise patient to take medication as directed at the same time each day, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid large amounts (6–8 glasses of grapefruit juice/day) during therapy.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially NSAIDs and cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if rash, irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.

- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of tachyarrhythmias.

dimethyl fumarate (dye-meth-il fue-ma-rate) Tecfidera

Classification

Therapeutic: anti-multiple sclerosis agents

Indications

Treatment of relapsing forms of multiple sclerosis.

Action

Activates nuclear factor (Nrf2) pathway involved in cellular response to oxidative stress. **Therapeutic Effects:** Decreased incidence/severity of relapse with decreased progression of lesions and disability.

Pharmacokinetics

Absorption: Following oral administration rapidly converted to active metabolite monomethyl fumarate (MMF) by enzymes in GI tract, blood, and tissue.

Distribution: Unknown.

Metabolism and Excretion: MMF is metabolized by the tricarboxylic acid (TCA) cycle. 60% eliminated via exhalation of CO₂. Minor amounts eliminated by re-

nal (16%) and fecal (1%) routes, trace amounts in urine.

Half-life: *MMF*—1 hr.

TIME/ACTION PROFILE (effects on disability)

ROUTE	ONSET	PEAK	DURATION
PO	24 wk	60 wk	Unk

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Serious infections (treatment may be withheld); **OB:** Use during pregnancy only if potential benefit justifies potential risk to fetus; **Lactation:** Use cautiously if breast feeding; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: **PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY.**

GI: **HEPATOTOXICITY**, abdominal pain, diarrhea, nausea, dyspepsia, ↑ liver enzymes, vomiting. **Derm:** flushing, erythema, pruritus, rash. **Hemat:** lymphopenia.

Misc: hypersensitivity reactions including **ANAPHYLAXIS** and **ANGIOEDEMA.**

Interactions

Drug-Drug: None noted.

Route/Dosage

PO (Adults): 120 mg twice daily for one week, then 240 mg twice daily.

Availability

Extended-release capsules: 120 mg, 240 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of infections (fever, sore throat). Consider withholding medication until serious infections are resolved.
- **Lab Test Considerations:** Monitor CBC with lymphocyte count before initiating therapy, after 6 months, and every 6 to 12 mo thereafter. If lymphocyte count is $<0.5 \times 10^9/L$ for >6 mo, consider interrupting therapy. Consider withholding therapy for patients with serious infections.
- Obtain serum aminotransferase, alkaline phosphatase, and total bilirubin levels prior to starting therapy and as clinically indicated. May cause ↑ hepatic transaminases. Discontinue therapy if clinically significant liver injury is suspected.
- May cause transient ↑ mean eosinophil count during first 2 mo of therapy.

Potential Nursing Diagnoses

Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer 120 mg twice daily for 7 days then increase to maintenance dose of 240 mg twice daily without regard to food. For patients with difficulty tolerating maintenance dose, may temporarily decrease to 120 mg twice daily; resume maintenance dose within 4 wks. Swallow capsules whole; do not open, crush, chew, or sprinkle on food. Discard any unused capsules 90 days after opening.

Patient/Family Teaching

- Instruct patient to take dimethyl fumarate as directed. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient not to share medication with others, even if they have the same symptoms; may be dangerous.
- May cause flushing (warmth, redness, itching, and/or burning sensation). Usually begins after starting and resolves over time. Administration of dimethyl fumarate with food or administration of non-enteric coated aspirin (up to a dose of 325 mg) 30 minutes prior to dimethyl fumarate dosing may decrease incidence or severity of flushing.
- Advise patient to notify health care professional promptly if signs and symptoms of PML (new or worsening weakness; trouble using their arms or legs; or changes to thinking, eyesight, strength or balance) or hypersensitivity reactions (difficulty breathing, urticaria, swelling of throat and tongue) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Rep:** Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Patients who become pregnant should be encouraged to join the pregnancy registry by calling 1-866-810-1462 or visiting www.tecfinderapregnancyregistry.com.

Evaluation/Desired Outcomes

- Decreased incidence/severity of relapse of multiple sclerosis.

dinoprostone (dye-noe-prost-one)

Cervidil Vaginal Insert, Prepidil Endocervical Gel, Prostin E Vaginal Suppository

Classification

Therapeutic: cervical ripening agent
Pharmacologic: oxytocics, prostaglandins

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Endocervical Gel, Vaginal Insert: Used to “ripen” the cervix in pregnancy at or near term when induction of labor is indicated. Vaginal Suppository: Induction of midtrimester abortion, Management of missed abortion up to 28 wk, Management of nonmetastatic gestational trophoblastic disease (benign hydatidiform mole).

Action

Produces contractions similar to those occurring during labor at term by stimulating the myometrium (oxytocic effect). Initiates softening, effacement, and dilation of the cervix (“ripening”). Also stimulates GI smooth muscle. **Therapeutic Effects:** Initiation of labor. Expulsion of fetus.

Pharmacokinetics

Absorption: Rapidly absorbed.

Distribution: Unknown. Action is mostly local.

Metabolism and Excretion: Metabolized by enzymes in lung, kidneys, spleen, and liver tissue.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cervical ripening (gel)	rapid	30–45 min	unknown
Cervical ripening (insert)	rapid	unknown	12 hr
Abortion time (suppository)	10 min	12–24 hr	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to prostaglandins or additives in the gel or suppository; The gel/insert should be avoided in situations in which prolonged uterine contractions should be avoided, including: Previous cesarean section or uterine surgery; Cephalopelvic disproportion; Traumatic delivery or difficult labor; Multiparity (≥ 6 term pregnancies); Hyperactive or hypertonic uterus; Fetal distress (if delivery is not imminent); Unexplained vaginal bleeding; Placenta previa; Vasa previa; Active herpes genitalis; Obstetric emergency requiring surgical intervention; Situations in which vaginal delivery is contraindicated; Presence of acute pelvic inflammatory disease or ruptured membranes; Concurrent oxytocic therapy (wait for 30 min after removing insert before using oxytocin).

Use Cautiously in: Uterine scarring; Asthma; Hypotension; Cardiac disease; Adrenal disorders; Anemia; Jaundice; Diabetes mellitus; Epilepsy; Glaucoma; Pulmonary, renal, or hepatic disease; Multiparity (up to 5 previous term pregnancies); Women > 30 yr, those with complications during pregnancy, and those with a gestational age > 40 wk (\uparrow risk of disseminated intravascular coagulation).

Adverse Reactions/Side Effects

Endocervical Gel, Vaginal Insert.

GU: uterine contractile abnormalities, warm feeling in vagina. **MS:** back pain. **Misc:** AMNIOTIC FLUID EMBOLISM, fever.

Suppository

CNS: headache, drowsiness, syncope. **Resp:** coughing, dyspnea, wheezing. **CV:** hypotension, hypertension. **GI:** diarrhea, nausea, vomiting. **GU:** UTERINE RUPTURE, urinary tract infection, uterine hyperstimulation, vaginal/uterine pain. **Misc:** allergic reactions including ANAPHYLAXIS, chills, fever.

Interactions

Drug-Drug: Augments the effects of other oxytocics.

Route/Dosage

Cervical Ripening

Vag (Adults , Cervical): Endocervical gel—0.5 mg; if response is unfavorable, may repeat in 6 hr (not to exceed 1.5 mg/24 hr). **Vaginal insert**—one 10-mg insert.

Abortifacient

Vag (Adults): One 20-mg suppository, repeat q 3–5 hr (not to exceed 240 mg total or longer than 48 hr).

Availability

Endocervical gel (Prepidil): 0.5 mg dinoprostone in 3 g of gel vehicle in a prefilled syringe with catheters.

Vaginal insert (Cervidil): 10 mg. **Vaginal suppository (Prostin E Vaginal):** 20 mg.

NURSING IMPLICATIONS

Assessment

- **Abortifacient:** Monitor frequency, duration, and force of contractions and uterine resting tone. Opioid analgesics may be administered for uterine pain.
- Monitor temperature, pulse, and BP periodically throughout therapy. Dinoprostone-induced fever (elevation $> 1.1^{\circ}\text{C}$ or 2°F) usually occurs within 15–45 min after insertion of suppository. This returns to normal 2–6 hr after discontinuation or removal of suppository from vagina.
- **Auscultate breath sounds.** Wheezing and sensation of chest tightness may indicate hypersensitivity reaction.
- Assess for nausea, vomiting, and diarrhea in patients receiving suppository. Vomiting and diarrhea occur frequently. Patient should be premedicated with antiemetic and antidiarrheal.
- Monitor amount and type of vaginal discharge. Notify health care professional immediately if symptoms of hemorrhage (increased bleeding, hypotension, pallor, tachycardia) occur.
- **Cervical Ripening:** Monitor uterine activity, fetal status, and dilation and effacement of cervix continuously throughout therapy. Assess for hypertonus,

sustained uterine contractility, and fetal distress. Insert should be removed at the onset of active labor.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Abortifacient:** Warm the suppository to room temperature just before use.
- Wear gloves when handling unwrapped suppository to prevent absorption through skin.
- Patient should remain supine for 10 min after insertion of suppository; then she may be ambulatory.
- **Vaginal Insert:** Place vaginal insert transversely in the posterior vaginal fornix immediately after removing from foil package. Warming of insert and sterile conditions are not required. Use vaginal insert only with a retrieval system. Use minimal amount of water-soluble lubricant during insertion; avoid excess because it may hamper release of dinoprostone from insert. Patient should remain supine for 2 hr after insertion, then may ambulate.
- Vaginal insert delivers dinoprostone 0.3 mg/hr over 12 hr. Remove insert at the onset of active labor, before amniotomy, or after 12 hr.
- Oxytocin should not be used during or less than 30 min after removal of insert.
- **Endocervical Gel:** Determine degree of effacement before insertion of the endocervical catheter. Do not administer above the level of the internal os. Use a 20-mm endocervical catheter if no effacement is present and a 10-mm catheter if the cervix is 50% effaced.
- Use caution to prevent contact of dinoprostone gel with skin. Wash hands thoroughly with soap and water after administration.
- Bring gel to room temperature just before administration. Do not force warming with external sources (water bath, microwave). Remove peel-off seal from end of syringe; then remove the protective end cap and insert end cap into plunger stopper assembly in barrel of syringe. Aseptically remove catheter from package. Firmly attach catheter hub to syringe tip; click is evidence of attachment. Fill catheter with sterile gel by pushing plunger to expel air from catheter before administration to patient. Gel is stable for 24 mo if refrigerated.
- Patient should be in dorsal position with cervix visualized using a speculum. Introduce gel with catheter into cervical canal using sterile technique. Administer gel by gentle expulsion from syringe and then remove catheter. Do not attempt to administer small amount of gel remaining in syringe. Use syringe for only 1 patient; discard syringe, catheter, and unused package contents after using.

- Patient should remain supine for 15–30 min after administration to minimize leakage from cervical canal.
- Oxytocin may be administered 6–12 hr after desired response from dinoprostone gel. If no cervical/uterine response to initial dose of dinoprostone is obtained, repeat dose may be administered in 6 hr.

Patient/Family Teaching

- Explain purpose of medication and vaginal exams.
- **Abortifacient:** Instruct patient to notify health care professional immediately if fever and chills, foul-smelling vaginal discharge, lower abdominal pain, or increased bleeding occurs.
- Provide emotional support throughout therapy.
- **Cervical Ripening:** Inform patient that she may experience a warm feeling in her vagina during administration.
- Advise patient to notify health care professional if contractions become prolonged.

Evaluation/Desired Outcomes

- Complete abortion. Continuous administration for more than 2 days is not usually recommended.
- Cervical ripening and induction of labor.

dinutuximab (di-noo-tux-i-mab) Unituxin

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

Indications

Treatment (with granulocyte-macrophage colony-stimulating factor [GM-CSF], interleukin-2 [IL-2], and 13-cis-retinoic acid [RA]) of pediatric patients with high-risk neuroblastoma who have had at least a partial response to previous first-line multiagent, multimodality therapy.

Action

Acts as a glycolipid disialoganglioside (GD2)-binding monoclonal antibody that binds to specific cells in the CNS and peripheral nerves, inducing cell lysis through antibody-dependent cell-mediated cytotoxicity (ADCC) and complement-dependent cytotoxicity (CDC). **Therapeutic Effects:** Decreased progression of neuroblastoma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 10 days.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (event-free survival probability)

ROUTE	ONSET	PEAK	DURATION
IV	6 mo	2 yr	unknown

Contraindications/Precautions

Contraindicated in: Previous anaphylactic reaction to dinutuximab; **OB:** May cause fetal harm; **Lactation:** Discontinue breast feeding.

Use Cautiously in: Female patients with reproductive potential (effective contraception is required);

Geriatric: Safe and effective use in geriatric patients has not been established; Safe and effective use in renal or hepatic impairment has not been established; **Pediatric:** Has been used in children.

Adverse Reactions/Side Effects

CNS: REVERSE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME (RPLS). **EENT:** neurologic disorders of the eye.

Resp: hypoxia. **CV:** HYPOTENSION, tachycardia. **GI:** ↓ appetite, diarrhea, ↑ liver enzymes, vomiting. **GU:** proteinuria, urinary retention. **Derm:** urticaria. **F and E:**

HYPOKALEMIA, hypocalcemia, hyponatremia. **Hemat:** anemia, lymphopenia, neutropenia, thrombocytopenia.

Metab: hyperglycemia, hypertriglyceridemia, hypoalbuminemia, ↑ weight. **Neuro:** neuropathic pain, peripheral neuropathy, transverse myelitis. **Misc:** CAPILLARY LEAK SYNDROME, FEBRILE NEUTROPENIA, INFUSION-RELATED REACTIONS, pain, ATYPICAL HEMOLYTIC UREMIC SYNDROME.

Interactions

Drug-Drug: ↑ risk of myelosuppression with other myelosuppressants, antineoplastics and radiation therapy.

Route/Dosage

Pretreatment with opioid analgesics, antihistamines and antipyretics is required.

IV (Adults): 17.5 mg/m²/day for 4 consecutive days for up to 5 cycles. Infusion-related reactions may require slowed infusion rate, dose reduction or discontinuation.

Availability

Solution for IV administration (requires further dilution): 3.5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess hematologic, respiratory, hepatic, and renal function prior to each course of dinutuximab to determine adequate function.
- Monitor for signs and symptoms of infusion reactions during and for at least 4 hrs following completion of infusion. Infusion reactions usually occur during or within 24 hours of completing infusion. *For mild to moderate infusion reactions* (transient rash, fever, rigors, localized urticaria) that re-

spond promptly to antihistamines or antipyretics, decrease infusion rate to 50% previous rate and monitor closely. After resolution, gradually increase infusion rate up to maximum rate of 1.75 mg/m²/hour. *For serious infusion reactions* (facial and upper airway edema, dyspnea, bronchospasm, stridor, urticaria, hypotension) immediately interrupt dinutuximab infusion and institute supportive therapy. If symptoms resolve rapidly, decrease infusion rate to 50% previous rate and monitor closely. For first recurrence of symptoms, discontinue dinutuximab until next day. If symptoms resolve and continued treatment is warranted, premedicate with hydrocortisone 1 mg/kg (maximum dose 50 mg) IV administer dinutuximab at rate of 0.875 mg/m²/hour in an intensive care unit. Discontinue dinutuximab permanently for life-threatening reactions.

- Assess pain (abdominal pain, generalized pain, extremity pain, back pain, neuralgia, musculoskeletal chest pain, arthralgia) frequently during and following therapy. See Implementation for analgesic guidelines.
- Assess for signs and symptoms of peripheral neuropathy (lower extremity weakness and inability to ambulate, neurogenic bladder) frequently during therapy. May occur more frequently in adult patients. Permanently discontinue dinutuximab in patients with Grade 2 peripheral motor neuropathy, Grade 3 sensory neuropathy that interferes with daily activities for more than 2 weeks, or Grade 4 sensory neuropathy.
- Monitor for signs and symptoms of capillary leak syndrome (severe hypotension, hypoalbuminemia, hemoconcentration). *At onset of moderate to severe, but not life threatening symptoms*, interrupt dinutuximab infusion; resume infusion at 50% previous rate when symptoms resolve. Then gradually increase infusion rate up to a maximum rate of 1.75 mg/m²/hour. *For life-threatening symptoms*, discontinue current cycle of dinutuximab. Administer subsequent cycles at 50% of previous rate. Permanently discontinue dinutuximab if symptoms recur.
- Monitor BP closely during therapy. Administer required hydration prior to dinutuximab infusion. Interrupt therapy and institute supportive measures if symptomatic hypotension occurs. Resume at 50% infusion rate. If BP remains stable for at least 2 hours, increase infusion rate as tolerated up to a maximum rate of 1.75 mg/m²/hour.
- Monitor for signs and symptoms of infection during therapy. If severe systemic infection or sepsis occur, discontinue dinutuximab until resolution of infection, then continue subsequent cycles.
- Monitor for neurological disorders of the eye (blurred vision, photophobia, mydriasis, fixed or unequal pupils, optic nerve disorder, eyelid ptosis, papilledema) during therapy. Interrupt therapy in patients with dilated pupil with sluggish light reflex or other visual disturbances not causing visual loss.

Upon resolution and if continued treatment is warranted, decrease dinutuximab dose by 50%. Permanently discontinue dinutuximab in patients with recurrent signs or symptoms of eye disorder following dose reduction and in patients with loss of vision.

- Assess for urinary retention during and periodically following therapy. If urinary retention does not resolve following discontinuation of opioids, permanently discontinue dinutuximab.
- Monitor for signs and symptoms of transverse myelitis (weakness, paresthesia, sensory loss, incontinence). If symptoms occur, permanently discontinue dinutuximab.
- Assess for signs and symptoms of reverse posterior leukoencephalopathy syndrome (RPLS) (severe headache, hypertension, visual changes, lethargy, seizures). Discontinue dinutuximab if symptoms occur.
- **Monitor for signs and symptoms of hemolytic uremic syndrome (fatigue, dizziness, fainting, pallor, edema, decreased urine output, hematuria) during therapy. Permanently discontinue dinutuximab and provide supportive therapy if signs occur.**
- **Lab Test Considerations:** Monitor peripheral blood counts.
- Monitor serum electrolytes daily during therapy. May cause hypokalemia, hyponatremia, and hypocalcemia. Discontinue therapy if Grade 4 hyponatremia occurs despite appropriate fluid management.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Acute pain (Adverse Reactions)

Implementation

- **Pretreatment:** Administer 10 mL/kg 0.9% NaCl as an infusion 1 hr prior to dinutuximab infusion.
- Administer 50 mcg/kg morphine immediately before dinutuximab infusion, then continue as morphine drip at infusion rate of 20 to 50 mcg/kg/hour during and for two hours following completion of dinutuximab. Give additional 25 mcg/kg to 50 mcg/kg IV morphine as needed for pain up to once every 2 hours followed by an increase in morphine infusion rate in clinically stable patient.
- Consider fentanyl or hydromorphone if morphine not tolerated.
- If pain is inadequately managed with opioids, consider gabapentin or lidocaine in conjunction with IV morphine.
- For severe pain, decrease dinutuximab infusion rate to 0.875 mg/m²/hour. Discontinue dinutuximab permanently if Grade 3 pain unresponsive to maximum supportive measures occurs.
- Administer an antihistamine such as diphenhydramine (0.5 to 1 mg/kg; maximum dose 50 mg) IV over 10 to 15 minutes starting 20 min before initia-

tion of dinutuximab and as tolerated every 4 to 6 hours during infusion.

- Administer acetaminophen (10 to 15 mg/kg; maximum dose 650 mg) 20 minutes before each dinutuximab infusion and every 4 to 6 hours as needed for fever or pain. Administer ibuprofen (5 to 10 mg/kg) every 6 hours as needed for control of persistent fever or pain.
- **Continuous Infusion:** Store vials in refrigerator protected from light. **Diluent:** Withdraw solution from vial and inject into 100 mL of 0.9% NaCl. Mix by gentle inversion; do not shake. Do not administer solutions that are discolored, cloudy, or contain particulate matter. Store diluted solution in refrigerator; administer within 4 hrs and discard after 24 hrs. **Rate:** Infuse over 10–20 hrs for 4 consecutive days for a maximum of 5 cycles. Begin with infusion rate of 0.875 mg/m²/hr for 30 min. Gradually increase for a maximum of 1.75 mg/m²/hr as tolerated.

Patient/Family Teaching

- Explain purpose of dinutuximab to patient and caregivers.
- Advise patient to notify health care professional if signs and symptoms of infusion reaction (facial or lip swelling, urticaria, difficulty breathing, lightheadedness or dizziness occurring during or within 24 hours after infusion), capillary leak syndrome, hypotension, infection, or hemolytic uremic syndrome occur.
- Inform patient and caregiver of risk of pain and peripheral neuropathy. Advise patient to notify health care professional if pain, numbness, tingling, burning, or weakness occur.
- Advise patient to notify health care professional if signs and symptoms of neurological eye disorder (blurred vision, photophobia, ptosis, diplopia, unequal pupil size) occur.
- Caution female patients to use effective contraception during and for at least 2 mo following therapy. Advise patient to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decreased progression of neuroblastoma.

diphenhydRAMINE (oral, parenteral)

(dye-fen-hye-dra-meen)

★ Aller-Aide, ★ Allerdryl, ★ Allergy Formula, AllerMax, ★ Allernix, Banophen, Benadryl Dye-Free Allergy, Benadryl Allergy, Benadryl, ★ Benylin, ★ Calmex, Compoz, Compoz Nighttime Sleep Aid,

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

✳ Dimetane Allergy, Diphen AF, Diphen Cough, ✳ Diphenhist, ✳ Dormex, ✳ Dormiphen, Genahist, 40 Winks, Hyrexin-50, ✳ Insomnal, Maximum Strength Nytol, Maximum Strength Sleepinal, Midol PM, Miles Nervine, ✳ Nadryl, Nighttime Sleep Aid, Nytol, Scot-Tussin Allergy DM, Siladril, Silphen, Sleep-Eze 3, Sleepwell 2-night, Sominex, Snooze Fast, Sominex, Tusstat, Twilite, Unisom Nighttime Sleep-Aid

Classification

Therapeutic: allergy, cold, and cough remedies, antihistamines, antitussives

Indications

Relief of allergic symptoms caused by histamine release including: Anaphylaxis, Seasonal and perennial allergic rhinitis, Allergic dermatoses. Parkinson's disease and dystonic reactions from medications. Mild nighttime sedation. Prevention of motion sickness. Antitussive (syrup only).

Action

Antagonizes the effects of histamine at H₁-receptor sites; does not bind to or inactivate histamine. Significant CNS depressant and anticholinergic properties. **Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, nasal and ocular pruritus, ocular tearing and redness, urticaria). Relief of acute dystonic reactions. Prevention of motion sickness. Suppression of cough.

Pharmacokinetics

Absorption: Well absorbed after oral or IM administration but 40–60% of an oral dose reaches systemic circulation due to first-pass metabolism.

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Metabolism and Excretion: 95% metabolized by the liver.

Half-life: 2.4–7 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	2–4 hr	4–8 hr
IM	20–30 min	2–4 hr	4–8 hr
IV	rapid	unknown	4–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attacks of asthma; **Lactation:** Lactation; Known alcohol intolerance (some liquid products).

Use Cautiously in: Severe liver disease; Angle-closure glaucoma; Seizure disorders; Prostatic hyperpla-

sia; Peptic ulcer; May cause paradoxical excitation in young children; Hyperthyroidism; **OB:** Safety not established; **Ger:** Appears on *Beers list*. Geriatric patients are more susceptible to adverse drug reactions and anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia); dose ↓ or nonanticholinergic antihistamine recommended.

Adverse Reactions/Side Effects

CNS: drowsiness, dizziness, headache, paradoxical excitation (increased in children). **EENT:** blurred vision, tinnitus. **CV:** hypotension, palpitations. **GI:** anorexia, dry mouth, constipation, nausea. **GU:** dysuria, frequency, urinary retention. **Derm:** photosensitivity.

Resp: chest tightness, thickened bronchial secretions, wheezing. **Local:** pain at IM site.

Interactions

Drug-Drug: ↑ risk of CNS depression with other antihistamines, alcohol, opioid analgesics, and sedative/hypnotics. ↑ anticholinergic effects with tricyclic antidepressants, quinidine, or disopyramide. MAO inhibitors intensify and prolong the anticholinergic effects of antihistamines.

Drug-Natural Products: Concomitant use of kava-kava, valerian, or chamomile can ↑ CNS depression.

Route/Dosage

PO (Adults and Children >12 yr): *Antihistaminic/antiemetic/antivertiginic*—25–50 mg q 4–6 hr, not to exceed 300 mg/day. *Antitussive*—25 mg q 4 hr as needed, not to exceed 150 mg/day. *Antidyskinetic*—25–50 mg q 4 hr (not to exceed 400 mg/day). *Sedative/hypnotic*—50 mg 20–30 min before bedtime.

PO (Children 6–12 yr): *Antihistaminic/antiemetic/antivertiginic*—12.5–25 mg q 4–6 hr (not to exceed 150 mg/day). *Antidyskinetic*—1–1.5 mg/kg q 6–8 hr as needed (not to exceed 300 mg/day). *Antitussive*—12.5 mg q 4 hr (not to exceed 75 mg/day). *Sedative/hypnotic*—1 mg/kg/dose 20–30 min before bedtime (not to exceed 50 mg).

PO (Children 2–6 yr): *Antihistaminic/antiemetic/antivertiginic*—6.25–12.5 mg q 4–6 hr (not to exceed 37.5 mg/day). *Antidyskinetic*—1–1.5 mg/kg q 4–6 hr as needed (not to exceed 300 mg/day). *Antitussive*—6.25 mg q 4 hr (not to exceed 37.5 mg/24 hr). *Sedative/hypnotic*—1 mg/kg/dose 20–30 min before bedtime (not to exceed 50 mg).

IM, IV (Adults): 25–50 mg q 4 hr as needed (may need up to 100-mg dose, not to exceed 400 mg/day).

IM, IV (Children): 1.25 mg/kg (37.5 mg/m²) 4 times daily (not to exceed 300 mg/day).

Topical (Adults and Children ≥2 yr): Apply to affected area up to 3–4 times daily.

Availability (generic available)

Capsules: 25 mg^{Rx, OTC}, 50 mg^{Rx, OTC}. **Tablets:** ✳ 12.5 mg^{Rx, OTC}, 25 mg^{Rx, OTC}, 50 mg^{Rx, OTC}. **Chewable tablets**

(grape flavor): 25 mg^{Rx, OTC}. **Orally disintegrating strips (cherry and grape flavor):** 12.5 mg^{Rx, OTC}, 25 mg^{OTC}. **Orally disintegrating tablets:** 12.5 mg^{OTC}, 25 mg^{OTC}, 50 mg^{Rx, OTC}. **Elixir (cherry and other flavors):** 12.5 mg/5 mL^{Rx, OTC}. **Syrup (cherry and raspberry flavor):** * 6.25 mg/5 mL^{Rx, OTC}, 12.5 mg/5 mL^{Rx, OTC}. **Cream:** 1%^{Rx, OTC}, 2%^{Rx, OTC}. **Topical gel:** 2%^{OTC}. **Topical spray:** 2%^{OTC}. **Topical stick:** 2%^{OTC}. **Injection:** 50 mg/mL. **In combination with:** analgesics, decongestants, and expectorants, in OTC pain, sleep, cough, and cold preparations. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Diphenhydramine has multiple uses. Determine why the medication was ordered and assess symptoms that apply to the individual patient. **Ger:** Appears in the *Beers list*. May cause sedation and confusion due to increased sensitivity to anticholinergic effects. Monitor carefully, assess for confusion, delirium, other anticholinergic side effects and fall risk. Institute measures to prevent falls.
- **Prevention and Treatment of Anaphylaxis:** Assess for urticaria and for patency of airway.
- **Allergic Rhinitis:** Assess degree of nasal stuffiness, rhinorrhea, and sneezing.
- **Parkinsonism and Extrapyramidal Reactions:** Assess movement disorder before and after administration.
- **Insomnia:** Assess sleep patterns.
- **Motion Sickness:** Assess nausea, vomiting, bowel sounds, and abdominal pain.
- **Cough Suppressant:** Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 mL daily to decrease viscosity of bronchial secretions.
- **Pruritus:** Assess degree of itching, skin rash, and inflammation.
- **Lab Test Considerations:** May ↓ skin response to allergy tests. Discontinue 4 days before skin testing.

Potential Nursing Diagnoses

Insomnia (Indications)

Risk for deficient fluid volume (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse Benadryl with benzepiril. Do not confuse diphenhydramine with dimenhydrinate.**
- When used for insomnia, administer 20 min before bedtime and schedule activities to minimize interruption of sleep.
- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr be-

fore exposure to conditions that may precipitate motion sickness.

- **PO:** Administer with meals or milk to minimize GI irritation. Capsule may be emptied and contents taken with water or food.
- Orally disintegrating tablets and strips should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.
- **IM:** Administer 50 mg/mL into well-developed muscle. Avoid subcut injections.

IV Administration

- **IV Push: Diluent:** May be further diluted in 0.9% NaCl, 0.45% NaCl, D5W, D10W, dextrose/saline combinations, Ringer's solution, LR, and dextrose/Ringer's combinations. **Concentration:** 25 mg/mL. **Rate:** Infuse at a rate not to exceed 25 mg/min.
- **Y-Site Compatibility:** acetaminophen, aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B lipid complex, amphotericin B liposome, amsacrine, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefataroline, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dextrazoxane, digoxin, diltiazem, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, folic acid, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methotrexate, methylodopate, metoclopramide, metoprolol, metronidazole, midazolam, mitomycin, mitoxantrone, morphine, moxifloxacin, multiple vitamins, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, papaverine,

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quiniapristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

● **Y-Site Incompatibility:** allopurinol, aminophylline, amphotericin B colloidal, ampicillin, azathioprine, cefazolin, cefepime, cefotaxime, cefotetan, ceftioxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, dantrolene, dexamethasone, diazepam, diazoxide, fluorouracil, foscarnet, furosemide, ganciclovir, indomethacin, insulin, ketorolac, methylprednisolone, milrinone, nitroprusside, oxacillin, pantoprazole, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, trimethoprim/sulfamethoxazole.

● **Topical:** Apply a thin coat and rub gently until absorbed. Only for topical use; avoid ingestion.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not exceed recommended amount. Caution patient not to use oral OTC diphenhydramine products with any other product containing diphenhydramine, including products used topically.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- May cause dry mouth. Inform patient that frequent oral rinses, good oral hygiene, and sugarless gum or candy may minimize this effect. Notify health care professional if dry mouth persists for more than 2 wk.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoidance of nicotine and caffeine) to patients taking diphenhydramine to aid sleep.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Caution patient to avoid use of alcohol and other CNS depressants concurrently with this medication.
- **Pedi:** Can cause excitation in children. Caution parents or caregivers about proper dose calculation; overdose, especially in infants and children, can cause hallucinations, seizures, or death. **Caution parents to avoid OTC cough and cold products while breast feeding or to children <4 yr.**
- **Geri:** Instruct older adults to avoid OTC products that contain diphenhydramine due to increased sensitivity to anticholinergic effects and potential for adverse reactions related to these effects.

- Advise patients taking diphenhydramine in OTC preparations to notify health care professional if symptoms worsen or persist for more than 7 days.

Evaluation/Desired Outcomes

- Prevention of, or decreased urticaria in, anaphylaxis or other allergic reactions.
- Decreased dyskinesia in parkinsonism and extrapyramidal reactions.
- Sedation when used as a sedative/hypnotic.
- Prevention of or decrease in nausea and vomiting caused by motion sickness.
- Decrease in frequency and intensity of cough without eliminating cough reflex.

DIURETICS (POTASSIUM-SPARING)

aMILoride (a-mill-oh-ride)

★ Midamor

spironolactone
(speer-oh-no-lak-tone)

Aldactone

triamterene (trye-am-ter-een)

Dyrenium

Classification

Therapeutic: diuretics

Pharmacologic: potassium-sparing diuretics

Indications

Counteract potassium loss caused by other diuretics. Used with other agents (thiazides) to treat edema or hypertension. Primary hyperaldosteronism (spironolactone only). **Unlabeled Use: Spironolactone:** Management of HF (low doses).

Action

Inhibition of sodium reabsorption in the kidney while saving potassium and hydrogen ions (spironolactone achieves this effect by antagonizing aldosterone receptors). **Therapeutic Effects:** Weak diuretic and anti-hypertensive response when compared with other diuretics. Conservation of potassium.

Pharmacokinetics

Absorption: *Amiloride*—30–90% absorbed; *spironolactone*—>90% absorbed; *triamterene*—30–70% absorbed.

Distribution: *Amiloride* and *triamterene*—widely distributed; all cross the placenta and enter breast milk.

Protein Binding: *Spironolactone* >90%.

Metabolism and Excretion: *Amiloride*—50% eliminated unchanged in urine, 40% excreted in the feces; *spironolactone*—converted by the liver to its active diuretic compound (canrenone); *triamterene*—80% metabolized by the liver, some excretion of unchanged drug.

Half-life: *Amiloride*—6–9 hr; *spironolactone*—78–84 min (spironolactone); 13–24 hr (canrenone); *triamterene*—1.7–2.5 hr.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
Amiloride	2 hr†	6–10 hr†	24 hr†
Spironolactone	unknown	2–3 days‡	2–3 days‡
Triamterene	2–4 hr†	1–several days‡	7–9 hr†

†Single dose.

‡Multiple doses.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hyperkalemia; Anuria; Acute renal insufficiency; Significant renal dysfunction (CCr \leq 30 mL/min or SCr $>$ 2.5 mg/dL).

Use Cautiously in: Hepatic dysfunction; **Geriatric:** Presence of age-related renal dysfunction may lead to \uparrow risk of hyperkalemia; Diabetes (\uparrow risk of hyperkalemia); History of gout or kidney stones (triamterene only); Concurrent use of potassium supplements or potassium-containing salt substitutes; **OB, Lactation, Pediatric:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness; *spironolactone* only, clumsiness, headache. **CV:** arrhythmias. **GI:** *amiloride*—constipation, nausea, vomiting. **GU:** *spironolactone*—erectile dysfunction; *triamterene*—nephrolithiasis.

Derm: STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS; *triamterene*—photosensitivity. **Endo:** *spironolactone*—breast tenderness, gynecostasia, irregular menses, voice deepening. **F and E:** hyperkalemia, hyponatremia. **Hemat:** *spironolactone*—agranulocytosis; *triamterene*—hemolytic anemia, thrombocytopenia. **MS:** muscle cramps. **Misc:** allergic reactions.

Interactions

Drug-Drug: \uparrow hypotension with acute ingestion of alcohol, other antihypertensives, or nitrates. Use with ACE inhibitors, angiotensin II receptor antagonists, NSAIDs, potassium supplements, cyclosporine, or tacrolimus \uparrow risk of hyperkalemia. May \uparrow levels/risk of toxicity from lithium. Effectiveness may be \downarrow by NSAIDs. Spironolactone may \uparrow effects of digoxin.

Route/Dosage

Amiloride

PO (Adults): HTN—5–10 mg/day (up to 20 mg).

PO (Children 1–17 yr): 0.4–0.625 mg/kg/day (maximum = 20 mg/day) (unlabeled use).

Spironolactone

PO (Adults): Edema—25–200 mg/day in 1–2 divided doses. HTN—50–100 mg/day in 1–2 divided doses. Diuretic-induced hypokalemia—25–100 mg/day in 1–2 divided doses. **Diagnosis of primary hyperaldosteronism**—100–400 mg/day in 1–2 divided doses. HF—12.5–25 mg/day (unlabeled use).

PO (Children 1–17 yr): Diuretic, HTN—1 mg/kg/day in 1–2 divided doses (should not exceed 3.3 mg/kg/day or 100 mg/day) (unlabeled use). **Diagnosis of primary hyperaldosteronism**—125–375 mg/m²/day in 1–2 divided doses (unlabeled use).

PO (Neonates): 1–3 mg/kg/day in 1–2 divided doses.

Triamterene

PO (Adults): HTN—100 mg twice daily (not to exceed 300 mg/day; lower doses in combination products).

PO (Children): HTN—1–2 mg/kg/day in 2 divided doses; should not exceed 4 mg/kg/day or 300 mg/day.

Availability

Amiloride (generic available)

Tablets: 5 mg. **Cost:** Generic—\$59.00/100.

Spironolactone (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** Generic—25 mg \$10.83/100, 50 mg \$23.97/100, 100 mg \$24.87/100. **In combination with:** hydrochlorothiazide (Aldactazide). See Appendix B.

Triamterene

Capsules: 50 mg, 100 mg. **Cost:** 50 mg \$404.14/100, 100 mg \$372.44/100. **In combination with:** hydrochlorothiazide (Dyazide, Maxzide). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios and daily weight during therapy.
- If medication is given as an adjunct to anti-hypertensive therapy, monitor BP before administering.
- Assess patient frequently for development of hyperkalemia (fatigue, muscle weakness, paresthesia, confusion, dyspnea, ECG changes, cardiac arrhythmias). Patients who have diabetes mellitus or kidney disease and geriatric patients are at increased risk of developing these symptoms.
- Periodic ECGs are recommended in patients receiving prolonged therapy.
- Assess patient for skin rash frequently during therapy. Discontinue diuretic at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

- **Lab Test Considerations:** Serum potassium levels should be evaluated before and routinely during therapy. Withhold drug and notify health care professional if patient becomes hyperkalemic.
- Monitor BUN, serum creatinine, and electrolytes before and periodically during therapy. May cause ↑ serum magnesium, BUN, creatinine, potassium, and urinary calcium excretion levels. May also cause ↓ sodium levels.
- Discontinue potassium-sparing diuretics 3 days before a glucose tolerance test because of risk of severe hyperkalemia.
- *Spironolactone* may cause false ↑ of plasma cortisol concentrations. Spironolactone should be withdrawn 4–7 days before test.
- Monitor platelet count and total and differential leukocyte count periodically during therapy in patients taking *triamterene*.

Potential Nursing Diagnoses

Excess fluid volume (Indications)

Implementation

- Do not confuse *amiloride* with *amlodipine*.
- **PO:** Administer in AM to avoid interrupting sleep pattern.
- Administer with food or milk to minimize gastric irritation and to increase bioavailability.
- *Triamterene* capsules may be opened and contents mixed with food or fluids for patients with difficulty swallowing.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- Caution patient to avoid salt substitutes and foods that contain high levels of potassium or sodium unless prescribed by health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications concurrently with this therapy, especially OTC decongestants, cough or cold preparations, or appetite suppressants due to potential for increased BP.
- Advise patients taking *triamterene* to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if rash, muscle weakness or cramps; fatigue; or severe nausea, vomiting, or diarrhea occurs.
- Emphasize the need for follow-up exams to monitor progress.

- **Hypertension:** Reinforce need to continue additional therapies for hypertension (weight loss, restricted sodium intake, stress reduction, moderation of alcohol intake, regular exercise, and cessation of smoking). Medication helps control but does not cure hypertension.
- Teach patient and family the correct technique for checking BP weekly.

Evaluation/Desired Outcomes

- Increase in diuresis and decrease in edema while maintaining serum potassium level in an acceptable range.
- Decrease in BP.
- Prevention of hypokalemia in patients taking diuretics.
- Treatment of hyperaldosteronism.

DIURETICS (THIAZIDE)

chlorthiazide

(klor-oh-thye-a-zide)

Diuril

chlorthalidone (thiazide-like)

(klor-thal-i-doan)

Thalitone

hydroCHLORothiazide

(hye-droe-klor-oh-thye-a-zide)

Microzide, Oretic,  Urozide

Classification

Therapeutic: antihypertensives, diuretics

Pharmacologic: thiazide diuretics

Indications

Management of mild to moderate hypertension. Treatment of edema associated with: HF, Renal dysfunction, Cirrhosis, Glucocorticoid therapy, Estrogen therapy.

Action

Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of BP in hypertensive patients and diuresis with mobilization of edema.

Pharmacokinetics

Absorption: All are rapidly absorbed after oral administration.

Distribution: All cross the placenta and enter breast milk.

Metabolism and Excretion: All are excreted mainly unchanged by the kidneys.

Half-life: *Chlorthiazide*—1–2 hr; *chlorthalidone*—35–50 hr; *hydrochlorothiazide*—6–15 hr.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
Chlorothiazide PO	2 hr	4 hr	6–12 hr
Chlorothiazide IV	15 min	30 min	2 hr
Chlorthalidone	2 hr	2 hr	48–72 hr
Hydrochlorothiazide†	2 hr	3–6 hr	6–12 hr

†Onset of antihypertensive effect is 3–4 days and does not become maximal for 7–14 days of dosing.

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity with other thiazides or sulfonamides may exist); Some products contain tartrazine and should be avoided in patients with known intolerance; Anuria; **Lactation:** Lactation.

Use Cautiously in: Renal or hepatic impairment; **OB:** Pregnancy (jaundice or thrombocytopenia may be seen in the newborn).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy, weakness. **CV:** hypotension. **EENT:** acute angle-closure glaucoma (hydrochlorothiazide), acute myopia (hydrochlorothiazide). **GI:** anorexia, cramping, hepatitis, nausea, pancreatitis, vomiting. **Derm:** STEVENS-JOHNSON SYNDROME, photosensitivity, rash. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypercalcemia, hypochloremic alkalosis, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia. **Hemat:** thrombocytopenia. **Metab:** hypercholesterolemia, hyperuricemia. **MS:** muscle cramps.

Interactions

Drug-Drug: Additive hypotension with other antihypertensives, acute ingestion of alcohol, or nitrates. Additive hypokalemia with corticosteroids, amphotericin B, or piperacillin/tazobactam. May ↑ lithium levels. Cholestyramine or colestipol ↓ absorption. Hypokalemia ↑ risk of digoxin toxicity. NSAIDs may ↓ effectiveness.

Route/Dosage

When used as a diuretic in adults, generally given daily, but may be given every other day or 2–3 days/week.

Chlorothiazide

PO (Adults): 125 mg–2 g/day in 1–2 divided doses.

PO (Children >6 mos): 20 mg/kg/day in 1–2 divided doses (maximum dose = 1 g/day).

PO (Neonates ≤6 mo): 10–20 mg/kg every 12 hr (maximum dose = 375 mg/day).

IV (Adults): 500 mg–1 g/day in 1–2 divided doses.

IV (Children >6 mos): 4 mg/kg/day in 1–2 divided doses (maximum dose = 20 mg/kg/day) (unlabeled use).

IV (Neonates ≤6 mo): 1–4 mg/kg every 12 hr (maximum dose = 20 mg/kg/day) (unlabeled use).

Chlorthalidone

PO (Adults): 12.5–100 mg once daily (daily doses above 25 mg are associated with greater likelihood of electrolyte abnormalities).

Hydrochlorothiazide

PO (Adults): 12.5–100 mg/day in 1–2 divided doses (up to 200 mg/day); not to exceed 50 mg/day for hypertension; daily doses above 25 mg are associated with greater likelihood of electrolyte abnormalities.

PO (Children >6 mo): 1–3 mg/kg/day in 2 divided doses (not to exceed 37.5 mg/day).

PO (Children <6 mo): 1–3 mg/kg/day in 2 divided doses.

Availability**Chlorothiazide (generic available)**

Tablets: 250 mg, 500 mg. **Cost:** *Generic*—250 mg \$13.08/100, 500 mg \$25.25/100. **Oral suspension:** 250 mg/5 mL. **Cost:** *Generic*—\$63.36/237 mL. **Powder for injection:** 500 mg/vial.

Chlorthalidone (generic available)

Tablets: 25 mg, 50 mg. **Cost:** *Generic*—25 mg \$55.17/100, 50 mg \$68.04/100, 100 mg \$101.25/100.

In combination with: atenolol (Tenoretic), clonidine (Clorpres). See Appendix B.

Hydrochlorothiazide (generic available)

Tablets: 12.5 mg, 25 mg, 50 mg. **Cost:** *Generic*—12.5 mg \$82.43/100, 25 mg \$8.48/100, 50 mg \$16.45/100. **Capsules:** 12.5 mg. **In combination with:** numerous antihypertensive agents. See Appendix B.

NURSING IMPLICATIONS**Assessment**

- Monitor BP, intake, output, and daily weight and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Notify health care professional if these signs of electrolyte imbalance occur. Patients taking digoxin are at risk of digoxin toxicity because of the potassium-depleting effect of the diuretic.
- If hypokalemia occurs, consideration may be given to potassium supplements or ↓ dose of diuretic.
- Assess patient for allergy to sulfonamides. **Assess patient for skin rash frequently during therapy. Discontinue diuretic at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.**

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Hypertension:** Monitor BP before and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- **Lab Test Considerations:** Monitor electrolytes (especially potassium), blood glucose, BUN, serum creatinine, and uric acid levels before and periodically throughout therapy.
- May cause ↑ in serum and urine glucose in diabetic patients.
- May cause ↑ in serum bilirubin, calcium, creatinine, and uric acid, and ↓ in serum magnesium, potassium, sodium, and urinary calcium concentrations.
- May cause ↑ serum cholesterol, low-density lipoprotein, and triglyceride concentrations.

Potential Nursing Diagnoses

Excess fluid volume (Indications)

Risk for deficient fluid volume (Side Effects)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not confuse hydrochlorothiazide with hydroxyzine or hydralazine.
- Administer in the morning to prevent disruption of sleep cycle.
- Intermittent dose schedule may be used for continued control of edema.
- **PO:** May give with food or milk to minimize GI irritation. Tablets may be crushed and mixed with fluid to facilitate swallowing.

IV Administration

- **Intermittent Infusion:** Reconstitute chlorothiazide with at least 18 mL of sterile water for injection. Shake to dissolve. Stable for 24 hr at room temperature. **Diluent:** May be given undiluted or may be diluted further with D5W or 0.9% NaCl. **Concentration:** Up to 28 mg/mL. **Rate:** If administered undiluted may give by IV push over 3–5 min. If diluted, may run over 30 min.
- **Y-Site Compatibility:** alprostadil, aminophylline, atropine, calcium chloride, calcium gluconate, chloramphenicol, cyclophosphamide, dexamethasone, digoxin, epinephrine, erythromycin, furosemide, gentamicin, heparin, hydrocortisone sodium succinate, isoproterenol, lidocaine, mechlorethamine, methohexital, methyldopate, norepinephrine, oxytocin, penicillin G, phenobarbital, phentolamine, potassium chloride, procainamide, propranolol, succinylcholine.
- **Y-Site Incompatibility:** chlorpromazine, hydralazine, prochlorperazine, promethazine.

Patient/Family Teaching

- Instruct patient to take this medication at the same time each day. Take missed dose as soon as remembered but not just before next dose is due. Do not double doses.

- Instruct patient to monitor weight biweekly and notify health care professional of significant changes.
- Caution patient to change positions slowly to minimize orthostatic hypotension. This may be potentiated by alcohol.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient to discuss dietary potassium requirements with health care professional (see Appendix K).
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to report rash, muscle weakness, cramps, nausea, vomiting, diarrhea, or dizziness to health care professional.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Advise patients to continue taking the medication even if feeling better. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family in correct technique for monitoring weekly BP.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially cough or cold preparations.

Evaluation/Desired Outcomes

- Decrease in BP.
- Increase in urine output.
- Decrease in edema.

divalproex sodium, See VALPROATES.

HIGH ALERT

DOBUTamine (doe-byoo-ta-meen) Dobutrex

Classification

Therapeutic: inotropics
Pharmacologic: adrenergics

Indications

Short-term (<48 hr) management of heart failure caused by depressed contractility from organic heart disease or surgical procedures.

Action

Stimulates beta₁ (myocardial)-adrenergic receptors with relatively minor effect on heart rate or peripheral

blood vessels. **Therapeutic Effects:** Increased cardiac output without significantly increased heart rate.

Pharmacokinetics

Absorption: Administered by IV infusion only, resulting in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Metabolized by the liver and other tissues.

Half-life: 2 min.

TIME/ACTION PROFILE (inotropic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	10 min	brief (min)

Contraindications/Precautions

Contraindicated in: Hypersensitivity to dobutamine or bisulfites; Idiopathic hypertrophic subaortic stenosis.

Use Cautiously in: History of hypertension (increased risk of exaggerated pressor response); MI; Atrial fibrillation (pretreatment with digitalis glycosides recommended); History of ventricular atopic activity (may be exacerbated); Hypovolemia (correct before administration); Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: headache. **Resp:** shortness of breath. **CV:** hypertension, increased heart rate, premature ventricular contractions, angina pectoris, arrhythmias, hypotension, palpitations. **GI:** nausea, vomiting. **Local:** phlebitis. **Misc:** hypersensitivity reactions including skin rash, fever, bronchospasm or eosinophilia, nonanginal chest pain.

Interactions

Drug-Drug: Use with **nitroprusside**; may have a synergistic effect on ↑ cardiac output. **Beta blockers** may negate the effect of dobutamine. ↑ risk of arrhythmias or hypertension with some **anesthetics (cyclopropane, halothane)**, **MAO inhibitors**, **oxytocics**, or **tricyclic antidepressants**.

Route/Dosage

IV (Adults and Children): 2.5–15 mcg/kg/min titrate to response (up to 40 mcg/kg/min).

IV (Neonates): 2–15 mcg/kg/min.

Availability

Injection: 12.5 mg/mL in 20-, 40-, and 100-mL vials.

Premixed infusion: 250 mg/250 mL, 500 mg/500 mL, 500 mg/250 mL, 1000 mg/250 mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, heart rate, ECG, pulmonary capillary wedge pressure (PCWP), cardiac output, CVP, and

urinary output continuously during the administration. Report significant changes in vital signs or arrhythmias. Consult physician for parameters for pulse, BP, or ECG changes for adjusting dose or discontinuing medication.

- Palpate peripheral pulses and assess appearance of extremities routinely throughout dobutamine administration. Notify physician if quality of pulse deteriorates or if extremities become cold or mottled.
- Lab Test Considerations:** Monitor potassium concentrations during therapy; may cause hypokalemia.
- Monitor electrolytes, BUN, creatinine, and prothrombin time weekly during prolonged therapy.
- Toxicity and Overdose:** If overdose occurs, reduction or discontinuation of therapy is the only treatment necessary because of the short duration of dobutamine.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Ineffective tissue perfusion (Indications)

Implementation

- High Alert:** IV vasoactive medications are potentially dangerous. Have second practitioner independently check original order, dosage calculations, and infusion pump settings. Do not confuse dobutamine with dopamine. If available as floor stock, store in separate areas.
- Correct hypovolemia with volume expanders before initiating dobutamine therapy.
- Administer into a large vein and assess administration site frequently. Extravasation may cause pain and inflammation.

IV Administration

- Continuous Infusion:** **Diluent:** Vials must be diluted before use. Dilute 250–1000 mg in 250–500 mL of D5W, 0.9% NaCl, 0.45% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or LR. Admixed infusions stable for 48 hr at room temperature and 7 days if refrigerated. Premixed infusions are already diluted and ready to use. **Concentration:** 0.25–5 mg/mL. **Rate:** Based on patient's weight (see Route/Dosage section). Administer via infusion pump to ensure precise amount delivered. Titrate to patient response (heart rate, presence of ectopic activity, BP, urine output, CVP, PCWP, cardiac index). Dose should be titrated so heart rate does not increase by >10% of baseline.
- Y-Site Compatibility:** amifostine, amikacin, amiodarone, anidulafungin, argatroban, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cimetidine, ciprofloxacin, cisatracurium, cyclosporine, cladribine, dexmedetomidine, diazepam, digoxin,

* = Canadian drug name. † = Genetic implication. ~~_____~~ = Discontinued.

*CAPITALS indicates life-threatening; _____ indicate most frequent.

diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, epinephrine, epifibatide, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, gemcitabine, gentamicin, granisetron, haloperidol, hydromorphone, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, norepinephrine, ondansetron, oxaliplatin, palonosetron, pancuronium, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, ranitidine, remifentanyl, streptokinase, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zidovudine.

- **Y-Site Incompatibility:** acyclovir, alteplase, aminophylline, amphotericin B cholesteryl sulfate, ampicillin, ampicillin/sulbactam, amphotericin B, cefazolin, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, ertapenem, fosfarnet, ganciclovir, hydrocortisone sodium succinate, indomethacin, ketorolac, lansoprazole, micafungin, pantoprazole, pemetrexed, penicillin G potassium, phenytoin, phytonadione, piperacillin/tazobactam, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole, warfarin.

Patient/Family Teaching

- Explain to patient the rationale for instituting this medication and the need for frequent monitoring.
- Advise patient to inform nurse immediately if chest pain; dyspnea; or numbness, tingling, or burning of extremities occurs.
- Instruct patient to notify nurse immediately of pain or discomfort at the site of administration.
- **Home Care Issues:** Instruct caregiver on proper care of IV equipment.
- Instruct caregiver to report signs of worsening HF (shortness of breath, orthopnea, decreased exercise tolerance), abdominal pain, and nausea or vomiting to health care professional promptly.

Evaluation/Desired Outcomes

- Increase in cardiac output.
- Improved hemodynamic parameters.
- Increased urine output.

HIGH ALERT

DOCEtaxel (doe-se-tax-el)

Docefrez, Taxotere

Classification

Therapeutic: antineoplastics

Pharmacologic: taxoids

Indications

Breast cancer (locally advanced/metastatic breast cancer or with doxorubicin and cyclophosphamide as adjuvant treatment of node-positive disease). Non-small-cell lung cancer (locally advanced/metastatic) after failure on platinum regimen or with platinum as initial therapy). Advanced metastatic hormone-refractory prostate cancer (with prednisone). Squamous cell carcinoma of the head and neck (locally advanced) with cisplatin and fluorouracil. Gastric adenocarcinoma (locally advanced) with cisplatin and fluorouracil.

Action

Interferes with normal cellular microtubule function required for interphase and mitosis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver; metabolites undergo fecal elimination.

Half-life: 11.1 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	5–9 days	7 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to polysorbate 80; Known alcohol intolerance; Neutrophil count <1500/mm³; Liver impairment (serum bilirubin >upper limit of normal, ALT and/or AST >1.5 times upper limit of normal, with alkaline phosphatase >2.5 times upper limit of normal); **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: **OB:** Patients with child-bearing potential; **Pedi:** Efficacy not established.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, alcohol intoxication. **EENT:** cystoid macular edema. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, INTERSTITIAL LUNG DISEASE, PULMONARY FIBROSIS, bronchospasm, dyspnea. **CV:** ASCITES, CARDIAC TAMPONADE, PERICARDIAL EFFUSION, PULMONARY EDEMA, peripheral edema. **GI:** diarrhea, nausea, stomatitis, vomiting. **Derm:** alopecia, edema, rash, dermatitis, desquamation, erythema, nail disorders. **Hemat:** anemia, leukopenia, thrombocytopenia, leukemia. **Local:** injection site reactions. **MS:** myalgia, arthralgia. **Neuro:** neurosensory deficits, peripheral neuropathy. **Misc:** hypersensitivity reactions, including ANAPHYLAXIS.

Interactions

Drug-Drug: ↑ bone marrow depression may occur with other antineoplastics or radiation therapy. Strong inhibitors of CYP3A4, including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, or **voriconazole** ↑ levels and the risk of toxicity; avoid concomitant use (if need to use, ↓ docetaxel dose by 50%).

Route/Dosage

IV (Adults): *Breast cancer*—60–100 mg/m² every 3 wk; *Breast cancer adjuvant therapy*—75 mg/m² every 3 wk for 6 cycles (with doxorubicin and cyclophosphamide); *Non–small-cell lung cancer*—75 mg/m² every 3 wk (alone or with platinum); *Prostate cancer*—75 mg/m² every 3 wk (with oral prednisone); *Squamous cell head and neck cancer*—75 mg/m² every 3 wk for 3–4 cycles (with cisplatin and fluorouracil); *Gastric adenocarcinoma*—75 mg/m² every 3 wk (with cisplatin and fluorouracil).

Availability (generic available)

Injection concentrate: 10 mg/mL (dose of 100 mg/m² contains 0.15 g/m² of ethanol), 20 mg/mL (dose of 100 mg/m² contains 1.975 g/m² of ethanol), 40 mg/mL (dose of 100 mg/m² contains 0.15 g/m² of ethanol).

Lyophilized powder for injection: 20 mg/vial, 80 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and after administration.
- Assess infusion site for patency. Docetaxel is not a vesicant. If extravasation occurs, discontinue docetaxel immediately and aspirate the IV needle. Apply cold compresses to the site for 24 hr.
- **Monitor for hypersensitivity reactions continuously during infusion.** These are most common after first and second doses of docetaxel. Reactions may consist of bronchospasm, hypotension, and/or erythema. Mild to moderate reactions may be treated symptomatically and infusion slowed or stopped until reaction subsides. Severe reactions require discontinuation of therapy and symptomatic treatment. Do not readminister docetaxel to patients with previous severe reactions. Severe edema may also occur. Weigh patients before each treatment. Fluid accumulation may result in edema, ascites, and pleural or pericardial effusions. Pretreatment with corticosteroids (such as dexamethasone 8 mg PO twice daily for 3 days, starting 1 day before docetaxel) is recommended to minimize edema and hypersensitivity reactions. PO furosemide may be used to treat edema. For hormone-refractory metastatic prostate cancer (given with prednisone), recommended pre-

medication regimen is dexamethasone 8 mg PO, at 12 hr, 3 hr and 1 hr before docetaxel infusion.

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess for rash. May occur on feet or hands but may also occur on arms, face, or thorax, usually with pruritus. Rash usually occurs within 1 wk after infusion and resolves before next infusion.
- Assess for development of neurosensory deficit (paresthesia, dysesthesia, pain, burning). May also cause weakness. Pyridoxine may be used to minimize symptoms. Severe symptoms may require dose reduction or discontinuation.
- Assess for arthralgia and myalgia, which are usually relieved by nonopioid analgesics but may be severe enough to require treatment with opioid analgesics.
- Assess for diarrhea and stomatitis. If Grade 3 or 4, reduce dose.
- **Lab Test Considerations:** Monitor CBC and differential before each treatment. Frequently causes neutropenia (<2000 neutrophils/mm³); may require dose adjustment. If neutrophil count <1500/mm³, hold dose. Neutropenia is reversible and not cumulative. The nadir is 8 days, with a duration of 7 days. May also cause thrombocytopenia and anemia.
- Monitor liver function studies (AST, ALT, alkaline phosphatase, bilirubin) before each cycle. If AST/ALT >2.5 to ≤5 x upper limit of normal and AP ≤2.5 x upper limit of normal, or AST/ALT >1.5 to ≤5 x upper limit of normal and AP >2.5 to ≤5 x ULN, reduce dose by 20%. If AST/ALT >5 x upper limit of normal and/or AP >5 x upper limit of normal discontinue therapy.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Risk for injury (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- **High Alert:** Do not confuse Taxotere (docetaxel) with Taxol (paclitaxel).
- Premedicate with dexamethasone 8 mg twice daily for 3 days starting 1 day before docetaxel infusion to reduce incidence and severity of fluid retention and hypersensitivity reactions. Premedicate patients with

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

hormone-refractory metastatic prostate cancer with PO dexamethasone 8 mg, at 12 hr, 3 hr and 1 hr before docetaxel infusion.

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** *For injection concentrate:* Before dilution, allow vials to stand at room temperature for 5 min. Solution is pale yellow to brownish yellow. *For powder for injection:* Allow number of vials required for dose to stand at room temperature for 5 min. Reconstitute with diluent provided, 1 mL for 20-mg vial or 4 mL for 80-mg vial. Shake vial to dissolve. Solution should be clear; do not administer solutions that are discolored or contain a precipitate. Allow solution to stand for a few minutes for air bubbles to dissipate. May be refrigerated for up to 8 hrs. **Concentration:** 20 mg/0.8 mL for 20-mg vial; 24 mg/mL for 80-mg vial. **Diluent:** Withdraw required amount and inject into 250-mL bag of 0.9% NaCl or D5W. If a dose greater than 200 mg is required, use a larger volume diluent so that concentration of 0.74 mg/mL is not exceeded. Rotate gently to mix. Do not administer solutions that are cloudy or contain a precipitate. Diluted solution must be infused within 4 hrs. **Concentration:** 0.3 mg/mL to 0.74 mg/mL. **Rate:** Administer over 1 hr.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftazidime, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eripapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydro-morphone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, me-

peridine, meropenem, mesna, methotrexate, methylglucate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nafcillin, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinu-pristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B liposome, dantrolene, doxorubicin liposome, idarubicin, methylprednisolone, nalbuphine, phenytoin.

Patient/Family Teaching

- **Instruct patient to report signs of hypersensitivity reactions (trouble breathing; sudden swelling of face, lips, tongue, throat; trouble swallowing; hives; rash; redness all over body) to health care professional immediately.**
- Advise patient to notify health care professional if fever $> 101^{\circ}\text{F}$; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor.
- Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Fatigue is a frequent side effect of docetaxel. Advise patient that frequent rest periods and pacing of activities may minimize fatigue.
- Instruct patient to notify health care professional if signs of fluid retention (peripheral edema in the lower extremities, weight gain, dyspnea), abdominal pain, yellow skin, weakness, paresthesia, gait disturbances, swelling of the feet, or joint or muscle aches occur.
- Alcohol content of docetaxel may impair CNS. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Advise patient to avoid alcohol during therapy.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if changes in vision occur. Obtain a prompt and comprehensive ophthalmologic examination. May require discontinuation of docetaxel and a nontaxane cancer therapy used.
- Discuss with patient the possibility of hair loss. Complete hair loss usually begins after 1 or 2 treatments and is reversible after discontinuation of therapy. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise female patients to use effective contraception during therapy and to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancy in women with advanced breast cancer.
- Decrease in size or spread of malignancy in locally advanced or metastatic non–small-cell lung cancer, squamous cell carcinoma of the head and neck, and gastric adenocarcinoma.
- Decreased size or spread of advanced metastatic hormone-refractory prostate cancer.

DOCUSATE (dok-yoo-sate)

docusate calcium

Kao-Tin, Kaopectate Stool Softener

docusate sodium

Colace, Correctol, Diocto, Docu-Soft, Docusoft S, DOK,  Dosolax, DSS, Dulcolax, Dulcolax Stool Softener, Enemeez, Fleet Pedialax, Fleet Sof-Lax, Phillips Liquid-Gels,  Selax, Silace,  Soflax

Classification

Therapeutic: laxatives

Pharmacologic: stool softeners

Indications

PO: Prevention of constipation (in patients who should avoid straining, such as after MI or rectal surgery).

Rect: Used as enema to soften fecal impaction.

Action

Promotes incorporation of water into stool, resulting in softer fecal mass. May also promote electrolyte and wa-

ter secretion into the colon. **Therapeutic Effects:** Softening and passage of stool.

Pharmacokinetics

Absorption: Small amounts may be absorbed from the small intestine after oral administration. Absorption from the rectum is not known.

Distribution: Unknown.

Metabolism and Excretion: Amounts absorbed after oral administration are eliminated in bile.

Half-life: Unknown.

TIME/ACTION PROFILE (softening of stool)

ROUTE	ONSET	PEAK	DURATION
PO	12–72 hr	unknown	unknown
Rectal	2–15 min	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain, nausea, or vomiting, especially when associated with fever or other signs of an acute abdomen.

Use Cautiously in: Excessive or prolonged use may lead to dependence; Should not be used if prompt results are desired; **OB, Lactation:** Has been used safely.

Adverse Reactions/Side Effects

EENT: throat irritation. **GI:** mild cramps, diarrhea.

Derm: rashes.

Interactions

Drug-Drug: None significant.

Route/Dosage

Docusate Calcium

PO (Adults): 240 mg once daily.

Docusate Sodium

PO (Adults and Children >12 yr): 50–400 mg in 1–4 divided doses.

PO (Children 6–12 yr): 40–150 mg in 1–4 divided doses.

PO (Children 3–6 yr): 20–60 mg in 1–4 divided doses.

PO (Children <3 yr): 10–40 mg in 1–4 divided doses.

PO (Infants): 5 mg/kg/day in 1–4 divided doses.

Rect (Adults): 50–100 mg or 1 unit containing 283 mg docusate sodium, soft soap, and glycerin.

Availability (generic available)

Docusate Calcium

Capsules: 240 mg^{OTC}.

Docusate Sodium (generic available)

Tablets: 100 mg^{OTC}. **Capsules:** 50 mg^{OTC}, 100 mg^{OTC}, 250 mg^{OTC}. **Syrup:** 20 mg/5 mL^{OTC}. **Liquid:** 50 mg/5 mL^{OTC}. **Enema:** 283 mg/5 mL^{OTC}. **In combination**

with: stimulant laxatives^{OTC}. See Appendix B.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- Do not confuse Colace with Cozaar. Do not confuse Dulcolax (docusate sodium) with Dulcolax (bisacodyl). Do not confuse Kaopectate Stool Softener (docusate calcium) with Kaopectate (bismuth subsalicylate).
- This medication does not stimulate intestinal peristalsis; stimulant laxative may be required for constipation.
- PO:** Administer with a full glass of water or juice. May be administered on an empty stomach for more rapid results.
- Oral solution may be diluted in milk, infant formula, or fruit juice to decrease bitter taste.
- Do not administer within 2 hr of other laxatives, especially mineral oil. May cause increased absorption.
- Rect:** Administer as a retention or flushing enema.

Patient/Family Teaching

- Advise patients that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patients to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake (6–8 full glasses/day), and increasing mobility. Normal bowel habits are variable and may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient not to use laxatives when abdominal pain, nausea, vomiting, or fever is present.
- Advise patient not to take docusate within 2 hr of other laxatives.

Evaluation/Desired Outcomes

- A soft, formed bowel movement, usually within 24–48 hr. Therapy may take 3–5 days for results. Rectal dose forms produce results within 2–15 min.

dofetilide (doe-fet-il-ide)

Tikosyn

Classification

Therapeutic: antiarrhythmics (class III)

Indications

Maintenance of normal sinus rhythm (delay in time to recurrence of atrial fibrillation/atrial flutter [AF/AFL]) in patients with AF/AFL lasting more than one week, and

who have been converted to normal sinus rhythm. Conversion of AF and AFL to normal sinus rhythm.

Action

Blocks cardiac ion channels responsible for transport of potassium. Increases monophasic action potential duration. Increases effective refractory period. **Therapeutic Effects:** Prevention of recurrent AF/AFL. Conversion of AF/AFL to normal sinus rhythm.

Pharmacokinetics

Absorption: Well absorbed (>90%) following oral administration.

Distribution: Unknown.

Metabolism and Excretion: 80% excreted by kidneys via cationic renal secretion, mostly as unchanged drug; 20% excreted as inactive metabolites; some metabolism in the liver via cytochrome P450 system (CYP3A4 isoenzyme).

Half-life: 10 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	within hrs	2–3 hr†	12–24 hr

†Steady state levels are achieved after 2–3 days.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Congenital or acquired prolonged QT syndromes; Baseline QT interval or QTc of >440 msec (500 msec in patients with ventricular conduction abnormalities); Creatinine clearance <20 mL/min; Concurrent use of verapamil, cimetidine, dolutegravir, ketoconazole, itraconazole, trimethoprim, megestrol, prochlorperazine, hydrochlorothiazide, or other QT-interval prolonging drugs;

Lactation: Avoid use.

Use Cautiously in: Underlying electrolyte abnormalities (↑ risk of serious arrhythmias; correct prior to administration); Creatinine clearance 20–60 mL/min (dose ↓ recommended); Severe hepatic impairment; **OB:** Use only when potential benefit to patient outweighs potential risk to fetus; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** VENTRICULAR ARRHYTHMIAS (including torsade de pointes), chest pain, QT interval prolongation.

Interactions

Drug-Drug: Hydrochlorothiazide, verapamil, cimetidine, ketoconazole, itraconazole, trimethoprim, megestrol, dolutegravir, and prochlorperazine ↑ dofetilide levels and the risk of QT interval prolongation with arrhythmias; concurrent use is contraindicated. **QT interval prolonging drugs** may ↑ the risk of QT interval prolongation with arrhythmias; concurrent use contraindicated. **Amiloride, metformin, and triamterene** may also ↑ dofetilide levels; use with caution. Inhibitors of the cytochrome P450 system

(CYP450 3A4 isoenzyme) including **macrolide anti-infectives**, **azole antifungals**, **protease inhibitor antiretrovirals**, **SSRI antidepressants**, **amiodarone**, **diltiazem**, **nefazodone**, **quinine**, and **zafirlukast** may also ↑ blood levels and the risk of arrhythmias and concurrent use should be undertaken with caution. Should not be used concurrently with other **class I or III antiarrhythmics** due to ↑ risk of arrhythmias. Hypokalemia or hypomagnesemia from **potassium-depleting diuretics** ↑ the risk of arrhythmias; correct abnormalities prior to administration. Concurrent use of **digoxin** may ↑ the risk of arrhythmias.

Drug-Food: **Grapefruit juice** may ↑ levels; avoid concurrent use.

Route/Dosage

Dosing should be adjusted according to renal function and assessment of QT interval.

PO (Adults): *Starting dose*—500 mcg twice daily; *maintenance dose*—250 mcg twice daily (not to exceed 500 mcg twice daily).

Renal Impairment

PO (Adults): *CCr 40–60 mL/min Starting dose*—250 mcg twice daily; *maintenance dose*—125 mcg twice daily; *CCr 20–40 mL/min Starting dose*—125 mcg twice daily; *maintenance dose*—125 mcg once daily.

Availability

Capsules: 125 mcg, 250 mcg, 500 mcg.

NURSING IMPLICATIONS

Assessment

- Monitor ECG, pulse, and BP continuously during initiation of therapy and for at least 3 days or a minimum of 12 hrs after electrical or pharmacological conversion to normal sinus rhythm, whichever is greater, then periodically during therapy. Evaluate QTc prior to initiation of therapy and every 3 mo during therapy. If QTc exceeds 440 msec (500 msec in patients with ventricular conduction abnormalities), discontinue dofetilide and monitor patient until QTc returns to baseline.
- Assess the patient's medication history including OTC, Rx, and natural/herbal products, with emphasis on those that interact with dofetilide (see Interactions).
- **Lab Test Considerations:** Creatinine clearance must be calculated for all patients prior to administration and every 3 mo during therapy.
- Maintain serum potassium in normal range before and during dofetilide therapy.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- Dofetilide must be initiated or reinitiated and monitored for at least 3 days in a setting that provides continuous ECG monitoring and has personnel trained in the management of serious ventricular arrhythmias. Due to the potential for life-threatening ventricular arrhythmias, dofetilide is usually used for patients with highly symptomatic AF/AFL.
- Patients with AF should be anticoagulated according to usual protocol prior to electrical or pharmacological cardioversion.
- Make sure patient has an adequate supply of dofetilide prior to discharge to prevent interruption of therapy.
- Patients should not be discharged from the hospital within 12 hr of electrical or pharmacological conversion to normal sinus rhythm.
- **PO:** Administer at the same time each day without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling well. If a dose is missed, skip dose; do not double next dose. Take next dose at usual time.
- Advise patient to avoid grapefruit juice during therapy; may increase drug levels.
- Advise patient to read *Medication Guide* prior to initiation of therapy and reread with each Rx refill in case of changes. Emphasize need for compliance with therapy, potential for drug interactions, and need for periodic monitoring to minimize the risk of serious arrhythmias.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Advise patient to consult health care professional immediately if they faint, become dizzy, or have fast heartbeats. If health care professional is unavailable, instruct patient to go to nearest hospital emergency department, take remaining dofetilide capsules, and show them to health care professional. If symptoms associated with altered electrolyte balance such as excessive or prolonged diarrhea, sweating, or vomiting or loss of appetite or thirst occur, health care professional should also be notified immediately.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Prevention of recurrent AF/AFL.
- Conversion of AF/AFL to normal sinus rhythm.
- If patients do not convert to normal sinus rhythm within 24 hr of initiation of therapy, electrical conversion should be considered.

dolasetron (dol-a-se-tron)

Anzemet

Classification

Therapeutic: antiemetics

Pharmacologic: 5-HT₃ antagonists

Indications

PO: Prevention of nausea and vomiting associated with emetogenic chemotherapy.

Action

Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea/vomiting associated with emetogenic chemotherapy or surgery.

Pharmacokinetics

Absorption: Well absorbed but rapidly metabolized to hydrodolasetron, the active metabolite.

Distribution: Unknown.

Metabolism and Excretion: 61% of hydrodolasetron is excreted unchanged by the kidneys.

Half-life: *Hydrodolasetron*—8.1 hr (shorter in children).

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Congenital long QT syndrome; Complete heart block (unless pacemaker present).

Use Cautiously in: Patients with risk factors for cardiac conduction abnormalities (underlying structural heart disease, sick sinus syndrome, atrial fibrillation and slow ventricular rate, myocardial ischemia, concurrent beta-blocker, verapamil, diltiazem, or antiarrhythmic therapy); Hypokalemia, hypomagnesemia, concurrent therapy with diuretics, or history of cumulative high-dose anthracycline therapy; **Geri:** ↑ risk for cardiac conduction abnormalities; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache (increased in cancer patients), dizziness, fatigue, syncope. **CV:** **CARDIAC ARREST, TORSADE DE POINTES, VENTRICULAR ARRHYTHMIAS**, bradycardia, heart block, hypertension, hypotension, PR interval prolongation, QRS interval prolongation, QT interval prolongation, tachycardia. **GI:** diarrhea, dyspepsia. **GU:** oliguria. **Derm:** pruritus. **Misc:** **SEROTONIN SYNDROME**, chills, fever, pain.

Interactions

Drug-Drug: Concurrent **diuretic** or **antiarrhythmic** therapy or cumulative **high-dose anthracycline therapy** may ↑ risk of conduction abnormalities. Blood levels and effects of hydrodolasetron are ↑ by **atenolol** and **cimetidine**. Blood levels and effects of hydrodolasetron are ↓ by **rifampin**. ↑ risk of QT interval prolongation with other **agents causing QT interval prolongation**. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs, SNRIs, tricyclic antidepressants, MAOIs, fentanyl, lithium, buspirone, tramadol, methylene blue, and triptans** ↑ risk of serotonin syndrome.

Route/Dosage

Prevention of Chemotherapy-Induced Nausea/Vomiting

PO (Adults): 100 mg given within 1 hr before chemotherapy.

PO (Children 2–16 yr): 1.8 mg/kg given within 1 hr before chemotherapy (not to exceed 100 mg).

Availability

Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Monitor ECG in patients with HF, bradycardia, underlying heart disease, renal impairment, and elderly patients.
- **Lab Test Considerations:** Monitor serum potassium and magnesium prior to and periodically during therapy.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- **PO:** Administer within 1 hr before chemotherapy.

Patient/Family Teaching

- Explain purpose of dolasetron to patient.
- Advise patient to notify health care professional if nausea or vomiting occurs.
- Advise patient to notify health care professional symptoms of abnormal heart rate or rhythm (racing

heart beat, shortness of breath, dizziness, fainting) occur.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy.

dolutegravir
(doe-loo-teg-ra-vir)
Tivicay

Classification

Therapeutic: antiretrovirals
Pharmacologic: integrase strand transfer inhibitors (INSTI)

Indications

Treatment of HIV-1 infection, in combination with other antiretrovirals.

Action

Inhibits HIV-1 integrase, which is required for viral replication. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics

Absorption: Absorption follows oral administration; bioavailability is unknown.

Distribution: Enters CSF.

Protein Binding: >98.9%.

Metabolism and Excretion: Metabolized primarily by the UGT1A1 enzyme system with some metabolism by CYP3A4. 53% excreted unchanged in feces. Metabolites are renally excreted, minimal renal elimination of unchanged drug. **⚠** Poor metabolizers of dolutegravir have ↑ levels and ↓ clearance.

Half-life: 14 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unk	2–3 hr	12–24 hr†

†Depends on concurrent use of metabolic inducers.

Contraindications/Precautions

Contraindicated in: Concurrent use of dofetilide; Severe hepatic impairment; **Lactation:** Breast feeding not recommended in HIV-infected patients.

Use Cautiously in: Underlying hepatic disease, including hepatitis B or C (↑ risk for hepatotoxicity); Severe renal impairment; **Ger:** Consider age-related ↓ in cardiac, renal and hepatic function, chronic disease states and concurrent medications; **OB:** Use during pregnancy only if clearly needed; **Pedi:** Children <30 kg or INSTI-experienced with resistance documented to other INSTIs (raltegravir) (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: headache, insomnia, fatigue. **GI:** HEPATOTOXICITY (↑ WITH HEPATITIS B OR C). **GU:** renal impairment.

Derm: pruritus. **Metab:** fat accumulation/redistribution. **MS:** myositis. **Misc:** HYPERSENSITIVITY REACTIONS (including rash, constitutional symptoms, and liver injury), immune reconstitution syndrome.

Interactions

Drug-Drug: May ↑ blood levels and toxicity from **dofetilide**; concurrent use contraindicated. Blood levels and effectiveness are ↓ by **etravirine** (should not be used concurrently without atazanavir/ritonavir, darunavir/ritonavir or lopinavir/ritonavir). Blood levels and effectiveness are ↓ by **efavirenz**, **fosamprenavir/ritonavir**, **tipranavir/ritonavir**, **carbamazepine**, and **rifampin**; ↑ dose of dolutegravir recommended. Blood levels and effectiveness may be ↓ by **nevirapine**; avoid concurrent use. May ↑ blood levels and toxicity from **metformin**; do not exceed metformin dose of 1000 mg/day. Blood levels and effectiveness may be ↓ by **oxcarbazepine**, **phenobarbital**, **phenytoin**; avoid concurrent use. Absorption and effectiveness may be ↓ by cation-containing **antacids**, **buffered medications**, **calcium supplements** (oral), **iron supplements** (oral), **laxatives**, or **sucralfate**; dolutegravir should be taken 2 hr before or 6 hr after; may also take dolutegravir and calcium or iron supplements with food.

Drug-Natural Products: Blood levels and effectiveness may be ↓ **St. John's wort**; avoid concurrent use.

Route/Dosage

PO (Adults): *Treatment-naïve or treatment-experienced INSTI-naïve patients*—50 mg once daily; *Treatment-naïve or treatment-experienced INSTI-naïve patients currently receiving efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir, carbamazepine, or rifampin*—50 mg twice daily; *INSTI-experienced with certain INSTI-associated resistance substitutions or clinically suspected INSTI resistance (consider other combinations that do not include metabolic inducers)*—50 mg twice daily.

PO (Children ≥40 kg): *Treatment-naïve or treatment-experienced INSTI-naïve patients*—50 mg once daily; *Treatment-naïve or treatment-experienced INSTI-naïve patients currently receiving efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir, carbamazepine, or rifampin*—50 mg twice daily.

PO (Children 30–39 kg): *Treatment-naïve or treatment-experienced INSTI-naïve patients*—35 mg once daily; *Treatment-naïve or treatment-experienced INSTI-naïve patients currently receiving efavirenz, fosamprenavir/ritonavir, tipranavir/ritonavir, carbamazepine, or rifampin*—35 mg twice daily.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Availability

Tablets: 10 mg, 25 mg, 50 mg. **In combination with:** abacavir and lamivudine (Triumeq). See Appendix B.

NURSING IMPLICATIONS**Assessment**

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- **Monitor for signs and symptoms of hypersensitivity reactions** (rash, fever, malaise, fatigue, muscle or joint aches, blisters or peeling of skin, oral blisters or lesions, conjunctivitis, facial edema, hepatitis, eosinophilia, angioedema, difficulty breathing). Discontinue therapy and do not restart.
- **Lab Test Considerations:** Monitor viral load and CD4 counts regularly during therapy.
- May cause ↓ ANC, hemoglobin, total neutrophils, and platelet counts.
- May cause ↑ serum glucose, lipase, AST, ALT, total bilirubin, creatine kinase concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be administered without regard to food.

Patient/Family Teaching

- Emphasize the importance of taking donepezil as directed. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered unless within 4 hr of next dose; then skip dose. Do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx renewal in case of changes.
- Instruct patient that donepezil should not be shared with others.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Inform patient that donepezil does not cure AIDS or prevent associated or opportunistic infections. Donepezil does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of donepezil are unknown at this time.
- **Advise patient to notify health care professional if signs and symptoms of hypersensitivity or infection occur.**

- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- **Rep:** Advise patients to notify health care professional if pregnancy is planned or suspected. Breast feeding should be avoided during therapy. Pregnant patients should be encouraged to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

donepezil (doe-nep-i-zill)

Aricept, Aricept-ODT

Classification

Therapeutic: anti-Alzheimer's agents

Pharmacologic: cholinergics (cholinesterase inhibitors)

Indications

Mild, moderate, or severe dementia/neurocognitive disorder associated with Alzheimer's disease.

Action

Inhibits acetylcholinesterase thus improving cholinergic function by making more acetylcholine available.

Therapeutic Effects: May temporarily lessen some of the dementia associated with Alzheimer's disease. Enhances cognition. Does not cure the disease.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Protein Binding: 96%.

Metabolism and Excretion: Partially metabolized by the liver (CYP2D6 and CYP3A4 enzymes) and partially excreted by kidneys (17% unchanged). Two metabolites are pharmacologically active.

Half-life: 70 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	several wk	6 wk†

†Return to baseline after discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to donepezil or piperidine derivatives.

Use Cautiously in: Underlying cardiac disease, especially sick sinus syndrome or supraventricular conduction defects; History of ulcer disease or currently taking NSAIDs; History of seizures; History of asthma or obstructive pulmonary disease; **OB, Lactation, Pedi:** Safety not established; assumed to be secreted in breast milk. Discontinue drug or bottle-feed.

Adverse Reactions/Side Effects

CNS: headache, abnormal dreams, depression, dizziness, drowsiness, fatigue, insomnia, syncope, sedation (unusual). **CV:** atrial fibrillation, hypertension, hypotension, vasodilation. **GI:** diarrhea, nausea, anorexia, vomiting, weight gain (unusual). **GU:** frequent urination. **Derm:** ecchymoses. **Metab:** hot flashes, weight loss. **MS:** arthritis, muscle cramps.

Interactions

Drug-Drug: Exaggerates muscle relaxation from succinylcholine. Interferes with the action of anticholinergics. ↑ cholinergic effects of bethanechol. May ↑ risk of GI bleeding from NSAIDs. Quinidine and ketoconazole ↓ metabolism of donepezil. Rifampin, carbamazepine, dexamethasone, phenobarbital, and phenytoin induce the enzymes that metabolize donepezil and may ↓ its effects.

Drug-Natural Products: Jimson weed and scopolia may antagonize cholinergic effects.

Route/Dosage

Mild to Moderate Alzheimer's Disease

PO (Adults): 5 mg once daily; after 4–6 wk may ↑ to 10 mg once daily (dose should not exceed 5 mg/day in frail, elderly females).

Severe Alzheimer's Disease

PO (Adults): 5 mg once daily; may ↑ to 10 mg once daily after 4–6 wk; after 3 mo, may then ↑ to 23 mg once daily.

Availability (generic available)

Tablets: 5 mg, 10 mg, 23 mg. **Cost:** Aricept—23 mg \$1,059.91/90; Generic—All strengths \$23.97/90.

Orally disintegrating tablets: 5 mg, 10 mg. **Cost:** Generic—All strengths \$233.62/30. **In combination with:** memantine (Namzaric). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- Monitor heart rate periodically during therapy. May cause bradycardia.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Impaired environmental interpretation syndrome (Indications)

Risk for injury (Indications)

Implementation

- Do not confuse Aricept with Aciphex or Azilect.
- **PO:** Administer in the evening just before going to bed. May be taken without regard to food.
- **Oral disintegrating tablets** should be allowed to dissolve on tongue; follow with water.
- Swallow 23 mg tablet whole. Do not split, crush, or chew; may increase rate of absorption.

Patient/Family Teaching

- Emphasize the importance of taking donepezil daily, as directed. Missed doses should be skipped and regular schedule returned to the following day. Do not take more than prescribed; higher doses do not increase effects but may increase side effects.
- Inform patient/family that it may take wk before improvement in baseline behavior is observed.
- Caution patient and caregiver that donepezil may cause dizziness.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, diarrhea, or changes in color of stool occur or if new symptoms occur or previously noted symptoms increase in severity.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Advise patient and caregiver to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

HIGH ALERT

DOPamine (dope-a-meen)

Intropin,  Revimine

Classification

Therapeutic: inotropics, vasopressors
Pharmacologic: adrenergics

Indications

Adjunct to standard measures to improve: BP, Cardiac output, Urine output in treatment of shock unrespon-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

sive to fluid replacement. Increase renal perfusion (low doses).

Action

Small doses (0.5–3 mcg/kg/min) stimulate dopaminergic receptors, producing renal vasodilation. Larger doses (2–10 mcg/kg/min) stimulate dopaminergic and beta₁-adrenergic receptors, producing cardiac stimulation and renal vasodilation. Doses greater than 10 mcg/kg/min stimulate alpha-adrenergic receptors and may cause renal vasoconstriction. **Therapeutic Effects:** Increased cardiac output, increased BP, and improved renal blood flow.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Widely distributed but does not cross the blood-brain barrier.

Metabolism and Excretion: Metabolized in liver, kidneys, and plasma.

Half-life: 2 min.

TIME/ACTION PROFILE (hemodynamic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	up to 10 min	<10 min

Contraindications/Precautions

Contraindicated in: Tachyarrhythmias; Pheochromocytoma; Hypersensitivity to bisulfites (some products).

Use Cautiously in: Hypovolemia; Myocardial infarction; Occlusive vascular diseases; **Geri:** Older patients may be more susceptible to adverse effects; **OB:** Pregnancy and lactation (safety not established).

Adverse Reactions/Side Effects

CNS: headache. **EENT:** mydriasis (high dose).

Resp: dyspnea. **CV:** arrhythmias, hypotension, angina, ECG change, palpitations, vasoconstriction. **GI:** nausea, vomiting. **Derm:** piloerection. **Local:** irritation at IV site.

Interactions

Drug-Drug: Use with MAO inhibitors, ergot alkaloids (ergotamine), doxapram, or some antidepressants results in severe hypertension. Use with IV phenytoin may cause hypotension and bradycardia. Use with general anesthetics may result in arrhythmias. **Beta blockers** may antagonize cardiac effects.

Route/Dosage

IV (Adults): *Dopaminergic (renal vasodilation) effects*—1–5 mcg/kg/min. *Beta-adrenergic (cardiac stimulation) effects*—5–15 mcg/kg/min. *Alpha-adrenergic (increased peripheral vascular resistance) effects*—>15 mcg/kg/min; infusion rate may be increased as needed.

IV (Children and Infants): 1–20 mcg/kg/min, depending on desired response (1–5 mcg/kg/min has been used to improve renal blood flow).

IV (Neonates): 1–20 mcg/kg/min.

Availability (generic available)

Injection for dilution: 40 mg/mL, 80 mg/mL, 160 mg/mL. **Premixed injection:** 200 mg/250 mL, 400 mg/250 mL, 800 mg/250 mL, 800 mg/500 mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, heart rate, pulse pressure, ECG, pulmonary capillary wedge pressure (PCWP), cardiac output, CVP, and urinary output continuously during administration. Report significant changes in vital signs or arrhythmias. Consult physician for parameters for pulse, BP, or ECG changes for adjusting dose or discontinuing medication.
- Monitor urine output frequently throughout administration. Report decreases in urine output promptly.
- Palpate peripheral pulses and assess appearance of extremities routinely during dopamine administration. Notify physician if quality of pulse deteriorates or if extremities become cold or mottled.
- If hypotension occurs, administration rate should be increased. If hypotension continues, more potent vasoconstrictors (norepinephrine) may be administered.
- **Toxicity and Overdose:** If excessive hypertension occurs, rate of infusion should be decreased or temporarily discontinued until BP is decreased.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Ineffective tissue perfusion (Indications)

Implementation

- **High Alert:** IV vasoactive medications are potentially dangerous. Have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse dopamine with dobutamine. If both are available as floor stock, store in separate areas.
- Correct hypovolemia with volume expanders before initiating dopamine therapy.
- Extravasation may cause severe irritation, necrosis, and sloughing of tissue. Administer into a large vein and assess administration site frequently. If extravasation occurs, affected area should be infiltrated liberally with 10–15 mL of 0.9% NaCl containing 5–10 mg of phentolamine. For pediatric patients, use 1 mL of phentolamine dilution to infiltrate (do not exceed 5 mg total). Infiltration within 12 hr of extravasation produces immediate hyperemic changes.

IV Administration

- **Continuous Infusion:** **Diluent:** Dopamine vials must be diluted before use. Dilute 200–800 mg of dopamine in 250–500 mL of 0.9% NaCl, D5W, D5/

LR, D5/0.45% NaCl, D5/0.9% NaCl, or LR. Admixed solution is stable for 24 hr. Discard solutions that are cloudy, discolored, or contain a precipitate. Premixed infusions are already diluted and ready to use. **Concentration:** 0.8–3.2 mg/mL. **Rate:** Based on patient's weight (see Route/Dosage section). Infusion must be administered via infusion pump to ensure precise amount delivered. Titrate to response (BP, heart rate, urine output, peripheral perfusion, presence of ectopic activity, cardiac index). Decrease rate gradually when discontinuing to prevent marked decreases in BP.

- **Y-Site Compatibility:** amifostine, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, cladribine, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, doxorubicin liposome, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, flucanazole, foscarnet, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, palonosetron, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, ranitidine, remifentanyl, sargramostim, streptokinase, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, verapamil, vitamin B complex with C, voriconazole, warfarin, zidovudine.
- **Y-Site Incompatibility:** acyclovir, alteplase, amphotericin B cholesteryl sulfate, ampicillin, cefazolin, chloramphenicol, diazepam, ganciclovir, indomethacin, insulin, lansoprazole, phenytoin, thiopental, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Explain to patient the rationale for instituting this medication and the need for frequent monitoring.
- Advise patient to inform nurse immediately if chest pain; dyspnea; numbness, tingling, or burning of extremities occurs.

- Instruct patient to inform nurse immediately of pain or discomfort at the site of administration.

Evaluation/Desired Outcomes

- Increase in BP.
- Increase in peripheral circulation.
- Increase in urine output.

doxazosin (dox-ay-zoe-in) Cardura, Cardura XL

Classification

Therapeutic: antihypertensives
Pharmacologic: peripherally acting antiadrenergics

Indications

Hypertension (alone or with other agents) (immediate-release only). Symptomatic benign prostatic hyperplasia (BPH).

Action

Dilates both arteries and veins by blocking postsynaptic alpha₁-adrenergic receptors. **Therapeutic Effects:** Lowering of BP. Increased urine flow and decreased symptoms of BPH.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Probably enters breast milk; rest of distribution unknown.

Protein Binding: 98–99%.

Metabolism and Excretion: Extensively metabolized by the liver.

Half-life: 22 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO†	1–2 hr	2–6 hr	24 hr
PO-XL‡	5 wk	unknown	unknown

† Antihypertensive effect.

‡ Improved urinary flow and BPH symptoms.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Hepatic dysfunction; Gastrointestinal narrowing (XL only); **Ger:** Appears on Beers list. Geriatric patients are at ↑ risk for hypotension; **OB, Lactation, Pedi:** Safety not established; Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome).

Adverse Reactions/Side Effects

CNS: dizziness, headache, depression, drowsiness, fatigue, nervousness, weakness. **EENT:** abnormal vision, blurred vision, conjunctivitis, epistaxis, intraoper-

* = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

active floppy iris syndrome. **Resp:** dyspnea. **CV:** first-dose orthostatic hypotension, arrhythmias, chest pain, edema, palpitations. **GI:** abdominal discomfort, constipation, diarrhea, dry mouth, flatulence, nausea, vomiting. **GU:** ↓ libido, priapism, sexual dysfunction. **Derm:** flushing, rash, urticaria. **MS:** arthralgia, arthritis, gout, myalgia.

Interactions

Drug-Drug: ↑ risk of hypotension with **sildenafil, tadalafil, vardenafil**, other **antihypertensives, nitrates**, or acute ingestion of **alcohol**. **NSAIDs, sympathomimetics**, or **estrogens** may ↓ effects of antihypertensive therapy.

Route/Dosage

Hypertension

PO (Adults): — 1 mg once daily, may be gradually ↑ at 2-wk intervals to 2–16 mg/day; incidence of postural hypotension greatly ↑ at doses >4 mg/day. **BPH**— 1 mg once daily, may be gradually increased to 8 mg/day.

Benign Prostatic Hyperplasia

PO (Adults): *Immediate release*— 1 mg once daily, may be ↑ every 1–2 wk up to 8 mg/day; *Extended release*— 4 mg once daily (with breakfast), may be ↑ in 3–4 wk to 8 mg/day.

Availability (generic available)

Tablets: 1 mg, 2 mg, 4 mg, 8 mg. **Cost:** *Generic*— 1 mg \$60.00/100, 2 mg \$79.89/100, 4 mg \$85.34/100, 8 mg \$60.41/100. **Extended-release tablets:** 4 mg, 8 mg. **Cost:** 4 mg \$84.62/30, 8 mg \$88.90/30.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse 2–6 hr after first dose, with each increase in dose, and periodically during therapy. Report significant changes.
- Assess for first-dose orthostatic hypotension and syncope. Incidence may be dose related. Observe patient closely during this period and take precautions to prevent injury.
- Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy. Report weight gain or edema.
- **BPH:** Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) prior to and periodically during therapy.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Risk for injury (Side Effects)

Implementation

- **Do not confuse Cardura with Coumadin.**
- **PO:** Administer daily dose at bedtime.
- XL tablets should be swallowed whole; do not break, crush, or chew.
- **Hypertension:** May be administered concurrently with a diuretic or other antihypertensive.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to decrease orthostatic hypotension. May cause syncopal episodes, especially within first 24 hr of therapy, with dose increase, and with resumption of therapy after interruption.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially cold preparations, without consulting health care professional, especially cough, cold, or allergy remedies.
- Advise male patient to notify health care professional if priapism or erection of longer than 4 hr occurs; may lead to permanent impotence if not treated.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up visits to determine effectiveness of therapy.
- **Hypertension:** Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and report significant changes.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Decrease in urinary symptoms of BPH.

doxercalciferol, See VITAMIN D COMPOUNDS.

HIGH ALERT

DOXOrubicin

(dox-oh-roo-bi-sin)

* Adriamycin, * Caelyx, * Myocet

Classification

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

Indications

Alone or with other modalities in the treatment of various solid tumors including: Breast, Ovarian, Bladder, Bronchogenic carcinoma, Malignant lymphomas and leukemias.

Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase-specific. Also has immunosuppressive properties. **Therapeutic**

Effects: Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP2D6 and CYP3A4). Converted by liver to an active compound. Excreted predominantly in the bile, 50% as unchanged drug. Less than 5% eliminated unchanged in the urine.

Half-life: 16.7 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	10 days	14 days	21–24 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: History of cardiac disease or high cumulative doses of anthracyclines; Depressed bone marrow reserve; Liver impairment (reduce dose if serum bilirubin >1.2 mg/dL); **Pedi, Geri:** Children, geriatric patients, mediastinal radiation, concurrent cyclophosphamide (↑ risk of cardiotoxicity); **Rep:** Patients with childbearing potential.

Adverse Reactions/Side Effects

Resp: recall pneumonitis. **CV:** **CARDIOMYOPATHY**, ECG changes. **GI:** diarrhea, esophagitis, nausea, stomatitis, vomiting. **GU:** red urine. **Derm:** alopecia, photosensitivity. **Endo:** sterility, prepubertal growth failure with temporary gonadal impairment (children

only). **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site, tissue necrosis. **Me-tab:** hyperuricemia. **Misc:** hypersensitivity reactions.

Interactions
